PHARMACOPOEIA OF THE PEOPLE'S REPUBLIC OF CHINA

(2005)

Volume Ⅰ

ISBN 7-117-06982-1

This pharmacopoeia is the English version edited from Pharmacopoeia of the People's Republic of China 2005. The Chinese edition is approved by the State Food and Drug Administration of the People's Republic of China to be effective from July 1, 2005, in accordance with the official document GSYJZ (2005) 234.

Preface

This edition of the Pharmacopoeia of the People's Republic of China (known as *the Chinese Pharmacopoeia 2005* or in abbreviation as Ch. P 2005) has been prepared in accordance with the principles and designed plan decided by the Eighth Chinese Pharmacopoeia Commission and accomplished with the effort made by Commission members and its Secretariat over more than two years. *The Chinese Pharmacopoeia 2005* adopted by the Executive Commission of the Chinese Pharmacopoeia Commission is approved for implementation by the State Food and Drug Administration of China. This is the eighth edition of Chinese Pharmacopoeia since the founding of the People's Republic of China.

The Chinese Pharmacopoeia 2005 has been considerably revised and improved in General Notices, Requirements of Monographs, General Requirements for Preparations in Appendices and new testing methods, etc. Based on the introduction of advanced technology and experimental methods widely adopted in China and abroad, the contents of Appendices are revised by and large in consistence with those nowadays applied internationally for drug quality control. On the premise that every effort should be made to follow the principle of "safety for use, reliability of therapeutic effect, feasibility of processes, controllability of manufacturing quality and perfection of specification", the monographs admitted in the Pharmacopoeia on the whole reflect the actual clinical use of drugs in China. Furthermore, stylistic rules and layout, wording, units, and symbols, etc. have also been standardized.

The Chinese Pharmacopoeia 2005 is published in three volumes. Volume Ⅰ contains monographs of Chinese materia medica and prepared slice, vegetable oil/fat and its extract, Chinese traditional patent medicines, single ingredient of Chinese crude drug preparations etc.; Volume Ⅱ deals with monographs of chemical drugs, antibiotics, biochemical preparations, radiopharmaceuticals and excipients for pharmaceutical use; Volume Ⅲ contains biological products. *The Requirements for Biologics of the People's Republic of China* is now incorporated into the Chinese Pharmacopoeia for the first time. Based on the characteristics and the needs of improvement of Chinese traditional medicines, chemical drugs and biological products, the research work and the studies are carried out in an active way on drug standards and methodology. At the same time, great efforts are made to unify the national drug standards and to bring them in line with the international standards progressively. In addition, emphasis have been put to harmonization in Appendices of different volumes of Pharmacopoeia, to a sound connection between individual monographs and the relevant appendices, and to the standardization of text wording so as to make this edition more precise and better structured.

The increase of the number of monographs in *the Chinese Pharmacopoeia 2005* is obvious which contains up to 3214 monographs of drugs, with 525 new admissions in total. Volume Ⅰ contains 1146 monographs, with 154 new admissions and 453 revised; Volume Ⅱ deals with 1967 monographs, with 327 new admissions and 522 revised; Volume Ⅲ contains 101 monographs, with 44 new admissions and 57 revised. 9 monographs adopted in *the Chinese Pharmacopoeia 2000* are not admitted in this edition and

123 monographs adopted in *the Requirements for Biologics of the People's Republic of China 2000* and in its *Supplement 2000* are not admitted in this edition.

The number of monographs in Appendices of this edition is much expanded. There are 98 monographs admitted in Appendices of Volume Ⅰ with 12 new admissions, 31 revised and 1 deleted. There are 137 monographs in Appendices of Volume Ⅱ with 13 new admissions, 65 revised and 1 deleted. There are 140 monographs in Appendices of Volume Ⅲ with 62 new admissions, 78 revised and 1 deleted. The monographs in Appendices common to all the three volumes are presented in each volume respectively in a harmonized and unified form.

Extensive applications of contemporary techniques of analysis are shown in this edition. In Volume Ⅰ, the number of monographs adopting thin layer chromatography in the test for identification reaches 1523 and 45 monographs for content determination; the number of monographs adopting high performance liquid chromatography (HPLC) reaches 479 and 518 items are involved; and the number of monographs adopting gas chromatography in the tests for identification and content reaches 47. In Volume Ⅱ, the number of monographs, including testing items, adopting HPLC reaches 848 with an increase of 566 in comparison with that in 2000 edition, and this method is mostly used for the analysis of complex formulation and those drugs containing much more interfering factors such as impurities or excipients, and used for content determination in 223 newly admitted monographs. The number of monographs required for identification by infrared analysis reaches 70; the tests for dissolution and test of content uniformity are added in test items in 93 and 37 monographs, respectively, and the test for related substances is added in 226 monographs, and the requirements for systematic suitability testing are more reasonable. Based on the validation of methodology, the test for bacterial endotoxins instead of pyrogen test in rabbits is introduced to 73 monographs; on the premise that the drug purity is ensured, the test for undue toxicity for 42 monographs is deleted.

Significant revisions and expansion are made in the Appendices of this edition leading a great improvement in the monographs of Appendices. In order to adapt the need of drug administration, new preparations such as implants, rinsing agents, enemas, paint, and smeared films, etc. are admitted in the General Requirement for Preparations. Many subtypes of dosage form are also admitted in General Requirement for Preparations, such as soluble tablets and vaginal effervescent tablets admitted into General Requirement for tablets; sustained release capsules and controlled release capsules admitted into General Requirement for capsules, etc. Test for sterility is added in test items in some of preparations of General Requirement for Preparations. New general testing methods have been admitted, such as Determination of Total Organic Carbon in the Water for Pharmaceutical Use, Test for Visible Particles in Injections, Mass Spectrometry, Determination of Cataplasms Adhension, Test for Allergen, Biological Assay of Calcitonin and Growth Hormone, etc. Furthermore, considerable revisions are made for a number of Appendices according to modern techniques and practical situation, for example, the tests on 12 pesticides containing organic phosphorous and 3 pesticides containing pyrethroid are added for determination of pesticide residues; the test for small volume of injection is included in the Test for Particulate Matter in Injections; the test for system suitability is admitted for Thin-layer Chromatography; Microbial Limit Tests is revised according to the requirements of drug administration route and tests for validation are added; the time of incubation in sterility test has been changed from 7 to 14 days.

In the section of guidelines, such guidelines have been revised to keep pace with the development of

research and production of drugs as the Guidelines the Stability Testing of Drug Substances and Preparations and the Guidelines for Sustained, Controlled and Delayed Release Preparations, and new guidelines are admitted such as the Guidelines for Hygroscopicity and Guidelines for Near-infrared (NIR) Spectrophotometry, etc. Although those guidelines do not serve as legal requirements, they play an important role in assessment of drug quality, in establishing, standardizing and implementing uniform pharmaceutical specification of drugs and medicines.

The safety of pharmaceuticals is another important issue of *the Chinese Pharmacopoeia 2005*. In Appendices of Volume Ⅰ, for example, atomic absorption spectrophotometry or inductively coupled plasma mass spectrometry is introduced to determine 6 kinds of heavy metals and deleterious elements, and the limits for lead, cadmium, mercury, arsenic and cupper are stipulated for the first time; the harmful solvents, such as benzene etc. used in pharmaceuticals should be substituted by other solvents as far as possible. The Guidelines for Application of Safety Tests for Injection of Traditional Chinese Medicine is also admitted in this edition; In Volume Ⅱ, the Test for Particulate Matter in Injections is applied to 126 Injections intended for intravenous injection; the number of monographs adopting the Test for Bacterial Endotoxin reaches 112; the Determination of Residual Solvent includes the requirements of the International Conference on Harmonization (ICH) for residual solvents, and the test is required for 24 drug substances; the Guidelines for the Analysis of Impurities in Drugs, Guidance for the Quality Control of Positron Emission Tomographic and Technetium [^{99m}Tc] Radiopharmaceutical Preparations are also admitted. In Volume Ⅲ, new methods such as Determination of Reverse Transcriptase Activity and Test for Residual Aluminum Content in Human Albumin etc. are admitted, and some test methods are improved such as the test for residual bovine serum albumin and test for residual CHO cell protein, etc. On consideration of the status quo of medical industry and practical situation of drugs for clinical use, the requirements set forth in Detailed Regulations for Clarity Test and Criteria formerly issued by the Ministry of Health are replaced by the method for Determination of Visible Particles in this edition so as to enhance the safety of pharmaceuticals including injections.

According to the theory of traditional Chinese medicine——diagnosis and treatment based on an overall analysis of the illness and the patient's condition, the *Indications* under the Chinese patent preparations have been scientifically standardized, so as to avoid the phenomenon of easy misleading usage of drugs and to give prominence to features of the above theory. At the same time, the attention should be paid to the fact that a phenomenon of "different diseases having same syndrome" and "same disease having different syndromes" exists between "Syndrome" in traditional Chinese medicine and "Disease" in Western medicine. The close combination of "Syndrome" in traditional Chinese medicine and corresponding "Disease" in Western medicine embodies the scientificity and accuracy of the expression of *Indications*, so as to ensure clinicians to understand the *Indications* precisely and make use of drugs rationally, thus facilitating the sound development of traditional Chinese medicine in the new era.

The working procedures for preparation of this edition also has been improved. In addition to the traditional way of requesting for comments, the contents of revised appendices and monographs should be publicized on the website of the Chinese Pharmacopoeia Commission for three months, aiming at collecting comments widely from various institutions and organizations. All the feedbacks and inputs should be reviewed by the relevant subcommittee to ensure the feasibility and practicability of the standards and methods revised in this edition of Pharmacopoeia, and ensure that the principle of "openness, justice and fairness" is kept in the process of compiling and editing.

In order to make it easy for reading, *the Chinese Pharmacopoeia 2005* adopts the half-measure in its layout for the first time, and the improvement of quality in printing and binding makes this edition look more elegant.

Thanks to the well-organized work by the Secretariat of the Chinese Pharmacopoeia Commission, the joint efforts made by all the participants and the support from institutions and organizations concerned, the compilation of *the Chinese Pharmacopoeia 2005* proceeded smoothly and the goal is reached as designed despite the heavy work schedule and high requirements for the task. Now *the Chinese Pharmacopoeia 2005* is presenting its new style in front of the world and will play a greater role both in initiating new prospect of national drug administrative work and in the development of the medical industry in China.

郭俊英

Chairman, the eighth Chinese Pharmacopoeia
Commission of the People's Republic of China

(December 2004)

History of the Pharmacopoeia of the People's Republic of China

The Chinese Communist Party and the Chinese Government have attached great importance to medical and health care of the Chinese people. The People's Republic of China was founded on October 1, 1949 and right in November of that year the Ministry of Health convened a meeting of medical and pharmaceutical experts in Beijing on the compilation of a pharmacopoeia. In January 1950, the Ministry of Health invited Professor Meng Mudi, a well-known pharmacist from Shanghai, to take up the responsibility for the establishment of the Editorial Commission of Pharmacopoeia of China and its secretariat to deal with daily work concerning the compilation of such a compendium for new China.

In April 1950, a working seminar was held in Shanghai, at which the principles and guidelines on the selection of monographs were discussed and the monographs to be included in the Pharmacopoeia were decided. It was recommended under the direction of the Ministry of Health that the new Pharmacopoeia should be compiled in such a way that it is in conformity with the Chinese situations and that it should be nationalistic, scientific and popular in nature. Thereafter, The Ministry of Health invited 49 experts as members and 35 as correspondent members of the Commission who were appointed to 8 panels (nomenclature, chemicals, pharmaceutical preparations, medicaments of plant origins, biological products, medicaments of animal origins, pharmacology, and dosage) respectively. Health Minister Li Dequan served as the chairperson of the Commission. The first Editorial Commission of Pharmacopoeia of the People's Republic of China was thus formally established.

The first Editorial Commission meeting composed of all members was held in Beijing April 24-28, 1951, where resolutions were made on the title of the Pharmacopoeia, list of selected monographs, the nomenclatures, units of measurement and weights, format, the order of arrangement etc. Based on recommendations from the Commission meeting, the draft of the pharmacopoeia was then revised by the Secretariat and submitted to the Ministry of Health for review and the Culture and Education Commission of the State Council for approval at the end of 1952. The Ministry of Health published the first *Chinese Pharmacopoeia* in 1953.

The Chinese Pharmacopoeia 1953 edition contained 531 monographs of substances and articles, including 215 chemicals, 65 medicaments from plant origins, oils and fats, 13 medicaments from animal origins, 2 antibiotics, 25 biological products, and 211 pharmaceutical preparations. After the publication of the Pharmacopoeia the first addendum of the 1953 edition was published in 1957.

The Ministry of Health set up the second Chinese Pharmacopoeia Commission in 1955, with 49 members and 68 correspondent members. Due to various reasons, this Commission failed to fulfill its mission. The third Commission was established in 1957, with 80 members (no correspondent members appointed) and

Professor Tang Tenghan, a well-known pharmaceutical chemist, as its chairman. The first meeting of the third Commission was convened from July 28 to August 5 of the same year. Health Minister Li Dequan pointed out at the meeting that it was a big flaw that the first Pharmacopoeia did not cover Chinese traditional medicines that the Chinese people were so used to. At the meeting principles in compiling a Pharmacopoeia were made and nature and purpose of such a compendium were discussed and constitution of the Commission was revised. It was agreed unanimously to admit well-defined Chinese traditional medicines to the Pharmacopoeia. On August 27, six expert committees and a panel under the Commission were approved and set up by the Ministry of Health, namely, the committees of medicines, chemicals, pharmaceutical preparations, biochemicals, pharmacognosy and biological products, and a panel of nomenclature. Under the Commission a Standing Committee was organized, however, routine work in general was dealt with by its Secretariat.

In 1958, it was recommended by the Standing Committee and approved by the Ministry of Health to invite 8 doctors of Chinese traditional medicine and 3 experts of Chinese traditional medicaments as members of an expert committee dealing with the quality specifications of crude drugs used as Chinese traditional medicaments and Chinese patent preparations. Collaborative efforts were made by experts in this field in many parts of this country to incorporate the theory and practical experience of Chinese traditional medicine into the monographs concerned.

The second meeting of this Commission was held in Beijing from June 25 to July 5, 1959. A list of monographs being admitted to the new Pharmacopoeia was proposed and the draft texts reviewed in detail by the expert committees concerned. The work was accomplished in 1962. The State Council approved the publication of the Pharmacopoeia of the People's Republic of China 1963 edition. On January 26, 1965, the Ministry of Health issued a document for *the Chinese Pharmacopoeia 1963* edition and the relevant provisions for its implementation.

The Chinese Pharmacopoeia 1963 edition contained 1310 monographs in its two volumes, each with separated General Notices and relevant appendices. 446 monographs of commonly used Chinese traditional medicaments and 197 monographs of Chinese traditional patent preparations were admitted to Volume Ⅰ, and 667 monographs of chemical drugs were admitted to Volume Ⅱ. Additionally, "therapeutic function and chief indication" were stated in the monographs admitted to Volume Ⅰ and "action and use" of those admitted to Volume Ⅱ.

The Chinese Pharmacopoeia Commission stopped functioning in 1966 due to the turmoil caused by the "Cultural Revolution". On April 28, 1972, the State Council agreed to the suggestion in the report of the Ministry of Health that "the Commission should be re-established with the participation of Ministries of Health, Petroleum and Chemical industry, Commerce and the PLA's Ministry of Health, headed by the Ministry of Health". A working meeting of the Chinese Pharmacopoeia Commission was convened under the above direction from May 31 to June 10 of the same year in Beijing. 88 representatives of various competent authorities and organizations, including all Provincial (Autonomous regional or Municipal) Departments of Drug Policy and Management, Institutes for Drug Control and others attended the meeting. The focus of the meeting was on the guiding principle, working process, requirements and objects of the editing of the national Pharmacopoeia. The revision plan was recommended after exchange of past experiences in various aspects. Arrangements were made for the drafting of individual monographs by the organizations concerned. The second meeting of the Chinese Pharmacopoeia Commission was held

in Beijing in April 1973. Some guidelines, basic requirements of the Pharmacopoeia and sample monographs for Chinese traditional medicaments and modern medicinal substance as well as the respective explanatory notes had been well discussed and appropriate recommendations were made. The drafting of individual monographs was rearranged according to the place of origin of Chinese medicines and the conditions of pharmaceutical production. On October 4, 1979 the Ministry of Health promulgated that *the Chinese Pharmacopoeia 1977* edition would come into use on January 1, 1980. The total of monographs contained in the 1977 edition is 1925. In Volume Ⅰ, 1152 monographs were admitted, including 882 monographs of Chinese herbal drugs in general used and in the region of national minorities, extracts of Chinese herbal medicines, oils and fats and some preparation made of single medicinal ingredient. 270 monographs of Chinese traditional patent preparations (including those preparations used in the region of national minorities) were also admitted in the Volume Ⅰ. 773 monographs of chemicals and biological products etc. were admitted in Volume Ⅱ.

In 1979 the Ministry of Health invited 112 experts as members to form the fourth Chinese Pharmacopoeia Commission, and Health Minister Qian Xinzhong was its Chairman. The first plenary meeting of that Commission was held from Nov. 22 to Nov. 28 in the same year in Beijing. Discussion and amendment were made on the constitution of the commission, provisions for the management of specifications for pharmaceutical preparations and its working plan in the meeting. Ten specialized advisory groups were appointed in the fields of Chinese traditional medicine, Chinese traditional medicaments, medicine and pharmacology, chemicals, biochemicals, pharmaceutical preparations, antibiotics, biological products, radiopharmaceuticals and nomenclature respectively. Monographs being admitted to the new Pharmacopoeia were recommended by the advisory groups concerned. The advisory group on Chinese traditional medicine had the responsibility to review and select the range of monographs to be included in Volume Ⅰ and the advisory group on medicine and pharmacology had the same responsibility for Volume Ⅱ. The institutes for drug control and competent authorities or organizations in the locality (provinces, autonomous regions and municipalities), where the drug substance concerned was produced provided draft text of individual monograph with prominent experience and excellent quality. Coordinated review and technical validation were organized by the Secretariat. Some monographs were drafted only after the completion of objective collaborative studies as required. Finally, members of respective advisory groups and representatives of institutes for drug control and drug manufacturers concerned reviewed the draft text, and then sent to the Ministry of Heath for approval. *The Chinese Pharmacopoeia 1985* edition was published in September 1985 as planned. The effective date was set on April 1, 1986 as approved by the Ministry of Health. In this edition of Pharmacopoeia, 1489 monographs of drugs were admitted. 506 monographs of Chinese traditional medicaments, crude drugs, vegetable oils and fats and preparations of single ingredient, 207 monographs of Chinese traditional patent preparations, totally amount to 713 monographs were admitted to Volume Ⅰ. 776 monographs of chemicals, biological products etc. were admitted to Volume Ⅱ.

The "Drug Administration Law of the People's Republic of China" came into effect on July 1, 1985. It stipulated that "the quality of drugs and medicines must comply with a national, provincial, autonomous regional or municipal standard", and that "the Pharmacopoeia of People's Republic of China and standards for drugs and medicines published and promulgated by Ministry of Health of the State Council are national standards for drugs and medicines". It further stated, "The Chinese Pharmacopoeia Commission subordinate to the Ministry of Health of the State Council is responsible for the stipulation and revision of national standards for drugs and medicines". It defines clearly the official nature of standards for drugs

and medicines and responsibilities of the Commission.

In 1986 the Ministry of Health reorganized the Chinese Pharmacopoeia Commission in accordance with its constitution and invited 150 experts as members of the fifth Commission with Health Minister Cui Yueli as Chairman. The office dealing with routine work was changed to a system with the Secretary General as its chief executive officer. The first meeting of this Commission was convened May 5-8 of the same year. The constitution of the Commission was revised. Comments were made on the task of drug standardization during the seventh Five-year Plan for National Reconstruction. The guidelines and principles of the 1990 edition of the pharmacopoeia were discussed and agreed at the meeting. Panel meetings on Chinese traditional medicaments, Chinese patent preparations, chemicals, antibiotics, biochemicals and pharmacology were held respectively for the tasks of drafting different parts of the next edition and necessary research projects to be carried out. The addendum to *the Chinese Pharmacopoeia 1985* edition was published in November 1987 with 23 new admissions and 172 specific monographs and 21 general monographs were revised or amended. Based on *the Chinese Pharmacopoeia 1985* edition, its first English version was formally published in October 1988. Also published in that year were the selected notes in Volume Ⅱ. By March 1989, the draft text of the new pharmacopoeia was basically ready for comments through the efforts made by various organizations and associations. The Secretariat of the Chinese Pharmacopoeia Commission was authorized to organize reviewing and editing. In December 1989, an extended meeting attended by the chairman, vice-chairmen of the Commission and the chairmen of all advisory groups was held in Beijing. It was recommended to send the draft text to the Ministry of Health for comments and approval. The Ministry of Health then publishes it as *the Chinese Pharmacopoeia 1990* edition, on December 3, 1990 with effective date on July 1, 1991.

This new edition of the pharmacopoeia is still published in two volumes containing 1751 monographs of substances and articles. 784 monographs including 509 monographs of Chinese traditional medicaments and 275 monographs of Chinese traditional patent preparations and single ingredient preparations are admitted to Volume Ⅰ, while 967 monographs on chemicals, antibiotics, biological products and pharmaceutical preparations are admitted to Volume Ⅱ. In comparison with the preceding edition, 80 new monographs are admitted and 3 monographs deleted from Volume Ⅰ; 213 new monographs are admitted (including 5 monographs transferred from Volume Ⅰ to Volume Ⅱ) and 25 monographs deleted (3 from Volume Ⅰ and 22 from Volume Ⅱ). Appropriate changes have been made on titles of certain drug substances and articles as required. The headings "Action and use" and "Administration and dose" are changed to "Category" and "Dosage" respectively. "A Guide to Clinical Use of Drugs" was published as a companion volume to *the Chinese Pharmacopoeia* to serve as a guiding reference for medical and pharmaceutical practices. The infrared reference spectra are deleted from the Appendix with the publication of a separate volume—the Atlas of Infrared Spectra of Drugs.

The sixth Chinese Pharmacopoeia Commission was organized in 1991 with 168 members invited by the Ministry of Health, and Health Minister Chen Minzhang as its chairman. The first meeting of that Commission took place May 16-18 of the same year, attended by all members. In this meeting, the constitution of the Commission was further revised and the working plan for compilation and editing of *the Chinese Pharmacopoeia 1995* edition were discussed and substantial recommendations were made. A Standing Committee composed of the chairman, vice chairman and 11 other experts were set up with 13 subcommittees in respective specialized fields, namely, Chinese traditional medicine, Chinese traditional medicaments, Chinese traditional patent medicines, Modern medicine, Pharmacology, Chemicals Ⅰ, Ⅱ

and Ⅲ, Antibiotics, Biochemicals, Biological products, Radiopharmaceuticals and Nomenclature. The subcommittees then convened extended meetings in their specific fields, respectively, to work out the programs for revision of the Pharmacopoeia.

Drafts of the appendices of the 1995 edition were sent out in 1993 to relevant local organizations as a reference for the compilation and revision of the new edition. By July 1994 almost all local drafting had been finished and the subcommittees started organizing reviews. On Nov. 29, 1994 the drafts were discussed and further reviewed at an extended meeting of the Standing Committee, and then submitted to the Ministry of Health for approval. *The Chinese Pharmacopoeia 1995* edition came into use as of April 1, 1996 as promulgated by the Ministry of Health.

There are 2375 monographs in that edition. 920 monographs, including 522 monographs of Chinese traditional crude drugs and of oils and fats, 398 monographs of Chinese traditional patent medicines and of preparations of single ingredient were admitted to Volume Ⅰ. In Volume Ⅱ, it was composed of 1455 monographs of chemicals, antibiotics, biochemicals, radiopharmaceuticals, biological products and some excipients. In comparison with the previous edition, 142 and 499 new admissions were admitted in Volume Ⅰ, Ⅱ respectively. English titles of drugs and preparation were adopted in Volume Ⅱ and the Latin titles were deleted, while Chinese titles only use their official common names and no alternate names. The first Volume (1995 edition) of "Atlas of Infrared Spectra of Drugs and Medicines" was also compiled. "A Guide of Clinical Use of Drugs" was revised, and published together with the 1995 edition of *the Chinese Pharmacopoeia*. Ministry of Health approved that the "Indication" and "Dosage" in the later should be adopted as the basis for promotion of drug administration and management by competent authorities of drug management and drug manufacturing.

The sixth Chinese Pharmacopoeia Commission published the first and second addenda in 1992 and 1993, respectively. It also published "Commentary to Volume Ⅱ of *the Chinese Pharmacopoeia 1990* edition". "Selected Commentary to Volume Ⅰ of *the Chinese Pharmacopoeia 1990* edition", "Atlas of Traditional Chinese Medicines", "Atlas of Thin Layer Chromatography of Chinese Traditional Medicines" and "Adopted names of Chinese pharmaceutical products" as references in series relevant to pharmacopoeia. English version of *the Chinese Pharmacopoeia 1990* edition was published in July 1993.

To strengthen standardization of drugs and medicines, the Ministry of Health decided, on May 21, 1993, that the Secretariat of the Chinese Pharmacopoeia Commission separated from the National Institute for the Control of Pharmaceutical and Biological Products and subordinated directly to the Ministry of Health. That was an important reform measure in the restructuring of the Commission.

Approved by the Ministry of Health, the seventh Chinese Pharmacopoeia Commission was set up in May 1996. The Ministry invited 204 members, including 18 honorary members, to form the Commission. Health Minister Chen Minzhang served as its Chairman. In September 1998 as approved by Document No. 32 (1998) of Central Office of Organization, the name of Pharmacopoeia Commission of the Ministry of Health was changed to the Chinese Pharmacopoeia Commission, and the administration of the Commission was transferred to the State Drug Administration (SDA). After change of the management system and passing away of Health Minister Chen Minzhang, the Standing Committee of the seventh Pharmacopoeia Commission decided to appoint chairman and vice chairmen of the Commission, as so stipulated in its Constitution in December 1999. Under that Commission there were 16 specialty

subcommittees: Chinese traditional medicine, Chinese traditional medicaments Ⅰ, Ⅱ, Ⅲ, and Ⅳ, modern medicine, nomenclature, appendices, pharmaceutical preparations, pharmacology, chemicals Ⅰ and Ⅱ, antibiotics, biochemicals, radiopharmaceuticals and biological products.

The first meeting of the seventh Commission was held in 1996, at which the design plans for the 2000 edition of *the Chinese Pharmacopoeia* were endorsed. The guiding principles decided were that the Volume Ⅰ should have special features in content and its quality should be largely improved, and the Volume Ⅱ should reflect the combination of improvement and suitability to specific situations in China as well as a combination of advancement and characteristics. As scheduled in the plans, all subcommittees convened their own meetings and carried out their tasks starting from October 1996. By the end of 1997, all revision of the appendixes and general rules for drug and medicine preparations had been finished and sent to local drafting organizations for comments. A first draft was finalized at the end of 1998, and after reviews by related organizations in different parts of China; the 16 subcommittees further reviewed it by the end of October 1999. *The Chinese Pharmacopoeia 2000* edition was finally reviewed and passed by the seventh Chinese Pharmacopoeia Commission in December 1999, and submitted to the State Drug Administration for approval of publication. This edition was published in January 2000 and come into effect from July 1, 2000.

The 2000 edition contains a total of 2691 monographs, with 992 ones in Volume Ⅰ and 1699 in Volume Ⅱ. There are 399 new monographs and 562 revised ones in this edition. Appendices have been considerably improved. There are 10 new and 31 revised appendices in Volume Ⅰ, and 27 new and 32 revised ones in Volume Ⅱ. The Volume Ⅱ has, for the first time, included 6 guidelines for Validation of Analytical Method Adopted in Pharmaceutical Quality Specification etc., which will play a role in the standardization and regulation of testing methods. Application of modern analytical techniques is further enhanced and stressed in this edition.

The seventh Chinese Pharmacopoeia Commission has also compiled the 1997 and the 1998 addendum of *the Chinese Pharmacopoeia 1995* edition, the "Adopted Names of Chinese Pharmaceutical Products (1998 Addendum)", "Atlas of Infrared Spectra of Drugs and Medicines" (Volume Ⅱ) and the third edition of "A Guide to Clinical Use of Drugs". The English edition of *the Chinese Pharmacopoeia 1995* was published in 1997. To strengthen exchanges and cooperation, this Commission has decided to publish concurrently both Chinese and English versions of *the Chinese Pharmacopoeia 2000* edition.

"Dosage" and "Precaution" in preceding editions are too simple to reflect accurately the actual clinical use of drugs therefore deleted from this edition (Volume Ⅱ) as so proposed in the design plans for the relevant contents of those two headings have been included in "A Guide to Clinical Use of Drugs".

Approved by the State Drug Administration (redesigned to be State Food and Drug Administration in September 2003), the eighth Chinese Pharmacopoeia Commission was set up in October 2002. The State Drug Administration invited 312 experts as members of the Commission and did not appoint any honorary member. The Commissioner of the State Drug Administration, Mr. Zheng Xiaoyu served as its Chairman. The Standing Committee of the Commission was assigned as Executive Committee. The plenary session of the Chinese Pharmacopoeia Commission was authorized to examine and approve *the Chinese Pharmacopoeia* and the important items of the national specifications for pharmaceutical preparations. 24 subcommittees of specific duty and/or appointment are set up under the Commission. On the basis of previous Commission, 3 new subcommittees were established: namely ethnic medicines, microorganism, and packing materials and excipients; former subcommittee of biological products was expanded to 6 ones,

namely: blood products, viral vaccines, bacterial vaccines, somatic cell therapy and gene therapy, recombinant DNA products and diagnostic reagents for *in vivo test*.

The first meeting of the eighth Chinese Pharmacopoeia Commission and its Executive Committee took place in October 2002, approved "the design plans for the 2005 edition of *the Chinese Pharmacopoeia*". The design plans clearly indicated that the *Pharmacopoeia* should adhere to guiding principles of "succession and development" and "theory combined with practice"; and editing principles of pharmacopoeia should be adhered to scientific, practical and specifical basis. The meeting decided that *Requirements for Biologics of the People's Republic of China*, known as the *Chinese Requirements for Biologics* (CBR), would be integrated into the pharmacopoeia as its Volume Ⅲ; "A Guide to Clinical Use of Traditional Chinese Patent Preparations" is to be compiled for the first time.

All designated subcommittee meetings have been convened since November 2002, to deal with the assigned duty recommended on the meeting in various aspects. By July 2003, the draft of appendices was accomplished at first and sent to relevant authorities and institutions for comments. Early in 2004, the first draft of appendices and text of pharmaceutical and biological products was basically ready and consecutively published on the website of the Chinese Pharmacopoeia Commission for 3 months, so as to get the feedbacks from various organizations and associations. Subcommittees, one after the other, convened meetings to review and revise the drafts from June to August, the Executive Committee of eighth Chinese Pharmacopoeia Commission endorsed *the Chinese Pharmacopoeia 2005* in September of the same year. In December 2004, the draft text was sent to the State Food and Drug Administration for approval and promulgation. *The Chinese Pharmacopoeia 2005* was published on January 2005 with effective date on July 1, 2005. The number of monographs in *the Chinese Pharmacopoeia 2005* is considerably increased. It contains up to 3214 monographs of drugs and other articles with 525 new admissions. Volume Ⅰ contains 1146 monographs, with 154 new admissions and 453 revised; Volume Ⅱ deals with 1967 monographs, with 328 new admissions and 522 revised; Volume Ⅲ contains 101 monographs, with 44 new admissions and 57 revised. 9 monographs adopted in *the Chinese Pharmacopoeia 2000* are deleted in this edition. 123 monographs adopted in the *Requirements for Biologics of the People's Republic of China 2000* and in its *Supplement 2002* are not admitted in this edition.

The numbers of appendices in this edition are as follows: 98 monographs admitted in Volume Ⅰ with 12 new admissions, 31 revised and 1 deleted; 137 monographs in Volume Ⅱ with 13 new admissions, 65 revised and 1 deleted; 140 monographs in Volume Ⅲ with 62 new admissions, 78 revised and 1 deleted. Appropriate monographs common to all three volumes are presented in each volume respectively in a harmonized and unified form.

Under the active leadership of the Chairman of the Chinese Pharmacopoeia Commission, the issue of pharmaceutical safety is emphasized particularly. In Volume Ⅰ, atomic absorption spectrophotometry and inductively coupled plasma mass spectrometry are applied to determine the deleterious elements (lead, cadmium, mercury, arsenic and cuppers) and the limits of these elements have been stipulated; the guidelines of the safety test for the injections of traditional Chinese medicines is also added to the Volume Ⅰ. In Volume Ⅱ, the Test for Particulate Matter in Injections is applied to 126 injections intended for intravenous injections; the number of monographs adopting the Test for Bacterial Endotoxin reaches 112; the Determination of Residual Solvents includes the requirements of International Conference on

Appendices

Ⅴ B Colourimetry (incorporated Ⅴ A Ultraviolet Spectrophotometry and Clourimetry)

Ⅸ B Determination of Scraps

"Practical insoluble or insoluble" refers to that 1 g (ml) of solute is not soluble completely in 10000 ml of solvent.

Testing method Unless specified otherwise, weigh out finely powdered sample or measure an amount of liquid sample, place the sample in a certain volume of the solvent at a temperature of 25℃±2℃, shake strongly for 30 seconds at an interval of 5 minutes. Observe the solubility behavior for 30 minutes. It is considered to be completely soluble, if none of the particles or droplet of the solute is observed.

(3) Physical constants or parameters including relative density, distilling range, melting point or melting range, congealing point, specific rotation, refractive index, viscosity, specific absorbance, iodine value, saponification value and acid value etc., are useful for tests for identification and give some indication of the drug purity. It is one of the chief criteria for appraisal and assessment of drug quality.

9. Identification refers to identification by experience, microscopical physical and chemical examinations. Transectional, external and powder observations under microscope indicate the microscopical characteristics of the sample prepared with specific process.

10. Test section under the monograph includes tests or observations of impurities being tested for efficacy, homogenicity, quality and safety of the various tests are framed from the impurities possibly existed and produced by validated manufacturing process and normal storage condition.
All preparations, unless specified otherwise, must comply with the general requirements stated under the general requirements for preparations of the pharmacopoeia.
The "single dose package" in the general requirements of the preparations refers to the package of drug with dose for once administration specified in the monograph. Those drugs specified the dose range of administration in the usage and dosage, or its dose of one package being less than that of once administration, must be tested as single dose package.

11. The crude drugs refer to that requires no processing, and should be treated according to the statement of "cleaning" described in the general requirement of "Processing of crude drugs" in the Appendices. Certain poisonous or highly potent crude drugs or crudc drugs being used without processing, in particular, must be expressed clearly to avoid any mistake.

12. Characteristics and channel tropism of crude drugs are general statements based on theory and practice of Chinese traditional medicine.

13. Action and indications of crude drugs and preparations are generalized statements of the theory and practice in using traditional compound preparations in Chinese traditional medicine, new indications may well be adopted on long term medical practical experiences, and this requirement is stated for reference in drug usage.

14. The usage of crude drugs, unless specified otherwise, applies to a decoction or cook with water and taken orally. Dosage states the usual daily dose for adults, and it may be increased or decrease, if necessary.

15. The contraindications or adverse reactions stated under "Precaution" indicates the main contraindications and adverse reactions, excluding from those commonly occurrence of side effects as observed by the Chinese traditional medical physician.

16. Storage refers to the basic conditions for storage and preservation of a drug. Mineral drugs should be stored in dry, clean place. It is stated by the following terms:

"Protected from light" refers to that a drug should be kept in light resistant container such as amber coloured container, or a colourless transparent or semitransparent container wrapped with black paper;

"Well closed" refers to that the container is able to protect the content from extraneous matters or lose of contents on normal handling condition;

"Tightly closed" refers to that the container should be able to protect the contents from efflorescence, deliquescence, volatilization or interference of extraneous matters;

"Hermetically sealed" or "Tightly sealed" refers to that the container is sealed on fusion or sealed tightly with suitable material to protect against contamination and from permeability of air and moisture;

"Cool place" refers to that the storage temperature is not exceeding 20℃;

"Cool and dark place" refers to that the container is kept in the dark place, protected from light and the ambient temperature is not exceeding 20℃;

"Cold place" refers to that the container is kept at ambient temperature of 2-10℃.

"Normal temperature" refers to that the container is kept at ambient temperature of 10-30℃.

If no specification on temperature in storage of monograph, the temperature refers to normal temperature.

17. The crude drugs, excipients and adjuvants used in preparations or dosage forms should comply with the requirements of this edition of Pharmacopoeia. The crude drugs not admitted to this edition of pharmacopoeia, which should comply with the requirements approved by competent authorities of drug quality control or provincial, autonomous regional or municipal drug quality control departments. For the excipients not admitted in this edition of Pharmacopoeia, their specification should be established, which should comply with requirements for pharmaceutical use and be approved by the drug regulatory authority of the state council.

The same crude drug used in different preparations (especially various administration routes) should comply with the quality control corresponding to clinic practice.

18. The crude drugs in formulated preparations refer to clean crude drugs. Processed crude drugs, unless specified otherwise, should be made by the processing procedure of the drug concerned. The dosage stated in formulated preparation refers to the dosage of clean crude drug or powdered processed crude drug.

19. Certain preparations are stated by the title of the drug in part, some are stated without dosage as well as without procedure.

Testing methods and Limits

20. The drugs and preparations should be tested with official methods stated in the pharmacopoeia. It is not precluded from the application of alternative methods, if they have been proved to be satisfactory in comparison with official methods accordingly. In case of doubt or dispute, the methods of Pharmacopoeia are authoritative for judgement.

21. Purity requirements and limits of purity of a drug as well as the weight (or content) variation of a preparation or dosage form stated in the monograph concerned include the values of upper and lower limits and the medium value. Whether these values are expressed in percentage or in absolute

numerical value, the last decimal is a significant value.

In calculating of testing result, the last effective figure is measured in one decimal place more than the significant decimal place indicated in the requirement and round up or down to the specified decimal place by the rule of commensuration.

22. The percentage content of the drug is calculated by weight, unless specified otherwise. If an upper limit of the content of a drug is stated as over 100%, it refers to a value possibly obtained by the assigned assay method in the monograph, representing the limit or permissible deviation stated in the Pharmacopoeia. In case of no upper limit is stated, the upper limit is considered to be not more than the equivalent amount of 101.0%.

The limit range of content of a preparation or dosage form is assigned on the basis of contents of active ingredient or ingredients, assay method being applied and possible change occurred in the process of manufacturing and/or storage. A 100% labelled amount of active ingredient or ingredients should be used in manufacturing process.

Chemical Reference Substances, Reference Drugs, Reference Extractives, Reference Standards

23. Chemical reference substances, reference drugs, reference extractives, reference standards excluding of internal standards used in chromatographic methods refer to the standard materials used in testing of identification, test and assay. Those are established, standardized and distributed by the institution designated by the institution designated by the drug regulatory authority of the State Council.

Chemical reference substances, unless specified otherwise, should be dried in a constant vacuum desiccator with phosphorus pentoxide for at least 12 hours for use.

The establishment or alteration in unit of potency or content of reference standards and chemical reference substances should be conduct in comparison with original reference standard, chemical reference substances or International Reference Standard by collaborative standardization, and the protocol and testing results should be reviewed and approved by audit process.

Chemical reference substances, reference drugs, reference standards are distributed with appropriate instruction insert to state the method of usage, quality specification, expiry date and amount or content of the standard material concerned.

Units of Measurement

24. The measuring apparatus used for tests and assays should comply with the relevant requirements promulgated by the technical supervision authority of the State Council.

25. The units of measurement in this edition of Pharmacopoeia:

(1) The official names and symbols of units of measurement are listed as follows: Units of length: meter m; decimeter dm; centimeter cm; millimeter mm; micrometer μm; nanometer nm.

Units of volume: liter (L); milliliter (ml); microliter (μl)

Units of mass (weight): kilogram (kg); gram (g); milligram (mg); microgram (μg)

Units of pressure: pascal (Pa); kilopascal (kPa); megapascal (MPa)

Units of kinetic viscosity: pascal seconds (Pa • s)

Units of kinematic viscosity: square millimeter per second (mm^2/s) Units of wave number: reciprocal of centimeter (cm^{-1})

Units of density: kilogram per cubic meter (kg/m^3); gram per cubic centimeter (g/cm^3)

Units of radioactivity: becquerel (Bq); kilobecquerel (kBq); megabecquerel (MBq)

(2) Where the strengths or concentrations of the volumetric solutions and test solutions are expressed

in terms of mol/L in this edition of Pharmacopoeia, the expression of "XXX volumetric solution (YYY mol/L)" is adopted for the volumetric solution which should be accurately standardized. The expression of "YYY mol/L XXX solution" is adopted for solutions of other purpose without specific accuracy of their concentration.

(3) Temperature is expressed in ℃ (degree Celsius).

The temperature of a *Water bath* is 98-100℃, unless specified otherwise;

Hot water refers to that at a temperature of 70-80℃;

Slightly warm or Warm water refers to that at a temperature of 40-50℃;

Room temperature refers to that at a temperature of 10-30℃;

Cold water refers to that at a temperature of 2-10℃;

Ice bath refers to the bath temperature is kept at about 0℃;

Allow to cool refers to that the object is cooled to room temperature;

(4) The symbol used for the expression of percentage is %, usually by weight, but the percentage of solutions, unless specified otherwise, refers to the number of grams of solute in 100 ml of the solution. The percentage of ethanol refers to percentage by volume at 20℃.

The following symbols may be used when needed:

% (g/g) expresses the number of grams of a solute in 100 g of solution;

% (ml/ml) expresses the number of milliliters of a solute in 100 ml of solution;

% (ml/g) expresses the number of milliliters of a solute in 100 g of solution;

% (g/ml) expresses the number of grams of a solute in 100 ml of solution.

(5) The Drop of a liquid refers to that 1.0 ml of water is equivalent to 20 drops at the temperature of 20℃.

(6) The expression " (1→10)" stated under the solution refers to a solution of 10 ml produced by adding sufficient quantity of solvent to dissolve 1.0 g or 1.0 ml of a solute. It is understood to be aqueous solution, if the solvent is not specified. In case of two or more solvents are used as a mixture, a hyphen is inserted between different solvents indicated by names, the parenthesis followed expresses the proportion of each solvent by volume in the mixture.

(7) Sieves of Chinese National Standard R40/3 series are adopted in the Pharmacopoeia and the numbers are assigned as follows:

Sieve No.	Average internal diameter of aperture (μm)	Mesh No.
1	2000±70	10
2	850±29	24
3	355±13	50
4	250±9.9	65
5	180±7.6	80
6	150±6.6	100
7	125±5.8	120
8	90±4.6	150
9	75±4.1	200

Powders are graded as follows:

Very coarse All particles pass through No. 1 sieve, not more than 20% pass through No. 3 sieve;

Coarse All particles pass through No. 2 sieve, not more than 40% pass through No. 4 sieve;

Medium All particles pass through No. 4 sieve, not more than 60% pass through No. 5 sieve;

Fine All particles pass through No. 5 sieve, not less than 95% pass through No. 6 sieve;

Very fine All particles pass through No. 6 sieve, not less than 95% pass through No. 7 sieve;

Ultra fine All particles pass through No. 8 sieve, not less than 95% pass through No. 9 sieve.

(8) Ethanol refers to that of 95% (ml/ml) in strength, unless specified otherwise.

26. The atomic weights adopted for calculating the molecular weights and the conversion factors are the values recently published by the International Union of Pure and Applied Chemistry.

Precision and Accuracy

27. The accuracy of sampling quantity and precision of testing are defined in this edition of Pharmacopoeia.

(1) The quantity obtained by weighing or measuring the substance being examined and reagent being used is expressed in Arabic figures. The required precision is expressed by the significant numerical place. For example, the measurement of "0.1 g" by weight, refers to that 0.06-0.14 g of the substance may be weighed; for "2 g", 1.5-2.5 g of the substance may be weighed; for "2.0 g", it refers to 1.95-2.05 g of the substance may be weighed; for "2.00 g", it refers to that 1.995-2.005 g of the substance may be weighed.

Weigh accurately indicates that the precision of measurement should be made to an accuracy of 0.1%; *weigh* indicates that an accuracy being made to 1%. *Measure accurately* indicates the accuracy of the volume being measured complies with the national standard of pipet being used for the measurement of required volume; *Measure* indicates that the measuring cylinder or other measuring apparatus being used complies with requirements for the measurement of volume to the significant numerical place. The word *about* states that the measuring quantity should not exceed±10% of the specified quantity.

(2) *Constant weight*, unless specified otherwise, refers to that the drying or ignition of a substance or material in two consecutive weighings do not differ by more than 0.3 mg. The second and subsequent weighing are made after an additional hour of drying each time under the similar condition. The second weighing of the substance or material made to constant weight by ignition is made after 30 minutes under similar condition.

(3) The expression of *calculated on the dried (anhydrous or solvent free) basis* indicates that, unless specified otherwise, the undried substance or solvent containing substance is used for the required testing. The result of "Loss on dying (moisture or solvent)" should be subtracted from the amount of substance.

(4) *Blank test* refers to a test carried out in the similar manner without the substance being examined or using same amount of solvent instead of the solution being tested. The statement of *to make any necessary correction of the result with a blank test* refers to that the result is calculated by subtracting number of milliliters of titrant used in blank test from that consumed in assay of the substance being examined.

(5) The temperature for a test is at room temperature whenever the temperature is not stated. In case of that the temperature variation influences significantly to the testing result, the test should be carried out at a temperature of 25℃±2℃, unless specified otherwise.

Reagents, Test solutions and Indicators

28. Reagents used in tests and assays, unless specified otherwise, should comply with the requirements stated in the Appendix of the Pharmacopoeia. Different grades of reagents conform to national standards or those issued by the competent authorities may be used of choice. Test solutions, buffer solutions, indicator solutions, volumetric solutions and so on should comply with the statements or be prepared as directed in the Appendix of the Pharmacopoeia.

29. Water being used in tests and assays refer to purified water. Water being used for the test of acidity or alkalinity is of the water freshly boiled and cooled to room temperature.

30. Test for acidity or alkalinity of a solution without the statement of indicator being used refers to that Litmus paper is used.

Animal Test

31. Laboratory animals used and managed in animal tests should comply with the requirements stipulated and promulgated by competent authorities of the State Council.
The strain, age, sex etc., should comply with the requirements for quality control of drugs and biological products.
The animal tests should be adopted only in necessary condition and become less popular, as for the purity of drugs raise to higher level and more precise chemical, physical or cellular method should be applied to replace the animal test as much as possible for the quality control of drugs and biological products.

Insert sheet, Package and Labelling

32. The insert sheet of drugs should be in conformity with the requirements of "The Drug Administration Law of the People's Republic of China", and provisions for insert sheet promulgated by the drug regulatory authority of the State Council.

33. The immediate packaging materials and containers should be in conformity with the relevant provisions promulgated by the drug regulatory authority of the State Council. The immediate packaging materials and containers must be innocuous, clean, not interact with the drugs being packed, and do not affect the drug quality in the containers.

34. Labelling of drugs must comply with the requirements of "The Drug Administration Law of The People's Republic of China", and the provisions for the package and labelling promulgated by the drug regulatory authority of the State Council. The content of the labelling for different packaging should be printed in accord with the above requirement, in which the drug information should be provided as more as possible.

35. A stated mark should be printed on the insert sheet and the labelling of package for narcotics, psychological drugs, toxic drugs for medical use, radioactive drugs, drugs for external use and nonprescription drugs.

MONOGRAPHS
PART I

Chinese Materia Medica and Prepared Slices of Chinese Crude Drugs

Agkistrodon
(蕲蛇, Qishe)

Long-nosed Pit Viper

Long-nosed Pit Viper is the dried body of *Agkistrodon acutus* (Güenther) (Fam. Viperidae). The drug is collected in summer or autumn, opened in the abdomen, removed from the viscera, washed clean, held open with bamboo piece, coiled up in disc-shape. The bamboo piece is removed after being dried.

Description In coiled up disc, 17-34 cm in diameter, the body up to 2 m long. The head, located in the centre of the disc, slightly raised upward, triangular and flattened, tip of the snout upward, commonly known as "Qiaobitou (upward nose)". Upper jaw with tubular fangs, sharp and hollow. Each side of the dorsum bearing 17-25 V-shaped stripe patterns alternated blackish-brown with light brown, both upper ends of the "V" stripe patterns contacted at the mid-dorsal line and forming a square stripe pattern, commonly known as "Fangshengwen". Some of the "V" stripe patterns not exactly contacted with those on the other side, and arranged alternatively. The abdomen opened or not, greyish-white. Scales relatively large, with black subrounded spots, commonly known as "Lianzhuban (a patch like a string of beads)". The inner wall of the abdomen yellowish-white, the spinous process of the vertebrae relatively high, projected upward in shape of a blade, anterior and posterior hypapophysis similar in shape, mostly falcate, inclined posteriorly, tip obviously beyond the convex hind surface of the centrum. The tail tapered abruptly, with one dark grey triangular horny scale at the end. Odour, stinking; taste, slightly salty.

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix X A, the hot extraction method), using dilute ethanol as the solvent, not less than 10.0 per cent.

Processing *Agkistrodon* Remove from the head and scales, and cut into sections of about 3 cm long.

Agkistrodon Flesh Remove from the head, soften thoroughly with yellow rice wine, eliminate the scales and bones, and dry.

Agkistrodon (processed with wine) Stir-bake the clean sections of Agkistrodon with yellow rice wine as described under the method for stir-baking with wine (Appendix II D) to dryness, using 20 kg of yellow rice wine per 100 kg of Agkistrodon.

Action To dispel *wind*, remove obstruction of *channels* and *collaterals*, and arrest spasm.

Indications Chronic rheumatic or rheumatoid arthritis with numbness and contracture; hemiplegia in stroke; convulsion, tetanus; leprosy, scabies and ringworm.

Usage and dosage 3-9 g; 1-1.5 g, ground into powder and taken with water, 2-3 times a day.

Storage Preserve in a dry place, protected from mould and moth.

Aloe
(芦荟, Luhui)

Aloes

Aloes is the dried concentrated matter obtained from the juice of the leaf of *Aloe barbadensis* Miller, *Aloe ferox* Miller or other species of the same genus. *Aloe barbadensis* is habitually known as "Old Aloes" and *Aloe ferox* is known as "New Aloes".

Description *Old Aloes* Irregular pieces, often broken, polygonal, varying in size. Externally dark reddish-brown or dark borwn, lusterless. Texture light and hard, uneasily broken, fracture rough or with pockmarked striations; hygroscopic. Odour, characteristic; taste, very bitter.

New Aloes Externally dark brown, slightly green, lustrous. Texture light and lax, easily broken; fracture glassy, with striations.

Identification (1) To 0.5 g of the powder, add 50 ml of water, shake thoroughly, filter. To 5 ml of the filtrate add 0.2 g of borax, heat to dissolve. To several drops of the solution add 30 ml of water, mix well, a green fluorescence is produced. Examine under ultra-violet light at 365 nm, a light yellow fluorescence is produced. To 2 ml of the filtrate, add 2 ml of nitric acid, mix well, a brownish-red colour is produced for *Aloe barbadensis*, and a yellowish-green colour for *Aloe ferox*. To 2 ml of the filtrate, add an equal volume of saturated bromine water, a yellow precipitate is produced.

(2) To 0.1 g of the powder, add 5 ml of ferric chloride TS and 5 ml of dilute hydrochloric acid, shake thoroughly, heat on a water bath for 5 minutes. Allow to cool, add 10 ml of carbon tetrachloride, shake slowly for 1 minute. To 6 ml of carbon tetrachloride solution add 3 ml of ammonia TS, shake, a rose-red to cherry-red colour is produced in the ammonia layer.

(3) To 0.5 g of the powder, add 20 ml of methanol, boil on a water bath, shake for several minutes and filter, use the filtrate as the test solution. Dissolve aloin CRS in methanol to prepare a solution containing 5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of ethyl acetate, methanol and water (100 : 17 : 13) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air and spray with 10% solution of potassium hydroxide in methanol. Examine under ultra-violet light at 365 nm. A fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot in the chromatogram obtained with the reference solution.

Water Carry out the determination of water (Appendix IX H, method 1), not more than 12.0 per cent.

Total Ash Not more than 4.0 per cent (Appendix IX K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix IX K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix X A), using ethanol as the solvent, not less than 60.0 per cent.

Assay Carry out the method for high performance liquid

chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use a column packed with octadecylsilane bonded silica gel as the stationary phase and the mixture of acetonitrile-water (25 : 75) as mobile phase. As detector a spectrophotometer set at 355 nm. The number of the theoretical plate of the column is not less than 2000, calculated with the reference to the peak of aloin.

Reference solution dissolve barbaloin, accurately weighed, in methanol to produce a methanol solution containing 0.2 mg of barbaloin per ml, mix well.

Test solution Place 0.1 g of the power (through No. 5 sieves) of *Aloe barbadensis* or 0.2 g of the powder of *Aloe ferox*, accurately weighed, to a 100 ml volumetric flask, add a quantity of methanol, ultrasonicate for 30 minutes, cool, add methanol to volume, mix well, filter, as the test solution.

Procedure Inject accurately 10 μl of the reference solution and of the test solution respectively into the column, and calculate the contents.
It contains not less than 18.0 per cent of aloin for *Aloe barbadensis*, and not less than 6.0 per cent of aloin for *Aloe ferox*, calculated with reference to the dried drug.

Processing Cut to small pieces.

Action To remove *heat* from the liver, and relax the bowels.

Indications Constipation; infantile malnutrition due to improper feeding and convulsion; external use for eczema and ringworm.

Usage and dosage 2-5 g; for external use, appropriate quantity is ground into powder and applied topically.

Storage Preserve in a cool and dry place.

Alumen
(白矾, Baifan)

Alum

Alum is a processed mineral of sulfates of alum-stone, containing mainly potassium aluminium sulfate [$KAl(SO_4)_2 \cdot 12H_2O$].

Description Irregular masses or granular, colourless or pale yellowish-white, transparent or translucent. Externally somewhat smooth or uneven, with fine and dense longitudinal ridges, and glassy lustre. Texture hard and fragile. Odour, slight; taste, sour, slightly sweet and extremely astringent.

Identification The aqueous solution yields the reactions characteristic of aluminium salts, potassium salts and sulfates (Appendix Ⅳ).

Ammonium salts Dissolve 0.1 g of the drug in 100 ml of ammonia-free water. Transfer 10 ml of the solution to a Nessler tube, add 40 ml of ammonia-free water and 2 ml of alkaline mercuric potassium iodide TS, any colour produced is not more intense than that of a mixture of 1 ml of ammonium chloride solution (dissolve 31.5 mg of ammonium chloride in 1000 ml of ammonia-free water), 2 ml of alkaline mercuric potassium iodide TS and 49 ml of ammonia-free water.

Copper and Zinc To 1 g of the drug add 100 ml of water and slight excess of ammonia TS, boil and filter, the filtrate should not be blue. Acidify the filtrate with acetic acid, add hydrogen sulfide TS, it should not be turbid.

Iron Dissolve 0.35 g of the drug in 20 ml of water, add 2 drops of nitric acid, boil for 5 minutes, neutralize with sodium hydroxide TS to produce slight turbidity, add 1 ml of dilute hydrochloric acid TS, 1 ml of potassium ferrocyanide TS and sufficient quantity of water to 50 ml, mix well, no blue colour is produced within 1 hour.

Heavy metals Dissolve 1 g of the drug in 2 ml of dilute acetic acid TS and a quantity of water to 25 ml, carry out the limit test for heavy metals (Appendix Ⅸ E, method 1): not more than 20 ppm.

Assay Dissolve about 0.3 g of the drug, accurately weighed, in 20 ml of water, add 20 ml of acetic acid-ammonium acetate BS (pH 6.0), and 25 ml of disodium edetate (0.05 mol/L) VS, accurately measured, boil for 3-5 minutes, cool. Add 1 ml of xylenol orange IS and titrate with zinc solution (0.05 mol/L) VS until the colour turns from yellow to red. Perform a blank determination and make any necessary correction. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 23.72 mg of potassium aluminium sulfate [$KAl(SO_4)_2 \cdot 12H_2O$].
It contains not less than 99.0 per cent of potassium aluminium sulfate [$KAl(SO_4)_2 \cdot 12H_2O$].

Processing *Alumen* Eliminate foreign matter, break to pieces before use.

Alumen (calcined) Calcine the clean Alumen as described under the method for calcining openly (Appendix Ⅱ D) to lax and fragile.

Action To counteract toxicity, kill parasites, arrest discharges, and relieve itching by external use; to arrest bleeding, relieve diarrhea, and dispel *wind-phlegm* by internal adminstration.

Alumen (calcined) To arrest discharge, promote the healing of ulcers, arrest bleeding, and resolve putridity.

Indications External use for eczema, scabies, otitis media with purulent discharge; internal use for chronic diarrhea, hematochezia, abnormal uterine bleeding, epilepsy and mania.

Alumen (calcined) Eczema, discharge from ulcers otitis media with purulent discharge, excessive leukorrhea with pudendal itching, bleeding from the nose or gums; nasal polyp.

Usage and dosage For external use, appropriate quantity is ground into powder for topical application or dissolved in water for washing; 0.6-1.5 g for oral administration.

Storage Preserve in a dry place.

Arillus Longan
(龙眼肉, Longyanrou)

Longan Aril

Longan Aril is the aril of *Dimocarpus longan* Lour. (Fam. Sapindaceae). The drug is collected in summer and autumn when fruit is ripe, dried, removed from shell and nutlet, dried in the sun until it becomes unsticky.

Description Longitudinally broken and irregular slices, frequently several slices agglutinated, about 1.5 cm long, 2-4 cm wide, about 1 mm thick. Brown, translucent. One surface shrunken, the other surface lustrous, with longitudinally fine wrinkles. Texture soft. Odour, slightly aromatic; taste, sweet.

Identification Transverse section: Outer epidermal cells 1 row, subsquare. Inner epidermal cells 1 row, walls slightly

thickened, and covered with a relatively thickened cuticle. Parenchymatous cells between outer and inner epidermis large, cylindrical, in numerous rows, 148 μm in diameter. Some of the parenchymatous cells containing pale yellow masses and oil droplets.

Water Carry out the method as described under the determination of water (Appendix Ⅸ H, method I), not more than 15.0 per cent.

Total ash Not more than 4.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method as described under the determination of water-soluble extractives (Appendix Ⅹ A), not less than 70.0 per cent.

Action To tonify the heart and the spleen, nourish blood, and tranquilize the mind.

Indications Cardiac palpitation, forgetfulness and insomnia due to deficiency of qi and blood; anemia.

Usage and dosage 9-15 g.

Storage Preserve in a ventilated dry place, protected from moisture and moth.

Arisaema cum Bile (胆南星, Dannanxing)

Bile Arisaema

Bile Arisaema is prepared from finely powdered *Rhizoma Arisaematis* (processed) and the bile of ox, sheep or pig, or prepared by fermentation of finely powdered *Rhizoma Arisaematis* with the bile of ox, sheep or pig.

Description Cubic or cylindrical, brownish-yellow, greyish-brown or brownish-black. Texture hard. Odour, slightly fishy; taste, bitter.

Identification (1) Powder: Pale yellowish-brown. Parenchymatous cells subrounded, filled with gelatinized starch granules. Raphides of calcium oxalate 20-90 μm long. Spiral and annular vessels 8-60 μm in diameter.
(2) To 0.2 g of the powder add 5 ml of water, shake and filter. Transfer 2 ml of the filtrate to a test tube, add 0.5 ml of freshly prepared furfural (1→100), and add 2 ml of sulfuric acid along the tube wall; a brownish-red ring produces at the junction of the two layers.

Action To remove *heat* and resolve *phlegm*, and calm the nerves.

Indications Cough with yellowish sticky expectoration; stroke, mania, epilepsy.

Usage and dosage 3-6 g.

Storage Preserve in a ventilated dry place, protected from moth.

Aspongopus (九香虫, Jiuxiangchong)

Stink-bug

Stink-bug is the dried body of *Aspongopus chinensis* Dallas (Fam. Pentatomidae). The drug is collected from November to the next March, placed in an appropriate container, suffocated with wine, then taken out and dried in the shade; or scalded to death by boiling water, taken out, and dried.

Description Somewhat hexagonal and flattened ellipsoidal, 1.6-2 cm long, about 1 cm wide. Externally brown or brownish-black, slightly lustrous. Small head and thorax slightly triangular; compound eyes protruded, ovoid, ocellus one pair; a pair of antennae each with 5 segments, usually fallen off. Dorsum bearing 2 pairs of wings, the outer pair relatively hard at the basal, the inner pair membranous and transparent. Thorax bearing 3 pairs of legs, usually fallen off. Abdomen brownish-red to brownish-black, each segment with projected small points near the margin. Texture fragile, pale brown contents in abdomen visible when broken. Odour, characteristic; taste, slightly salty.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol as the solvent, not less than 10.0 per cent.

Processing *Aspongopus* Eliminate foreign matter.

Aspongopus (*stir-baked*) Stir-bake clean Aspongopus as described under the method for simple stir-baking (Appendix Ⅱ D) until an aromatic odour is produced.

Action To regulate the flow of *qi* and relieve pain, warm the stomach, and restore the *kidney-yang*.

Indications Epigastric pain with distension due to cold in the stomach or stagnation of *qi* in the liver and stomach; impotence and aching of the loins and knees in deficiency syndrome of the kidney.

Usage and dosage 3-9 g.

Storage Preserve in wood boxes lined with wax paper, protected from moisture and moth.

Benzoinum
(安息香, Anxixiang)

Benzoin

Benzoin is the dried resin collected from the trunk of *Styrax tonkinensis* (Pierre) Craib ex Hart. (Fam. Styracaceae), which is injured naturally or incised in summer and autumn, and dried in the shade.

Description Small irregular pieces, somewhat flat, often stuck into masses. Externally orange-yellow, with waxy lustre (naturally injured resin); or irregularly cylindrical, flat pieces, externally greyish-white to pale yellowish-white (artificially incised resin). Texture fragile, easily broken; fracture even, white, gradually becoming pale yellowish-brown or reddish-brown on storage, soften and melt on heating. Odour, aromatic; taste, slightly pungent, with a sensation of sand when chewing.

Identification (1) Heat 0.25 g in a dry test tube, an irritant, aromatic odour and numerous, prismatic sublimates are produced.
(2) To 0.1 g add 5 ml of ethanol, grind, and filter. To the filtrate add 0.5 ml of 5% ferric chloride in ethanol; a light green colour is produced which changes to yellowish-green.

Loss on drying When the coarse powder is dried over sulfuric acid in a vacuum desiccator to constant weight, loses not more than 2.0 per cent of its weight (Appendix Ⅸ G).

Total ash Not more than 0.50 per cent (Appendix Ⅸ K).

Ethanol-insoluble matter Extract 2.5 g, accurately weighed, of the fine powder in a Soxhlet's extractor with ethanol until the extraction is complete. Dry the residue to constant weight at 100℃, not more than 2.0 per cent.

Assay Weigh accurately 1.5 g of the powder, in a flask, add 25 ml of ethanolic potassium hydroxide solution (0.5 mol/L), and heat under reflux on a water bath for 1.5 hours. Evaporate the ethanol and disperse the residue in 50 ml of hot water. Allow it to cool, add 150 ml of water and 50 ml of magnesium sulfate solution (1→20), mix well, and allow to stand for 10 minutes. Filter, wash the residue with 20 ml of water. Acidify the combined filtrate and washings with hydrochloric acid, transfer to a separator, and extract successively with 50, 40, 30 and 30 ml of ether, then extract the combined ether extracts with 20, 20, 10, 10 and 10 ml of sodium carbonate solution (1→20) successively, washing each aqueous extract with the same 20 ml of ether. Acidify the combined aqueous extracts with hydrochloric acid, and extract again successively with 30, 20, 10 and 10 ml of ether. Combine and transfer the ether extracts to a weighed flask, evaporate most of ether with a current of air and rotate the flask to disperse the residue on the inner wall of the flask. Dry the flask to constant weight over sulfuric acid in a vacuum desiccator, weigh accurately. The weight of residue represents the content of total balsamic acid in the sample. Calculate the percentage on the dried basis, subtracted the content of ethanol-insoluble matter, the percentage represents the content of total balsamic acid.
It contains not less than 30.0 per cent of total balsamic acid, calculated on the basis of ethanol extractives.

Action To restore consciousness, activate the flow of *qi* and blood, and relieve pain.

Indications Loss of consciousness in stroke and attack of noxious factors, syncope due to violent excitement or postpartum anemia; pain in the chest and epigastrium; infantile convulsion.

Usage and dosage 0.6-1.5 g; usually as an ingredient in pills or powder.

Storage Preserve in a cool and dry place.

Bombyx Batryticatus
(僵蚕, Jiangcan)

Stiff Silkworm

Stiff Silkworm is the dried body of the 4-5th stage larva of *Bombyx mori* Linnaeus. (Fam. Bombycidae) died of infection (or artificial infection) of *Beauveria bassiana* (Bals.) Vuill ant. The drug is usually collected in spring or autumn, and dried.

Description Somewhat cylindric, usually curved and shrunken, 2-5 cm long, 0.5-0.7 cm in diameter. Externally greyish-yellow, covered with white powdery aerial mycelia and conidia. Head relatively round, 8 pairs of legs, segments prominent, caudal portion somewhat dichotomic. Texture hard and fragile, easily broken. Fracture even, peripheral layer white, middle part with 4 bright brown or bright black rings of silk glands. Odour, slightly stinking; taste, slightly salty.

Identification Powder: Greyish-brown. The mycelia almost colourless, slender rolled and twisted in the body walls. Broken pieces of the trachea walls slightly curved or arch-like, with brown or dark brown spiral filaments. The surface of the epidermis with reticulated shrunken striations and small pointed projections formed by the striations; with rounded setae pits, the margin of the pits yellow. Setae yellow or yellowish-brown, surface smooth, walls slightly thickened. The indigested mulberry leaf tissues mostly containing clusters or prisms of calcium oxalate.

Foreign matter Not more than 3.0 per cent (Appendix Ⅸ A).

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 13.0 per cent.

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol as the solvent, not less than 20.0 per cent.

Processing *Bombyx Batryticatus* Wash clean and dry, eliminate foreign matter.

Bombyx Batryticatus (*stir-baked*) Stir-bake clean Bombyx Batryticatus as described under the method for stir-baking with bran (Appendix Ⅱ D) until the surface become yellow.

Action To dispel *wind*, relieve convulsion, and dissolve lumps.

Indications Convulsion; sore throat, cutaneous itching; submaxillary lymphadenitis; facial paralysis.

Usage and dosage 5-9 g.

Storage Preserve in a dry place, protected from moth.

Borneolum (*d*-Borneolum) (天然冰片, Tianran Bingpian)

Natural Borneol

Natural Borneol is the crystal produced from the flash branches and leaves of *Cinnamomum camphora* (L.) Presl (Fam. Lauraceae) by steam distillation.

Description A white crystalline powder or flaky crystal. Odour, delicately aromatic; taste, pungent and cool. Volatile, a heavy fume produced on burning with a yellow flame.
Freely soluble in ethanol, chloroform or ether; practically insoluble in water.

Melting rang 204-209 ℃ (Appendix Ⅶ C).

Specific optical rotation +34°-+38°, in a solution of 0.1 g per ml in ethanol (Appendix Ⅶ E).

Identification To a quantity of the sample, add chloroform to produce a solution containing 2 mg per ml as the test solution. Dissolve *d*-borneol CRS in chloroform to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of n-hexane and ethyl acetate (17 : 3) as the mobile phase. Apply separately to the plate 2 μl of the test solution and the reference solution. After developing and removal of the plate, dry in air. Spray with a 1% vanillin solution in sulfuric acid in ethanol, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Isoborneol Dissolve a quantity of isoborneol CRS in chloroform to produced a solution of 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), operating according to the "Identification", apply separately to the plate 2 μl of the test solution produced in the "Identification" and the reference solution. No spots observed in the chromatogram obtained with the test solution correspond in position to the spots in the chromatogram obtained with the reference solution.

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use 10% polyethylene glycol (PEG)-20M as the stationary phase, and maintain the column temperature at 140℃. The number of the theoretical plate of the column is not less than 1900, calculated with reference to the peak of *d*-borneol and the resolution factor between the peak of borneol and isoborneol complies with the related requirements.

Correction factor Dissolve a quantity of methyl salicylate, accurately weighed, in ethyl acetate to produce a solution containing 1 mg per ml, as an internal standard solution. Dissolve 12.5 mg of *d*-borneol CRS, accurately weighed, in a 25 ml volumetric flask and dilute with the internal standard solution to volume, and mix well. Inject accurately 2 μl of the solution into column, calculate the correction factor for borneol.

Procedure Dissolve about 12.5 mg, accurately weighed, in a 25 ml volumetric flask and dilute with the internal standard solution to volume, and mix well as the test solution. Inject accurately 2 μl of the test solution into the column and calculate the contents.
It contains not less than 95.0 per cent of *d*-borneol ($C_{10}H_{18}O$).

Action To induce resuscitation, clear *heat* and alleviate pain.

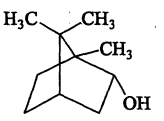
Indications Impaired consciousness in febrile diseases, spasm, apoplexy, phlegm syncope, convulsive epilepsy, phlegmatic coma, laryngalgia, toothache, sore mouth, carbuncles, bloodshot eyes.

Usage and dosage 0.3-0.9g, used in pills or in powder form. Appropriate quantity for external application.

Storage Preserve in a tightly closed containers, stored in a cool place.

Borneolum Syntheticum (冰片, Bingpian)

Borneol



$C_{10}H_{18}O$ 154.25

Description Colourless, transparent, or white, translucent, loose and fragile, plate crystals; volatile, a heavy fume is produced on burning with a bright flame. Odour, delicately aromatic; taste, pungent and cool. Freely soluble in ehtanol, chloroform or ether; practically insoluble in water.

Melting point 205-210℃ (Appendix Ⅶ C).

Identification (1) Dissolve about 10 mg in several drops of ethanol, add 1-2 drops of freshly prepared 1% solution of vanillin in sulfuric acid; a purple colour is produced immediately.
(2) To 3 g add 10 ml of nitric acid; a reddish-brown gas is produced immediately. Add 20 ml of water after the subsidence of the gas, mix well and filter, wash the residue with water; a smell resembling camphor is perceptible.

pH value Grind 2.5 g to fine powder, shake well with 25 ml of water and filter. Divide the filtrate into two portions of 10 ml each. Add 2 drops of methyl red IS to one portion and 2 drops of phenolphthalein IS to the other, the solutions are not red in colour.

Non-volatile matter Evaporate 10 g on a water bath in a weighed evaporating dish and dry at 105℃ to constant weight, not more than 3.5 mg (0.035 per cent).

Water Dissolve 1 g in 10 ml of petroleum ether with shaking, the solution is clear.

Heavy metals Dissolve 2 g in 23 ml of ethanol, add 2 ml of dilute acetic acid, carry out the limit test for heavy metals (Appendix Ⅸ E, method 1), not more than 0.0005 per cent.

Arsenic Mix well 1 g with 0.5 g of calcium hydroxide and 2 ml of water, heat on a water bath, allow it to volatilize, cool. Neutralize with hydrochloric acid, then add 5 ml of hydrochloric acid and a quantity of water to make up the volume to 28 ml. Carry out the limit test for arsenic (Appendix Ⅸ F), not more than 0.0002 per cent.

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use a column packed with 10 per cent polyethylene glycol (PEG)-20M as the stationary phase, and maintain the column temperature at 140℃. The number of the theoretical plate of the column is not less than 1900, calculated with reference to the peak of borneol and the resolution factor between the peak of borneol and isoborneol complies with the related requirements.

Correction factor Dissolve a quantity methyl salicylate, accurately weighed, in ethyl acetate to produce a solution containing 5 mg per ml, mix well as internal standard solution. Dissolve about 50 mg of (±)-borneol CRS, accurately weighed, in a 10 ml volumetric flask and dilute with the internal standard solution to volume, mix well. Inject accurately 1 μl of the solution into column, calculate the correction factor for borneol.

Procedure Dissolve about 50 mg, accurately weighed, in a 10 ml volumetric flask and dilute with the internal standard solution to volume, mix well. Inject accurately 1 μl of the test solution into the column and calculate the contents.
It contains not less than 55.0 per cent, calculated as borneol ($C_{10}H_{18}O$).

Action To restore consciousness, remove *heat*, and relieve pain.

Indications Loss of consciousness and convulsion in febrile diseases, stroke and attack of noxious factors; syncope due to violent excitment; inflammation of the eyes, ulcers in the mouth, sore throat, purulent discharge from the auditory canal.

Usage and dosage 0.15-0.3 g, used in pills or powder; for external use, appropriate quantity is ground into powder and applied topically.

Precaution Used with caution in pregnancy.

Storage Preserve in tightly closed containers, stored in a cool place.

Bulbus Allii Macrostemonis (薤白, Xiebai)

Longstamen Onion Bulb

Longstamen Onion Bulb is the dried bulb of *Allium macrostemon* Bge. or *Allium chinensis* G. Don (Fam. Liliaceae). The drug is collected in summer and autumn, washed clean, removed from fibrous root, steamed thoroughly or scalded thoroughly in boiling water, and dried in the sun.

Description *Bulb of Allium macrostemon* Irregularly ovoid, 0.5-1.5 cm high, 0.5-1.8 cm in diameter. Externally yellowish-white or pale yellowish-brown, crumpled, translucent, bearing whitish membranous scales, with bulged plateau at base. Texture hard, horny. Odour, alliaceous; taste, slightly pungent.

Bulb of Allium chinensis Slightly compressed long-ovate, 1-3 cm high, 0.3-1.2 cm in diameter. Externally pale yellowish-brown or brown, marked with shallowly longitudinal wrinkles. Texture rather soft, cut surface showing 2-3 layers of scale leaves, sticky to teeth on chewing.

Identification To 4 g of the powder add 20 ml of *n*-hexane, ultrasonicate for 20 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of *n*-hexane as the test solution. Produce a reference drug solution of 4 g of Bulbus Allii Macrostemonis reference drug in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H as the coating substance and a mixture of *n*-hexane and ethyl acetate (10 : 1) as the mobile phase. Apply separately 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, expose to iodine vapour to visualize clearly. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Action To remove the retained *phlegm* from the chest, promote the flow of *qi* and relieve its stagnation.

Indications Angina pectoris; cough and dyspnea caused by retained phlegm; tenesmus in dysentery.

Usage and dosage 5-9 g.

Storage Preserve in a dry place, protected from moth.

Bulbus Fritillariae Cirrhosae (川贝母, Chuanbeimu)

Tendrilleaf Fritillary Bulb

Tendrilleaf Fritillary Bulb is the dried bulb of *Fritillaria cirrhosa* D. Don, *Fritillaria unibracteata* Hsiao et K. C. Hsia, *Fritillaria przewalskii* Maxim. or *Fritillaria delavayi* Franch. (Fam. Liliaceae). According to the different characters, the drug derived from the former three are known as "Songbei" and "Qingbei" respectively, and the drug derived from the latter is known as "Lubei".
The drug is collected in summer or autumn, or when the snow melts, removed from fibrous root, coarse bark and soil, and dried in the sun or at a lower temperature.

Description *Songbei* Subconical or subspherical, 0.3-0.8 cm high, 0.3-0.9 cm in diameter. Externally whitish. The outer scale leaves 2, varying considerably in size, with the large scale closely embracing the small one, the uncovered part appearing crescent, commonly known as "Huaizhong Baoyue" (holding the moon in the arms). Apex closed, with subcylindrical and slightly tapering buds and 1-2 small scales inside; apex obtuse or slightly acute, base even and slightly concave, with a greyish-brown disk at central part, remains of fibrous roots occasionally found. Texture hard and fragile, fracture white, starchy. Odour, slight; taste, slightly bitter.

Qingbei Nearly oblate, 0.4-1.4 cm high, 0.4-1.6 cm in diameter. Outer scale leaves 2, almost uniform in size, embraced. Apex open, with buds and 2-3 small scales inside and slender cylindrical remains of a stem.

Lubei Long conical, 0.7-2.5 cm high, 0.5-2.5 cm in diameter. Externally whitish or pale brownish-yellow, some brown-maculate. Outer scales leaves 2, almost uniform in size. Apex open and somewhat tapering, base slightly acute or relatively obtuse.

Identification Powder: Whitish.

Songbei and Qingbei Starch granules fairly abundant, broadly ovoid, long spheroidal or irregularly spheroidal, some with uneven or slightly branch-like edges, 5-64 μm in diameter, hilum short slit-shaped, pointed, V-shaped or U-shaped, and faint striations visible. Epidermal cells subrectangular, anticlinal walls sinuous, rounded or oblate anomocytic stomata occasionally found. Spiral vessels 5-26

μm in diameter.

Lubei Starch granules broadly ovoid, conchoidal, reniform or ellipsoidal, up to 60 μm in diameter, hilum V-shaped, stellate or pointed, striations distinct. Spiral and reticulate vessels even up to 64 μm in diameter.

Water Carry out the method for the determination of water (Appendix Ⅸ H, Method 1), not more than 15.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 0.5 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol as solvent, not less than 9.0 per cent.

Action To remove *heat*, moisten the lung, resolve *phlegm* and relieve cough.

Indications Dry cough due to *heat* in the lung; cough with bloody sputum in consumptive diseases.

Usage and dosage 3-9 g; ground into powder and taken with water, 1-2 g each time.

Precaution Incompatible with Radix Aconiti and allied drugs.

Storage Preserve in a ventilated dry place, protected from moth.

Bulbus Fritillariae Hupehensis (湖北贝母, Hubeibeimu)

Hubei Fritillary Bulb

Hubei Fritillary Bulb is the dried bulb of *Fritillaria hupehensis* Hsiao et K. C. Hsia (Fam. Liliaceae). The drug is collected in early summer when the plant is withered, soaked in limewater or water and then dried.

Description Oblate, 0.8-2.2 cm in height, 0.8-3.5 cm in diameter. Externally whitish to brownish, the outer scale leaves 2, fleshy, nearly reniform, or varying considerably in size, the large scale closely embracing the small one, apex closed or open, with 2-6 scales and shrunken stem remains. Internally yellowish to whitish. Base depressed, with remains of brownish epidermis and a few fibrous roots. The single scale leaf reniform-shoe-shaped, 2.5-3.2 cm in length, 1.8-2 cm in diameter. Texture fragile, fracture whitish, starchy. Odour, slight; taste, bitter.

Identification (1) Powder: Pale brownish-yellow. Starch granules fairly abundant, broadly ovoid, long ellipsoid or subspheroid, 7-54 μm in diameter, hilum pointed, V-shaped, slit-shaped or separated to be like horsetail, striations fine and dense, distinct; compound granules of 2-3 components, smaller, visible occasionally. Epidermis cells subsquare or polygonal, anticlinal walls irregularly beaded; sometimes stomata visible, oblate, 54-62 μm in diameter, with 4-5 subsidiary cells. Crystals of calcium oxalate rhombic, subsquare, granular or clustered, up to 50 μm in diameter. Spiral vessels or annular vessels, 60-20 μm in diameter.
(2) To 10 g, in powder, add 50 ml of ethanol, heat under reflux for 1 hour, filter, evaporate the filtrate to dryness. Macerate the residue in 10 ml of dilute hydrochloric acid, stir to dissolve, filter, adjust the filtrate to pH 10 or above with 40% sodium hydroxide solution. Extract by shaking with two 10-ml quantities of chloroform, combine the chloroform extracts and evaporate to dryness. Dissolve the residue in 1 ml of absolute ethanol as the test solution. Prepare a solution of Bulbus Fritillariae Hupehensis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxy-methylcellulose as the coating substance and a mixture of benzene, ethyl acetate and diethylamine (30 : 20 : 3.8) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with dilute potassium iodobismuthate TS. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Assay Weigh accurately 2 g, in fine powder, to a stopper conical flask, moisten with 2 ml of strong ammonia TS, add accurately 50 ml of ether, tightly stoppered and shake, allow to stand for 24 hours. Measure accurately 25 ml of the supernatant into an evaporating dish, evaporate to dryness. Dissolve the residue with a quantity of absolute ethanol, transfer to a 5 ml volumetric flask and dilute to volume, mix well, used as the test solution. Dissolve a quantity of hupehenine CRS in absolute ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ether, ethyl acetate and diethylamine (3 : 3 : 4 : 1) as the mobile phase. Apply separately 10-20 μl of the test solution and 1 μl, 5 μl of the reference solution alternatively to the plate. After developing and removal of the plate, dry in air. Spray with dilute potassium iodobismuthate TS. Cover the plate with a piece of glass of the same size and fix up the edge with tape. Carry out the method for thin layer chromatography (thin layer chromatographic scanning method, Appendix Ⅵ B), scan immediately at wavelength of $\lambda_S = 500$ nm, $\lambda_R = 600$ nm. Measure the integration values of the absorbance from the test solution and the reference solution respectively, calculate the content.
It contains not less than 0.020 per cent of hupehenine ($C_{27}H_{45}NO_2$).

Processing Wash clean and dry.

Action To remove *heat* and resolve *phlegm*, relieve cough and dispel the obstruction.

Indications Cough due to *heat-phlegm*, subcutaneous nodule scrofula, swelling carbuncles and sore *toxicity*.

Usage and dosage 3-9 g; ground into powder and taken with water.

Precaution Incompatible with Radix Aconiti and allied drugs.

Storage Preserve in a dry place, protected from moth.

Bulbus Fritillariae Pallidiflorae (伊贝母, Yibeimu)

Sinkiang Fritillary Bulb

Sinkiang Fritillary Bulb is the dried bulb of *Fritillaria walujewii* Regel or *Fritillaria pallidiflora* Schrenk (Fam. Liliaceae). The drug is collected from May to July, removed from soil, dried in the sun, and then removed from fibrous root and the outerbark.

Description *Bulbs of Fritillaria walujewii* Oblate, 0.5-1.5 cm high. Externally whitish and smooth. The outer

scale leaves 2, crescent, plump and fleshy, almost uniform in size and closed together. Apex spread and open out, base rounded and obtuse, with relatively larger scale leaf, remain of a stem and a bud inside. Texture hard and fragile, fracture white, starchy. Odour, slight; taste, slightly bitter.

Bulbs of Fritillaria pallidiflora Conical, relatively large. Externally somewhat rough, pale yellowish-white. The outer scale leaves 2, cordate, plump and large, significantly varying or almost uniform in size, closely embraced each other. Apex slightly acute with a few open, base slightly concave.

Identification (1) Powder: Whitish, mainly consisting of starch granules.

Bulbs of Fritillaria walujewii Starch granules simple, broadly ovoid, ovoid or conchoidal, 5-54 μm in diameter, hilum pointed, V-shaped or shortly slit-shaped, striations distinct; compound granules less, of 2 components. Epidermal cells subrectangular, with sinuous anticlinal walls, containing small prisms of calcium oxalate. Stomata anomocytic, with 4-6 subsidiary cells, spiral and annular vessels 9-56 μm in diameter.

Bulbs of Fritillaria pallidiflora Starch granules simple, broadly ovoid, triangular-ovoid, conchoidal or irregularly rounded, up to 60 μm in diameter, hilum pointed, V-shaped or crossed. Vessels about 50 μm in diameter.

(2) To 5 g of the powder add 2 ml of strong ammonia TS and 20 ml of chloroform, shake, allow to stand overnight, filter, and evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of chloroform as the test solution. Prepare a solution of 5 g of Balbus Fritillariae Pallidiflorae reference drug in the same manner as the reference drug solution. Dissolve sipeimine CRS in chloroform to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 2% sodium hydroxide solution as the coating substance and the lower layer of chloroform, ethyl acetate, methanol and water (8 : 8 : 3 : 2), standing below 10℃, as the mobile phase. Apply separately 2-4 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, and spray with dilute optassium iodobismuthate TS and sodium nitrite TS successively. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. A brown spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Total ash Not more than 4.5 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 0.9 per cent (Appendix Ⅸ K).

Extractives Carry out the cold maceration extraction method as described under the determination of ethanol-soluble extractives (Appendix Ⅹ A), using 70% ethanol as the solvent, not less than 9.0 per cent.

Action To remove *heat* from the lung, resolve *phlegm*, and reduce nodules.

Indications *Heat* in the lung manifested by cough, stuffiness feeling in the chest and sticky sputum; scrofula and other inflammatory nodules.

Usage and dosage 3-9 g.

Precaution Incompatible with Radix Aconiti and allied drugs.

Storage Preserve in a ventilated dry place, protected from moth.

Bulbus Fritillariae Thunbergii (浙贝母, Zhebeimu)

Thunberg Fritillary Bulb

Thunberg Fritillary Bulb is the dried bulb of *Fritillaria thunbergii* Miq. (Fam. Liliaceae). The drug is collected in early summer when the plant is withered, washed clean, and classified according to its size. The larger one is removed from the central bud and commonly known as "Dabei", the smaller one, with the central bud not removed, is commonly known as "Zhubei". The drug is removed from the outer bark by dashing and mixed with calcinated shell powder to absorb the juice dashed out and dried. Or the drug is classified according to its size, washed clean, removed from the central bud, cut into thick slice while fresh, washed clean, and dried, commonly known as "Zhebeipian".

Description *Dabei* Outer single scale leaf of bulb, slightly in crescent shape, 1-2 cm high, 2-3.5 cm in dia-meter. The outer surface whitish to pale yellow, the inner surface white or pale brown, covered with white powder. Texture hard and fragile, easily broken, fracture white to yellowish-white, highly starchy. Odour, slight; taste, slightly bitter.

Zhubei Whole bulb, oblate, 1-1.5 cm high, 1-2.5 cm in diameter. Externally whitish, the outer scale leaves 2, plump and fleshy, slightly in reniform, holding to each other, containing 2-3 small scale leaves and dried shrunken stem remains.

Zhebeipian Slices cut from the outer single scale leaf of bulb, elliptical or subrounded, 1-2 cm in diameter, surface of edge pale yellow, cut surface even, powdery-white. Texture, hard and fragile, easily broken, fracture powdery-white, highly starchy.

Identification (1) Powder: Pale yellowish-white. Starch granules numerous, simple granules ovoid, broad-ovoid or elliptical, 6-56 μm in diameter, striations indistinct. Epidermis cells subpolygonal or rectangular, anticlinal walls beaded-thickened; stomata less visible, with 4-5 subsidiary cells. Crystals of calcium oxalate less visible, minute, mostly granular, some in fusiform, square or thin bacilliform. Vessels mostly spiral, up to 18 μm in diameter.

(2) To 5 g of the powder add 2 ml of strong ammonia solution and 20 ml of chloroform. Allow to stand overnight, filter and evaporate 8 ml of the filtrate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Dissolve peimine CRS and peinine CRS in chloroform to produce a mixture containing 2 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of ethyl acetate, methanol and strong ammonia TS (17 : 2 : 1) as the mobile phase. Apply separately 10-20 μl of the test solution and 10 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with dilute potassium iodobismuthate TS. The spots in the chromatogram obtained with the test solution correspond in position and colour with the spots in the chromatogram obtained with the reference solution.

Water Carry out the method for determination of water

(Appendix Ⅸ H, method 1), not more than 18.0 per cent.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol as the solvent, not less than 8.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, water and diethylamine (70 : 30 : 0.03) as the mobile phase. Use an evaporative light scattering detector. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of peimine.

Reference solution Weigh accurately a quantity of peimine CRS and peinine CRS, respectively, dissolve in methanol to produce a mixture containing 0.2 mg and 0.15 mg of each per ml.

Test solution Weigh accurately 2 g of the powder (through No. 4 sieve) to a flask, add 4 ml of strong ammonia TS and macerate for 1 hour. Accurately add 40 ml of a mixture of chloroform and methanol (4 : 1), weigh, heat under reflux on a water bath at 80℃ for 2 hours, cool and weigh again, replenish the loss of solvent with the above mixture and filter. Measure accurately 10 ml of the successive filtrate and evaporate to dryness in an evaporating dish. Dissolve the residue with methanol, transfer to a 2 ml volumetric flask, dilute with methanol to volume and mix well.

Procedure Accurately inject 10 μl, 20 μl of the reference solution and 5-15 μl of the test solution, respectively, into the column, and calculate the content, using a calibration equation of logarithm alteration of two external standards.
It contains not less than 0.080 per cent of the total amount of peimine ($C_{27}H_{45}NO_3$) and peinine ($C_{27}H_{43}NO_3$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry; or pound to pieces.

Action To remove *heat* and reduce nodulation, resolve *phlegm* and relieve cough.

Indications Attack of *wind-heat* on the lung; cough due to *phlegm-heat*; lung abscess; mastitis; sores, scrofula.

Usage and dosage 4.5-9 g.

Precaution Incompatible with Radix Aconiti and allied drugs.

Storage Preserve in a dry place, protected from moth.

Bulbus Fritillariae Ussuriensis (平贝母, Pingbeimu)

Ussuri Fritillary Bulb

Ussuri Fritillary Bulb is the dried bulb of *Fritillaria ussuriensis* Maxim. (Fam. Liliaceae). The drug is collected in spring, removed from outer bark, fibrous root and soil, dried in the sun or at a lower temperature.

Description Oblate, 0.5-1 cm high, 0.6-2 cm in diameter. Externally milk white or pale yellowish-white, outer scale leaves 2, plump, uniform in size or the large scale leaf embracing the small one, apex slightly flat or dented, frequently slightly split, scales in the centre small. Texture hard and fragile, fracture starchy. Odour, slightly; taste, bitter.

Identification (1) Powder: Starch granules simple, rounded-triangular, ovoid, rounded-conchoidal, triangular-ovoid, long-cocooned, 6-58 (-74) μm in diameter, up to 67 μm long, hilum cleft-like, pointed or V-shaped in the smaller end, striations dense and distinct. Semi-compound few, hila 2, simple granules with multihila visible occasinally, hila 2-4. Stomata subrounded or depressed rounded, 40-48 (50) μm in diameter, with 4-6 subsidiary cells.
(2) To 10 g of the powder add 10 ml of strong ammonia TS and 30 ml of chloroform, ultrasonicate for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of methanol as the test solution. Dissolve pingbeimine A CRS in methanol to produce a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, methanol and strong ammonia TS (6 : 1 : 0.5) as the mobile phase. Apply separately 12 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with dilute potassium iodobismuthate TS and 5% sodium nitrite TS successively. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Processing Eliminate foreign matter. Break to pieces before use.

Action To remove *heat* from the lung, relieve cough and resolve *phlegm*.

Indications Heat in the lung with cough, sticky and bloody sputum, and distress in the chest.

Usage and dosage 3-9 g; or 1-2 g each time, ground into powder and taken with water.

Precaution Incompatible with Radix Aconiti and allied drugs.

Storage Preserve in a ventilated dry place, protected from moth.

Bulbus Lilii (百合, Baihe)

Lily Bulb

Lily bulb is the dried fleshy scale leaf of *Lilium lancifolium* Thunb., *Lilium brownii* F. E. Brown var. *viridulum* Baker or *Lilium pumilum* DC. The drug is collected in autumn, and washed clean. The scale leaves are stripped off, treated with boiling water for a moment, and dried.

Description Elongated elliptical, 2-5 cm long, 1-2 cm wide, 3-4 mm thick at middle. Externally whitish, pale brownish-yellow or purplish, with several longitudinal and paralled white vascular bundles. Apex somewhat acute, base relatively broad, margins thin, undulate, slightly curved inwards. Texture hard and fragile, fracture relatively even, horny. Odour, slight; taste, slightly bitter.

Identification To 1 g of the powder add 10 ml of methanol, ultrasonicate for 20 minutes and filter. Concentrate the filtrate to 1 ml as the test solution. Prepare a solution of Bulbus Lilii reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of the mixture of petroleum ether (60-90℃), ethyl acetate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air, spray with a 10% solution of phosphomolybdic acid in ethanol and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution.

Extractives Carry out the cold extraction method as described under the determination for water soluble extractive (Appendix Ⅹ A), not less than 18.0 per cent.

Processing *Bulbus Lilii* Eliminate foreign matter.

Bulbus Lilii (*honeyed*) Stir-bake the clean Bulbus Lilii as described under the method for stir-baking with honey (Appendix Ⅱ D) to no longer sticky, using 5 kg of refined honey per 100 kg of *Bulbus Lilii*.

Action To nourish *yin* and moisten the lung, and tranquilize the mind.

Indications Deficiency of *yin* with chronic cough and bloody sputum; fidgets, palpitation, insomnia, dream-disturbed sleep and absent-mindedness.

Usage and dosage 6-12 g.

Storage Preserve in a ventilated dry place.

Bungarus Parvus
(金钱白花蛇, Jinqian Baihuashe)

Coin-like White-banded Snake

Coin-like White-banded Snake is the dried body of *Bungarus multicinctus* Blyth (Fam. Elapidae). The drug is collected in summer or autumn, opened in the abdomen, removed from the viscera, cleaned, immersed in ethanol, coiled up in disc-shape, fixed with a bamboo slip, and dried.

Description Disc-shaped, 3-6 cm in diameter of disc, 0.2-0.4 cm in diameter of snake. Head located in the centre of disc; tail slender, usually inserted into mouth; 1 pair of poisonous grooved fangs on the anterior end of maxilla in mouth, 2 internasals, loreal absent, upper and lower labials usually 7 respectively. Dorsum black or greyish-black, with 45-58 white annulations, alternating with black ones. The white rings 1-2 scales wide on the back, gradually widened towards the venter, and the black rings 3-5 scales wide. A median vertebral ridge raising distinctly. Scales on the vertebral ridge enlarged into hexagonal; dorsal scales small and dense, 15 rows throughout the body, subcaudals single row. Odour, slightly stinking; taste, slightly salty.

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol as the solvent, not less than 15.0 per cent.

Processing Eliminate dust and other attached impurities, and cut into sections.

Action To dispel *wind*, to remove obstruction from the collaterals, and relieve spasm.

Indications Chronic rheumatoid arthritis with numbness and muscular contracture; apoplectic hemiplegia and facial paralysis; convulsion, tetanus; scabies; ringworm; festered scrofula.

Usage and dosage 3-4.5g; 1-1.5g, ground into powder and taken with water.

Storage Preserve in a dry place, protected from mould and moth.

Cacumen Platycladi (侧柏叶, Cebaiye)

Chinese Arborvitae Twig and Leaf

Chinese Arborvitae Twig and Leaf is the dried twig and leaf of *Platycladus orientalis* (L.) Franco (Fam. Cupressaceae). The drug is collected in summer and autumn, and dried in the shade.

Description Frequently branched, twigs flattened. Leaves small, scale-shaped, decussate, close to stems, dark green or yellowish-green. Texture fragile, easily broken. Odour, delicately aromatic; taste, bitter, astringent and slightly pungent.

Identification (1) Powder: Yellowish-green. Upper epidermal cells of leaf rectangular, with slightly thickened walls. Lower epidermal cells subsquare, stomata numerous, sunken, subsidiary cells relatively large, dumbbell-shaped in side view. Parenchymatous cells containing oil droplets. Fibres slender, about 18 μm in diameter. Bordered pitted tracheids sometimes present.

(2) To 3 g of the powder add 50 ml of 70% ethanol and 3 ml of hydrochloric acid solution, heat under reflux for 3 hours, filter, use the filtrate as the test solution. Dissolve quercetin CRS in ethanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and a mixture of benzene, ethyl acetate and formic acid (5 : 2 : 1) as the mobile phase. Apply separately to the plate 5 μl of the test solution and 1 μl of the reference solution. After developing and removal of the plate, dry in air, spray with 1% aluminum chloride in ethanol and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Foreign matter Not more than 6 per cent (Appendix Ⅸ A).

Water Not more than 11.0 per cent (Appendix Ⅸ H, method 2).

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using ethanol as the solvent, not less than 15.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, 0.01 mol/L potassium dihydrogenphosphate and glacial acetic acid (40 : 60 : 1.5) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of the theoretical plates of the column is not less than 1500, calculated with reference to the peak of quercitroside.

Reference solution Weigh accurately a quantity of quercitroside CRS, add methanol to produce a solution containing 50 μg per ml.

Test solution Take 0.5 g of the powder, accurately weighed, to a stopper conical flask, accurately add 20 ml of methanol, and weigh. Ultrasonicate for 30 minutes, cool, weigh again and compensate the loss of the weight with methanol, shake well and filter. Use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 0.10 per cent of quercitroside ($C_{21}H_{20}O_{11}$), calculated with reference to the dried drug.

Processing *Cacumen Platycladi* Eliminate hard twigs and foreign matter.

Cacumen Platycladi (*carbonized*) Carbonize the clean Cacumen Platycladi as described under the method for carbonizing by stir-baking (Appendix Ⅱ D), until the surface becomes charred brown and the inner part charred yellow.

Action To arrest bleeding by removing *heat* from blood, and promote the growth of black hair.

Indications Epistaxis, hematemesis, hemptysis, hematochezia, abnormal uterine bleeding; loss of hair due to *heat* in the blood; premature greying of hair and beard.

Usage and dosage 6-12 g; appropriate quantity for external use.

Storage Preserve in a dry place.

Cacumen Tamaricis (西河柳, Xiheliu)

Chinese Tamarisk Twig

Chinese Tamarisk Twig is the dried young twig and leaf of *Tamarix chinensis* Lour. (Fam. Tamaricaceae). The drug is collected in summer before flowering, and dried in the shade.

Description Twigs thin cylindrical, 0.5-1.5 mm in diameter. Externally greyish-green, with numerous alternate scale-shaped leaflets. Texture fragile, easily broken. Thick twigs reddish-brown externally, leaflets often fallen off, with prominent remains of petioles. Fracture yellowish-white, with a pith in the centre. Odour, slight; taste, weak.

Processing Eliminate old twigs and foreign matter, wash clean, soften slightly, cut into sections, and dry in the sun.

Action To induce diaphoresis and dispel *wind* and promote eruption.

Indications Measles without adequate eruption; rheumatic arthralgia.

Usage and dosage 3-6 g, for external use, appropriate quantity is decocted for topical application or washing.

Storage Preserve in a dry place.

Calculus Bovis (牛黄, Niuhuang)

Cow-bezoar

Cow-bezoar is the dried gallstone of *Bos taurus domesticus* Gmelin (Fam. Bovidae). If the bezoar is found during slaughter, the bile is filtered. The

drug is collected, removed from surrounding thin membrane, and dried in the shade.

Description Mostly ovoid, subspheroidal, triangular or cubic, varying in size, 0.6-3 (-4.5) cm in diameter, occasionally tubular or in broken pieces. Externally yellowish-red to brownish-yellow, some with a layer of black lustrous thin membrane, commonly known as "Wujinyi" (black-gold clothing), some rough, with wart-like protuberances, some with crackes. Texture light and fragile, easily peeled, fracture golden yellow, with fine and dense concentric circular lines, some with white core. Odour, aromatic; taste, bitter then sweet, with cool sense; easily broken on chewing but not sticky to the teeth.

Identification (1) Mix some amount of the drug with water, and paint on nails; the colour of the nails turns to yellow, commonly known as "Guajia".

(2) Mount a small quantity of the drug with chloral hydrate TS without heating. Examine under microscope: irregular masses consisting of a number of yellowish-brown or brownish-red small granules. Standing for a moment, the pigments dissolved rapidly, and a bright golden-yellow colour is produced, turning to green after standing for a long time.

(3) To 10 mg of the powder add 20 ml of chloroform, ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethanol as the test solution. Dissolve cholic acid CRS and deoxycholic acid CRS in ethanol to produce a mixture containing 2 mg of each per ml as the refernece solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of isooctane, ethyl acetate and glacial acetic acid (15 : 7 : 5) as the mobile phase. Apply separately to the plate 2 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots distinct, examine under ultraviolet light at 365 nm. The two fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(4) To 10 mg of the power add 5 ml of a mixture of chloroform and glacial acetic acid (4 : 1), ultrasonicate for 5 minutes, filter, use the filtrate as the test solution. Dissolve bilirubin CRS in the mixture of chloroform glacial acetic acid (4 : 1) produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, acetyl acetate, methanol and glacial acetic acid (10 : 3 : 0.1 : 0.1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Carry out the determination of water (Appendix Ⅸ H, method 1), not more than 9.0 per cent.

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Free bilirubin Weigh accurately 10 mg of the powder to a 50 ml volumetric flask, add 30 ml of chloroform, heat to warm and cool, dilute with chloroform to volume, mix well, filter and use the successive filtrate. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 453 nm, not over than 0.70.

Assay ***Cholic acid*** Weigh accurately 0.2 g of the fine powder to a stopper conical flask, accurately add 50 ml of methanol, and weigh. Ultrasonicate for 30 minutes, weigh again, replenish the loss of weight with methanol and filter. Evaporate exactly 25 ml of the successive filtrate to dryness, add 10 ml of 20% sodium hydroxide solution to the residue, heat under reflux for 2 hours, allow to cool, adjust the pH to acidity with 19 ml of dilute hydrochloric acid. Extract with 4 quantities (25, 25, 20 ml and 20 ml) of ethyl acetate, filter the extract solutions through the same piece of defatted cotton spreaded with a small quantity of anhydrous sodium sulfate. Combine the extracts and evaporate to dryness. Dissolve the residue in methanol and transfer to a 10 ml volumetric flask, dilute with methanol to volume and mix well, used as the test solution. Weigh accurately a quantity of cholic acid CRS, previously dried to constant weight at 105℃, dissolve in methanol to produce a solution containing 0.48 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of isooctane, *n*-butyl acetate, glacial acetic acid and formic acid (8 : 4 : 2 : 1) as the mobile phase. Apply separately to the plate 2 μl of the test solution, 1 μl and 3 μl of the reference solution alternatively. After developing to 14-17 cm from the base line and removal of the plate, dry in air, spray with a 30% solution of sulfuric acid in ethanol and heat at 105℃ to visualize clearly. Cover the plate with a piece of glass of the same size and fix up with tape. Carry out the method for thin layer chromatography (thin layer chromatographic scanning method) (Appendix Ⅵ B), scan at the wavelength of $\lambda_S = 380$ nm, $\lambda_R = 650$ nm. Measure the integration values of the absorbance from the test solution and the reference solution, respectively, and calculated the content.

It contains not less than 4.0 per cent of cholic acid ($C_{24}H_{40}O_5$), calculated with reference to the dried drug.

Bilirubin *Reference solution* Dissolve about 10 mg of bilirubin CRS, accurately weighed, with a quantity of chloroform in an 100 ml amber volumetric flask, and dilute to volume. Transfer accurately 5 ml to a 50 ml amber volumetric flask, add ethanol to volume, mix well (containing 0.01 mg of bilirubin per ml).

Calibration standard Transfer separately 1, 2, 3, 4 ml and 5 ml of the reference solution, accurately measured, to stopper test tubes and dilute with ethanol to 9 ml, add separately 1 ml of the diazotied sulfanilic acid solution (solution A: to 0.1 g of sulfanilic acid, add 1.5 ml hydrochloric acid, dilute with water to 100 ml; solution B: dissolve 0.5 g of sodium nitrite with water to 100 ml. Keep in a refrigerator. Mix 10 ml of solution A and 0.3 ml of solution B well before using), mix well, allow to stand in a dark place at 15-20℃ for 1 hour. Perform a blank in the same reagents. Carry out the method of ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), determine the absorbance at 533 nm and plot the standard curve, using absorbance as ordinate and concentration as abscissa.

Procedure Weigh accurately 10 mg of the fine powder to a conical flask, add 60 ml of a mixture solution of chloroform and ethanol (7 : 3) and 1 drop of hydrochloric acid, mix well, heat under reflux on a water bath for 30 minutes, allow to cool. Transfer the extract to a 100 ml amber volumetric flask, wash the container with the above mixture solution. Combine the washings into the volumetric flask, dilute with the mixture to volume, mix well. Transfer accurately 10 ml of the supernatant to a 50 ml amber volumetric flask, dilute with ethanol to volume, mix well. Transfer accurately 3 ml of the solution to a stopper test tube. Determine the absorbance as described under calibration standard, beginning at the words "add ethanol to 9 ml", read the weight of bilirubin (mg) from the standard curve and calculate the

content of bilirubin ($C_{33}H_{36}N_4O_6$).
It contains not less than 35.0 per cent of bilirubin ($C_{33}H_{36}N_4O_6$) calculated with reference to the dried drug.

Action To restore consciousness by reducing *fire* and eliminating *phlegm*, relieve convulsion, and counteract *toxicity*.

Indications Impairment of consciousness in febrile diseases and stroke; infantile convulsion, epilepsy, mania; sore throat, ulcers in the mouth; carbuncles and boils.

Usage and dosage 0.15-0.35 g, mostly used in pills or powder; for external use, appropriate quantity is ground into powder and applied topically.

Storage Preserve in well closed container, stored in a cool and dry place, protected from light, moisture and pressure.

Calculus Bovis Artifactus (人工牛黄, Rengong Niuhuang)

Artificial Cow-bezoan

Artificial Cow-bezoan is prepared with powder of cow bile, cholic acid, hyodeoxycholic acid, taurine, bilirubin, cholesterol and trace elements, etc.

Description Loose powder, yellow. Taste bitter, slightly sweet.

Identification (1) To the test solution obtained under Assay of Bilirubin, carry out the method of ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), the maximum absorption of the solution exhibits at 453 nm.
(2) To 0.1 g of the powder add a quantity of methanol in a 10 ml volumetric flask, ultrasonicate for 5 minutes, dilute with methanol to volume, mix well, allow to stand, and use the supernatant as the test solution. Dissolve cholic acid CRS and hyodeoxycholic acid CRS in methanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane, ethyl acetate, acetic acid and methanol (20 : 25 : 2 : 3) as the mobile phase. Apply separately to the plate 4 μl of the test solution and 2 μl of the reference solution. After developing and removal of the plate, dry in air and spray with a 10% solution of phosphomolybdic acid in ethanol, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference solution.
(3) To 10 mg of Pulvis Fellis Bovis reference drug add a quantity of methanol, and ultrasonicate to extract completely, add methanol again to 10 ml, mix well, allow to stand, and use the supernatant as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, glacial acetic acid and water (7.5 : 10 : 0.3) as the mobile phase. Apply separately to the plate 8 μl of the test solution obtained under Identification (2) and the above reference drug solution. After developing and removal of the plate, dry in air and spray with a 10% solution of phosphomolybdic acid in ethanol, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution.
(4) To 50 mg of the powder add 5 ml of water, ultrasonicate for 5 minutes, add methanol to 10 ml, allow to stand, and use the supernatant as the test solution. Dissolve taurine CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of *n*-butanol, ethanol, acetic acid and water (4 : 1 : 2 : 1) as the mobile phase. Apply separately to the plate 2 μl of each of the above two solutions. After developing and removal of the plate, dry in air and heat at 105℃ for 10 minutes, spray with a 1% solution of ninhydrine in ethanol, and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 5.0 per cent.

Assay ***Cholic acid*** *Reference solution* Weigh accurately 12.5 mg of cholic acid CRS to a 25 ml volumetric flask, dissolve in 60% glacial acetic acid and dilute to volume, mix well (containing 0.5 mg per ml).

Calibration standard Measure accurately 0.2 ml, 0.4 ml, 0.6 ml, 0.8 ml and 1 ml of the reference solution, respectively, to stopper test tubes, each tube add 60% glacial acetic acid to 1.0 ml, then add 1.0 ml of freshly prepared furfural solution (1→100), and mix well. Keep in an ice-bath for 5 minutes, accurately add 13 ml of sulfuric acid solution (a mixture of 50 ml sulfuric acid in 65 ml water), mix well, heat on a water bath at 70℃ for 10 minutes, and immediately cool in an ice-bath for 2 minutes. Use the mixture of the corresponding reagents as a blank. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 605 nm and plot the standard curve, using absorbance as ordinate and concentration as abscissa.

Procedure Weigh accurately 0.1 g of the powder to a 50 ml volumetric flask, add a quantity of 60% glacial acetic acid and ultrasonicate for 5 minutes, dilute with the same solvent to volume, mix well and filter. Discard the initial filtrate, measure accurately 1 ml of the successive filtrate in two stopper test tubes labeled A and B, respectively, add 1 ml of freshly prepared furfural solution in tube A, and 1 ml of water in tube B as the blank. Carry out the method as described under *Calibration standard*, beginning at the words "Keep in an ice-bath for 5 minutes", measure the absorbance, read out the weight of cholic acid (mg) in the test sclution from the standard curve, and calculate the content.
It contains not less than 13.0 per cent of cholic acid ($C_{24}H_{40}O_5$), calculated with reference to the dried drug.

Bilirubin *Reference solution* Weigh accurately 10 mg of bilirubin CRS to a 100 ml brown volumetric flask, add 80 ml of chloroform, ultrasonicate to dissolve completely, dilute with chloroform to volume and mix well. Measure accurately 10 ml to a 50 ml brown volumetric flask, dilute with chloroform to volume, and mix well (containing 20 μg per ml).

Calibration standard Measure accurately 4 ml, 5 ml, 6 ml, 7 ml and 8 ml of the reference solution, respectively, to 25 ml brown volumetric flasks, dilute with chloroform to volume, and mix well. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 453 nm and plot the standard curve, using absorbance as ordinate and concentration as abscissa.

Procedure Weigh accurately 80 mg of the powder to a 100 ml brown volumetric flask, add 80 ml of chloroform, ultrasonicate to dissolve completely, dilute with chloroform to volume, mix well and filter. Discard the initial filtrate and use the successive filtrate as the test solution. Measure the absorbance at 453 nm, read out the weight of bilirubin (mg) in the test solution from the standard curve, and calculate the content.

It contains not less than 0.63 per cent of bilirubin ($C_{32}H_{26}N_4O_6$), calculated with reference to the dried drug.

Action To clear *heat* and *toxin*, resolve *phlegm* and relieve convulsion.

Indications Delirium and coma due to *phlegm-heat*, infantile acute convulsion, sore throat, sores on the mouth and tongue, and carbuncles and boils.

Usage and dosage 0.15-0.35 g, used in a formula, appropriate quantity for external use.

Storage Preserve in well closed containers, protected from moisture and light, stored in a cool place.

Attached:

Bilirubin
(胆红素, Danhongsu)

Bilirubin is prepared with pig (or cow) bile by extracting and processing.

Description Crystal powder, orange to reddish-brown.

Identification (1) To the test solution obtained under Assay of Bilirubin, carry out the method of ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), determine and plot the absorption curve from 400 nm to 500 nm. It should be same with the profile obtained with the bilirubin CRS, and the maximum absorption exhibits at 453 nm.
(2) Dissolve a quantity of the powder in chloroform to produce a solution containing 0.1 mg per ml as the test solution. Dissolve bilirubin CRS in chloroform as the reference solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and glacial acetic acid (10 : 1 : 0.5) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Loss on drying Dry about 0.5 g of the powder at 60℃ for 4 hours in vacuum, losses not more than 2.0 per cent (Appendix Ⅸ G).

Assay Weigh accurately 10 mg of the powder, grind with a small quantity of chloroform, transfer to a 100 ml brown volumetric flask, ultrasonicate to dissolve completely, cool immediately, dilute with chloroform to volume, and mix well. Measure accurately 5 ml to another 100 ml brown volumetric flask, dilute with chloroform to volume, and mix well. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 453 nm, calculate the content according to the absorption coefficient of bilirubin ($E_{1cm}^{1\%}$) being 1038.
It contains not less than 90.0 per cent of bilirubin ($C_{32}H_{26}N_4O_6$), calculated with reference to the dried drug.

Usage Material for making Artificial Cow-bezoan.

Storage Preserve in well closed container, protected from moisture and light.

Hyodeoxycholic Acid
(猪去氧胆酸, Zhu Quyang Dansuan)

Hyodeoxycholic Acid is prepared with pig bile by extracting and processing.
Chemically, it is 3α,6α-dihydroxyl-5β-cholanic acid.

Description Powder, white or whitish. Odour slight; taste, slight bitter.

Easily dissoluble in ethanol, slightly dissoluble in acetone, rarely dissoluble in ethyl acetate, chloroform and ether, hardly dissoluble in water.

Melting point Not lower than 170℃ (Appendix Ⅶ C), decomposing while melting.

Identification To 5 mg of the powder add 2 ml of 60% glacial acetic acid and 1 ml of freshly prepared furfural solution and mix well. Separate the solution into two parts, and transfer to two test tubes labeled A and B, respectively. Add 10 ml of sulfuric acid (7→10) in tube A, and 10 ml of sulfuric acid (4→10) in tube B, keep both tubes on a water bath at 70℃ for several minutes. A red colour is produced in tube A, and gradually turns to reddish-violet, and the colour in tube B is not changed.

Alcohol solubility Heat 0.5 g of the powder with 50 ml of ethanol at 60℃ to dissolve completely, stand for 1 hour at 20-25℃, the solution should be clear and no obvious precipitate.

Loss on drying Dry a quantity of the powder at 105℃ to constant weight, losses not more than 1.0 per cent (Appendix Ⅸ G).

Residue on ignition Not more than 0.2 per cent (Appendix Ⅸ J).

Usage Material for making Artificial Cow-bezoan.

Storage Preserve in well closed container.

Pulvis Fellis Bovis
(牛胆粉, Niudanfen)

Powder Cow-bile

Powder Cow-bile is the preparation of cow bile.

Description Powder, yellowish-brown. Taste, bitter, hygroscopic.

Identification To 50 mg of the powder add 10 ml of methanol, ultrasonicate to extract completely, mix well, allow to stand, and use the supernatant as the test solution. Prepare a solution of 50 mg of Pulvis Fellis Bovis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, glacial acetic acid and water (7.5 : 10 : 0.3) as the mobile phase. Apply separately to the plate 4 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with a 10% solution of phosphomolybdic acid in ethanol and heat at 105℃ for 5 minutes. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 5.0 per cent.

Pulvis Fellis Suis To 0.1 g of the powder add 10 ml of methanol, ultrasonicate and filter. Evaporate the filtrate nearly to dryness, dissolve partially in 5 ml of a 2.5 mol/L solution of sodium hydroxide, and transfer to a stopper test tube. Hydrolyze on a water bath for 5 hours, cool, and add dropwise hydrochloric acid to pH 2-3. Extract with three 10-ml quantities of ethyl acetate, evaporate the extracts to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve hyodeoxycholic acid CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of isooctane, *n*-butyl ether and glacial acetic acid (8 : 5 : 5) as the mobile phase. Apply separately to the plate 2 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with a 10% solution of phosphomolybdic acid in ethanol, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution should not be corresponding in position and colour to the spot obtained with the reference solution.

Assay *Reference solution* Weigh accurately 12.5 mg of cholic acid CRS to a 25 ml volumetric flask, dissolve in 60% glacial acetic acid and dilute to volume, mix well (containing 0.5 mg of cholic acid per ml).

Calibration standard Measure accurately 0.2 ml, 0.4 ml, 0.6 ml,

0.8 ml and 1 ml of the reference solution, respectively, to stopper test tubes, each tube add 60% glacial acetic acid to 1.0 ml, then add 1.0 ml of freshly prepared furfural solution (1→100), keep in an ice-bath for 5 minutes, accurately add 13 ml of sulfuric acid solution (a mixture of 50 ml sulfuric acid in 65 ml water), mix well, heat on a water bath at 70℃ for 10 minutes, and immediately cool in an ice-bath for 2 minutes. Use the mixture of the corresponding reagents as a blank. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 605 nm and plot the standard curve, using absorbance as ordinate and concentration as abscissa.

Procedure Grind 60 mg, weighed accurately, with a quantity of 60% glacial acetic acid, transfer to a 50 ml volumetric flask, dilute to volume with 60% glacial acetic acid, mix well and filter. Discard the initial filtrate, measure accurately 1 ml of the successive filtrate in two stopper test tubes labeled A and B, respectively, add 1 ml of freshly prepared furfural solution in tube A, and 1 ml of water in tube B as a blank. Carry out the method as described under *Calibration standard*, beginning at the words "keep in an ice-bath for 5 minutes", measure the absorbance, read out the weight of cholic acid (mg) in the test solution from the standard curve, and calculate the content.

It contains not less than 42.0 per cent of cholic acid ($C_{24}H_{40}O_5$), calculated with reference to the dried drug.

Usage Material for making Artificial Cow-bezoan.

Storage Preserve in tightly closed container, protected from moisture and light, stored in a cool place.

Cholic Acid
(胆酸，Dansuan)

Cholic Acid is prepared with cow or sheep bile by extracting and processing.

Description Powder, white or whitish. Odour, slight; taste, bitter.

Identification Ultrasonicate 0.1 g with 2 ml of 60% glacial acetic acid for 10 minutes to dissolve, filter, transfer 1 ml of the filtrate in a test tube, add 1 ml of freshly prepared furfural solution (1→100) and 13 ml of sulfuric acid solution (a mixture of 50 ml sulfuric acid in 65 ml water), and heat on a water bath at 70℃. A bluish violet colour should be produced.

Alcohol solubility Heat and ultrasonicate 0.5 g with 50 ml of ethanol at 60℃ to dissolve completely, stand for 1 hour at 20-25℃, the solution should be clear and no obvious precipitate.

Loss on drying Dry a quantity of the powder at 105℃ for 2 hours, losses not more than 1.0 per cent (Appendix Ⅸ G).

Residue on ignition Not more than 0.3 per cent (Appendix Ⅸ J), using 1.0 g.

Assay ***Reference solution*** Weigh accurately 12.5 mg of cholic acid CRS, dried previously to constant weight at 105℃, to a 25 ml volumetric flask, dissolve in 60% glacial acetic acid and dilute to volume, mix well (containing 0.5 mg of cholic acid per ml).

Calibration standard Measure accurately 0.2 ml, 0.4 ml, 0.6 ml, 0.8 ml and 1 ml of the reference solution, respectively, to stopper test tubes, each tube add 60% glacial acetic acid to 1.0 ml, then add 1.0 ml of freshly prepared furfural solution (1→100), and mix well. Keep in an ice-bath for 5 minutes, accurately add 13 ml of sulfuric acid solution (a mixture of 50 ml sulfuric acid in 65 ml water), mix well, heat on a water bath at 70℃ for 10 minutes, and immediately cool in an ice-bath for 2 minutes. Use the mixture of the corresponding reagents as a blank. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 605 nm and plot the standard curve, using absorbance as ordinate and concentration as abscissa.

Procedure Weigh accurately 0.15 g to a 50 ml volumetric flask, add a quantity of 60% glacial acetic acid and ultrasonicate, take out and cool, dilute with 60% glacial acetic acid to volume, mix well and filter. Discard the initial filtrate, measure accurately 5 ml of the successive filtrate to a 50 ml volumetric flask, dilute with 60% glacial acetic acid to volume. Measure accurately 1 ml in two stopper test tubes labeled A and B, respectively, add 1 ml of freshly prepared furfural solution in tube A, and 1 ml of water in tube B as a blank. Carry out the method as described under *Calibration standard*, beginning at the words "Keep in an ice-bath for 5 minutes", measure the absorbance, read out the weight of cholic acid (mg) in the test solution from the standard curve, and calculate the content.

It contains not less than 80.0 per cent of cholic acid ($C_{24}H_{40}O_5$), calculated with reference to the dried drug.

Usage Material for making Artificial Cow-bezoan.

Storage Preserve in well closed container.

Cholesterol
(胆固醇，Danguchun)

Cholesterol is prepared with encephalon of cow, sheep or pig, by extracting and processing.

Description Crystal or crystal powder, white or whitish. Odour, slight.

Melting point Not lower than 140℃ (Appendix Ⅵ C).

Identification (1) Dissolve 10 mg in 1 ml of chloroform, and add 1 ml of sulfuric acid. A blood red colour is produced in chloroform layer and a green fluorescence is produced in sulfuric acid layer.

(2) Dissolve 5 mg in 2 ml of chloroform, add 1 ml of acetic anhydrite and 1 drop of sulfuric acid. A pink colour is produced and immediately turns to red, then turns to blue and light green at last.

Alcohol solubility Heat gently 0.4 g with 50 ml of ethanol to dissolve completely, stand for 2 hours, the solution should be clear and no obvious precipitate.

Acidity Weigh accurately 1 g to a conical flask, dissolve in 10 ml of ether, add accurately 10 ml of a 0.1 mol/L solution of sodium hydroxide, shake for 1 minute, heat gently to expel the ether, then boil for 5 minutes, and cool. Add 2 drops of phenolphthalein IS, titrate with sulfuric acid VS (0.1 mol/L) to the end point. Carry out the above test with a blank solution in the same manner. The consumptive difference between the test solution and the blank solution should not be more than 0.5 ml.

Loss on drying Dry a quantity of the powder at 105℃ for 3 hours, losses not more than 1.0 per cent (Appendix Ⅸ G).

Residue on ignition Not more than 0.2 per cent (Appendix Ⅸ J), using 1.0 g.

Usage Material for making Artificial Cow-bezoan.

Storage Preserve in well closed container, protected from light.

Calculus Bovis Sativus
(体外培育牛黄，Tiwai Peiyu Niuhuang)

Cow-bezoan Cultured in Vitro

Cow-bezoan Cultured in Vitro is prepared with fresh bile of *Bos taurus domesticus* Gmelin (Fam. Bovide) as mother liquor, adding deoxycholic acid, cholic acid and compound calcium bilirubin, etc.

Description Spheroidal or subspheroidal, 0.5-3 cm in diameter. Surface smooth, yellowish-red to brownish-yellow. Texture light and fragile, fracture with fine concentric circular lines. Odour, aromatic; taste, bitter then sweet, with cool sense; easily broken on chewing, but not sticky to teeth.

Identification (1) Mix a small quantity of the powder with

water, and paint it on nails. The colour of nails turns to yellow.

(2) Mount a small quantity of the powder with chloral hydrate TS without heating, examine under microscope: irregular masses mostly aggregated by numbers of yellowish-brown or brownish-red small granules. Stand for a moment, the pigments dissolved rapidly, and a bright golden-yellow colour is produced, turning to green after stand for a long time.

(3) To a small quantity of the powder add 1 ml of chloroform, mix well, add 2 drops of sulfuric acid and 2 drops of strong hydrogen peroxide solution (30%), and shake. A green colour is produced immediately.

(4) To 0.1 g of the powder add 1 ml of hydrochloric acid and 10 ml of chloroform, shake and mix well, a yellowish-brown colour is shown in the chloroform layer. Separate the chloroform layer, add 5 ml of barium hydroxide TS and shake, a yellowish-brown precipitate is produced immediately. Remove the water layer and the precipitate, to 1 ml of chloroform solution add 1 ml of acetic anhydrite and 2 drops of sulfuric acid, mix well and stand. A green colour is produced.

(5) To 10 mg of the powder add 20 ml of chloroform, ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve cholic acid CRS and deoxycholic acid CRS in ethanol to produce a mixture containing 2 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of isooctane, ethyl acetate and glacial acetic acid (15 : 7 : 5) as the mobile phase. Apply separately to the plate 2 μl of the above two solutions. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots clear, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 9.0 per cent.

Free Bilirubin To 10 mg of the fine powder add 5 ml of chloroform, heat to warm and shake. Filter, discard the initial filtrate and use the successive filtrate. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 453 nm, not more than 0.70.

Assay ***Cholic acid*** Weigh accurately 0.2 g of the fine powder to a stopper conical flask, accurately add 50 ml of methanol, tightly stopper and weigh, ultrasonicate for 30 minutes, weigh again, replenish the loss of weight with methanol, mix well and filter. Evaporate accurately 25 ml of the successive filtrate to dryness, dissolve the residue in 10 ml of 20% solution of sodium hydroxide, heat under reflux for 2 hours, cool, and adjust pH to acidic with 19 ml of dilute hydrochloric acid. Extract with 4 quantities (25 ml, 25 ml, 20 ml and 20 ml) of ethyl acetate, filter the four ethyl acetate extracts through the same piece of defatted cotton covered with a small quantity of anhydrous sodium sulfate. Combine the filtrates, evaporate to dryness, dissolve the residue in methanol and transfer to a 10 ml volumetric flask, dilute with methanol to volume and mix well, used as the test solution. Dissolve a quantity of cholic acid CRS, previously dried to constant weight at 105℃ and weighed accurately, in methanol to produce a solution containing 0.48 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of isooctane, *n*-butyl acetate, glacial acetic acid and formic acid (8 : 4 : 2 : 1) as the mobile phase. Apply separately to the plate 2 μl of the test solution, 1 μl and 3 μl of the reference solutions alternatively. After developing to 14-17 cm, removal of the plate, dry in air, spray with a 30% solution of sulfuric acid in ethanol and heat at 105℃ to the spots clear. Cover the plate with a piece of glass of the same size and fix up with tape. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method) and scan at wavelength of $\lambda_S = 380$ nm, $\lambda_R = 650$ nm. Measure the integration values of the absorbance from the test solution and the reference solution respectively, and calculate the content.

It contains not less than 6.0 per cent of cholic acid ($C_{24}H_{40}O_5$), calculated with reference to the dried drug.

Bilirubin *Reference solution* Weigh accurately 10 mg of bilirubin CRS to a 100 ml brown volumetric flask, dissolve in chloroform and dilute to volume, and mix well. Transfer accurately 5 ml to a 50 ml brown volumetric flask, dilute to volume with ethanol, and mix well (containing 10 μg per ml).

Calibration standard Measure accurately 1 ml, 2 ml, 3 ml, 4 ml and 5 ml of the reference solution, respectively, to stopper test tubes, each tube add ethanol to 9 ml, and then add 1 ml of the diazotized solution (a mixture of 10 ml of solution A and 0.3 ml of solution B, mixed before use. Solution A: dissolve 0.1 g of sulfanilic acid in 1.5 ml hydrochloric acid, dilute with water to 100 ml. Solution B: dissolve 0.5 g of sodium nitrite in water and dilute to 100 ml, keep in a refrigerator.), mix well, and allow to stand at 15-20℃ for 1 hour in a dark place. Use the mixture of the corresponding reagents as a blank. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 533 nm and plot the standard curve, using absorbance as ordinate and concentration as abscissa.

Procedure Weigh accurately 10 mg of the fine powder to a conical flask, add 60 ml of a mixture of chloroform and ethanol (7 : 3) and 1 drop of hydrochloric acid, mix well, heat under reflux on a water bath for 30 minutes. Cool and transfer to a 100 ml brown volumetric flask, wash the container with the same mixture, combine the washings to the volumetric flask, dilute with the mixture to volume, and mix well. Transfer accurately 10 ml of the supernatant to a 50 ml brown volumetric flask, dilute with ethanol to volume, and mix well. Transfer accurately 3 ml of the solution to a stopper test tube, carry out the method as described under *Calibration standard*, beginning at the words "add ethanol to 9 ml", measure the absorbance, and read out the weight of bilirubin (mg) from the standard curve, and calculate the content.

It contains not less than 35.0 per cent of bilirubin ($C_{33}H_{36}N_4O_6$), calculated with reference to the dried drug.

Action To clear *heart-fire*, eliminate *phlegm* for resuscitation, cool the liver, tranquilize endogenous wind, and remove toxic materials.

Indications Impaired consciousness in febrile diseases, delirium, mental confusion due to phlegm, convulsion, epilepsy, swollen and painful throat, sores on the mouth and tongue, carbuncles and boils.

Usage and dosage 0.15-0.35 g, mostly used in pills or powder form; appropriate quantity for external use.

Storage Preserve in well closed container, protected from light, moisture and pressure, stored under room temperature.

Period of validity Three years.

Attached:

Deoxycholic Acid (去氧胆酸，Quyang Dansuan)

Deoxycholic Acid is prepared with cow bile by extracting and processing.

Description Crystal powder, white. Odour, slight; taste, slight bitter.
Easily dissoluble in glacial acetic acid and ethanol, indissoluble in water.

Identification Dissolve 10 mg of the powder in 5 ml of ethanol as the test solution. Dissolve deoxycholic acid CRS in ethanol to produce a solution containing 2 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of isooctane, ethyl acetate and glacial acetic acid (15 ∶ 7 ∶ 5) as the mobile phase. Apply separately to the plate 2 μl of the above two solutions. After developing and removal of the plate, and dry in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots clear. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Loss on drying Dry a quantity of the powder at 105℃ for 4 hours, losses not more than 0.5 per cent (Appendix Ⅸ G).

Residue on ignition Not more than 0.2 per cent (Appendix Ⅸ J).

Assay Weigh accurately 0.5 g of the powder, add 60 ml of neutral ethanol (indicated by phenolphthalein IS), heat on a water bath to dissolve, and cool. Add several drops of phenolphthalein IS and 20 ml of cooled water boiled freshly, titrate with sodium hydroxide VS (0.1 mol/L), again add 100 ml of cooled water boiled freshly while near the end point, and continue titrate to the end point. Each per ml of sodium hydroxide (0.1 mol/L) corresponds to 39.26 mg of deoxycholic acid ($C_{24}H_{40}O_4$).
It contains not less than 95.0 per cent of deoxycholic acid ($C_{24}H_{40}O_4$), calculated with reference to the dried drug.

Usage Material for making Cow-bezoan Cultured in Vitro.

Storage Preserve in well closed container.

Cholic Acid (胆酸，Dansuan)

Cholic Acid is prepared with cow or sheep bile, or bile paste, by extracting and processing.

Description Crystal powder, white. Odour, slight; taste, bitter.

Identification Dissolve 10 mg of the powder in 5 ml of ethanol as the test solution. Dissolve cholic acid CRS in ethanol to produce a solution containing 2 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of isooctane, ethyl acetate and glacial acetic acid (15 ∶ 7 ∶ 5) as the mobile phase. Apply separately to the plate 2 μl of the above two solutions. After developing and removal of the plate, and dry in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots clear. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Loss on drying Dry a quantity of the powder at 105℃ for 4 hours, losses not more than 0.5 per cent (Appendix Ⅸ G).

Residue on ignition Not more than 0.2 per cent (Appendix Ⅸ J).

Assay Weigh accurately 0.4 g of the powder to a 250 ml conical flask, add 20 ml of water and 40 ml of ethanol, cover with a watch glass, slowly heat on a water bath to dissolve completely, and cool. Add 5 drops of phenolphthalein IS and titrate with sodium hydroxide VS (0.1 mol/L). Each per ml of sodium hydroxide (0.1 mol/L) corresponds to 40.86 mg of cholic acid ($C_{24}H_{40}O_5$).
It contains not less than 95.0 per cent of cholic acid ($C_{24}H_{40}O_5$), calculated with reference to the dried drug.

Usage Material for making Cow-bezoan Cultured in Vitro.

Storage Preserve in well closed container.

Compound Calcium Bilirubin (复合胆红素钙，Fuhe Danhongsugai)

Compound Calcium Bilirubin is made of cow bile, bilirubin and saturated solution of calcium hydroxide.

Description Powder, brownish-red or brownish-yellow. Taste stinking.

Identification To 5 mg of the powder add 15 ml of chloroform and 0.1 ml of hydrochloric acid (5→10), ultrasonicate for 30 minutes, add 30 ml of chloroform, mix well, filter, and use the successive filtrate as the test solution. Dissolve bilirubin CRS in chloroform to produce a solution containing 0.1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and glacial acetic acid (10 ∶ 1 ∶ 0.5) as the mobile phase. Apply separately to the plate 10 μl of the above two solutions. After developing and removal of the plate, dry in air. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 5.0 per cent.

Assay ***Reference solution*** Weigh accurately 10 mg of bilirubin CRS to a 100 ml brown volumetric flask, dissolve in chloroform and dilute to volume, and mix well. Transfer accurately 5 ml to a 50 ml brown volumetric flask, dilute to volume with ethanol, and mix well (containing 10 μg per ml).

Calibration standard Measure accurately 1 ml, 2 ml, 3 ml, 4 ml and 5 ml of the reference solution, respectively, to stopper test tubes, each tube add ethanol to 9 ml, and then add 1 ml of the diazotized solution (a mixture of 10 ml of solution A and 0.3 ml of solution B, mixed before use. Solution A: dissolve 0.1 g of sulfanilic acid in 1.5 ml hydrochloric acid, dilute with water to 100 ml. Solution B: dissolve 0.5 g of sodium nitrite in water and dilute to 100 ml, keep in a refrigerator.), mix well, and allow to stand at 15-20℃ for 1 hour in a dark place. Use the mixture of the corresponding reagents as a blank. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 533 nm and plot the standard curve, using absorbance as ordinate and concentration as abscissa.

Procedure Weigh accurately 10 mg of the fine powder to a conical flask, add 60 ml of a mixture of chloroform and ethanol (7 ∶ 3) and 1 drop of hydrochloric acid, mix well, heat under reflux on a water bath for 30 minutes. Cool and transfer to a 100 ml brown volumetric flask, wash the container with the same mixture, combine the washings to the volumetric flask, dilute with the mixture to volume, and mix well. Transfer accurately 10 ml of the supernatant to a 50 ml brown volumetric flask, dilute with ethanol to volume, and mix well. Transfer accurately 3 ml of the solution to a stopper test tube, carry out the method as described under *Calibration standard*, beginning at the words "add ethanol to 9 ml", measure the absorbance, read out the weight of bilirubin (mg) from the standard curve, and calculate the content.
It contains not less than 43.0 per cent of bilirubin ($C_{33}H_{36}N_4O_6$), calculated with reference to the dried drug.

Usage Material for making Cow-bezoan Cultured in Vitro.

Storage Preserve in well closed container.

Calomelas
(轻粉，Qingfen)

Calomel

Calomel is a mercurous chloride (Hg_2Cl_2).

Description White, lustrous, scaly or snow-flake like crystals, or a crystalline powder. Gradually darkened on exposing to light. Odour, slight; almost tasteless.

Identification (1) Turns to black with calcium hydroxide TS, ammonia TS or sodium hydroxide TS.
(2) Heat a mixture of equal quantities of the drug and anhydrous sodium carbonate in a dry test tube, it decomposes to produce metallic mercury, condensed on the tube wall. Dissolve the residue left in test tube with dilute nitric acid TS and filter, the filtrate yields the reactions characteristic of chlorides (Appendix Ⅳ).

Mercuric chloride Shake 2 g of the drug in 20 ml of ether for 5 minutes, filter, allow to stand and expel the ether. Dissolve the residue in 10 ml of water and 2 drops of dilute nitric acid TS, carry out the limit test for chlorides (Appendix Ⅸ C). Any turbidity produced is not more intense than a reference solution prepared with 7 ml of standard solution of sodium chloride.

Mercury globule Spread 1 g of the drug on a piece of white paper, examine under a lens, no mercury globule should be found.

Residue on ignition Not more than 0.1 per cent (Appendix Ⅸ J).

Assay To about 0.5 g of the powder, accurately weighed, in a stopper flask, add 10 ml of water, shake well, add 50 ml of iodine (0.1 mol/L) VS, accurately measured, stopper tightly, shake vigorously until most of the powder is dissolved, add 8 ml of potassium iodide solution (5→10), stopper tightly, shake vigorously to dissolve completely, titrate with sodium thiosulfate (0.1 mol/L) VS towards the end of titration, add starch IS, continue to titrate until the blue colour disappears. Each ml of iodine (0.1 mol/L) VS is equivalent to 23.61 mg of Hg_2Cl_2.
It contains not less than 99.0 per cent of mercurous chloride (Hg_2Cl_2).

Action External use: to kill parasites, counteract toxicity, and promote the healing of ulcers. Internal use: to remove *phlegm* and cause drastic purgation.

Indications For external use: scabies, ringworm, ecthyma, syphilis, ulcers, eczema.
For oral aministration: edema and abdominal distension with oliguria and constipation.

Usage and dosage For external use, appropriate quantity is ground into powder and applied topically. For oral administration, 0.1-0.2 g, 1-2 times a day, mostly used in pills or capsules. Gargle after taking the drug.

Precaution Because of its toxicity, overdosage should be avoided, used with caution for oral administration, and contraindicated in pregnancy.

Storage Preserve in a well closed container, protected from light and stored in a dry place.

Calyx Kaki
(柿蒂，Shidi)

Persimmon Calyx

Persimmon Calyx is the dried persistent calyx of *Diospyros kaki* Thunb. (Fam. Ebenaceae). The drug is collected in winter when the fruit is ripe, washed clean, and dried in the sun.

Description Oblate, 1.5-2.5 cm in diameter. Relatively thick in the middle, slightly prominent, with a rounded scar of fruit fallen off and somewhat thin at the edge, 4-lobed, the lobes frequently reflexed, easily broken. A fruit stalk or a pitted scar of fruit stalk remained at the base. Outer surface yellowish-brown or reddish-brown, inner surface yellowish-brown, densely covered with fine pubescences. Texture hard and fragile. Odour, slight; taste, astringent.

Identification To 2 g of the powder add 10 ml of 70% ethanol, warmly macerate for 2 hours, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol and use as the test solution. Dissolve Gallic acid CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B) using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of toluene (saturated with water)-methyl formate-formic acid (5∶4∶1) as the mobile phase. Apply separately 5 μl of test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry it in air, spray with 1% solution of ferric chloride in ethanol. A spot in the chromatogram obtained with the test solution corresponds in colour and position to spot in the chromatogram obtained with the reference solution.

Processing Eliminate foreign matter, wash clean, remove the stalk, dry, or break to pieces.

Action To check the upward flow of the stomach *qi*.

Indications Hiccup.

Usage and dosage 4.5-9 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Calyx seu Fructus Physalis
(锦灯笼，Jindenglong)

Franchet Groundcherry Fruit

Franchet Groundcherry Fruit is the dried persistent calyx or the persistent calyx with fruit of *Physalis alkekengi* L. var. *franchetii* (Mast.) Makino (Fam. Solanaceae). The drug is collected in autumn when the fruit is ripe and the persistent calyx turns to red or orange-red, and dried.

Description Somewhat lantern-shaped, mostly flattened, 3-4.5 cm long, 2.5-4 cm wide. Externally orange-red or orange-yellow, possessing 5 distinct longitudinal ribs, with fine reticulate veins between them. Apex acuminate, slightly 5-lobed, base somewhat truncate, centre dented, with a fruit stalk. Texture light and pliable, hollowed, some containing brownish-red or orange-red fruit. Fruit

spherical, mostly flattened, 1-1.5 cm in diameter, pericarp shrunken, containing numerous seeds. Odour, slight; taste, calyx bitter and fruit sweet, slightly sour.

Identification To 1 g of the powder add 10 ml of petroleum ether (30-60℃), macerate for 15 minutes, discard the petroleum ether, evaporate the residue on a water bath to dryness. Add 10 ml of chloroform to the residue, macerate for 30 min with frequently shaking, filter and concentrate the filtrate to 1 ml as the test solution. Prepare a solution of 1 g reference drug of Calyx seu Fructus Physalis in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (boiling range 60-90℃) -acetone (20 : 1) as the mobile phase. Apply separately 10-15 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. The orange-yellow spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with reference solution.

Action To remove *toxic-heat*, soothe the sore throat, resolve *phlegm*, and relieve dysuria.

Indications Sore throat and hoarseness of voice; cough with yellow sticky sputum; dysuria; external use for pemphigus and eczema.

Usage and dosage 5-9 g; for external use, appropriate quantity is pounded into paste and applied topically.

Storage Preserve in a ventilated and dry place, protected from moth.

Carapax et Plastrum Testudinis (龟甲, Guijia)

Tortoise Carapace and Plastron

Tortoise Carapace and Plastron is the carapace and plastron of *Chinemys reevesii* (Gray) (Fam. Emydidae). The animal is captured all the year round, but usually in autumn or winter, killed or scalded to death by boiling water. The drug is collected, removed from the remaining muscles, and dried in the sun.

Description The carapace and plastron being connected by a bony bridge, the former slightly longer than and also separated from the latter. The carapace long elliptic, arciform, 7.5-22 cm long, 6-18 cm wide, the outer surface brown or blackish-brown, 3 vertebral ridges, 1 nuchal scute, anterior part narrow than posterior part; 5 vertebral scutes, for the 1st vertebral scute, the length greater than or nearly equal to the width; for the 2nd to 4th ones, the length smaller than the width; 4 symmetrical costal scutes at both sides, 11 marginal scutes at each side; 2 pygal scutes. The plastron plate-like, subrectangular elliptic, 6.4-21 cm long, 5.5-17 cm wide, the outer surface pale yellowish-brown to brownish-black, with 12 horny scutes, each usually with purplish-brown radiated viens, the sutures between abdominal, pectoral and femoral scutes in the same long, those between gular and anal scutes shorter, that between humeral scutes shortest; the inner surface yellowish-white to greyish-white, some with slight bloodstain or remaining muscles, 9 pieces of bony plates visible after cleaning and the serrated edges inlaid each other. Anterior end obtuse or truncate, posterior end with a triangular notch; wing like bony bridge curved upward obliquely at both lateral sides. Texture hard. Odour, slightly stinking; taste, slightly salty.

Processing *Carapax et Plastrum Testudinis* Steam in a pan for 45 minutes, take out and put in hot water, remove skin and meat by a scrub-brush immediately, then wash clean and dry in the sun.

Carapax et Plastrum Testudinis (*processed with vinegar*) Stir-bake the clean Carapax et Plastrum Testudinis with sand as described under the method for scalding (Appendix Ⅱ D) until the colour of the surface turns to yellowish. Take out, temper with vinegar, and dry, Break to pieces before use.
Use 20 kg of vinegar per 100 kg of Carapax et Plastrum Testudinis.

Action To nourish *yin* and subdue *yang*, replenish the kidney and strengthen the bones, and enrich blood and benefit the heart.

Indications Consumptive fever and night sweating due to deficiency of *yin*; vertigo, tremors due to *internal-wind*, weakness of legs; amnesia.

Usage and dosage 9-24 g, decocted first.

Storage Preserve in a dry place, protected from moth.

Preparation Tortoise Shell Glue.

Carapax Trionycis (鳖甲, Biejia)

Turtle Carapace

Turtle Carapace is the carapace of *Trionyx sinensis* Wiegmann (Fam. Trionychidae). The animal is collected all the year round, but mostly in autumn or winter, killed, scalded by boiling water until the hard skin of the carapace can be peeled off, taken out. The drug is collected, removed from the remaining muscles, and dried in the sun.

Description Elliptic or oval, dorsal surface convex, 10-15 cm long, 9-14 cm wide. The outer surface blackish-borwn or dark green, somewhat lustrous, with fine reticular wrinkles and greyish-yellow or greyish-white spots, longitudinal ridge in the middle, eight transverse concave strips arranged symmetrically on each side of the ridge. Serrated sutures observable when the outer skin peeled off. Inner surface whitish, projecting vertebrae in the middle, the cervical vertebrae curved inward, 8 ribs arranged on each side of the vertebrae, stretched out of the margin. Texture hard. Odour, slightly stinking; taste, weak.

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol as the solvent, not less than 5.0 per cent.

Processing *Carapax Trionycis* Steam in a pan for 45 minutes. Take out and put in hot water, remove skin and muscle by a hard-brush immediately, wash clean and dry in the sun.

Carapax Trionycis (*processed with vinegar*) Scald clean Carapax Trionycis with sand as described under the method for scalding (Appendix Ⅱ D), until the surface becomes yellowish. Take out, temper with vinegar, and dry. Break to pieces before use.
Using 20 kg of vinegar per 100 kg of Carapax Trionycis.

Action To nourish *yin* and subdue exberant *yang*, reduce

masses and nodulations, and relieve consumptive fever.

Indications Fever due to deficiency of *yin*; consumptive fever; tremor due to *internal-wind*; amenorrhea, mass in the abdomen; chronic malaria with splenomegaly.

Usage and dosage 9-24 g, pounded to pieces, decocted first.

Storage Preserve in a dry place, protected from moth.

Catechu
(儿茶, Ercha)

Cutch, Black Catechu

Cutch or Black Catechu is the dried concentrated decoction prepared from the peeled branch and stem of *Acacia catechu* (L. f.) Willd. (Fam. Leguminosae). The branch and stem are collected in winter, peeled, cut into big pieces, decocted with water. The decoction is concentrated, and dried.

Description Square or irregular masses, varying in size. Externally brown or blackish-brown, smooth and somewhat lustrous. Texture hard, easily broken; fracture irregular, lustrous, porous, sticky when moistened. Odour, slight; taste, astringent, bitter and then sweet.

Identification (1) Powder: Brown. Needle crystals and yellowish-brown masses visible.
(2) Macerate a matchstick in water solution of the drug, allow to be dyed slightly. After drying, macerate in hydrochloric acid and remove immediately, bake beside a flame; a dark red colour is produced on the matchstick.
(3) To 0.5 g of the powder add 30 ml ether, ultrasonicate for 10 minutes, filter and evaporate the filtrates to dryness. Dissolve the residue with 5 ml of methanol as the test solution. Dissolve catechin CRS and epicatechin CRS in mathanol to produce a mixed solution containing 0.2 mg per ml respectively as the reference solution, carry out the method for thin layer chromatography (Appendix Ⅵ B), using cellulose as the coating substance and a mixture of *n*-butanol-acetic acid-water (3 : 2 : 1) as the mobile phase. Apply separately to the plate 5 μl of the test solution and 2 μl of the reference solution. After developing and removal of the plate, dry in air, then spray with a 10% solution of ethanol in sulfuric acid and heat until obtaining clear spots. The same red spots in the chromatogram obtained with the test solution corresponds in position and colour to the spots obtained with the reference solution.

Water Carry out the method as described under determination of water (Appendix Ⅸ H, method 2), not more than 17.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use a column packed with octadecylsilane bonded silica gel as the stationary phase and the mixture of 0.04 mol/L citric acid-*N*, *N*-dimethylformamide-tetrahydrofuran (45 : 8 : 2) as the mobile phase. Detection wavelength is 280 nm and temperature of the column is 35℃. The number of the theoretical plate of the column is not less than 3000, calculated with reference to the peak of catechin.

Reference solution Dissolve catechin CRS and epicatechin CRS, accurately weighed, in a mixture of methanol-water (1 : 1) to produce a mixed solution containing 0.15 mg of catechin and 0.1 mg of epicatechin per ml, mix well.

Test solution Dissolve 0.02 g of the powder, accurately weighed, in 40 ml mixture of methanol-water (1 : 1) in a 50 ml volumetric flask and ultrasonicate 20 minutes, dilute with mixture of methanol-water (1 : 1) to volume, filter through 0.45 μm, mix well.

Procedure Inject accurately 5 μl of the reference solution and of the test solution respectively into the column, and calculate the contents.
It contains not less than 21.0 per cent of the total contents, calculated as catechin ($C_{15}H_{14}O_6$) and epicatechin ($C_{15}H_{14}O_6$).

Processing Eliminate foreign matter. Break into pieces before use.

Action To arrest exudation, promote the growth of new tissue, and cure wounds.

Indications Festering wound difficult to heal up; skin diseases with watery discharge; ulcers in the mouth; tranmatic injury with pain and bleeding.

Usage and dosage 1-3 g, decocted with wrapping, used in pills or powder; appropriate quantity for external use.

Storage Preserve in a dry place, protected from moisture.

Caulis Akebiae
(木通, Mutong)

Akebia Stem

Akebia Stem is the dried lianoid stem of *Akebia quinata* (Thunb.) Decne., *Akebia trifoliata* (Thunb.) Koidz. or *Akebia trifoliata* (Thunb.) Koidz. var. *australis* (Diels) Rehd. (Fam. Lardizabalaceae). The drug is collected in autumn, removed from fine branch, and dried in the shade.

Description Cylindrical, often slightly twisted, 30-70 cm long, 0.5-2 cm in diameter. Externally greyish-brown, rough, with irregular longitudinal cracks and furrows. Lenticels distinct. Nodes sometimes swollen, with scars of lateral branches. Texture light, compact, uneasily broken, fracture uneven, bark relatively broad, yellowish-brown, granular dots visible, pale yellow, wood yellowish-white, rays arranged radially, pith small, occasionally hollowed, yellowish-white or yellowish-brown. Odour, slight; taste, slightly bitter and astringent.

Identification Dissolve oleanolic acid CRS and hederagenin CRS in methanol to produce two solutions containing 1 mg of each per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane, ethyl acetate and glacial acetic acid (6 : 4 : 0.25) as the mobile phase. Apply separately to the plate 2 μl of each of the reference solutions and 10 μl of the test solution obtained under the Assay. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Water Not more than 10.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 6.5 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use

octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water, glacial acetic acid and triethylamine (87 : 13 : 0.04 : 0.02) as the mobile phase. As detector a spectrophotometer set at 210 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of oleanolic acid.

Reference solution Dissolve a quantity of oleanolic acid CRS and hederagenin CRS, accurately weighed, in methanol to produce a mixture containing 1 mg of each per ml.

Test solution Weigh accurately 2 g of the coarse powder (through No. 4 sieve), add 50 ml of methanol, ultrasonicate (power 250 W, frequency 50 kHz) for 30 minutes, filter, wash the residue with an appropriate quantity of methanol, combine the filtrate and washing, evaporate to dryness, dissolve the residue in 10 ml of water, extract with three 20-ml quantities of *n*-butanol saturated with water, combine the extracts and evaporate to dryness, to the residue add 20 ml of methanol and 2 ml of hydrochloric acid, heat under reflux for 4 hours, add 10 ml of water, extract with two 20-ml quantities of chloroform with frequent shaking, combine the chloroform extracts and evaporate to dryness, dissolve the residue in methanol, transfer to a 10 ml volumetric flask and dilute to volume, mix well.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 0.15 per cent of the total amount of oleanolic acid ($C_{30}H_{48}O_3$) and hederagenin ($C_{30}H_{48}O_4$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into slices, and dry.

Action To clear *heart-fire*, induce urination, stimulate menstrual flow and promote lactation.

Indications Feverish sensation in the chest, laryngalgia, pharyngalgia, deep-coloured urine, five types of stranguria, edema, general contraction pain, amenorrhea and hypogalactia.

Usage and dosage 3-6 g.

Storage Preserve in a ventilated and dry place.

Caulis Bambusae in Taenia (竹茹, Zhuru)

Bamboo Shavings

Bamboo Shavings is the dried middle shavings of stem of *Bambusa tuldoides* Munro, *Sinocalamus beecheyanus* (Munro) McClure var. *pubescens* P. F. Li or *Phyllostachys nigra* (Lodd.) Munro var. *henonis* (Mitf.) Stapf ex Rendle (Fam. Gramineae). The drug is collected all the year round. After peeling, the greenish middle layer of fresh stem is cut into sliver or shaving, bundled, and dried in the shade. The former is called "Sanzhuru" (Scattered Bamboo Shavings) and the latter is called "Qizhuru"(Uniform Bamboo Shavings).

Description Occurring in masses formed by numerous rolled irregular slivers, or in long slat-shaped shavings, varying in width and thickness, greenish or yellowish-green. Texture light, loose, flexible and elastic. Odour, slight; taste, weak.

Extractives Carry out the method for determination of water-soluble extractives (Appendix X A, the hot extraction method), not less than 4.0 per cent.

Processing *Caulis Bambusae in Taenia* Eliminate foreign matter, cut into sections or crumple up into small masses.

Caulis Bambusae in Taenia (processed with ginger) Stir-bake the clean Caulis Bambusae in Taenia as described under the method for stir-baking with ginger juice (Appendix II D) until it becomes yellow.

Action To remove *heat*, resolve *phlegm*, relieve restlessness and arrest vomiting.

Indications Cough due to *heat* and *phlegm*; restlessness, vomiting, palpitation and insomnia caused by excessive *fire* in the gallbaldder; stroke with impairment of consciousness; stiff tongue and vomiting due to *heat* in the stomach; hyperemesis gravidarum, threatened abortion.

Usage and dosage 4.5-9 g.

Storage Preserve in a dry place, protected from mould and moth.

Caulis Clematidis Armandii (川木通, Chuanmutong)

Armand Clematis Stem

Armand Clematis Stem is the dried lianoid stem of *Clematis armandii* Franch. or *Clematis montana* Buch.-Ham. (Fam. Ranunculaceae). The drug is collected in spring and autumn, removed from the coarse bark, and dried in the sun; or cut into thin slice when fresh and dried in the sun.

Description Long cylindrical, slightly twisted, 50-100 cm long, 2-3.5 cm in diameter, Externally yellowish-brown, with longitudinal furrows and ridges. Nodes usually swollen, with leaf scars and branch scars. The remained bark easily torn. Texture hard, uneasily broken, the slices 2-4 mm thick, uneven on margin, the remained bark yellowish-brown, wood yellowish-brown or pale yellow, with yellowish-white radial striations and cracks, vessel pores scattered densely. Pith relatively small, whitish or yellowish-brown, occasionally hollowed. Odour, slight; taste, weak.

Identification To 25 g of the coarse powder add 250 ml of water, decoct for 30 minutes, filter, concentrate the filtrate to about 50 ml, cool, extract with two quantities (50, 25 ml) of *n*-butanol saturated with water, combine the *n*-butanol solutions, wash with five 30-ml quantities of 2% sodium hydroxide solution, and wash with water to neutral degree. Evaporate the *n*-butanol solution to dryness, dissolve the residue in 25 ml of ethanol, add 2 ml of hydrochloric acid, heat under reflux for 1 hour, evaporate to dryness. To the residue add 10 ml of water, stir thoroughly, extract with two 20-ml quantities of ethyl acetate saturated with water, combine the ethyl acetate solutions and evaporate to dryness, dissolve the residue in 2 ml of methanol as the test solution. Dissolve oleanolic acid CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of cyclohexane and acetone (4 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots clear. A bluish brown spot in the chromatogram

obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. Examine under ultraviolet light at 365 nm. A fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Processing For unsliced, soak briefly, soften thoroughly, cut into thin slices, and dry in the sun.

Action To remove *heat* and induce urination, stimulate menstrual discharge, and promote lactation.

Indications Edema, stranguria; arthralgia; ame-norrhea; lack of lactation.

Usage and dosage 3-6 g.

Storage Preserve in a ventilated and dry place, protected from moisture.

Caulis Dendrobii (石斛, Shihu)

Dendrobium

Dendrobium is the fresh or dried stem of *Dendrobium nobile* Lindl., *Dendrobium candidum* Wall. ex Lindl. or *Dendrobium fimbriatum* Hook. var. *oculatum* Hook. and similar species. (Fam. Orchidaceae). The drug is collected in all the year round. For the fresh stem, removed from root and soil, and for the dried stem, removed from foreign matter, treated with boiling water for a moment or baked gently to soften, then rubbed while baking or sun drying to remove the leaf sheath, and dried. Some fibrous roots of *Dendrobium candidum* are trimmed off, stir-baked while twisting to a spiral or spring form, then baked to dryness, known as Tiepifengdou (Erhuanshihu, earring-like Dendrobium).

Description *Fresh Dendrobium* Cylindrical or flattened-cylindrical, about 30 cm long, 0.4-1.2 cm in diameter. Externally yellowish-green, smooth or striated longitudinally, with distinct nodes, deeply coloured, bearing membranous leaf sheaths. Fleshy, succulent, easily broken. Odour slight; taste, slightly bitter, then sweet and viscous on chewing.

Stem of Dendrobium nobile Flattened-cylindrical, 20-40 cm long, 4-6 mm in diameter, internodes 2.5-3 cm long. Externally golden or greenish-yellow, deeply furrowed longitudinally. Texture hard and fragile, fracture relatively even. Taste, bitter.

Tiepifengdou Spiral or spring-like, usually with 2-4 spires, 3.5-8 cm long when stem pulled straight, 2-3 mm in diameter. Externally yellowish-green, finely wrinkled longitudinally, at one end some short fibrous roots remained at the base of stem. Texture compact, easily broken, fracture even. Viscous on chewing.

Stem of Dendrobium fimbriatum var. *oculatum* Long cylindrical, 40-120 cm long, 5-8 mm in diameter, internodes 3-4.5 cm long. Externally yellow to dark yellow, deeply grooved longitudinally. Texture lax, fracture fibrous. Taste, slightly bitter.

Identification Transverse section of stem:

Stem of Dendrobium nobile Epidermal cells of 1 layer, flattened, covered with bright yellow cuticle. Parenchyma cells varying distinctly in size, with pitted walls, scattered with numerous collateral vascular bundles, arranged in 7-8 whorls. Fibre bundles at the outer side of vascular bundles crescent or semicircular, parenchymatous cells at the outer part containing subrounded silica bodies, xylem with 1-3 relatively large vessels. Most of cells containing needle crystals of calcium oxalate accompanied by vascular bundles.

Tiepifengdou Outer walls and lateral walls of epidermal cells slightly thickened and faintly lignified. Vascular bundles somewhat arranged in 4-5 whorls, small parenchymatous cells at the outer part containing silica bodies. Most of cells containing needle crystals of calcium oxalate occurring near the epidermis.

Stem of Dendrobium fimbriatum var. *oculatum* Epidermal cells flattened-rounded, outer walls and lateral walls thickened, lignified and striated. Parenchymatous cells similar in size, with pitted walls. Vascular bundles somewhat arranged in 3-4 whorls.

Processing For the dried stem, remove remains of roots, wash clean, cut into sections and dry. For the fresh stem, wash clean, cut into sections.

Action To benefit the stomach, promote the production of body fluid, nourish *yin*, and remove *heat*.

Indications Thirst due to impairment of *yin* or deficiency of body fluid; loss of appetite with nausea; fever in deficiency condition after a severe disease; impaired vision.

Usage and dosage 6-12 g; or 15-30 g of the fresh stem, decocted first in a compound prescription and longer decocted when it is prescribed alone.

Storage Preserve in a ventilated and dry place, protected from moisture; keep the fresh stem in a cool and moist place, protected from freezing.

Caulis Erycibes (丁公藤, Dinggongteng)

Obtuseleaf Erycibe Stem

Obtuseleaf Erycibe Stem is the dried lianoid stem of *Erycibe obtusfolia* Benth. or *Erycibe schmidtii* Craib (Fam. Convolvulaceae). The drug is collected all the year round, cut into section or piece, and dried in the sun.

Description In oblique sections or pieces, 1-10 cm in diameter. Externally greyish-yellow, greyish-brown or pale brown, slightly rough, with shallow furrows and irregular longitudinal or turtle-like fissures. Lenticles spot-like or protuberant, yellowish-white. Older cork exfoliated. Texture hard, with relatively rich fibres, uneasily broken. Cut surface elliptical, yellowish-brown or pale yellowish-brown, abnormal vascular bundles flowery or piece-like, vessels of xylem pitted. Odour, slight; taste, weak.

Identification To 3 g of the powder add 40 ml of ethanol, allow to macerate overnight, heat under reflux for 6 hours, filter. To the filtrate, add 6 ml of hydrochloric acid (6 mol/L), heat under reflux for 3 hours, evaporate to dryness on a water bath, dissolve the residue in 10 ml of ethanol as the test solution. Dissolve scopoletin CRS in ethanol to produce a solution containing 0.25 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B) using silica gel G mixed with

sodium carboxymethylcellulose as the coating substance and a mixture of cyclohexane, chloroform, ethyl acetate and formic acid (6 : 10 : 7 : 1.2) as the mobile phase. Apply separately to the plate 3 μl of each of the above two solutions. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. A bright blue fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using ethanol as the solvent, not less than 3.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and glacial acetic acid (32 : 68 : 0.16) as the mobile phase. As detector a spectrophotometer set at 298 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of scopoletin.

Reference solution Dissolve a quantity of scopoletin CRS, accurately weighed, in methanol to produce a solution containing 40 μg per ml.

Test solution Weigh accurately 1 g of the powder (through No. 4 sieve) to a stopper conical flask. Add accurately 50 ml of 70% ethanol, weigh, heat on a water bath for 6 hours, allow to cool, weigh again, replenish the loss of the weight with 70% ethanol, mix well and filter. Measure accurately 25 ml of the successive filtrate to a flask, concentrate to about 1 ml, add 10 ml of 3 mol/L hydro-chloric acid, heat on a water bath for 2 hours, cool immediately. Transfer to a separating funnel, wash the flask several times with 10 ml of water, combine the washings to the separating funnel, add 2 g of sodium chloride, extract with five 15-ml quantities of chloroform, combine the chloroform extracts, add 2 g of anhydrous sodium sulfate, stir well and filter, wash the separating funnel with a small quantity of chloroform, filter, combine the filtrates and evaporate to almost dryness below 70℃, immediately dissolve the residue in methanol, transfer to a 10 ml volumetric flask, dilute to volume and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 0.050 per cent of scopoletin ($C_{10}H_8O_4$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into slices, and dry in the sun.

Action To dispel *wind* and deprive *dampness*, reduce swelling, relieve pain.

Indications Rheumatic arthralgia, hemiplegia, traumatic injury marked by pain and swelling.

Usage and dosage 3-6 g, made into tincture for oral administration or external application.

Precaution Induce perspiration strongly, used with caution in poor health, contraindicated in pregnancy.

Storage Preserve in a dry place.

Caulis Fibraufeae (黄藤, Huangteng)

Common Fibraurea Stem

Common Fibraurea Stem is the dried lianoid stem of *Fibraurea recisa* Pierre. (Fam. Menispermaceae). The drug is collected in autumn and winter, cut into section, and dried in the sun.

Description Long cylindrical, slightly twisted, 0.6-3 cm in diameter. Externally greyish-brown to yellowish-brown, rough, with longitudinal furrows and transverse cracks, outer bark of the old stem easily fallen off. Texture hard, uneasily broken, dusting on breaking, fracture uneven, yellow, fibrous, showing radially arranged striations alternated with brownish-yellow and yellowish-brown colours, pores of vessels fine, xylem sometimes with cracks. Centre yellowish-brown or hollowed. Odour, slight; taste, bitter.

Identification (1) Transverse section: Cork of numerous layers of cells containing brown contents, sometimes the walls lignified and thickened as stone cells. Stone cell groups occurring in cortex of the old stem. Vascular bundles collateral. fibre groups occurring in the outside of phloem. Fascicular cambium obvious. Vessels in xylem large, up to about 30 μm in diameter, wood fibres thick-walled. Rays broad, with stone cell groups. Pith mostly broken, fibres visible. Prisms of calcium oxalate existing in the stone cells or in the neighboring cells of stone cell and fibre groups. Parenchymatous cells containing starch granules.

(2) To 0.5 g of the powder add 10 ml of ethanol, ultrasonicate for 10 minutes, filter, use the filtrate as the test solution. Dissolve palmatine hydrochloride CRS in methanol to produce a solution containing 0.1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate, isopropanol, methanol and concentrated ammonia solution (6 : 3 : 1.5 : 1.5 : 0.5) as the mobile phase. Apply separately to the plate 2 μl of each of the above two solutions. After developing in a chamber saturated with ammonia vapour and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. A fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using a solution of 1% hydrochloric acid in methanol as the solvent, not less than 17.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.4% phosphoric acid solution (32 : 68) as the mobile phase, and maintain the column temperature at 40℃. As detector a spectrophotometer set at 345 nm. The number of theoretical plates of the column is not less than

5000, calculated with reference to the peak of palmatine hydrochloride.

Reference solution Dissolve a quantity of palmatine hydrochloride CRS, accurately weighed, in a solution of 1% hydrochloric acid in methanol to produce a solution containing 30 μg per ml.

Test solution Weigh accurately 0.6 g of the powder (through No. 3 sieve) to a stopper conical flask, add accurately 100 ml of a solution of 1% hydrochloric acid in methanol, weigh, stand overnight, heat on a water bath for 1 hour, allow to cool, weigh again, replenish the loss of the weight with a solution of 1% hydrochloric acid in methanol, mix well, filter. Accurately measure 2 ml of the successive filtrate to a 10 ml volumetric flask, dilute with a solution of 1% hydrochloric acid in methanol to volume, mix well.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 2.0 per cent of palmatine hydrochloride ($C_{21}H_{22}NO_4 \cdot HCl$), calculated with reference to the dried drug.

Action To clear *toxic-heat*, purge *fire* and relax bowels.

Indications Constipation or dysentery, sore throat, bloodshot eyes, carbuncles and sores due to abundant *toxic-heat* in the interior.

Usage and dosage 30-60 g, appropriate quantity for external use.

Storage Preserve in a ventilated and dry place, protected from mould.

Caulis Lonicerae Japonicae (忍冬藤, Rendongteng)

Honeysuckle Stem

Honeysuckle Stem is the dried stem and branch of *Lonicera japonica* Thunb. (Fam. Caprifoliaceae). The drug is collected in autumn and winter, and dried in the sun.

Description Long cylindrical, frequently branched, usually twisted into a bundle, 1.5-6 mm in diameter. Externally brownish-red to dark brown, some greyish-green, glabrous or pubescent; outer bark easily fallen off. Branches much-nodose, internodes 6-9 cm long, showing remains of leaves and leaf scars. Texture fragile, easily broken, fracture yellowish-white, hollow. Odour, slight; taste of older branches slightly bitter, and the younger ones weak.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 4.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.4% phosphoric acid solution (10 : 90) as the mobile phase. As detector a spectrophotometer set at 327 nm. The number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of chlorogenic acid.

Reference solution Dissolve a quantity of chlorogenic acid CRS, accurately weighed, in 50% methanol to produce a solution containing 40 μg per ml.

Test solution Weigh accurately 1 g of the powder (through No. 3 sieve) to a stopper conical flask. Add accurately 25 ml of 50% methanol, weigh, ultrasonicate (power 250 W, frequency 30 kHz) for 30 minutes, allow to cool, weigh again, replenish the loss of the weight with 50% methanol, mix well and filter.

Procedure Inject accurately 10 μl of the reference solution and 5-10 μl of the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.10 per cent of chlorogenic acid ($C_{16}H_{18}O_9$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into sections, and dry.

Action To remove *toxic-heat*, and dispel *wind* from the channels and collaterals.

Indications Epidemic febrile diseases, acute dysentery, carbuncles, sores, acute arthritis with redness, swelling and pain of the joint.

Usage and dosage 9-30 g.

Storage Preserve in a dry place.

Caulis Mahoniae (功劳木, Gonglaomu)

Chinese Mahonia Stem

Chinese Mahonia Stem is the dried stem of *Mahonia bealei* (Fort.) Carr. or *Mahonia fortunei* (Lindl.) Fedde (Fam. Berberidaceae). The drug is collected all the year round, cut into piece and dried.

Description In irregular pieces, varying in size. Externally greyish-yellow to dark brown, with distinct longitudinal furrows and fine transverse cracks, sometimes outer bark relatively smooth, lustrous or showing remains of petioles. In cut surface, bark narrow, dark brown, wood yellow, showing several concentrical rings and radial striations arranged densely. Pith somewhat dark in colour. Texture hard. Odour, slight; taste, bitter.

Identification To 0.3 g of the powder add 5 ml of methanol, ultrasonicate for 15 minutes, filter and dilute the filtrate with methanol to 5 ml as the test solution. Dissolve berberine hydrochloride CRS, palmatine hydrochloride CRS and jatrorrhizine hydrochloride CRS in methanol to produce a mixture containing 0.5 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia solution (6 : 3 : 1.5 : 1.5 : 0.5) as the mobile phase. Apply separately to the plate 1 μl of each of the above two solutions. After developing in a chamber saturated with ammonia vapour and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. Three yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Water Not more than 9.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using ethanol as the solvent, not less than 3.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and potassium dihydrogen phosphate buffer solution (monitor the pH value to 3.0 with phosphoric acid)(30 : 70) as the mobile phase. As detector a spectrophotometer set at 265 nm. The number of theoretical plates of the column is not less than 5000, calculated with reference to the peak of berberine hydrochloride.

Reference solution Dissolve a quantity of berberine hydrochloride CRS, accurately weighed, in a mixture of acetonitrile and water (3 : 7) to produce a solution containing 20 μg per ml.

Test solution Weigh accurately 0.25 g of the coarse powder, add accurately 50 ml of a mixture of hydrochloric acid and methanol (1 : 100), weigh, macerate at room temperature for 30 minutes, ultrasonicate (power 500 W, frequency 40 kHz) for 45 minutes, allow to cool, weigh again, replenish the loss of the weight with a mixture of hydrochloric acid and methanol (1 : 100), mix well and filter. Accurately measure 5 ml of the successive filtrate to a flask and evaporate to dryness, dissolve the residue in a mixture of acetonitrile and water (3 : 7), transfer to a 5 ml volumetric flask, dilute to volume, mix well and filter.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.20 per cent of berberine hydrochloride ($C_{20}H_{17}NO_4 \cdot HCl$), calculated with reference to the dried drug.

Action To remove *damp-heat*, quench *fire*, and counteract *toxicity*.

Indications Acute dysentery, icteric hepatitis conjunctivitis, ulcers, boils, carbuncles; toothache due to *fire* in the stomach.

Usage and dosage 9-15 g; appropriate quantity for external use.

Storage Preserve in a dry place.

Caulis Perillae (紫苏梗, Zisugeng)

Perilla Stem

Perilla Stem is the dried stem of *Perilla frutescens* (L.) Britt. (Fam. Labiatae). The drug is collected after fruit is ripe in autumn, removed from foreign matter, and dried in the sun; or cut into slice when fresh, and dried in the sun.

Description Square, four angles obtuse, varying in length, 0.5-1.5 cm in diameter. Externally purplish-brown or dark purple, with longitudinal furrows and fine longitudinal striations, nodes slightly swollen, with opposite branch scars and leaf scars. Texture light and hard, fracture lobed. Slices 2-5 mm thick, usually rhomboidal, wood yellowish-white, medullary rays fine and dense, radiate, pith white, lax or falling off. Odour, slightly aromatic; taste, weak.

Processing Eliminate foreign matter, soak briefly, soften thoroughly, cut into thick slices and dry.

Action To regulate the flow of *qi* and the function of the stomach, alleviate pain, and prevent abortion.

Indications Feeling of stuffiness in the chest, epigastralgia, belching and vomiting; threatened abortion.

Usage and dosage 5-9 g.

Storage Preserve in a cool and dry place.

Caulis Piperis Kadsurae (海风藤, Haifengteng)

Kadsura Pepper Stem

Kadsura Pepper Stem is the dried stem of *Piper kadsura* (Choisy) Ohwi (Fam. Piperaceae). The drug is collected in summer and autumn, removed from root and leaf, and dried in the sun.

Description Flat-cylindrical, slightly curved, 15-60 cm long, 0.3-2 cm in diameter. Externally greyish-brown or brown, rough, with longitudinally ridged striations and distinct nodes. Internodes 3-12 cm long, nodes swollen, bearing adventitious roots. Texture light, fragile, easily broken, fracture uneven, bark narrow, wood broad, greyish-yellow, vessel pores numerous, rays greyish-white, arranged radially, usually cleft between bark and wood, pith in centre, greyish-brown. Odour, aromatic; taste, slightly bitter and pungent.

Identification To 1 g of the powder add 30 ml of methanol, ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethanol as the test solution. Prepare a solution with 1 g of Caulis Piperis Kadsurae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, acetone and methanol (7 : 1 : 0.5) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The main spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol TS as the solvent, not less than 10.0 per cent.

Processing Eliminate foreign matter, soak, soften thoroughly, cut into thick slices, and dry in the sun.

Action To relieve rheumatic condition.

Indications Rheumatic or rheumatoid arthritis with joint pain, muscular contracture and ankylosis.

Usage and dosage 6-12 g.

Storage Preserve in a ventilated and dry place.

Caulis Polygoni Multiflori (首乌藤, Shouwuteng)

Tuber Fleeceflower Stem

Tuber Fleeceflower Stem is the dried lianoid stem of *Polygonum multiflorum* Thunb. (Fam. Polygonaceae). The drug is collected in autumn and winter, removed from the remained leaf, bundled up, and dried.

Description Long cylindrical, slightly twisted, branched, varying in length, 4-7 mm in diameter. Externally purplish-red to purplish-brown, rough, with twisted longitudinal wrinkles. Nodes slightly swollen, with scars of lateral branches. The outer bark thin and easily stripped. Texture fragile, easily broken, in fracture, bark purplish-red, wood yellowish-white or pale brown, vessel pores distinct, pith lax and whitish. Odour, slight; taste, slightly bitter and astringent.

Identification (1) Transverse section: Epidermal cells sometimes remained. Cork consisting of 3-4 layers of cells, containing brown pigment. Cortex relatively narrow. Fibre bundles in pericycle arranged in a discontinuous ring. Walls of fibres markedly thickened and lignified; groups of stone cells occasionally existing among fibre bundles. Phloem relatively wide. Cambium in a ring. Vessels in xylem subrounded, up to 204 μm in diameter, singly scattered or several aggregated. Pith relatively small. Parenchymatous cells containing clusters of calcium oxalate.

(2) To 0.25 g of the powder add 50 ml of ethanol, heat under reflux on a water bath for 1 hour, filter, and concentrate the filtrate to 3 ml as the test solution. Prepare a solution with 0.25 g of Caulis Polygoni Multiflori reference drug in the same manner as the reference drug solution. Dissolve emodin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H containing sodium carboxymethylcellulose as the coating substance and a mixture of benzene and ethanol (2 : 1) as the mobile phase. Apply in strips separately to the plate 2 μl of each of the above three solutions. After developing to 3.5 cm and removal of the plate, dry in air, and then using a mixture of benzene and ethanol (4 : 1) as the mobile phase, after developing to 7 cm in a chamber pre-saturated for 15 minutes and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent strips in the chromatogram obtained with the test solution correspond in position and colour to the strips in the chromatograms obtained with the reference drug and reference solutions.

Processing Eliminate foreign matter, wash clean, cut into sections, and dry in the sun.

Action To nourish blood, induce tranquilization, dispel *wind*, and remove obstruction of channels and collaterals.

Indications Insomnia, dream-disturbed sleep; general aching in blood deficiency; rheumatic arthralgia; external use for itching.

Usage and dosage 9-15 g; for external use, appropriate quantity is decocted for washing.

Storage Preserve in a dry place.

Caulis Sargentodoxae (大血藤, Daxueteng)

Sargentgloryvine Stem

Sargentgloryvine Stem is the dried lianoid stem of *Sargentodoxa cuneata* (Oliv.) Rehd. et Wils. (Fam. Lardizabalaceae). The drug is collected in autumn and winter, removed from lateral branch, cut into section, and dried.

Description Cylindrical, slightly curved, 30-60 cm long, 1-3 cm in diameter. Externally greyish-brown, rough, the outer layer often scaling off, the exposed surface dark reddish-brown, sometimes showing inflated nodes and slightly dented branch scars or leaf scars. Texture hard, in fracture, bark reddish-brown, some inlaid into the wood, wood yellowish-white, with numerous fine pores of vessels and rays arranged radially. Odour, slight; taste, slightly astringent.

Identification (1) Transverse section: Cork of several layers of cells containing brownish-red contents. Stone cells in cortex usually several in groups, some of them containing prisms of calcium oxalate. Vascular bundles collateral. Secretory cells in phloem arranged tangentially and alternated with sieve tubes; a few stone cell groups scattered. Fascicular cambium obvious. Vessels in xylem mostly single and scattered, subrounded, up to about 400 μm in diameter, surrounded by wood fibres. Rays broad, stone cells abundant in the outer part, some of them containing prisms of calcium oxalate. Stone cell groups in pith visible. Parenchymatous cells containing brown or brownish-red contents.

(2) To 5 g of the coarse powder add 50 ml of methanol, ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 10 ml of 2% sodium hydroxide solution, monitor the pH value to 2 with hydrochloric acid, extract with three 10-ml quantities of ether with frequent shaking, combine the ether solutions and expel the solvent, dissolve the residue in 2 ml of methanol as the test solution. Prepare a solution with 5 g of Caulis Sargentoxae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, acetone and formic acid (8 : 1 : 0.8) as the mobile phase. Apply separately to the plate 2 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with 2% ferric chloride in ethanol. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 4.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using ethanol as the solvent, not less than 5.0 per cent.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry.

Action To remove *toxic-heat*, promote blood circulation, and relieve rheumatic condition.

Indications Acute appendicitis; amenorrhea, dysmenorrhea;

rheumatic arthralgia; traumatic swelling and pain.

Usage and dosage 9-15 g.

Storage Preserve in a ventilated and dry place.

Caulis Sinomenii
(青风藤, Qingfengteng)

Orientvine Stem

Orientvine Stem is the dried lianoid stem of *Sinomenium acutum* (Thunb.) Rehd. et Wils. or *Sinomenium acutum* (Thunb.) Rehd. et Wils. var. *cinereum* Rehd. et Wils. (Fam. Menispermaceae). The drug is collected in late autumn and early winter, tied up in bundle or cut into long section, and dried in the sun.

Description Long cylindrical, usually somewhat curved, 20-70 cm long or more, 0.5-2 cm in diameter. Externally greenish-brown to brown, some greyish-brown, with fine longitudinal striations and lenticels. Nodes slightly swollen and branched. Texture light, hard and fragile, easily broken, fracture uneven, greyish-yellow or pale greyish-brown, bark narrow, wood rays arranged radially, pith pale yellowish-white or yellowish-brown. Odour, slight; taste, bitter.

Identification (1) Transverse section: The outmost is epidermis, covered with thick cuticle, or cork. Cortex scattered with fibres and stone cells. Pericyclic fibre groups in crescent shape, the inner side of fibre groups usually possessing 2-5 layers of stone cells, tangentially elongated and linked with stone cell groups in rays to a ring. Vascular bundles collateral. Phloem rays gradually widened outwards, occurring conical or branched stone cells; phloem, cells mostly collapsed, sometimes scattered with 1-3 fibres. Xylem vessels singly scattered or serveral linked up tangentially. The walls of cells surrounding pith relatively thickened, distinctly pitted. Parenchymatous cells containing starch granules and needle crystals of calcium oxalate.

Powder: Yellowish-brown or greyish-brown. Epidermal cells yellow or yellowish-brown, subrounded or oblong in lateral view, 24-78 μm in diameter, covered with cuticle. Stone cells pale yellow or yellow, subsquare, fusiform, elliptical or irregular, walls relatively thickened, pit canals distinct. Cortex fibres pale yellow or yellow, 27-70 μm in diameter, with heavily thickened walls and a narrow lumen. Needle crystals of calcium oxalate small, occurring in parenchymatous cells.

(2) Heat under reflux 2 g of the powder with 25 ml of ethanol for 1 hour and filter. Evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ethanol as the test solution. Dissolve sinomenine CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G mixed with a 2% solution of sodium hydroxide as the coating substance and the upper layer of a mixture of toluene, ethyl acetate, methanol and water (2 : 4 : 2 : 1) standing below 10℃ as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with potassium iodobismuthate TS and sodium nitrite in ethanol TS, successively. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Total ash Not more than 6.0 per cent (Appendix IX K).

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and phosphate BS (to 0.005 mol/L sodium hydrogen phosphate solution, monitor the pH value to 8.0 with 0.005 mol/L sodium dihydrogen phosphate solution, and monitor the pH value to 9.0 with 1% triethylamine) (55 : 45) as the mobile phase. As detector a spectrophotometer set at 262 nm. The number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of sinomenine.

Reference solution Dissolve a quantity of sinomenine CRS, weighed accurately, in methanol to produce a solution containing 0.5 mg per ml.

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve) in a stopper conical flask, accurately add 20 ml of 70% ethanol, stopper well, weigh, ultrasonicate for 20 minutes (power 150 W, frequency 20 kHz), cool, weigh again and compensate the loss of the weight with 70% ethanol, shake thoroughly, filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 0.5 per cent of sinomenine ($C_{19}H_{23}NO_4$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, soak briefly, soften thoroughly, cut into thick slices, and dry.

Action To relieve rheumatic condition, remove obstruction of the channels and collaterals, and cause urination.

Indications Rheumatic joint pain and swelling; paralysis; itching.

Usage and dosage 6-12 g.

Storage Preserve in a dry place.

Caulis Spatholobi
(鸡血藤, Jixueteng)

Suberect Spatholobus Stem

Suberect Spatholobus Stem is the dried lianoid stem of *Spatholobus suberectus* Dunn (Fam. Leguminosae). The drug is collected in autumn and winter. removed from branch and leaf, cut into slice, and dried in the sun.

Description Elliptical, oblong or irregular oblique slices, 0.3-1 cm thick. Cork greyish-brown, sometimes greyish-white patches visible and appearing reddish-brown when the cork exfoliated. Texture compact and hard. In the transversely cut surface, xylem reddish-brown or brown, showing numerous pores of vessels; phloem with resinous secretion reddish-brown to blackish-brown, arranged alternately with xylem, forming 3-8 eccentric semi-circular rings; pith inclined to one side. Odour, slight; taste, astringent.

Identification (1) Transverse section: Cork consisting of several layers of cells with brownish-red contents. Cortex relatively narrow, showing groups of stone cells filled with brownish-red contents in lumen; parenchymatous cells containing prisms of calcium oxalate. Abnormal vascular bundles arranged by phloem alternating with xylem in several

whorls. In phloem, the outermost being a layer of sclerenchymatous cells, consisting of groups of stone cells and fibre bundles; most of rays pressed; secretory cells abundant, filled with brownish-red contents, usually several to 10 or more grouped and arranged tangentially in layers; fibre bundles relatively abundant, non-lignified to slightly lignified, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres, the walls of crystal cells lignified and thickened; groups of stone cells scattered. Xylem rays sometimes containing brownish-red contents; vessels mostly single and scattered, subrounded, up to 400 μm in diameter; bundles of xylary fibres also forming crystal fibres; a few of xylary parenchymatous cells containing brownish-red contents.

(2) Heat under reflux 1 g of the powder with 100 ml of ethanol for 1 hour, filter, evaporate the filtrate to dryness, dissolve the residue in 2 ml of methanol, add 1 g of silica gel, stir well, expel the solvent, apply to a small column (1.0 cm in inner diameter) packed with silica gel (100-200 mesh, 2 g), pre-elute with 30 ml of petroleum ether (60-90℃). Elute with 40 ml of chloroform, evaporate the chloroform eluate to dryness, dissolve the residue in 0.5 ml of chloroform as the test solution. Dissolve formononetin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (30 : 1) as the mobile phase. Apply separately to the plate 5-10 μl of the test solution and 5 μl of the reference solution. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. A fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 4.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 0.6 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using ethanol as the solvent, not less than 8.0 per cent.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into pieces, and dry in the sun.

Action To enrich the blood, activate blood circulation, and remove obstruction of the channels and collaterals.

Indications Menstrual disorders; anemia; numbness and paralysis; rheumatic arthralgia.

Usage and dosage 9-15 g.

Storage Preserve in a ventilated and dry place, protected from mould and moth.

Caulis Trachelospermi (络石藤, Luoshiteng)

Chinese Starjasmine Stem

Chinese Starjasmine Stem is the dried lianoid stem with leaf of *Trachelospermum jasminoides* (Lindl.) Lem. (Fam. Apocynaceae). The drug is collected from winter to next spring, removed from foreign matter, and dried in the sun.

Description Stem cylindrical, curved, much-branched, varying in length, 1-5 mm in diameter; externally reddish-brown, with dotted lenticels and adventitious roots; texture hard, fracture pale yellowish-white, frequently hollowed. Leaves opposite, short petioled; when being spread, elliptical or ovate-lanceolate, 1-8 cm long, 0.7-3.5 cm wide, margin entire, slightly rolled; upper surface dark green or brownish-green, lower surface relatively pale-coloured. Texture leathery. Odour, slight; taste, slightly bitter.

Identification Transverse section: Cork consisting of several layers of brownish-red cells, unicellular non-glandular hairs visible, thick-walled and warty. The inner side of cork possessing a cycle of stone cells, between cork and cycle of stone cells occurring prisms of calcium oxalate. Cortex narrow, phloem thin, non-lignified fibre bundles in the outer side, interruptedly arranged in a ring. Cambium in a ring. Xylem consisting of lignified cells, vessels commonly scattered singly. The inner part of xylem occurring internal cambium and phloem. In pith, lignified fibres in bundles, surrounded by parenchymatous cells containing prism of calcium oxalate. Pith usually ruptured.

Processing Eliminate foreign matter, wash clean, soften briefly, cut into sections and dry.

Action To dispel *wind* and remove obstruction from the channels and remove *heat* from blood and cause subsidence of swelling.

Indications Rheumatic arthritis with muscular contracture, aching of the loins and knees; inflammation of the throat, carbuncles and boils; traumatic injuries.

Usage and dosage 6-12 g; for external use, appropriate quantity of the fresh drug is pounded into paste for topical application.

Storage Preserve in a dry place.

Cera Chinensis (虫白蜡, Chongbaila)

Insect Wax

Insect Wax is the purified wax secreted by male insect of *Ericerus pela* (Chavannes) Guerin, which dwelling gregariously at the stem and branch of *Fraxinus chinensis* Roxb, *Ligustrum lucidum* Ait. (Fam. Oleaceae) or other species of the genus *Ligustrum*.

Description White or whitish masses. The surface smooth or slightly wrinkled, lustrous. Texture light, hard, somewhat fragile, broken when rubbing. Fracture stripe-shaped or granular. Odour, slight; tasteless.

Melting point 81-85℃ (Appendix Ⅶ C).

Acid value Not more than 1 (Appendix Ⅸ N).

Saponification value 70-92 (Appendix Ⅸ N).

Iodine value Not more than 9 (Appendix Ⅸ N).

Usage Excipient and lubricant for making pills and tablets.

Storage Preserve in well closed containers, stored in a cool place.

Cera Flava
(蜂蜡，Fengla)

Beeswax

Beeswax is the wax secreted by *Apis cerana* Fabricius or *Apis mellifera* Linnaeus. (Fam. Apidae). The drug is collected by heating the honeycomb with water, filtering while hot, cooling, and purified.

Description Irregular masses, varying in size. Externally yellow, pale yellowish-brown or yellowish-white, opaque or slightly transparent, smooth. Texture light, waxy; fracture sandy, soften when rubbing. Odour, aromatic, resembling honey; taste, slightly sweet.

Processing Melt before use, clarify, and eliminate foreign matter.

Action To arrest discharges, promote healing of wounds and tissue regeneration, and alleviate pain.

Indications Ulcer difficulty to heal, wounds, burns and scalds.

Usage and dosage For external use, appropriate quantity is melted and applied topically; often used as excipient and ground substanse of ointments.

Storage Preserve in a cool place, protected from heat.

Cinnabaris
(朱砂，Zhusha)

Cinnabar

Cinnabar is a mineral of sulfides of cinnabar group, containing mainly mercuric sulfide (HgS). The mineral is collected, and the clean part is sorted out, removed from foreign matter containing iron with magnet, and freed from foreign stone and soil by washing.

Description Aggregates of granulous or lumpy masses, in granules or pieces, bright red or dark red, streak red to brownish-red, lustrous. Texture heavy and fragile. Pieces easily broken and granules with glittering gloss. Odourless and tasteless.

Identification (1) Moisten the powder with hydrochloric acid, rub on a clean surface of copper slice. The surface shows the silver gloss, which disappears immediately on heating.
(2) Dissolve 2 g of the powder in 2 ml of a mixture of hydrochloric acid and nitric acid (3 : 1), evaporate to dryness. Dissolve the residue in 2 ml of water and filter. The filtrate yields the reactions characteristic of mercuric salts and sulfates (Appendix Ⅳ).

Iron Boil 1 g of the powder with 20 ml of dilute hydrochloric acid TS for 10 minutes, allow to cool, filter into a 250 ml volumetric flask, neutralize with sodium hydroxide TS, and dilute with water to volume. Carry out the limit test for iron (Appendix Ⅸ D), using 10 ml. Any colour produced is not more intense than that of a reference solution prepared with 4 ml of ferric standard solution (0.1%).

Assay Dissolve about 0.3 g of the powder, weighed accurately, with 10 ml of sulfuric acid and 1.5 g of potassium nitrate in a conical flask by heating. Allow to cool, add 50 ml of water and 1% potassium permanganate solution until a pink colour is produced, then add dropwise 2% ferrous sulfate solution until the pink colour disappears. Add 2 ml of ammonium ferric sulfate IS and titrate with ammonium thiocyanate (0.1 mol/L) VS. Each ml of ammonium thiocyanate (0.1 mol/L) VS is equivalent to 11.63 mg of mercuric sulfide (HgS).
It contains not less than 96.0 per cent of mercuric sulfide (HgS).

Processing *Cinnabaris powder* Remove iron powder with magnet; or levigate as described under the method for levigating (Appendix Ⅱ D), and dry in air or below 40℃. Bright red and very fine powder, texture light, without granules when kneaded by fingers, without iron powder when absorbed by magnet. Odourless and tasteless. It complies with the above tests for identification (1), (2) and Iron.

Dissolvable mercuric salts Dissolve 1 g of the powder in 10 ml of water, shake well, filter, and allow to stand. The filtrate should not yield the reactions characteristic of mercuric salts (Appendix Ⅳ).
Weigh accurately about 0.20 g of the powder, carry out the above method for assay, it contains not less than 98.0 per cent of mercuric sulfide (HgS).

Action To cause sedation and counteract *toxicity*.

Indications Palpitation, insomnia and dream-disturbed sleep; epilepsy, mania, infantile convulsion; blurred vision; ulcers in the mouth; painful swelling of the throat; boils and sores.

Usage and dosage 0.1-0.5 g. It is usually used in pills or powder and not decocted.

Precaution For oral administration, large doses or long term administration of small doses should be avoided because of the toxicity; contraindicated in patients with hepatic or renal dysfunction.

Storage Preserve in a dry place.

Colla Carapax et Plastrum Testudinis
(龟甲胶，Guijiajiao)

Glue of Tortoise Shell

Glue of Tortoise Shell is the solid glue prepared from tortoise shell by decoction and concentration.

Procedure Soak tortoise shell in water and rinse clean, decoct with water several times, filter and combine the filtrates (or add a little fine powder of alum), allow to stand, filter, concentrate the glutinous filtrate (or add appropriate amount of yellow rice wine, crystal sugar, soybean oil) to thick glue, allow to cool and congeal, cut into pieces and dried in the air.

Description Rectangular or square flat pieces. Dark brown. Texture hard and fragile, fracture bright, transparent when looking against the light. Odour, slightly stinking; taste, weak.

Identification Dissolve 2 g in 10 ml of water, filter, and test the successive filtrate as follow:
(1) To 1 ml of the filtrate add 0.5 ml of ninhydrine TS, heat on a water bath for 15 minutes. A bluish violet colour is produced.
(2) To 1 ml of the filtrate add several drops of a freshly prepared mixture of 1% solution of cupric sulfate and 40%

solution of sodium hydroxide (1 : 1), and shake. A redish violet colour is produced.

Water Weigh accurately 1 g, add 2 ml of water, heat to dissolve and evaporate to dryness. Keep the thickness not over than 2-3 mm, carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent.

Heavy metals Carry out the limit test for heavy metals (Appendix Ⅸ E, method 2), using the ignited residue (Appendix Ⅸ J), not more than 30 ppm.

Insoluble matter in water Weigh accurately 1.0 g of the powder, add 10 ml of water and heat to dissolve. Transfer to a 10 ml centrifuge tube previously dried to constant weight, centrifuge, discard the oil slick on tube wall and the supernatant. Add warm water to volume along the tube wall, centrifuge, wash 3 times in the same manner and discard the supernatant. Heat the centrifugal tube at 105℃ for 2 hours, take out, cool at a dryer for 30 minutes, weigh accurately and calculate, not less than 2.0 per cent.

Other requirements Complies with the general requirements for glues (Appendix Ⅰ G).

Assay Weigh accurately 0.2 g of the powder, carry out the method for determination of nitrogen (Appendix Ⅸ L, method 1), it contains not less than 9.0 per cent of the total nitrogen (N).

Action To nourish *yin* and blood, and arrest bleeding.

Indications Consumptive fever and night sweating due to deficiency of *yin*; weakness and aching of the loins and knees; anemia; abnormal uterine bleeding, excessive leukorrhea.

Usage and dosage 3-9 g, taken after melted in decoction.

Storage Preserve in well closed container.

Colla Corii Asini (阿胶, Ejiao)

Donkey-hide Glue

Donkey-hide Glue is the solid glue prepared from the dried or fresh skin of *Equus asinus* Linnaeus (Fam. Equidae) by decoction and concentration.

Procedure Soak the donkey-hide, remove the hairs, cut into small pieces, rinse again, decoct with water several times, filter and combine the filtrates. Concentrate the glutinous filtrate (or add a quantity of yellow rice wine, crystal sugar, soya-bean oil, respectively) to thick glue, allow to cool and congeal, cut into pieces, and dry in the air.

Description Rectangular, square piece or small piece, dark-brown, lustrous. Texture hard and fragile, fracture lustrous, fragment brown and translucent when looking against the light. Odour, slight; taste, slightly sweet.

Identification To 0.2 g of the coarse powder, add 8 ml of hydrochloric acid solution, (6 mol/L) hydrolyzed at 105℃ for 6 hours, add 6 ml of water, mix well and filter. Evaporate the filtrate to dryness, and dissolve the residue in 10 ml of methanol as the test solution. Dissolve glycine CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of phenol and 5% solution of borax (4 : 1) as the mobile phase. Apply separately to the plate 2 μl of the test solution and 1 μl of the reference solution. After developing and removal of the plate, dry in air. Spray with a 0.2% solution of ninhydrine in ethanol and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Water Heat to dissolve 1 g, accurately weighed, in 2 ml of water, and evaporate to dryness on a water bath. Keep the thickness not over than 2-3 mm. Carry out the method for the determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent.

Total ash Not more than 1.0 per cent (Appendix Ⅸ K), using 1 g.

Heavy metals Carry out the limit test for heavy metals (Appendix Ⅸ E, method 2), using the residue obtained under the test for total ash, not more than 30 ppm.

Arsenic To 2 g add 1 g of calcium hydroxide and a small quantity of water, stir well. After drying, ignite gently at first and then incinerate at 500-600℃. Allow to cool, dissolve the residue in 3 ml of hydrochloric acid and a quantity of water to 30 ml. To 10 ml of the solution, add 4 ml of hydrochloric acid and 14 ml of water, carry out the limit test for arsenic (Appendix Ⅸ F), not more than 3 ppm.

Insoluble matter in water Weigh accurately 1.0 g of the powder, add 10 ml of water and heat to dissolve. Transfer to a 10 ml centrifuge tube previously dried to constant weight, centrifuge, discard the oil slick on tube wall and the supernatant. Add warm water to volume along the tube wall, centrifuge, wash 3 times in the same manner and discard the supernatant. Heat the centrifugal tube at 105℃ for 2 hours, take out, cool in a dryer for 30 minutes, weigh accurately and calculate, not less than 2.0 per cent.

Volatile alkaline substance Weigh accurately 5 g to a 100 ml volumetric flask, add water to dissolve and dilute to volume, mix well. Transfer accurately 5 ml to a Kjeldahl flask, add 5 ml of 1% magnesium oxide suspension immediatly, stopper immediately and tightly, distill with steam, and collect the distillate into 5 ml of 2% boric acid solution, add 5 drops of a mixed indicator of methyl red and bromocresol green IS, collect the distillate for 7 minutes from the first drop. Carry out the method for the determination of nitrogen (Appendix Ⅸ L method 2) with the distillate. It contains not more than 100 mg of volatile alkaline matter in 100 g of the drug, calculated as nitrogen (N).

Other requirements Complies with the general requirements for glues (Appendix Ⅰ G).

Assay Weigh accurately 0.2 g of the powder, carry out the method for determination of nitrogen (Appendix Ⅸ L, method 1), it contains not less than 13.0 per cent of the total nitrogen (N).

Processing *Colla Corii Asini*: Break to pieces.

Bead of Colla Corii Asinin Soften Colla Corii Asini by gentle heating, cut into small pieces. Scald with clam shell powder as described under the method for scalding (Appendix Ⅱ D) to produce beads without soft core.

Action To nourish *yin* and blood, relieve *dryness*, and arrest bleeding.

Indications Anemia with dizziness; palpitation and muscular weakness; insomnia numbness and tremors due to deficiency of blood; dry cough; hemoptysis, hematemesis, hematuria, excessive menstrual discharge, uterine bleeding during pregnancy.

Usage and dosage 3-9 g, taken after melted in decoction.

Storage Preserve in well closed container.

Colla Cornus Cervi
(鹿角胶, Lujiaojiao)

Deerhorn Glue

Deerhorn Glue is a solid glue prepared from deerhorn by decoction and concentration.

Procedure Saw the deerhorn into pieces, soak in water and rinse until clear. Decoct with water several times, filter, combine the filtrates (or add a little fine powder of alum), allow to stand and filter. Concentrate the glutinous filtrate (or add a quantity of yellow rice wine, crystal sugar, soybean oil) to thick glue, allow to cool and congeal, cut into pieces, and dry in the air.

Description Square flat pieces, yellowish-brown or reddish-brown, translucent, some with a yellowish-white foam layer in the upper part. Texture fragile, easily broken; fracture bright. Odour slight; taste, slightly sweet.

Identification To 0.4 g of the powder add 5 ml of 70% ethanol, ultrasonicate for 15 minutes, filter and use the filtrate as the test solution. Dissolve glycine CRS in 70% ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-butanol, glacial acetic acid and water (3 : 1 : 1) as the mobile phase. Apply separately to the plate 5 μl of the above two solutions. After developing and removal of the plate, dry in air. Spray with ninhydrine TS and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Water Weigh accurately 1 g, add 2 ml of water, heat to dissolve and evaporate to dryness. Keep the thickness not over than 2-3 mm, carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent.

Total ash Not more than 3.0 per cent (Appendix Ⅸ K), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix Ⅸ E, method 2), using the residue obtained under the test for Total Ash, not more than 30 ppm.

Arsenic To 1.0 g add 1 g of calcium hydroxide and a small quantity of water, stir well. After drying, ignite gently at first and then incinerate at 500-600℃. Allow to cool, add 5 ml of hydrochloric acid and 2 ml of water, carry out the limit test for arsenic (Appendix Ⅸ F), not more than 2 ppm.

Insoluble matter in water Weigh accurately 1.0 g of the powder, add 10 ml of water and heat to dissolve. Transfer to a 10 ml centrifuge tube previously dried to constant weight, centrifuge, discard the oil slick on tube wall and the supernatant. Add warm water to volume along the tube wall, centrifuge, wash 3 times in the same manner and discard the supernatant. Heat the centrifugal tube at 105℃ for 2 hours, take out, cool in a dryer for 30 minutes, weigh accurately and calculate, not less than 2.0 per cent.

Other requirements Complies with the general requirements for glues (Appendix Ⅰ G).

Assay Weigh accurately 0.2 g of the powder, carry out the method for determination of nitrogen (Appendix Ⅸ L, method 1), it contains not less than 10.0 per cent of the total nitrogen (N).

Action To warm the kidney, replenish the liver, and to nourish vital essence and blood.

Indications Impotence, spermatorrhea, aching in the loins and knees accompanied with cold sensation; debility and emaciation; abnormal uterine bleeding, hematochezia, hematuria; abscesses in *deficiency-cold* condition.

Usage and dosage 3-6 g, taken after melted decoction.

Specification 6 g per piece.

Storage Preserve in well closed container.

Concha Arcae
(瓦楞子, Walengzi)

Arc Shell

Arc Shell is the shell of *Arca subcrenata* Lischke, *Arca granosa* Linnaeus or *Arca inflata* Reeve (Fam. Arcidae). The drug is collected from autumn or winter to next spring, washed clean, treated with boiling water for a moment, removed from soft part, and dried.

Description *Shell of Arca subcrenata* Somewhat triangular or fan-shaped, 4-5 cm long, 3-4 cm high. The outer surface bulgy, with brownish minute hairs or dropped. The umbo projecting, curling inwards, 30-34 ribs radiated from the umbo to the ventral side. The inner surface of the shell smooth, white, with depressions on the margin corresponding to the ribs on the outer surface. The hinge bearing a row of denticles. Texture hard. Odour, slight; taste, weak.

Shell of Arca granosa 2.5-4 cm long, 2-3 cm high. The outer surface without brownish minute hairs, 18-21 radiate ribs with granular protuberances.

Shell of Arca inflata 7-9 cm long, 6-8 cm high. The outer surface with 42-48 radiate ribs.

Processing *Concha Arcae* Wash clean, dry and break to pieces.

Concha Arcae (calcined) Calcine clean Concha Arcae as described under the method for calcining openly (Appendix Ⅱ D) until it becomes crisp.

Action To eliminate *phlegm*, remove blood stasis, to soften hard masses and dissolve lumps, and relieve gastric pain by reducing acid.

Indications Retention of sticky phlegm difficult to expectorate; goitre, scrofula, masses in the abdomen; gastric pain with acid regurgitation.

Usage and dosage 9-15 g, decocted first.

Storage Preserve in a dry place.

Concha Haliotidis
(石决明, Shijueming)

Abalone Shell

Abalone Shell is the shell of *Haliotis diversicolour*

Reeve, *Haliotis discus hannai* Ino., *Haliotis ovina* Gmelin, *Haliotis ruber* (Leach), *Haliotis asinina* Linnaeus or *Haliotis laevigata* (Donovan) (Fam. Haliotidae). The drug is collected in summer or autumn, removed from the soft part, washed clean, and dried.

Description *Shell of Haliotis diversicolour* Elongate ovoid, inner side somewhat ear-like; 7-9 cm long, 5-6 cm wide, about 2 cm high. The outer surface dark red, with many irregular spiral ribs and fine growth lines; the spire small, the shell body large; more than 20 tubercular protuberances arranged towards right from the apex of the spire part, each of the last 6-9 protuberances with an opening on the same level with the shell surface. The inner surface smooth, with pearlaceous coloured lustre. The shell relatively thick, texture hard, uneasily broken. Odourless; taste, slightly salty.

Shell of Haliotis discus Oblong, 8-12 cm long, 6-8 cm wide, 2-3 cm high. The outer surface greyish-brown, with many rough and irregular wrinkles, growth lines distinct, usually with attachments such as bryozoans or spirobis, each of the last 4-5 protuberances with an opening above the shell surface. The shell relatively thin.

Shell of Haliotis ovina Subrounded, 4-8 cm long, 2.5-6 cm wide, 0.8-2 cm high. The umbo near the mid-portion and higher than the surface of shell, the spire and the shell body each occupying about one half of the shell surface, the border of the spire bearing 2 rows of neat protuberances, more conspicuous at the upper part, the last 4-5 protuberances with tubiform openings.

Shell of Haliotis ruber Flat ovoid, 13-17 cm long, 11-14 cm wide, 3.5-6 cm high. The outer surface brick-red, the spire occupying about one half of the shell surface, the spiral ribs and growth lines wavy ridged; with about 30 tubercular protuberances, each of the last 7-9 protuberances with an opening above the shell surface.

Shell of Haliotis asinina Long and narrow, somewhat twisted, ear-like, 5-8 cm long, 2.5-3.5 cm wide, about 1 cm high. The outer surface smooth, with patterns of jade green, purple, brown colour, etc.; the spire small, the shell body large; each of the last 5-7 protuberances with an opening on the same level with the shell surface, mostly ellipsoidal. The shell thin, texture relatively fragile.

Shell of Haliotis laevigata Ovoid, 11-14 cm long, 8.5-11 cm wide, 3-6.5 cm high. The outer surface brick-red, smooth, the umbo higher than the shell surface, growth lines relatively conspicuous; the spire occupying about one third of the shell surface, about 30 tubercular protuberances, each of the last 9 protuberances with an opening on the same level with the shell surface.

Processing *Concha Haliotides* Eliminate foreign matter, wash clean, dry and break to pieces.

Concha Haliotidis (calcined) Calcine clean Concha Haliotidis as described under the method for calcining openly (Appendix Ⅱ D) until it becomes crisp.

Action To subdue hyperactivity of the liver, quench its *fire* and improve eyesight.

Indications Headache and dizziness; blurred vision due to nebula, optic atrophy and night blindness.

Usage and dosage 3-15 g, decocted first.

Storage Preserve in a dry place.

Concha Margaritifera (珍珠母, Zhenzhumu)

Nacre

Nacre is made of the shell of fresh-water clams, *Hyriopsis cumingii* (Lea) and *Cristaria plicata* (Leach) (Fam. Unionidae) or *Pteria martensii* (Dunker) (Fam. Peteriidae). The drug is collected, removed from muscles, washed clean and dried.

Description *Shell of Hyriopsis cumingii* Somewhat in scalene tetragonal. The growth lines of outer surface arranged in concentric rings, dorsal posterior margin projected upward, forming large triangular sail-like hind wing. The inner surface with distinct trace of mantle; trace of anterior adductor somewhat ovoid, trace of posterior adductor somewhat triangular. Both left and right shells with 2 pseudo-cardinal teeth, left shell with 2 slat lateral teeth, right shell with 1 slat lateral tooth; lustrous. Texture hard. Odour, slightly stinking; taste, weak.

Shell of Cristaria plicata In scalene triangular. Dorsal posterior margin expand upward, forming large crest. The inner surface with somewhat distinct trace of mantle; trace of anterior adductor large and wedge-shaped, trace of posterior adductor irregular ovoid, longitudinal ribs, convex and concave below posterior lateral tooth correspond to those of the outer surface. Both left and right shells with 1 short and slight thick posterior lateral tooth and 1 tiny weak anterior lateral tooth, both with no pseudo-cardinal tooth.

Shell of Pteria martensii In oblique square, posterior ear large, anterior ear small, dorsal margin flat and straight, ventral margin rounded, growth lines very thin and dense, in the form of slices, trace of adductor large, elongate rounded, with 1 protruded long cardinal tooth.

Identification (1) Powder: Whitish. Irregular broken pieces, surface mostly uneven, with distinct granular nature, some in laminated structure, margin mostly irregular serrated.
(2) To the powder, add dilute hydrochloric acid, a lot of bubbles are produced immediately, filter, the filtrate yields the reaction characteristic of calcium salts (Appendix Ⅳ).

Processing *Concha Margaritifera* Eliminate foreign matter, break to pieces.

Concha Margaritifera (calcined) Calcine the clean Concha Margaritifera as described under the method for calcining openly (Appendix Ⅱ D) until it becomes crisp.

Action To subdue hyperactivity of the liver, calm the nerves, and improve vision.

Indications Headache, dizziness, fidgetness and insomnia; inflammation of the eyes due to *heat* in the liver; blurred vision in deficiency of the liver.

Usage and dosage 10-25 g, decocted first.

Storage Preserve in a dry place, protected from dust.

Concha Meretricis seu Cyclinae (蛤壳, Geqiao)

Clam Shell

Clam Shell is the shell of *Meretrix meretrix*

Linnaeus or *Cyclina sinensis* Gmelin (Fam. Veneridae). The drug is collected in summer or autumn, removed from soft part washed clean, dried in the sun.

Description *Shell of Meretrix meretrix* Fan-like or subrounded, the dorsal margin somewhat triangular; the ventral margin arch-like, 3-10 cm long, 2-8 cm high. The umbo projected, slightly near the front of the dorsal side. The outer surface smooth, yellowish-brown, with distinct concentric growth lines, the dorsal part usually with serrated or undulated brown stripes. The inner surface white, no tooth-like stripes at the margin, the front and hind shell margins sometimes slightly purple. The hinge rather wide. The right shell with three cardinal teeth and two front lateral teeth; the left shell with three cardinal teeth and one front lateral tooth. Texture hard, fracture with laminated stripes. Odour, slight; taste, weak.

Shell of Cyclina sinensis Subrounded, the umbo projected, located near the middle of the dorsal side. The outer surface pale yellow or brownish-red, the concentric growth lines projected from the shell, somewhat like circular ribs. The inner surface white or pink, the margin often purple and with neat small tooth-like stripes. Both the right and left shells with three cardinal teeth, but no lateral tooth at the hinge.

Processing *Concha Meretricis seu Cyclinae* Wash clean, break to pieces and dry.

Concha Meretricis seu Cyclinae (*calcined*) Calcine the Concha Meretricis seu Cyclinae as described under the method for calcining openly (Appendix Ⅱ B) until it becomes crisp.

Action To remove *heat* and resolve *phlegm*, soften hard masses and eliminate nodulations, and alleviate epigastric pain by inhibiting acid secretion.

Indications Cough, chest pain and bloody sputum caused by *heat* in the lung; scrofula, goitre; epigastric pain associated with acid regurgitation; external use for eczema and scalds.

Usage and dosage 6-15 g, decocted first; powdered concha; decocted with wrapping; for external use, appropriate quantity is ground into extremely fine powder and sprayed on the lesions or applied topically after mixing with oil.

Storage Preserve in a dry place.

Concha Ostreae (牡蛎, Muli)

Oyster Shell

Oyster Shell is the shell of *Ostrea gigas* Thunberg, *Ostrea talienwhanensis* Crosse or *Ostrea rivularis* Gould (Fam. Osteridae). The drug is collected all the year round, removed from soft part, washed clean, and dried in the sun.

Description *Shell of Ostrea gigas* In elongated pieces, dorsal and ventral edges almost parallel, 10-50 cm long, 4-15 cm high. The right shell relatively small, scales strong and thick, arranged in layers or striated. The outer surface smooth or with several depressions, pale purple, greyish-white or yellowish-brown; the inner surface porcelain white, without denticles at both sides of the umbo. The left shell deeply depressed, scales bigger and more rough than those of the right shell, attachment surface of the umbo small. Texture hard, fracture stratiform, white. Odour, slight; taste, slightly salty.

Shell of Ostrea talienwhanensis Subtriangular, dorsal and ventral edges V-shaped. The outer surface of the right shell pale yellow, concentric scales arranged loosely and undulated up and down; the inner surface white. The left shell bearing strong and thick concentric scales, several distinct ribs radiated from the umbo, the inner surface concaved in box-shaped; hinge surface small.

Shell of Ostrea rivularis Rounded, oval or triangular. The outer surface of the right shell slightly uneven, grey, purple, brown, yellow, etc; concentric scales in a ring, thin and fragile when immature and overlaped one another after several years growth. The inner surface white, sometimes the edge pale purple.

Processing *Concha Ostreae* Wash clean, then dry and grind to pieces.

Concha Ostreae (*calcined*) Calcine the clean Concha Ostreae as described under the method for calcining openly (Appendix Ⅱ D) until it becomes crisp.

Action To induce sedation, to nourish *yin* and subdue the overflowing of *yang*, and to soften hard masses and eliminate nodulation.

Conch Ostreae (*calcined*) To arrest discharge.

Indications Palpitation, insomnia, dizziness and tinnitus; scrofula, masses in the abdomen.

Concha Ostreae (*calcined*) Spontaneous sweating, night sweating; seminal emission; abnormal uterine bleeding, excessive leukorrhea; epigastric pain with acid regurgitation.

Usage and dosage 9-30 g, decocted first.

Storage Preserve in a dry place.

Concretio Silicea Bambusae (天竺黄, Tianzhuhuang)

Tabasheer

Tabasheer is the dired masses of secretion in stem of *Bambusa textilis* McClure or *Schizostachyum chinense* Rendle (Fam. Gramineae). The drug is collected in autumn and winter.

Description Irregular pieces or granules, varying in size. Externally greyish-blue, greyish-yellow or greyish-white, some pure white, translucent, somewhat lustrous. Texture light, hard and fragile, easily broken; strongly hygroscopic. Odour, slight; taste, weak.

Identification (1) Ignite and incinerate a quantity of the drug, dissolve the residue in a mixture of 1 volume of hydrochloric acid and 1 volume of nitric acid, filter. To the filtrate add ammonium molybdate TS, shake, then add ferrous sulfate TS, a blue colour is produced.
(2) Spot 1 drop of potassium ferrocyanide TS to a piece of filter paper, allow to dry, apply 1 drop of the drug solution in hydrochloric acid, 10 drops of water and 1 drop of 0.1% alizarin red solution in ethanol; a red ring in a violet spot is produced on exposing to ammonia vapour.

Volume ratio Place gently 10 g of powder of medium size to a measuring cylinder, the volume is not less than 35 ml.

Water absorbing capacity To 5 g of the powder add 50 ml of water, allow stand for a moment, filter through moistened filter paper, the filtrate is not more than 44 ml.

Action To remove *phlegm-heat*, cool the heart and counteract convulsions.

Indications Impairment of consciousness in febrile diseases, stroke, infantile convulsion and night crying caused by *phlegm-heat*.

Usage and dosage 3-9 g.

Storage Preserve in well closed containers, stored in a dry place.

Cordyceps
(冬虫夏草, Dongchong xiacao)

Chinese Caterpillar Fungus

Chinese Caterpillar Fungus is a composite consisting of the stroma of the fungus, *Cordyceps sinensis* (Berk.) Sacc. (Fam. Hypocreaceae), parasitized on the larva of some species of insects (Fam. Hepialidae), and the dead caterpillar. The drug is collected in early summer while the stromata have come up out of the ground but the spores have not ejected, partially dried in the sun, removed from the attached fibrous matter and other impurities, and dried in the sun or at a low temperature.

Description A dead caterpillar jointed with a stroma growing in the head of the larva. The caterpillar resembling a silkworm, 3-5 cm long, 3-8 mm in diameter; externally deep yellow to yellowish-brown, with 20-30 annulations, some of those near the head relatively fine; head reddish-brown, feet 8 pairs, the 4 pairs in the middle relatively conspicuous; texture fragile, easily broken, fracture slightly even, yellowish-white. Stromata slenderly cylindrical, 4-7 cm long, about 3 mm in diameter; externally deep brown to brown, with fine longitudinal wrinkles, slightly swollen above. Texture flexible, fracture whitish. Odour, fleshy; taste, slightly bitter.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and phosphate BS (pH 6.5) [add 68.5 ml of sodium dihydrogen phosphate solution (0.01 mol/L) to 31.5 ml of disodium hydrogen phosphate solution (0.01 mol/L) and mix well (pH 6.5)] -methanol (17 : 3) as the mobile phase. As detector a spectrophotometor set at 260 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of adenosine.

Reference solution Weigh accurately a quantity of adenosine CRS, add 90% methanol to prepare a solution containing 20 μg per ml and use as the reference solution.

Test solution Weigh accurately about 0.5 g of the powder (through No. 3 sieve) in a stoppered conical flask, add accurately 10 ml of 90% methanol, stopper tightly, mix well and weigh the quantity, heat and reflux for 30 min, allow to cool, weigh again, add 90% methanol to the definite weight, mix well, filter, collect the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution respectively into the column, determine and calculate the content.

It contains not less than 0.010 per cent of adenosine ($C_{10}H_{13}N_5O_4$).

Action To tonify the lung and the kidney, arrest bleeding, and dissolve *phlegm*.

Indications Chronic cough and asthma; hemoptysis in phthisis; impotence and seminal emission with aching of loins and knees.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place, protected from moth.

Coriolus
(云芝, Yunzhi)

Coriolus Versicolour Sporphore

Coriolus Versicolour Sporphore is the dried sporphore of *Coriolus versicolour* (L. ex Fr.) Quel. (Fam. Polyporaceae). The drug is collected all the year, removed from foreign matter, and dried in the sun.

Description The single pileus fan-shaped, semi-rounded or conchoidal, usually piled as imbricated or torus-shaped of lotus flower, 1-10 cm in diameter, 1-4 mm thick. Surface with gray, brown, blue, and purplish-black hairs, densely grown, arranged in the concentric circles with several colour, edge thin. The ventral part grayish-brown, yellowish-brown, or pale yellow, and white at the others, fungi tubes arranging densely, the opening almost round or polygonal, some of them with terminal teeth. Shell's texture leathery, uneasily broken, fracture sub-white, about 1 mm thick, fungi tubes mono layer, 0.5-2 mm, mostly pale brown the opening round or polygonal, 3 to 5 cells per mm^2. odour, light; taste, weak.

Identification (1) Longitudinal section: Observing under an anatomic microscope: Shell exterior with hairs layer, composed of different hyphaes in length, no branch, arranging densely, containing numerous pigment granules. Sporphore layer thick, colourless, hyphaes arranging densely. Fungi tube layer situated at the lowest-side, composed of fungi tubes, and arranging in order.

Powder: Pale yellow. Spores cylinder, curved slightly, 5-7 μm long, 2-3 μm in diameter, composed of two walls, out wall flat and colourless, inner wall pale brown. Hyphae divided four kinds: hair hypha colourless, one or some cells connected, no branch, 3-5 μm in diameter, wall with numerous granular substance; skeleton hypha relatively wide, 5-7 μm in diameter, no branch, cell wall relatively smooth, colourless; the wall of breeding hypha very thin and transparent, 3-4 μm in diameter, no branch, cell wall smooth; entwining hypha relatively thin, 1.5-4 μm in diameter, usually curved.

(2) To 2 g of the coarse powder add 20 ml of water, heat on a water bathe for 10 minutes, filter. To 2 ml of filtrate add 4-5 drops of alkaline cupric tartrate TS, heat on a water bathe for 5 minutes. A red precipitate is produced.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 4.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of water-soluble extractives (Appendix Ⅹ A), not less than 18.0 per cent.

Assay ***Total saccharides*** Weight accurately 5 g of the coarse powder to a conical flask, add accurately 120 ml of water, weigh and heat under reflux on a water bath for 60 minutes, cool, weigh again and restore the original weight

with water to the initial weight, mix well, Filter through cotton wool. Measure accurately 10 ml of the filtrate, add 1-2 drops of phenolphthalein IS, and regulate the pH to neutral reaction with sodium hydroxide TS, add 25 ml of dilute sulfuric acid, heat under reflux on a water bath for 4 hours, cool to the room temperature, add accurately 25 ml of iodine (0.1 mol/L) VS, add dropsically 4 ml of sodium hydroxide TS and shake violently, stopper tightly, put in a dark place for 10 minutes, add 4 ml of dilute sulfuric acid, titrate immediately with sodium thiosulfate (0.1 mol/L) VS. Add 2 ml of starch IS near by the terminal point, titrate continually until the blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of iodine (0.1 mol/L) is equivalent to 9.008 mg of anhydrous glucose ($C_6H_{12}O_6$).

Monosaccharide Measure accurately 40 ml of filtrat prepared as 'Total saccharides', add 1-2 drops of phenolphthalein IS, and adjust the pH to neutral with sodium hydroxide TS, and proceed as described under 'Total saccharides', beginning at the words "add accurately 25 ml of iodine (0.1 mol/L) VS, …". Each ml of iodine (0.1 mol/L) is equivalent to 9.008 mg of anhydrous glucose ($C_6H_{12}O_6$).
The content of mono saccharide subtracted from the content of Total saccharides is the content of Coriolus saccharide.
It contains not less than 3.2 per cent of Coriolus saccharide, calculated as anhydrous glucose ($C_6H_{12}O_6$), with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, and dry.

Action To regulate the immunity function.

Indications Chronic hepatitis and active hepatitis.

Usage and dosage 9-27 g.

Storage Preserve in a ventilated and dry place.

Cornu Bubali
(水牛角, Shuiniujiao)

Buffalo Horn

Buffalo Horn is the horn of *Bubalus bubalis* Linnaeus (Fam. Bovidae). The drug is boiled with water, removed from bony plug, and dried.

Description Somewhat flattened and curved conical, varying in length. The surface brownish-black or greyish-black, with several transverse grooves on one side, and densely transverse depressed stripes on the other side. The upper part gradually pointed, with longitudinal stripes; the basal part somewhat triangular, hollowed. Texture horny, hard. Odour, slightly stinking; taste, weak.

Identification Powder: Greyish-brown. Irregular broken pieces pale greyish-white or greyish-yellow. In longitudinal section, slender spindle-shaped striations, longitudinal slits and minute greyish-brown pigment granules visible. In transverse section, spindle shaped striations parallely arranged, waved, with many yellowish-brown pigment granules. The surface of some broken pieces relatively even, pigment granules and slits less, poorly visible.

Processing Wash clean, cut to slices or file to coarse powder.

Action To remove *toxic-heat*, reduce *heat* in blood, and arrest convulsion.

Indications High fever, delirium and eruptions in epidemic diseases; spitting of blood, epistaxis; convulsion, mania.

Usage and dosage 15-30 g, decocted first over 3 hours.

Storage Preserve in a dry place, protected from mould.

Cornu Cervi
(鹿角, Lujiao)

Deer Horn (Antler)

Deer Horn is the ossified antler, or antler base which fallen off in the next spring after the pilose antler is cut, of *Cervus elaphus* Linnaeus or *Cervus nippon* Temminck (Fam. Cervidae), commonly known as "malujiao (red deer antler)", "Meihualujiao (sika deer antler)", "Lujiao tuopan (dropped disk of antler)" respectively. The drug is collected in spring, removed from mud and sand, dried in air.

Description *Malujiao* Branched, usually divided into 4-6 branches, 50-120 cm in total length. The main branch curved, 3-6 cm in diameter. The plate-like basal part with irregular protuberances, commonly known as "Zhenzhupan" (pearl plate), usually with sparse small pores at the margin of the plate. The side branches mostly stretched toward one side. The first side branch near the pearl plate, almost in right angle or in obtuse angle to the main branch; and the second branch stretched near the first one, commonly known as "Zuodifenzhi" (branches sit on the ground); the second branch is relatively apart from the third one. Externally greyish-brown or greyish-yellow, lustrous, tip smooth; the middle and lower parts usually with warty tubercles known as "Guding" (bony nail) and interrupted longitudinal ridges varying in length, commonly known as "Kugualeng" (balsam pear ridges). Texture hard. The outer part of the fracture bony, greyish-white or slightly brown, the central part usually greyish-brown or slaty, with honeycomb-like pores. Odour, slight; taste, slightly salty.

Meihualujiao Usually divided into 3-4 branches, 30-60 cm in total length, 2.5-5 cm in diameter. The side branches mostly stretched towards two sides. The first side branch near the pearl plate, the second one relatively apart from the first one. The end of the main branch divided into two small branches. Externally yellowish-brown or greyish-brown, the end of branches greyish-white, with distinct bony nails below the end of branches, and longitudinally arranged in the form of "Kugualeng". The tip of the bony nails greyish-white or greyish-yellow, lustrous.

Lujiaotuopan In helmet or flattened helmet, 3-6 cm in diameter (pearl plate 4.5-6.5 cm in diameter), 1.5-4 cm high. Externally greyish-brown or greyish-yellow, lustrous. Bottom surface even, honeycomb-like, mostly yellowish-white or yellowish-brown. The margin of the pearl plate usually with sparse small pores. The upper surface slightly even or irregular semispheroidal in shape. Texture hard. The outer part of the fracture bony, greyish-white or whitish.

Extractives Pulverize about 10 g of the transverse slices to midium powder, and stir well. Weigh accurately 4 g into a beaker, add 90 ml of water, heat to boil and keep slight boiling for 1 hour (make up the loss in water constantly), filter while hot, wash the residue with 10 ml of hot water, filter. Combine the filtrate to a 100 ml of volumetric flask, dilute with water to volumn. Measure accurately 25 ml of the solution, carry out the method for determination of water-soluble extractives (Appendix X A, the hot extraction method), not less than 17.0 per cent.

Processing Wash clean, saw into sections, soak in warm water, take out, cut into slices and dry in air; or powder with a file.

Action To warm the kidney and strengthen the tendons and bones, and promote blood circulation and cause subsidence of swelling.

Indications Impotence, seminal emission, back pain with cold sensation; abscesses in *deficiency-cold* condition ulcers and sores; mastitis at early stage marked by congestion, swelling and pain.

Usage and dosage 6-15 g.

Storage Preserve in a dry place.

Cornu Cervi Degelatinatum (鹿角霜, Lujiaoshuang)

Degelatined Deer-horn

Degelatined Deer-horn is the piece of antler removed from gelatin. The drug is produced in spring or autumn. The ossified antler is decocted to eliminate the gelatin. The piece of antler is taken out, and dried.

Description Long cylindrical or irregular pieces, varying in size. The surface greyish-white and powdery, often with longitudinal ridges, occasionally with grey or greyish-brown dots. Light, texture crisp, the outer layer of fracture relatively dense, white or greyish-white, the inner layer greyish-brown or greyish-yellow, with honeycomb-like pores. Hygroscopical. Odour, slight; taste, weak, with sense of sticky to teeth on chewing.

Processing Break to pieces before use.

Action To reinforce the *kidney-yang*, and arrest bleeding.

Indications *Yang-deficiency* of the spleen and the kidney characterized by anorexia, vomiting, diarrhea, excessive leukorrhea, enuresis or frequent urination; abnormal uterine bleeding; subcutaneous infection and nodulation.

Usage and dosage 9-15 g, decocted first.

Storage Preserve in a dry place.

Cornu Cervi Pantotrichum (鹿茸, Lurong)

Pilose Antler

Pilose Antler is the young unossified hairy antler of male *Cervus nippon* Temminck or *Cervus elaphus* Linnaeus (Fam. Cervidae). The former is known as "Hualurong" (sika deer pilose antler), the later known as "Malurong" (red deer pilose antler). The drug is collected in summer or autumn, processed, and dried in the shade or bake-dried.

Description *Hualurong* Branched, cylindrical. The antler with one side branch commonly known as "Ergang" (double branches); the main branch as "Dating" (big branch), 17-20 cm long, cut surface 4-5 cm in diameter; the side branch arosing at about 1 cm from the cut surface known as "Menzhuang" (side branch), 9-15 cm long, slightly smaller than "Dating" in diameter. The outer skin reddish-brown or brown, usually lustrous, densely covered with reddish-yellow or brownish-yellow soft hairs, relatively thick at the upper end, and sparse at the lower end, a greyish-black vein at the base between the main and side branches, the skin and hairs nestled closely each other. The cut surface yellowish-white, without bony element in the outer part, small pores densely distributed in the central portion. Texture light. Odour, slightly stinking; taste, slightly salty. The antler with two side branches commonly known as "Sancha" (triple branches), "Dating" 23-33 cm long and smaller than that of "Ergang" in diameter, slightly bow-shaped and flattened, the tip slightly pointed, the lower part usually bearing longitudinal ridged veins and lumps. Skin reddish-yellow, the soft hairs relatively sparse and thick.
The autumn pilose antler similar to the summer pilose antler, but "Dating" is longer and not round or lower part thicker than upper part, the lower part with longitudinal ridged veins. Skin greyish-yellow, the soft hairs relatively coarse. The outer part of the cut surface usually ossified. Rather heavy. No stinking odour.

Malurong Larger and thicker than Hualurong, more branched. The antler with one, two, three, four or more side branches commonly known as "Danmen" (single side branch), "Lianhua" (lotus), "Sancha" (triple side branches) and "Sicha" (quadruple side branches) respectively. Also divided into "Dongmalurong" (east red deer pilose antler) and "Ximalurong" (west red deer pilose antler) according to the producing area.

Dongmalurong "Dating" of "Danmen" 25-27 cm long, about 3 cm in diameter. The outer skin greyish-black, soft hairs greyish-brown or greyish-yellow. The outer skin of the cut surface rather thick, greyish-black. The central portion of the cut surface densely with small pores. Texture of the "Danmen" tender. "Dating" of "Lianhua" up to 33 cm long, with ridged veins at the lower part, the cut surface with relatively larger honeycomb-like pores. The skin of "Sancha" dark, texture rather tough. "Sicha" with sparse and thick soft hairs; the lower part of "Dating" with ridged veins and lumps, tip usually without soft hairs, commonly known as "Niantou" (hairless tip).

Ximalurong "Dating" 30-100 cm long, usually not round, tip round or flattened. The surface with ridges but usually shrunken and shrivelled. The branches rather long and curved; the soft hairs thick and long, grey or greyish-black. The cut surface in a relative dark colour and usually bony. Odour, stinking; taste, salty.

Identification (1) To about 0.1 g of the powder add 4 ml of water, heat for 15 minutes, cool and filter. To 1 ml of the filtrate add 3 drops of ninhydrin TS, mix well, boil for several minutes, a bluish-violet colour is produced. To another 1 ml of the filtrate add 2 drops of 10% sodium hydroxide solution, mix well, and add 0.5% cupric sulfate solution dropwise, a bluish-violet colour is produced.
(2) To 0.4 g of the powder add 5 ml of 70% ethanol, ultrasonicate for 15 minutes, filter, and use the filtrate as the test solution. Prepare a solution of 0.4 g of Cornu Cervi Pantotrichum reference drug in the same manner as the reference drug solution. Dissolve glycine CRS in 70% ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G mixed with carboxymethylcellulose sodium as the coating substance and a mixture of *n*-butanol, glacial acetic acid and water (3 : 1 : 1) as the mobile phase. Apply separately to the plate 8 μl of the test solution and the reference drug solution respectively, and 1 μl of the reference solution. After developing and removal of the plate, dry in air. Spray with 2% solution of ninhydrin in acetone and heat at 105℃ to the spots clear. The main spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in

the chromatogram obtained with the reference solution.

Processing *Cornu Cervi Pantotrichum (sliced)* Burn away the soft hairs, scrape clean, wrap it with a clothing band, add hot white rice wine into the small holes on the cut surface until it is softened thoroughly or steam briefly after filled with wine, cut into thin slices, press, and dry.

Cornu Cervi Pantotrichum (powdered) Burn away the soft hairs, scrape clean, split into pieces and pulverize.

Action To reinforce *kidney-yang*, replenish vital essence and blood, and strengthen the tendons and bones, regulate thorouphfare and conception vessels, and promote the bursting of abscess and drainage of pus.

Indications Impotence, spermatorrhea, or frigidity and infertility; emaciation, lassitude, aversion to cold, dizziness, tinnitus, impairment of hearing, back pain accompanied with cold sensation, and weakness of the limbs; abnormal uterine bleeding and leukorrhea; chronic sores difficult to heal.

Usage and dosage 1-2 g ground into fine powder and taken liquid with it.

Storage Preserve in well closed containers, stored in a cool and dry place, protected from moth.

Cornu Saigae Tataricae (羚羊角, Lingyangjiao)

Antelope Horn

Antelope Horn is the horn of *Saiga tatarica* Linnaeus (Fam. Bovidae). The drug is sawed off from the animal, dried in the sun.

Description Elongated conical, somewhat arciform curved, 15-33 cm long; whitish or yellowish-white, basal part somewhat slaty. The younger branch smooth, with jade-like lustre, fine blood vessels or purplish-black patterns visible when seen against light, without crackles. The older branch with fine longitudinal crackles. The main part, except the pointed end, with 10-16 raised circular ridges, about 2 cm apart each other, when held with hand, four fingers just embeded in the sunken parts. Cross section of basal part rounded, 3-4 cm in diameter, with a hard, heavy bony core, commonly known as "Gusai" (bony plug). The bony core about one-half or one-third of the total length, the surface with raised longitudinal ridges inlaid closely with the depressed furrows of inner side of the horny sheath, the hinge serrated in cross section. The lower half of the horn hollow when the bony core removed. Whole horn translucent, the centre of the upper half with a faintly distinguishable thin canal leading directly to the apex when seen against light. The canal commonly known as "Tongtianyan" (the hole leading to the sky). Texture hard. Odour, slight; taste, weak.

Identification Transverse section: Somewhat undulated. The undulation most clear at the apex, usually with bundles in the peak, the bundles mostly triangular; the undulation somewhat clear in the middle portion, bundles mostly shaped like a double convex lens; the undulation indistinct in the basal portion, bundles elliptical to subrounded. Medullary cavities varying in size, 10-50 (80) μm in long diameter, largest in the basal part. Cortical cells of the bundles flattened shuttle shaped, in 3-5 layers. Interval between bundles relatively wide, filled with subisodiameteric polygonal, elongate rhombic or narrow elongated basic horny cells. Both of the cortical cells or basic horny cells colourless, transparent, without or only with a few minute pale grey pigment granules, with a strong refractive round granule or thread-like substance in the centre of the cell.

Processing *Cornu Saigae Tataricae (sliced)* Soak in warm water, take out, cut into thin slices, and dry.

Cornu Saigae Tataricae (powdered) Break, and pulverize to powder.

Action To remove *heat* from liver, arrest convulsion, improve vision, and remove toxic substances from blood.

Indications High fever with convulsion and impairment of consciousness; syncope, epilepsy, mamia; headache and dizziness; redness of the eye with corneal opacity; epidemic febrile diseases with eruption; carbuncles, abscesses and sores.

Usage and dosage 1-3 g, decocted alone over 2 hours; ground with liquid or ground into powder, 0.3-0.6 g each time.

Storage Preserve in a cool and dry place.

Cortex Acanthopanacis (五加皮, Wujiapi)

Slenderstyle Acanthopanax Bark

Slenderstyle Acanthopanax Bark is the dried root bark of *Acanthopanax gracilistylus* W. W. Smith (Fam. Araliaceae). The root is collected in summer and autumn, washed clean, the bark is stripped off, and dried in the sun.

Description Irregular quills, 5-15 cm long, 0.4-1.4 cm in diameter, about 2 mm thick. Outer surface greyish-brown, with slightly twisted longitudinal wrinkles and transverse lenticel-like scars; inner surface pale yellow or greyish-yellow, with fine longitudinal striations. Texture light, fragile, easily broken, fracture irregular, greyish-white. Odour, slightly aromatic; taste, slightly pungent and bitter.

Identification Transverse section: Cork cells several layers. Cortex narrow, scattered with a few secretory canals. Phloem broad, with clefts in the outer part, rays 1-5 cells wide; secretory canals fairly frequent, surrounded with 4-11 secretory cells. Parenchymatous cells containing clusters of calcium oxalate and small starch granules.
Powder: Greyish-white. Clusters of calcium oxalate 8-64 μm in diameter, sometimes the crystal cells linked together, with clusters arranged in rows. Cork cells rectangular or polygonal, thin-walled; sometimes the walls of cork cells of older root barks unevenly thickened, less pitted. Fragments of secretory canals containing colourless or pale yellow secretion. Starch granules abundant, simple granules polygonal or subspherical, 2-8 μm in diameter; compound granules consisting of 2 to tens of components.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry in the sun.

Action To relieve rheumatic condition, and tonify the liver and the kindney, and strengthen the tendons and bones.

Indications Rheumatic or rheumatoid arthralgia with flaccidity of extremities; retarded walking and lack of strength in children; edema.

Usage and dosage 4.5-9 g.

Storage Preserve in a dry place, protected from mould and moth.

Cortex Ailanthi
(椿皮，Chunpi)

Tree-of-heaven Bark

Tree-of-heaven Bark is the dried root bark or stem bark of *Ailanthus altissima* (Mill.) Swingle (Fam. Simaroubaceae). The drug is collected all year round, dried in the sun or dried in the sun after removing the coarse bark.

Description Root bark: Irregular pieces or quills, varying in size, 0.3-1 cm thick. Outer surface greyish-yellow or yellowish-brown, rough, with numerous longitudinal lenticel-like prominences, and irregularly fissured transversely and longitudinally; outer surface of the drug free from rough bark, yellowish-white. Inner surface pale yellow, relatively even, densely covered with small spindle-shaped holes or spots. Texture hard and fragile; fracture granular at the outer part, fibrous at the inner part. Odour, slight; taste, bitter.

Stem bark: Irregular plates or pieces, varying in size, 0.5-2 cm thick. Outer surface greyish-black, very rough and deeply fissured.

Identification (1) Powder of root bark: Pale greyish-yellow. Stone cells numerous, subrounded, subsquare or irregular, 24-96 μm in diameter, walls thickened, or thicker on three sides and thinner on one side, some containing prisms of calcium oxalate. Fibres 20-40 μm in diameter, walls extremely thickened and lignified. Prisms of calcium oxalate 11-48 μm in diameter; clusters up to 48 μm in diameter. Starch granules subspherical or ovoid, 3-13 μm in diameter.

Powder of stem bark: Greyish-yellow. Fragments of cork cells numerous, clusters of calcium oxalate occasionally present, starch granules absent.

(2) To 2 g of the powder add 20 ml of ether, ultrasonicate for 15 minutes, filter, expel the filtrate to dryness. dissolve the residue in 1 ml of ethanol as the test solution. Prepare a solution with 2 g of Cortex Ailanthi reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (4 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 11.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol TS as the solvent, not less than 5.0 per cent.

Processing *Cortex Ailanthi* Eliminate foreign matter, wash clean, soften thoroughly, cut into slivers or sections, and dry.

Cortex Ailanthi (*stir-baked with bran*) Stir-bake the slivers of Cortex Ailanthi as described under the method for stir-baking with bran (Appendix Ⅱ D) until a slightly yellow colour is produced.

Action To remove *damp-heat* and arrest discharge (leukorrhea, diarrhea and hemorrhage).

Indications Morbid leukorrhea; diarrhea caused by *damp-heat*; chronic diarrhea, chronic dysentery; hematochezia, abnormal uterine bleeding.

Usage and dosage 6-9 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Cortex Albiziae
(合欢皮，Hehuanpi)

Silktree Albizia Bark

Silktree Albizia Bark is the dried stem bark of *Albizia julibrissin* Durazz. (Fam. Leguminosae). The drug is collected in summer and autumn, and dried in the sun.

Description Quilled or semi-quilled, 40-80 cm long, 1-3 mm thick. Outer surface greyish-brown, somewhat longitudinally wrinkled, some shallowly fissured, with dense and distinct transversal elliptical lenticels, brown or brownish-red, occasionally showing prominent transversal ribs or some large rounded branch scars, and often covered with patches of lichens; inner surface pale yellowish-brown or yellowish-white, smooth, with fine and dense longitudinal striations. Texture hard and fragile, easily broken, fracture fibrously laminated, pale yellowish-brown or yellowish-white. Odour, slightly aromatic; taste, weak, slightly astringent and slightly irritating, with a disagreeable sensation in the throat afterwards.

Identification (1) Powder: Greyish-yellow. Stone cells suboblong, subrounded, rectangular, slat-shaped or irregular, 16-58 μm in diameter, walls relatively thickened, pit canals distinct, some branched. Fibres slender, 7-22 μm in diameter, usually in bundles, surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres, the walls of cells containing crystals unevenly thickened, lignified or slightly lignified. Prisms of calcium oxalate 5-26 μm in diameter. Parenchymatous cells of phloem relatively small, walls slightly thickened with rounded pits in radial sectional view, some aggregated to pit groups; the walls somewhat beaded in tangential sectional view.

(2) To 1 g of the powder add 30 ml of methanol, ultrasonicate for 30 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in dehydrated ethanol as the test solution. Prepare a solution, with 1 g of Cortex Albiziae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, methanol and formic acid (6 : 0.5 : 0.1) as the mobile phase. Apply separately to the plate 3 μl of each of the above two solutions. After developing and removal of the plate, dry in air, and expose to iodine vapour to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Not more than 10.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol TS as the solvent, not less than 12.0 per cent.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into slivers or pieces, and dry.

Action To ease the mind and indue tranquillization, and cause subsidence of swelling by activating blood circulation.

Indications Distractibility, melancholy and insomnia; lung abscess; sores and traumatic injuries.

Usage and dosage 6-12 g; for external use, appropriate quantity is ground into powder, mixed with liquid and applied topically.

Storage Preserve in a ventilated and dry place.

Cortex Cinnamomi (肉桂, Rougui)

Cassia Bark

Cassia Bark is the dried stem bark of *Cinnamomum cassia* Presl (Fam. Lauraceae). The drug is frequently collected in autumn, and dried in the shade.

Description Channelled or quilled, 30-40 cm long, 3-10 cm wide or in diameter, 2-8 mm thick. Outer surface greyish-brown, slightly rough, with irregular fine wrinkles and transverse protruding lenticels, some showing greyish-white streaks; inner surface reddish-brown, somewhat even, with fine longitudinal striations and exhibiting oily trace on scratching. Texture hard and fragile, easily broken, fracture uneven, outer layer brown and relatively rough, inner layer reddish-brown and oily, showing a yellowish-brown line between two layers. Odour, strongly aromatic; taste, sweet and pungent.

Identification (1) Transverse section: Cork cells several layers, the innermost layer of cells with thickened and lignified outer walls. Cortex scattered with stone cells and secretory cells. Pericycle stone cells in groups arranged in an interrupted ring, accompanied by fibre bundles at outer side, the outer walls of stone cells usually thinner. Phloem rays 1-2 cells wide, containing minute needle crystals of calcium oxalate; fibres usually 2-3 in bundles; oil cells scattered throughout. Parenchymatous cells containing starch granules.
Powder: Reddish-brown. Most of fibres singly scattered, long fusiform, 195-920 μm long, up to 50 μm in diameter, walls thickened and lignified, pits indistinct. Stone cells subsquare or subrounded, 32-88 μm in diameter, walls thickened, some thin at one side. Oil cells subrounded or oblong, 45-108 μm in diameter. Needle crystals minute, scattered in ray cells. Cork cells polygonal, containing reddish-brown contents.
(2) Macerate 0.5 g of the powder with 10 ml of ethanol for 20 minutes with frequent shaking in a stopper flask and filter, use the filtrate as the test solution. Dissolve cinnamic aldehyde CRS in ethanol to prepare a solution containing 1 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G-as the coating substance, and a mixture of petroleum ether (60-90℃) and ethyl acetate (17 : 3) as the mobile phase. Apply separately to the plate 2-5 μl of the test solution and 2 μl of the reference solution. After developing and removal of the plate, dry in air, spray with ethanolic 2,4-dinitrophenylhydrazine TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 15.0 per cent (Appendix Ⅸ H, method 2).

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Assay ***Volatile oil*** Carry out the method for determination of volatile oil (Appendix Ⅹ D, method B).
It contains not less than 1.2 per cent (ml/g) of volatile oil.

Cinnamic aldehyde Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (35 : 75) as the mobile phase. As detector a spectrophotometer set at 290 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of cinnamic aldehyde.

Reference solution Dissolve a quantity of cinnamic aldehyde CRS, weighed accurately, in methanol to prepare a solution containing 10 μg per ml.

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve) in a stopper conical flask, add accurately 25 ml of methanol, weigh, ultrasonicate (power 350 W, frequency 35 kHz) for 10 minutes, stand overnight, ultrasonicate in the same manner, weigh again, compensate the loss of the weight with methanol, mix well and filter. Measure accurately 1 ml of the successive filtrate in a 25 ml volumetric flask, add methanol to volume, and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 1.5 per cent of cinnamic aldehyde (C_9H_8O), calculated with reference to the dried drug.

Processing Eliminate foreign matter and rough bark. Pound to pieces before use.

Action To reinforce *yang*, and lead the *fire* back to the kidney, dispel *cold* and relieve pain, and activate blood circulation and stimulate menstrual discharge.

Indications Impotence, frigidity, feeling of cold and pain in the loins and knees; dyspnea in deficiency of the kidney; dizziness, inflammation of the eyes and sore throat due to *yang-deficiency*; precordial and abdominal pain with cold sensation, vomiting and diarrhea in *deficiency-cold* syndrome; neurosis with a feeling of gas rushing up through the chest to the throat from the lower abdomen; amenorrhea, dysmenorrhea.

Usage and dosage 1-4.5 g.

Precaution Used with caution in the patients with bleeding tendency or pregnancy. Incompatible with Halloysitum Rubrum.

Storage Preserve in a cool and dry place.

Cortex Dictamni (白鲜皮, Baixianpi)

Densefruit Pittany Root-bark

Densefruit Pittany Root-bark is the dried root bark of

Dictamnus dasycarpus Turcz. (Fam. Rutaceae). The root is collected in spring and autumn, removed from soil and rough bark. The root bark is stripped off and dried.

Description Quilled, 5-15 cm long, 1-2 cm in diameter, 2-5 mm thick. Outer surface greyish-white or pale greyish-yellow, with fine longitudinal wrinkles and rootlet scars, frequently with small protruding granular dots; inner surface almost white, with fine longitudinal striations. Texture fragile, dusting on breaking, fracture uneven and somewhat lamellar, when outer layer peeled off, numerous glittering small spots observed on exposing to light. Odour, muttony; taste, slightly bitter.

Identification (1) Transverse section: Cork cells 10 or more layers. Cortex narrow, fibres mostly scattered singly, yellow, 25-100 μm in diameter, walls thickened and obviously striated. Phloem broad, rays 1-3 cells wide; fibres singly scattered. Parenchyma containing abundant clusters of calcium oxalate, 5-30 μm in diameter.
(2) To 1 g of the powder add 50 ml of ethanol, ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness. dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution with 1 g of Cortex Dictamni reference drug in the same manner as the reference drug solution. Dissolve fraxinellon in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (10 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the above three solutions. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Water Not more than 14.0 per cent (Appendix Ⅸ H, method 1).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of water-soluble extractives (Appendix Ⅹ A, the cold maceration method), not less than 20.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (62 : 38) as the mobile phase. As detector a spectrophotometer set at 218 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of fraxinellon.

Reference solution Dissolve a quantity of fraxinellon CRS, weighed accurately, in methanol to prepare a solution containing 60 μg per ml.

Test solution Weigh accurately 0.5 g of the coarse powder (dried at 60℃, through No. 4 sieve) to a flat-bottomed flask, add 50 ml of ethanol, ultrasonicate (power 220 W, frequency 50 kHz) for 30 minutes, filter. Add 50 ml of ethanol to the residue, ultrasonicate again, and filter. Combine the filtrates, recover ethanol in vaccum, dissolve the residue in methanol and transfer to a 5 ml volumetric flask, add methanol to volume, mix well.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.030 per cent of fraxinellon ($C_{12}H_{14}O_3$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften briefly, cut into thick slices, and dry.

Action To remove *damp-heat* and *toxicity* and dispel *wind*.

Indications Skin inflammation with yellowish watery discharge, eczema, rubella, tinea, scabies; acute rheumatic arthritis; jaundice with dark urine.

Usage and dosage 4.5-9 g; for external use, appropriate quantity is decocted for washing or ground into powder for topical application.

Storage Preserve in a ventilated and dry place.

Cortex Eucommiae (杜仲, Duzhong)

Eucommia Bark

Eucommia Bark is the dried stem bark of *Eucommia ulmoides* Oliv. (Fam. Eucom-miaceae). The drug is collected from April to June, removed from the coarse bark, piled up until the inner surface becomes purplish-brown, and dried in the sun.

Description Flat pieces, or two edges somewhat curved inwards, varying in size, 3-7 mm thick. Outer surface pale brown or greyish-brown, markedly wrinkled or fissured and channelled longitudinally; some barks relatively thin, showing distinct lenticels when the coarse bark unscraped; inner surface dark purple, smooth. Texture fragile, easily broken, fracture linked up by fine, dense, silvery and elastic rubber threads. Odour, slight; taste, slightly bitter.

Identification (1) Powder: Brown. Rubber threads stripe-shaped or twisted into masses, surface granular. Stone cells numerous, mostly in groups, subrectangular, subrounded, elongated-rectangular or irregular, 20-80 μm in diameter, up to 180 μm long, thick-walled, some containing rubber masses. Cork cells polygonal in surface view, 15-40 μm in diameter, with unevenly thickened, lignified and finely pitted walls; rectangular in lateral view, walls thickened on three sides and relatively thin on one side, pit canals distinct.
(2) Macerate 1 g of the powder in 10 ml of chloroform for 2 hours and filter. Evaporate the filtrate to dryness, add 1 ml of ethanol; an elastic film is produced.

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using 75% ethanol as the solvent, not less than 11.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecyl-silane bonded silica gel as the stationary phase and a mixture of methanol and water (25 : 75) as the mobile phase. As detector a spectrophotometer set at 277 nm. The number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of pinoresinol diglu-coside.

Reference solution Dissolve a quantity of pinoresinol diglucoside CRS, accurately weighed, in methanol to produce a solution containing 0.5 mg per ml, and mix well.

Test solution Take about 3 g of the drug, cut into pieces

and knead into flock. Transfer 2 g, accurately weighed, to a Soxhlet's extractor, add a quantity of chloroform, and heat under reflux for 6 hours. Discard the chloroform solution, expel chloroform of the residue, and transfer again to a Soxhlet's extractor, add a quantity of methanol and heat under reflux for 6 hours. Concentrate the methanol extract to an appropriate volume, then transfer to a 10 ml volumetric flask, add methanol to volume, shake well, and filter.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.10 per cent of pinoresinol diglucoside ($C_{32}H_{42}O_{16}$).

Processing *Cortex Eucommiae* Scrap off the remains of coarse bark, wash clean, cut into pieces or slivers, and dry.

Cortex Eucommiae (processed with salt) Stir-bake the pieces or slivers of Cortex Eucommiae as described under the method for stir-baking with salt-water (Appendix Ⅱ D) until the rubber threads broken off and the surface charred. Pieces or slivers, externally charred. Elasticity of the rubber threads weak when broken. Taste, slight salty. Perform the determination of extractives in the same manner as described above, not less than 12.0 per cent.

Action To tonify the liver and the kidney, to strengthen the tendons and bones, and prevent miscarriage.

Indications Deficiency condition of the kidney marked by lumbago and lack of strength; threatened abortion; hypertension.

Usage and dosage 6-9 g.

Storage Perserve in a ventilated and dry place.

Cortex Fraxini
(秦皮, Qinpi)

Ash Bark

Ash Bark is the dried branch bark or stem bark of *Fraxinus rhynchophylla* Hance, *Fraxinus chinen-sis* Roxb., *Fraxinus szaboana* Lingelsh. or *Fraxinus stylosa* Lingelsh. (Fam. Oleanaceae). The drug is collected in spring and autumn, dried in the sun.

Description *Branch bark* Quilled or channelled, 10-60 cm long, 1.5-3 mm thick. Outer surface greyish-white, greyish-brown to blackish-brown, or alternated in patches, even or slightly rough, with greyish-white and rounded dotted lenticels, and fine oblique wrinkles, some with branch scars; inner surface yellowish-white or brown, smooth. Texture hard and fragile, fracture fibrous, yellowish-white. Odour, slight; taste, bitter.

Stem bark Slat pieces, 3-6 mm thick. Outer surface greyish-brown, with rimose furrows and reddish-brown rounded or transversal lenticels. Texture hard, fracture relatively fibrous.

Identification (1) Macerate the drug in hot water, the extract shows a bright blue fluorescence in daylight.
(2) Transverse section: Cork cells 5-10 layers. Phelloderm consisting of several layers of polygonal collenchymatous cells. Cortex relatively wide, fibres and stone cells scattered singly or in groups. The annular band composed of stone cells and fibre bundles occurring in pericycle, occasionally interrupted. Phloem rays 1-3 cells wide; fibre bundles and some stone cells arranged in layers, intercrossed with rays in "#" shape. Parenchymatous cells containing sandy crystals of calcium oxalate.
(3) Heat under reflux 1 g of the powder with 10 ml of methanol for 10 minutes, cool, filter and use the filtrate as the test solution. Dissolve aesculin CRS, aesculetin CRS and fraxetin CRS in methanol to produce a mixture containing 2 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of chloroform, methanol and formic acid (6 : 1 : 0.5) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution; spray with a mixture of ferric chloride TS and potassium ferricyanide TS (1 : 1), the spots turn dark blue.

Water Not more than 7.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using ethanol as the solvent, not less than 8.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% phosphoric acid (12 : 88) as the mobile phase. As detector a spectrophotometer set at 334 nm. The number of theoretical plates of the column is not less than 5000, calculated with reference to the peak of aesculetin.

Reference solution Weigh accurately 10 mg of each of aesculin CRS and aesculetin CRS, dried to constant weight at 80℃, in a 50 ml volumetric flask, add separately methanol to dissolve and dilute to volume, mix well. Measure accurately 5 ml of aesculin, 3 ml of aesculetin to a 10 ml volumetric flask separately, add methanol to volume, and mix well (aesculin: 0.1 mg per ml; aesculetin: 60 μg per ml).

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve) in a stopper conical flask, add accurately 50 ml of methanol, weigh, heat under on a water bath for 60 minutes, cool, weigh again, compensate the loss of the weight with methanol, mix well, filter through microporous filter membrane (0.45 μm), and use the successive filtrate.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 1.0 per cent of the total amount of aesculin ($C_{15}H_{16}O_9$), and aesculetin ($C_9H_6O_4$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into slices, and dry in the sun.

Action To remove *damp-heat*, arrest discharge, and improve eyesight.

Indications Acute dysentery and diarrhea; morbid leukorrhea; inflammation of the eyes; nebula.

Usage and dosage 6-12 g; for external use, appropriate quantity is decocted for washing.

Storage Preserve in a ventilated and dry place.

Cortex Illicii
(地枫皮, Difengpi)

Difengpi Bark

Difengpi Bark is the dried stem bark of *Illicium difengpi* K. I. B. et K. I. M. (Fam. Magnoliaceae). The drug is collected in spring and autumn, and dried in the sun or at a low temperature.

Description Quilled or channelled, 5-15 cm long, 1-4 cm in diameter, 2-3 mm thick. Outer surface greyish-brown to dark-brown, some showing greyish-white patches of lichens, coarse bark easily exfoliated or fallen off, the exposed layer brownish-red. Inner surface brown or brownish-red, with distinct fine longitudinal wrinkles. Texture lax and fragile, easily broken, fracture granular. Odour, slightly aromatic; taste, slightly astringent.

Identification (1) Transverse section: Cork consisting of several layers of cells, the inner walls relatively thickened, containing reddish-brown substances. Cortex scattered with groups of stone cells, parquet with a few fibre bundles; secretory cells present. Phloem rays 1 cell wide, also occurring secretory cells, but smaller than those in cortex. Parenchymatous cells containing reddish-brown substances and starch granules.
(2) To 2 g of the coarse powder add 5 ml of chloroform, shake, macerate for 30 minutes, and filter. Spot the filtrate to filter paper. After drying, examine under ultraviolet at light 254 nm, a scarlet to pale scarlet fluorescence is produced.

Processing Eliminate foreign matter, wash clean, break to pieces, and dry in the sun.

Action To relieve rheumatic condition, and promote the flow of *qi* and relieve pain.

Indications Rheumatic arthralgia, lumbar muscle strain.

Usage and dosage 6-9 g.

Storage Preserve in a dry place.

Cortex Lycii
(地骨皮, Digupi)

Chinese Wolfberry Root-bark

Chinese Wolfberry Root-bark is the dried root bark of *Lycium chinense* Mill. or *Lycium barbarum* L. (Fam. Solanaceae). The root is collected in early spring or late autumn, and washed clean. Then the root bark is stripped off, and dried in the sun.

Description Quilled or channelled, 3-10 cm long, 0.5-1.5 cm wide, 1-3 mm thick. Outer surface greyish-yellow to brownish-yellow, rough, with irregular longitudinal fissures, easily exfoliated. Inner surface yellowish-white to greyish-yellow, relatively even, with fine longitudinal striations. Texture light and fragile, easily broken, fracture uneven, outer layers yellowish-brown and inner layers greyish-white. Odour, slight; taste, sweetish and then bitter.

Identification Transverse section: Cork consisting of 4-10 or more layers of cells, with relatively thick rhytidome outside. Most phloem rays 1 cell wide; fibres singly scattered, or 2 to several in bundles. Parenchymatous cells containing sandy crystals of calcium oxalate and numerous starch granules.

Total ash Not more than 11.0 per cent (Appendix Ⅸ K).

Processing Eliminate foreign matter and the remains of wood, wash clean, and dry in the sun.

Action To reduce *heat* in blood, relieve consumptive fever, and remove *heat* from the lung.

Indications Afternoon fever and night sweating in consumptive diseases; cough, hemoptysis and epistaxis due to *heat* in the lung; wasting-thirst caused by internal *heat*.

Usage and dosage 9-15 g.

Storage Preserve in a dry place.

Cortex Magnoliae Officinalis
(厚朴, Houpo)

Officinal Magnolia Bark

Officinal Magnolia Bark is the dried stem bark, root bark or branch bark of *Magnolia officinalis* Rehd. et Wils. or *Magnolia officinalis* Rehd. et Wils. var. *biloba* Rehd. et Wils. (Fam. Magnoliaceae). The drug is collected from April to June. The root bark and the branch bark are dried in the shade. The stem bark is slightly decocted in boiling water and piled up in a wet place until its inner surface purplish-brown or dark brown, softened by steaming, rolled and dried.

Description *Stem bark* Quilled singly or double quilled, 30-35 cm long, 2-7 mm thick, commonly known as "Tongpo"; stem bark near the root with one end spread out like a bell, 13-25 cm long, 3-8 mm thick, commonly known as "Xuetongpo". Outer surface greyish-brown, rough, sometimes scaly, easily exfoliated, with distinct elliptical lenticels and longitudinal wrinkles, appearing yellowish-brown when the coarse bark peeled; inner surface purplish-brown or dark purplish-brown, relatively smooth, with fine and dense longitudinal striations and exhibiting oily trace on scratching. Texture hard, uneasily broken, fracture granular, greyish-brown in the outer layer and purplish-brown or brown in the inner layer, oily, sometimes numerous small bright spots visible. Odour, aromatic; taste, pungent and slightly bitter.

Root bark (*Genpo*) Quilled singly or pieced irregularly, some curved like chicken intestines, commonly known as "Jichangpo". Texture hard, easily broken, fracture fibrous.

Branch bark (*Zhipo*) Quilled singly, 10-20 cm long, 1-2 mm thick. Texture fragile, easily broken, fracture fibrous.

Identification (1) Transverse section: Cork consisting of over 10 layers of cells, sometimes rhytidome observed. The outer side of cortex showing a ring of stone cells and the inner side scattered with numerous oil cells and groups of stone cells. Phloem rays 1-3 cells wide; fibres mostly several in bundles; oil cells scattered.
Powder: Brown. Fibres numerous, 15-32 μm in diameter, walls strongly thickened, sometimes undulate or serrate at one side, lignified, pit canals indistinct. Stone cells subsquare, elliptical, ovate, or irregularly branched, 11-65 μm in diameter, sometimes striations visible. Oil cells elliptical or subrounded, 50-85 μm in diameter, containing yellowish-brown oily contents.
(2) To 0.5 g of the powder add 5 ml of methanol, stopper

well, shake for 30 minutes, filter and use the filtrate as the test solution. Dissolve magnolol CRS and honokiol CRS in methanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and methanol (27 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with a 1% solution of vanillin in sulfuric acid, heat at 100℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (78 : 22) as the mobile phase. As detector a spectrophotometer set at 294 nm. The number of the theoretical plates of the column is not less than 3800, calculated with reference to the peak of magnolol.

Reference solution Weigh accurately a quantity of magnolol CRS and honokiol CRS, add methanol to produce two solutions containing 40 μg of magnolol and 24 μg of honokiol per ml respectively.

Test solution Weigh accurately 0.2 g of the powder (through No. 3 sieve) in a stopper conical flask, accurately add 25 ml of methanol, shake well, stopper tightly, macerate for 24 hours, and filter. Measure accurately 5 ml of the successive filtrate to a 25 ml volumetric flask, add methanol to volume, mix well as the test solution.

Procedure Inject accurately 4 μl of each of the above two reference solutions respectively, and 3-5 μl of the test solution into the column, and calculate the content.
It contains not less than 2.0 per cent of the total amount of magnolol ($C_{18}H_{18}O_2$) and honokiol ($C_{18}H_{18}O_2$), calculated with reference to the dried drug.

Processing *Cortex Magnoliae officinalis* Scrape off the coarse bark, wash clean, soften thoroughly, cut into slivers, and dry in the sun.
The slivers curved, fracture fibrous, outer surface yellowish-brown, inner surface dark purplish-brown.

Cortex Magnoliae officinalis (baked with ginger) Stir-bake the slivers of Cortex Magnoliae Officinalis as described under the method for stir-baking with ginger juice (Appendix Ⅱ D) to dryness.
The slivers curved, fracture fibrous and purplish-brown.

Action To eliminate *damp* and relieve distension.

Indications Accumulation of *damp* in the spleen and the stomach marked by epigastric stuffiness, vomiting and diarrhea; abdominal distension and constipation due to retention of undigested food; cough and dyspnea caused by retained *damp*.

Usage and dosage 3-9 g.

Storage Preserve in a ventilated and dry place.

Cortex Meliae
(苦楝皮, Kulianpi)

Szechwan Chinaberry Bark

Szechwan Chinaberry Bark is the dried stem bark or root bark of *Melia toosendan* Sieb. et Zucc. or *Melia azedarach* L. (Fam. Meliaceae). The drug is collected in spring and autumn, dried in the sun or dried in the sun after removal of the coarse bark.

Description Irregularly tabular, channelled or semiquilled, varying in length and width, 2-6 mm thick. Outer surface greyish-brown, rough, with interwoven longitudinal wrinkles and greyish-brown dotted lenticels, pale yellow when the coarse bark is peeled; inner surface almost white or pale yollow. Texture flexible, uneasily broken, fracture fibrous, laminated, easily separated. Odour, slight; taste, bitter.

Identification (1) Choose a section of the drug, fold and rub with hands, it may be laminated, the lamination appearing alternately yellow and white layers, each lamina minutely reticulated.
(2) Macerate about 1 g of the powder with 10 ml of ether for 2 hours with frequent shaking, and filter. Evaporate 1 ml of the filtrate to dryness, add several drops of *p*-dimethylaminobenzaldehyde TS; a red colour is produced. Evaporate another 1 ml of the filtrate to dryness in a test tube, add 1 ml of acetic anhydride, stir, add several drops of sulfuric acid along the tube wall; a green colour in acetic anhydride layer and a red to purplish-red colour in sulfuric acid layer are produced.
(3) To 2 g of the powder add 25 ml of acetone, ultrasonicate for 25 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution with 2 g of Cortex Meliae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and acetone (40 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into slivers, and dry.

Action To repel worms and cure dermatosis.

Indications Ascariasis, oxyuriosis, abdominal pain due to intestinal parasitosis. External use for scabies and tinea.

Usage and dosage 4.5-9 g; for external use, appropriate quantity is ground into powder and applied topically after mixed with lard.

Precaution Used with caution in the patients with hepatitis or nephritis.

Storage Preserve in a ventilated and dry place, protected from moisture.

Cortex Mori
(桑白皮, Sangbaipi)

White Mulberry Root-bark

White Mulberry Root-bark is the dried root bark of *Morus alba* L. (Fam. Moraceae). The root is collected in late autumn while leaf falling off and in early spring before germination, removed from the yellowish-brown coarse bark, cut longi-tudinally. The root bark is stripped off, and dried in the sun.

Description Quilled, channelled or flat pieced, twisted, varying in length and width, 1-4 mm thick. Outer surface white or pale yellowish-white, relatively even, some with orange-yellow or brownish-yellow remains of scaly bark; inner surface yellowish-white or greyish-yellow, with fine longitudinal striations. Texture light and tenacious, strongly fibrous, uneasily broken, but easily stripped longitudinally, dusting on stripping. Odour, slight; taste, slightly sweet.

Identification (1) Transverse section: Phloem rays 2-6 cells wide; laticiferous tubes scattered; fibres scattered singly or in bundles, unlignified or slightly lignified; parenchymatous cells containing starch granules, some containing prisms of calcium oxalate. The groups of sclerenchymatous cells mixed with stone cells, scattered in the older root bark, most cells containing prisms.
Powder: Pale greyish-yellow. Fibres numerous, mostly broken, 13-26 μm in diameter, walls thickened, unlignified to slightly lignified. Prisms of calcium oxalate 11-32 μm in diameter. Stone cells subrounded, subsquare or irregular, 22-52 μm in diameter, walls relatively thickened or extremely thickened, with distinct pits and pit-canals, some containing prisms. Crystal-containing sclerenchymatous cells present. Starch granules numerous, subrounded, 4-16 μm in diameter.
(2) To 2 g of the powder add 20 ml of saturated sodium carbonate solution, ultrasonicate for 20 minutes, filter and adjust the pH value of the filtrate to 1-2 with dilute hydrochloric acid, allow to stand for 30 minutes, and filter. Extract the filtrate with two 10-ml quantities of ethyl acetate, combine the ethyl acetate extracts and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution with 2 g of Cortex Mori reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide as the coating substance and acetic acid as the mobile phase. Apply separately to the film 5 μl of each of the above two solutions. After developing (about 10 cm) and removal of the film, dry in air and examine under ultraviolet light at 365 nm. Two main fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Processing *Cortex Mori* Wash clean, soften briefly, cut into slivers, and dry.

Cortex Mori (*processed with honey*) Stir-bake the slivers of Cortex Mori as described under the method for stir-baking with honey (Appendix Ⅱ D) until it is no more sticky to fingers.

Action To remove *heat* from the lung, relieve asthma, and induce urination.

Indications Cough and asthma caused by *heat* in the lung; anasarca with oliguria.

Usage and dosage 6-12 g.

Storage Preserve in a ventilated and dry place, protected from moisture and moth.

Cortex Moutan
(牡丹皮, Mudanpi)

Tree Peony Bark

Tree Peony Bark is the dried root bark of *Paeonia suffruticosa* Andr. (Fam. Ranunculaceae). The root is collected in autumn, removed from rootlets and soil, the root bark is stripped off, and dried in the sun.

Description Quilled or semiquilled, longitudinally fissured, somewhat involute or opened, 5-20 cm long, 5-12 mm in diameter, 1-4 mm thick. Outer surface greyish-brown or yellowish-brown, showing numerous transverse lenticel-like prominences and rootlet scars, the exposed surface where cork fallen off appearing pink; inner surface pale greyish-yellow or pale brown, with obvious fine longitudinal striations, usually showing bright crystals. Texture hard and fragile, easily broken, fracture relatively even, mealy, pale pink. Odour, aromatic; taste, slightly bitter and astringent.

Identification (1) Powder: Pale reddish-brown. Starch granules fairly abundant, simple granules subrounded or polygonal, 3-16 μm in diameter, hilum pointed, cleft or V-shaped, compound granules of 2-6 components. Clusters of calcium oxalate 9-45 μm in diameter, sometimes crystal cells jointed, arranged in rows, or several clusters in one cell. Cork cells rectangular, slightly thick-walled, pale red.
(2) Shake 1 g of the powder with 10 ml of ether for 10 minutes and filter. Evaporate the filtrate to dryness, dissolve the residue in 2 ml of acetone as the test solution. Dissolve paeonol CRS in acetone to produce a solution containing 5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silca gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (3 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with a 5% solution of ferric chloride in ethanol acidified with hydrochloric acid, and heat to the spots clear. A bluish-brown spot in the chromatogram obtained with the test solution corresponds in postion and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 2).

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using ethanol as the solvent, not less than 15.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (45 : 55) as the mobile phase. As detector a spectrophotometer set at 274 nm. The number of theoretical plates of the column is not less than 5000, calculated with reference to the peak of paeonol.

Reference solution Dissolve a quantity of paeonol CRS, weighed accurately, in methanol to prepare a solution containing 20 μg per ml.

Test solution Weigh accurately 0.5 g of the coarse powder to a stopper conical flask, add accurately 50 ml of methanol, weigh, ultrasonicate (power 300 W, frequence 50 kHz) for 30 minutes, cool, weigh again, compensate the loss of the weight with methanol, mix well, and filter. Measure accurately 1 ml of the successive filtrate to a 10 ml volumetric flask, add methanol to volume, mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the

column, and calculate the content.
It contains not less than 1.2 per cent of paeonol ($C_9H_{10}O_3$), calculated with reference to the dried drug.

Processing Wash clean rapidly, soften, cut into thin slices, and dry in the sun.

Action To remove *heat* from blood, activate blood circulation and eliminate blood stasis.

Indications Eruptions in epidemic diseases; spitting of blood, epistaxis; consumptive fever occurring at night and subsiding in the morning without sweating; amenorrhea, dysmenorrhea; carbuncles and sores; traumatic injuries.

Usage and dosage 6-12 g.

Storage Preserve in a cool and dry place.

Cortex Periplocae (香加皮, Xiangjiapi)

Chinese Silkvine Root-bark

Chinese Silkvine Root-bark is the dried root bark of *Periploca sepium* Bge. (Fam. Asclepiadaceae). The root is collected in spring and autumn, the root bark is stripped off, and dried in the sun.

Description Quilled or channelled, a few pieced irregularly, 3-10 cm long, 1-2 cm in diameter, 2-4 mm thick. Outer surface greyish-brown or yellowish-brown, cork soft and loose, often scaly, easily exfoliated; inner surface pale yellow or pale yellowish-brown, relatively smooth, with fine longitudinal striations. Texture light and fragile, easily broken, fracture uneven, yellowish-white. Odour, characteristic and aromatic; taste, bitter.

Identification (1) Powder: Pale brown. Prisms of calcium oxalate rare, 9-20 μm in diameter. Stone cells rectangular or subpolygonal, 24-70 μm in diameter. Laticiferous tubes containing colourless oily granules. Cork cells brownish-yellow. Starch granules numerous, simple granules subrounded or oblong, 3-11 μm in diameter; compound granules of 2-6 components.
(2) Distill 10 g of the powder with 150 ml of water in a 250 ml flask, the odour of distillate characteristic and aromatic. Transfer 10 ml of the distillate to two test tubes. To one test tube add 1 drop of 1% ferric chloride solution, a brownish-red colour is produced. To another tube add 5 ml of saturated solution of hydrazine sulfate and a few crystals of sodium acetate, warm gently and cool, a pale yellowish-green precipitate is produced. Examine under ultraviolet light at 365 nm, showing a strong yellow fluorescence.
(3) Heat under reflux 1 g of the powder with 10 ml of ethanol for 1 hour, filter. Transfer the filtrate to a 25 ml volumetric flask, and dilute with ethanol to volume, shake well. Transfer 1 ml of the ethanol solution to a 20 ml volumetric flask, dilute with ethanol to volume, shake well. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix V A), the absorption exhibits a maximum at 278 nm.
(4) To 2 g of the powder add 30 ml of methanol, heat under reflux for 1 hour, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Dissolve 4-methoxy salicylic aldehyde CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃), ethyl acetate and glacial acetic acid (20 : 3 : 0.5) as the mobile phase. Apply separately to the plate 2 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with dinitrophenylhydrazine TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and acetic acid (70 : 30 : 2) as the mobile phase. As detector a spectrophotometer set at 278 nm. The number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of 4-methoxyl salicylic aldehyde.

Internal standard solution Dissolve a quantity of *n*-butyl-*p*-hydroxybenzoate, accurately weighed, in 60% methanol to produce a solution containing 6 mg per ml as the internal standard solution.

Procedure Weigh accurately a quantity of 4-methoxyl salicylic aldehyde CRS in a brown volumetric flask, dissolve and dilute with 60% methanol to produce a solution containing 1 mg per ml. Accurately transfer 4 ml of the above solution and 2 ml of the internal standard solution to a 25 ml volumetric flask, dilute with 60% methanol to volume, and mix well. Inject accurately 20 μl into the column and plot the chromatogram. Accurately weigh 250-500 mg of the coarse powder, dried at 60℃ for 4 hours, in a 50 ml flask. Add 15 ml of 60% methanol, heat under reflux for 1.5 hours, and filter. Transfer the filtrate to a 25 ml volumetric flask, wash the container with 60% methanol, filter the washings to the same flask, add accurately 2 ml of the internal standard solution, dilute with 60% methanol to volume, and mix well. Filter with a 0.5 μm membrane filter and use the filtrate as the test solution. Inject 20 μl into the column, measure the peak area and calculate the content with corrected internal standard method.
It contains not less than 0.20 per cent of 4-methoxyl salicylic aldehyde ($C_8H_8O_3$) on the dried basis at 60℃ for 4 hours.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry in the sun.

Action To relieve rheumatic conditions and strengthen tendons and bones.

Indications Rheumatic arthritis with aching and weakness of the loins and knees, cardiac palpitation, shortness of breath and edema of the lower extremities.

Usage and dosage 3-6 g.

Precaution Overdosage should be avoided because of its toxicity.

Storage Preserve in a cool and dry place.

Cortex Phellodendri Amurensis (关黄柏, Guanhuangbo)

Amur cork-tree

Amur Cork-tree is the dried bark of *Phellodendron amurense* Rupr. (Fam. Rutaceae). The drug is collected, removed from coarse bark, and dried in the sun.

Description Tabular or shallowly channeled, varying in length and width, 2-4 mm thick. Outer surface yellowish-green or pale brownish-yellow, relatively even, with irregular longitudinal fissures, lenticel scars small and

infrequently visible, occasionally remaining greyish-white coarse bark. Inner surface yellow or yellowish-brown. Texture light and relatively hard, fracture fibrous, showing lobelike layers, bright yellow or yellowish-green. Odour, slight; taste, very bitter, viscous on chewing.

Identification (1) Powder: Greenish-yellow or yellow. Fibres bright yellow, 16-38 μm in diameter, often in bundles, surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres; the walls of crystal cells lignified and thickened. Stone cells bright yellow, subrounded or fusiform, 35-80 μm in diameter, some branched, walls thickened, with distinct striations. Prisms of calcium oxalate 24 μm in diameter.
(2) Heat under reflux 0.1 g of the powder with 5 ml of methanol for 15 minutes and filter, add methanol to about 5 ml as the test solution. Prepare a solution with 0.1 g of Cortex Phellodendri Amurensis reference drug in the same manner as the reference drug solution. Dissolve berberine hydrochloride CRS in methanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (10 : 6 : 1 : 1) as the mobile phase. Apply separately to the plate 1 μl of each of the above three solutions. After developing in a chamber saturated with ammonia vapour and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 8.5 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% phosphoric acid (50 : 50) (to each of 100 ml add 0.1 g of sodium dodecylsulfonate) as the mobile phase. As detector a spectrophotometer set at 265 nm. The number of theoretical plates of the column is not less than 4000, calculated with reference to the peak of berberine hydrochloride.

Reference solution Weigh accurately a quantity of berberine hydrochloride CRS, previously dried at 100℃ for 5 hours, dissolve in the mobile phase to prepare a solution containing 0.1 mg per ml.

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve) in a stopper conical flask, add accurately 50 ml of the mobile phase, weigh, ultrasonicate (power, 250 W; frequency, 40 kHz) for 40 minutes, cool, weigh again, compensate the loss of the weight with the mobile phase, mix well, filter, and use the successive filtrate.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.60 per cent of berberine hydrochloride ($C_{20}H_{17}NO_4 \cdot HCl$), calculated with reference to the dried drug.

Processing *Cortex Phellodendri Amurensis* Eliminate foreign matter, spray with water, soften thoroughly, cut into slivers and dry.

Cortex Phellodendri Amurensis (processed with salt) Stir-bake the slivers of Cortex Phellodendri Amurensis as described under the method for stir-baking with salt water (Appendix Ⅱ D) to dryness.

Cortex Phellodendri Amurensis (carbonized) Stir-bake the slivers of Cortex Phellodendri Amurensis as described under the method for carbonizing by stir-baking (Appendix Ⅱ D) until the surface becomes charred-black.

Action To clear *heat* and *dampness*, purge *fire* and eliminate steaming of bone, relieve *toxicity* and cure sores.

Indications Diarrhea or dysentery, jaundice, morbid leukorrhea, stranguria, beriberi, joint or muscular disorders with pain due to wind, cold or dampness and flaccidity of limbs, steaming of bone with hectic fever, night sweat, seminal emission, pyocutaneous diseases, eczema with pruritus.

Stir-baked Cortex Phellodendri with salt To nourish yin to lessen fire. Night sweat and steaming of bone due to flaming of fire from yin deficiency.

Usage and dosage 3-12 g; appropriate quantity for external use.

Storage Preserve in a ventilated and dry place, protected from moisture.

Cortex Phellodendri Chinensis (黄柏, Huangbo)

Chinese Cork-tree

Chinese Cork-tree is the dried bark of *Phellodendron chinensis* Schneid. (Fam. Rutaceae). The drug is commonly called "Chuanhuangbo". The drug is collected, removed from coarse bark, and dried in the sun.

Description Tabular or shallowly channelled, varying in length and width, 1-6 mm thick. Outer surface yellowish-brown, even or longitudinally furrowed, some showing scars of lenticels, and remains of greyish-brown coarse bark, inner surface dark yellow or pale brown, with fine longitudinal ridges. Texture light and hard, fracture fibrous, showing lobelike layers, dark yellow. Odour, slight; taste, very bitter, viscous on chewing.

Identification (1) Powder: bright yellow. Fibres bright yellow, 16-38 μm in diameter, often in bundles, surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres; the walls of crystal cells lignified and thickened. Stone cells bright yellow, subrounded, 35-128 μm in diameter, some branched, sharp at the top, walls thickened, with distinct striations; sometimes large fibrous stone cells visible, up to 900 μm in length. Prisms of calcium oxalate numerous.
(2) Heat under reflux 0.1 g of the powder with 5 ml of methanol for 15 minutes and filter, add methanol to 5 ml as the test solution. Prepare a solution with 0.1 g of Cortex Phellodendri Chinensis reference drug in the same manner as the referenc drug solution. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica G as the coating substance and a mixture of toluene, ethyl acetate, methanol, isopropanol and water (6 : 3 : 2 : 1.5 : 0.3) as the mobile phase. Apply separately to the plate 1 μl of each of the above three solutions. After developing about 8 cm in a chamber pre-equilibrated with the above mobile phase and concentrated ammonia vapour for 15 min and removal of the plate, dry in

air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the cold maceration method), using dilute ethanol TS as the solvent, not less than 14.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% phosphoric acid (50 : 50) (to each of 100 ml add 0.1 g of sodium dodecylsulfonate) as the mobile phase. As detector a spectrophotometer set at 265 nm. The number of theoretical plates of the column is not less than 4000, calculated with reference to the peak of berberine hydrochloride.

Reference solution Dissolve a quantity of berberine hydrochloride CRS, heated previously at 100℃ for 5 hours, weighed accurately, in the mobile phase to prepare a solution containing 0.1 mg per ml.

Test solution Weigh accurately 0.1 g of the powder (through No. 3 sieve) to a 100 ml volumetric flask, add 80 ml of the mobile phase, ultrasonicate (power, 250 W; frequency, 40 kHz) for 40 minutes, cool, dilute with the mobile phase to volume, mix well, filter, and use the successive filtrate.

Procedure Inject accurately 5 μl of the reference solution and 5-20 μl of the test solution into the column, and calculate the content.

It contains not less than 3.0 per cent of berberine hydrochloride ($C_{20}H_{17}NO_4 \cdot HCl$), calculated with reference to the dried drug.

Processing *Cortex Phellodendri Chinensis* Eliminate foreign matter, spray with water, soften thoroughly, cut into slivers and dry.

Cortex Phellodendri Chinensis (*processed with salt*) Stir-bake the slivers of Cortex Phellodendri Chinensis as described under the method for stir-baking with salt water (Appendix Ⅱ D) to dryness.

Cortex Phellodendri Chinensis (*carbonized*) Stir-bake the slivers of Cortex Phellodendri Chinensis as described under the method for carbonizing by stir-baking (Appendix Ⅱ D) until the surface becomes charred-black.

Action To remove *damp-heat*, quench *fire*, counteract *toxicity*, and relieve consumptive fever.

Cortex Phellodendri Chinensis (*processed with salt*) To nourish *yin* and reduce *fire*.

Indications Dysentery, jaunice and morbid leukorrhea caused by *damp-heat*; urinary infectious; weakness and edema of legs; consumptive fever and night sweating; seminal emission; sores and skin infection with local redness and swelling; eczema with itching.

Cortex Phellodendri Chinensis (*processed with salt*) Night sweating and consumptive fever due to exuberant *fire* secondary to deficiency *of yin*.

Usage and dosage 3-12 g; appropriate quantity for external use.

Storage Preserve in a ventilated and dry place, protected from moisture.

Cortex Pseudolaricis (土荆皮, Tujingpi)

Golden Larch Bark

Golden Larch Bark is the dried root bark or stem bark near the root of *Pseudolarix kaempferi* Gord. (Fam. Pinaceae). The drug is collected in summer, and dried in the sun.

Description Root bark irregularly long slat-shaped, twisted and slightly rolled, varying in size, 2-5 mm thick. Outer surface greyish-yellow, rough, with wrinkes and greyish-white transverse lenticel-like prominences, the rugged external tissues frequently scaling off, with reddish-brown exposed surface. Inner surface yellowish-brown to reddish-brown, even, with fine longitudinal striations. Texture flexible, fracture splintery, easily detachable in flakes. Odour, slight; taste, bitter and astringent.

Stem bark in flat pieces, up to about 8 mm thick, the rugged external tissues relatively thick. Outer surface cracked and inner surface relatively rough.

Identification (1) Powder: Pale brown or brownish-red. Stone cells abundant, subrectangular, subrounded or irregularly branched, 30-96 μm in diameter, containing yellowish-brown masses. Most sieve cells in bundles, 20-40 μm in diameter, numerous elliptical sieve areas scattered over the side walls, Mucilage cells subrounded, 100-300 μm in diameter. Resin cells longitudinally connected into tubeform, containing reddish-brown to yellowish-brown resinous matter, sometimes embedded with prisms of calcium oxalate. Walls of cork cells slightly thickend, sometimes lignified and pitted.

(2) To 1 g of the powder add 20 ml of methanol, ultrasonicate for 20 minutes, allow to cool, filter, and use the filtrate as the test solution. Prepare a solution with 1 g of Cortex Pseudolaricis reference drug in the same manner as the reference drug solution. Dissolve pseudolaric acid CRS in methanol to prepare a solution containing 0.2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and formic acid (14 : 4 : 0.5) as the mobile phase. Apply separately to the plate 5 μl of each of the above three solutions. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and heat at 105℃ to the spots clear. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using 75% ethanol as the solvent, not less than 15.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octylsilane bonded silica gel as the stationary phase and a mixture

of methanol and 1% acetic acid solution (50 : 50) as the mobile phase. As detector a spectrophotometer set at 260 nm. The number of theoretical plates of the column is not less than 5000, calculated with reference to the peak of pseudolaric acid.

Reference solution Dissolve a quantity of pseudolaric acid CRS, weighed accurately, in methanol to prepare a solution containing 45 μg per ml as the reference solution.

Test solution Weigh accurately 0.2 g of the powder (through No. 3 sieve) to a stopper conical flask, add accurately 25 ml of methanol, weigh, heat on a water bath for 1 hour, cool, weigh again, compensate the loss of the weight with methanol, mix well, filter, and use the successive filtrate.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.25 per cent of pseudolaric acid ($C_{23}H_{28}O_8$), calculated with reference to the dried drug.

Processing Wash clean, soften slightly, cut into slivers, and dry in the sun.

Action To kill parasites and relieve itching.

Indications Scabies and tinea.

Usage and dosage Appropriate quantity soaked with vinegar or wine, or ground into powder and mixed with water for topical application.

Storage Preserve in a dry place.

Crinis Carbonisatus (血余炭, Xueyutan)

Carbonized Hair

Carbonized Hair is made of the human hair. The hair is removed from foreign matter, washed with soda water, rinsed clean with water, dried in the sun, carbonized by calcining, cooled in air.

Description In irregular pieces, black, lustrous, with many fine pores. Texture light and fragile. Odour, scorching on burning; taste, bitter.

Acid-insoluble ash Not more than 10 per cent (Appendix Ⅸ K).

Action To arrest bleeding and remove blood stasis.

Indications Hematemesis, epistaxis, hematuria, abnormal uterine bleeding, traumatic bleeding.

Usage and dosage 4.5-9 g.

Storage Preserve in a dry place.

Endoconcha Sepiae (海螵蛸, Haipiaoxiao)

Cuttlebone

Cuttlebone is the dried internal shell of *Sepiella maindroni* de Rochebrune or *Sepia esculenta* Hoyle (Fam. Sepiidae). The drug is collected, washed clean, and dried.

Description *Internal shell of Sepiella maindroni* Flattened oblong, thick in the central part and thin at the edge, 9-14 cm long, 2.5-3.5 cm wide, and about 1.3 cm thick. The dorsal surface bearing a porcelain white ridge-like protuberance, both sides somewhat reddish, with indistinct minute tubercles. The ventral surface white, with fine and dense undulate transverse striations from the caudal end to the middle portion. Horny margin translucent; the caudal portion relatively wide and even, without bony spine. Texture light and lax, easily broken. Fracture powdery, showing loose striations. Odour, slightly stinking; taste, slightly salty.

Internal shell of Sepia esculenta 13-23 cm long, up to about 6.5 cm wide. The dorsal surface with distinct tubercles, somewhat laminated arranged. The ventral surface mostly covered by the fine and dense undulate transverse striations, and a longitudinal shallow groove in the middle. The horny margin of the caudal portion gradully widen and curved ventrally, with a bony spine at the end of the caudal portion, usually broken and fallen off.

Identification (1) Powder: whitish. Irregular transparent thin slices abundant, some with fine striations; some in irregular broken pieces, with reticulate or dotted striations on the surface.
(2) To the powder add dilute hydrochloric acid, bubbles are produced.

Processing Eliminate foreign matter, wash clean, dry, break to small pieces.
Mostly in irregular or subrectangular small pieces; whitish or slightly yellowish; taste, weak.

Action To stop bleeding, arrest seminal discharge or leukorrhea, inhibit gastric secretion, and promote the healing of wound.

Indications Gastric pain with acid regurgitation; spitting of blood, epistaxis, abnormal uterine bleeding, hematochezia; seminal emission, spermatorrhea; morbid leukorrhea; external use for traumatic bleeding and wound with purulent discharge.

Usage and dosage 5-9 g; for external use, appropriate quantity to be ground into powder and applied topically.

Storage Preserve in a dry place.

Endothelium Corneum Gigeriae Galli (鸡内金, Jineijin)

Chicken's Gizzard-skin

Chicken's Gizzard-skin is the dried inner wall of the gizzard of *Gallus gallus domesticus* Brisson (Fam. Phasianidae). The gizzard is collected after the chicken is killed. The inner wall of the gizzard is

peeled off immediately, washed clean, and dried.

Description In irregular rolled slices, about 2 mm in thickness. Externally yellow, yellowish-green or yellowish-brown, thin and translucent, with prominent streak-shaped wrinkles. Texture fragile, easily broken, fracture horny, lustrous. Odour, slightly stinking; taste, slightly bitter.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent.

Total ash Not more than 2.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol TS as the solvent, not less than 7.5 per cent.

Processing *Endothelium Corneum Gigeriae Galli* Wash clean, and dry.

Endothelium Corneum Gigeriae Galli (*Stir-baked*) Stir-bake the clean Endothelium Corneum Gigeriae Galli as described under the method for simple stir-baking or scalding (Appendix Ⅱ D) to swell.
Externally dark yellowish-brown to charring yellow, granular or fine bubble-shaped under magnifying glass, broken when bend gently, fracture lustrous.

Endothelium Corneum Gigeriae Galli (*processed with vinegar*) Stir-bake the clean Endothelium Corneum Gigeriae Galli as described under the method for simple stir-baking (Appendix Ⅱ D) to swell, spray with vinegar, take out, and dry. To each 100 kg of Endothelium Corneum Gigeriae Galli add 15 kg of vinegar.

Action To promote digestion, arrest seminal emission, and cure enuresis.

Indications Vomiting and diarrhea due to indigestion, malnutrition due to improper feeding, and enuresis in children; seminal emission.

Usage and dosage 3-9 g.

Storage Preserve in a dry place, protected from moth.

Eupolyphaga seu Steleophaga (土鳖虫, Tubiechong)

Ground Beetle

Ground Beetle is the dried body of female, *Eupolyphaga sinensis* Walker or *Steleophaga plancyi* (Boleny) (Fam. Corydiidae). The drug is collected, scalded to death by boiling water, and dried in the sun or by heat.

Description *Body of Eupolyphaga sinensis* Flattened ovoid, 1.3-3 cm long, 1.2-2.4 cm wide. Anterior end relatively narrow, posterior end relatively broad, dorsal side purplish-brown, lustrous, wingless. Dorsal plate of prothorax fairly developed, covering the head; dorsal plate of abdomen consisiting of 9 segments, imbricating. Ventral surface reddish-brown. Head relatively small, with a pair of filiform antennae, usually sheded. Thorax bearing 3 pairs of legs with fine hairs and spines. Abdomen with transversely annular segments. Texture lax and fragile, easily broken. Odour, stinking and foul; taste, slightly salty.

Body of Steleophaga plancyi 2.2-3.7 cm long, 1.4-2.5 cm wide. Dorsal side blackish-brown, usually with pale yellowish-brown specks and black spots near the edges.

Identification (1) Powder: Greyish-brown. Fragments of the body wall deep brown or yellow, irregular striation in surface view, setae short thick or slender thin, usually adhered to the surface, setae pits visible, formed by setae fallen off, rounded, 5-32 μm in diameter; setae brownish-yellow or yellow, sharply pointed or blunt at the tip, 12-270 μm long, 10-32 μm in diameter, some with longitudinal straight striations. Striated muscle fibers colourless or light yellow, usually broken, with dense transverse stripes, straight or slight undulated, the light bands wider than the dark bands.
(2) To 1 g of the power add 25 ml of methanol, ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness. Dissolve the residue in 5 ml of methanol as the test solution. Prepare a solution of 1 g of Eupolyphage seu Steleophaga reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, dichloromethane and acetone (5 : 5 : 0.5) as the mobile phase. Apply separately to the plate 10 μl of the above two solutions. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Spray with TS of vanillin in sulfuric acid, and heat at 105℃ to spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Foreign matter Not more than 5.0 per cent (Appendix Ⅸ A).

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 10.0 per cent.

Total ash Not more than 13.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 5.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of water-soluble extractives (Appendix Ⅹ A, the hot extraction method), not less than 22.0 per cent.

Action To remove blood stasis with powerful effect, and promote the healing of bone fracture.

Indications Bone fracture; amenorrhea and formation of masses in the abdomen due to blood stasis.

Usage and dosage 3-9 g.

Precaution Contraindicated in pregnancy.

Storage Preserve in a ventilated dry place, protected from moth.

Exocarpium Benincasae (冬瓜皮, Dongguapi)

Chinese Waxgourd Peel

Chinese Waxgourd Peel is the dried exocarp of *Benincasa hispida* (Thunb.) Cogn. (Fam. Cucurbitaceae). The fruit is washed clean, and the exocarp is collected, and dried in the sun.

Description Irregular pieces, frequently involute, varying in size. The outer surface greyish-green or yellowish-white,

glaucous, sometimes smooth; the inner surface relatively rough, sometimes the veins of vascular bundles visible. Texture light and fragile. Odour, slight; taste, weak.

Identification Powder: Brownish-yellow to yellowish-green. Epiderm cells of the pericarp subpolyangular in surface view, anticlinal walls smooth and straight; stomata anomocytic, subsidiary cells 5-7. Stone cells aggregated, sub-rounded or polyangular, 10-56 μm in diameter, pits and pit canals distinct. Spiral vessels numerous, 16-54 μm in diameter.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1). It contains not more than 12.0 per cent.

Total ash Not more than 12.0 per cent (Appendix Ⅸ K).

Processing Eliminate foreign matter, wash clean, cut into pieces or wide slivers, dry in the sun.

Action To cause urination.

Indications Edema with oliguria; thirsty and scanty dark urine due to *summer-heat*.

Usage and dosage 9-30 g.

Storage Preserve in a dry place.

Exocarpium Citri Grandis (化橘红, Huajuhong)

Pummelo Peel

Pummelo Peel is the dried exocarp of unripe or almost ripe *Citrus grandis* "Tomentosa" or *Citrus grandis* (L.) Osbeck (Fam. Rutaceae). The former is commonly known as "Maojuhong", and the latter "Guangqizhua" or "Guangwuzhua". The drug is collected in summer when the fruit is unripe, treated with boiling water for a moment, and the exocarp is cut into five or seven valves, removed from the emergence and parts of mesocarp, compressed to a definite shape, and dried.

Description *Exocarp of Citrus grandis* "Tomentosa" Opposite-foldly septangular-shaped or spreadly star-shaped, the single piece willow-leaf-shaped. When whole, 15-28 cm in diameter, when spread, 2-5 mm thick. Outer surface yellowish-green, densely pubescent, with wrinkles and small oil cavities; inner surface yellowish-white or pale yellowish-brown, with veins striations. Texture fragile, easily broken, fracture uneven, with one row of uneven and sunken oil cavities in the outer border, the inner part slightly soft and elastic. Odour, aromatic; taste, bitter and slightly pungent.

Exocarp of Citrus grandis Outer surface yellowish-green to yellowish-brown, glabrous.

Identification (1) Powder: Dark green to brown. Parenchymatous cells of mesocarp irregular, walls unevenly thickened, some beaded or extremely thickened at corners. Epidermal cells of pericarp polygonal, subsquare or rectangular in surface view, anticlinal walls thickened. Stomata subrounded, 18-31 μm in diameter, with 5-7 subsidiary cells, covered with cuticle layer in lateral view the outer radial walls thickened. Fracture of nonglandular hairs visible occasionally, cells of fragments up to over ten, about 33 μm in diameter at the widest position, walls warty or outer walls smooth and inner walls rough, lumina containing pale yellow or brown granular masses. Prisms of calcium oxalate polyhedral, rhombic, rhomboid-prismatic, rectangular or irregular, 1-32 μm in diameter, 5-40 μm long, occurring in parenchymatous cells of mesocarp, abundantly or in rows. Vessels spiral or reticulated. Stone cells and fibres visible occasionally.

(2) To 1 g of the powder add 10 ml of methanol, heat under reflux for 20 minutes, cool and filter. To 1 ml of the filtrate add about 5 mg of potassium tetrahydroborate, mix well and add several drops of hydrochloric acid; a cherry-red or purple colour is produced.

(3) Use the filtrate obtained from Identification (2) as the test solution. Dissolve naringin CRS in methanol to produce a solution containing 0.4 mg per ml as the reference solution. Carry out the method for thin layer chroma tography (Appendix Ⅵ B), using silica gel G as the coating substances and the upper layer of ethyl acetate, formic acid and water (10 : 2 : 3) as the mobile phase. Apply to the plate 10 μl of each of two solutions. After developing and removal of the plate, dry in air, spray with aluminium chloride TS and examine under ultraviolet light at 365 nm. The fluorescent sopts in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and methanol, acid acetic and water (35 : 4 : 61) as the mobile phase. The wavelength of the detector is 283 nm. The number of theoretical plates for the column is not less than 1000, calculated with the reference to the peak of naringin.

Reference solution Weigh accurately 20 mg of naringin CRS, in a 100 ml volumetric flask, dilute with methanol to volume, and mix well. Accurately measure 3ml in a 10 ml volumetric flask, dilute with methanol to volume, and mix well (containing 60 μg of naringin per ml).

Test solution Weigh accurately 1 g of the coarse powder, in a Soxhlet's extractor, add 80 ml of petroleum ether (60-90℃), heat under reflux on a water bath for 2-3 hours. Discard the petroleum ether extract and expel solvent remained in the residue, add 80 ml of methanol, further heat under reflux on a water bath for 3 hours until the extract is colourless, cool, and filter. Transfer the filtrate to a 100 ml volumetric flask, wash the container with a small quantity of methanol for several times, filter the washings to the same flask, dilute with methanol to volume, and mix well. Measure accurately 5 ml in a 25 ml volumetric flask, dilute with methanol to volume, and mix well.

Procedure Inject accurately 5 μl of the reference solution and 3-20 μl (varying according to the content) of the test solution into the column, and calculate the content.

It contains not less than 1.5 per cent of naringin ($C_{27}H_{32}O_{14} \cdot 2H_2O$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean; soften thoroughly, cut into slivers or pieces, and dry in the sun.

Action To dispel *cold*, eliminate *damp* and *phlegm*, and promote qi flow.

Indications Cough, itching of the throat and profuse expectoration due to *cold*; nausea, vomiting and epigastric distension caused by improper diet or excessive drinking.

Usage and dosage 3-6 g.

Storage Preserve in a cool and dry place, protected from moth.

Exocarpium Citri Rubrum (橘红, Juhong)

Red Tangerine Peel

Red Tangerine Peel is the dried exocarp of *Citrus reticulata* Blanco and its cultivars (Fam. Rutaceae). The ripe fruit is collected in late autumn and early winter, the exocarp is splited and collected, dried in the sun or in the shade.

Description Long stripes or irregular thin slices, margin shrunken and curved inward. The outer surface yellowish-brown or orange-red, becoming dark brown on storage, with numerous yellowish-white oil cavities. The inner surface yellowish-white, with numerous sunken and transparent small spots. Texture fragile, easily broken. Odour, aromatic; taste, slightly bitter and numb.

Identification (1) Powder: Pale yellowish-brown. Epidermal cells of the pericarp polygonal, subsquare or rectangular in surface view, anticlinal walls thickened, stomata subrounded, 18-26 μm in diameter, subsidiary cells indistinct; covered with cuticle in side view and the outer part of radial walls thickened. The walls of parenchymatous cells surrounding the fragments of oil cavities slightly thickened. Parenchymatous cells containing prisms of calcium oxalate.

(2) To 0.3 g of the powder add 10 ml of methanol, heat under reflux for 20 minutes, concentrate 5 ml of the filtrate to 1 ml as the test solution. Dissolve hesperidin CRS in methanol to produce a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B) using silica gel G as the coating substance and a mixture of ethyl acetate, methanol, and water (100 : 17 : 3) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing (about 3 cm) and removal of the plate, dry in air. And then use a mixture of toluene, ethyl acetate, formic acid, and water (20 : 10 : 1 : 1, supernatant) as the mobile phase, after developing (about to 8 cm) and removal of the plate, dry in air, spray with aluminium chloride, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in colour and position to spot in the chromatogram obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and methanol and water (40 : 60) as the mobile phase. The wavelength of the detector is 284 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of hesperidin.

Reference solution Weigh accurately a quantity of hesperidin CRS, dissolve in methanol to produce a solution containing 60 μg per ml as the reference solution.

Test solution Weigh accurately about 0.2 g of the powder (through No. 4 sieve), add 20 ml of methanol, heat and reflux for 1 hour, allow to cool, transfer to a 50 ml volumetric flask, wash the container and the residue with a little of methanol for several times, add the washings to the same volumetric flask, add methanol to the volume, mix well, filter, collect the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution respectively into the column, determine and calculate the content.

It contains not less than 1.7 per cent of hesperidin ($C_{28}H_{34}O_{15}$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, cut into slices.

Action To dispel *cold*, eliminate *dampness* and *phlegm*, and promote *qi* flow.

Indications Cough, itching of the throat and profuse expectoration of phlegm due to *cold*; nausea, vomiting and epigastric distension caused by improper diet or excessive cold drinks.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place, protected from moth.

Note: The main cultivaries are *Citrus reticulata* 'Dahongpao' and *Citrus reticulata* 'Tangerina'.

Flos Albiziae
(合欢花，Hehuanhua)

Albizia Flower

Albizia Flower is the dried inflorescence of *Albizia julibrissin* Durazz. (Fam. Leguminosae). The drug is collected when flowering on fine days in summer, and dried in the sun in time.

Description Capitulum crumpled to masses. The whole pedicel 3-4 cm long, sometimes separated from capitulum, yellowish-green, with striations, covered with sparse hairs. The whole flower densely covered with tomenta, slender and curved, 0.7-1 cm long, pale yellow or yellowish-brown, without or almost without pedicel. Calyx tubular, 5-toothed at the apex. Corolla tube about 2 times in length of calyx tube, 5-lobed at the apex, lobes lanceolate. Stamens numerous, filaments slender, yellowish-brown, accreted at the lower part and separated at the upper part, longexerted. Odour, slightly aromatic; taste, weak.

Identification (1) Powder: Greyish-yellow. Non-glandular hairs unicellular, 81-447 μm long. Prisms of calcium oxalate frequently occurring in the parenchymatous cells, 3-31 μm in diameter. Compound pollen grains oblate, 16 polysomic, 81-146 μm in diameter, the central 8 monosomic arranged in cruciform and surrounded by the other 8 monosomic; individual monosomic subsquare or long-spherical.
(2) To 1 g of the powder add 10 ml of ether, stand for 1 hour, filter, evaporate the filtrate to dryness, dissolve the residue in 0.5 ml of ethyl acetate as the test solution. Prepare a solution of Flos Albiziae reference drug in the same manner as the test solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B) using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (17 : 3) as the mobile phase. Apply separately 6 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% solution of vanillin in sulfuric acid, dry with hot air until the colour of spots appear clearly. The spot in the chromatogram obtained with the test solution corresponds in colour and position to the spot in the chromatogram obtained with the reference drug solution.

Foreign matter Not more than 2 per cent (Appendix Ⅸ A).

Water Not more than 15.0 per cent (Appendix Ⅸ H, Method 1).

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using dilute ethanol as the solvent, not less than 25.0 per cent.

Action To ease the mind and induce tranquilization.

Indications Anxiety, depression and insomnia.

Usage and dosage 4.5-9 g.

Storage Preserve in a ventilated and dry place.

Flos Buddlejae
(密蒙花，Mimenghua)

Pale Butterflybush Flower

Pale Butterflybush Flower is the dried flower bud and its inflorescence of *Buddleja officinalis* Maxim. (Fam. Loganiaceae). The drug is collected in spring before flowering, removed from foreign matter, and dried.

Description Mainly small branches of inflorescence bearing dense flower buds, irregularly conical, 1.5-3 cm long. Externally greyish-yellow or brownish-yellow, densely pubescent. Flower buds clavate, with the upper side slightly larger. 0.3-1 cm long, 0.1-0.2 cm in diameter; calyx campanulate with 4 terminal teeth; corolla tubular, as long as calyx or longer, with 4 terminal lobes, lobes ovate; stamens 4, inserted on the middle of corolla tube. Texture soft. Odour, slightly aromatic; taste, slightly bitter and pungent.

Identification Calyx and corolla in surface view: The lower epidermis densely covered with non-glandular hairs, usually 4-celled, at the base 2-celled, uniseriate; at the apex 2-celled, biseriate, each cell 2-forked, forks 250-500 μm long, walls extremely thick, lumen linear. The upper epidermis of corolla with few non-glandular hairs, unicellular, 200-600 μm long, walls with numerous spiny emergences. Pollen grains globose, 13-20 μm in diameter, exine smooth, with 3 germinal pores.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and acetic acid (45 : 54.5 : 0.5) as the mobile phase. As detector a spectrophotometer set at 326 nm. The number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of buddleoside.

Reference solution Dissolve 10 mg of buddleoside CRS, accurately weighed, in a 100 ml volumetric flask, dilute with methanol to volume, shake thoroughly to produce a solution of 0.1 mg per ml.

Test solution Weigh accurately 0.5 g of the powder in a Sohxlet's extractor, add 100 ml of petroleum ether (60-90℃), heat under reflux for 2 hours, discard petroleum ether and expel, add 100 ml of methanol and heat under reflux for 4 hours, concentrate the extracts to a quantity on an evaporating dish, transfer to a 50 ml volumetric flask, add methanol to volume.

Procedure Inject separately 10 μl of the reference solution and 5-10 μl of the test solution, accurately measured, into the column, determine and calculate the content. It contains not less than 0.50 per cent of buddleoside ($C_{28}H_{32}O_{14}$).

Action To remove *heat*, replenish the liver and remove nebula to improve vision.

Indications Inflammation of eyes with lacrimation and photophobia; blurred vision due to deficiency of the *liver*; nebula.

Usage and dosage 3-9 g.

Storage Preserve in a ventilated and dry place, protected from moisture.

Flos Campsis
(凌霄花, Lingxiaohua)

Trumpetcreeper Flower

Trumpetcreeper Flower is the dried flower of *Campsis grandiflora* (Thunb.) K. Schum. or *Campsis radicans* (L.) Seem. (Fam. Bignoniaceae). The drug is collected at flowering in summer and autumn, and dried.

Description *Flower of Campsis grandiflora* Frequently shrunken and curved, yellowish-brown to dark brown, the whole one, 4-5 cm long. Calyx tube campanulate, 2-2.5 cm long, 5-lobed, up to the middle of calyx tube, bearing 5 longitudinal lines from the base of calyx tube to the apex of calyx tooth. Corolla 5-lobed at the apex, lobes hemicircular, connected at the lower part, funnel-shaped, with fine striations on the surface, relatively distinct on the inner surface. Stamens 4, didynamous, inserted on the corolla tube, anthers-shaped, style 1, stigma flat. Odour, slightly aromatic; taste, slightly bitter and sour.

Flower of Campsis radicans The whole one, 6-7 cm long. Calyx tube 1.5-2 cm long, coriaceous, 5-toothed at the apex, the teeth short triangular, about 1/3 in length of calyx tube, longitudinal lines on the outer surface of calyx tube indistinct. The inner surface of corolla tube bearing distinct, dark brown striations.

Identification (1) Powder: Yellowish-brown. Pollen grains subrounded, 24-31 μm in diameter, with 3 furrows, surface bearing extremely fine reticulate strations. Glandular hairs yellowish or yellowish-brown, head ellipsoid, subrounded or oval, 1-2 layer of cells palisade-like arranged in lateral view, stalk 1-3 celled. Epidermal cells of corolla subpolygonal, spiral vessels visible.

(2) To 0.5 g of the powder add 15 ml of petroleum ether (60-90℃), sonicate for 15 minutes, filter, discard the filtrate. To the drug residue add 15 ml of methanol, sonicate for 15 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Prepare the reference drug solution using 0.5 g of Flos Campsis reference drug treated in the same manner. Carry out the method for thin-layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of chloroform and methanol (9 : 1) as the mobile phase. Apply separately to the plate 1 μl of each of the above two solutions. After developing and removal of the plate, dry in air, treat it with idiom vapour until clear spots appear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference drug solution.

Action To remove *heat* from the blood, remove blood stasis and dispel *wind*.

Indications Abnormal menstruation, amenorrhea with abdominal masses; swelling breast after childbirth; rubella red in colour; itching; acne.

Usage and dosage 5-9 g.

Precaution Be cautious about pregnant women.

Storage Preserve in a ventilated and dry place, protected from moisture.

Flos Carthami
(红花, Honghua)

Safflower

Safflower is the dried flower of *Carthamus tinctorius* L. (Fam. Compostiae). The drug is collected in summer when its colour turns from yellow to red, and dried in shade or in the sun.

Description The drug consisting of tubular flowers without ovaries, 1-2 cm long. Externally reddish-yellow or red. Corolla tubes slender, 5-lobed at the apex, the lobes narrowly belt-shaped, 5-8 mm long. Stamens 5, anthers aggregated to a tube, yellowish-white. Stigma long cylindrical, slightly 2-cleft. Texture pliable. Odour, slightly aromatic; taste, slightly bitter.

Identification (1) Powder: Orange-yellow. The fragments of corolla, filament and stigma frequently visible. Long tubular secretory cells present, generally accompanied by vessels, up to 66 μm in diameter, containing yellowish-brown to reddish-brown secretion. Outer walls of terminal epidermal cells of corolla lobes projecting to be tomentellate. Upper epidermal cells of stigma and style differentiated into conical unicellular hairs, acuminate or slightly obtuse at the apex. Pollen grains subrounded, elliptical or olivary, up to 60 μm in diameter, with 3 germinal pores, exine dentate-spinose. Prisms of calcium oxalate occurring in parenchymatous cells, 2-6 μm in diameter.

(2) To 0.5 g of the powder add 5 ml of 80% acetone solution, stopper tightly, shake constantly for 15 minutes and allow to stand; the supernatant liquid is used as the test solution. Prepare the reference drug solution in the same manner using 0.5 g of Flos Carthami reference drug. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H containing carboxymethylcellulose sodium as the coating substance and a mixture of ethyl acetate, formic acid and water-methanol (7 : 2 : 3 : 0.4) as the mobile phase. Apply separately to the plate 5 μl of each of the solutions. After developing and removal of the plate, dry in air. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution.

Foreign matter Not more than 2% (Appendix Ⅸ A).

Water Not more than 13.0 per cent (Appendix Ⅸ H, Method 1).

Total ash Not more than 15.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 5.0 per cent (Appendix Ⅸ K).

Absorbance *Red pigment* Dry the drug in a desiccator over silica gel for 24 hours and grind into a fine powder. Macerate warmly about 0.25 g of the fine powder, accurately weighed, with 50 ml of 80% acetone solution in a conical flask at 50℃ on a water bath for 90 minutes, cool, filter through a sintered glass funnel (No. 3) into a 100 ml volumetric flask, wash the residue with 25 ml of 80% acetone solution in portions. Transfer the washings into the volumetric flask, add 80% acetone solution to the volume, and mix well. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance of the solution at 518 nm, not less than 0.20.

Extractives Carry out the cold maceration method for determination of water-soluble extractives (Appendix Ⅹ

A), not less than 30.0 per cent.

Assay Hydroxysafflor yellow A Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, acetonitrile and 0.7% phosphate acid solution (26 : 2 : 72) as the mobile phase. As detector a spectrophotometer set at 403 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of hydroxysafflor yellow A CRS.

Reference solution Dissolve a quantity of hydroxysafflor yellow A CRS, accurately weighed, in 25% methanol to produce a solution of 0.13 mg per ml.

Test solution Weigh accurately 0.4 g of the powder (through No. 3 sieve) in a conical flask with stopper, add 50 ml of 25% methanol, accurately measured, weigh accurately and ultrasonicate (power, 300 W; frequency, 50 kHz) for 40 minutes, allow it to cool and weigh again, replenish the loss of the solvent with 25% methanol, and mix well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the two solutions into the column, and calculate the content.
It contains not less than 1.0 per cent of hydroxysafflor yellow A ($C_{27}H_{30}O_{15}$), calculated with reference to the dried drug.

Kaempferol Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.4% phosphate acid solution (52 : 48) as the mobile phase. As detector a spectrophotometer set at 367 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of kaempferol CRS.

Reference solution Dissolve a quantity of kaempferol CRS, accurately weighed, in methanol to produce a solution of 9 μg per ml.

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve) in a conical flask with stopper, add 25 ml of methanol, accurately measured, weigh accurately and heat under reflux for 30 minutes, allow it to cool and weigh again, replenish the loss of the solvent with methanol, mix well and filter. Measure accurately 15 ml of the successive filtrate to a flat bottom flask, add 5 ml of hydrochloric acid (15→37), mix well and heat to hydrolysis on a water bath for 30 minutes, cool immediately, transfer to a 25 ml volumetric flask, dilute with methanol to volume and mix well.

Procedure Inject accurately 10 μl of each of the two solutions into the column, and calculate the content.
It contains not less than 0.050 per cent of kaempferol CRS ($C_{15}H_{10}O_6$), calculated with reference to the dried drug.

Action To activate blood circulation and stimulate menstrual discharge, and to remove blood stasis and relieve pain.

Indications Amenorrhea, dysmenorrhea; retention of lochia; abdominal masses; traumatic injuries, sores and ulcers with swelling and pain.

Usage and dosage 3-9 g.

Precaution Be cautious about pregnant women.

Storage Preserve in a cool and dry place, protected from moisture and moth.

Flos Caryophylli
(丁香, Dingxiang)

Clove

Clove is the dried flower bud of *Eugenia caryophyllata* Thunb. (Fam. Myrtaceae). The drug is collected when it turns from green to brick-red, and dried in the sun.

Description Pestle-shaped, 1-2 cm long. Corolla globular, 0.3-0.5 cm in diameter, petals 4, imbricated, dark brown to brownish-yellow, enclosing stamens and style. After rubbing into pieces, numerous yellow and granular anthers visible. Calyx tube cylindrical, slightly flattened, sometimes slightly curved, 0.7-1.4 cm long, 0.3-0.6 cm in diameter, reddish-brown or dark brown, sepals 4, triangular, occurring at the upper part, separating in cruciform. Texture hard, oily. Odour, strongly aromatic; taste, pungent and numb.

Identification (1) Transverse section of the middle of calyx tube: Epidermal cells 1 row, with relatively thick cuticle. Oil cavities 2-3 rows, longitudinally elongated-elliptical, 150-200 μm long, scattered in the outer part of cortex. 20-50 small bicollateral vascular bundles underneath, arranged in an interrupted ring and surrounded by few pericyclic fibres, with thickened and lignified walls. Aerenchyma consisting of several layers of parenchymatous cells, occurring in the inner part, with large intercellular space. Numerous small vascular bundles scattered in the stele parenchyma. Parenchymatous cells consisting of numerous fine clusters of calcium oxalate.
Powder: Dark reddish-brown. Fibres spindle-shaped, apex obtusely rounded, with thickened walls. Pollen grains numerous, triangular in polar view and two convex lense-shaped in equatorial surface view, with 3 furrows. Clusters of calcium oxalate numerous, 4-26 μm in diameter, occurring in relatively small parenchymatous cells. Oil cavities frequently broken, dividing lines of secretory cells indistinct, containing yellow oil.
(2) To 0.5 g of the powder add 5 ml of ether, shake for several minutes, filter, the filtrate is used as the test solution. Dissolve eugenol CRS in ether to produce a solution containing 16 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica G as the coating substance and a mixture of petroleum ether (60-90℃)-ethyl acetate (9 : 1) as the mobile phase. Apply 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% solutions of vanillin in sulfuric acid and heat at 105℃. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Foreign matter Not more than 4 per cent (Appendix Ⅸ A).

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use 10% polyethylene glycol (PEG)-20M as the stationary phase and maintain the column temperature at 190℃. The number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of eugenol.

Reference solution Dissolve a quantity of eugenol CRS,

accurately weighed, in hexane to produce a solution of 2 mg per ml.

Test solution To about 0.3 g of the powder (through No. 2 sieve), accurately weighed, add 20 ml of hexane, accurately measured, weigh and ultrasonicate for 15 minutes, allow to cool to room temperature and weigh again, replenish the loss of the solvent with hexane, mix well, and filter.

Procedure Inject accurately 1 μl of each of the two solutions into the column. Calculate the content of $C_{10}H_{12}O_2$.
It contains not less than 11.0 per cent of eugenol ($C_{10}H_{12}O_2$).

Processing Eliminate foreign matter and sift the dust. Pound to pieces before use.

Action To warm the *middle-energizer*, check adverse rise of the *stomach-qi*, and restore the *kidney yang*.

Indications Hiccuping, vomiting, poor appitite, diarrhea and epigastric and abdominal pain with cold sensation in *deficiency-cold* syndromes of the spleen and stomach; impotence due to *deficiency* of the kidney.

Usage and dosage 1-3 g.

Precaution Incompatible with Radix Curcumae.

Storage Preserve in a cool and dry place.

Flos Celosiae Cristatae (鸡冠花, Jiguanhua)

Cockcomb Flower

Cockcomb Flower is the dried capitulum of *Celosia cristata* L. (Fam. Amaranthaceae). The drug is collected on flowering in autumn, and dried in the sun.

Description Spike mostly flat and fleshy, cockcomb-shaped, 8-25 cm long, 5-20 cm wide. The upper margin broad, bearing folds and dense linear scales, narrowed towards the base, often with remaining flat stem. Externally red, purplish-red or yellowish-white; aggregating numerous florets below the middle. Persistent bracts and perianth-segment of the florets membranous. Fruit dehiscent by lid, seeds oblate, kidney-shaped, black, lustrous. Texture light and pliable. Odour, slight; taste, weak.

Identification To 2 g of the chips add 30 ml of ethanol, heat under reflux for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of ethanol as the test solution. Prepare the reference drug solution using 2 g of Flos Celosiae Cristatae reference drug treated in the same manner. Carry out the method for thin-layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and acetone (5 : 1) as the mobile phase. Apply separately to the plate 2 μl of each of the above two solutions. After developing and removal of the plate, dry in air, spray with a 5% solution of vanillin in sulfuric acid and heat to the spots clear. The spots in the chromatogram obtained with the test solution corresponds in position and colour to the spots obtained with the reference drug solution.

Processing *Flos Celosiae Cristatae* Eliminate foreign matter and remains of stems, cut into sections.

Flos Celosiae Cristatae (carbonized) Stir-bake the sections of Flos Celosiae Cristatae as described under the method for carbonizing by stir-baking (Appendix Ⅱ D) until it becomes charred-black.

Action To arrest discharge (bleeding, leukorrhea and diarrhea) as an astringent.

Indications Hematemesis, metrorrhagia and metrostaxis, hematochezia, hemorrhoidal bleeding, morbid leukorrhea, chronic dysentery with persistent diarrhea.

Usage and dosage 6-12 g.

Storage Preserve in a ventilated dry place.

Flos Chrysanthemi (菊花, Juhua)

Chrysanthemun Flower

Chrysanthemum Flower is the dried capitulum of *Chrysanthemum morifolium* Ramat. (Fam. Compositae). The drug is collected in batches in September to November on flowering, dried in shade or by baking or dried in the sun after fuming and steaming. It is classified into "Boju", "Chuju", "Gongju" and "Hangju" according to different localities of production and variations in processing methods.

Description *Boju* Obconical or cylindrical, sometimes slightly compressed to fan-shape, 1.5-3 cm in diameter, separated. Involucre dish-shaped; bracts 3-4 layers, ovate or elliptical, herbaceous, yellowish-green or brownish-green, the outer surface covered with white hairs, margin membranous. Receptacle hemispherical, without paleas or palea hairs. Ligulate florets several rows, female, marginal, whitish, strongly straight and upward, longitudinally folded and wrinkled. Golden glandular spots scattered; tubular florets abundant, hermaphrodite, occurring in the centre, concealed by the ligulate florets, yellow, with 5 terminal teeth. Achenes undeveloped, pappus absent. Texture light and soft, lax and brittle when dried. Odour, pleasant and aromatic; taste, sweet, slightly bitter.

Chuju Irregularly spherical or oblate, 1.5-2.5 cm in diameter; ligulate florets whitish, irregularly twisted, curved inward, margin wrinkled, sometimes pale brown glandular spots visible; tubular florets mostly concealed.

Gongju Obiate or irregularly spherical, 1.5-2.5 cm in diameter; ligulate florets white or whitish, obliquely upward, the upper part folded outward, margin slightly curved inward and wrinkled, glandular spots usually absent; tubular florets few, exposed.

Hangju Dish-shaped or oblate, 2.5-4 cm in diameter, often several connected forming plates, ligulate florets whitish or yellow, spread flatly or folded slightly, agglutinated to each other, glandular spots usually absent; tubular florets abundant, exposed.

Identification To 1 g of the chips add 20 ml of petroleum ether (30-60℃), ultrasonicate for 10 minutes, discard petroleum ether, evaporate the drug residue to dryness, add 1 ml of dilute hydrochloric acid and 50 ml of ethyl acetate, ultrasonicate for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of methanol as the test solution. Dissolve chlorogenic acid CRS in ethanol to produce a solution of 0.5 mg per ml as the reference solution. Carry out the method for thin-layer chromatography (Appendix Ⅵ B), using polyamide membrane as the coating substance and the upper layer of a

mixture of toluene-ethyl acetate-formic acid-glacial acetic acid-water (2 : 30 : 2 : 2 : 4) as the mobile phase. Apply separately to the plate 0.5-1 μl of each of the above two solutions After developing and removal of the plate, dry in air, and examine under ultra-violet light at 365 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of 0.1 mol/L sodium dihydrogen phosphate buffer [Dissolve 15.6 g of sodium dihydrogen phosphate ($NaH_2PO_4 \cdot 2H_2O$) in water to produce 1000 ml, add a quantity of phosphoric acid to adjust pH to 2.7] and methanol (70 : 30) as the mobile phase. As detector a spectrophotometer set at 328 nm. The number of theoretical plates of the column is not less than 2500, calculated with reference to the peak of chlorogenic acid.

Reference solution Dissolve a quantity of chlorogenic acid CRS, accurately weighed, in water in an amber coloured volumetric flask, to produce a solution of 0.1 mg per ml. (Stored at the temperature below 10℃.)

Test solution Weigh accurately 1 g of the powder (through No. 1 sieve) in a conical flask, add 50 ml of methanol, accurately measured, weigh accurately to 0.01 g and heat under reflux for 2 hours, allow it to cool and weigh again, make up the loss in weight with methanol to the initial weight and mix well. Filter, measure accurately 10 ml of the successive filtrate and evaporate to dryness. To the residue add 5 ml of chloroform, macerate for 3 minutes, discard the chloroform layer. Expel chloroform, dissolve the residue in a quantity of water, transfer to a 5 ml volumetric flask, add water to volume and shake thoroughly. The test solution should be tested within day.

Procedure Inject 10 μl of each of the two solutions, both accurately measured, into the column and calculate the content.

It contains not less than 0.20 per cent of chlorogenic acid ($C_{16}H_{18}O_9$), calculated with reference to the dried drug.

Action To dispel *wind-heat*, pacify hyperactivity of the liver, and improve eyesight.

Indications *wind-heat* due to common cold, headache and dizziness; inflammation of the eyes; blurred vision.

Usage and dosage 5-9 g.

Storage Preserve in well closed containers, stored in a cool and dry place, protected from mould and moth.

Flos Chrysanthemi Indici (野菊花, Yejuhua)

Wild Chrysanthemum Flower

Wild Chrysanthemum Flower is the dried capitulum of *Chrysanthemum indicum* L. (Fam. Compositae). The drug is collected at the early stage of flowering in autumn and winter, and dried in the sun or dried after steaming.

Description Subspherical, 0.3-1 cm in diameter, brownish-yellow. Involucre consisting of 4-5 rows of bracts, the outer bracts oval or strip-shaped, the middle part of the outer surface greyish-green or pale brown in the centre, often covered with white hairs, margin scarious; the inner bracts elongated-elliptical, scarious, hairs absent on the outer surface. Remaining pedicel at the base of involucre. Ligulate florets 1 whorl, yellow, crumpled and rolled; tubular florets numerous, deep yellow. Texture light. Odour, aromatic; taste, bitter.

Identification To 0.3 g of the powder add 15 ml of methanol, ultrasonicate for 30 minutes, cool and filter, use the filtrate as the test solution. Prepare a solution of 0.3 g of Flos Chrysanthemi Indici reference drug in the same manner as the reference drug solution. Dissolve buddleoside CRS in methanol to produce a solution of 0.2 mg per ml as the reference solution. Carry out the method for thin-layer chromatography (Appendix Ⅵ B), using polyamide membrane as the coating substance and a mixture of ethyl acetate-butanone-chloroform-formic acid-water (15 : 15 : 6 : 4 : 1) as the mobile phase. Apply separately to the plate 3 μl of each of the above three solutions. After developing and removal of the plate, dry in hot air, spray with 2% aluminium muriate, dry in hot air and examine under ultra-violet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference drug solution and the spot obtained with the reference solution.

Water Not more than 14.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 9.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and glacial acetic acid (52 : 46 : 2) as the mobile phase. As detector a spectrophotometer set at 334 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of buddleoside CRS.

Reference solution Dissolve a quantity of buddleoside CRS, dried previously over phosphorous pentoxide in vacuum (50℃) to constant weight and weighed accurately, in methanol (heat if necessary) to produce a solution of 25 μg per ml.

Test solution Weigh accurately 0.25 g of the powder (through No. 3 sieve) in a conical flask with stopper, add 100 ml of methanol, accurately measured, weigh accurately and heat under reflux for 3 hours, allow to cool and weigh again, replenish the loss of the solvent with methanol, and mix well. Filter with a microporous filter membrane of 0.45 μm and use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the two solutions into the column, and calculate the content.

It contains not less than 0.80 per cent of buddleoside ($C_{28}H_{32}O_{14}$), calculated with reference to the dried drug.

Action To remove toxic *heat*.

Indications Boils, carbuncles, inflammation of the eyes, headache and dizziness.

Usage and dosage 9-15 g; for external use, appropriate quantity to be made into decoction for washing or made into ointment for topical application.

Storage Preserve in a cool and dry place, protected from moisture and moth.

Flos Daturae
(洋金花, Yangjinhua)

Datura Flower

Datura Flower is the dried flower of *Datura metel* L. (Fam. Solanaceae). The drug is collected in April to November at the beginning of flowering, dried in the sun or at a low temperature.

Description Usually crumpled and strip-shaped, when whole, 9-15 cm long. Calyx tubular, 2/5 in length of corolla, greyish-green or greyish-yellow, apex 5-lobed, with 5 longitudinal veins at the base, surface slightly pubescent; corolla trumpet-shaped, pale yellow or yellowish-brown, apex slightly 5 lobed, lobes short acuminate, with 3 distinct longitudinal veins below the acumination, slightly sunken between two lobes; stamens 5, filaments adnate to the corolla tube, 3/4 in length of corolla; pistil 1, stigma stick-shaped. Texture of samples by heat dried, pliable; odour, characteristic. That of sun-dried sample, fragile. Odour, slight; taste, slightly bitter.

Identification (1) Powder: Pale yellow. Pollen grains subspherical or oblong, 42-65 μm in diameter, with striate sculptures. Non-glandular hairs of calyx 1-3 celled, with warts on the walls. Glandular hairs each with a 1-5 celled head and a 1-5 celled stalk. Non-glandular hairs on the edge of corolla lobe, 1-10 celled, with slightly warty prominences on the walls. Non-glandular hairs on the base of filament, thick, 1-5 celled, up to 128 μm in diameter at the base, apex obtusely rounded. Sand crystals, prisms and clusters of calcium oxalate occurring in the parenchymatous cells of corolla and calyx.

(2) To 1 g of the powder add 1 ml of concentrated ammonia TS, mix well, add 25 ml of chloroform, stir well. Allow to stand over night, filter, evaporate the filtrate to dryness. Dissolve the residue in 1 ml of chloroform, use the solution as the test solution. Dissolve atropine sulfate CRS and scopolamine hydrobromide CRS in methanol to produce a solution containing 4 mg each per ml as the reference solution. Carry out the method for thin-layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate-methanol-concentrated ammonia TS (17 : 2 : 1) as the mobile phase. Apply 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with dilute potassium iodobismuthate TS. The spots due to atropine and scopolamine in the chromatogram obtained with the test solution correspond in position and colour to those obtained with the reference solution.

Water Not more than 11.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 11.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), not less than 9.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.07 mol/L sodium phosphate buffer (containing 0.0175 mol/L sodium dodecyl sulfonate, adjust pH to 6.0 with phosphoric acid) (50 : 100) as the mobile phase. As detector a spectrophotometer set at 216 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of scopolamine hydrobromide.

Reference solution Weigh accurately a quantity of scopolamine hydrobromide CRS and dissolve in the mobile phase to produce a solution of 0.5 mg per ml (The weight of scopolamine equals to that of scopolamine hydrobromide divided by 1.445).

Test solution Weigh accurately 1 g of the powder (through No. 3 sieve) in a conical flask, add 10 ml of 2 mol/L hydrochloric acid, and ultrasonicate (power, 250 W; frequency, 40 kHz) for 30 minutes, cool and filter, wash the residue and the filter with 10 ml of 2 mol/L hydrochloric acid in portions, combine the filtrates and washings, adjust pH to 9.0 with concentrated ammonia TS, extract by shaking with four 10-ml quantities of chloroform, combine the chloroform extracts, recover chloroform to dryness. Dissolve the residue in the mobile phase, transfer to a 5 ml volumetric flask, dilute to volume and mix well.

Procedure Inject accurately 10 μl of each of the two solutions into the column and calculate the content.

It contains not less than 0.15 per cent of scopolamine ($C_{17}H_{21}NO_4$), calculated with reference to the dried drug.

Action To relieve asthma and cough, alleviate pain, and arrest spasm.

Indications Asthma and cough; epigastric pain with cold sensation; rheumatic arthralgia; chronic infantile convulsions; anesthesia for surgical operation.

Usage and dosage 0.3-0.6 g, mostly used in pills or powder. It can be put into a cigarette-like roll for smoking (daily dose not exceeding 1.5 g). Appropriate quantity for external use.

Precaution Contraindicated in patients with cough and asthma caused by afflications from exterior pathogenic feature or *phlegm-heat*, glaucoma, hypertension, or tachycardia.

Storage Preserve in a dry place, protected from mould and moth.

Flos Eriocauli
(谷精草, Gujingcao)

Pipewort Flower

Pipewort Flower is the dried capitulum with peduncle of *Eriocaulon buergerianum* Koern. (Fam. Eriocaulaceae). The drug is collected in autumn, the capitulum is picked up with peduncle, and dried in the sun.

Description Capitulum hemispherical, 4-5 mm in diameter. Bracts densely arranged in numerous layers at the base, pale yellowish-green, lustrous, densely pubescent at the upper margin. The top of the capitulum greyish-white. After rubbing, numerous black anthers and fine, yellowish-green, unripe fruits visible. Peduncles slender, varying in length, less than 1 mm in diameter, pale yellowish-green, bearing numerous twisted ridges. Texture pliable. Odour, slight; taste, weak.

Identifcation (1) Powder: Yellowish-green. The head of glandular hair long elliptical, 1-4 celled, surface bearing densely fine reticulate striations; Stalk unicellular, Non-glandular hairs extremely long, 2-4 celled. Epidermal cells of seed coat flat-long-haxagonal in surface view, walls bearing derivative umbrella-shaped pillar. Epidermal cells of

peduncle stripe-shaped in surface view, surface bearing longitudinal cutin striations, stomata sub-rectangular. Pericarp cells subpolygonal in surface view, anticlinal walls bead-like thickened. Pollen grains subrounded, bearing spiral-shaped germinal aperture.

(2) To 1 g of the powder add 30 ml of ethanol, ultrasonicate for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ethanol as the test solution. Prepare a solution of 1 g of Flos Eriocauli reference drug in the same manner as the reference drug solution. Carry out the method for thin-layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of toluene-acetone (10 : 0.6) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution corresponds in position and colour to the spots obtained with the reference drug solution.

Processing Eliminate foreign matter, cut into sections.

Action To disperse *wind-heat*, improve vision and remove nebula.

Indications Inflammation of the eyes with photophobia and headache caused by *wind-heat*, nebula.

Usage and dosage 4.5-9 g.

Storage Preserve in a ventilated and dry place.

Flos Farfarae (款冬花, Kuandonghua)

Common Coltsfoot Flower

Common Coltsfoot Flower is the dried flower bud of *Tussilago farfara* L. (Fam. Compositae). The drug is collected in December or before the ground is frozen while the flower is still under the ground, removed from pedicels and soil, and dried in shade.

Description Long clavate. Solitary or 2-3 accreted at the base, 1-2.5 cm long, 0.5-1 cm in diameter. The upper part broader and the lower part gradually slender or pedicelled, enclosed by numerous scaly bracts. The outer surface of bracts purplish-red or pale red, inner surface densely covered with white flocky hairs. Light, showing white hairs after ripping. Odour, aromatic; taste, slightly bitter and pungent.

Processing *Flos Farfarae* Eliminate foreign matter and residual pedicels.

Flos Farfarae (processed with honey) Stir-bake the clean Flos Farfarae as described under the method for stir-baking with honey (Appendix Ⅱ D) until it is no longer sticky to fingers.

Action To relieve cough and resolve phlegm, moisture the lung, cheek adverse rise of the *lurg-qi*.

Indications Acute or chronic cough with dyspnea and copious expectoration of phlegm; hemoptysis in consumptive diseases.

Usage and dosage 5-9 g.

Storage Preserve in a dry place, protected from moisture and moth.

Flos Genkwa (芫花, Yuanhua)

Lilac Daphne Flower Bud

Lilac Daphne Flower Bud is the dried flower bud of *Daphne genkwa* Sieb. et Zucc. (Fam. Thymelaeaceae). The drug is collected in spring before flowering, removed from foreign matter, and dried.

Description Usually 3-7 flowers, subtended by 1-2 bracts, in clusters on shoots, mostly fallen off and a single flower remained, clavate, frequently curved, 1-1.7 cm long, about 1.5 mm in diameter; perianth tube purplish or greyish-green externally, densely pubescent, 4-lobed at the apex, lobes purplish or yellowish-brown. Texture soft. Odour, slight; taste, sweet and slightly pungent.

Identification (1) In surface view: Pollen grains yellow, subspherical, 23-45 μm in diameter, exine with distinct reticulate sculptures. Lower surface of perianth bearing non-glandular hairs, unicellular, usually curved, 88-780 μm long, 15-23 μm in diameter, walls relatively thick, slightly warty.

(2) To 1 g of the powder add 20 ml of petroleum ether (30-60℃), ultrasonicate for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ethanol as the test solution. Prepare the reference drug solution using 1 g of Flos Genkwa reference drug treated in the same manner. Carry out the method for thin-layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and ethyl acetate (10 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air, and examine under ultra-violet light at 365 nm. The sapphire fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference drug solution.

Processing *Flos Genkwa* Eliminate foreign matter.

Flos Genkwa (processed with vinegar) Stir-bake the clean Flos Genkwa as described under the method for sitr-baking with vinegar (Appendix Ⅱ D) until vinegar is absorbed entirely, using 30 kg of vinegar per 100 kg of Flos Genkwa.

Action To cause drastic purgation and expel the retained fluid, and remove the toxic substance from the interior of the body and eliminate fungi.

Indications Anasarca, hydrothorax and ascites with dyspnea, constipation and oliguria; external use for scabies, tinea and frostbite.

Usage and dosage 1.5-3 g.
Flos Genkwa (processed with vinegar) To be ground into powder, 0.6-0.9 g, once a day.

Precaution Contraindicated in pregnancy. Incompatible with Radix Glycyrrhizae.

Storage Preserve in a ventilated dry place, protected from mould and moth.

Flos Inulae
(旋覆花, Xuanfuhua)

Inula Flower

Inula Flower is the dried capitulum of *Inula japonica* Thunb. or *Inula britannica* L. (Fam. Compositae). The drug is collected in summer and autumn at flowering, removed from foreign matter, and dried in the shade or in the sun.

Description Oblate or subspherical, 1-2 cm in diameter. Involucre consisting of numerous bracts, imbricated; bracts lanceolate or strip-shaped, greyish-yellow, 4-11 mm long; Sometimes pedicels remaining at the base of involucre, surfaces of the bracts and pedicel covered with white hairs. Ligulate florets 1 row, yellow, about 1 cm long, mostly rolled, often fallen, with 3 terminal teeth; tubular florets numerous, brownish-yellow, about 5 mm long, with 5 terminal teeth; numerous white pappi occurring at the apex of ovary, 5-6 mm long. Small elliptical achene sometimes visible. Texture light, easily broken and separated. Odour, slight; taste, slightly bitter.

Identification (1) Surface view of various parts: Non-glandular hairs of bracts 1-8 celled, base of the multicellular ones large and the apical cell especially long; the inner rows of bracts bearing 2-3 celled seriate non-glandular hairs. Pappus consisting of multiseriate non-glandular hairs, margin cells slightly convex. Epidermal cells of ovary containing cylindrical crystals of calcium oxalate, up to 48 μm long, 2-5 μm in diameter; non-glandular hairs of ovary biserrated, one unicellular and the other often bicellular, 90-220 μm long. Glandular hairs of bracts and corolla clavate, with a multi-cellular head, mostly biseriate, covered with cuticle sac; stalk multicellular, biseriate. Pollen grains subspherical, 22-33 μm in diameter, exine spiny, about 3 μm long, with 3 germinal pores.
(2) To 2 g of the powder in a conical flask with stopper add 30 ml of petroleum ether (60-90℃), stopper tightly and macerate for 1 hour, heat under reflux for 30 minutes, cool, filter and concentrate the filtrate to nearly dryness. Dissolve the residue in 2 ml of petroleum ether (60-90℃) as the test solution. Prepare the reference drug solution using 2 g of Flos Inulae reference drug treated in the same manner. Carry out the method for thin-layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (5 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air, spray with a 5% solution of vanillin in sulfuric acid and heat to the spots clear. The principal spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference drug solution.

Processing *Flos Inulae* Eliminate pedicels, leaves and other foreign matter.

Flos Inulae (*processed with honey*) Stir-bake the clean Flos Inulae as described under the method for stir-baking with honey (Appendix Ⅱ D) until it is no longer sticky to fingers.

Action To bring *qi* down, eliminate phlegm, promote diuresis, and arrest vomiting.

Indications Cough in common cold; cough with dyspnea and copious expectoration due to accumulation of phlegm; belching, nausea and vomiting with stuffiness sensation in the chest and epigastric region.

Usage and dosage 3-9 g, decoeted with wrapping.

Storage Preserve in a dry place, protected from moisture.

Flos Lonicerae
(山银花, Shanyinhua)

Honeysuckle Flower

Honeysuckle Flower is the dried flower bud or opening flower of *Lonicera hypoglauca* Miq., *Lonicera confusa* DC., or *Lonicera macranthoides* Hand.-Mazz. (Fam. Caprifoliaceae). The drug is collected before flowering in early summer, and dried.

Description *Flower of Lonicera macranthoides* Clavate, slightly curved, 3-4.5 cm long, about 2 mm in diameter in upper part and 1 mm in diameter in lower part. Externally greenish-brown or yellowish-white. Flowers grouped in clusters, the length of lobes of corolla shorter than the 1/2 of the whole length of opened flowers. Texture slightly hard and springy. Odour, delicately aromatic; taste, slightly bitter and sweet.

Flower of Lonicera confusa 1.6-3.5 cm long, 0.5-2 mm in diameter. Calyx tube and corolla densely covered with grayish-white hairs. Ovary hairy.

Flower of Lonicera hypoglauca 2.5-4.5 cm long, 0.8-2 mm in diameter. externally yellowish-white to yellowish-brown, glabrous of sparsely pubescent. Calyx tube glabrous, 5-lobed at the apex, lobes long-triangular, pubescent. The lower lip of corolla recurved when open. Style glabrous.

Identification To 0.2 g of the powder add 5 ml of methanol, macerate for 12 hours, filter, the filtrate is used as test solution. Dissolve chlorogenic acid CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H containing sodium carboxymethylcellulose as the coating substance and the upper layer of the mixture of butylacetate, formic acid and water (7 : 2.5 : 2.5) as the mobile phase. Apply separately to the plate 10-20 μl of the test solution and 10 μl of the reference solution. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot obtained with the reference solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent.

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of acetonitrile and 0.4% phosphoric acid solution (12 : 88) as the mobile phase. As detector a spectrophotometer set at 327 nm. The number of theoretical plates of the column is not less than 1000, calculated with the reference to the peak of chlorogenic acid CRS.

Reference solution Weigh accurately a quantity of chlorogenic

acid CRS in an amber volumetric flask, add 50% methanol to produce a solution containing 40 μg per ml as the reference solution.

Test solution Weigh accurately 0.5 g of the coarse powder (pass through No. 4 sieve) to a stopper conical flask, add accurately 50 ml of 50% methanol, weigh and ultrasonicate for 30 minutes (power, 250 W; frequency, 35 kHz), cool, weigh again and restore the originat weight with 50% methanol to the initial weight, and mix well. Filter, measure accurately 5 ml of the successive filtrate in a 25 ml amber volumetric flask, add 50% methanol to add 10 ml of methanol to the residue, extract again for one time as the same manner. Transfer the filtrate to a 25 ml volumetric flask, wash the container with a quantity of methanol for two times, filter the washings to the same flask, dilute with methanol to volume. Mix well, filter through millipore membrane (0.45 μm), use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and the test solution into the column respectively, determine, and calculate the content.
It contains not less than 0.080 per cent of l-pulegone ($C_{10}H_{16}O$), calculated with reference to the dried drug.

Action To clear toxic *heat*, eliminate *wind-heat* with herbs cool in property.

Indications Carbuncles and sores, laryngalgia, erysipelas, bloody dysentery due to *toxic-heat*, common cold due to *wind-heat* and warm diseases.

Usage and dosage 6-15g.

Storage Preserve in a cool and dry place, protected from moisture and moth.

Flos Lonicerae Japonicae (金银花, Jinyinhua)

Japanese Honeysuckle Flower

Honeysuckle Flower is the dried flower bud or opening flower of *Lonicera japonica* Thunb. (Fam Capri-foliaceae). The drug is collected before flowering in early summer, and dried.

Description Clavate, stout in upper part and tapered downwards, slightly curved, 2-3 cm long, about 3 mm in diameter in upper part and 1.5 mm in diameter in lower part. Externally yellowish-white or greenish-white, gradually darken on keeping, densely pubescent. Foliaceous bracts occasionally visible. Calyx green, 5-lobed at the apex, lobes pubescent, about 2 mm long. Corolla tubular when open, apex 2-lipped; stamens 5, epipetalous, yellow; pistil 1, ovary glabrous. Odour, delicately aromatic; taste, weak and slightly bitter.

Identification To 0.2 g of the powder add 5 ml of methanol, macerate for 12 hours, filter, the filtrate is used as test solution. Dissolve chlorogenic acid CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H containing sodium carboxymethylcellulose as the coating substance and the upper layer of butylacetate-formic acid-water (7∶2.5∶2.5) as the mobile phase. Apply separately to the plate 10-20 μl of the test solution and 10 μl of the reference solution. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot obtained with the reference solution.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Heavy metal Carry out the limit test for Pb, Ge, As, Hg and Cu (Appendix Ⅸ B), not more than 5 ppm for Pb; not more than 3 ppb for Ge; not more than 2 ppm for As; not more than 2 ppb for Hg; not more than 20 ppm for Cu.

Assay ***Chlorogenic acid*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.4% phosphoric acid solution (13∶87) as the mobile phase. As detector a spectrophotometer set at 327 nm. The number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of chlorogenic acid CRS.

Reference solution Weigh accurately a quantity of chlorogenic acid CRS in an amber volumetric flask, add 50% methanol to produce a solution of 40 μg per ml.

Test solution Weigh accurately 0.5 g of the powder (through No. 4 sieve) in a conical flask with stopper, add 50 ml of 50% methanol, accurately measured, weigh and ultrasonicate (power, 250 W; frequency, 35 kHz) for 30 minutes; cool, weigh again and restore the original weight with 50% methanol to the initial weight and mix well. Filter, measure accurately 5 ml of the successive filtrate in a 25 ml amber volumetric flask, add 50% methanol to volume and mix well.

Procedure Inject accurately 5-10 μl of each of the two solutions into the column and calculate the content.
It contains not less than 1.5 per cent of chlorogenic acid ($C_{16}H_{18}O_9$), calculated with reference to the dried drug.

Luteolin-7-O-glucoside Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, acetonitrile as the mobile phase A, 0.5% glacial acetic acid solution as the mobile phase B, elute in gradient as the following:

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0-30	10→30	90→70

As detector a spectrophotometer set at 350 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of luteolin-7-*O*-glucoside CRS.

Reference solution Dissolve a quantity of luteolin-7-*O*-glucoside CRS, accurately weighed, in 70% ethanol to produce a solution of 40 μg per ml.

Test solution Weigh accurately 3 g of the fine powder (through No. 4 sieve) in a conical flask with stopper, add 50 ml of 70% ethanol, accurately measured, weigh and ultrasonicate (power, 250 W; frequency, 35 kHz) for 1 hour; cool, weigh again and restore the original weight with 70% ethanol to the initial weight and mix well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the two solutions

into the column and calculate the content.
It contains not less than 0.10 per cent of luteolin-7-*O*-glucoside ($C_{21}H_{20}O_{11}$), calculated with reference to the dried drug.

Action To remove toxic *heat* and dispel *wind-heat*.

Indications Carbuncles, boils, erysipelas, acute dysentery, pharyngitis, upper respiratory infection, epidemic febrile diseases.

Usage and dosage 6-15 g.

Storage Preserve in a cool and dry place, protected from moisture and moth.

Flos Magnoliae (辛夷, Xinyi)

Biond Magnolia Flower

Biond Magnolia Flower is the dried flower bud of *Magnolia biondii* Pamp., *Magnolia denudata* Desr. or *Magnolia sprengeri* Pamp. (Fam. Magnoliaceae). The drug is collected in late winter and early spring before flowering, removed from branchlet, and dried in the shade.

Description *Flower of Magnolia biondii* Long ovoid, like the tip of a writing brush, 1.2-2.5 cm long, 0.8-1.5 cm in diameter. Mostly the base with a pedicel, about 5 mm long, exhibiting whitish dotted lenticels. Bracts 2-3 layers, each layer 2 segments, bearing small scaly buds between 2 layers of bracts, outer surface of bract densely covered with greyish-white or greyish-green tomenta, inner surface brownish, glabrous. Perianth-segments 9, brownish, outer ones 3, stripe-shaped, about 1/4 in length of the inner ones, sepaloid, inner ones 6, arranged in 2 whorls of 3. Staments and pistils numerous, spirally arranged. Texture light and fragile. Odour, aromatic; taste, pungent, cool and slightly bitter.

Flower of Magnolia denudata 1.5-3 cm long, 1-1.5 cm in diameter. Base with a stouter pedicel, lenticels brownish. Outer surface of bract densely covered with greyish-white or greyish-green hairs. Perianth-segments 9, outer whorls and inner whorls homogeneous.

Flower of Magnolia sprengeri 2-4 cm long, 1-2 cm in diameter. Pedicels stout, lenticels red-brown. Outer surface of bract densely covered with yellowish or yellowish-green tomenta, sometimes the outermost bracts appearing blackish-brown after the hairs fallen off. Perianth-segments 10-12-15, less differentiated between the outer and inner whorls.

Identification (1) Powder: greyish-green or slightly yellowish-green. Non-glandular hairs numerous, scattered and frequently broken. 2-4 celled when whole, unicellular also exist, 4-13 μm thick, the basal cells short and thick, obviously inflated, heavily thick-walled, like stone cells. Stone cells grouped, elliptical, irregular or branched, 4-20 μm thick, with obliterated pit canals; brownish-yellow secretion contained in cell. Oil cells, numerous, subrounded, some containing little oil droplets. Epidermal cells of perianth-segments flat-squared, anticlinal wall beaded.
(2) To 1 g of the coarse powder add 10 ml of chloroform, stopper tightly and ultrasonicate for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of chloroform as the test solution. Dissolve magnolin CRS in methanol to produce a solution of 1 mg per ml as the reference solution. Carry out the method for thin-layer chromatography (Appendix VI B), using silica gel H containing sodium carboxymethylcellulose as the coating substance and a mixture of chloroform and ether (5 : 1) as the mobile phase. Apply separately to the plate 2-10 μl of each of the above two solutions. After developing and removal of the plate, dry in air, spray with a 10% sulfuric acid in ethanol, heat at 90℃ to the spots clear. The purplish-red spot in the chromatogram obtained with the test solution corresponds in position and the colour to the spot obtained with the reference solution.

Water Not more than 18.0 per cent (Appendix IX H, method 4).

Assay ***Volatile oil*** Carry out the method for determination of volatile oil (Appendix X D).
It contains not less than 1.0 per cent (ml/g) of volatile oil.

Magnolin Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, tetrahydrofuran and water (35 : 1 : 64) as the mobile phase. As detector a spectrophotometer set at 278 nm. The number of theoretical plates of the column is not less than 9000, calculated with reference to the peak of magnolin.

Reference solution Weigh accurately a quantity of magnolin CRS, previously dried in vacuum to constant weight at 60℃, add methanol to produce a solution of 0.1 mg per ml.

Test solution To about 1 g of the coarse powder, accurately weighed, in a conical flask with stopper, add 20 ml of ethyl acetate, accurately measured, weigh and macerate for 30 minutes, ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, cool and weigh again, make up the loss in weight with methanol to the initial weight, mix well. Filter and transfer 3 ml of the successive filtrate, accurately measured, to the pretreated neutral aluminium oxide column (100-200 mesh, 2 g, 9 mm in internal diameter, filled with the neutral aluminium oxide using wet method, washed previously with 5 ml of ethyl acetate). Elute with 15 ml of methanol, collect the elute in a 25 ml volumetric flask; add methanol to volume and mix well, filter with a microporous filter membrane of 0.45 μm and use the filtrate as the test solution.

Procedure Inject 4-10 μl of each of the reference solution and the test solution respectively, accurately measured, into the column, determine and calculate the content.
It contains not less than 0.40 per cent of magnolin ($C_{23}H_{28}O_7$), calculated with reference to the dried drug.

Action To dispel *wind-cold* and relieve nasal obstruction.

Indications Headache and nasal obstruction due to exterior *wind-cold*; sinusitis with purulent discharge.

Usage and dosage 3-9 g; appropriate quantity for external use.

Storage Preserve in a cool and dry place.

Flos Magnoliae Officinalis (厚朴花, Houpohua)

Officinal Magnolia Flower

Officinal Magnolia Flower is the dried flower bud of *Magnolia officinalis* Rehd. et Wils. or *Magnolia officinalis* Rehd. et Wils. var. *biloba* Rehd. et

Wils (Fam. Magnoliaceae). The drug is collected in spring before flowering, steamed briefly, and dried in the sun or at a low temperature.

Description Long conical, 4-7 cm long, 1.5-2.5 cm in diameter at the base. Reddish-brown to brown. Usually perianth-segments 12, fleshy, the ones of outer whorle rectangular-obovate, the ones of inner whorle spatulate. Stamens numerous, anthers linear, yellowish-brown, filaments broad and short. Carpels numerous, free, spirally aggregated on a conical receptacle. Pedicels 0.5-2 cm long, densely covered with greyish-yellow tomenta, occasionally glabrous. Texture fragile, breakable. Odour, aromatic; taste, weak.

Identification (1) Powder: Reddish-brown. Epidermal cells of perianth-segments polygonal or elliptical, surface densely warty and some finely striated. Stone cells numerous, irregularly branched, with distinctly pitted walls, 7-13 μm thick, and a large lumen. Oil cells subrounded or elliptical, 37-85 μm in diameter, slightly thick-walled, containing yellowish-brown contents. Pollen grains elliptical, 48-68 μm in long diameter, 37-48 μm in short diameter, anasulcate, exine with fine reticulate sculptures. Non-glandular hairs consisting of 1-3 cells, 820-2300 μm long, the walls heavily thickened, sometimes surface showing spiral-cuticular striations, unicellular hairs acuminate at the apex, slightly inflated at the base; the basal cells of multicellular hairs relatively short or obviously inflated, thin-walled.

(2) To 1 g of the powder add 8 ml of methanol, stopper tightly and shake for 30 minutes, filter, use the filtrate as the test solution. Dissolve magnolol CRS and honokiol CRS in methanol to produce a solution containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B) using silica gel G as the coating substance and a mixture of benzene and methanol (27 : 1) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with 1% solution of vanillin in sulfuric acid, dry at 100℃ for about 10 minutes. The spots in the chromatogram obtained with the test solution correspond in colour and position to the spots in the chromatogram obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, acetonitrile and water (50 : 20 : 30) as the mobile phase. As detector a spectrophotometer set at 294 nm. The number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of magnolol.

Reference solution Dissolve a quantity of magnolol CRS and honokiol CRS, accurately weighed, in methanol to produce two solutions containing 60 μg of magnolol and 40 μg of honokiol per ml respectively.

Test solution Weigh accurately 1 g of the coarse powder in a conical flask with stopper, add 25 ml of methanol, accurately measured, stopper tightly and weigh, ultrasonicate for 30 minutes, allow it to cool and weigh again, make up the loss in weight with methanol to the initial weight and mix well, and allow to stand for 30 minutes. Filter the supernatant liquid with a microporous filter membrane of 0.45 μm and use the filtrate as the test solution.

Procedure Inject 10 μl of each of the two reference solutions and the test solution, accurately measured, into the column. Calculate the total content of magnolol ($C_{18}H_{18}O_2$) and honokiol ($C_{18}H_{18}O_2$).

It contains not less than 0.20 per cent of the total amount of magnolol ($C_{18}H_{18}O_2$) and honokiol ($C_{18}H_{18}O_2$).

Action To regulate *qi* flow and resolke *damp*.

Indications Feeling of stuffiness and distension in the chest and epigastrium with loss of appetite.

Usage and dosage 3-9 g.

Storage Preserve in a dry place, protected from mould and moth.

Flos Mume
(梅花, Meihua)

Plum Flower

Plum Flower is the dried flower bud of *Prunus mume* (Sieb.) Sieb. et Zucc. (Fam. Rosaceae). The drug is collected before flowering in early spring, and dried in time at a low temperature.

Description Subspherical, 3-6 mm in diameter, with short pedicle. Bracts consisting of numerous layers, scaly, brown. Calyx 5, greyish-green or brownish-red. Petals 5 or numerous, yellowish-white or pale pink. Stamens numerous; pistil 1, ovary densely pubescent. Texture light. Odour, delicately aromatic; taste, slightly bitter and astringent.

Action To regulate the stomach and spleen function and soothe the *liver-qi*, resolve *phlegm*, and counteract *toxicity*.

Indications Depression with fidget; epigastric pain due to stagnation of the *liver-qi* or *stomach-qi*; globus hystericus; scrofula, ulcers.

Usage and dosage 3-5 g.

Storage Preserve in a cool and dry place, protected from mould and moth.

Flos Rhododendri Mollis
(闹羊花, Naoyanghua)

Yellow Azalea Flower

Yellow Azalea Flower is the dried flower of *Rhododendron molle* G. Don (Fam. Ericaceae). The drug is collected at the early stage of flowering in April and May, and dried in the shade or in the sun.

Description Several flowers aggregated at a peduncle, mostly fallen off and a single flower remained, greyish-yellow to yellowish-brown, shrunken. Sepals 5-lobed, hemirounded to triangular, margins with slender hairs. Corolla campanulate, tube relatively long, up to 2.5 cm long, with contortuplicate, 5-lobed apex. Petals broadly ovate, with obtuse or retuse apex. Stamens 5, filaments curved, as long as or slightly longer than corolla, pubescent below the middle part, anthers reddish-brown, poricidal. Pistil 1, stigma cephaloid. Pedicel 1-2.8 cm long, brown, pubescent. Odour, slight; taste, slightly numb.

Identification (1) Powder: Yellowish-brown. Pollen grains tetrahedral, 58-97 μm in diameter, with 3 germinal pores. Non-glandular hairs of calyx multicellular, crossed in several rows, 29-68 μm in diameter. Non-glandular hairs of corolla

unicellular, 10-20 μm in diameter, up to 400 μm long, walls thin, sometimes warts visible. Epidermal cells of microdiodanges subpolygonal or subrounded, 13-31 μm in diameter, arranged regularly and closely, walls slightly thickened, sometimes with distinct pits, cells containing yellowish-brown contents. Epidermal cells of corolla rectangular, subsquare or irregular, 26-78 μm in diameter, with thin and sinuous walls.

(2) To 1 g of the powder add 50 ml of water saturation solution in n-butyl alcohol, ultrasonicate for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of anhydrous ethanol as the test solution. Prepare a solution of 1 g of Flos Rhododendri Mollis reference drug in the same manner as the reference drug solution. Carry out the method for thin-layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of toluene, ethyl acetate and methanol (5 : 4 : 0.5) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air, spray with 10% antimony trichlorine chloroform solution and heat at 105℃ until clear spots appear. The spots in the chromatogram obtained with the test solution corresponds in position and colour to the spots obtained with the reference drug solution.

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 4.0 per cent (Appendix Ⅸ K).

Action To relieve rheumatic conditions, and to eliminate blood stasis and alleviate pain.

Indications Rheumatic arthralgia; traumatic injuries; chronic eczema and neutro dermatitis.

Usage and dosage 0.6-1.5 g, to be made into infusion with wine or into pills or powder; for external use, appropriate quantity to be decocted for washing or the fresh flower to be pounded into paste for topical application.

Precaution Overdosage or long-term administration should be avoided. Contraindicated in debility and pregnancy.

Storage Preserve in a dry place, protected from moisture.

Flos Rosae Chinensis (月季花, Yuejihua)

Chinese Rose Flower

Chinese Rose Flower is the dried flower of *Rosa chinensis* Jacq. (Fam. Rosaceae). The drug is collected all year round, starting from the early stage of flowering, and dried in the shade or at a low temperature.

Description Subspherical, 1.5-2.5 cm in diameter. receptacle oblong; calyx 5, dark green, with acuminate apex; petals imbricated, sometimes fallen off, oblong, purplish-red or pale purplish-red; stamens numerous, yellow. Texture light and fragile. Odour, delicately aromatic; taste, weak and slightly bitter.

Action To promote blood circulation and regulate menstruation.

Indications Menstrual disorders, dysmenorrhea.

Usage and dosage 1.5-4.5 g.

Storage Preserve in a cool and dry place, protected from press and moth.

Flos Rosae Rugosae (玫瑰花, Meiguihua)

Rose Flower

Rose Flower is the dried flower bud of *Rosa rugosa* Thunb. (Fam. Rosaceae). The drug is collected in batches before flowering in late spring and early summer, and dried in time at a low temperature.

Description Nearly hemispherical or irregularly massed, 0.7-1.5 cm in diameter. Remaining pedicle pubescent, receptacle hemispherical, accreted with calyx at the base. Calyx 5, lanceolate, yellowish-green or brownish-green, pubescent. Petals frequently crumpled, broadly ovate when unfolded, imbricated, purplish-red, sometimes yellowish-brown. Stamens numerous, yellowish-brown. Style numerous, stigma cephaloid at the receptacle. Texture light and fragile. Odour, strongly aromatic; taste, slightly bitter and astringent.

Identification Surface view of calyx: Non-glandular hairs densely covered, unicellular, frequently curved, 136-680 μm long, with thickened and lignified walls. Glandular hairs, with a multicellular head, oblate, 64-180 μm in diameter, and a multiseriated stalk, 50-340 μm long, sometimes showing unicellular branches at the base. Clusters of calcium oxalate 9-25 μm in diameter.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using 20% ethanol as the solvent, not less than 28.0 per cent.

Action To relieve stagnation of *qi*, regulate blood circulation, and kill pain.

Indications Epigastric pain, loss at appitite, nausea and vomiting caused by the stagnated *liver-qi* and *stomach-qi*; menstrual disorders; traumatic pains.

Usage and dosage 1.5-6 g.

Storage Preserve in well closed containers, stored in a cool and dry place.

Flos Sophorae (槐花, Huaihua)

Pagodatree Flower

Pagodatree Flower is the dried flower and flower bud of *Sophora japonica* L. (Fam. Legu-minosae). The drug is collected in summer at flowering or when flower buds are forming, dried in time and removed from branch, pedicel and foreign matter. The former is known as "Huaihua", and the later "Huaimi".

Description *Huaihua* Crumpled and rolled, petals mostly fallen off. When whole, calyx campanulate, yellowish-green, 5-lobed at the apex. Petals 5, yellow or yellowish-white, 1 larger, subrounded, the apex retuse, the other 4 oblong. Stamens 10, 9 accreted at the base. Filaments

slender. Pistil cylindrical, curved. Texture light. Odour, slight; taste, slightly bitter.

Huaimi Ovoid and ellipsoidal, 2-6 mm long, about 2 mm in diameter. Calyx with several longitudinal striations at the lower part. Petals yellowish-white, unflowering, occurring above the calyx. Pedicels slender. Texture light, broken after rubbing. Odour, slight; taste, slightly bitter and astringent.

Identification (1) Powder: Yellowish-green. Pollen grains subspherical or obtusely triangular, 14-19 μm in diameter, with 3 pores. Non-glandular hairs consisting of 1-3 cells, 86-660 μm long. Stomata, anomocytic, with 4-8 subsidiary cells. Prisms of calcium oxalate infrequently visible.
(2) To 0.1 g of the powder add 10 ml of ethanol, heat for 5 minutes and filter. To 1 ml of the filtrate, add a small quantity of magnesium powder and 2-3 drops of hydrochloric acid; a cherry red colour is produced.
(3) Shake 0.2 g of the powder with 5 ml of methanol for 10 minutes, and filter, use the filtrate as the test solution. Dissolve rutin CRS in methanol to produce a solution containing 4 mg per ml as the reference solution. Carry out the method for thin layer chromatograhy (Appendix Ⅵ B), using silica G as the coating substance and a mixture of ethyl acetate, formic acid and water (8 : 1 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the two solutions. After developing and removal of the plate, dry in air and spray with 1% aluminium chloride TS. Allow to evaporate ethanol and examine under ultra-violet light at 365 nm. The fluorescent spot due to rutin in the chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot obtained with the reference solution.

Water Not more than 11.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 14.0 per cent for *Huaihua*, and not more than 9.0 per cent for *Huaimi* (Appendix Ⅸ K).

Acid-insoluble ash Not more than 8.0 per cent for *Huaihua*, and not more than 3.0 per cent for *Huaimi* (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for the determination of ethanol-soluble extractives (Appendix Ⅹ A), using 30% methanol as the solvent, not less than 37.0 per cent for *Huaihua*, and not less than 43.0 per cent for *Huaimi*.

Assay ***Total flavonoids***

Reference solution Weigh accurately 50 mg of rutin CRS dried previously in vacuum to constant weight at 120℃, to a 25 ml volumetric flask and dissolve in a quantity of methanol by warming gently on a water bath. Allow to cool, add methanol to volume, mix well. Measure accurately 10 ml of the solution into a 100 ml volumetric flask, dilute with water to volume, mix well (containing 0.2 mg of anhydrous rutin per ml).

Calibration standard Measure accurately 1, 2, 3, 4, 5 and 6 ml of the reference solution respectively into a 25 ml volumetric flask, add water to 6.0 ml and add 1 ml of 5% sodium nitrite solution, mix well. Allow to stand for 6 minutes, add 1 ml of 10% aluminium nitrate solution, mix well, allow to stand for 6 minutes, add 10 ml of sodium hydroxide TS, dilute with water to volume, mix well, and allow to stand for 15 minutes. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), using the corresponding solvent as a blank, measure the absorbance at 500 nm and plot the standard curve, using absorbance as ordinate and concentration as abscissa.

Procedure Weigh accurately 1 g of the coarse powder, to a Soxhlet's extractor, add a quantity of ether and heat under reflux until the extract is colourless. Allow to cool, and discard ether solvent, Add 90 ml of methanol, heat under reflux until the extract is colourless. Transfer the extract to a 100 ml volumetric flask, wash the flask with a small quantity of methanol, combine the washing into the volumetric flask, add methanol to volume and mix well. Measure accurately 10 ml to a 100 ml volumetric flask, add water to volume and mix well. Measure accurately 3 ml to a 25 ml volumetric flask. Proceed as described under calibration standard, beginning at the words "add water to 6.0 ml...", Measure the absorbance, read out the weight (μg) of anhydrous rutin in the test solution from the standard curve and calculate the content of $C_{27}H_{30}O_{16}$.
It contains not less than 8.0 per cent of anhydrous rutin ($C_{27}H_{30}O_{16}$) for *Huaihua* and not less than 20.0 per cent of anhydrous rutin ($C_{27}H_{30}O_{16}$) for *Huaimi*, calculated with reference to the dried drug.

Rutin Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 1% glacial acetic acid solution (32 : 68) as the mobile phase. As detector a spectrophotometer set at 257 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of rutin.

Reference solution Weigh accurately a quantity of rutin CRS dried previously in vacuum to constant weight at 120℃, add methanol to produce a solution of 0.1 mg per ml.

Test solution Weigh accurately a quantity of the coarse powder (0.2 g of *Huaihua* and 0.1 g of *Huaimi*) in a conical flask with stopper, add 50 ml of methanol, accurately measured, weigh and ultrasonicate (power, 250 W; frequency, 25 kHz) for 30 minutes; cool, weigh again, replenish the loss of the solvent with methanol, and mix well. Filter, measure accurately 2 ml of the successive filtrate in a 10 ml volumetric flask, add methanol to volume and mix well.

Procedure Inject 10 μl of each of the two solutions, accurately measured, into the column, and calculate the content.
It contains not less than 6.0 per cent of anhydrous rutin ($C_{27}H_{30}O_{16}$) for *Huaihua* and not less than 15.0 per cent of anhydrous rutin ($C_{27}H_{30}O_{16}$) for *Huaimi*, calculated with reference to the dried drug.

Processing *Flos Sophorae* Eliminate foreign matter.

Flos Sophorae (*stir-baked*) Stir-bake the clean Flos Sophorae as described under the method for simple stir-baking (Appendix Ⅱ D) until a dark yellow colour is produced externally.

Flos Sophorae (*carbonized*) Stir-bake the clean Flos Sophorae as described under the method for carbonizing by stir-baking (Appendix Ⅱ D) until a charred brown colour is produced externally.

Action To arrest bleeding by reducing *heat* in blood, and quench excessive *fire* in the liver.

Indications Hematochezia, hemorrhoidal bleeding, dysentery with bloody stools, abnormal uterine bleeding, spitting of blood, epistaxis; bloodshot eyes, headache and dizziness due to excessive *fire* in the liver.

Usage and dosage 5-9 g.

Storage Preserve in a dry place, protected from moisture and moth.

Fluoritum
(紫石英，Zishiying)

Fluorite

Fluorite is a mineral of fluorides of fluorite group, containing mainly calcium fluoride (CaF_2). The drug is collected, and removed from foreign matter.

Description Aggregates of granules or masses. In irregular pieces with angularities, purple or green, uneven in colour, streak white. Translucent to transparent, with glassy lustre. Externally often with crevices. Texture hard and fragile, easily broken. Odour, slight; taste, weak.

Identification (1) To 0.1 g of the fine powder add 2 ml of hydrochloric acid and 5 ml of 4% boric acid solution, heat to boil gently to dissolve. To 1 drop of the solution on a slide add 1 drop of sulfuric acid solution (1→4), allow to stand for a moment, and examine under a microscope. The needle crystals are observed.
(2) Examine the drug under ultraviolet light at 365 nm, a bright purple or purple to bluish-purple fluorescence is shown.
(3) Mix well 20 mg of the fine powder with 15 mg of the powder of silicon dioxide, transfer to a dry test tube with a rubber stopper wrapped with tin foil, add 10 drops of sulfuric acid. Insert a fine glass tube with a drop of water at the lower opening through the rubber stopper to 3.5 cm from the bottom of the test tube. Heat on an asbestos board carefully, while the water-drop moves upward and downward, stop heating for about 1 minute, then heat again, until a dense white fume is produced. Stand for 2-3 minutes, take out the stopper and the glass tube, wash the lower end of the tube with 2-3 drops of water to a crucible, add 1 drop of the solution of ammonium molybdate [dissolve 3 g of ammonium molybdate in 60 ml of water, add 20 ml of nitric acid solution (1→2), mix well], heat briefly, a pale yellow colour is produced. Allow to stand for 1-2 minutes, add 1 drop of 1% solution of benzidine (dissolve 1 g of benzidine in 100 ml of 10% solution of acetic acid) and 1-2 drops of a saturated solution of sodium acetate, a blue colour or a blue precipitate is produced immediately.

Assay Dissolve about 0.1 g of the fine powder, accurately weighed, in 2 ml of hydrochloric acid and 5 ml of 4% boric acid solution in a conical flask by heating. Add 300 ml of water, 10 ml of 10% triethanolamine solution and 1 drop of methyl red IS, then add dropwise 10% potassium hydroxide solution until the solution turns to yellow. Add an excess of 15 ml, and about 30 mg of calcein indicator mixture, titrate with disodium edetate (0.05 mol/L) VS until the yellowish-green fluorescence disappears and turns to orange. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 3.904 mg of calcium fluoride (CaF_2).
It contains not less than 85.0 per cent of calcium fluoride (CaF_2).

Processing *Fluoritum* Eliminate foreign matter, break to pieces.

Fluoritum (calcined with vinegar) Calcine the clean pieces of fluoritum as described under the method for calcining openly (Appendix Ⅱ D) to red thoroughly, quench with vinegar, using 30 kg of vinegar per 100 kg of Fluoritum.

Action To induce sedation, and warm the lung and the uterus.

Indications Insomnia, dreamfulness sleep and palpitation; cough and dyspnea due to *deficiency* of the lung; infertility.

Usage and dosage 9-15 g, crushed into pieces and decocted first.

Storage Preserve in a dry place.

Folium Aconiti Kusnezoffii
(草乌叶，Caowuye)

Kusnezoff Monkshood Leaf

Kusnezoff Monkshood Leaf, a habitually used drug of the Mongol nationality, is the dried leaf of *Aconitum kusnezoffii* Reichb. (Fam. Ranunculaceae). The drug is collected in summer when foliage growing luxuriantly before flowering, removed from foreign matter, and dried immediately.

Description Mostly crumpled, rolled and broken, when whole, ovate, 3-divided, 5-12 cm long, 10-17 cm wide, greyish-green or yellowish-green. The middle lobe rhombic, acuminate, subpinnatipartite, the lateral lobes 2-partite; lobules lanceolate or ovate-lanceolate. Upper surface slightly pubescent, lower surface glabrous. Petioles 2-6 cm long. Texture fragile. Odour, slight; taste, slightly salty and pungent.

Identification (1) Surface view of leaf: Anticlinal walls of upper epidermal cells slightly sinuous, the outer periclinal walls sometimes with sparsely striated cuticle. Non-glandular hairs unicellular, mostly sickle-shaped, curved, up to 468 μm long, 44 μm in diameter, with warty walls. Anticlinal walls of lower epidermal cells strongly sinuous; stomata numerous, anomocytic, with 3-5 subsidiary cells.
(2) To 5 g of the powder add 25 ml of chloroform, shake thoroughly. Add 2 ml of sodium carbonate TS, shake for 30 minutes, filter. Add 4 ml of dilute hydrochloric acid TS to the filtrate, shake, separate the acid solution and filter. Transfer the filtrate into two test tubes, add 2 drops of potassium iodobismuthate TS to one test tube, a brownish-yellow precipitate is produced; add 2 drops of silitungsten acid TS to another test tube, a greyish-white precipitate is produced.

Action To remove toxic *heat*, and relieve pain.

Indications Fever in febrile diseases; diarrhea and abdominal pain, headache, toothache.

Usage and dosage 1-1.2 g; generally used in making pills and powder.

Precaution Be cautious about pregnant women.

Storage Preserve in a dry place.

Folium Apocyni Veneti
(罗布麻叶，Luobumaye)

Dogbane Leaf

Dogbane Leaf is the dried leaf of *Apocynum venetum* L. (Fam. Apocynaceae). The drug is collected in summer, removed from foreign matter, and dried.

Description Mostly crumpled and rolled, some broken, when whole, elliptical-lanceolate or ovate-lanceolate, 2-5 cm long, 0.5-2 cm wide, pale green or greyish-green, apex obtuse and mucronate, base obtuse or cuneate, margin

serrulate, usually recurved, glabrous on both surfaces, veins on lower surface prominent; petioles thin, about 4 mm long. Texture fragile. Odour, slight; taste, weak.

Identification (1) Surface view of leaf: Upper and lower epidermal cells polygonal, anticlinal walls straight, with granular cuticular striations on surface; stomata paracytic. Transverse section: Epidermal cells flattened, with convex outer walls. Mesophyll consisting of upper and lower palisade tissues, usually with 2 layers of palisade cells under upper epidermis, and 1 layer under lower epidermis, the cells very short; spongy tissue of 2-4 layers of cells, containing brown contents. Vascular bundle of midrib bicollateral, laticiferous tubes scattered in its surroundings and in phloem.
(2) To 1 g of the powder add 50 ml of ether, heat under reflux for 1 hour, cool, filter, discard the ether solution, add 25 ml of water to the residue, heat under reflux for 1 hour, cool, filter, extract the filtrate with two 20-ml quantities of ethyl acetate, combine the ethyl acetate extracts, evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution with 1 g of Folium Apocyni Veneti reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13 : 7 : 2) allowed to stand previously overnight below 10℃ as the mobile phase. Apply separately to the plate 3 μl of each of the above two solutions. After developing and removal of the plate, dry in air, spray with 3% aluminum chloride in ethanol, heat at 105℃ to the spots clear, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(3) To 0.5 g of the powder add 50 ml of 80% methanol, heat under reflux for 1 hour, cool, filter, evaporate to dryness, dissolve the residue in 20 ml of water, extract with two 20-ml quantities of ether, discard the ether solutions, add 5 ml of hydrochloric acid to the water solution, heat under reflux for 1 hour, remove, cool immediately, extract with two 20-ml quantities of ether, combine the ether extracts, wash with 10 ml of water, discard the water solution, filter the ether solution through a filter paper paved with a quantity of anhydrous sodium sulfate, expel the filtrate to dryness, dissolve the residue in 1 ml of ethanol as the test solution. Dissolve quercetin CRS and kaempferol CRS in ethanol to prepare two solutions containing 0.5 mg of each per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of hexane, ethyl acetate and formic acid (7 : 5 : 0.8) as the mobile phase. Apply separately to the plate 5 μl of the test solution and 2 μl of each of the reference solutions. After developing and removal of the plate, dry in air, spray with 3% aluminum chloride in ethanol, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions; examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Water Not more than 11.0 per cent (Appendix Ⅸ H, method 1).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using 75% ethanol as the solvent, not less than 20.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.4% phosphoric acid (50 : 50) as the mobile phase; maintain the column temperature at 30℃. As detector a spectrophotometer set at 360 nm. The number of theoretical plates of the column is not less than 4000, calculated with reference to the peak of quercetin.

Reference solution Dissolve a quantity of quercetin CRS, weighed accurately, in 80% methanol to prepare a solution containing 30 μg per ml.

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve) to a stopper conical flask, add accurately 50 ml of 80% methanol, weigh, heat on a water bath for 1 hour, cool, weigh again, compensate the loss of the weight with 80% methanol, mix well and filter. Measure accurately 10 ml of the successive filtrate, add 1 ml of hydrochloric acid, heat under reflux on a water bath at 90℃ for 60 minutes, cool immediately, transfer to a 25 ml volumetric flask, dilute with 80% methanol to volume, mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.60 per cent of quercetin ($C_{15}H_{11}O_7$), calculated with reference to the dried drug.

Action To pacify hyperactivity of the liver and soothe the mind, remove *heat* and diuresis.

Indications Dizziness, palpitation and insomnia, and edema due to hyperactivity of the liver; hypertension; neurasthenia; nephritic edema.

Usage and dosage 6-12 g.

Storage Preserve in a cool and dry place.

Folium Artemisiae Argyi (艾叶, Aiye)

Argy Wormwood Leaf

Argy Wormwood Leaf is the dried leaf of *Artemisia argyi* Lévl. et Vant. (Fam. Compositae). The drug is collected in summer before flowering, removed from foreign matter, and dried in the sun.

Description Mostly crumpled and broken, short petioled. When whole, ovate-elliptical, pinnatipartite, segments elliptical-lanceolate, margin irregularly dentate; upper surface greyish-green or dark yellowish-green, sparsely pubescent and glandular-punctate, lower surface densely greyish-white tomentose. Texture soft. Odour, delicately aromatic; taste, bitter.

Identification Powder: Greenish-brown. Non-glandular hairs occurring in two types: one type T-shaped, with a elongated and bent apical cell, unequally 2-armed and a 2-4 celled stalk; the other type of uniseriate, 3-5 celled, with a very long and twisted apical cell, frequently broken. Glandular hairs paramecium-like in surface view, consisting of 4 or 6 oppositely-overlapped cells, devoid of stalk. Clusters of calcium oxalate 3-7 μm in diameter, occurring in mesophyll cells.

Processing *Folium Artemisiae Argyi* Eliminate foreign matter and petioles, and sift.

Folium Artemisiae Argyi (carbonized and processed with

vinegar) Stir-bake clean Folium Artemisiae Argyi as described under the method of carbonizing by stir-baking (Appendix Ⅱ D) until the surface is charred, then spray with vinegar and stir-bake to dryness.
To each 100 kg of Folium Artemisiae Argyi add 15 kg of vinegar.

Action To dispel *cold*, relieve pain, warm the meridians and arrest bleeding.

Folium Artemisiae Argyi (*carbonized and processed with vinegar*) To arrest excessive menstrual discharge.

Indications Cold pain in the lower abdomen; menstrual disorders caused by cold; infertility; spitting of blood, epistaxis, uterine bleeding in pregnancy, excessive menstrual flow or prolonged menstruation; external use for itching.

Folium Artemisiae (*carbonized and processed with vinegar*) hemorrhage in *deficiency-cold* condition.

Usage and dosage 3-9 g; appropriate quantity is used in moxibustion or fumigation and wash.

Storage Preserve in a cool and dry place.

Folium Crataegi (山楂叶, Shanzhaye)

Hawthorn Leaf

Hawthorn Leaf is the dried leaf of *Crataegus pinnatifida* Bge. var. major N. E. Br. or *Crataegus pinnatifida* Bge. (Fam. Rosaceae). The drug is collected in summer and autumn, and dried in the air.

Description Mostly broken, when whole, broadly ovate, 6-12 cm long, 5-8 cm wide. Green to brownish-yellow, apex acuminate, base broadly cuneate, 2-6 pinnate-lobed margin acutely biserrate; petiole 2-6 cm long, stipule ovate to ovate-lanceolate. Odour, slight; taste, astringent, slightly bitter.

Identification (1) Powder: Green to brownish-yellow. Clusters of calcium oxalate 10-30 μm in diameter, prisms of calcium oxalate, 15-30 μm in diameter, scattered or accompanied by leaf trace bundle or vascular bundle. Spiral vessels 20-40 μm in diameter. Non-glandular hairs unicellular, long conical, base 30-40 μm in diameter. Fibres in bundle, 15 μm in diameter, with thickened walls.
(2) To 2 g of the powder add 50 ml of dilute ethanol TS, heat under reflux for 1.5 hours, cool, filter, evaporate the filtrate until no ethanol remained, add 10 ml of water, wash with two 20-ml quantities of petroleum ether (30-60℃), discard the petroleum ether solutions, extract the water solution with two 20-ml quantities of ethyl acetate, combine the ethyl acetate extracts, evaporate to dryness, dissolve the residue in 2 ml of ethanol as the test solution. Dissolve rutin CRS and hyperoside CRS in ethanol to prepare two solutions containing 0.1 mg of each per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide as the coating substance and a mixture of ethanol, acetone and water (7 : 5 : 6) as the mobile phase. Apply separately to the film 1-2 μl of each of the above three solutions. After developing and removal of the film, dry in air, spray with aluminum chloride in ethanol TS, heat under a current of hot air to dryness, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the cold maceration method), using dilute ethanol TS as the solvent, not less than 20.0 per cent.

Assay ***Total flavonoids***

Reference solution Weigh accurately 25 mg of rutin CRS, dried previously to constant weight at 120℃, in a 50 ml volumetric flask, add a quantity of ethanol, ultrasonicate to dissolve, cool, add ethanol to volume and mix well. Measure accurately 20 ml of the solution to a 50 ml volumetric flask, add water to volume and mix well (containing 0.2 mg of anhydrous rutin per ml).

Calibration standard Measure accurately 1, 2, 3, 4, 5 and 6 ml of the reference solution, respectively, into a 25 ml volumetric flask, add water to 6 ml, add 1 ml of 5% sodium nitrate, mix well, allow to stand for 6 minutes, add 1 ml of 10% aluminum nitrate, mix well, allow to stand for 6 minutes, add 10 ml of sodium hydroxide solution, add water to volume, mix well, allow to stand for 15 minutes. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), using the corresponding solvent as a blank, immediately measure the absorbance at 500 nm and plot the standard curve, using absorbance as ordinate and concentration as abscissa.

Procedure Weigh accurately 1 g of the fine powder into a Soxhlet's extractor, add chloroform, and heat under reflux until the extract colourless. Discard the chloroform extract and expel solvent remained in the residue, add methanol, heat under reflux for about 4 hours until the extract colourless, and evaporate the methanol extract to dryness. Dissolve the residue in dilute ethanol TS, transfer to a 50 ml volumetric flask, add dilute ethanol TS to volume, mix well as the stock solution. Filter the stock solution, measure accurately 5 ml of the successive filtrate to a 25 ml volumetric flask, dilute with water to volume and mix well.
Measure accurately 2 ml of the solution to a 25 ml volumetric flask, carry out the procedure as described under the calibration standard beginning at the words "add water to 6 ml..." to "measure the absorbance at 500 nm", read out the weight of rutin in the test solution from the standard curve, and calculate the content.
It contains not less than 7.0 per cent of total flavonoids, calculated as anhydrous rutin ($C_{27}H_{30}O_{16}$) with reference to the dried drug.

Hyperoside Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, methanol, tetrahydrofuran and 0.5% glacial acetic acid (1 : 1 : 19.4 : 78.6) as the mobile phase. As detector a spectrophotometer set at 363 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of hyperoside.

Reference solution Dissolve a quantity of hyperoside CRS, weighed accurately, in dilute ethanol TS to prepare a solution containing 20 μg per ml.

Test solution Measure the stock solution obtained under the Assay of total flavonoids, filter through microporous filter membrane (0.45 μm), and use the successive filtrate.

Procedure Inject accurately 10 μl of each of the reference

solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.050 per cent of hyperoside ($C_{21}H_{20}O_{12}$), calculated with reference to the dried drug.

Action To activate blood circulation to remove blood stagnation, and regulate *qi* flow to activate meridians.

Indications Constriction in the chest, palpitation, amnesia, vertigo and tinnitus due to stagnation of *qi* and blood.

Usage and dosage 3-10 g; or taken after soaked in boiling water.

Storage Preserve in a dry place.

Folium Eriobotryae (枇杷叶, Pipaye)

Loquat Leaf

Loquat Leaf is the dried leaf of *Eriobotrya japonica* (Thunb.) Lindl. (Fam. Rosaceae). The drug is collected all year round, tired up in small bundles after partial drying, and dried in the sun.

Description Oblong or obovate, 12-30 cm long, 4-9 cm wide. Apex acute, base cuneate, margin sparsely serrate and entire near base. Upper surface greyish-green, yellowish-brown or reddish-brown, relatively smooth; lower surface densely yellow tomentose, midrib on lower surface distinctly prominent, lateral veins pinnate; petioles very short, brownish-yellow tomentose. Texture leathery and fragile, easily broken. Odour, slight; taste, slightly bitter.

Identification Transverse section: Upper epidermal cells rectangular, covered with thick cuticle; lower epidermis bearing numerous unicellular non-glandular hairs, usually curved into a V-form near midrib, stomata visible. Palisade tissue 3-4 layers of cells, spongy tissue loose, all containing prisms and clusters of calcium oxalate. Vascular bundle of midrib collateral, nearly ringed; pericycle fibre bundles, arranged in an interrupted ring, with lignified walls, surrounded by parenchymatous cells containing prisms, forming crystal fibres; mucilage cells and prisms of calcium oxalate scattered in parenchyma.

Extractives Carry out the method for detemination of water-soluble extractives (Appendix Ⅹ A, the hot extraction method), not less than 10.0 per cent.

Processing *Folium Eriobotryae* Eliminate the hairs, spray with water to soften, cut into slivers and dry.

Folium Eriobotryae (*processed with honey*) Stir-bake the slivers of Folium Eriobotryae as described under the method for stir-baking with honey (Appendix Ⅱ D) until it is no more sticky to fingers, using 20 kg of refined honey per 100 kg of the slivers of Folium Eriobotryae.

Action To remove *heat* from the lung and stomach, and to relieve cough and vomiting.

Indications Cough and dyspnea caused by *heat* in the lung; vomiting, fever and thirst caused by *heat* in the stomach.

Usage and dosage 6-9 g.

Storage Preserve in a dry place.

Preparation Loquat Leaf Extracts.

Folium et Cacumen Murrayae (九里香, Jiulixiang)

Murraya Jasminorage

Murraya Jasminorage is the dried leaf and young foliferous branch of *Murraya exotica* L. or *Murraya paniculata* (L.) Jack (Fam. Rutaceae). The drug is collected all year round, removed from old branch, and dried in shade.

Description *Leaf and cacumen of Murraya exotica* Young branches cylindrical, 1-5 mm in diameter, externally greyish-brown, longitudinally wrinkled. Texture compact and flexible, uneasily broken, fracture uneven. Leaves pinnately compound, leaflets 3-9, mostly fallen off, obovate or subrhombic, the widest part above the middle, 3 cm long, 1.5 cm wide; apex obtuse, acute or retuse, base slightly oblique, margin entire; yellowish-green, texture thin leathery, the upper surface bearing transparent glandular dots, leaflets short petioled or nearly sessile, the lower part sometimes pubescent. Odour, aromatic; taste bitter, pungent and numb.

Leaf and cacumen of Murraya paniculata Leaflets ovate or elliptical, the widest part at or under the middle, 2-8 cm long, 1-3 cm wide, acuminate or short acute.

Identification (1) Transverse section: Upper and lower epidermis of 1 layer of cells respectively, rectangular, bearing unicellular non-glandular hairs, 30-70 (100) μm long, 9-15 μm in diameter, mesophyll tissue bifacial, palisade tissue of 2-3 layers of cells, not through the midrib; vascular bundle of midrib bicollateral, lignified fibres occurring above and under the vascular bundle; mesophyll tissue containing numerous clusters of calcium oxalate, 9-25 μm in diameter, sometimes prisms visible; oil cavities numerous, rounded, 80-120 μm in diameter, containing yellow oil droplets.
(2) To 2 g of the coarse powder add 20 ml of ethanol, heat under reflex for 30 minutes, and filter. Evaporate 5 ml of the filtrate to dryness, and dissolve the residue in 2 ml of ethyl acetate. Transfer to a test tube, add 2-3 drops of each of a freshly prepared a 7% solution of hydroxylamine hydrochloride in methanol and a 10% solution of potassium hydroxide in methanol, mix well, heat gently, cool, adjust the pH value to 3-4 with dilute hydrochloric acid TS. Add a 1% solution of ferric chloride in ethanol, a purplish-red colour is produced.

Action To promote the flow of *qi*, relieve pain, and resolve blood stasis.

Indications Stomach-ache, rheumatic arthralgia; external application for toothache, traumatic swelling and pain, snake or insect.

Usage and dosage 6-12 g; appropriate quantity of the fresh drug to be pounded into paste for topical application.

Storage Preserve in a dry place.

Folium Eucommiae (杜仲叶, Duzhongye)

Eucommia Leaf

Eucommia Leaf is the dried leaf of *Eucommia ulmoides* Oliv. (Fam. Eucommiaceae). The drug

is collected in summer and autumn when foliage branch growing luxuriantly, dried in the sun or at a lower temperature.

Description Mostly broken, when whole, elliptical or ovate, 7-15 cm long, 3.5-7 cm wide. Surface yellowish-green or yellowish-brown, somewhat lustrous, apex acuminate, base rounded or broadly cuneate, margin dentate, short-petioled. Texture fragile, easily broken on rubbing, fracture linked up by a few of silvery and elastic rubber threads. Odour, slight; taste, slightly bitter.

Identification Use the test solution obtained under the Assay as the test solution. To 1 g of Folium Eucommiae reference drug add 25 ml of methanol, heat under reflux for 1 hour, cool, filter, and use the filtrate as the reference drug solution. Dissolve chlorogenic acid CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of ethyl acetate, formic acid and water (7 : 2.5 : 2.5) as the mobile phase. Apply separately to the plate 5-10 μl of each of the above three solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and reference solution.

Water Not more than 15.0 per cent (Appendix Ⅸ H, method 1).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol TS as the solvent, not less than 16.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.4% phosphoric acid (13 : 87) as the mobile phase. As detector a spectrophotometer set at 327 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of chlorogenic acid.

Reference solution Weigh accurately a quantity of chlorogenic acid CRS to an amber volumetric flask, dissolve in 50% methanol to prepare a solution containing 50 μg per ml.

Test solution Weigh accurately 1 g of the powder (through No. 3 sieve) in a stopper conical flask, add accurately 25 ml of 50% methanol, weigh, heat on a water bath for 30 minutes, cool, weigh again, compensate the loss of the weight with 50% methanol, mix well, filter through microporous filter membrane (0.45 μm), and use the successive filtrate.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.080 per cent of chlorogenic acid ($C_{16}H_{18}O_9$), calculated with reference to the dried drug.

Action To reinforce the liver and kidney, and tone up bones and muscles.

Indications Dizziness, aching pain of the lower back and knees, flaccidity of limbs.

Usage and dosage 10-15 g.

Storage Preserve in a dry place.

Folium Ginkgo
(银杏叶, Yinxingye)

Ginkgo Leaf

Ginkgo Leaf is the dried leaf of *Ginkgo biloba* L. (Fam. Ginkgoaceae). The drug is collected in autumn when leaf green, and dried immediately.

Description Mostly crumpled or broken. When whole, fan-shaped, 3-12 cm long, 5-15 cm wide, yellowish-green or pale brownish-yellow. Upper margin irregularly sinuous, some retuse at the middle, deep to the 4/5 length of leaf. Veins dichotomous-parallel, fine and dense, glabrous, easily torn longitudinally. Base truncate, petioles 2-8 cm long. Texture light. Odour, slight; taste, slightly bitter.

Identification (1) To 1 g of the powder add 10 ml of methanol, heat under reflux for 10 minutes, cool, filter, and use the filtrate as the test solution. Prepare a solution with 1 g of Folium Ginkgo reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 4% sodium acetate as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately to the plate 6 μl of each of the above two solutions. After developing and removal of the plate, dry in air, spray with 3% aluminum chloride in ethanol, dry in hot air, and examine under ultraviolet light at 365 nm. The main fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(2) To 1 g of the powder add 40 ml of 50% acetone solution, heat under reflux for 3 hours, filter, evaporate the filtrate to dryness, dissolve the residue in 20 ml of water, extract with two 20-ml quantities of ethyl acetate, combine the ethyl acetate solutions, evaporate to dryness, dissolve the residue in 5 ml of 15% ethanol and apply to a polyamide column (30-60 mesh, 1 g, 1 cm in interdiameter, packed using water as the solvent by wet method), elute with 40 ml of 5% ethanol, collect the eluate, expel the ethanol on a water bath, extract the solution remained with two 20-ml quantities of ethyl acetate, combine the extracts, evaporate to dryness, dissolve the residue in 1 ml of acetone as the test solution. Dissolve ginkgolide A CRS, ginkgolide B CRS, ginkgolide C CRS and bilobalide CRS in acetone to prepare a mixture containing 0.5 mg of each of ginkgolides A, B, C and 1 mg of bilobalide per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose containing 4% sodium acetate solution as the coating substance and a mixture of toluene, ethyl acetate, acetone and methanol (10 : 5 : 5 : 0.6) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing below 15℃ and removal of the plate, dry in air, fumigate with acetic anhydride vapour for 15 minutes, heat at 140-160℃ for 30 minutes, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Foreign matter Not more than 2 per cent (Appendix Ⅸ A).

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method)), using dilute ethanol TS as the solvent, not less than 25.0 per cent.

Assay ***Total flavonol glycosides*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.4% phosphoric acid (50 : 50) as the mobile phase. As detector a spectrophotometer set at 360 nm. The number of theoretical plates of the column is not less than 2500, calculated with reference to the peak of quercetin.

Reference solution Weigh accurately a quantity of quercetin CRS, kaempferol CRS, isorhamnetin CRS, previously dried overnight over phosphorous pentoxide, dissolve in methanol to prepare a mixture containing 30 μg of each of quercetin and kaempferol and 20 μg of isorhamnetin per ml as the reference solution.

Test solution Weigh accurately 1 g of the medium powder into a Soxhlet's extractor, add chloroform and heat under reflux for 2 hours. Discard the chloroform solution, evaporate the residue to dryness, add methanol, heat under reflux for 4 hours, and evaporate the extract to dryness. Dissolve the residue in 25 ml of a mixture of methanol and 25% hydrochloric acid (4 : 1), heat under reflux for 30 minutes, cool, transfer to a 50 ml volumetric flask, add methanol to volume, and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the contents of quercetin, kaempferol and isorhamnetin, respectively. Calculate the content of total amount of flavonol glycosides using the following equation.
The content of total amount of flavonol glycosides = (the content of quercetin + the content of kaempferol + the content of isorhamnetin) × 2.51.
It contains not less than 0.40 per cent of total amount of flavonol glycosides, calculated with reference to the dried drug.

Terpenoid lactones Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, tetrahydrofuran and water (25 : 10 : 65) as the mobile phase. Use an evaporative light scattering detector. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of bilobalide.

Reference solution Weigh accurately a quantity of ginkgolide A CRS, ginkgolide B CRS, ginkgolide C CRS and bilobalide CRS, previously dried overnight over phosphorous pentoxide, add 50% methanol to prepare a mixture containing 0.18 mg of ginkgolide A, 0.08 mg of ginkgolide B, 0.10 mg of ginkgolide C and 0.20 mg of bilobalide per ml as the reference solution.

Test solution Weigh accurately 1.5 g of the medium powder into a Soxhlet's extractor, add petroleum ether (30-60℃) and heat under reflux on a water bath at 70℃ for 1 hour. Discard the petroleum ether (30-60℃) solution, evaporate the residue and the filter paper to dryness at 60℃ in an oven, add methanol, heat under reflux for 6 hours, evaporate the extract to dryness, dissolve the residue in methanol, transfer accurately to a 10 ml volumetric flask, ultrasonicate for 30 minutes, cool, add methanol to volume, mix well, and allow to stand. Measure accurately 5 ml of the supernatant and apply to an acidic aluminium oxide column (200-300 mesh, 3 g, 1 cm in interdiameter, packed using methanol as the solvent by wet method), elute with 25 ml of methanol, collect the eluate, evaporate to dryness, dissolve the residue in 5 ml of methanol, transfer to a 10 ml volumetric flask, add 4.5 ml of water, ultrasonicate (power 300 W, frequency 50 kHz) for 30 minutes, cool, add methanol to volume, mix well and filter.

Procedure Inject accurately 10 μl and 20 μl of the reference solution and 10-20 μl of the test solution, respectively, into the column, and calculate the content of ginkgolide A, ginkgolide B, ginkgolide C and bilobalide, respectively, using a calibration equation of logarithm alteration of two external standards.
It contains not less than 0.25 per cent of total amount of ginkgolide A ($C_{20}H_{24}O_9$), ginkgolide B ($C_{20}H_{24}O_{10}$), ginkgolide C ($C_{20}H_{24}O_{11}$) and bilobalide ($C_{15}H_{18}O_8$), calculated with reference to the dried drug.

Processing Eliminate foreign matter and sift off soil.

Action To astringe the *lung-qi* and relieve dyspnea, to aetivate blood circulation and eliminate the *blood stasis*, and to relieve pain.

Indications *Deficiency of lung* marked by cough and aetivate; coronary heart disease, angina pectoris, and hyperlipemia.

Usage and dosage 9-12 g.

Precaution Contraindicated in patients with exterior pathogenic factors.

Storage Preserve in a ventilated and dry place.

Folium Ginseng
(人参叶, Renshenye)

Ginseng Leaf

Ginseng Leaf is the dried leaf of *Panax ginseng* C. A. Mey. (Fam. Araliaceae). The drug is collected in autumn, and dried in the air or baked.

Description Usually in small bundles, sheaf-shaped or fan-shaped, 12-35 cm long. Leaves palmately compound, long petioled, dark green, 3-6 verticillate. Leaflets usually 5, occasionally 7 or 9, ovate or obovate, the basal ones 2-8 cm long, 1-4 cm wide; the upper ones similar in size, 4-16 cm long, 2-7 cm wide, cuneate at the base, acuminate at the apex, margin serrulate and bristly, veins on the upper surface bristly, and veins on the lower surface prominent. Texture papery, easily broken. Odour, delicately aromatic; taste, slightly bitter and sweet.

Identification (1) Powder: Yellowish-green. Upper epidermal cells irregular, nearly rectangular, 35-92 μm long, 32-60 μm wide, with sinuous or deep sinuous anticlinal walls. Lower epidermal cells similar to upper epidermal cells, relatively small, stomata anomocytic, subsidiary cells 31-35 μm long. Palisade tissue absent, mesophyll consisting of 4 layers of subrounded parenchymatous cells, 18-29 μm in diameter, containing chloroplasts or clusters of calciun oxalate, 12-40 μm in diameter, acutangular.
(2) Moisten 0.2 g of the powder in a 10 ml stopper test tube with 1 ml of water, add 5 ml of *n*-butanol saturated with water, mix well by shaking, stand at room temperature for 48 hours. To 1 portion of the supernatant add 3 portions of water saturated with *n*-butanol, mix well by shaking, allow to stand until two layers separated (centrifuge if necessary),

use the supernatant as the test solution. Disslove ginsenoside Rg_1 CRS and ginsenoside Re CRS in methanol to produce a mixture containing 2.5 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of *n*-butanol, ethyl acetate and water (4 : 1 : 5) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with sulfuric acid solution (1→10), heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in colour and position to the spots in the chromatogram obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.05% phosphoric acid (100 : 400) as the mobile phase. As detector a spectrophotometer set at 203 nm. The number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of ginsenoside Re.

Reference solution Weigh accurately a quantity of ginsenoside Rg_1 CRS and ginsenoside Re CRS respectively, add methanol to produce two solutions containing 0.25 mg of ginsenoside Rg_1 and 0.5 mg of ginsenoside Re per ml respectively.

Test solution Weigh accurately 0.2 g of the powder to a Soxhlet's extractor, add 30 ml of chloroform, heat under reflux for 1 hours. Discard the chloroform solution, expel chloroform of the residue, add 30 ml of methanol, heat under reflux for 3 hours, evaporate the extract to dryness. Dissolve the residue in 10 ml of water, extrace with two 10-ml quantities of petroleum ether (30-60℃), discard the petroleum ether extracts, apply the water solution to a column packed with D101 macroporous resin (1.5 cm in inner diameter, 15 cm in length), elute with 50 ml of water, discard the water eluate, elute again with 50 ml of 20% ethanol, discard the 20% ethanol eluate, elute successively with 80 ml of 80% ethanol, collect 70 ml of the eluate and evaporate to dryness. Dissolve the residue in methanol and transfer accurately to a 10 ml volumetric flask, add methanol to volume, mix well.

Procedure Inject accurately 10 μl of each of the reference solutions and the test solution into the column, respectively, and calculate the content.

It contains not less than 2.25 per cent of the total amount of ginsenoside Rg_1 ($C_{42}H_{72}O_{14}$) and ginsenoside Re ($C_{48}H_{82}O_{18}$).

Action To nourish general *qi* and lung, expel summer-heat, and promote production of body fluids.

Indications Cough caused by *qi deficiency*, dysphoria due to summer-heat, thirst due to fluids deficiency, dizziness, weakness of the limbs.

Usage and dosage 3-9 g.

Precaution Incompatible with Rhizoma et Radix Veratri.

Storage Preserve in a cool and dry place, protected from moisture.

Folium Ilicis Cornutae
(枸骨叶, Gouguye)

Chinese Holly Leaf

Chinese Holly Leaf is the dried leaf of *Ilex cornuta* Lindl. ex Paxt. (Fam. Aquifoliaceae). The drug is collected in autumn, removed from foreign matter, and dried in the sun.

Description Subrectangular, oblong-rectangular, occasionally long-ovate, 3-8 cm long, 1.5-4 cm wide. Apex with 3 relatively big hard spines, the apical one usually recurved; base truncate or broadly cuneate, sometimes each of both sides with 1-3 spines, edges somewhat recurved; long-ovate leaves usually free from spines. Upper surface yellowish-green or greenish-brown, lustrous; lower surface greyish-yellow or greyish-green. Veins pinnate; short-petioled. Texture leathery, hard and thick. Odour, slight; taste, slightly bitter.

Identification Transverse section at the base of leaf: Upper epidermal cells subsquare, thick-walled, covered with a thick cuticle, bearing unicellular non-glandular hairs near midrib. Lower epidermal cells relatively small, stomata visible. Palisade tissue of 2-4 layers of cells; spongy tissue loose. 1 to several layers of collenchymatous cells occurring inside the upper and lower epidermis at midrib. Vascular bundle of midrib collateral, with lignified fibre groups above and below the vascular bundle, Collenchymatous cells, stone cells in semi-ring and lignified fibre groups sequently occurring inside the epidermis of margin; several layers of collenchymatous cells at the margin near the petiole; absent above the base. Stone cells occasionally occurring in the collenchyma inside the epidermis of margin and the lower epidermis of midrib, and outside the fibre groups below the phloem. Parenchyma and lower epidermal cells frequently containing clusters of calcium oxalate.

Action To remove *heat*, to pacify the hyperactivity of the liver, and replenish the *kidney-yin*.

Indications Hemoptysis and afternoon fever in phthisis; dizziness, and bluned vision hypertension.

Usage and dosage 9-15 g.

Storage Preserve in a dry place.

Folium Isatidis
(大青叶, Daqingye)

Dyers Woad Leaf

Dyers Woad Leaf is the dried leaf of *Isatis indigotica* Fort. (Fam. Cruciferae). The drug is collected 2-3 times in summer and autumn, removed from foreign matter, and dried in the sun.

Description Mostly crumpled and rolled, sometimes broken. When whole, long-elliptical to oblong-oblanceolate, 5-20 cm long, 2-6 cm wide, upper surface dark greyish-green, sometimes small deeper coloured prominences present; apex obtuse, margin entire or slightly undulate, base attenuate and decurrent into the petiole appearing wing-shaped; petioles 4-10 cm long, pale brownish-yellow. Texture fragile. Odour, slight; taste, slightly sour, bitter and astringent.

Identification (1) Powder: Greenish-brown. Anticlinal walls of lower epidermal cells slightly sinuous and somewhat beaded; stomata anomocytic, with 3-4 subsidiary cells. Palisade tissue and spongy tissue indistinctly differentiated.

(2) To 0.5 g of the powder add 20 ml of chloroform, heat under reflux for 1 hour, filter and evaporate the filtrate to 1 ml as the test solution. Dissolve indigotin CRS and indirubin CRS in chloroform to produce a mixture containing 1 mg of

each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, chloroform and acetone (5 : 4 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air. The blue spot and pale purplish-red spot in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using ethanol as the solvent, not less than 16.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (75 : 25) as the mobile phase. As detector a spectrophotometer set at 289 nm. The number of theoretical plates of the column is not less than 4000, calculated with reference to the peak of indirubin.

Reference solution Dissolve a quantity of indirubin CRS, weighed accurately, in methanol to prepare a solution containing 2 μg per ml.

Test solution Weigh accurately 0.25 g of the fine powder to a Soxhlet's extractor, add appropriate quantity of chloroform to macerate for 15 hours, heat under reflux to the extract colourless. Recover the solvent to dryness, dissolve the residue in methanol and transfer to a 100 ml volumetric flask, add methanol to volume and mix well.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.020 per cent of indirubin ($C_{16}H_{10}N_2O_2$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash rapidly, cut into pieces, and dry.

Action To remove toxic *heat*, cool blood, to reduce eruptions.

Indications High fever with impairment of consciousness and skin eruptions in epidemic diseases; jaundice; acute dysentery; mumps; inflammation of the throat, erysipelas, carbuncles.

Usage and dosage 9-15 g.

Storage Preserve in a ventilated and dry place, protected from mould.

Folium Mori
(桑叶, Sangye)

Mulberry Leaf

Mulberry Leaf is the dried leaf of *Morus alba* L. (Fam. Moraceae). The drug is collected at the early frost season, removed from foreign matter, and dried in the sun.

Description Mostly crumpled and broken. When whole, petioled, ovate or broadly ovate, 8-15 cm long, 7-13 cm wide; apex acuminate, base truncate, round or cordate, margin dentate or obtuse-dentate, some irregularly partite. Upper surface yellowish-green or pale yellowish-brown, some with small warty protrudings; lower surface relatively light in colour, veins prominent, lateral veins reticulate, sparsely pubescent on the veins, cluster of hairs occurring at the vein base. Texture fragile. Odour, slight; taste, weak, slightly bitter and astringent.

Identification (1) Powder: Yellowish-green or yellowish-brown. The upper epidermis occurring large crystal cells, containing cystolith, 47-77 μm in diameter. Stomata in lower epidermis anomocytic, with 4-6 subsidiary cells. Non-glandular hairs unicellular, 50-230 μm long. Clusters of calcium oxalate 5-16 μm in diameter; prisms occasionally visible.
(2) To 2 g of the powder add 30 ml of petroleum ether (60-90℃), heat under reflux for 30 minutes, discard the petroleum ether solution, evaporate the residue to dryness, add 30 ml of ethanol, ultrasonicate for 20 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 10 ml of hot water, heat on a water bath at 60℃, stir to dissolve, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution with 2 g of Folium Mori reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of toluene, ethyl acetate and formic acid (5 : 2 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing (about 8 cm) in a chamber pre-equilibriated with the mobile phase for 10 minutes and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Not more than 15.0 per cent (Appendix Ⅸ H, method 1).

Acid-insoluble ash Not more than 4.5 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dehydrated ethanol as the solvent, not less than 5.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, methanol as the mobile phase A, 0.5% phosphoric acid as the mobile phase B, elute in gradient as the following:

Time(min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0-5	30	70
5-10	30→35	70→65
10-15	35→40	65→60
15-18	40→50	60→50

As detector a spectrophotometer set at 358 nm. The number of theoretical plates of the column is not less than 5000, calculated with reference to the peak of rutin.

Reference solution Weigh accurately a quantity of rutin CRS, dried previously to constant weight at 120℃ in vacuum, dissolve in methanol to prepare a solution containing 0.1 mg per ml.

Test solution Weigh accurately 1 g of the powder (through No. 3 sieve) to a round-bottom flask, add 50 ml of methanol, heat under reflux for 30 minutes, filter, extract the residue with two 50-ml quantities of methanol and combine the filtrates. Recover the solvent in vacuum, dissolve the residue in methanol, transfer to a 25 ml volumetric flask, dilute to volume, and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.10 per cent of rutin ($C_{27}H_{30}O_{16}$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, rub to break, remove the petioles, sift off the dust.

Action To dispel *wind-heat* and remove *heat* from the lung, to subdue hyperactivity of the liver and improve eyesight.

Indications Common cold due to *wind-heat*, dry cough due to *heat* in the lung dizziness, headache, inflammation of the eye, blurred vision.

Usage and dosage 5-9 g.

Storage Preserve in a dry place.

Folium Nelumbinis (荷叶, Heye)

Lotus Leaf

Lotus Leaf is the dried leaf of *Nelumbo nucifera* Gaertn. (Fam. Nymphaeaceae). The drug is collected in summer and autumn, dried in the sun to remove most of water, removed from the petioles, folded to semicircular or plicate, and dried again.

Description Semicircular or plicate, subrounded when spread, 20-50 cm in diameter, margin entire or slightly sinuous. Upper surface dark green or yellowish-green, relatively rough, lower surface pale greyish-brown, relatively smooth, with 21-22 thick veins, radiating from the centre to the border, with convex remains of petiole in the centre. Texture fragile, easily broken. Odour, slightly aromatic; taste, slightly bitter.

Identification Powder: Greyish-green. Upper epidermal cells polygonal, with papillary or short tomentose protuberances; stomata, anomocytic, subsidiary cells 5-8. Anticlinal walls of lower epidermal cells slightly sinuous, sometimes beaded. Clusters of calcium oxalate numerous, up to 40 μm in diameter.

Water Not more than 15.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 12.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.5 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using 70% ethanol as the solvent not less than 10.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, water, triethylamine and glacial acetic acid (27 : 70.6 : 1.6 : 0.78) as the mobile phase. As detector a spectrophotometer set at 270 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of nuciferine.

Reference solution Dissolve a quantity of nuciferine CRS, weighed accurately, in methanol to prepare a solution containing 16 μg per ml.

Test solution Weigh accurately 0.5 g of the coarse powder to a stopper cornical flask, add accurately 50 ml of methanol, weigh, heat on a water bath for 2.5 hours, cool, weigh again, compensate the loss of the weight with methanol, mix well, and filter. Measure accurately 5 ml of the successive filtrate to a 10 ml volumetric flask, dilute with water to volume, and mix well.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.10 per cent of nuciferine ($C_{19}H_{21}NO_2$), calculated with reference to the dried drug.

Processing *Folium Nelumbinis* Spray with water, soften briefly, cut into slivers and dry.

Folium Nelumbinis (*carbonized*) Carbonize the clean Folium Nelumbinis as described under the method for carbonizing by calcining (Appendix Ⅱ D).

Action To relieve summer-heat, invigorate the spleen function and arrest bleeding by reducing *heat* in blood.

Folium Nelumbinis (*carbonized*): To arrest bleeding, remove *blood stasis*.

Indications Dire thirst caused by *summer-heat* with dire thirst; diarrhea caused by *summer-damp* or *deficiency* of the spleen; spitting of blood, epistaxis, hematochezia and abnormal uterine bleeding caused by *heat* in blood.

Folium Nelumbinis (*carbonized*): Various kind of bleeding and massive postpartum hemorrhage.

Usage and dosage 3-9 g; 15-30 g for fresh Folium Nelumbinis; 3-6 g of Folium Nelumbinis (carbonized).

Storage Preserve in a ventilated and dry place, protected from moth.

Folium Perillae (紫苏叶, Zisuye)

Perilla Leaf

Perilla Leaf is the dried leaf (or bearing young branch) of *Perilla frutescens* (L.) Britt. (Fam. Labiatae). The drug is collected in summer when foliage branch growing luxuriantly, removed from foreign matter, and dired in the sun.

Description Mostly crumpled, rolled and broken, when whole, ovate, 4-11 cm long, 2.5-9 cm wide. Apex acuminate or acute, base rounded or broadly cuneate, margin crenate. Both surfaces purple or the upper green and the lower purple, scattered with greyish-white hairs, and occurring numerous dotted glandular scales on the lower surface. Petioles 2-7 cm long, purple or purplish-green. Texture fragile. Young branches, 2-5 mm in diameter; purplish-green, with a pith in the centre of fracture. Odour, delicately aromatic; taste, slightly pungent.

Identification (1) Surface view of leaf: Some epidermal cells containing purple pigment. A red colour is produced

immediately on adding 10% hydrochloric acid solution; or a bright green colour is produced on adding 5% potassium hydroxide solution, subsequently changed to yellowish-green.
(2) To 0.7 g of the coarse powder in a round-bottom flask add 250 ml of water, mix well, connect the flask with a volatile oil determination apparatus, add water from the top of the apparatus until it reaches the mark and overflows to the flask, add 1.5 ml of petroleum ether (60-90℃) and connect the flask to a reflux condenser, heat to boil and keep in gentle boiling for 2 hours, cool, and separate the petroleum ether layer as the test solution. Prepare a solution with 0.7 g of Folium Perillae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (19 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing (about 15 cm) and removal of the plate, dry in air. Spray with dinitrophenylhydrazine TS, and allow to stand. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Processing Eliminate foreign matter and old branches; or spray with water, cut into pieces and dry.

Action To induce perspiration and dispel *cold*, and regulate the stomach function.

Indications Common cold with cough and nausea; morning sickness; fish or crab poisoning.

Usage and dosage 5-9 g.

Storage Preserve in a cool and dry place.

Folium Polygoni Tinctorii (蓼大青叶, Liaodaqingye)

Indigoplant Leaf

Indigoplant Leaf is the dried leaf of *Polygonum tinctorium* Ait. (Fam. Polygonaceae). The drug is collected twice in summer and autumn when foliage branch growing luxuriantly, removed from stem and foreign matter, and dried.

Description Mostly crumpled and broken, when whole, elliptical, 3-8 cm long, 2-5 cm wide, bluish-green or blackish-blue, apex obtuse, base attenuate, margin entire. Veins pale yellowish-brown, slightly prominent on the lower surface. Petioles flattened, occasionally with membranaceous ochrea. Texture fragile. Odour, slight; taste, slightly astringent and bitter.

Identification (1) Surface view of leaf: Epidermal cells polygonal, anticlinal walls straight or slightly sinuous; stomata paracytic, a few anomocytic. Glandular hairs with a 4-8 celled head, and a bicellular or multicellular stalk, biseriate or multiseriate. Non-glandular hairs multiseriate, with lignified and thickened walls, frequently occuring on the edge and midrib of leaf. Mesophyll tissue containing numerous blue to bluish-black pigment granules. Clusters of calcium oxalate numerous, 12-80 μm in diameter.
(2) Concentrate 10 ml of the chloroform solution obtained under the Assay to 1 ml as the test solution. Dissolve indigo CRS in chloroform to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, chloroform and acetone (5 : 4 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air. The blue spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (6 : 4) as the mobile phase. As detector a spectrophotometer set at 604 nm. The number of theoretical plates of the column is not less than 1800, calculated with reference to the peak of indigo.

Reference solution Dissolve 2.5 mg of indigo CRS, accurately weighed, in a 250 ml volumetric flask, add about 200 ml of a 2% solution of chloral hydrate in chloroform (weigh 2.0 g of chloral hydrate, previously dried over silica gel in a desiccator for 24 hours, add chloroform to 100 ml, allow to stand until the solution is turbid, dehydrate with anhydrous sodium sulfate and filter), ultrasonicate (power 250 W, frequency 33 kHz) for 1.5 hours, allow to cool, dilute with a 2% solution of chloral hydrate in chloroform to volume, and mix well (containing 10 μg of indigo per ml).

Test solution Weigh accurately 25 mg of the fine powder in a 25 ml volumetric flask, add about 20 ml of a 2% solution of chloral hydrate in chloroform, ultrasonicate (power, 250 W; frequency, 33 kHz) for 1.5 hours, allow to cool, dilute with a 2% solution of chloral hydrate in chloroform to volume, mix well and filter. Use the successive filtrate as the test solution.

Procedure Inject accurately 4-10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.50 per cent of indigo ($C_{16}H_{10}N_2O_2$).

Action To remove toxic *heat*, and to reduce eruptions by reducing *heat* in blood.

Indications Fever and eruptions in epidemic diseases; cough and dyspnea due to *heat* in the lung; inflammation of the throat, mumps, erysipelas, carbuncles.

Usage and dosage 9-15 g; for external use, appropriate quantity of the fresh leaves to be pounded into paste and applied topically.

Storage Preserve in a ventilated and dry place.

Folium Pyrrosiae (石韦, Shiwei)

Shearer's Pyrrosia Leaf

Shearer's Pyrrosia Leaf is the dried leaf of *Pyrrosia sheareri* (Bak.) Ching, *Pyrrosia lingua* (Thunb.) Farwell or *Pyrrosia petiolosa* (Christ) Ching (Fam. Polypodiaceae). The drug is collected all year round, removed from rhizome and root, and dried in the sun or in the shade.

Description *Leaf of Pyrrosia sheareri* Fronds slightly crumpled, when whole, lanceolate, 10-25 cm long, 3-5 cm wide, apex acuminate, base auriculate oblique, margin entire, edges usually rolled inwards. Upper surface yellowish-green or greyish-green, sparsely black rounded-pitted; lower surface densely covered with reddish-brown stellate hairs, sometimes the area between the lateral veins

completely covered with brown rounded-spotted sori. Stipes with 4 ribs, 10-20 cm long, 1.5-3 mm in diameter, slightly twisted, grooved longitudinally. Fronds leathery. Odour, slight; taste, slightly astringent and bitter.

Leaf of Pyrrosia lingua Fronds lanceolate or oblong-lanceolate, 8-12 cm long, 1-3 cm wide, base cuneate and symmetrical. Sori closely and regularly arranged between the lateral veins. Stipes 5-10 cm long, about 1.5 mm in diameter.

Leaf of Pyrrosia petiolosa Fronds mostly rolled into a quill, when whole, oblong or ovate-oblong, 3-8 cm long, 1-2.5 cm wide, base cuneate and symmetrical. Lower surface with indistinct lateral veins and completely covered with sori. Stipes 3-12 cm long, about 1 mm in diameter.

Identification Powder: Yellowish-brown. Stellate hairs with a 7-12 celled body, showing a radiate arrangement of upper and lower layers, cells lanceolate, apex acute, some with longitudinal or irregular reticulate striations on the surface; and a 1-9 celled stalk. Spores ellipsoidal in polar view and reniform in equatorial view, with warty walls. Lower epidermal cells of leaf polygonal, with beaded anticlinal walls and subrounded stomata. Fibres long fusiform, filled with reddish-brown or brown masses.

Foreign matter Not more than 3 per cent (Appendix Ⅸ A).

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 0.8 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol TS as the solvent, not less than 18.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.5% phosphoric acid (11 : 89) as the mobile phase. As detector a spectrophotometer set at 326 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of chlorogenic acid.

Reference solution Weigh accurately a quantity of chlorogenic acid CRS to an amber volumetric flask, dissolve in 50% methanol to prepare a solution containing 40 μg per ml.

Test solution Weigh accurately 0.2 g of the powder (through No. 2 sieve) to a stopper cornical flask, add accurately 25 ml of 50% methanol, weigh, ultrasonicate (power 300 W, frequency 25 kHz) for 45 minutes, cool, weigh again, compensate the loss of the weight with 50% methanol, mix well, filter, and use the successive filtrate.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 0.30 per cent of chlorogenic acid ($C_{16}H_{18}O_9$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, cut into sections, dry in the sun and sift.

Action To induce urination, relieve dysuria, remove *heat* and arrest bleeding.

Indications Urinary infection and urolithiasis with difficult painful urination; spitting of blood, epistaxis, hematuria, abnormal uterine bleeding; cough and asthma due to *heat* in the lung.

Usage and dosage 6-12 g.

Storage Preserve in a ventilated and dry place.

Folium Rhododendri Daurici (满山红, Manshanhong)

Dahurian Rhododendron Leaf

Dahurian Rhododendron Leaf is the dried leaf of *Rhododendron dauricum* L. (Fam. Ericaceae). The drug is collected in summer and autumn, and dried in the shade.

Description Mostly recurved and tubular, sometimes crumpled and broken. When whole, elliptical or long-obovate, 2-7.5 cm long, 1-3 cm wide; apex obtuse, base subrounded or broadly cuneate, margin entire; upper surface dark green to brownish-green, scattered with pale yellow glandular scales; lower surface greyish-green, glandular scales numerous. Petioles 3-10 mm long. Texture nearly leathery. Odour, aromatic and characteristic; taste, relatively bitter and slightly pungent.

Identification (1) Transverse section: Upper epidermal cells rectangular, covered with cuticle, bearing glandular scales at the sunken places; lower epidermal cells subrounded, with sinuous walls, stomata and glandular scales present. Palisade tissue of 2-3 layers of cells, spongy cells subrounded. Vascular bundle of midrib bicollateral pericyclic fibres arranged in an interrupted ring, numerous layers of collenchymatous cells occurring inside the upper and lower epidermis, the upper epidermis of midrib bearing unicellular non-glandular hairs. Parenchymatous cells and spongy cells containing clusters of calcium oxalate.

(2) To 5 g of the coarse powder add 50 ml of ethanol, ultrasonicate for 15 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue with three 10-ml quantities of 40% ethanol by heating on a water bath, filter when hot, combine the filtrates and evaporate to dryness. Extract the water solution with two 15-ml quantities of ether, combine the ether extracts and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution with 5 g of Folium Rhododendri Daurici reference drug in the same manner as the reference drug solution. Dissolve farrerol CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of toluene, ethyl acetate and formic acid (7 : 2 : 0.5) as the mobile phase. Apply separately to the plate 5 μl of each of the above three solutions. After developing in a chamber pre-equilibrated with the mobile phase for 15 minutes and removal of the plate, dry in air. Spray with aluminium chloride TS, heat to the spots clear, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution and the reference drug solution.

Water Not more than 9.0 per cent (Appendix Ⅸ H, method 2).

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using 60% ethanol as the solvent, not

less than 20.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (60 : 40) as the mobile phase. As detector a spectrophotometer set at 295 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of farrerol.

Reference solution Dissolve a quantity of farrerol CRS, weighed accurately, in methanol to prepare a solution containing 60 μg per ml.

Test solution Weigh accurately 1 g of the fine powder to a stopper conical flask, add accurately 50 ml of 60% methanol, weigh, ultrasonicate (power 250 W, frequency 33 kHz) for 15 minutes, cool, weigh again, compensate the loss of the weight with 60% methanol and filter. Measure accurately 25 ml of the successive filtrate, evaporate to dryness, dissolve the residue in 60% methanol, transfer to a 5 ml volumetric flask, dilute with 60% methanol to volume, mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.080 per cent of farrerol ($C_{17}H_{16}O_5$), calculated with reference to the dried drug.

Action To arrest cough and expectoration of phlegm.

Indications Acute and chronic bronchitis.

Usage and dosage 25-50 g, then take the medicated preparation; 6-12 g, macerated with 40% ethanol.

Storage Preserve in a cool and dry place, protected from moisture and heat.

Folium Sennae
(番泻叶, Fanxieye)

Senna Leaf

Senna Leaf is the dried leaflet of *Cassia angustifolia* Vahl or *Cassia acutifolia* Delile (Fam. Leguminosae).

Description *Leaf of Cassia angustifolia* Elongated ovate or ovate-lanceolate, 1.5-5 cm long, 0.4-2 cm wide, margin entire, apex acute, base slightly asymmetrical. Upper surface yellowish-green, lower surface pale yellowish-green, glabrous or nearly glabrous, veins slightly prominent. Texture leathery. Odour, slight and characteristic; taste, slightly bitter and mucilaginous.

Leaf of Cassia acutifolia Lanceolate or elongated ovate, slightly rolled, apex mucronate or slightly convex, base asymmetrical, both surfaces covered with fine and short hairs.

Identification (1) Powder: Pale green or yellowish-green. Crystal fibres numerous, prisms of calcium oxalate 12-15 μm in diameter. Non-glandular hairs unicellular, 100-350 μm long, 12-25 μm in diameter, with thickened and warty walls. Clusters of calcium oxalate occurring in parenchymatous cells of mesophyll, 9-20 μm in diameter. Epidermal cells of both surfaces polygonal in surface view, with straight anticlinal walls; stomata occurring on both surfaces, mostly paracytic, subsidiary cells mostly 2, sometimes 3.
(2) To 25 mg of the powder add 50 ml of water and 2 ml of hydrochloric acid, heat on a water bath for 15 minutes, allow to cool. Extract with 40 ml of ether, separate the ether layer and dehydrate with anhydrous sodium sulfate and filter. Evaporate 5 ml of the filtrate to dryness, allow to cool, add 5 ml of ammonia TS, a yellow or orange colour is produced, changing to purplish-red when heated on a water bath for 2 minutes.
(3) To 0.5 g of the powder add 3 ml of a mixture solution of equal quantities of ethanol and water, ultrasonicate for 30 minutes, centrifuge, use the supernatant as the test solution. Prepare a solution with 0.5 g of Folium Sennae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, *n*-propanol and water (4 : 4 : 3) as the mobile phase. Apply separately in strip to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Spray with 20% nitric acid solution, heat at 120℃ for 10 minutes, allow to cool, spray again with a 5% solution of potassium hydroxide in dilute ethanol TS, examine in daylight. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Foreign matter Not more than 6 per cent (Appendix Ⅸ A).

Water Not more than 10.0 per cent (Appendix H, method 1).

Assay Protect from light throughout the assay, all reagents must be freshly prepared.
Weigh accurately 0.15 g of the fine powder to a round-bottom flask, add 30 ml of water, shake thoroughly, weigh, heat under reflux on a water bath for 15 minutes. Allow to cool, weigh and compensate the loss of the weight with water, shake well. Centrifuge and transfer accurately 20 ml of the supernatant to a 150 ml separator. Add 0.1 ml of hydrochloric acid (2 mol/L), extract with three 15-ml quantities of chloroform, allow to separate and discard the chloroform layer. Add 0.1 g of sodium bicarbonate to the water layer, shake for 3 minutes. Centrifuge and transfer accurately 10 ml of the supernatant to a 100 ml round-bottom flask. Add 20 ml of 10.5% ferric chloride solution, mix well, heat under reflux on a water bath for 20 minutes, the level of water in water bath must be higher than that of liquid in flask. Add immediately 1 ml of hydrochloric acid again and continue heating for 20 minutes with frequent shaking until the precipitate is dissolved completely, the time must be controlled strictly. Allow to cool, transfer the mixture to a separator, extract with three 25-ml quantities of ether. Wash the combined ether extracts with two 15-ml quantities of water and discard the washings. Filter the ether extracts through dry filter paper to a 100 ml amber coloured volumetric flask and wash the filter with ether. Combine the washings with ether extracts, then add ether to volume. Measure accurately 10 ml of the ether solution and evaporate carefully to dryness by gentle heating, dissolve the residue in 10 ml of a 0.5% solution of magnesium acetate in methanol, accurately measured. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), using methanol as a blank. Immediately measure the absorbance at 515 nm. Calculate the content of sennoside B, taking 240 as the value of A (1%, 1 cm).
It contains not less than 2.5 per cent of total sennosides, calculated as sennoside B ($C_{42}H_{38}O_{20}$).

Action To purge *heat*, relax the bowels and induce urination.

Indications Accumulation of *heat* marked by constipation

and abdominal pain; edema.

Usage and dosage 2-6 g, added when the decoction is nearly done, or taken after soaked in boiling water.

Precaution Be cautious about pregnant women.

Storage Preserve in a ventilated and dry place, protected from light.

Folium Viticis Negundo (牡荆叶, Mujingye)

Hempleaf Negundo Chastetree Leaf

Hempleaf Negundo Chastetree Leaf is the fresh leaf of *Vitex negundo* L. var. *cannabifolia* (Sieb. et Zucc.) Hand.-Mazz. (Fam. Verbenaceae). The drug is collected in summer and autumn when foliage growing luxuriantly, removed from stem and branch.

Description Leaves digitately compound, leaflets 5 or 3, lanceolate or elliptical-lanceolate, the middle leaflet 5-10 cm long, 2-4 cm wide, the lateral leaflets relatively small, apex acuminate, base cuneate, margin dentate. Upper surface green, lower surface pale green, both surfaces pubescent along veins, relatively dense on the lower surface of young leaf. Petioles 2-6 cm long, with a shallow groove, densely covered with greyish-white pubescences. Odour, aromatic; taste, pungent, slightly bitter.

Identification Transverse section: Upper epidermal cells arranged regularly, pubescent on both surfaces and more prominent on the lower surface. Palisade tissue of 3-4 layers of cells; spongy tissue loose. Vascular bundles of midrib collateral, U-shaped, with 1-5 small vascular bundles in the hollow of U-shaped part, pits visible on surrounding parenchymatous cells, several layers of collenchymatous cells occurring inside the upper epidermis and lower epidermis.
Surface view of leaf: Upper epidermal cells subpolygonal or irregular, with sinuous anticlinal walls; Non-glandular hairs 1-4-celled, apical cells elongated, with warty prominences; Glandular scales with a 4-celled head, up to 55 μm in diameter, and an unicellular stalk; Small glandular hairs few, with a 1-4-celled head, up to 25 μm in diameter, and a 1-3-celled stalk, very short. Lower epidermal cells relatively small, 17-30 (45) μm long, 12-25 μm in diameter, with slightly sinuous or straight anticlinal walls; stomata anomocytic, 15-20 μm in diameter, with 3-6 subsidiary cells; Non-glandular hairs, glandular scales and small glandular hairs numerous.

Action To induce expectoration, relieve cough and asthma.

Indications Chronic bronchitis with cough and asthma.

Usage and dosage Fresh Oleum Viticis Negundo for the extraction of volatile oil.

Storage Preserve in a cool place.

Fructus Akebiae (预知子, Yuzhizi)

Akebia Fruit

Akebia Fruit is the dried nearly ripe fruit of *Akebia quinata* (Thunb.) Decne., *Akebia trifoliata* (Thunb.) Koidz. or *Akebia trifoliata* (Thunb.) Koidz. var. *australis* (Diels) Rehd. (Fam. Lardizabalaceae). The drug is collected in summer or autumn when the fruit turned greenish-yellow, dried in the sun or treated in boiling water for a moment, then dried in the sun.

Description Reniform or prolate-ellipsoidal, slightly curved, 3-9 cm long, 1.5-3.5 cm in diameter. Externally yellowish-brown or blackish-brown, with deep irregular wrinkles. Apex obtuse, exhibiting a fruit stalk scar at the base. Texture hard, sarcocarp pale yellow or yellowish-brown; seeds numerous, flattened and prolate-ovoid, yellowish-brown or purplish-brown, lustrous, and linearly striated. Odour, slightly aromatic; taste bitter.

Processing Wash clean, dry in the sun. Break to pieces before use.

Action To regulate the flow of the *liver-qi*, promote blood circulation and relieve pain, and promote diuresis.

Indications Epigastric and hypochondriac distension and pain; amenorrhea, dysmenorrhea; oliguria; snake-and insect bite.

Usage and dosage 3-9 g.

Storage Preserve in a ventilated and dry place.

Fructus Alpiniae Oxyphyllae (益智, Yizhi)

Sharpleaf Glangal Fruit

Sharpleaf Glangal Fruit is the dried ripe fruit of *Alpinia oxyphylla* Miq. (Fam. Zingiberaceae). The drug is collected in summer and autumn when the fruit turns from green to red, dried in the sun or at a low temperature.

Description Ellipsoidal, with both ends slightly acute 1.2-2 cm long, 1-1.3 cm in diameter. Externally brown or greyish-brown, with 13-20 longitudinal, uneven and prominent lines on the surface, remains of perianth on the apex and fruit stalk at the base. Pericarp thin and slightly tenacious, adhering closely to seeds. Seeds gathered in groups and divided to three valves by septum with 6-11 seeds in each valve. Individual seed irregularly oblate, with slightly obtuse ribs, about 3 mm in diameter, externally greyish-brown or greyish-yellow, covered with pale brown membranous aril. Texture, hard, endosperm white. Odour, characteristically aromatic; taste, pungent and slightly bitter.

Identification (1) Transverse section of seed: Parenchymatous cells sometimes remained. Epidermal cells of testa subrounded, subsquare or rectangular, slightly radially elongated, relatively thick-walled. Hypodermis consisting of 1 row of parenchymatous cells, containing yellowish-brown contents. Oil cells 1 row, subsquare or rectangular, containing yellow oil droplets; pigment layer consisting of several rows of yellowish-brown cells, scattered with 1-3 rows of relatively large subrounded oil cells containing yellow oil droplets. Tegmen consisting of 1 row of palisade sclerenchyma cells, yellowish-brown or reddish-brown, the inner and lateral walls extremely thick, lumina small, containing a silica body. Perisperm cells filled with starch granules. Endosperm cell contain aleurone grains and fatty oil droplets.
Powder: Yellowish-brown. Epidermal cells of testa strap-shaped in surface view, up to 29 μm in diameter, walls slightly thickened, often vertical with hypodermis. Cells of pigment layer wrinkled, indistinctly bordered, containing

reddish-brown and dark brown contents, most cells broken to irregular pigment fragments. Oil cells subsquare, rectangular or scattered among the cells of pigment layer. Sclerenchymatous cells of tegmen yellowish-brown or brown, polygonal in surface view, walls thickened and unlignified, containing silica bodies; in section view, showing 1 row of palisade-like cells, the inner and lateral walls extremely thickened, lumina eccentric, containing silica bodies. Perisperm cells filled with starch masses, aggregated of fine starch granules. Endosperm cells containing aleurone grains and fatty oil droplets.

(2) Dissolve a quantity of volatile oil obtained under Assay in dehydrated ethanol to produce a solution containing 10 μl per ml as the test solution. Produce a solution of Fructus Alpiniae Oxyphyllae reference drug in the same manner used as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of *n*-hexane-ethyl acetate (9 : 1) as the mobile phase. Apply separately 5-10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. The dark spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution, then spray with dinitrophenylhydrazine dilute TS, and the spots become gradually orange-red for a moment.

Assay Carry out the method for determination of volatile oil (Appendix Ⅹ D).

The seeds contain not less than 1.0% (ml/g) of volatile oil.

Processing *Semen Alpiniae Oxyphyllae* Eliminate foreign matter and pericarp, break to pieces before use.

Semen Alpiniae Oxyphyllae (processed with salt) Stir-bake the Semen Alpiniae Oxyphyllae as described under the method for stir-baking with salt (Appendix Ⅱ D) to dryness, break to pieces before use.

Action To warm the spleen, relieve diarrhea and arrest excessive discharge of saliva, warm the kidney, and arrest seminal emission and polyaria.

Indications Diarrhea, abdominal pain with cold sensation *cold* syndrome of the *kidney* characterized by, and salivation due to spleen *deficiency* in *cold* condition; enuresis, frequent urination, seminal emission and whitish discharge from urethra due to *kidney-yang deficiency*.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place.

Fructus Amomi (砂仁, Sharen)

Villous Amomum Fruit

Villous Amomum Fruit is the dried ripe fruit of *Amomum villosum* Lour., *Amomum villosum* Lour. var. *xanthioides* T. L. Wu et Senjen or *Amomum longiligulare* T. L. Wu (Fam. Zingiberaceae). The drug is collected between summer and autumn when ripe, and dried in the sun or at a low temperature.

Description *Fruit of Amomum villosum and Amomum villosum* var. *xanthioides* Ellipsoidal or ovoid, indistinctly 3-ridged, 1.5-2 cm long, 1-1.5 cm in diameter. Externally brown, densely covered with spiny protrudings, apex with remains of perianth, and base often bearing a fruit stalk. Pericarp thin and soft. Seeds agglutinated into a mass, 3-ridged obtusely, divided into 3 groups by white septa, and each group containing 5-26 seeds. Seeds irregularly polyhedral, 2-3 mm in diameter; externally brownish-red or dark brown, finely wrinkled, covered with pale brown membranous aril; texture hard, endosperm greyish-white. Odour, strongly aromatic; taste, pungent, cool and slightly bitter.

Fruit of Amomum longiligulare Long ellipsoidal or ovoid, distinctly 3-ridged distinctly, 1.5-2 cm long, 0.8-1.2 cm in diameter. Externally with flaky and branched soft spines, base showing a scar of fruit stalk. Pericarp thickened and hard. Masses of seeds relatively small, each group containing 3-24 seeds, 1.5-2 mm in diameter. Odour and taste slightly weak.

Identification (1) Transverse section of seed of Fructus Amomum villosum: Sometimes remains of aril present. Epidermal cells of testa 1 row, radially elongated, slightly thick-walled; hypodermal cells 1 row, containing brown or reddish-brown contents. Oil cells in 1 row 76-106 μm long, 16-25 μm wide, containing yellow oil droplets. Pigment layer consisting of several rows of brown cells, polygonal, and irregularly arranged. Endotesta consisting of 1 row of palisade-like thick-walled cells, yellowish-brown, small, with heavily thickened inner and lateral walls, containing a silica body. Cells of perisperm containing starch granules and a few fine prisms of calcium oxalate. Cells of endosperm containing small aleurone grains and fatty oil droplets.

Powder: Greyish-brown. Thick-walled cells of endotesta reddish-brown or yellow-brown, polygonal in surface view, with thickened and non-lignified walls, lumen containing a silica body; showing 1 row of palisade cells in section view with heavily thickened inner and lateral walls, lumen inclined to the outer side and containing a silica body. Epidermal cells of testa pale yellow, stripe-shaped in surface view, usually vertically arranged with hypodermal cells in an upper and lower layered pattern; hypodermal cells containing brown or reddish-brown contents. Cells of pigment layer shrivelled with indistinct boarder, containing reddish-brown or dark brown contents. Cells of perisperm subrectangular or irregular, filled with starch masses formed by aggregation of small starch granules, some containing small prisms of calcium oxalate. Cells of endosperm containing minute aleurone grains and fatty oil droplets. Oil cells colourless, thin-walled and scattered with oil droplets occasionally.

(2) Dissolve the volatile oil obtained under the Assay in ethanol to produce a solution containing 20 μl per ml as the test solution. Dissolve bornyl acetate CRS in ethanol to produce a solution containing 10 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane-ethyl acetate (22 : 1) as the mobile phase. Apply separately to the plate 1 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with a 5% solution of vanillin in surfuric acid, heat until the colour of the spot cleared up. A purplish-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H, method 2), not more than 15.0 per cent.

Assay Carry out the method for the determination of volatile oil (Appendix Ⅹ D).

Masses of seeds of Amomum Villosum contain not less than 3.0% of volatile oil (ml/g).

Masses of seeds of Amomum Longiligulare contain not less than 1.0% of volatile oil (ml/g).

Processing Eliminate foreign matter. Break to pieces before

use.

Action To eliminate *damp* and improve appetite, warm the spleen and check diarrhea, and prevent abortion.

Indications Accumulation of *damp* in the *spleen* and the stomach marked by epigastric stuffiness and loss at appitite; vomiting and diarrhea due to *deficiency-cold* of the spleen and the stomach; morning sickness; threatened abortion.

Usage and dosage 3-6 g, added when the decoction is nearly done.

Storage Preserve in a cool and dry place.

Fructus Amomi Rotundus (豆蔻, Doukou)

Round Cardamon Fruit

Round Cardamon Fruit is the dried ripe fruit of *Amomum kravanh* Pirre ex Gagnep. or *Amomum compactum* Soland ex Maton (Fam. Zingiberaceae). It can be classified as "Protogenic Round Cardamon Fruit" and "Indonesian Round Cardamon Fruit" according to the different localities of production.

Description *Protogenic Round Cardamon Fruit* Subspherical, 1.2-1.8 cm in diameter. Externally yellowish-white to pale yellowish-brown, with 3 relatively deep longitudinal furrows, apex possessing a prominent stylopodium, base with a dented scar of fruit stalk, both ends bearing pale brown pubescences. Texture of pericarp light and brittle, easily broken longitudinally, 3 loculi, each containing about 10 seeds; seeds irregularly polyhedral, dorsal surface slightly raised, 3-4 mm in diameter, externally dark brown, with wrinkles and remains of aril. Odour, aromatic; taste, pungent and cool, slightly camphor-like.

Indonesian Round Cardamon Fruit Relatively small, externally yellowish-white, sometimes slightly purplish-brown, testa relatively thin, seeds thin and blighted. Odour, relatively weak.

Identification Take the volatile oil obtained under the Assay as the test solution, and a solution of cineol CRS as the reference solution (both can be diluted with an appropriate quantity of ethanol if necessary). Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and benzene-ethyl acetate (9.5 : 0.5) as the mobile phase. Apply 10 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with a 5% solution of vanillin in sulfuric acid, heat at 105℃ for 5-10 minutes and examine immediately. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Foreign matter Not more than 1 per cent for Protogenic Round Cardamon Fruit, and not more than 2 per cent for Indonesian Round Cardamon Fruit (Appendix Ⅸ A).

Water Carry out the method for determination of water (Appendix Ⅸ H, method 2), not more than 11.0 per cent of water for Protogenic Round Cardamon Fruit, and not more than 12.0 per cent of water for Indonesian Round Cardamon Fruit.

Assay ***Volatile oil*** Take 30-50 g of broken seeds, carry out the method for determination of volatile oil (Appendix Ⅹ D). It contains not less than 5.0 per cent (ml/g) of volatile oil for Protogenic Round Cardamon Seeds, and not less than 4.0 per cent (ml/g) of volatile oil for Indonesion Round Cardamon seed.

Cineole Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use 10% SE-54 as the stationary phase; maintain the column temperature at 110℃. The number of theoretical plates of the column is not less than 1000, calculated with the reference to the peak of cineole.

Reference solution Dissolve a quantity of cineole CRS, accurately weighed, in n-hexane to produce a solution of 25 mg per ml.

Test solution Weigh accurately 5 g of the powder (through No. 3 sieve) in a round-bottom flask, add 200 ml of water, connect the apparatus for determination of volatile oil, add water to 3 ml volume, add 2-3 ml of n-hexane, connect the condenser, heat to boil slightly for 2 hours, cool, separate n-hexane layer and allow to filter through the funnel containing 1 g of dehydrated sodium sulfate into a 5 ml volumetric flask, wash the flask with a small quantity of n-hexane, combine the washings to the volumetric flask and dilute with n-hexane to volume and mix well.

Procedure Inject accurately 1 μl of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 3.0 per cent of cineole ($C_{10}H_{18}O$), calculated with reference to the dried drug.

Processing Eliminate foreign matter. Break to pieces before use.

Action To resolve *damp*, remove retained food, promote the flow of *qi* and warm the spleen and stomach to promote digestion.

Indications Loss of appetite due to accumulation of *damp* in the spleen and stomach; feeling of suffocation in the chest with loss of appitite at the early stage of *damp-warm* syndromes; nausea, vomiting, distending pain in the chest and abdomen, caused by *cold-damp*; indigestion.

Usage and dosage 3-6 g, added when the decoction is nearly done.

Storage Preserve in well closed containers, stored in a cool and dry place, protected from moth.

Fructus Anisi Stellati (八角茴香, Bajiaohuixiang)

Chinese Star Anise

Chinese Star Anise is the dried ripe fruit of *Illcium verum* Hook. f. (Fam. Magnoliaceae). The drug is collected in autumn and winter when the fruit turns from green to yellow, and dried after treated with boiling water for a moment or dried directly.

Description Mostly aggregate fruit of 8 follicles radiated from the central axis. Follicles 1-2 cm long, 0.3-0.5 cm wide, 0.6-1 cm high; outer surface reddish-brown, irregularly wrinkled, summit beaked, upper part mostly dehiscent; inner surface pale brown, smooth and lustrous. Texture hard and brittle. Fruit stalk 3-4 cm long, connected to the base of the fruit, curved, usually deciduous. Each follicle containing a compressed-ovoid seed, about 6 mm long, reddish-brown or yellowish-brown, lustrous, with a hilum at the acute end; endosperm white, oily. Odour, aromatic; taste, pungent and

sweet.

Identification (1) Powder: Reddish-brown. Palisade cells of endocarp column-shaped, 200-546 μm long, walls slightly thick with cross or V-shaped pits. Stone cells of testa yellow, subpolygonal in surface view, walls strongly thickened, undulate, lumina branched, containing brownish-black contents; rectangular in lateral view with unevenly thickened walls. Stone cells of pericarp subrectangular, oblong or branched with thickened walls. Fibres long, scattered singly or in bundles, 29-60 μm in diameter, walls lignified and pitted. Cells of mesocarp reddish-brown, with oil cells scattered. Cells of endosperm polygonal, containing oil droplets and aleurone grains.

(2) to 1 g of the coarse powder add 15 ml of petroleum ether (60-90℃) -ether (1 : 1), stopper tightly, shake for 15 minutes, and filter. Evaporate the filtrate on a water bath to dryness, and dissolve the residue in 2 ml of dehydrated ethanol as the test solution. Apply 2 μl of the test solution to a thin-layer chromatographic plate coated with silica gel G containing sodium carboxymethyl cellulose, dry in air, and then apply about 2 μl of phloroglucinol in hydrochloric acid TS: a pink and violet-red cycle line is exhibited.

(3) Transfer accurately 10 μl of the test solution obtained under Identification test (2) to a 10 ml volumetric flack, dilute with dehydrated ethanol to volume, and mix well. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A). The light absorbance of the solution exhibits a maximum at 259 nm.

(4) Prepare a solution of 1 g of the coarse powder of Fructus Anisi Stellati reference drug in the same manner as described under Identification as test (2) the reference drug solution. Dissolve anisaldehyde CRS in 2 ml of dehydrated ethanol to produce a solution containing 20 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing carboxymethyl-cellulose sodium as the coating substance and a mixture of petroleum ether (30-60℃)-acetone-ethyl acetate (19 : 1 : 1) as the mobile phase. Apply separately 5-10μl each of the test solution obtained as described under Identification test (2) and the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with phloroglucinol in hydrochloric acid TS. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution, and the orange to orange-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Assay Carry out the method for determination of volatile oil (Appendix Ⅹ D).

It contains not less than 4.0 per cent (ml/g) of the volatile oil.

Action To dispel *cold* and warm *yang*, regulate the flow of *qi* to relieve pain.

Indications Abdominal colic; lumbago due to *deficiency* of the kidney; vomiting, cold pain in the epigastrium and abdomen due to cold of the stomach.

Usage and dosage 3-6 g.

Storage Preserve in a cool and dry place.

Fructus Arctii
(牛蒡子, Niubangzi)

Great Burdock Achene

Great Burdock Achene is the dried ripe fruit of *Arctium lappa* L. (Fam. Compositae). The infructescence is collected in autumn when ripe, and dried in the sun, the fruit is tapped out, removed from foreign matter, and dried again in the sun.

Description Long-obovate, slightly flattened, somewhat curved, 5-7 mm long, 2-3 mm wide. Externally greyish-brown, purplish-black mottled, with several longitudinal ribs, usually 1-2 middle ribs relatively distinct. Summit obtuse-rounded, slightly broad, with a circular ring at the top, and a pointed remain of style in the center; base slightly narrowed, bearing surface pale in colour. Pericarp relatively hard, cotyledons 2, yellowish-white, oily. Odour, slight; taste, bitter, slightly pungent and numb.

Identification (1) Powder: Greyish-brown. Stone cells of endocarp slightly flattened, tapering-fusiform, long-elliptical or tapering-ovate, closely mosaic in surface view; 70-224 μm long, 13-70 μm wide, the walls up to 20 μm thick, lignified, with transversely elongated pits. Reticulate cells of mesocarp polygonal in transverse sectional view, anticlinal walls spotted-thickened; cells elongated in longitudinal sectional view, the walls with fine and dense crisscross striations. Prisms of calcium oxalate 3-9 μm in diameter, occurring abundantly in yellow parenchymatous cells of mesocarp, borders of crystal cells indistinct. Cells of cotyledons filled with aleurone grains, some containing small clusters and oil droplets.

(2) To 0.5 g of the powder add 20 ml of ethanol, ultrasonicate for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of methanol as the test solution. Prepare a solution of 0.5 g reference drug of Fructus Arctii in the same manner as the reference drug solution. Dissolve arctiin CRS in ethanol to produce a solution containing 5 mg per ml as the reference solution. Carry out the method for thin-layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform-methanol-water (40 : 8 : 1) as the mobile phase. Apply separately 3 μl each of the three solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulphuric acid in ethanol and heat to the spot distinct. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spots in the chromatogram obtained with the reference solution and the reference drug solution.

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and methanol-water (1 : 1.1) as the mobile phase. The wavelength of the detector is 280 nm. The number of theoretic plates of the column is not less than 1500, calculated with the reference to the peak of arctiin.

Reference solution Weight accurately arctiin CRS, in methanol to produce a solution containing 0.5 mg per ml and mix well.

Test solution Weight accurately 0.5 g of the powder (through No. 3 sieve) in a 50 ml of volumetric flask, add 45 ml of methanol, ultrasonicate (power, 150 W; frequency, 20 kHz) for 20 min, supply with methanol to the volume, mix well and filter. Use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl each of the reference solution and the test solution, separately, into the column, determine and calculate the content.
It contains not less 5.0 per cent arctiin ($C_{27}H_{34}O_{11}$).

Processing *Fructus Arctii* Eliminate foreign matter, wash and dry. Break to pieces before use.

Fructus Arctii (*stir-baked*) Stir-bake the clean Fructus Arctii as described under the method for simple stir-baking (Appendix Ⅱ D) until it becomes inflated and slightly scented. Break to pieces before use.

Action To dispel *wind-heat*, ventilate the lung and promote eruption, clear *heat-toxicity*, and to soothe sore throat.

Indications Cough and expectoration in influenza or upper respiratory infection due to *wind-heat*; measles; rubella; sore throat; mumps; erysipelas, carbuncles and sores.

Usage and dosage 6-12 g.

Storage Preserve in a ventilated and dry place.

Fructus Aristolochiae (马兜铃, Madouling)

Dutohmanspipe Fruit

Dutohmanspipe Fruit is the dried ripe fruit of *Aristolochia contorta* Bge. or *Aristolochia debilis* Sieb. et Zucc. (Fam. Aristolochiaceae). The drug is collected in autumn when the fruit turns from green to yellow, and dried.

Description Ovoid, 3-7 cm long, 2-4 cm in diameter. Outer surface yellowish-green, greyish-green or brown, with 12 longitudinal ribs, from which extending numerous horizontal parallel veinlets. Apex flattened and obtuse, base with a slender fruitstalk. Pericarp light and fragile, easily divided into 6 valves, fruit stalk also divided into 6 splittings. Inner surface of pericarp smooth and lustrous, with dense transverse veins. Fruit 6-locular, containing many seeds in each locule, overlapped and arranged regularly. Seeds flattened and thin, obtuse-triangular or fan shaped, 6-10 mm long, 8-12 mm wide, winged all around, pale brown. Odour, characteristic; taste, slightly bitter.

Identification To 3 g of the powder add 50 ml of ethanol, heat under reflux on a water bath for 1 hour, filter. Evaporate the filtrate to dryness, dissolve the residue in 5 ml of ethanol as the test solution. Extract the reference drug of Fructus Aristolochiae in the same manner, use the extract as the reference solution (1); use a 0.5 mg per ml solution of aristolochic acid CRS in ethanol as the reference solution (2). Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of toluene-ethyl acetate-water-formic acid (20 : 10 : 1 : 1) as the mobile phase. Apply in strip separately 5 μl each of the three solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent strips in the chromatogram obtained with the test solution correspond in position and colour to the strips in the chromatogram obtained with the two reference solutions.

Processing *Fructus Aristolochiae* Eliminate foreign matter, sift, and rub the fruit to pieces.

Fructus Aristolochiae (*processed with honey*) Stir-bake the clean Fructus Aristolochiae as described under the method of stir-baking with honey (Appendix Ⅱ D) until not sticky to fingers.

Action To remove *heat* from the lung and relieve cough and dyspnea, and remove *heat* from the large intestine (rectum) to treat hemorrhoid.

Indications Dyspnea asthma, cough and bloody sputum due to *heat* in the lung; bleeding, swollen and painful hemorrhoids due to *heat* in the large intestine.

Usage and dosage 3-9 g.

Storage Preserve in a dry place.

Fructus Aurantii (枳壳, Zhiqiao)

Orange Fruit

Orange Fruit is the dried, immature fruit of *Citrus aurantium* L. and its cultivated varieties (Fam. Rutaceae). The drug is collected in July when the fruit is green yet. Cut in the middle into two parts, dried in the sun or at a low temperature.

Description Semispheroidal, 3-5 cm in diameter. Exocarp dark brown or brown, with granular convexes and sunken oil cavity spots at the apex; remains of style or fruit stalk scar distinct. Mesocarp in transverse section yellowish-white, smooth and slightly prominent, 0.4-1.3 cm thick, with 1-2 rows of oil cavaties at the outer part of pericarp. Texture hard, uneasily broken. Pulp vesicles 7-12, a few up to 15, juice vesicles dried and shrunken, brown to dark brown, containing seeds. Odour, aromatic; taste, bitter and slightly sour.

Identification (1) Powder: Yellowish-white or brownish-yellow, cells of mesocarp subrounded or irregular, most cell walls unevenly thickened and beaded. Epidermal cells of pericarp polygonal, subsquare or rectangular in surface view; stomata subrounded, 16-34 μm in diameter, subsidiary cells 5-9, covered with cuticle in lateral view. Juice vesicle tissues pale yellow or colourless, membranous, epidermal cells narrow and long in surface view, shrunken, crisscross with cells of pericarp and juice vesicle, prisms of calcium oxalate existing in cells of pericarp and juice vesicle, abundant in the cells adjacent to epidermis, rhombic, polygonal or biconical, 3-30 μm in diameter. Spiral and reticulated vessels and tracheids small.
(2) To 0.5 g of the powder add 10 ml of methanol, heat under reflux for 10 minutes, filter. To 1 ml of the filtrate add about 5 mg of potassium tetrahydroborate, mix well, add several drops of hydrochloric acid; a cherry red to purplish-red colour is produced.

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and acetonitrile-water (21.5 : 80.5, adjust pH=3 with phosphoric acid) as the mobile phase. As detector a spectrophotometer set at 283 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to

the peak of naringin.

Reference solution Weigh accurately 15 mg of naringin CRS (dried to constant weight after decompression) to a 50 ml of volumetric flask, add methanol to volume, mix well and use as the reference solution.

Test solution Weigh accurately about 0.2 g of the powder in a stopper conical flask, add accurately 50 ml of methanol, stopper tightly and weigh, heat and reflux for 1.5 hour, allow to cool, stopper tightly, weigh again, replenish the loss of the solvent with methanol, mix well, filter, discard the initial filtrate, collect accurately 10 ml of the successive filtrate, evaporate to dryness, dissolve the residue with 3-5 ml of water, allow to cool, add to a column of polyamide (50-80 mesh, 2 g, 1.8 cm in inner diameter, in wet-way), wash with 25 ml of water, discard the water. Wash again with 50 ml of methanol, collect the eludes, transfer to a 50 ml volumetric flask, mix well, as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution respectively into the column, determine and calculate the content.

It contains not less than 4.0 per cent of naringin ($C_{27}H_{32}O_{14} \cdot 2H_2O$).

Processing *Fructus Aurantii* Irregular arciform and strip-shaped slices, long to 5 cm, wide to 1.3 cm. Transverse section, exocarp brown to dark brown, mesocarp yellowish-white to yellowish-brown, with 1-2 rows of dotted oil cavaties at the outer part of pericarp, sometimes with a few purplish-brown pulp vesicles. Texture hard. Odour, aromatic; taste, bitter and slightly sour.

Fructus Aurantii (stir-baked with bran) Irregular arciform and strip-shaped slices, relatively dark colour, sometimes with charred spots, odour, slightly aromatic.

Action To regulate the flow of *qi*, remove its stagnation, and alleviate distension.

Indications Distending pain in the chest and hypo-chondriac regions due to stagnation of *qi*; indigestion with retention of *phlegm* and *fluid*; gastroptosis, prolapse of the rectum, prolapse of the uterus.

Usage and dosage 3-9 g.

Precaution Be cautious about pregnant women.

Storage Preserve in a cool and dry place, protected from moth.

Note: The main cultivated varieties are *Citrus aurantium* 'Huangpi', *Citrus aurantium* 'Daidai', *Citrus aurantium* 'Chuluan' and *Citrus aurantium* 'Tangcheng'.

Fructus Aurantii Immaturus (枳实, Zhishi)

Immature Orange Fruit

Immature Orange Fruit is the dried young fruit of *Citrus aurantium* L. and its cultivars or *Citrus sinensis* Osbeck (Fam. Rutaceae). The fallen fruit is collected in May and June, removed from foreign matter, cut transversely in the middle into two parts, dried in the sun or at a low temperature; the small fruit dried similarly without cutting.

Description Semispheroidal, a few spheroidal, 0.5-2.5 cm in diameter. Exocarp dark green or dark brownish-green, with granular protrudings and wrinkles, remains of style or fruit stalk scar distinct. Mesocarp in transverse section slightly expanded, yellowish-white or yellowish-brown, 0.3-1.2 cm thick, with 1-2 rows of oil cavities on the outer part, endocarp and juice vesicles brown. Texture hard. Odour, aromatic; taste, bitter and slightly sour.

Identification (1) Powder: Pale yellow or brownish-yellow. Cells of mesocarp subrounded or irregular, most cell walls unevenly thickened and beaded. Epidermal cells of pericarp polygonal, subsquare or rectangular in surface view, stomata subrounded, 18-26 μm in diameter, subsidiary cells 5-9; covered with cuticle in lateral view. Prisms of calcium oxalate existing in cells of pericarp and juice vesicles mostly visible in cells adjacent to epidermis, rhombic, polygonal or biconical, 2-24 μm in diameter. Parenchymatous cells containing yellow or colourless hesperidin crystals, in rounded or amorphous masses, some with radial striations. Fragments of oil cavity abundant, secretory cells slender and curved. Spiral and reticulated vessels and tracheids small.

(2) To 0.5 g of the powder add 10 ml of methanol, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness. Dissolve the residue with 0.5 ml of methanol as the test solution. Dissolve synephrine CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing a mixture of 1% solution of sodium hydroxide and sodium carboxymethylcellulose as the coating substance and a mixture of *n*-butanol-acetic acid-water (4 : 1 : 5) as the mobile phase. Apply separately 2 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a mixed solution of 0.5% ninhydrin TS in ethanol and heat at 105℃ to the spot clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 15.0 per cent (Appendix Ⅸ H, Method 2).

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅸ A), using 70% ethanol as the solvent, not less than 12.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and mono potassium phosphate solution (dissolve 0.6 g of mono potassium phosphate, 1.0 g of sodium dodecyl sulfate, 1 ml of glacial acetic acid in water and dilute to 1000 ml) (50 : 50) as the mobile phase. As detector a spectrophotometer set at 275 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of synephrine.

Reference solution Dissolve a quantity of synephrine CRS in water, accurately weighed, to produce a solution containing 30 μg per ml as the reference solution.

Test solution Weigh accurately 1 g of the powder in a conical flask with stopper, add 50 ml of methanol, weigh accurately and heat under reflux for 1.5 hours, cool and weigh again, make up the loss in weight with methanol to the initial weight, mix well and filter. Measure accurately 10 ml of the successive filtrate and evaporate to dryness. Dissolve the residue in 10 ml of water, mix well, apply to a column (1.5 cm I.D.) packed with polyamide (60-90 mesh, 2.5 g). Elute with 25 ml of water and collect the eluates, transfer to a 25 ml volumetric flask. Dilute with water to volume and mix well. Filter with a microporous

filter membrane of 0.45 μm and use the successive filtrate as the test solution.

Procedure Inject accurately 10-20 μl of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.30 per cent of synephrine ($C_9H_{13}NO_2$), calculated with reference to the dried drug.

Processing *Immature Orange Fruit* Eliminate the foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry.
Irregularly strip or circular slices, 2.5 cm long, 1.2 cm wide, 0.3-1.5 cm in diameter. Exocarp in transverse section black-green or dark brown, mesocarp yellowish-white or yellowish-brown, with 1-2 rows of oil cavities on the outer part, endocarp and juice vesicles brown.

Immature Orange Fruit (stir-baked with bran) Stir-bake the slices of Immature Orange Fruit as described under the method for stir-baking with bran (Appendix Ⅱ D) until a deep colour is produced.
Irregularly strip or circular slices; dark colour, some dark spots.

Action To resolve stognacy or *phlegm* and relieve stuffiness sensation in the chest and abdomen.

Indications Stagnation of *qi* marked by indigestion, fullness and distending pain, tenesmus in dysentery, or constipation; pectoral pain and stuffiness sensation due to stagnation of *phlegm* and *qi*; thoracic accumulation gastroptosis, prolapse of the rectum, prolapse of the uterus.

Usage and dosage 3-9 g.

Precaution Be cautious about pregnant women.

Storage Preserve in a cool and dry place, protected from moth.

Note: The cultivated varieties are the same as described under Fructus Aurantii.

Fructus Broussonetiae (楮实子, Chushizi)

Papermulberry Fruit

Papermulberry Fruit is the dried ripe fruit of *Broussonetia papyrifera* (L.) Vent. (Fam. Moraceae). The drug is collected in autumn when ripe, washed clean, dried in the sun, removed from greyish-white, membranous persistent calyx and foreign matter.

Description Somewhat spherical or ovoid, slightly flattened, about 1.5 mm in diameter. Externally reddish-brown, showing reticulated wrinkles or grandular prominences, with ridges on one side and furrows on the other side, some bearing fruit stalk. Texture hard and brittle, easily broken by pressing. Endosperm almost white, oily, Odour, slight; taste, weak.

Identification Powder: Reddish-brown. Palisade cell walls of pericarp mucilaginous, remaining denticulate striate-thickened part, fine awn-like in shape. Crystalliferous sclerenchymatous cells abundant, brownish-yellow, subpolygonal in surface view, containing clusters of calcium oxalate; subrectangular in section view, inner walls extremely thickened, lumina situated along outside, clusters oblong. Sclerenchymatous cells of endocarp extremely flattened, frequently overlapped in many layers with indistinct boundary. Epidermal cells of testa polygonal in surface view, with slightly beaded, unlignified walls and yellowish-brown content containing lumina.

Water Not more than 9.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.2 per cent (Appendix Ⅸ K).

Action To replenish the kidney, remove *heat* from the liver, nebula, and promote urination.

Indications Aching and weakness of the loins and knees, consumptive fever, dizziness and blurred vision; nebula; edema.

Usage and dosage 6-12 g.

Storage Preserve in a dry place, protected from moth.

Fructus Bruceae (鸦胆子, Yadanzi)

Java Brucea Fruit

Java Brucea Fruit is the dried ripe fruit of *Brucea javanica* (L.) Merr. (Fam. Simarubaceae). The drug is collected in autumn when ripe, removed from foreign matter, and dried in the sun.

Description Ovoid, 6-10 mm long, 4-7 mm in diameter. Externally black or brown, with raised reticulate wrinkles, lumina irregularly polygonal, obviously ribbed at both sides. Apex acuminate, base having a dented fruit stalk scar, shell hard and brittle. Seeds ovoid, 5-6 mm long, 3-5 mm in diameter, externally whitish or yellowish-white, with reticulate; testa thin, cotyledons milky white, oily. Odour, slight; taste, extremely bitter.

Identification Powder of pericarp: Brown. Epidermal cells polygonal, containing brown contents. Parenchymatous cells polygonal, containing clusters of calcium oxalate, up to 30 μm in diameter, and prisms. Stone cells subrounded or polygonal, 14-38 μm in diameter.
Powder of seed: Yellowish-white. The cells of testa polygonal, slightly elongated. The cells of endosperm and cotyledon containing aleurone grains.

Processing Eliminate the shells and other foreign matter.

Action To remove toxic *heat*, to stop malarial attacks, to relieve dysentery, and to cauterize vegetations.

Indications Dysentery, malaria; external use for vegetation, corn.

Usage and dosage 0.5-2 g to be taken after wrapped in Arillus Longan or in capsules; appropriate quantity for external use.

Storage Preserve in a dry place.

Fructus Canarii (青果, Qingguo)

Chinese White Olive

Chinese White Olive is the dried ripe fruit of *Canarium album* Raeusch. (Fam. Bruseraceae). The drug is collected in autumn when ripe, and dried.

Description Fusiform, both ends obtusely acute, 2.5-4 cm long, 1-1.5 cm in diameter. Externally brownish-yellow or blackish-brown, with irregular wrinkles. Sarcocarp greyish-brown or dark brown, texture hard. Kernel fusiform, dark

reddish-brown, with longitudinal ribs; 3 loculi, each containing 1 seed. Odour, slight; taste of sarcocarp, astringent, slightly sweet on chewing.

Identification Transverse section of pericarp: Exocarp consisting of 1 row of sclerenchymatous cell, containing yellowish-brown contents, and covered with a cuticle. Parenchymatous cell of mesocarp about 10 layers, with vascular bundles scattered, oil cavities mostly scattering at the outside of vascular bundles. Endocarp consisting of some rows of stone cells. Parenchymatous cells containing clusters or prisms of calcium oxalate.

Processing Eliminate foreign matter, wash clean, and dry in the sun. Break into pieces before use.

Action To remove *heat* and cure sore throat, to promote the production of body fluid, and counteract toxicity.

Indications Pain and swelling of the throat, cough; dire thirst; fish or crab poisoning.

Usage and dosage 4.5-9 g.

Storage Preserve in a dry place, protected from moth.

Fructus Cannabis (火麻仁, Huomaren)

Hemp Seed

Hemp Seed is the dried ripe fruit of *Cannabis sativa* L. (Fam. Moraceae). The drug is collected in autumn when ripe, removed from foreign matter, and dried in the sun.

Description Ovoid. 4-5.5 mm long. 2.5-4 mm in diameter. Externally greyish-green or greyish-yellow, with fine and white or brown reticulations, ribbed at both sides, somewhat acute at the apex, with round fruit stalk scar at the base. Pericarp thin and brittle, easily broken. Testa green, cotyledons 2, milky-white and oily. Odour, slight; taste, weak.

Identification To 2 g of the powder add 50 ml of ether, heat under reflux for 1 hour, filter, wash the residue with 20 ml of ether for one time, discard the ether, add 30 ml of methanol to the residue, heat under reflux for 1 hour, filter, evaporate the filtrate to dryness. Dissolve the residue in 2 ml of methanol as the test solution. Prepare a solution of 2 g reference drug of Fructus Cannabis in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of toluene-ethyl acetate-formic acid (15 : 1 : 0.3) as the mobile phase. Apply separately 2 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a mixed solution of 1% vanillin in ethanol-sulphuric acid (1 : 1) and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Processing *Fructus Cannabis* Eliminate foreign matter and pericarp.

Fructus Cannabis (*stir-baked*) Stir-bake the Fructus Cannabis as described under the method for simple stir-baking (Appendix Ⅱ D) until it becomes yellow and scented.

Action To moisten intestines to loose bowel.

Indications Constipation due to *deficiency of* blood and intestinal fluid.

Usage and dosage 9-15 g.

Storage Preserve in a cool and dry place, protected from heat and moth.

Fructus Carotae (南鶴虱, Nanheshi)

Wild Carrot Fruit

Wild Carrot Fruit is the dried ripe fruit of *Daucus carota* L. (Fam. Umbelliferae). The fruit branch is cut in autumn when the fruit is ripe, dried in the sun. The fruit is tapped off, and removed from foreign matter.

Description Cremocarp ellipsoidal, mostly separated into mericarp. Mericarp 3-4 mm long, 1.5-2.5 mm wide. Externally pale greenish-brown or brownish-yellow, apex bearing remains of a style, base obtuse, dorsal surface raised, with 4 narrow-winged subribs, each rib densely covered with 1 row of yellowish-white hooks of each about 1.5 mm long. The dented portion between every 2 ribs having indistinct main ribs, scattered with short hairs. Commissural surface flattened, with 3 hairy veins. Kernel almost white, oily. Texture light. Odour, aromatic when rubbed; taste, slightly pungent and bitter.

Identification (1) Transverse section of mericarp: Cells of exocarp 1 layer, parts of the cells differentiating to unicellular non-glandular hairs at the rib, hairs 86-390 μm long. Large vittae occurring in mesocarp, 1 at the base of each subrib and 2 in the commissural surface. Vittae flattened-oblong, 50-120 μm in diameter, containing yellowish-brown oil droplets, inner side of mainribs with fine vascular bundles. Endocarp consisting of 1 layer of flattened parenchymatous cells. Cells of testa containing reddish-brown contents. Endosperm plump, parenchymatous cells polygonal, with slightly thickened walls, containing fatty oil and aleurone grains with a minute cluster of calcium oxalate. (2) To 1 g of the powder add 20 ml of ether, macerate over night, filter, evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ether as the test solution. Prepare a solution of 1 g of Fructus Carotae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene-ethyl acetate-formic acid (8 : 1 : 1) as the mobile phase. Apply separately to the plate 1-2 μl each of the two solutions. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. Spray with 5% solution of vanillin in sulfuric acid and heat under a current of hot air to the spot distinct. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Action To kill worms, and to remove undigested food.

Indications Ascariasis, oxyuriasis, taeniasis, abdominal pain caused by intestinal parasitosis; malnutrition and retention of undigested food due to improper feeding.

Usage and dosage 3-9 g.

Storage Preserve in a ventilated and dry place.

Fructus Carpesii (鹤虱, Heshi)

Common Carpesium Fruit

Common Carpesium Fruit is the dried ripe fruit of *Carpesium abrotanoides* L. (Fam. Compositae). The drug is collected in autumn when ripe, removed from foreign matter, and dried in the sun.

Description Cylindrical, small, 3-4 mm long, less than 1 mm in diameter. Externally yellowish-brown or dark brown, with numerous longitudinal ridges. One end contracted, beak-shaped, and the apex spread to form a greyish-white ring; another end slightly acute, bearing inserted scars. Pericarp thin, fibrous, testa extremely thin and transparent, cotyledons 2, almost white, slightly oily. Odour, characteristic; taste, slightly bitter.

Identification Transverse section: Cells of epicarp 1 row, each containing columnar crystals of calcium oxalate. Several rows of brown parenchymatous cells of mesocarp, shrunken with indistinct bounds, fibre bundles occurring at the ribs, consisting of about ten of thickened and lignified-walled fibres, 1 row of endocarp cells dark brown. Cells of testa flattened, endosperm remained; parenchymatous cells of embryo filled with aleurone grains and fatty oil droplets, the outmost layer cells of cotyledon containing fine crystals of calcium oxalate.

Action To parasties worms, and remove undigested food.

Indications Ascarisis, oxyuriasis, taeniasis; abdominal pain or infantile malnutrition due to intestinal parasitosis.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place.

Fructus Caryophylli (母丁香, Mudingxiang)

Clove Fruit

Clove Fruit is the dried fruit of *Eugenia caryophyllata* Thunb. (Fam. Myrtaceae). The drug is collected when nearly ripe, and dried in the sun.

Description Ovoid or oblong, 1.5-3.0 cm long, 0.5-1.0 cm in diameter. Surface yellowish-brown or dark brown, with fine wrinkles. Apex having four persistent calyxes, bended, hook-shaped, remain of a fruit stalk scar at the base. The seeds separated from the fruit shell, cotyledons 2, brown or dark brown, oily, with a longitudinal furrow in the center. Embryo fine pole-shaped. Odour, aromatic; taste, pungent and numb.

Identification (1) Powder: Dark brown. Starch granules numerous, simple granules long ovoid, conchoidal, round or irregular shaped, 14-35 μm in diameter. Fibres visible, single or forming fibre bundles, pale yellowish-brown, long shuttle-shaped, 9-41 μm in diameter. Stone cells singly scattered or grouped, pale yellowish-brown, elongated, sub-triangular or irregular shaped, and some branched visible occasionally, 14-88 μm, with dense striations and distinct pit canals. Clusters of calcium oxalate occurring in the parenchymatous cells, 7-43 μm in diameter, prisms of calcium oxalate occasionally visible. Oil cavities frequently broken.

(2) To 1.5 g of the powder add 5 ml of ether, shake for several minutes, filter, the filtrate is used as the test solution. Prepare a solution of 1.5 g of Fructus Caryophylli reference drug and 5 ml of ether in the same manner as the reference drug solution. Dissolve eugenol CRS in ether to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (9 : 1) as the mobile phase. Apply 5 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% solution of vanillin in sulfuric acid and hear at 105℃. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution and the reference drug solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H, method 2), not more than 12.0 per cent.

Total ash Not more than 4.0 per cent (Appendix Ⅸ K).

Extraction Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using ethanol as the solvent, not less than 15.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of methanol and water (65 : 40) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of eugenol CRS.

Reference solution Weigh accurately a quantity of eugenol CRS, dissolve in dehydrated ethanol to produce a solution containing 0.1 mg per ml as the reference solution.

Test solution Weigh accurately 0.3 g of the coarse powder (through No. 2 sieve) to a 25 ml volumetric flask, add dehydrated ethanol to volume, macerate for 24 hours. Mix well, filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and the test solution into the column respectively, determine, and calculate the content.
It contains not less than 0.65 per cent of eugenol ($C_{10}H_{12}O_2$), calculated with reference to the dried drug.

Processing Eliminate foreign matter. Break to pieces before use.

Action To warm the *middle energizer* to descend adverserising *qi*, and reinforce the kidney to strengthen *yang*.

Indications Hiccuping vomiting, poor appetite, diarrhea, psychroalgia of the epigastrium and abdomen due to *cold* in the spleen and stomach in a *deficiency* syndrome, and impotence due to *deficiency* in the kidney.

Usage and dosage 1-3 g, taken orally or in powder form for external use.

Precaution Incompatible with to Radix Curcumae.

Storage Preserve in a cool and dry place.

Fructus Chaenomelis (木瓜, Mugua)

Common Floweringqince Fruit

Common Floweringqince Fruit is the dried nearly ripe fruit of *Chaenomeles speciosa* (Sweet) Nakai

(Fam. Rosaceae). The drug is collected in summer and autumn when the fruit turns greenish-yellow, boiled in water until the exocarp becomes greyish-white in colour, halved longitudinally, and dried in the sun.

Description Mostly in longitudinally oblong halves, 4-9 cm long, 2-5 cm wide, 1-2.5 cm thick. Externally purplish-red or reddish-brown, with irregular, deep wrinkles; edge of cut surface rolled inwards, pulp reddish-brown, central part dented, brownish-yellow. Seed long-triangular, mostly falling off. Texture hard. Odour, slightly aromatic; taste, sour.

Identification (1) Powder: Yellowish-brown or reddish-brown. Stone cells in group or isolated, colourless, pale yellow or orange, rounded, elliptical or subpolygonal, 20-82 μm in diameter, striation well-defined, pit-canal minute, lumen contain brown or orange substance. Exocarp cell polygonal or subpolygonal. 10-35 μm in diameter, lumen contain brown or reddish-brown substance. Mesocarp parenchymatous cell pale yellow or pale brown, subrounded, wrinkles, containing minute prisms or calcium oxalate.
(2) To 1 g of the powder add 25 ml of ether, heat under reflux for 1 hour, filter and evaporate the residue to dryness. Add 25 ml of ethanol, heat under reflux for 1 hour, cool and filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 1 g of Fructus Chaenomelis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and ethyl acetate-formic acid-water (8 : 1.5 : 1) as the mobile phase. Apply separately 3 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% solution of aluminium chloride in ethanol and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Not more than 15.0 per cent (Appendix Ⅸ H, Method 1).

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 0.6 per cent (Appendix Ⅸ K).

Acidity To 5 g of the powder add 50 ml of water, shake, allow to stand for 1 hour and filter. The pH value of the filtrate is 3.0-4.0 (Appendix Ⅶ G).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using ethanol as the solvent, not less than 15.0 per cent.

Processing Wash clean, soften or steam thoroughly, cut into thin slices and dry in the sun.

Action To pacify *liver-yang* and lessen contracture, regulate stomach function and dispel *damp*.

Indications Arthritis with ankylosis , aching and heaviness sensation of the loins and knees; systremma due to vomiting and diarrhea; edema and weakness of the legs.

Usage and dosage 6-9 g.

Storage Preserve in a dry place, protected from moisture and moth.

Fructus Chebulae (诃子, Hezi)

Medicine Terminalia Fruit

Medicine Terminalia Fruit is the dried ripe fruit of *Terminalia chebula* Retz. or *Terminalia chebula* Retz. var. *tomentella* Kurt. (Fam. Combretaceae). The drug is collected in autumn and winter when ripe, removed from foreign matter, and dried in the sun.

Description Oblong or ovoid, 2-4 cm long, 2-2.5 cm in diameter. Externally yellowish-brown or dark brown, somewhat lustrous, marked with 5-6 longitudinal ribs and irregular wrinkles, base with a rounded fruit stalk scar. Texture compact. Sarcocarp 2-4 mm thick, yellowish-brown or dark yellowish-brown; kernels 1.5-2.5 cm long, 1-1.5 cm in diameter, pale yellow, rough and hard. Seeds narrowly fusiform, about 1 cm long, 2-4 mm in diameter; testa yellowish-brown, cotyledons 2, white, overlapping and convolute. Odour, slight; taste, sour, astringent, then sweet.

Identification To 3 g of the powder without the core add 10 ml of ethanol, ultrasonicate for 20 minutes, use the supernatant as the test solution. Dissolve gallic acid CRS in ethanol to produce a solution containing 0.5 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform-ethyl acetate-formic acid (6 : 4 : 1) as the mobile phase. Apply separately to the plate 3 μl each of the two solutions. After developing and removal of the plate, dry in air, spray with a 2% solution of iron trichloride in ethanol. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Water Carry out the method as described under the determination of water (Appendix Ⅸ H, method 1), not more than 13.0 per cent.

Total ash not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the cold maceration method as described under the determination of water-soluble extractives (Appendix Ⅹ A), not less than 30.0 per cent.

Processing *Fructus Chebulae* Eliminate foreign matter, wash clean and dry. Break to pieces before use.

Sarcocarp of Fructus Chebulae Macerate clean Fructus Chebulae briefly, cover to soften, remove the kernels, and dry.

Action To check diarrhea and chronic cough, and soothe the sore throat.

Indications Protracted diarrhea with hematochezia or prolapse of the rectum; chronic cough with sore throat and hoarseness.

Usage and dosage 3-9 g.

Storage Preserve in a dry place.

Fructus Choerospondiatis (广枣, Guangzao)

Axillary Choerospondias Fruit

Axillary Choerospondias Fruit is the dried ripe fruit of *Choerospondias axillaris* (Roxb.) Burtt et Hill (Fam. Anacardiaceae), commonly used by the Mongol nationality. The drug is collected in autumn when ripe, removed from foreign matter and dried.

Description Ellipsoid or subovoid, 2-3 cm long, 1.4-2 cm in diameter. Externally blackish-brown or brown, somewhat lustrous, irregularly shrunken; showing a fruit stalk scar at the base. Pulp thin, brown. Texture hard and brittle. Kernel subovoid, yellowish-brown, apex having 5, occasionally 4 or 6, distinct small holes, each possessing a seed. Odour, slight taste, sour.

Identification (1) Powder: Brown. Stone cells of endocarp subrounded, elliptical, fusiform, retangular or irregular, some elonged to fibre-like or branched, 14-72 μm in diameter, 25-294 μm long, with thickened walls and distinct pit canals, lumina containing pale yellowish-brown contents. Fibers of endocarp lignified, with thickened or slightly thickened walls, crisscross arranged, and some of lumina containing yellowish-brown contents. Cells of exocarp subpolygonal in lateral view, containing brown contents, and subrectangular in lateral view, radially elongated, the outer and radial walls cutinized-thickened. Parenchymatous cells of mesocarp containing cluster and a few prisms of calcium oxalate, the clusters 17-42 μm in diameter, prisms rhomboid or irregular, 10-48 μm long, 7-27 μm in diameter.

(2) To 2 g of the powder, add 20 ml of 70% ethanol, heat under reflux for 15 minutes, filter, evaporate the filtrate to dryness, add 10 ml of ethyl acetate to dissolve, filter, transfer 1 ml of filtrate on a evaporating dish, evaporate to dryness, add 1 ml of saturated boric acid in acetone and 1 ml of 10% citric acid in acetone, respectively, a yellowish-green colour is produced, continually evaporate to dryness, examine under the ultraviolet light at 365 nm, a yellowish-green fluorescent is produced; add 1 ml of filtrate into the test tube, evaporate to dryness, add 1 ml of methanol to dissolve residue, add 3-4 drops of aluminium chloride TS, the colour of the solution somewhat turns dark, apply to filtering paper, examine under ultraviolet light at 365 nm, a yellowish-green fluorescent is produced.

(3) To 5 g of the powder add 30 ml of 70% ethanol, heat under reflux for 30 minutes, filter. Evaporate the filtrate to about 2 ml, add 5 ml of water to dissolve, extract with ether for 2 times, each of 15 ml, combine the ether solutions, evaporate to dryness, dissolve the residue with 1 ml of ethyl acetate as the test solution. Prepare a ethanol solution of gallic acid CRS containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of chloroform-acetone-formic acid (7∶2∶1) as the mobile phase. Apply separately to the plate 5 μl each of the two solutions. After developing (to 15 cm) and removal of the plate, dry in air. Fumigate with free ammonia. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Action To promote the flow of *qi* and blood, replenish the heart and ease the mind.

Indications Stagnation of *qi* and blood stasis marked by pectoral pain, palpitation and shortness of breath; restlessness.

Usage and dosage 1.5-2.5 g.

Storage Preserve in a cool and dry place.

Fructus Citri (香橼, Xiangyuan)

Citron Fruit

Citron Fruit is the dried ripe fruit of *Citrus medica* L. or *Citrus wilsonii* Tanaka (Fam. Rutaceae). The drug is collected in autumn when ripe, cut in fresh, dried in the sun or at a low temperature. The fruit of *Citrus wilsonii* can be used wholly or cut in the middle into two parts, dried in the sun or at a low temperature.

Description *Fruit of Citrus medica* Rounded or oblong slices, 4-10 cm in diameter, 0.2-0.5 cm thick. In transverse slices, the exocarp yellow or yellowish-green, the edge sinuous, scattering with sunken oil-spots; mesocarp 1-3 cm thick, yellowish-white, with irregular reticulated prominent vascular bundles; juice vesicles separated into 10-17 loculi. In longitudinal slices, the stele relatively thick. Texture soft and pliable. Odour, aromatic; taste, slightly sweet, bitter and pungent.

Fruit of Citrus wilsonii Subspherical, hemispherical or rounded slices, 4-7 cm in diameter. Externally blackish-green or yellowish-brown, with numerous sunken oil spots and reticulated wrinkles; remains of style and a prominent ring at the apex and remains of fruit stalk at the base. Texture hard. In cut surface or in transverse cut slices, oil spots distinct at the border, mesocarp about 0.5 cm thick, juice vesicles in 9-11 loculi, brown or pale reddish-brown, occasionally with yellowish-white seeds. Odour, aromatic; taste, sour and bitter.

Identification Macerate 0.25 g of the powder with 30 ml of petroleum ether (60-90℃) for 1 hour, ultrasonicate for 20 minutes, cool and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of petroleum ether (60-90℃) as the test solution. Prepare a solution of 1 g of Fructus citri reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (5∶1) as the mobile phase. Apply separately 5-10 μl of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 3% solution of vanillin in sulfuric acid and heat to the spots clear. The spots in the chromatogram obtained with test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Processing Break the whole one to pieces; soften the slices thoroughly, cut into slivers and dry in the air.

Action To regulate the *qi* flow the liver, spleen and stomach, and resolve *phlegm*.

Indications Stagnation of *qi* in the *liver* and stomach with manifestions of distending pain in the chest and hypochondria, fullness and stuffiness sensation in the epigastrium, vomiting and belching; cough with copious

expectoration.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place, protected from mould and moth.

Fructus Citri Sarcodactylis (佛手, Foshou)

Finger Citron

Finger Citron is the dried fruit of *Citrus medica* L. var. *sarcodactylis* Swingle (Fam. Rutaceae). The drug is collected in autumn when the fruit is turning yellow, cut longitudinally into slices, dried in the sun or at a low temperature.

Description Subelliptical or ovate slices, usually wrinkled or curved. 6-10 cm long, 3-7 cm wide, 2-4 mm thick. The apex somewhat wide, frequently with 3-5 finger-shaped lobes, and the base somewhat narrow, sometimes a scar of fruit stalk visible. Exocarp yellowish-green or orange-yellow, with wrinkles and oil spots. Mesocarp yellowish-white, scattered with uneven, linear or pointed vascular bundles. Texture hard and fragile, but pliable when moistened. Odour, aromatic; taste, slightly sweet, then bitter.

Identification (1) Powder: Pale brownish-yellow. Parenchymatous cells of mesocarp numerous, irregular or subrounded, walls unevenly thickened. Epidermal cells of pericarp irregularly polygonal in surface view, stomata occationally visible. Parenchymatous cells containing numerous prisms of calcium oxalate with polygonal, rhombic or biconelike.

(2) To 1 g of the powder add 10 ml of dehydrated ethanol, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness, dissolve it in 0.5 ml of dehydrated ethanol as the test solution. Prepare a solution of Fructus Citri Sarcodactylis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-cyclohexane-ethyl acetate (3 : 1) as the mobile phase. Apply separately 2 μl each of the above two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Carry out the method for determination of water (Appendix Ⅸ H); not more than 15 per cent.

Extractives Carry out the method for determination of ethanol soluble extractives, hot extraction method (Appendix Ⅹ A), using ethanol as the solvent; not less than 10.0 per cent.

Action To regulate the *qi* flow of the liver and stomach, and relieve pain.

Indications Stagnation of *qi* of the liver and stomach marked by distending pain in the chest and hypochondriac regions, stuffiness feeling in the stomach, poor appitite and vomiting.

Usage and dosage 3-9 g.

Storage Preserve in a dry place, protected from mould and moth.

Fructus Cnidii (蛇床子, Shechuangzi)

Common Cnidium Fruit

Common Cnidium Fruit is the dried ripe fruit of *Cnidium monnieri* (L.) Cuss. (Fam. Umbelliferae). The drug is collected in summer or autumn when ripe, removed from foreign matter, and dried in the sun.

Description Cremocarp, ellipsoidal, 2-4 mm long, about 2 mm in diameter. Externally greyish-yellow or greyish-brown; with 2 outcurved stylopods at the summit, and sometimes with a fine fruit stalk at the base. Dorsal surface of mericarps with five thin and longitudinal ridges, commissural surface flattened, with two brown and slightly raised longitudinal ribs. Pericarp lax and fragile, easily rubbed off, seed small, greyish-brown and oily. Odour, aromatic; taste, pungent, cool and numb.

Identification (1) Powder: Yellowish-green. Vittae frequently broken, inner walls containing golden yellow secretions, subrounded oil droplets visible. Epidermal cells subrectangular, anticlinal walls sinuous or beaded. Calcium oxalate clusters or subprisms, 3-6 μm in diameter. Parenchymatous cell subrounded, pale yellow or colourless, reticulated striations visible on surface.

(2) To about 0.3 g of the coarse powder, add 5 ml of ethanol, ultrasonicate for 5 minutes, lay aside for a while, and use the supernatant as the test solution. Dissolve osthol CRS with ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of benzene-ethyl acetate-*n*-hexane (3 : 3 : 2) as the mobile phase. Apply separately 2 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air, and examine it under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Water Not more than 13.0 per cent (Appendix Ⅸ H, Method 1).

Total ash Not more than 13.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 6.0 per cent (Appendix Ⅸ K).

Extractives Carry out the cold maceration method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using ethanol as the solvent, not less than 7.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (65 : 35) as the mobile phase. As detector a spectrophotometer set at 322 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of osthole.

Reference solution Dissolve a quantity of osthole CRS, accurately weighed, in ethanol to produce a solution of 45 μg per ml.

Test solution Weigh accurately 0.1 g of the powder (through No. 3 sieve) in a conical flask with stopper, add 25

ml of dehydrated ethanol, accurately measured, weigh accurately, allow to stand for 2 hours and ultrasonicate (power, 300 W; frequency, 50 kHz) for 30 minutes, cool and weigh again, make up the loss in weight with dehydrated ethanol to the initial weight and mix well. Measure accurately 5 ml of the supernatant to a 10 ml volumetric flask, dilute with dehydrated ethanol to volume and mix well.

Procedure Inject accurately 10 μl of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 1.0 per cent of osthole ($C_{15}H_{16}O_3$), calculated with reference to the dried drug.

Action To warm the kidney and promote virility, remove *damp*, dispel *wind*, and kill microorganisms.

Indications Impotence, frigidity, excessive leukorrhea caused by *cold-damp*; lumbago due to attack of *damp*; external use for eczema, vulval itching, trichomonas vaginitis.

Usage and dosage 3-9 g; appropriate quantity to be made into hot decoction for fumigation and wash, or to be ground into powder for topical application after mix with liquid.

Storage Preserve in a dry place.

Fructus Corni (山茱萸, Shanzhuyu)

Asiatic Cornelian Cherry Fruit

Asiatic Cornelian Cherry Fruit is the dried ripe sarcocarp of *Cornus officinalis* Sieb. et Zucc. (Fam. Cornaceae). The fruit is collected in later autumn and early winter when the pericarp turns red, baked over a soft fire or treated with boiling water for a moment, removed from kern in time and dried.

Description Irregularly flaky or bladdery, 1-1.5 cm long and 0.5-1 cm wide. Externally purplish-red to purplish-black, shrunken, lustrous. Sometimes with a rounded scar of persistent calyx at the apex and a scar of fruit stalk at the base. Texture soft. Odour, slight; taste, sour, astringent and slightly bitter.

Identification (1) Powder: Reddish-brown. Epidermal cells of pericarp polygonal or subrectangular in surface view, 16-30 μm in diameter, anticlinal walls beaded, outer periclinal walls granularly cutinized and thickened, lumen containing pale orange-yellow contents. Cells of mesocarp orange-brown, mostly shrunken. Clusters of calcium oxalate rare 12-32 μm in diameter. Stone cells subsquare, ovoid or rectangular, pits obvious and with a large lumen.
(2) To 0.5 g of the powder, add 10 ml of ethyl acetate, ultrasonicate for 15 minutes, filter. Evaporate the filtrate to dryness. Dissolve the residue with 2 ml of dehydrated ethanol as the test solution. Dissolve ursolic acid CRS in dehydrated ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of toluene, ethyl acetate and formic acid (20 : 4 : 0.5) as the mobile phase. Apply separately 5 μl of each of two solutions to the plate. After developing and removal of the plate, dry in air, spray with a 10% sulfuric acid in ethanol and heat at 105℃ to the spot clear. Examine in daylight, a violet red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. Examine under ultraviolet light at 365 nm, an orange fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Foreign matter (kerns and fruit stalks) Not more than 3 per cent (Appendix Ⅸ A).

Water Carry out the method as described under the determination of water (Appendix Ⅸ H, method 1), not more than 16.0 per cent.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 0.5 per cent (Appendix Ⅸ K).

Extractives Carry out the cold maceration method as described under the determination of water-soluble extractives (Appendix Ⅹ A), not less than 50.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (15 : 85) as the mobile phase. As detector a spectrophotometer set at 240 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of loganin.

Reference solution Dissolve a quantity of loganin CRS, accurately weighed, in 80% methanol to prepare a solution containing 40 μg per ml as the reference solution.

Test solution Weigh accurately 0.1 g of the powder (through No. 3 sieve) in a stopper conical flask, add 25 ml of 80% methanol accurately and weigh, heat under reflux for 1 hour, cool and weigh accurately again, replenish the loss of the solvent with 80% methanol, mix well and filter.

Procedure Inject accurately 10 μl of the reference solution and 10 μl of the test solution into the column, respectively, and calculate the content.
It contains not less than 0.60 per cent of loganin ($C_{17}H_{26}O_{10}$), calculated with reference to the dried drug.

Processing *Pulp of Fructus Corni* Eliminate foreign matter and remained kerns.

Pulp of Fructus Corni (processed with wine) Stew or steam the pulp of Fructus Corni as described under the method for stewing with wine or steaming with wine (Appendix Ⅱ D) until the wine is absorbed entirely.

Action To replenish the liver and kidney, restrain seminal emission and relieve collapse.

Indications Dizziness, tinnitus, aching pain in the loins and knees, impotence, seminal emission, enuresis, frequent urination, metrorrhagia and metrostaxis and leukorrhea; collapse with profuse sweating; diabetes.

Usage and dosage 6-12 g.

Storage Preserve in a dry place, protected from moth.

Fructus Crataegi (山楂, Shanzha)

Hawthorn Fruit

Hawthorn Fruit is the dried ripe fruit of *Crataegus pinnatifida* Bge. var *major* N. E. Br., or *Crataegus pinnatifida* Bge. (Fam. Rosaceae).

The drug is collected in autumn when ripe, cut into slices, and dried.

Description Rounded slices shrunken and uneven, 1-2.5 cm in diameter, 2-4 mm thick. Externally red, wrinkled, with small greyish-white spots. Pulp dark yellow to pale brown. Transverse slices of the middle part showing 5 pale yellow kerns, mostly fallen off, and loculi hollowed. Some slices exhibiting a slender fruit stalk or remains of calyx. Odour, slightly aromatic; taste, sour and slightly sweet.

Identification To 1 g of the powder add 4 ml of ethyl acetate, ultrasonicate for 15 minutes, filter, use the filtrate as the test solution. Dissolve ursolic acid CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene-ethyl acetate-formic acid (20∶4∶0.5) as the mobile phase. Apply separately 4 μl each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a solution of sulphuric acid in ethanol (3→10) and heat at 80℃ to the spot distinct. The violet-red spot under sunlight and orange-yellow spot under ultraviolet at 365 nm respectively, in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 3.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using ethanol as the solvent, not less than 21.0 per cent.

Assay Soak about 1 g of the fine powder, accurately weighed, in 100 ml of water, accurately measured, for 4 hours with occasional shaking, and filter. To 25 ml of the filtrate, accurately measured, add 50 ml of water, 2 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS and calculate the content. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 6.404 mg of $C_6H_8O_7$.
It contains not less than 5.0 per cent of organic acids, calculated as citric acid ($C_6H_8O_7$), with reference to the dried drug.

Processing *Fructus Crataegi* Eliminate foreign matter and fallen kernels.

Fructus Crataegi (*stir-baked*) Stir-bake the clean Fructus Crataegi as described under the method for simple stir-baking (Appendix Ⅱ D) until darken in colour.
Pulp yellowish-brown, few dark spots. Odour, slightly aromatic; taste, sour and slightly sweet. Identification complies with the test for identification described under Fructus Crataegi. Assay carry out the test for assay described under Fructus Crataegi. It contains not less than 4.0 per cent of organic acids, calculated as citric acid ($C_6H_8O_7$) on the dried basis.

Fructus Crataegi (*charred*) Stir-bake the clean Fructus Crataegi as described under the method for simple stir-baking (Appendix Ⅱ D) until it becomes burnt-brown externally and yellowish-brown internally.
Burnt-brown externally and yellowish-brown internally. Odour, slightly aromatic; taste, sour and slightly sweet. Identification complies with the test for identification described under Fructus Crataegi. Assay carry out the test for assay described under Fructus Crataegi. It contains not less than 4.0 per cent of organic acids, calculated as citric acid ($C_6H_8O_7$) on the dried basis.

Action To stimulate digestion and promote the functional activity of the stomach, improve the normal flow of *qi* and dissipate *blood stasis*.

Indications Stagnation of undigested meat with epigastric distension, diarrhea and abdominal pain; amenorrhea due to *blood stasis*, epigastric pain or abdominal colic after childbirth; hernial pain; hyperlipemia.

Fructus Crataegi (*charred*) Has more digestant action and is particularly useful for stagnation of undigested meat and diarrhea with inadequate discharge from the bowels.

Usage and dosage 9-12 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Fructus Crotonis (巴豆, Badou)

Croton Fruit

Croton Fruit is the dried ripe fruit of *Croton tiglium* L. (Fam. Euphorbiaceae). The drug is collected in autumn when ripe, piled up for 2-3 days, spread out, and dried.

Description Ovoid, usually 3-ribbed, 1.8-2.2 cm long, 1.4-2 cm in diameter. Externally greyish-yellow or slightly deep, with 6 longitudinal lines, apex truncate, base with a fruit stalk scar, 3 loculi in the shell each containing 1 seed. Seed slightly flattened-elliptical, 1.2-1.5 cm long, 7-9 mm in diameter; externally brown or greyish-brown, with a pointed hilum and a caruncle scar at one end, a slightly dented chalaza at other end, and a raphe between two ends; testa thin and brittle, tegmen white, membranous; kernels yellowish-white, oily. Odour, slight; taste pungent.

Identification To 0.1 g of the coarse powder of the kernels, add 10 ml of petroleum ether (30-60℃), ultrasonicate for 20 minutes, filter, use the filtrate as the test solution. Produce a solution of 0.1 g of Fructus Crotonis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of chloroform and petroleum ether (60-90℃) (2∶1) as the mobile phase. Apply separately to the plate 1-3 μl of the test solution and 2 μl of the reference drug solution. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spot clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H, method 1), not more than 12.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Assay Weigh accurately 1 g of the powder, to a Soxhlet's extractor, add a quantity of ether, and heat under reflux on a water bath for 8 hours until the fatty oil is fully extracted, transfer the extract to a evaporating dish dried previously to constant weight, evaporate the solvent at a low temperature on a water bath. Dry the residue for 1 hour at 100℃, transfer to a desiccator, cool for 30 min, and weigh accurately. It contains not less than 22.0 per cent of fatty oil, calculated with reference to the dried drug.

Processing *Fructus Crotonis* Remove the coats to take the kernels.

Action To cause corrosion by external use.

Indications Malignant ulcer, scabies, wart.

Usage and dosage Appropriate quantity to be ground into powder for topical application or pounded into paste and wrapped in a piece of gauze for rubbing onto the lesion.

Precaution Contraindicated in pregnancy. Incompatible with Semen Pharbitidis.

Storage Preserve in a cool and dry place.

Fructus Evodiae (吴茱萸, Wuzhuyu)

Medicinal Evodia Fruit

Medicinal Evodia Fruit is the dried and nearly ripe fruit of *Evodia rutaecarpa* (Juss.) Benth., *Evodia rutaecarpa* (Juss.) Benth. var. *officinalis* (Dode) Huang or *Evodia rutaecarpa* (Juss.) Benth. var. *bodinieri* (Dode) Huang (Fam. Rutaceae). The fruit spur is cut off from August to November when the fruit indehiscent, dried in the sun or at a low temperature, removed from shoot, leaf, fruit stalk and foreign matter.

Description Spheroidal or slightly flattened-pentagon spheroidal, 2-5 mm in diameter. Externally dark yellowish-green to brown, rough, with numerous spotted protrudings or depressed oil dots. A pentagon-stellate cleft present at the apex and a yellow-tomentose fruit stalk at the base. Texture hard and fragile. Transverse section showing 5-locular ovary, each locule possessing 1-2 yellowish seeds. Odour, strong aromatic; taste, pungent and bitter.

Identification (1) Powder: Brown. Non-glandular hairs 2-6 celled, 140-350 μm long, warts obvious, some lumina containing brownish-yellow to brownish-red contents. Glandular hairs with a 7-14 celled head, elliptical, usually containing yellowish-brown contents, and a 2-5 celled stalk. Clusters of calcium oxalate frequently found, 10-25 μm in diameter; prisms occasional found. Stone cells subrounded or rectangular, 35-70 μm in diameter, with large lumina. Pale yellow fragments of oil cavities sometimes visible.
(2) To 0.4 g of the powder, add 10 ml of ethanol, stand for 30 minutes, ultrasonicate for 30 minutes, filter, use the filtrate as the test solution. Prepare a solution of 0.4 g of Medicinal Evodia Fruit reference drug in the same manner as the reference drug solution. Dissolve rutaecarp CRS in ethanol to produce a solution containing 0.2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, ethyl acetate, methanol, and triethylamine (19 : 5 : 1 : 1) as the mobile phase. Apply separately to the plate 2 μl each of the three solutions. After developing and removal of the plate, spray with a solution of 10% sulfuric acid of ethanol, dry in air. Examine under ultraviolet light at 365 nm. The spots in the chromatogram obtained with test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Foreign matter Not more than 7 per cent (Appendix Ⅸ A).

Water Not more than 15.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile-octyl sodium sulfonate (43 : 57) as the mobile phase. As detector a spectrophotometer set at 225 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of evodiamine.

Reference solution Weigh accurately a quantity of evodiamine CRS and rutaecarpine CRS respectively, add ethanol to prepare a solution containing 10 μg respectively per ml and use as the reference solution.

Test solution Weigh accurately about 0.2 g of the powder, add 90 ml of ethanol, ultrasonicate for 40 minutes, allow to cool, add ethanol to the volume, mix well and use as the test solution.

Procedure Inject accurately 10 μl each of the reference solution and the test solution respectively into the column, determine and calculate the content.
It contains not less than 0.15 per cent of evodiamine ($C_{19}H_{17}N_3O$) and rutaecarpine ($C_{18}H_{13}N_3O$), calculated with reference to the dried drug.

Processing *Fructus Evodiae* Eliminate foreign matter.

Fructus Evodiae (prepared) Pound Radix Glycyrrhizae to pieces and decoct in a proper amount of water. Remove the residue, add clean Fructus Evodiae in a covered container to absorb the decoction entirely. Stir-bake until partially dry and then dry in the sun. To each 100 kg of Fructus Evodiae add 6 kg of Radix Glycyrrhizae in the processing.

Action To dispel *cold* and alleviate pain, relieve vomiting, and check diarrhea.

Indications Headache accompanied by retching and cold limbs; abdominal colic; weakness and edema of the legs; dysmenorrhea; epigastric distension and pain with vomiting and acid regurgitation; diarrhea occurring before dawn daily; hypertension. External use for ulcers on the mouth.

Usage and dosage 1.5-4.5 g; appropriate quantity for external use.

Storage Preserve in a cool and dry place.

Fructus Foeniculi (小茴香, Xiaohuixiang)

Fennel

Fennel is the dried ripe fruit of *Foeniculum vulgare* Mill. (Fam. Umbelliferae). The plant is cut in autumn when the fruit nearly ripe, dried in the sun, and then the drug is tapped off and removed from foreign matter.

Description Cremocarp, cylindrical, some slightly curved, 4-8 mm long, 1.5-2.5 mm in diameter. Externally yellowish-green or pale yellow, tapering slightly towards both ends, apex bearing remains of yellowish-brown projecting stylopodium, sometimes having a small fruit stalk at the base. Mericarp elongated-elliptical, with each dorsal

surface bearing five ribs and commissural surface flattened and broad. Transverse section showing a pentagonal, the four sides of dorsal surface nearly equal in length. Odour, characteristically aromatic; taste, slightly sweet and pungent.

Identification (1) Transverse section of mericarp: Exocarp consisting of 1 layer of flattened cells, covered cuticle at outside. Mesocarp with 5 ribs each containing a vascular bundle surrounded by numerous lignified reticulate cells. Vittae 6, of 4 situated in the dorsal, with a large, elliptical and brown vitta between every 2 ribs, and 2 commissural. Endocarp consisting of 1 layer of flattened thin-walled cells varying in length. The testa cells compressed and elongated, containing brown contents. Endosperm cells polygonal, filled with aleurone grains, each embedding a minute cluster of calcium oxalate.
(2) To 2 g of the powder add 20 ml of ether, ultrasonicate for 10 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Dissolve anisic aldehyde CRS in ethanol to produce a solution containing 1 μg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxylmethylcellulose as the coating substance and a mixture of petroleum ether (60-90℃)-ethyl acetate (17 : 2.5) as the mobile phase. Apply separately 10 μl each of the two solutions to the plate. After developing to 8 cm and removal of the plate, dry in air. Spray with a solution of dinitrophenylhydrazine TS. The orange-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Foreign matter Not more than 4.0 per cent (Appendix Ⅸ A).

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for determination of volatile oil (Appendix Ⅹ D).
It contains not less than 1.5 per cent (ml/g) of volatile oil.

Processing *Fructus Foeniculi* Eliminate foreign matter.

Fructus foeniculi (*processed with salt*) Stir-bake the clean Fructus Foeniculi as described under the method for processing with salt-water (Appendix Ⅱ D) to yellowish.

Action To dispel *cold* and relieve pain, and regulate the stomach function.

Fructus foeniculi (*processed with salt*) To dispel *cold* from the interior and warm the *kidney*, and relieve pain.

Indications Abdominal cold pain and cold extremities; dysmenorrhea with cold pain in the abdomen; distending pain in the epigastrium with poor appitite, vomiting and diarrhea; hydrocele of tunica vaginalis.

Fructus Foeniculi (*processed with salt*) Abdominal cold pain and cold extremities; contracting pain of testis dysmenorrhea with abdominal pain caused by *cold*.

Usage and dosage 3-6 g.

Storage Preserve in a cool and dry place.

Fructus Forsythiae
(连翘, Lianqiao)

Weeping Forsythia Capsule

Weeping Forsythia Capsule is the dried fruit of *Forsythia suspensa* (Thunb.) Vahl (Fam. Oleaceae). The drug is collected in autumn when nearly ripe and still greenish, removed from foreign matter, steamed thoroughly and dried in the sun (known as "Qingqiao"); or the drug is collected when fully ripe, dried, and removed from foreign matter (known as "Laoqiao")

Description Long ovoid to ovoid, slightly compressed, 1.5-2.5 cm long, 0.5-1.3 cm in diameter. Externally with irregular longitudinal wrinkles, numerous raised small maculates, and a longitudinal furrow on each of the two surfaces. Apex acute, bearing a small fruit stalk or its scar at the base. "Qingqiao" mostly indehiscent, externally greenish-brown, with less small greyish-white maculates, texture hard; seeds numerous, yellowish-green, slender, winged at one side. "Laoqiao" dehiscent from apex or to two segments, outer surface yellowish-brown or reddish-brown, inner surface mostly pale yellowish-brown, smooth, with a longitudinal septum. Texture brittle; seeds brown, mostly fallen off. Odour, slightly aromatic; taste, bitter.

Identification (1) Transverse section of pericarp: Exocarp consisting of 1 row of epidermal cells, with thickened outer and lateral walls and covered with cuticle. Mesocarp composed of vascular bundles scattered in parenchyma at the outer side, and many layers of stone cells at the inner side, elongated, subrounded or oblong, wall thickness variable, mostly tangentially parqueted and extended to the cells of the septum; endocarp consisting of 1 layer of parenchymatous cells.
(2) To 1 g of the powder add 30 ml of chloroform, heat under reflux for 1 hour, filter, discard the filtrate, evaporate the residue to dryness. Add 40 ml of methanol, heat under reflux for 1 hour, filter, condense the filtrate to about 1 ml. Apply the filtrate to a column (1-1.2 cm I.D.) containing 3 g of polymer (14-30 mesh) pre-elute with 50 ml of water. Wash with 50 ml of water, discard the water washing, then wash with 100 ml of ethanol, collect the eluent, evaporate the eluent to dryness. Dissolve the residue with 30 ml of water, filter to a separator, extract with 20 ml of ethyl acetate for two times, combine the extracts, evaporate the extracts to dryness. Dissolve the residue with 1 ml of methanol as the test solution. Prepare a solution of 1 g reference drug of Fructus Forsythiae in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing a mixture of 5% solution of sodium dihydrogen phosphate in sodium carboxymethylcellulose as the coating substance and a mixture of benzene-acetone-ethyl acetate-formic acid-water (20 : 25 : 30 : 3 : 3) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate, after developing and removal of the plate, dry in air. The fluorescence spots in the chromatogram obtained with the test solution correspond in position and colour to the spots with the reference solution under ultraviolet at 365 nm. Spray with a mixed solution of vanillin in sulfuric acid TS and heat to the spots distinct. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Foreign matters Not more than 3 per cent for green Fructus Forsythiae (known as "Qingqiao"), not more than 9 per cent for brown Fructus Forsythiae (Known as "Laoqiao") (Appendix Ⅸ A).

Water Not more than 10.0 per cent (Appendix Ⅸ H, method 2).

Total ash Not more than 4.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix

Ⅸ K).

Extractives Carry out the cold maceration method for determination of extractives (Appendix Ⅹ A), using 65% ethanol as the solvent; not less than 30.0 per cent for green Fructose Forsythiae (known as "Qingqiao"); not less than 16.0 per cent for brown Fructus Forsythiae (known as "Laoqiao").

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile-water (25 : 75) as the mobile phase. As detector a spectrophotometer set at 277 nm. The number of theoretic plates of the column is not less than 3000, calculated with the reference to the peak of forsythia side.

Reference solution Weigh accurately forsythia side CRS in methanol to produce a solution containing 0.2 mg per ml and mix well.

Test solution Weigh accurately 1 g of the powder in a conical flask with stopper, add accurately 15 ml of methanol and weigh. Allow to stand overnight, ultrasonicate for 25 minutes, cool and measure. Supply with methanol to the weight, mix well and filter. Measure accurately 5 ml of the successive filtrate, evaporate to nearly dryness, mix with neutral aluminum oxygen and then transfer to a column of neutral aluminium oxide (1 g, 100-120 mesh, 1-1.5 cm I. D.), elute with 80 ml of 70% ethanol solution. Collect the eluent, evaporate on water bath to dryness. Dissolve the residue with 50% ethanol solution in a 5 ml volumetric flask and add to the volume, mix well, filter with 0.45 μm microfilter.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, separately into the column, and calculate the content.
It contains not less 0.15 per cent forsythin ($C_{29}H_{36}O_{15}$), with reference to the dried basis.

Action To remove toxic *heat* to relieve swelling, and eliminate nodulation.

Indications Carbuncles, boils, lymphadenitis, mastitis, erysipelas; upper respiratory infection; febrile diseases at the early stage and at the stage with high fever, thirst, delirium and maculation; acute urinary infection with oliguria.

Usage and dosage 6-15 g.

Storage Preserve in a dry place.

Fructus Galangae (红豆蔻, Hongdoukou)

Galanga Galangal Fruit

Galanga Galangal Fruit is the fruit of *Alpinia galanga* Willd. (Fam. Zingiberaceae). The drug is collected in autumn when the fruit is turning red, removed from foreign matter, and dried in the sun.

Description Long spherical, slightly narrow in the middle, 0.7-1.2 cm long, 5-7 mm in diameter. Externally reddish-brown or dark red, somewhat shrunken, apex with yellowish-white tubular persistent calyx, base with a fruit stalk scar. Pericarp thin, easily broken. Seeds 6, oblate or triangular-polygonal, blackish-brown or reddish-brown, covered with a yellowish-white membranous aril, endosperm greyish-white. Odour, aromatic; taste, pungent.

Identification (1) Transverse section of seed: Aril consisting of 4-7 rows of cells, rounded or tangentially elongated, with slightly thickened walls. The outer part of testa consisting of 1-5 rows of unlignified and thick-walled fibres, rounded or polygonal, 13-45 μm in diameter, and 1 row of flattened, yellowish-brown or dark brown pigment cells beneath them; oil cells, 1 row, square or rectangular, 16-45 μm in diameter; pigment layer consisting of 3-5 rows of cells containing reddish-brown contents; tegmen consisting of 1 row of thick-walled palisade cells, about 65 μm long, 30 μm wide, yellowish-brown or reddish-brown, the inner walls and lateral walls adjacent to inner side strongly thickened, lumina containing a silica mass. The cells of perisperm filled with masses of starch granules and occasionally containing small prisms of calcium oxalate. The cells of endosperm containing aleurone grains and oil droplets.
(2) To 1 g of the pulverized sample, add 20 ml of ether, ultrasonicate for 10 minutes, and filter. Wash the residue with a quantity of 10 ml of ether, filter, combine the filtrates, and evaporate to dryness. Dissolve the residue with 1 ml of ethyl acetate as the test solution. Produce a solution of 1 g of Fructus Galangae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of *n*-hexane-ethyl acetate (17 : 3) as the mobile phase. Apply separately to the plate 5-10 μl of each of the two solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. The three spots with fluorescence in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution. Spray with a 5% solution of vanillin in sulfuric acid, and heat at 105℃ to the spots clear. The three spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Assay Weigh accurately a quantity of seeds, carry out the method for determination of volatile oil (Appendix Ⅹ D). The seeds contain not less than 0.40 per cent (ml/g) of volatile oil.

Processing Eliminate foreign matter. Break to pieces before use.

Action To dispel *damp-cold*, invigorate the function of the spleen, and promote digestion.

Indications Epigastric pain accompanied by cold sensation; abdominal distension from retention of undigested food, vomiting and diarrhea; excessive alcohol drinking.

Usage and dosage 3-6 g.

Storage Preserve in a cool and dry place.

Fructus Gardeniae (栀子, Zhizi)

Cape Jasmine Fruit

Cape Jasmine Fruit is the dried ripe fruit of *Gardenia jasminoides* Ellis (Fam. Rubiaceae). The drug is collected from September to November when it turns reddish-yellow, removed from the fruit stalk and foreign matter, steamed thoroughly or treated with boiling water for a moment, then dried.

Description Prolate-ovoid or ellipsoid, 1.5-3.5 cm long, 1-

1.5 cm in diameter. The outer surface reddish-yellow or brownish-red, with 6 longitudinal winged ribs and a conspicuous longitudinal and branched vein between two ribs. Summit bearing remains of sepals, base somewhat tapering and having a remain of fruit stalk. Pericarp thin and brittle, somewhat lustrous; the inner surface relatively pale in colour, lustrous, with 2-3 raised false septa. Seeds numerous, flattened-ovoid, aggregated into a mass, deep red or reddish-yellow, with fine and dense warts on the surface. Odour, slight; taste, slightly sour and bitter.

Identification (1) Powder: Reddish-brown. Stone cells of pericarp subrectangular, fibres of pericarp long and thin, fusiform, about 10 μm in diameter, up to 110 μm long, obliquely mosaicarranged; crystal stone cells subrounded or polygonal, 17-31 μm in diameter, with thickened walls, lumina containing prisms of calcium oxalate, about 8 μm in diameter. Stone cells of testa yellow or pale brown, elongated-polygonal, rectangular or irregular in shape, 60-112 μm in diameter, up to 230 μm long, with large-pitted and thickened walls and brownish-red lumina. Clusters of calcium oxalate 19-34 μm in diameter.
(2) To 1 g of the powder add 10 ml of 50% methanol, ultrasonicate for 40 minutes, filter and use the filtrate as the test solution. Prepare a solution of 1 g of Fructus Gardeniae reference drug in the same manner as the reference drug solution. Dissolve jasminoidin CRS in ethanol to produce a solution containing 4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate-acetone-formic acid-water (5∶5∶1∶1) as the mobile phase. Apply separately to the plate 2 μl each of the three solutions. After developing and removal of the plate, dry in air. Spray with sulfuric acid solution (5→10) in ethanol, heat at 110℃ for about 10 minutes. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Water Not more than 8.5 per cent (Appendix Ⅸ H, Method 1).

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile-water (15∶85) as the mobile phase. As detector a spectrophotometer set at 238 nm. The number of theoretical plates of the column is not less than 1500, calculated with the reference to the peak of gardenoside.

Reference solution Weigh accurately a quantity of gardenoside CRS, dissolve in methanol to produce a solution containing 30 μg per ml as the reference solution.

Test solution Weigh accurately 0.1 g of the powder (through No. 4 sieve) in a stopper conical flask, add accurately 25 ml of methanol, weigh the quantity, ultrasonicate for 20 minutes, weigh again, add methanol to the initial weight, filter, transfer accurately 10 ml of the successive filtrate to a 25 ml volumetric flask, add methanol to the volume and use as the test solution.

Procedure Inject accurately 10 μl each of the reference solution and the test solution respectively into the column, and calculate the content.
It contains not less than 1.8 per cent of gardenoside ($C_{17}H_{24}O_{10}$), calculated with reference to the dried drug.

Processing *Fructus Gardeniae* Eliminate foreign matter and grind to pieces.

Fructus Gardeniae (*stir-baked*) Stir-bake the clean Fructus Gardeniae as described under the method for smiple stir-baking (Appendix Ⅱ D) until its outer part turns to yellowish-brown.

Action To reduce *fire* and ease the mind, eliminate *damp-heat*, and remove *heat-toxicity* from blood.

Indications Febrile diseases with restlessness; jaundice with dark urine; hematuria with difficult painful urination; hemoptysis and epistaxis caused by *heat* in the blood; inflammation of the eyes; boils and sores; external use for sprains and bruises.

Usage and dosage 6-9 g; for external use, appropriate quantity of unprocessed fruit to be ground into powder and applied topically after mixed with a liquid.

Storage Preserve in a ventilated and dry place.

Fructus Gardeniae Praeparatus (焦栀子, Jiaozhizi)

Charred cape Jasmine Fruit

The drug is the processed Fructus Gardeniae.

Processing Stir-bake the clean Fructus Gardeniae or break to pieces in a hot pot with middle heat as described under the method for simple stir-baking (Appendix Ⅱ D) until it becomes burnt-brown or burnt-black externally and the inner surface and seed coats yellowish-brown or dark brown, then take them out and cool.

Description Same as Fructus Gardeniae or irregular fragments, the outer surface burnt-brown or burnt-black. Pericarp thin and fragile, the inner surface brown, seed mass brown or dark brown. Odour, slight; taste, slightly sour and bitter.

Identification Carry out the method described under the determination of Fructus Gardeniae (2), have the same results.

Action To arrest bleeding by removing *heat* from blood.

Indications Hemoptysis, epistaxis, hematuria and abnormal uterine bleeding caused by *heat* in the blood.

Usage and dosage 6-9 g.

Storage Same as *Fructus Gardeniae*.

Fructus Gleditsiae Abnormalis (猪牙皂, Zhuyazao)

Chinese Honeylocust Abnormal Fruit

Chinese Honeylocust Abnormal Fruit is the dried sterile fruit of *Gleditsia sinensis* Lam. (Fam. Leguminosae). The drug is collected in autumn, removed from foreign matter, and dried.

Description Cylindrical, somewhat flattened and curved, 5-11 cm long, 0.7-1.5 cm wide. Externally purplish-brown, covered with greyish-white, waxy, frost-like powders, lustrous after rubbed away, and with fine warts and linear or reticulated fissures. Apex with a beak-shaped remain of stylopod, base with a scar of fruit stalk. Texture hard and fragile, easily broken; fracutre brownish-yellow, lax in the centre, with pale green or brownish-yellow filiform substances, occasionally bearing incomplete grown seeds.

Odour, slight and irritating; taste, sweet then pungent.

Identification (1) Powder: Brownish-yellow. Stone cells numerous, subrounded, oblong or irregular in shape, 15-53 μm in diameter. Fibres frequently in bundles, 15-25 μm in diameter, with slightly lignified walls surrounded by parenchymatous cells containing prisms of calcium oxalate and a few clusters, forming crystal fibres; fibre bundles often accompanied by subsquare, thick-walled cells. Prisms of calcium oxalate 6-15 μm long; clusters 6-14 μm in diameter. Parenchymatous cells numerous, lignified, pits and pit-canals distinct. Epidermal cells of pericarp reddish-brown, polygonal in surface view, walls relatively thickened, with granular, striated cuticle.
(2) To 1 g of the powder add 8 ml of ethanol, heat under reflux for 5 minutes, allow to cool, and filter. Evaporate 0.5 ml of the filtrate in a small porcelain dish to dryness and allow to cool, add 3 drops of acetic anhydride, stir well and add 2 drops of sulfuric acid along the wall of the dish; a reddish-purple colour is produced gradually.
(3) Boil about 1 g of the powder in 10 ml of water for 10 minutes, filter. Shake the filtrate vigorously, a persistent froth is produced over 15 minutes.

Water Not more than 14.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Processing Eliminate foreign matter, wash and dry in the sun. Break to pieces before use.

Action To dispel *phlegm*, restore consciousness, and reduce nodulation and relieve of swelling.

Indications Loss of consciousness in stroke and epilepsy; sore throat, dyspnea and cough with phlegm difficult to spit out; constipation; external use for subcutaneous pyogenic infections.

Usage and dosage 1-1.5 g, generally used in making pills or powders; for external use, appropriate quantity to be ground into powder for blowing into nostrils to induce sneezing or for topical application after mixed with liquid.

Precaution Contraindicated in pregnancy and patients with hemoptysis or hematemesis.

Storage Preserve in a dry place, protected from moth.

Fructus Hippophae (沙棘, Shaji)

Seabuckthorn Fruit

Seabuckthorn Fruit is the dried ripe fruit of *Hippophae rhamnoides* L. (Fam. Elaeagnaceae), used commonly by the Mongolia and Tibetan nationalities. The drug is collected in autumn and winter when ripe or frozen hard, removed from foreign matter, and dried or dried after steamed.

Description Subspheroidal or flattened-spheroidal, 5-8 mm in diameter, sometimes several fruit adhering together. Externally orange-yellow or brownish-red, shrunken, with a remains of style at the apex and a short fruit stalk or its scar at the base. Sarcocarp oily and soft. Seeds oblique-ovoid, about 4 mm long, 2 mm wide, externally brown, lustrous, with a longitudinal furrow in the middle; testa relatively hard, kernel milky-white, oily. Odour, slight; taste, sour and astringent.

Identification (1) Surface view of pericarp: Epidermal cells of pericarp polygonal, anticlinal walls slightly thickened. Peltate haris numerous on epidermis, consisting of more than 100 unicellular hairs, the terminal separated, each cell 80-220 μm long, about 5 μm in diameter. The scar of hair grouped with 7-8 rounded cells, with slightly thickened walls. Parenchymatous cells of sarcocarp containing numerous orange-red or orange-yellow granular contents. Bright-yellow oil droplets numerous.
(2) Measure 30 ml of the test solution as described under 'Assay' for isorhamnetin, concentrated to 5 ml, add 25 ml of water, and extract with two 20-ml quantities of ethyl acetate, combine the ethyl acetate extracts, evaporate the extracts to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve isorhamnetin CRS and quercetin CRS in methanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing 3% solution of sodium acetate as the coating substance and a mixture of methylbene-ethyl acetate-acetone-formic acid (5 : 2 : 1) as the mobile phase. Apply separately 2 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with aluminium trichloric TS. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Foreign matter Not more than 4.0 per cent (Appendix Ⅸ A).

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ D), not less than 25.0 per cent.

Assay ***Total flavonoids*** *Reference solution* Weigh accurately 20 mg of rutin CRS, dried previously to constant weight at 120℃, in a 50 ml volumetric flask, dissolve with a quantity of 60% ethanol and heat slightly on a water bath, cool, dilute with 60% ethanol to volume, and mix well. Measure accurately 25 ml to a 50 ml volumetric flask, dilute with water to volume, and mix well to produce a solution containing 0.2 mg per ml as the reference solution.

Calibration standard Measure accurately 1.0、2.0、3.0、4.0、5.0 and 6.0 ml of the reference solution into a 25 ml volumetric flask, add 30% ethanol to 6.0 ml, add 1 ml of 5% sodium nitrite solution separately, mix well and allow to stand for 6 minutes, add 1 ml of 10% aluminium nitrate solution, mix well, allow to stand for 6 minutes. Add 10 ml of sodium hydroxide TS, dilute with 30% ethanol to volume, mix well, and allow to stand for 15 minutes. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), using the corresponding solvent as a blank, measure the absorbance at 500 nm and plot the standard curve, using the absorbance as ordinate and the concentration as abscissa.

Procedure Weigh accurately 2 g of the coarse powder, add 30 ml of 60% ethanol, heat under reflux for 2 hours, cool and filter. Extract the residue with two 25-ml quantities of 60% ethanol heated under reflux for 1 hour respectively, filter, wash the residue with a small quantity of 60% ethanol, combine the filtrates and washing into a 100 ml volumetric flask, dilute with 60% ethanol to volume, and mix well. Measure accurately 3 ml to a 25 ml volumetric

flask, add 30% ethanol to 6.0 ml. Proceed as described under 'Calibration standard', beginning at the words "add 1 ml of 5% sodium nitrite solution", measure the absorbance. Perform a blank determination with 3 ml of test solution in the same manner except adding sodium hydroxide TS. Read out the weight of rutin (mg) in the test solution from the standard curve, and calculate the content of total flavonoids.
It contains not less than 1.5 per cent of total flavonoids, calculated as rutin ($C_{27}H_{30}O_{16}$) with reference to the dried drug.

Isorhamnetin Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol-0.4% phosphoric acid (58 : 42) as the mobile phase. As detector a spectrophotometer set at 370 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of isorhamnetin.

Reference solution Dissolve a quantity of isorhamnetin CRS, accurately weighed, in methanol to produce a solution containing 10 μg per ml as the reference solution.

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve) in a stopper conical flask, add 50 ml of ethanol, weigh accurately, heat under reflux for 1 hour, cool and weigh accurately again, replenish the loss of the solvent with ethanol, mix well, and filter. Measure accurately 25 ml of the successive filtrate to a stopper conical flask, add 3.5 ml of hydrochloric acid, heat on a water bath at 75℃ for 1 hour, cool immediately, transfer into a 50 ml volumetric flask, wash the conical flask with a quantity of ethanol, combine the washing to the flask, dilute with ethanol to volume, and mix well.

Procedure Inject accurately 10 μl of the reference solution and the test solution into the column respectively, and calculate the content.
It contains not less than 0.10 per cent of isorhamnetin ($C_{16}H_{12}O_7$), calculated with reference to the dried drug.

Action To relieve cough and promote expectoration, promote digestion and remove stagnancy of food, and promote blood circulation and remove blood stasis.

Indications Cough with profuse expectoration; indigestion, stagnancy of food with abdominal pain; amenorrhea due to blood stagnation; traumatic swelling and ecchymoses.

Usage and dosage 3-9 g.

Storage Preserve in a ventilated and dry place, protected from mould and moth.

Fructus Hordei Germinatus (麦芽, Maiya)

Germinated Barley

Germinated Barley is the dried germinated ripe fruit of *Hordeum vulgare* L. (Fam. Gramineae). The fruit is soaked in water at an appropriate temperature and moisture until the budlet grows up to about 5 mm long, and dried.

Description Fusiform, 8-12 mm long, 3-4 mm in diameter. Externally pale yellow, dorsally enveloped in lemma, 5-veined, with a long awn broken or fallen; ventrally subtended by palea, with a longitudinal furrow after removal of lemma and palea; the budlet and the fibrous root grown at the base of the radicle. the budlet long lanceolate-linear, about 5 mm long, the fibrous roots fine and curved. Texture hard, fracture white, starchy. Odour, slight; taste slightly sweet.

Identification To 10 g of the powder add 30 ml of dehydrated ethanol, ultrasonicate for 40 minutes, filter. To the filtrate add 1 ml of a 50% solution of potassium hydroxide, heat under reflux for 15 minutes, and cool on ice bath for 5 minutes. Move to a separator, wash the container with 20 ml of water for twice and combine the washing solution to the separator. Extract with petroleum ether (60-90℃) for 3 times, 10 ml per time. Combine the petroleum ether layer, evaporate it on a water bath at 45℃ to dryness. Dissolve the residue with 1 ml of ethyl acetate as the test solution. Prepare a solution of 10 g of Fructus Hordei Germinatus reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of benzene-chloroform (1 : 1) as the mobile phase. Apply separately 10 μl each of the two solutions to the plate. After developing and removal of the plate, dry it in air. Spray with a 15% solution of nitric acid in 50% ethanol. Heat at 100℃ to the spot distinct, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Budding rate Carry out the method for sampling of crude drugs (Appendix Ⅱ A), taking 10 g of the drug in two portions diagonally determine the amount of the budding grains and of the total grains, calculate the percentage of budding rate.
The budding rate is not less than 85%.

Processing *Fructus Hordei Germinatus* Eliminate foreign matter.

Fructus Hordei Germinatus (*stir-baked*) Stir-bake the clean Fructus Hordei Germinatus as described under the method for simple stir-baking (Appendix Ⅱ D) until its outer part becomes brown, cool and sift.

Fructus Hordei Germinatus (*charred*) Stir-bake the clean Fructus Hordei Germinatus as described under the method for simple stir-baking (Appendix Ⅱ D) until its outer part becomes dark brown.

Action *Fructus Hordei Germinatus* To invigorate the function of the spleen, and regulate the function of the stomach.

Fructus Hordei Germinatus (*stir-baked*) To promote digestion, and stop lactation.

Fructus Hordei Germinatus (*charred*) To stimulate digestion and remove the retention of undigested food.

Indications *Fructus Hordei Germinatus* Poor appitite due to deficiency of the spleen; galactostasis.

Fructus Hordei Germinatus (*stir-baked*) Indigestion; weaning a baby.

Fructurs Hordei Germinatus (*charred*) Retention of undigested food with epigastric distension and pain.

Usage and dosage 9-15 g; 60 g of Fructus Hordei Germinatus (stir-baked) for stopping lactation.

Storage Preserve in a ventilated and dry place, protected from moth.

Fructus Jujubae (大枣, Dazao)

Chinese Date

Chinese Date is the dried ripe fruit of *Ziziphus*

jujuba Mill (Fam. Rhamnaceae). The drug is collected in autumn when ripe, and dried in the sun.

Description Ellipsoidal or spheroidal, 2-3.5 cm long, 1.5-2.5 cm in diameter. Externally dark red, somewhat lustrous, irregularly wrinkled. Base dented, with a short fruit stalk. Exocarp thin, mesocarp brownish-yellow or pale brown, fleshy, soft, sugary and oily. Kernel fusiform, acute at the both ends, texture hard. Odour, slightly aromatic; taste, sweet.

Identification To 2 g of the powder add 10 ml of petroleum ether (60-90℃), macerate for 10 min and ultrasonicate for 10 min, filter and discard the petroleum ether, dry the residue in air. Add 20 ml of ether, macerate for 1 hour and ultrasonicate for 15 min, filter and concentrate to 2 ml as the test solution. Dissolve oleanolic acid CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene-ethyl acetate-glacial acetic acid (14 : 4 : 0.5) as the mobile phase. Apply separately 10 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol and heat to the spot distinct. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Total ash Not more than 2.0 per cent (Appendix Ⅸ K).

Processing Eliminate foreign matter, wash clean, dry in the sun. Cut or remove the kernel before use.

Action To tonify the spleen and replenish *qi*, nourish blood, and ease the mind.

Indications Loss of appitite, lassitude and loose stools in *deficiency* syndromes of the spleen; hysteria in women.

Usage and dosage 6-15 g.

Storage Preserve in a dry place, protected from moth.

Fructus Kochiae (地肤子, Difuzi)

Belvedere Fruit

Belvedere Fruit is the dried ripe fruit of *Kochia scoparia* (L.) Schrad. (Fam. Chenopodiaceae). The plant is collected in autumn when the fruit is ripe, dried in the sun, and the fruit is gathered, and removed from foreign matter.

Description Oblate-spheroidal, fie-pointed star shape, 1-3 mm in diameter, surrounded by a persistant perianth. Externally greyish-green or pale brown, with 5 membranous winglets, the centre of dorsal surface having a sightly prominent, pointed fruit stalk scar and 5-10 radial veins; membranous pericarp visible when the perianth stripped, translucent. Seeds flattened-ovoid, about 1 mm long, black. Odour, slight; taste, slightly bitter.

Identification (1) Powder: Brown. Epidermic cells of perianth polygonal, stomata anomocytic, parenchymatous cells containing clusters of calcium oxalate. Pericarp cells subrectangular or polygonal, thin-walled, sinuous, contining numerously small prisms of calcium oxalate. Testa cells brown, polygonal or subsquare, mostly crumpled.
(2) To 1 g of the powder add 10 ml of methanol, ultrasonicate for 30 minutes, filter and use the filtrate as the test solution. Dissolve kochioside IC CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carbomethylcellulose as the coating substance and a mixture of chloroform-methanol-water (16 : 9 : 2) as the mobile phase. Apply separately 5 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat to the spots clear at 105℃. The purplish-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 14.0 per cent (Appendix Ⅸ H, Method 1).

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and glacial acetic acid (85 : 15 : 0.2) as the mobile phase. Use an evaporative light scattering detector. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of kochioside Ic.

Reference solution Dissolve a quantity of kochioside Ic CRS, accurately weighed, in methanol to produce a solution containing 0.5 mg per ml as the reference solution.

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve) in a conical flask with stopper, add 50 ml of methanol, accurately measured, and weigh accurately, allow to stand overnight, ultrasonicate for 30 minutes, cool and weigh again, make up the loss in weight with methanol to the initial weight and mix well.

Procedure Inject accurately 10 μl, 20 μl of the reference solution and 20 μl of the test solution into the column, respectively. Calculate the content with corrected logarithmic equation of external standard method.
It contains not less than 1.8 per cent of kochioside Ic ($C_{41}H_{64}O_{13}$), calculated with reference to the dried drug.

Action To remove *damp-heat*, dispel *wind*, and relieve itching.

Indications Painful and difficult urination; pruritus vulvae with leukorrhea; rubella, eczema, and cutaneous pruritus.

Usage and dosage 9-15 g; for external use, appropriate quantity to be decocted for fumigation and wash.

Storage Preserve in a ventilated and dry place, protected from moth.

Fructus Leonuri (茺蔚子, Chongweizi)

Motherwort Fruit

Motherwort Fruit is the dried ripe fruit of *Leonurus japonicus* Houtt. (Fam. Labiatae). The aerial parts of the plant is cut down in autumn when the fruit is ripe, and dried. The fruit is tapped out, and removed from foreign matter.

Description Trihedral, 2-3 mm long, about 1.5 mm wide.

Externally greyish-brown, with dark-coloured maculates, slightly broad and truncate at one end, gradually narrowed to be obtuse at the other end. Pericarp thin, cotyledons almost white, oily. Odour, slight; taste bitter.

Identification Powder: Yellowish-brown to deep brown. Cells of exocarp slightly radially elongated in transverse sectional view, variable in length, forming numerous raised ridges with yellow reticulated, unlignified cells; subpolygonal in surface view, striated-cuticulate, reticulated cells with striated-thickened walls. Sclerenchymatous cells of endocarp slightly tangentially elongated in transverse sectional view, with extremely thickened inner walls, but the outer walls relatively thin, eccentric lumina containing prisms of clacium oxalate; stellate in surface view or borders of cells indistinct, prisms obviously visible. Cells of mesocarp subpolygonal in surface view, with thin and sinuous walls. Epidermal cells of testa subsquare, with slightly thickened and sinuous walls, lumina containing pale yellowish-brown contents. Cells of endosperm containing fixed oil droplets and aleurone grains.

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Processing *Fructus Leonuri* Eliminate foreign matter, wash and dry.

Fructus Leonuri (*stir-baked*) Stir-bake the clean Fructus Leonuri as described under the method for simple stir-baking (Appendix Ⅱ D) until it cracks.

Action To activate blood circulation and regulate menstruation, subdue hyperactivity of the liver, and clear nebula.

Indications Menstrual disorders, amenorrhea, hysmenorrhea, inflammation of the eyes, with nebula; dizziness and headache.

Usage and dosage 4.5-9 g.

Precaution Used with caution in pupil dilation.

Storage Preserve in a ventilated and dry place.

Fructus Ligustri Lucidi (女贞子, Nüzhenzi)

Glossy Privet Fruit

Glossy Privet Fruit is the dried ripe fruit of *Ligustrum lucidum* Ait. (Fam. Oleaceae). The drug is collected when ripe in winter, removed from branch and leaf, steamed or treated with boiling water for a moment, and dried, or dried directly.

Description Ovoid, elliptical or reniform, 6-8.5 mm long, 3.5-5.5 mm in diameter. Externally blackish-purple or greyish-black, shrunken and uneven, with a fruit stalk scar or persistent calyx and a short fruit stalk at the base. Texture light. Epicarp thin, mesocarp relatively lax and soft, easily stripped off, endocarp woody, yellowish-brown, with longitudinal ribs. Seed 1, reniform, purplish-black, oily. Odour, slight; taste, sweet but slightly bitter and astringent.

Identification To 0.5 g of the powder add 20 ml of methanol, heat under reflux for 30 minutes, filter, evaporate the filtrate to dryness. Dissolve the residue with a mixture of ethanol-chloroform (3 : 2) as the test solution. Dissolve oleanolic acid CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane-acetone-ethyl acetate (5 : 2 : 1) as the mobile phase. Apply separately 5 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 80℃ to the spot distinct. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Foreign matter Not more than 3 per cent (Appendix Ⅸ A).

Assay Weigh accurately 1 g of the coarse powder, add 50 ml of ethanol, heat under reflux for 30 min, cool and filter. Add same quantity of ethanol to the residue for reflux twice. Combine the filtrate and evaporate to dryness. Dissolve the residue in ethanol to a 10 ml volumetric flask, add ethanol to the volume, mix well, used as the test solution. Dissolve oleanolic acid CRS, accurately weighed, in ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexine-acetone-ethyl acetate (5 : 2 : 1) as the mobile phase. Apply separately 2 μl of the test solution and 4 μl, 8 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 100℃ to the spot distinct. Cover the plate with a piece of glass of the same size and fix the edge with tape. Carry out the method for thin layer chromatography (Appendix Ⅵ B thin layer chromatographic scanning method), scan at wavelengths of λ_S = 530 nm, and λ_R = 700 nm, measure the integrated value of the absorbance, calculate the content. It contains not less than 0.6 per cent of oleanolic acid ($C_{30}H_{48}O_3$).

Processing *Fructus Ligustri Lucidi* Eliminate foreign matter, wash and dry.

Fructus Ligustri Lucidi (*processed with wine*) Stew or steam the clean Fructus Ligustri Lucidi as described under the method for stewing with wine or steaming with wine (Appendix Ⅱ D) until the wine is entirely absorbed or steamed thoroughly.

Action To replenish the liver and kidney, improve vision and promote hair growth.

Indications Vertigo, tinnitus, aching weakness in the loins and knees, premature graying hair and impaired eyesight due to *deficient yin* of the liver and kidney.

Usage and dosage 6-12 g.

Storage Preserve in a dry place.

Fructus Liquidambaris (路路通, Lulutong)

Beautiful Sweetgum Fruit

Beautiful Sweetgum Fruit is the dried ripe infructescences of *Liquidambar formosana* Hance (Fam. Hamamelidaceae). The drug is collected in winter when the fruit is ripe, removed from foreign matter, and dried.

Description Collective fruit, composed of numerous small capsules, spheroidal, 2-3 cm in diameter, with a fruit stalk at the base. Externally greyish-brown or brown, bearing numerous acute spines and small beaked obtuse spines, 0.5-1 mm long, often broken. Small capsules acrocidal, showing small honeycomb-shaped holes. Texture light and hard, uneasily broken. Odour, slight; taste, weak.

Identification (1) Powder: Dark brown. Fibres mostly broken, 13-45 μm in diameter, the end subrounded, walls sinuous, lignified, lumen wide or narrow, usually containing yellowish-brown substance. Stone cells of pericarp subsquare, spidle-shaped, irregular or branched, 53-398 μm in diameter, with thickened walls, pit-canal branched. Epidermal cell rectangular in fracture view, 34-55 μm long; polygonal in surface view 6-17 μm in diameter, walls thickened, with pit-canal, containing yellowish-brown substance. Unicellular non-glandular hairs curved, 42-126 μm long; 34-55 μm at the base, containing yellowish-brown substance.
(2) To 2 g of the powder, add 50 ml of ethyl acetate, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 2 ml of ethyl acetate as the test solution. Dissolve liquidambaric acid CRS in ethyl acetate to produce a solution containing 4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of petroleum ether (60-90℃)-ethyl acetate-glacial acetic acid (80 : 20 : 0.4) as the mobile phase. Apply separately 6 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with a 5% solution of vanillin in sulfuric acid and heat to the spots clear. The spots in the chromatogram obtained with test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 9.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.5 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol-water-glacial acetic acid (83 : 13 : 0.1) as the mobile phase. Use an evaporative light scattering detector. The number of theoretical plates of the column is not less than 6000, calculated with the reference to the peak of liquidambaric acid CRS.

Reference solution Dissolve a quantity of liquidambaric acid CRS, accurately weighed, in mobile phase to produce a solution containing 0.3 mg per ml as the reference solution.

Test solution Weigh accurately 0.6 g of the powder (through No. 3 sieve) in a stopper conical flask, add 20 ml of dehydrated ethanol, and ultrasonicate for 15 minutes, cool and weigh accurately again, replenish the loss of the solvent with dehydrated ethanol, mix well, and filter. Measure accurately 10 ml of the successive filtrate and evaporate the filtrate to dryness. Dissolve the residue with dehydrated ethanol to a 2 ml volumetric flask, dilute with dehydrated ethanol to volume, and mix well.

Procedure Inject accurately 5 μl, 8 μl of the reference solution and 5 μl of the test solution, respectively, into the column, measure and calculate the content with corrected logarithmic equation of external standard method.
It contains not less than 0.15 per cent of liquidambaric acid ($C_{30}H_{46}O_3$), calculated with reference to the dried drug.

Action To dispel *wind* and remove obstruction from the *collaterals*, promote diuresis, and stimulate menstrual discharge.

Indications Arthralgia with numbness and muscular contracture; edema; lack of lactation; amenorrhea.

Usage and dosage 5-9 g.

Storage Preserve in a dry place.

Fructus Litseae
(荜澄茄, Bichengqie)

Mountain Spicy Fruit

Mountain Spicy Fruit is the dried ripe fruit of *Litsea cubeba* (Lour.) Pers. (Fam. Lauraceae). The drug is collected in autumn when ripe, removed from foreign matter, and dried in the sun.

Description Subspheroidal, 4-6 mm in diameter. Externally brown to blackish-brown, with reticulated wrinkles. Occasionally the base bearing a persistant calyx and a fine fruit stalk. A hard fragile kernel visible when removing the pericarp. Seed 1, cotyledons 2, yellowish-brown, oily. Odour, aromatic; taste, slightly pungent and slightly bitter.

Identification To 0.25 g of the powder add 10 ml of petroleum ether (60-90℃), ultrasonicate for 15 minutes, cool and filter, use the filtrate as the test solution. Prepare a solution of 3 g of Fructus Litseae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using high performance silica gel G as the coating substance and the mixture of petroleum ether (60-90℃) and ether (3 : 2) as the mobile phase. Apply separately 5 μl of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. Examine under daylight and ultraviolet light at 365 nm. The spots or fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Not more than 10.0 per cent (Appendix Ⅸ H, Method 1).

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using ethanol as the solvent, not less than 28.0 per cent.

Action To warm the spleen and stomach to dispel *cold*, promote the flow of *qi* to relieve pain.

Indications Nausea and vomiting due to *cold* in the stomach, epigastric pain accompanied by feeling of cold; abdominal colic with cold sensition; turbid urine caused by *cold-damp*.

Usage and dosage 1.5-3 g.

Storage Preserve in a cool and dry place.

Fructus Lycii
(枸杞子, Gouqizi)

Barbary Wolfberry Fruit

Barbary Wolfberry Fruit is the dried ripe fruit of *Lycium barbarum* L. (Fam. Solanaceae). The drug is collected in summer and autumn when the fruit turns orange-red. After drying in the shade to make the

pericarp shrunken, the drug is exposed to strong sun light until the exocarp is dried and hard, and the pulp soft, removed from the fruit stalk.

Description Subfusiform or ellipsoid, 6-20 mm long, 3-10 mm in diameter. Externally scarlet or dark red, marked with a protrudent style scar at the apex, and a white fruit stalk scar at the base. Pericarp pliable and shrunken, sarcocarp fleshy, soft and viscous. Seeds 20-50, subreniform, flat and bent upwards, 1.5-1.9 mm long, 1-1.7 mm wide, pale yellow or brownish-yellow on surface. Odour, slight; taste, sweet.

Identification (1) Powder: Yellowish-orange of reddish-brown. Epidermal cells of pericarp polygonal or elongated-polygonal in surface view, straight or wave-curved, with cuticle striations. Parenchymatous cells of mesocarp subpolygonal, lumina containing orangish-red or redish-brown spherotical granules. Stone cells of testa irregular polygonal, walls thickened, wave-curved, striations distinct.
(2) To 0.5 g of the drug add 35 ml of water, heat and boil for 15 minutes, allow to cool, filter, extract the filtrate with 15 ml of ethyl acetate, evaporate the extract on water bath to about 1 ml and use as the test solution. Prepare a solution of 0.5 g of Fructus Lycii reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate-chloroform-formic acid (3 : 2 : 1) as the mobile phase. Apply separately to the plate 5 μl each of the two solutions. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H method 1, temperature at 80℃), not more than 13.0 per cent.

Total ash Not more than 5.0% (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of water-soluble extractives (Appendix Ⅹ A), not less than 55.0 per cent.

Assay ***Polysacchride of Barbary Wolfberry Fruit***
Reference solution Weigh accurately 25 mg of anhydrous glucose previously dried to constant weight at 105℃ in a 250 ml volumetric flask, add water to dissolve, dilute to volume, and mix well. (containing 0.1 mg anhydrous glucose per ml)

Calibration standard Transfer accurately 0.2, 0.4, 0.6, 0.8, 1.0 ml of the reference solution to stopper tube respectively, add water to 2.0 ml, add respectively 1 ml of 5% solution of phenol, mix well, add rapidly 5.0 ml of sulfuric acid, mix well, stand for 10 minutes, warm on a water bath at 40℃ for 15 minutes, take out and allow to cool to room temperature immediately. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), using the corresponding solution as the blank, measure the absorbance at 490 nm, and plot the calibration curve with the absorbance as ordinate and the concentration as abscissa.

Procedure Weigh accurately 0.5 g of the coarse powder of the Barbary Wolfberry Fruit in a flask, add 100 ml of ether, heat under reflux for 1 hour, stand and allow to cool, discard the ether, evaporate the residue to remove ether on a water bath, add 100 ml of 80% ethanol, heat under reflux for 1 hour, filter immediately, wash the residue and filtering container using 30 ml of 80% hot ethanol for several times, transfer the residue and filtering paper in a flask, add 150 ml of water, heat under reflux for 2 hour. Filter immediately, wash the filtering container using a small quantity of hot water, combine the filtrate and washing solution, allow to cool, transfer to a 250 ml volumetric flask, add water to volume, mix well, transfer accurately 1 ml of solution to a stopper tube, add 1.0 ml of water, carry out the procedure as described under calibration curve preparation, beginning at the words "add respectively 1 ml of 5% solution of phenol", read and calculate the weight (mg) of Barbary Wolfberry Fruit polysaccharide in the test solution from the calibration curve.
It contains not less than 1.8 per cent of polysaccharide, calculated as glucose ($C_6H_{12}O_6$) with reference to the dried drug.

Betaine Cut the Barbary Wolfberry Fruit into pieces, weigh accurately about 2 g in a flask, add 50 ml of 80% methanol, heat under reflux for 1 hour, allow to cool, filter, wash the residue and filtering container with 30 ml of 80% methanol, combine the filtrate and the washing solution, concentrate to 10 ml, adjust PH to 1 using hydrochloric acid, add 1 g of activated carbon, heat and boil, allow to cool, filter, wash using 15 ml water for several times, combine washing solution and filtrate, add 20 ml of fresh 2.5% ammonium chromium thiocyanate solution, mix well, stand for 3 hours below 10℃. Filter with G4 sintered glass funnel, wash precipitation using a small quantity ice water, add acetone to dissolve the residue, transfer to a 5 ml volumetric flask, add acetone to volume, mix well and used as the test solution. Weigh accurately a quantity of betaine CRS, add hydrochloric acid-methanol (0.5→100) to produce a solution containing 4 mg of betaine per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B) using silica gel G as the coating substance and a mixture of acetone-absolute ethanol-hydrochloric acid (10 : 6 : 1) as the mobile phase. Apply separately 5 μl of the test solution and 3 and 6 μl of the reference solution to the plate, previously saturated for 30 minutes, after developing and removal of the plate, dry in air, spray with fresh modified potassium iodobismuthate TS, stand for 1-3 h to the spot distinct. Carry out the method for thin layer chromatography (Appendix Ⅵ B thin layer chromatographic scanning method), scan at the wavelength of $\lambda_S = 515$ nm, $\lambda_R = 590$ nm. Measure the integration value of the absorbance from the test solution and the reference solution respectively, and calculate the content.
It contains not less than 0.30 per cent of betaine ($C_5H_{11}NO_2$) calculated with reference to the dried drug.

Action To reinforce the liver and the kidney, replenish vital essence and improve eyesight.

Indications General debility with *deficiency* of *vital essence* with manifestations of aching of the loins and knees, dizziness and tinnitus; diabetes caused by internal *heat*; anemia; impaired vision.

Usage and dosage 6-12 g.

Storage Preserve in a cool and dry place, protected from heat, moisture and moth.

Fructus Malvae
(冬葵果, Dongkuiguo)

Cluster Mallow Fruit

Cluster Mallow Fruit is the dried ripe fruit of *Malva verticillata* L. (Fam. Malvaceae), commonly used by the Mongolia nationality. The drug is collected in summer and autumn when ripe, removed from foreign

matter, and dried in the shade.

Description Oblate-orbiculate, 4-7 mm in diameter, covered with a membranaceous persistent calyx. Persistent calyx campanulate, yellowish-green or yellowish-brown, sometimes purplish, 5-cleft at apex, segments curved inwards, 3 linear-lanceolate bractlets present outside, fruit stalk thin and short. Fruit 10-12 valved, surrounding a conical axis arranged one whorl, mericarps suboblate, 1.4-2.5 mm in diameter, externally yellowish-white or yellowish-brown, with raised annulate fine lines. Seeds reniform, brownish-yellow or blackish-brown. Odour, slight; taste, astringent.

Identification (1) Persistent calyx in surface view: Stellate hairs of lower epidermis 2-8 celled (mostly 4-8 celled) with individual cell 50-1140 μm long, about 75 μm in diameter, slightly thick-walled; sessile glandular hairs elliptical, 5-7 celled, 25-38 μm in diameter. Unicellular non-glandular hairs of upper epidermis slender, curved or straight, up to 1190 μm long, with thin or slightly thickened walls. Anomocytic stomata on both surface. Parenchymatous cells in mesophyll containing clusters of calcium oxalate, 6-25 μm in diameter, with more acute angles.
Pericarp in transverse section: Epicarp consisting of a single layer of rectangular cuticularized epidermal cells with slightly thickened walls. Mesocarp consisting of 2-3 layers of subrounded parenchymatous cells, scattered with large mucilage cells, and a single layer prism cells containing crystal cells surrounded with thickened and lignified walls. Over 10 fibre bundles in a ring sandwished between mesocarp and endocarp. Endocarp consisting of a single layer of redially elongated stone cells, palisade-like, with strongly thickened and lignified lateral and inner walls.
(2) To 2 g of the powder add 20 ml of water, shake for 15 minutes and filter. Heat the filtrate with 1 g of activated carbon on a water bath for 15 minutes and filter. To 2 ml of the filtrate add 4 drops of alkaline cupric tartrate TS, heat on a water bath for 5 minutes, a brownish-red precipitate is produced. To another 2 ml of the filtrate add 3 drops of 10% solution of α-naphthol in ethanol, mix well, add 0.5 ml of sulfuric acid along the tube wall, a purplish-red colour is shown at the junction of the two layers.

Action To remove *heat* and induce urination, and relieve edema.

Indications Enuresis, edema, thirst and urinary infection with oliguria.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place.

Fructus Momordicae (罗汉果, Luohanguo)

Grosvenor Momordica Fruit

Grosvenor Momordica Fruit is the dried fruit of *Momordica grosvenori* Swingle (Fam. Cucurbitaceae). The drug is collected in autumn when the fruit turns from pale green to deep green, dried in the air for several days, and dried at a low temperature.

Description Ovoid, elliptical or spherical, 4.5-8.5 cm long, 3.5-6 cm in diameter. Externally brown, yellowish-brown or greenish-brown, marked with dark-coloured patches and covered with yellow fine hairs, some exhibiting 6-11 longitudinal lines. Apex with a style scar, and base with a fruit stalk scar. Texture light, fragile, pericarp thin, easily broken. Sarcocarp spongiform, pale brown. Seeds oblate, abundant, about 1.5 cm long and 1.2 cm wide, pale red to brownish-red, slightly dented between two surfaces, surrounded by radial furrows, and channelled at the edge. Odour, slight; taste, sweet.

Identification (1) Powder: Brown. Stone cells of sarcocarp mostly grouped, yellow, square or ovoid, 7-38 μm in diameter, walls thick, pit canals obvious. Stone cells of testa subrectangular or irregular, thin-waled, and with pits. Fibres long-fusiform, 16-42 μm in diametre, lumina relatively big, and pit canals obvious. Vessels scalariform and spiral, parenchymatous cells irregular, and pitted.
(2) To 2 g of the powder add 20 ml of dilute ethanol, heat under reflux for 30 minutes, filter, evaporate the filtrate to about 5 ml, extract with two portions of *n*-butanol (10 ml, 5 ml), evaporate the combined *n*-butanol extracts to dryness, dissolve the residue in 0.5 ml of methanol as the test solution. Prepare a solution of 2 g of Fructus Momordicae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of chloroform-methanol-water (60 : 10 : 1) as the mobile phase. Apply separately 10 μl each of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol solution, heat to the spot clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Water Carry out the method for determination of water (Appendix IX H, method 1), not more than 15.0 per cent.

Extractives Carry out the hot extraction method for determination of water-soluble extractives (Appendix X A), not less than 30.0 per cent.

Action To remove *heat*, moisten the lung and relax the bowels.

Indications Dry cough, sore throat and hoarseness due to *heat* in the lung; constipation due to lack of fluid in large intestine.

Usage and dosage 9-15 g.

Storage Preserve in a dry place, protected from mould and moth.

Fructus Mori (桑椹, Sangshen)

Mulberry Fruit

Mulberry Fruit is the dried fruit-spike of *Morus alba* L. (Fam. Moraceae). The drug is collected in April to June when the fruit turns red, dried in the sun, or dried after steaming briefly.

Description Collective fruit, aggregated by many small achenes, fruit-spike oblong, 1-2 cm long, 5-8 mm in diameter. Yellowish-brown, brownish-red to dark purple, with a short fruit stalk. Achene ovoid, slightly flattened, about 2 mm long and 1 mm wide, with 4 fleshy perianth-segments. Odour, slight; taste, slightly sour and sweet.

Extractives Carry out the hot extraction method for the determination of ethanolsoluble extractive (Appendix X A), using 85% ethanol as the solvent, not less than 15.0 per cent.

Action To nourish *yin* and blood, and promote the production of body fluids.

Indications Vertigo and tinnitus, palpitation, insomnia, premature graying hair and beard; thirst due to impairment of body fluids; diabetes caused by internal *heat*; constipation due to *deficiency of blood*.

Usage and dosage 9-15 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Fructus Mume (乌梅, Wumei)

Smoked Plum

Smoked Plum is the almost ripe and dried fruit of *Prunus mume* (Sieb.) Sieb. et zucc. (Fam. Rosaceae). The drug is collected in summer when almost ripe, baked at a low temperature, and covered until turns to black in colour.

Description Subspheroial or flattened-spheroidal, 1.5-3 cm in diameter. Externally black or brownish-black, shrunken, with a rounded fruit stalk scar at the base. Kern hard, ellipsoidal, brownish-yellow, with dented spots on surface; seeds flattened-ovoid, pale yellow. Odour, slight; taste, extremely sour.

Identification To 5 g of the powder add 30 ml of methanol, ultrasonicate for 30 minutes, cool and filter. Evaporate the filtrate to dryness, and dissolve the residue in 20 ml of water and transfer to a separating funnel, and extract with two 20 ml-quantity of ether, combine the extract and evaporate the extract to dryness, macerate the residue with two 15 ml-quantity of petroleum ether (30-60℃) for 2 minutes, discard petroleum ether, and dissolve the residue in 2 ml of dehydrated ethanol as the test solution. Prepare a solution of 5 g of Fructus Mume reference drug in the same manner as the reference drug solution. Dissolve ursolic acid CRS in dehydrated ethanol to produce a solution of 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane-chloroform-ethyl acetate-formic acid (20 : 5 : 8 : 0.1) as the mobile phase. Apply separately to the plate 1-2 μl of each of the above three solutions. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Water Not more than 16.0 per cent (Appendix Ⅸ H, method 2).

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 0.50 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of water-soluble extractives (Appendix Ⅹ A), not less than 24.0 per cent.

Assay Weigh accurately about 4 g of the very coarse powder in a conical flask, add 100 ml of water, accurately measured, heat under reflux for 4 hours, cool, filter, discard the initial filtrate, collect the successive filtrate. To 20 ml of the successive filtrate, accurately measured, add water to 80 ml. Carry out the method for potentiometric titration (Appendix Ⅶ A), titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 6.404 mg of $C_6H_8O_7$.
It contains not less than 15.0 per cent of organic acids, calculated as citric acid ($C_6H_8O_7$) with reference to the dried drug.

Processing *Fructus Mume* Eliminate foreign matter, wash, and dry.

Pulp of Fructus Mume Soften the clean Fructus Mume with water or by steaming, removed from kernels.

Fructus Mume (*carbonized*) Stir-bake the clean Fructus Mume as described under the method of carbonizing by stir-baking (Appendix Ⅱ D) until pericarp and pulp bulged.

Action To arrest persistent cough, relieve diarrhea by astringing the intestines, promote the production of body fluids, and relieve colic caused by ascaris.

Indications Persistent cough in *deficiency* syndromes of the lung; chronic dysentery or diarrhea; thirst in consumptive diseases; colic and vomiting caused by ascaris, biliary ascariasis.

Usage and dosage 6-12 g.

Storage Preserve in a cool and dry place, protected from moisture.

Fructus Oryzae Germinatus (稻芽, Daoya)

Rice-grain Sprout

Rice-grain Sprout is the dried germinated ripe fruit of *Oryza sativa* L. (Fam. Graminae). The fruit is soaked in water at an appropriate temperature and moisture, then dried when the fibrous roots grow to about 1 cm long.

Description Flattened-elliptical, both apexes acuminate, 7-9 mm long, about 3 mm in diameter. Lemma yellow, bearing white pubescences and 5 veins. One apex with 2 symmetrical, white strip-shaped lodicules, 2-3 mm long, from the inner side of one lodicule spreading 1-3 curved fibrous roots, 0.5-1.2 cm long. Texture hard, fracture white and starchy. Odour, slight; taste, weak.

Budding rate Carry out the method for Sampling of crude drugs (Appendix Ⅱ A), taking two samples from 10 g of the drug diagonally to count the germinative grains and the total grains then budding rate. The budding rate is not less than 85 per cent.

Processing *Fructus Oryzae Germinatus* Eliminate foreign matter.

Fructus Oryzae Germinatus (*stir-baked*) Stir-bake the clean *Fructus Oryzae Germinatus* as described under the method for simple stir-baking (Appendix Ⅱ D) until a dark yellow colour is produced.

Fructus Oryzae Germinatus (*charred*) Stir-bake the clean *Fructus Oryzae Germinatus* as described under the method for simple stir-baking (Appendix Ⅱ D) until it becomes charred yellow colour.

Action To promote digestion, invigorate the function of the spleen to improve appetite.

Fructus Oryzae Germinatus (*stir-baked*) To promote digestion.

Fructus Oryzae Germinatus (*charred*) To remove the ratained food.

Indications Retention of undigested food with abdominal distension and foul breath; poor appitite due to deficiency of

the spleen and the stomach.

Fructus Oryzae Germinatus (stir-baked) loss of appitite.

Fructus Oryzae Germinatus (charred) Retention of undigested food.

Usage and dosage 9-15 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Fructus Perillae (紫苏子, Zisuzi)

Perilla Fruit

Perilla Fruit is the dried ripe fruit of *Perilla frutescens* (L.) Britt. (Fam. Labiatae). The drug is collected in autumn when ripe, removed from foreign matter, and dried in the sun.

Description Ovoid or subspherical, about 1.5 mm in diameter. Externally greyish-brown, with dark purple and slightly protuberant reticulate striations, base slightly acute, with greyish-white and pointed fruit stalk scar. Pericarp thin and fragile, easily broken. Seeds yellowish-white, testa membranous, cotyledons 2, whitish and oily. Odour, aromatic by pressing; taste, slightly pungent.

Processing *Fructus Perillae* Eliminate foreign matter, wash clean, and dry.

Fructus Perillae (stir-baked) Stir-bake the clean Fructus Perillae as described under the method for simple stir-baking (Appendix Ⅱ D) until the drug burst.

Action To relieve dyspnea and cough, eliminate phlegm, and relax bowels.

Indications Cough and dyspnea due to accumulation of phlegm; constipation due to lack of intestinal fluid.

Usage and dosage 3-9 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Fructus Phyllanthi (余甘子, Yuganzi)

Emblic Leafflower Fruit

Emblic Leafflower Fruit is the dried ripe fruit of *Phyllanthus emblica* L. (Fam. Euphorbiaceae), used commonly by Tibetan nationality. The drug is collected in winter to next spring when ripe, removed from foreign matter, and dried.

Description Spheroidal or flattened-spheroidal, 1.2-2 cm in diameter. Externally brown to dark green, with pale yellow granular prominences, wrinkles and 6 indistinct ribs. Fruit stalk about 1 mm long. Exocarp 1-4 mm thick. Texture hard and fragile. Endocarp yellowish-white, hard kernel-like, showing 6 indistinct ribs on the surface and several vascular bundles at the upper part of dorsal suture, cracking to 6 valves after dried. Seeds 6, subtriquetrous, brown. Odour, slight; taste, sour, astringent and then sweet.

Identification To 0.5 g of the powder, add 25 ml of methanol, ultrasonicate for 30 minutes, filter, and use the filtrate as the test solution. Dissolve gallic acid CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide as the coating substance and a mixture of ethyl acetate and formic acid (3 : 1) as the mobile phase. Apply separately 2 μl of each of two solutions spotted as streak-shaped to the plate. After developing and removal of the plate, dry in air, spray with a 2% solution of ferric chloride TS in ethanol. The streaks in the chromatogram obtained with the test solution correspond in position and colour to the streaks in the chromatogram obtained with the reference solution.

Water Carry out the method as described under the determination of water (Appendix Ⅸ H, method 1), not more than 13.0 per cent.

Total ash not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash not more than 1.5 per cent (Appendix Ⅸ K).

Extractives Carry out the cold maceration method as described under the determination of water-soluble extractives (Appendix Ⅹ A), not less than 30.0 per cent.

Action To remove *heat* from blood, promote digestion and invigorate the spleen function, and promote the production of body fluids and relieve cough.

Indications Symptoms of blood stasis due to heat in the blood; maldigestion dyspepsia, abdominal distension; cough, sore throat, and dry.

Usage and dosage 3-9 g, usually made into pills or powder.

Storage Preserve in a dry and cool place.

Fructus Piperis (胡椒, Hujiao)

Pepper Fruit

Pepper Fruit is the dried and nearly ripe or ripe fruit of *Piper nigrum* L. (Fam. Piperaceae). The drug is collected in later autumn to next spring when the fruit is dark green, dried in the sun, known as "Black Pepper"; the drug is collected when the fruit turns to red, moistened for several days, removed from sarcocarp, dried in the sun, known as "White Pepper".

Description *Black Pepper* Spheroidal, 3.5-5 mm in diameter. Externally blackish-brown, with raised reticulated wrinkles, bearing a fine remains of style at the apex and a scar of fruit axis at the base. Texture hard, exocarp can be stripped, endocarp greyish-white or pale yellow. Fracture yellowish-white, starchy, possessing a small space at the centre. Odour, aromatic; taste, pungent.

White Pepper Externally greyish-white or pale yellowish-white, smooth, with numerous pale-coloured linear striations between apex and base.

Identification (1) Powder of Black Pepper: Dark grey. Stone cells of exocarp subsquare, rectangular or irregular, 19-66 μm in diameter, walls relatively thickened. Stone cells of endocarp subpolygonal in surface view, 20-30 μm in diameter, square in lateral view, one side of walls thin. Cells of testa brown, polygonal, with beaded walls. Oil cells relatively less, subrounded, 51-75 μm in diameter. Starch granules small, often grouped.

(2) To a small quantity of the powder add 1 drop of suphuric acid, a red colour is produced, turning to a reddish-brown

colour gradually and then to a dark brown colour.
(3) To 0.5 g of the powder add 5 ml of dehydrated ethanol, ultrasonicate for 30 minutes, and filter. Use the filtrate as the test solution. Dissolve piperine CRS in dehydrated ethanol in an amber volumetric flask to produce a solution containing 4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene-ethyl acetate-acetone (7 : 2 : 1) as the mobile phase. Apply separately 2 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% solution of sulfuric acid in ethanol and heat under a current of hot air to the spot distinct. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol-water (77 : 23) as the mobile phase. As detector a spectrophotometer set at 343 nm. The number of theoretical plates of the column is not less than 1500, calculated with the reference to the peak of piperine.

Internal standard solution Dissolve a quantity of *p*-dimethylaminobenzaldehyde, accurately weighed, in dehydrated ethanol in an amber volumetric flask to produce a solution containing 0.5 mg per ml as the internal standard solution.

Procedure Dissolve a quantity of piperine CRS, accurately weighed, in dehydrated ethanol in an amber volumetric flask to produce a solution containing 1 mg per ml. Measure accurately 2 ml of each of the above solution and the internal standard solution to a 25 ml amber volumetric flask, dilute with dehydrated ethanol to volume, and mix well. Inject 10 μl into the column, calculate the correction factor. Weigh accurately 0.25 g of the drug powder in a 100 ml amber volumetric flask, add 80 ml of dehydrated ethanol, and ultrasonicate (power, 150 W; frequency, 12 kHz) for at least 30 minutes, allow to stand to room temperature, dilute with dehydrated ethanol to volume, shake thoroughly and filter. Measure accurately 20 ml of the filtrate and 2 ml of the internal stardand solution in an amber volumetric flask and dilute with dehydrated ethanol to volume and mix well. Inject 10 μl into the column, measure the peak area and calculate the content with corrected internal standard method.
It contains not less than 3.0 per cent of piperine ($C_{17}H_{19}O_3N$).

Processing Eliminate foreign matter, break to the fine powder before use.

Action To dispel *cold* from the stomach, subdue upward *qi* flow and to eliminate *phlegm*.

Indications Vomiting, abdominal pain, diarrhea and loss of appitite due to *cold* in the stomach; inappetence, epilepsy with profuse *phlegm*.

Usage and dosage 0.6-1.5 g, ground into powder for oral administration; appropriate quantity for external use.

Storage Preserve in well closed containers, stored in a cool and dry place.

Fructus Piperis Longi
(荜茇, Bibo)

Long Pepper

Long Pepper is the dried and nearly ripe or ripe fruit-spike of *Piper longum* L. (Fam. Pipe-raceae). The drug is collected when the spike turns from green to black, removed from foreign matter, and dried in the sun.

Description Cylindrical, slightly curved, aggregated by numerous small berries, 1.5-3.5 cm long, 3-5 mm in diameter. Externally blackish-brown or brown, with obliquely and regularly arranged protrudings, base bearing a remains of peduncle or sometimes fallen away. Texture hard and easily broken, fracture irregular and granular. Small berries spheroidal, about 1 mm in diameter. Odour, characteristically aromatic; taste, pungent.

Identification (1) Powder: Greyish-brown. Stone cells subrounded, long-ovoid or polygonal, 25-61 μm in diameter, up to 170 μm long, walls relatively thickened, some distinctly striated. Oil cells subrounded, 25-66 μm in diameter. Cells of testa reddish-brown, long-polygonal, walls beaded. Starch granules small, usually aggregated.
(2) To a small quantity of the powder add 1 drop of sulphuric acid, a bright red colour is produced, gradually becomes reddish-brown and brown at last.
(3) To 0.8 g of the powder add 5 ml of dehydrated ethanol, ultrasonicate for 30 minutes, and filter. Use the filtrate as the test solution. Dissolve piperine CRS in dehydrated ethanol in an amber volumetric flask to produce a solution containing 4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene-ethyl acetate-acetone (7 : 2 : 1) as the mobile phase. Apply separately 2 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. Spray with 10% solution of sulphuric acid in ethanol and heat under a current of hot air to the spot distinct. The yellowish-brown spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Foreign matter Not more than 3 per cent (Appendix Ⅸ A).

Water Carry out the method for the determination of water (Appendix Ⅸ H, method 2), not more than 11.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol-water (77 : 23) as the mobile phase. As detector a spectrophotometer set at 343 nm. The number of theoretical plates of the column is not less than 1500, calculated with the reference to the peak of piperine.

Internal standard solution Dissolve a quantity of *p*-dimethylaminobenzaldehyde, accurately weighed, in dehydrated ethanol in an amber volumetric flask to produce a solution containing 0.5 mg per ml as the internal standard solution.

Procedure Dissolve a quantity of piperine CRS, accurately weighed, in dehydrated ethanol in an amber volumetric flask to produce a solution containing 1 mg per ml. Measure accurately 2 ml of each of the above solutions and the internal standard solution to a 25 ml amber volumetric flask, dilute with dehydrated ethanol to volume, and mix well. Inject 10 μl into the column, calculate the correction factor. Weigh accurately 0.25 g of the drug powder in a 100 ml amber volumetric flask, add 80 ml of dehydrated ethanol, and

ultrasonicate (power, 250 W; frequency, 20 kHz) for at least 30 minutes, allow to stand to room temperature, dilute with dehydrated ethanol to volume, shake thoroughly and filter. Measure accurately 20 ml of the filtrate and 2 ml of the internal stardand solution in an amber volumetric flask and dilute with dehydrated ethanol to volume and mix well. Inject 10 μl into the column, measure the peak area and calculate the content with corrected internal standard method.

It contains not less than 2.5 per cent of piperine ($C_{17}H_{19}O_3N$) calculated with reference to the dried drug.

Processing Eliminate foreign matter. Break to pieces before use.

Action To dispel *cold* from the spleen and the stomach, subdue upward *qi* flow and relieve pain.

Indications Epigastric pain, vomiting and diarrhea caused by *cold*, migraine; external use for toothache.

Usage and dosage 1.5-3 g; for external use, appropriate quantity to be ground into powder and filled in the cavity of dental caries.

Storage Preserve in a cool and dry place, protected from moth.

Fructus Podophylli (小叶莲, Xiaoyelian)

Common Sinopodophyllum Fruit

Common Sinopodophyllum Fruit is the dried ripe fruit of *Podophyllum hexandrum* Royle Ying (Fam. Berberidaceae), used commonly by the Tibetan nationality. The drug is collected in autumn when ripe, removed from foreign metter, and dried.

Description Ellipsoidal or subspheroidal, mostly flattened, 3-5.5 cm long, 2-4 cm in diameter. Externally purplish-red or purplish-brown, shrunken, seeds sometimes visible. Apex slightly acute, fruit stalk yellowish-brown, mostly fallen. Sarcocarp adhering to pericarp, forming a thin slice, easily broken, containing numerous seeds. Seeds subovoid, about 4 mm long, externally reddish-purple, with fine furrows and a small protrusion at one end. Texture hard; kernel white, oily. Odour, slight; taste, sour, sweet and astringent; seeds, bitter.

Action To regulate menstruation and promote the circulation of blood.

Indications Amenorrhea due to blood stasis, difficult labour, retention of dead fetus, retention of placenta.

Usage and dosage 3-9 g; usually made into pills or powder.

Storage Preserve in a dry place.

Fructus Polygoni Orientalis (水红花子, Shuihonghuazi)

Prince's-feather Fruit

Prince's-feather Fruit is the dried ripe fruit of *Polygonum orientale* L. (Fam. Polygonaceae). The fruit spike is collected in autumn when ripe, dried in the sun. The fruit is gathered, and removed from foreign matter.

Description Oblate, 2-3.5 mm in diameter, 1-1.5 mm thick. Externally brownish-black or reddish-brown, lustrous, somewhat dented on both surfaces, and slightly longitudinally raised in the middle, with a protrudent remains of style at the apex and a pale brown, slightly protrudent scar of fruit stalk at the base, some with the remains of membranous perianth. Texture hard. Odour, slight; taste, weak.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Action To reduce masses by dissipating blood stasis, and relieve pain by removing stagnancy of food.

Indications Masses in the abdomen, goitre with swelling pain, epigastric distending pain due to indigestion.

Usage and dosage 15-30 g; for external use, appropriate quantity to be made into plasters for topical application.

Storage Preserve in a dry place.

Fructus Psoraleae (补骨脂, Buguzhi)

Malaytea Scurfpea Fruit

Malaytea Scurfpea Fruit is the dried ripe fruit of *Psoralea corylifolia* L. (Fam. Leguminosae). The infructescence is collected in autumn when the fruit is ripe, dried in the sun, and the fruit is gathered, removed from foreign matter.

Description Reniform, slightly flattened, 3-5 mm long, 2-4 mm wide, about 1.5 mm thick. Externally black, blackish-brown or greyish-brown, with finely reticulate wrinkles. Apex obtuse-rounded, with a small prominence and the depressed end showing a scar of fruit stalk. Texture hard. Pericarp thin, uneasily stripped from seed; seed 1, cotyledons 2, yellowish-white, oily. Odour, aromatic; taste, pungent and slightly bitter.

Identification To 0.5 g of the powder add 20 ml of ethyl acetate, ultrasonicate for 15 minutes, filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve psoralen CRS and isopsoralen CRS in ethyl acetate to produce a solution containing 2 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane-ethyl acetate (4 : 1) as the mobile phase. Apply separately 2-4 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with a 10% solution of potassium hydroxide in methanol; and examine under ultraviolet light at 365 nm. The two bluish-white fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Foreign matter Not more than 5 per cent (Appendix Ⅸ A).

Water Not more than 9.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a

mixture of methanol and water (55 : 45) as the mobile phase. As detector a spectrophotometer set at 246 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of psoralen.

Reference solution Dissolve a quantity of psoralen CRS and isopsoralen CRS, accurately weighed, in methanol to produce a solution containing 20 μg per ml, respectively.

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve) into a Soxhlet's extractor, add a quantity of methanol and heat under reflux for 2 hours, cool and transfer into a 100 ml volumetric flask, dilute with methanol to volume and mix well.

Procedure Inject accurately 5-10 μl of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.70 per cent of the total content of psoralen ($C_{11}H_6O_3$) and isopsoralen ($C_{11}H_6O_3$), calculated with reference to the dried drug.

Processing *Fructus Psoraleae* Eliminate foreign matter.

Fructus Psoraleae (*processed with salt*) Stir-bake the clean Fructus Psoraleae as described under the method for stir-baking with salt-water (Appendix Ⅱ D) until slightly inflated.

Action To invigorate the function of the kidney, alleviate asthma, and relieve diarrhea.

Indications Impotence, seminal emission; enuresis, frequent urination; aching of the loins and knees with cold sensation; asthma in *deficiency* syndromes of the kidney; diarrhea occurring before dawn daily. External use for vitiligo and alopecia areata.

Usage and dosage 6-9 g; for external use, tincture of Fructus Psoraleae of 20%-30% in concentration to be applied topically.

Storage Preserve in a dry place.

Fructus Quisqualis (使君子, Shijunzi)

Rangooncreeper Fruit

Rangooncreeper Fruit is the dried ripe fruit of *Quisqualis indica* L. (Fam. Combretaceae). The fruit is collected in autumn when the pericarp turns purplish-black, removed from foreign matter, and dried.

Description Ellipsoidal or ovoid, 5-ribbed longitudinally, occasionally 4 to 9-ribbed, 2.5-4 cm long, about 2 cm in diameter. Externally blackish-brown to purplish-black, smooth, somewhat lustrous. Apex narrowly acute, base obtuserounded, with a marked rounded scar of fruit stalk. Texture hard. Transverse section frequently five-pointed starshaped, relatively thick at the ribs, with a subrounded hollowed centre. Seeds long-ellipsoidal or fusiform, about 2 cm long, 1 cm in diameter; externally brown or blackish-brown, with many longitudinal wrinkles; testa thin, easily stripped; cotyledons 2, yellowish-white, oily, fracture fissured. Odour, slightly aromatic; taste, slightly sweet.

Processing *Fructus Quisqualis* Eliminate foreign matter. Break to pieces before use.

Semen Quisqualis Remove the pericarp of the clean Fructus Quisqualis.

Semen Quisqualis (*stir-baked*) Stir-bake the clean Semen Quisqualis as described under the method for simple stir-baking (Appendix Ⅱ D) to scented.

Action To kill worms and promote digestion.

Indications Ascariasis, oxyuriasis, abdominal pain or infantile malnutrition due to intestinal parasitosis.

Usage and dosage 9-12 g crushed to pieces for making decoction; 6-9 g of the seeds mostly used in making pills or powder together with other herbs or taken alone in 1-2 divided doses.

Precaution Incompatible with strong tea.

Storage Preserve in a ventilated and dry place, protected from mould and moth.

Fructus Rosae Laevigatae (金樱子, Jinyingzi)

Cherokee Rose Fruit

Cherokee Rose Fruit is the dried ripe fruit of *Rosa laevigata* Michx. (Fam. Rosaceae). The drug is collected in October and November when the fruit turns red, dried, and removed from bristle.

Description Pseudo carp developed from receptacle, obovoid, 2-3.5 cm long, 1-2 cm in diameter. Externally reddish-yellow or reddish-brown with raised brown small scars of the fallen bristles. A dish like calyx remained at the apex, with a style base in the middle and the lower part gradually tapered. Texture hard. On cutting, the walls of receptacle 1-2 mm thick, with numerous small achenes inside, the inner surface of receptacle and achenes with yellowish tomenta. Odour, slight; taste, sweetish and slightly astringent.

Identification (1) Transverse section of receptacle wall: Outer epidermal cells subsquare or slightly radially elongated, with thickened and cutinized outer and lateral walls; cells of bristle scars on epidermis in longitudinal section radially elongated. Parenchymatous cells with slightly thickened and distinctly pitted walls, containing oil droplets and orange-yellow contents, some containing prisms and clusters of calcium oxalate; fibre bundles scattered in the outer part of cortex; collateral vascular bundles mostly situated in the central part of cortex, with fibre bundles outside the phloem, vessels scattered or radially arranged. Inner epidermal cells rectangular, with thickened and cutinized inner walls; non-glandular hairs or their remains lignified.

Powder of receptacle: Pale flesh-coloured. Non-glandular hairs of 1 or more cells, 505-1836 μm long, 16-31 μm in diameter, with lignified or slightly lignified walls and slightly curved and oblique striation on the surface, lumina containing yellowish-brown contents. Epidermal cells polygonal, thick-walled and containing yellowish-brown contents. Prisms of calcium oxalate abundant, rectangular or irregular, 16-39 μm in diameter; clusters sometimes visible, 27-66 μm in diameter Spiral, reticulate, annular and bordered pitted vessels 8-20 μm in diameter. parenchymatous cells polygonal, lignified, pitted and containing yellowish-brown contents. Fibres fusiform or stripy, yellow, up to 1071 μm long, 16-20 μm in diameter, with lignified walls. Masses of resin irregular in shape, yellowish-brown and translucent.

(2) Heat 5 g of the powder in 50 ml of water on a water bath at 60℃ for 15 minutes and filter immediately. To 1 ml of the filtrate add 4-5 drops of alkaline cupric tartrate TS, heat on a water bath for 5 minutes; a reddish-brown precipitate is produced. To another 1 ml of the filtrate, add 1-2 drops of 1% ferric chloride solution; a dark purple colour is produced.

(3) Shake vigorously 2 ml of the above filtrate in a stopper tube for 1 minute, a large amount of honeycomb-like foam is produced, which persists for 10 minutes.

Assay *Reference preparation* Weigh accurately 60 mg of anhydrous glucose previously dried to constant weight at 105℃ in a 100 ml volumetric flask, add water to dissolve and dilute to volume.

Calibration standard Transfer accurately 0.5, 1.0, 1.5, 2.0, 2.5 ml of the reference solution to 50 ml volumetric flask respectively, add water to the volume, mix well. Transfer accurately 2 ml each of the above solutions to stopper tubes, add respectively 1 ml of 4% solution of phenol, mix well, add rapidly 7.0 ml of sulfuric acid, mix well, warm on a water bath at 40℃ for 30 minutes, take out and keep in an ice bath for 5 minutes. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), using the corresponding solution as the blank, measure the absorbance at 490 nm, and plot the calibration curve with the absorbance as ordinate and the concentration as abscissa.

Procedure Weigh accurately 0.5 g of the coarse powder of the pulp of Fructus Rosae Laevigatae in a conical flask, add accurately 50 ml of water, weigh again, allow to stand for 1 hour, heat under reflux for 1 hour, allow to cool, weigh again, add water to the initial weight, mix well, filter, transfer accurately 1 ml of the successive filtrate to a 100 ml volumetric flask, add water to the volume, shake well, transfer accurately 25 ml of the solution to a 50 ml volumetric flask, add water to the volume, mix well, transfer accurately 2 ml of it to a stopper tube. Measure the absorbance, as described under calibration standard, beginning at the words "add respectively 1 ml of 4% solution of phenol", read and calculate the weight (μg) of Fructus Rosae Laevigatae polysaccharide in the test solution from the calibration curve.

It contains not less than 25.0 per cent of polysaccharide, calculated as anhydrous glucose ($C_6H_{12}O_6$) with reference to the dried drug.

Processing *Fructus Rosae Laevigatae* Eliminate froeign matter, wash and dry.

Pulp of Fructus Rosae Laevigatae Soak the clean Fructus Rosae Laevigatae briefly, soften thoroughly, halve longitudinally, remove hair and achenes and then dry.

Carry out the method of Assay, it contains not less than 25.0% of polysaccharide, calculated as glucose ($C_6H_{12}O_6$).

Action To arrest seminal emission, to restrain polyuria, and check diarrhea.

Indications Nocturnal emission, spermatorrhea; enuresis, frequent urination; abnormal uterine bleeding; excessive leukorrhea; protracted diarrhea; chronic dysentery.

Usage and dosage 6-12 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Fructus Rubi (覆盆子, Fupenzi)

Palmleaf Raspberry Fruit

Palmleaf Raspberry Fruit is the dried fruit of *Rubus chingii* Hu (Fam. Rosaceae). The drug is collected in early summer when it turns from green to greenish-yellow, removed from fruit stalk and leaf, treated with boiling water for a moment or steamed briefly, and dried.

Description Aggregate fruit consisting of numerous small drupes, conical or flattened-conical, 0.6-1.3 cm high, 0.5-1.2 cm in diameter. Externally yellowish-green or pale brown, apex obtuse, base depressed in the centre. Persistent calyx brown, with a scar of fruit stalk. Drupelets easily fallen, lunate, dorsal surface densely covered with greyish-wihte pubescences, reticulate striations distinct on both sides, ventral surface with prominent ridges. Texture hard and light. Odour, slight; taste, slightly sour and astringent.

Identification Powder: Brownish-yellow. Non-glandular hairs unicellular, 60-450 μm long, 12-20 μm in diameter, walls strongly thickened, lignified, most with double spiral striations, the upper part of some hairs easily fallen off, and the remains embeded in epidermis, round-polygonal or oblong in surface view, up to about 23 μm in diameter, lumina branched, similar to stone cells in shape. Clusters of calcium oxalate frequently visible, 18-50 μm in diameter. Fibres of pericarp yellow, crisscross or obliquely alternate.

Action To benefit the kidney, and arrest seminal emission and excessive urination.

Indications Enuresis, frequent urination, impotence, premature ejaculation, seminal emission and spermatorrhea in *deficiency* syndrome of the kidney.

Usage and dosage 6-12 g.

Storage Preserve in a dry place.

Fructus Schisandrae Chinensis (五味子, Wuweizi)

Chinese Magnoliavine Fruit

Chinese Magnoliavine Fruit is the dried ripe fruit of *Schisandra chinensis* (Turcz.) Barll. (Fam. Magnoliaceae). The drug is known as "Bei Wuweizi" (Northern Magnoliavine Fruit). The drug is collected in autumn when ripe, dried in the sun or after steamed, removed from stalk and foreign matter.

Description Irregularly spheroidal or compressed-spheroidal, 5-8 mm in diameter. Externally red, purplish-red or dull red, shrunken, oily, with soft pulp, sometimes externally blackish-red or covered with "white frost". Seeds 1-2, reniform, externally brownish-yellow, lustrous, testa thin and fragile. Odour of pulp, slight; taste, sour. Odour of seeds, aromatic on crushing; taste pungent and slightly bitter.

Identification (1) Transverse section: Pericarp consisting of 1 layer of square or rectangular epidermal cells, walls relatively thickened, covered with cuticle, oil cells scattered; mesocarp consisting of 10 or more layers of parenchymatous cells containing starch granules, scattered with small collateral vascular bundles; endocarp consisting of 1 layer of small square parenchymatous cells. The most outer layer of testa consisting of radially elongated stone cells, thick-walled, with fine and close pits and pit canals; beneath showing several layers of stone cells, subrounded, triangular or polygonal with larger pits; underneath the stone cell layers occurring a few layers of parenchymatous cells, raphe having vascular bundles; oil cell layer consisting of 1 layer of rectangular oil cells containing yellowish-brown volatile oil, with 3-5 layers of small cells lying below; inner epidermal cells of testa small, slightly thick-walled;

endosperm cells containing oil droplets and aleurone grains.
Powder: Dark purple, Stone cells of epidermis of testa polygonal or elongated-polygonal in surface view, 18-50 μm in diameter, walls thickened with very fine and close pit canals, lumina containing dark brown contents. Stone cells of the inner layers of testa polygonal, subrounded or irregular, up to 83 μm in diameter, walls slightly thickened, with relatively large pits. Epidermal cells of pericarp polygonal in surface view, anticlinal walls slightly beaded, with cuticle striations, scattered with oil cells. Cells of mesocarp shrivelled, containing dark brown contents and starch granules.
(2) To 1 g of the powder add 20 ml of chloroform, heat under reflux on a water bath for 30 minutes, filter, evaporate the filtrate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Produce a solution of Fructus Schisandrae Chinensis reference drug in the same manner as the reference drug solution. Dissolve deoxyschizandrin CRS in chloroform to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and the upper layer of petroleum ether (30-60℃)-ethyl formate-formic acid (15 : 5 : 1) as the mobile phase. Apply separately to the plate 2 μl each of the three solutions. After developing and removal of the plate, dry in air, examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Foreign matter Not more than 1 per cent (Appendix Ⅸ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol-water (13 : 7) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of schizandrol A.

Reference solution Weigh accurately schisandrin CRS 15 mg in a 50 ml volumetric flask, dissolve and dilute with methanol to volume, mix well and use as the reference solution (containing 0.3 mg of schisandrin per ml).

Test solution Weigh accurately about 0.25 g of the powder (through No. 3 sieve) in a 20 ml volumetric flask, add about 18 ml of methanol, ultrasonicate (power, 250 W; frequency, 20 kHz) for 20 minutes, take out, add methanol to volume, mix well, filter and use as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution respectively into the column, and calculate the content.
It contains not less than 0.40 per cent of schisandrin ($C_{24}H_{32}O_7$).

Processing *Fructus Schisandrae* Eliminate foreign matter. Break into pieces before use.

Fructus Schisandrae (processed with vinegar) Steam the clean Fructus Schisandrae as described under the method for steaming with vinegar (Appendix Ⅱ D) until the drug becomes black in colour. Break into pieces before use.
Externally black, oily, somewhat lustrous. Sarcocarp soft, mucilaginous. Seeds coats brow nish-red, lustrous.

Action To astringe, replenish *qi*, promote production of body fluids, tonify the kidney, and induce sedation.

Indications Chronic cough and dyspnea; nocturnal emission, spermatorrhea; enuresis, frequent urination; protracted diarrhea; spontaneous sweating, night sweating; impairment of body fluids with thirst, shortness of breath and feeble pulse; diabetes and wasting-thirst caused by internal *heat*; palpitation and insomnia.

Usage and dosage 1.5-6 g.

Storage Preserve in a ventilated and dry place, protected from mould.

Fructus Schisandrae Sphenantherae (南五味子, Nanwuweizi)

Southern Magnoliavine Fruit

Southern Magnoliavine Fruit is the dried ripe fruit of *Schisandra Sphenanthera* Rehd. et Wils. The drug is collected in autumn when ripe, dried in the sun, removed from stalk and foreign matter.

Description Spheroidal or compressed-spheroidal, 4-6 mm in diameter. Externally brownish-red to dark brown, shrunken and shrivelled, pulp usually adhered to seeds closely. Seeds 1-2, kidney-shaped, externally brownish-yellow, lustrous, testa thin and fragile. Odour of pulp, slight; taste, slightly sour.

Identification To 1 g of the powder add 20 ml of chloroform, heat under reflux on a water bath for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Prepare the reference drug solution using 1 g of Fructus Schisandra Sphenantherae reference drug in the same manner. Dissolve deoxyschizandrin CRS in chloroform to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin-layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and the upper layer of the mixture of petroleum ether (30-60℃)-ethyl formate-formic acid (15 : 5 : 1) as the mobile phase. Apply separately to the plate 2 μl each of the above three solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm, The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution and the reference solution.

Foreign matter Not more than 1 per cent (Appendix Ⅸ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of tetrahydrofuran-water (40 : 60) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of schisantherin A.

Reference solution Dissolve a quantity of schisantherin A CRS, accurately weighed, in methanol to produce a solution containing 20 μg per ml as the reference solution.

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve) in a stopper conical flask, add 50 ml of methanol, weigh methanol accurately, ultrasonicate (power, 250 W; frequency, 40 kHz) for 30 minutes, cool and weigh accurately again, replenish the loss of the solvent with methanol. Mix well, filter, use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 0.12 per cent of schisantherin A ($C_{30}H_{32}O_9$), calculated with reference to the dried drug.

Processing *Fructus Schisandra Sphenantherae* Eliminate foreign matter. Break into pieces before use.

Fructus Schisandra Sphenantherae (processed with vinegar) Steam the clean Fructus Schisandra Sphenantherae as described under the method for steaming with vinegar (Appendix II D) until the drug becomes black in colour. Break to pieces before use. Externally brownish-black, shrunken; pulp usually adhered to seeds closely and not viscous. Seeds: externally brown, lacklustre.

Action To astringe, replenish *qi*, promote production of body fluids, tonify the kidney, and induce sedation.

Indications Chronic cough and dyspnea; nocturnal emission, spermatorrhea; enuresis, frequent urination; protracted diarrhea; spontaneous sweating, night sweating; impairment of body fluids with thirst, shortness of breath and feeble pulse; diabetes and wasting-thirst caused by internal *heat*; palpitation and insomnia.

Usage and dosage 1.5-6 g.

Storage Preserve in a ventilated and dry place, protected from mould.

Fructus Setariae Germinatus (谷芽, Guya)

Millet Sprout

Millet Sprout is the dried ripe fruit of *Setaria italica* (L.) Beauv. (Fam. Gramineae) by germinating. The fruit is soaked in water at an appropriate temperature and moisture until the fibrous root grows up to about 4 mm long, and dried.

Description Subspheroidal, about 2 mm in diameter, apex obtuse-rounded, base somewhat acute. Outer shell consisting of coriaceous lemma and palea, pale yellow, with pointed wrinkles and fine primary fibrous roots on the lower part, about 3-6 mm long; a pale yellow or yellowish-white caryopsis (miller) visible when removed from the lemna and palea. Odour, slight; taste, slightly sweet.

Budding rate Carry out the method for Sampling of crude drugs (Appendix II A), taking 5 g of the drug by testing the amount of budding grains and of the total grains, calculate the percentage of budding rate.
The budding rate, not less than 85 per cent.

Processing *Fructus Setariae Germinatus* Eliminate froeign matter.

Fructus Setariae Germinatus (stir-baked) Stir-bake the clean Fructus Setariae Germinatus as described under the method for simple stir-baking (Appendix II D) until it becomes deep yellow.

Fructus Setariae Germinatus (charred) Stir-bake the clean Fructus Setariae Germinatus as described under the method for simple stir-baking (Appendix II D) until it becomes dark brown.

Action To promote digestion, invigorate the function of the spleen to improve appetite.

Fructus Setariae Germinatus (stir-baked) To promote digestion.

Fructus Setariae Germinatus (charred) To remove the retained food.

Indications Retention of undigested food with abdominal distension and foul breath; *inappetance due to deficiency* of the spleen and the stomach.

Fructus Setariae Germinatus (stir-baked) inappetance.

Fructus Setariae Germinatus (charred) Retention of undigested food.

Usage and dosage 9-15 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Fructus Silybi (水飞蓟, Shuifeiji)

Fruit of Silybum Marianum

Fruit of Silybum Marianum is the dried ripe fruit of *Silybum marianum* (L.) Gaertn. (Fam. Compositae). The drug is collected in autumn when the fruit is ripe, dried in the sun, the fruit is tapped out, removed from foreign matter, and dried again in the sun.

Description Long-obovate or elliptical, 5-7 mm long, 2-3 mm wide. Externally grayish-brown or dark brown, smooth, and with fine longitudinal veins. Summit obtuse-rounded, slightly broad, with a circular ring at the top, and a pointed remain of style in the center; base slightly narrowed. Texture hard, cotyledons 2, pale yellowish-white, oily. Odour, slightly; taste, weak.

Identification (1) Powder: Greyish-brown. The cells of exocarp long polygonal in surface view, and some of them containing pigment. Cells of mesocarp cylindrical or elliptical, with retiform wrinkles. Prisms of calcium oxalate occurring in view. Stone cells of endocarp widely fusiform in surface view, and the stratification unobvious. Cells of cotyledons containing small clusters and oil droplets.
(2) To 0.5 g of powder, add 20 ml of petroleum, heat under reflux on a water bath for 30 minutes, and filter, discard the filtrate, and volatilize petroleum in the residue; add 20 ml of methanol in the residue, heat under reflux on a water bath for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of silybin CRS in methanol to produce a solution of 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and the mixture of toluene, methyl acetate and formic acid (10 : 6 : 1) as the mobile phase. Apply separately 2 μl of the test solution and 5 μl of the reference solutions to the plate, develop two times and the developing distance is 8 cm per time. After developing and removal of the plate, dry in air. Spray with a solution of aluminium chloride in ethanol. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Water Carry out the method for the determination of water (Appendix IX H, method 1), not more than 10.0 per cent.

Total ash Not more than 9.0 per cent (Appendix IX K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix X A), using ethanol as the solvent, not less than 18.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of methanol, water and glacial acetic acid (48 : 52 : 1) as the mobile phase. As detector a spectrophotometer set at 287 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of silybin.

Reference solution Weigh accurately 12 mg of silybin CRS in a 50 ml of volumetric flask, add methanol to volume, and mix well. Measure accurately 5 ml of the solution in a 10 ml of volumetric flask, add methanol to volume, mix well, and used as the reference solution.

Test solution Weigh accurately 0.5 g of the coarse powder (pass through No. 3 sieve) to a stoppered conical flask, add accurately 50 ml of 75% methanol, weigh and heat under reflux on a water bath for 30 minutes, cool, weigh again and restore the original weight with 75% methanol to the initial weight, mix well, and stand. Filter through millipore membrane (0.45 μm), use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of the reference solution and the test solution into the column respectively, determine, and calculate the content with the sum of the two peak areas of silybin.
It contains not less than 0.60 per cent of silybin ($C_{25}H_{22}O_{10}$), calculated with reference to the dried drug.

Processing Eliminate foreign matter and ash.

Action To clear toxic *heat*, soothe the liver, and promote bile flow.

Indications Hypochondriac pain and jaundice due to *damp-heat* in the liver and gallbladder.

Usage and dosage Only in a patent medication.

Storage Preserve in a cool and dry place, and protected from moth.

Fructus Sophorae (槐角, Huaijiao)

Japanese Pagodatree Pod

Japanese Pagodatree Pod is the dried ripe fruit of *Sophora japonica* L. (Fam. Leguminosae). The drug is collected in winter, removed from foreign matter, and dried.

Description Beaded, 1-6 cm long, 0.6-1 cm in diameter. Externally yellowish-green or yellowish-brown, shrunken and rough, the side of the dorsal suture yellow. Texture soft, shrunken after drying, easily brocken at the collapsed part, fracture yellowish-green, viscous. Seeds 1-6, reniform, about 8 mm long, surface smooth, brownish-black, raphe at one side round, greyish-white; texture hard, cotyledons 2, yellowish-green, Odour of mesocarp weak; taste, bitter, testa of seeds bean-like on chewing.

Identification The retention time of the peaks obtained with the test solution and the reference solution under the **"Assay"** is concordant with each other.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, acetonitrile and 0.07% phosphate acid solution (12 : 20 : 68) as the mobile phase. As detector a spectrophotometer set at 260 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of sophoricoside.

Reference solution Dissolve a quantity of sophoricoside CRS, accurately weighed, in methanol to produce a solution containing 40 μg per ml as the reference solution.

Test solution Weigh accurately 2 g of the powder (through No. 3 sieve) in a conical flask with stopper, add 50 ml of 70% ethanol, accurately measured, weigh accurately, and ultrasonicate (power, 300 W; frequency, 25 kHz) for 45 minutes, cool and weigh again, make up the loss in weight with 70% ethanol to the initial weight and mix well. Filter and measure accurately 0.5 ml of the successive filtrate in a 20 ml volumetric flask. Dilute with methanol to volume, mix well.

Procedure Inject accurately 10 μl of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 4.0 per cent of sophoricoside ($C_{21}H_{20}O_{10}$), calculated with reference to the dried drug.

Processing *Fructus Sophorae* Eliminate foreign matter.

Fructus Sophorae (stir-baked with honey) Stir-bake the clean Fructus Sophorae as described under the method for stir-baking with honey (Appendix Ⅱ D) until the surface becomes lustrous and unsticky, using 5 kg of refined honey per 100 kg of Fructus Sophorae.

Action To remove *heat* and quench excess *fire*, and arrest bleeding by reducing *heat* in blood.

Indications Hematochezia caused by *heat* in the large intestine, hemorrhoidal bleeding; headache, dizziness and congestion of the eyes due to *liver-heat*.

Usage and dosage 6-9 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Fructus Terminaliae Billericae (毛诃子, Maohezi)

Belleric Terminalia Fruit

Belleric Terminalia Fruit is the dried ripe fruit of *Terminalia billerica* (Gaertn.) Roxb. (Fam. Combretaceae), used commonly by Tibetan nationality. The drug is collected in winter when ripe, removed from foreign matter, and dried in the sun.

Description Ovoid or ellipsoidal, 2-3.8 cm long, 1.5-3 cm in diameter. Externally brown, covered with reddish-brown pubescences, relatively fine and dense, 5 ribs and irregular wrinkles. Texture hard. Sarcocarp 2-5 mm thick, dark brown or pale greenish-yellow. Kern pale brownish-yellow. Seed 1, testa brownish-yellow, kernel yellowish-white, oily. Odour, slight; taste, astringent and bitter.

Identification (1) Powder: Yellowish-brown. Vasculum-like tracheary element, lignified. Non-glandular hairs easily visible, 2-3 celled brownish-yellow content containing. Clusters of calcium oxalate abundant, 17-54 μm in diameter. Stone cells subrounded, oval or rectangular; pit-canal well-marked, striations libriform. Fibre of endocarp, walls thickened, lignified, pit-canal well-marked. Exocarp cells with reticulated pits. Oil droplets and spiral vessels visible.
(2) To 2 g of the powder add 10 ml of ether, shake for 10

minutes, discard the ether, evaporate the residue to dryness. Add 20 ml of ethyl acetate, heat under reflux for 1 hour, cool and filter, evaporate the filtrate to dryness. Dissolve the residue in 2 ml of methanol as the test solution. Dissolve gallic acid CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of toluene (water saturated)-ethyl formate-formic acid (5∶4∶1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a solution of ferric chloride TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 12.0 per cent (Appendix IX H, method 1).

Total ash Not more than 5.0 per cent (Appendix IX K).

Extractives Carry out the cold maceration method for determination of water-soluble extractives (Appendix X A), not less than 20.0 per cent.

Action To remove toxic *heat*, artinge nourish blood, and coordinate the actions of various ingredients in a prescription.

Indications Various febrile diseases; diarrhea, impetigo; liver and gallbladder diseases; debility during convalescence.

Usage and dosage 3-9 g; usually made into pills or powder.

Storage Preserve in a dry place, protected from moth.

Fructus Toosendan (川楝子, Chuanlianzi)

Szechwan Chinaberry Fruit

Szechwan Chinaberry Fruit is the dried ripe fruit of *Melia toosendan* Sieb. et Zucc. (Fam. Meliaceae). The drug is collected in winter when ripe, removed from foreign matter, and dried.

Description Subspherical, 2-3.2 cm in diameter. Externally golden to brownish-yellow, somewhat lustrous, rarely dented or shrunken, with deep brown small dots. Apex with remains of style attached, base with dent and a fruit stalk scar. Epicarp leathery, usually forming a space with sarcocarp. Sarcocarp loose and soft, pale yellow, viscous when moistened with water. Kernels spherical or ovoid, texture hard, both ends truncate, with 6-8 longitudinal ribs and 6-8 loculi, each loculus containing a blackish-brown oblong seed. Odour, characteristic; taste, sour and bitter.

Identification (1) Powder: Yellowish-brown. Pericarp fibre bundles, 9-36 μm in diameter, the end subrounded, walls thickened, surrounded with parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Pericarp stone cells subrounded, unevenly elongated or polygonal, 14-54 μm in diameter, 150 μm long with warty protruding or short obtuse-rounded branches. Testa cells fresh yellow or yellowish-orange, with 1 layer of subsquare cells, 44 μm in diameter, walls thickened, with longitudinal lightly sinuous striation, connecting to pigment layer. Epidermal cell polygonal in surface view, with granular striation. Lumen of pigment layer cells of testa containing reddish-brown substance. Testa contain crystal cells, 13-27 μm in diameter, lumen contain lightly yellow, yellowish-brown or reddish-brown substance, and containing minute prisms of calcium oxalate, 5 μm in diameter. Calcium oxalate crystals 5-27 μm in diameter.

(2) To 1 g of the powder add 30 ml of ethanol, ultrasonicate for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ethanol as the test solution. Prepare a solution of 1 g of Fructus Toosendan reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of toluene-acetone (9∶1) as the mobile phase. Apply separately 4 μl of the test solution and the reference drug solution to the plate. After developing and drug removal of the plate, dry in air. Fume it in iodine vapour to the spots clear. The spots in the chromatogram obtained with test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Not more than 12.0 per cent (Appendix IX H, method 1).

Extractives Carry out the hot extraction method for determination of water-soluble extractives (Appendix X A), not less than 32.0 per cent.

Processing *Fructus Toosendan* Eliminate foreign matter. Break to pieces before use.

Fructus Toosendan (stir-baked) Cut clean Fructus Toosendan into thick slices or pulverize, stir-bake the drug as described under the method for simple stir-baking (Appendix II D) until the outer surface turns brown.

Action To relieve pain by smoothing the flow of the *liver-qi* and repel worms.

Indications Distending pain in the hypochondrium, epigastrium or in the abdomen; abdominal pain due to intestinal parasitosis.

Usage and dosage 4.5-9 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Fructus Tribuli (蒺藜, Jili)

Puncturevine Caltrop Fruit

Puncturevine Caltrop Fruit is the dried ripe fruit of *Tribulus terrestris* L. (Fam. Zygophyllaceae). The plant is collected in autumn when ripe, dried in the sun. The drug is tapped out, and removed from foreign matter.

Description Fruit consisting of 5 mericarps, radially arranged, 7-12 mm in diameter. Often spliting into single mericarp, hatchet-shaped, 3-6 mm long; dorsal surface yellowish-green, prominent, with longitudinal ribs and numerous spinlets, bearing symmetrically a pair of long spines and a pair of short spines; two lateral surfaces rough, with reticular striations, greyish-white. Texture hard. Odour, slight; taste, bitter and pungent.

Identification (1) Powder: Yellow-green. Pericarp fibres lignified, with upper and lower layers in crisscross arrangement, a few scattered singly, sometimes fibre bundles connected with stone cells. Stone cells elongated-elliptical or subrounded, occuring in groups. Testa cells polygonal or subsquare, about 30 μm in diameter, walls reticulately thickened, lignified. Prisms of calcium oxalate 8-20 μm in diameter.

(2) To 3 g of the powder add 50 ml of chloroform, ultrasonicate for 30 minutes, filter, discard chloroform, and evaporate the residue to dryness. Add 1 ml of water, mix well and add 50 ml of water saturation solution in *n*-butanol, ultrasonicate for 30 minutes, separate the upper layer, wash with 2 times in volume of ammonia TS, discard the washing. Evaporate the *n*-butanol layer to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 3 g of Fructus Tribuli reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of the mixture of chloroform-methanol-water (13 : 7 : 2) allowed to stand below 10℃ as the mobile phase. Apply separately 5 μl of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with *p*-dimethylaminobenzaldehyde modified TS (dissolve 1 g of *p*-dimethylaminobenzaldehyde in 34 ml of hydrochloric acid and 100 ml of methanol, mix well). Heat at 105℃ to the spots clear. The spots in the chromatogram obtained with test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Not more than 9.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 12.0 per cent (Appendix Ⅸ K).

Processing *Fructus Tribuli* Eliminate foreign matter.

Fructus Tribuli (*stir-baked*) Stir-bake the clean Fructus Tribuli as described under the method for simple stiry-baking (Appendix Ⅱ D) until a pale yellow colour is produced.

Action To subdue hyperactivity of the liver, promote blood circulation, dispel *wind* to nebula, and to arrest itching.

Indications Headache and dizziness, distending pain in the hypochondrium; cessation of lactation, mastitis; bloodshot eyes of nebula; urticaria with itching.

Usage and dosage 6-9 g.

Storage Preserve in a dry place, protected from mould.

Fructus Trichosanthis (瓜蒌, Gualou)

Snakegourd Fruit

Snakegourd Fruit is the dried ripe fruit of *Trichosanthes kirilowii* Maxim. or *Trichosanthes rosthornii* Harms (Fam. Cucurbitaceae). The drug is collected with fruit stalk in autumn, and dried in ventilated shade.

Description Subspherical or broadly ellipsoidal, 7-15 cm long, 6-10 cm in diameter. The outer surface orange-red or orange-yellow, shrunken or relatively smooth. Apex with a rounded style scar, base slightly acute, with remains of fruit stalk. Varying in weight. Texture fragile, easily split, the inner surface yellowish-white, with reddish-yellow reticulation, sarcocarp orange-yellow, viscous, adhering to many seeds into a mass. Odour, caramel-like; taste, slightly sour and sweet.

Processing Eliminate fruit stalks and soil, flatten, cut into slivers or pieces.

Action To remove *heat* and eliminate phlegm, alleviate chest pain, and to facilitate bowel movement.

Indications Cough with thick purulent sputum; angina pectoris and stuffiness sensation in the chest and epigastrium; mastitis, lung abscess, appendicitis; constipation.

Usage and dosage 9-15 g.

Precaution Incompatible with aconite and allied drugs.

Storage Preserve in a cool and dry place, protected from mould and moth.

Fructus Tsaoko (草果, Caoguo)

Caoguo

Caoguo is the dried ripe fruit of *Amomum tsaoko* Crevost et Lemaire (Fam. Zingiberaceae). The drug is collected in autumn when ripe, removed from foreign matter, and dried in the sun or at a low temperature.

Description Long ellipsoid, 3-obtuse-ridged, 2-4 cm long, 1-2.5 cm in diameter. Externally greyish-brown to reddish-brown, with longitudinally furrows and ribs, a rounded and projected stylopodium on the summit and a fruit stalk or its scar at the base. Pericarp tough, easily torn off longitudinally. On peeling off the exocarp the central part showing yellowish-brown septa dividing the masses of seeds into 3 groups, each having mostly 8-11 seeds. Seeds conical polyhedral, about 5 mm in diameter, externally reddish-brown, covered with greyish-white membranous aril. Seed with a longitudinal furrowed raphe and a dented hilum at the apex; texture hard, endosperm greyish-white. Odour, characteristic aromatic; taste, pungent and slightly bitter.

Identification (1) Transverse section of seed: Parenchymatous cells of arillus containing starch granules. Epidermal cells of testa brown, rectangular with relatively thick wall, hypodermis consisting of 1 layer of parenchymatous cells containing yellow contents; 1 row of oil cells, subsquare or rectangular, 42-162 μm long tangentially and 48-68 μm long radially, containing yellow oil droplets; pigment layer consisting of several rows of brown cells. Tegmen consisting of 1 row of palisade stone cells, reddish-brown, with heavily thickened inner and lateral walls, lumen small, containing silica bodies. Cells of perisperm containing starch granules and a few small clusters and prisms of calcium oxalate. Cells of endosperm containing aleurone granules and starch granules.

(2) Dissolve a quantity of volatile oil obtained under Assay in ethanol to produce a solution containing 50 μl per ml as the test solution. Dissolve a quantity of cineole in ethanol to produce a solution containing 20 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅳ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (17 : 3) as the mobile phase. Apply separately 1 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% solution of vanillin in sulfuric acid, and heat at 105℃ for several minutes. The blue spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 15.0 per cent (Appendix Ⅸ H, method 2).

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for determination of volatile oil (Appendix Ⅹ D).

The seeds contain not less than 1.4 per cent (ml/g) of volatile oil.

Processing *Seeds of Fructus Tsaoko* Stir-bake the fructus Tsaoko as described under the method for simple stir-baking (Appendix Ⅱ D) until it becomes brown and slightly inflated and then remove the husk to collect the seeds. Break into pieces before use.

Seeds of Fructus Tsaoko (processed with ginger) Stir-bake the seeds of Fructus Tsaoko as described under the method for stir-baking with ginger juice (Appendix Ⅱ D) to dryness. Break into pieces before use.

Action To dry *cold-damp* and warm the *middle-energizer*, dispel *phlegm* and cure malaria.

Indications Accumulation of *cold-damp* in the spleen and the stomach with manifestations of epigastric and abdominal distension, fullness sensition and vomiting; malaria with paroxysms of chills and fever.

Usage and dosage 3-6 g.

Storage Preserve in a cool and dry place.

Fructus Viticis (蔓荆子, Manjingzi)

Shrub Chastetree Fruit

Shrub Chastetree Fruit is the dried ripe fruit of *Vitex trifolia* L. var. *simplicifolia* Cham. or *Vitex trifolia* L. (Fam. Verbenaceae). The drug is collected in autumn when ripe, removed from foreign matter, and dried in the sun.

Description Spheroidal, 4-6 mm in diameter. Externally greyish-black or blackish-brown, covered with greyish-white frost-like hairs, bearing 4 longitudinal shallow furrows; apex slightly concave, with greyish-white persistent calyx and short fruit stalk at base. Calyx is ⅓-⅔ length of the fruit, 5-toothed, 2 of them relatively deep. and covered with densely pubescent. Texture light and hard, uneasily broken. Transverse section showing 4 loculi, each with 1 seed. Odour, characteristic and aromatic; taste, weak and slightly pungent.

Identification (1)Powder: Greyish-brown. Epidermal cells of calyx subrounded, walls frequently sinuous; non-glandular hairs 2-3 celled, apical cell relatively wide with warty protrudings. Cells of epicarp polygonal, with cuticle striations and scars of haris, bearing glandular hairs and non-glandular hairs. Glandular hairs in two types: one with a unicellular head and a 1-2 celled stalk, and the other a 2-6 celled head and a unicellular stalk. Non-glandular hairs, 2-4 celled, 14-68 μm long, often curved, warty-walled. Cells of mesocarp oblong or subrounded, walls slightly lignified, and with distinct pits. Vittae frequently broken, containing secretions, adjacent cells containing pale yellow oil droplets. Stone cells of endocarp elliptical or subsquare, 10-35 μm in diameter. Cells of testa rounded or subrounded, 42-73 μm in diameter, with reticulate striated and lignified walls.
(2) To 5 g of the powder add 50 ml of petroleum ether (60-90℃), heat under reflux for 2 hours, filter and discard the petroleum ether, evaporate the residue to dryness. Add 80 ml of acetone to the residue, heat under reflux for 1.5 hours, filter and evaporate the filtrate to dryness. Dissolve the residue with 2 ml methanol as the test solution. Dissolve vitexicarpin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G prepared by 1% solution of sodium hydroxide as the coating substance and a mixture of cyclohexine, ethyl acetate and methanol (3 : 2 : 0.2) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 10% solution of aluminum chloride. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Foreign matter Not more than 2 per cent (Appendix Ⅸ A).

Water Not more than 14.0 per cent (Appendix Ⅸ H, method 2).

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using methanol as the solvent, not less than 8.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.4% phosphoric acid solution (60 : 40) as the mobile phase. As detector a spectrophotometer set at 258 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of vitexicarpin.

Reference solution Dissolve a quantity of vitexicarpin CRS, accurately weighed, in methanol to produce a solution of 30 μg per ml.

Test solution Weigh accurately 2 g of the powder (through No. 3 sieve) in a conical flask with stopper, add 50 ml of methanol, accurately measured, and weigh accurately, heat under reflux for 1 hour, cool and weigh again, make up the loss in weight with methanol to the initial weight and mix well. Filter and use the filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 10 μl of the test solution into the column, and calculate the content.
It contains not less than 0.030 per cent of vitexicarpin ($C_{19}H_{18}O_8$), calculated with reference to the dried drug.

Processing *Fructus Viticis* Eliminate foreign matter.

Fructus Viticis (stir-baked) Stir-bake gently the clean Fructus Viticis as described under the method for simple stir-baking (Appendix Ⅱ D). Break into pieces before use.

Action To dispel *wind-heat* from the head and eyes.

Indications Headache in common cold due to *wind-heat*; painful swelling of the gums; inflammation of the eyes with lacrimation, poor eyesight or blurred vision and dizziness.

Usage and dosage 5-9 g.

Storage Preserve in a cool and dry place.

Fructus Xanthii (苍耳子, Cang'erzi)

Siberian Cocklebur Fruit

Siberian Cocklebur Fruit is the dried ripe bur with involucre of *Xanthium sibiricum* Patr. (Fam. Compositae). The drug is collected in autumn when ripe, dried and removed from stalk, leaf and other foreign matter.

Description Fusiform or ovoid, 1-1.5 cm long, 4-7 mm in diameter. Externally yellowish-brown or yellowish-green, with hooked spines throughout. Summit with 2 relatively thick spines, separated or linked up, base with a fruit stalk scar. Texture hard and flexible, the centre of transverse section showing a septum and 2 loculi, each having an achene. Achene slightly fusiform, relatively even at one side, apex with a protruding remains of style, pericarp thin, greyish-black, with longitudinal wrinkles. Testa membranous, pale grey, cotyledons 2, oily. Odour, slight; taste, slightly bitter.

Identification (1) Powder: Pale yellowish-brown to pale yellowish-green. Fibre bind or single, acerose and fusiform, pits and pit-canals visible or invisible, lignified thin-walled cells subquadrate, with pits. Cotyledon cells containing aleurone grains and oil droplets.
(2) To 2 g of the powder, add 25 ml of methanol, heat under reflux for 20 minutes and filter. Concentrate the filtrates to about 2 ml as the test solution. Produce a solution of 2 g of Fructus Xanthii reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of the mixture of n-butanol, glacial acetic acid and water (4 : 1 : 5) as the mobile phase. Apply separately 4 μl of each of two solutions to the plate. After developing and removal of the plate, dry in air, expose in ammonia vapour to the spot clear. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Water Carry out the method as described under the determination of water (Appendix Ⅸ H, method 1), not more than 12.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K)

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K)

Processing *Fructus Xanthii* Eliminate foreign matter.

Fructus Xanthii (*stir-baked*) Stir-bake the clean Fructus Xanthii as described under the method for simple stir-baking (Appendix Ⅱ D) to yellowish-brown, remove the spines and sift.

Action To dispel *wind* and *damp*, and relieve nasal obstruction.

Indications Headache caused by exterior *wind-cold*; rhinitis or sinusitis with nasal discharge; urticaria with itching; arthritis with muscular contracture caused by *wind-damp*.

Usage and dosage 3-9 g.

Storage Preserve in a dry place.

Galamina
(炉甘石, Luganshi)

Galamine

Galamine is a mineral of carbonates of smithsonite of calcite group, containing mainly zinc carbonate ($ZnCO_3$). The drug is collected, washed clean, dried in the sun, and removed from foreign matter.

Description Aggregate of masses, irregular; greyish-white or pale red. Externally powdery, lustreless, uneven, porous and honeycomb-like. Texture light, easily broken. Odour, slight; taste, slightly astringent.

Identification (1) To 1 g of the coarse powder add 10 ml of dilute hydrochloric acid TS effervescence is produced immediately. Pass the gas into calcium hydroxide TS, a white precipitate is produced.
(2) Dissolve 1 g of the coarse powder in 10 ml of dilute hydrochloric acid TS and filter. To the filtrate add potassium ferrocyanide TS, a white precipitate or a white precipitate scattering with a few blue precipitate is produced.

Assay Weigh accurately about 0.1 g of the powder previously dried at 105℃ for 1 hour to a conical flask. Add 10 ml of dilute hydrochloric acid TS and dissolve zinc salts by shaking. Add 10 ml of each of concentrated ammonia TS and ammonia-ammonium chloride BS (pH 10.0), mix well, add 10 ml of sodium dihydrogen phosphate TS, shake and filter. Wash the conical flask and the residue with three 10 ml quantities of a mixture of ammonia-ammonium chloride BS (pH 10.0) and water (1 : 4). Combine the washings and the filtrate, add 15 ml of a 30% solution of triethanolamine and a small quantity of eriochrome black T indicator mixture, titrate with disodium edetate (0.05 mol/L) VS until the colour turns from purple to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 4.069 mg of zinc oxide (ZnO).
It contains not less than 40.0 per cent of zinc oxide (ZnO), calculated with reference to the dried drug.

Processing *Calamina* Eliminate foreign matter and break to pieces.

Calamina (*calcined*) Calcine the clean Calamina as described under the method for calcining openly (Appendix Ⅱ D) until red thoroughly, then levigate as described under the method for levigating (Appendix Ⅱ D) and dry in the sun.

Action To counteract *toxicity*, clear nebula and improve eyesight, arrest discharges and heal ulcers, and relieve itching.

Indications Inflammation of the eyes, tarsitis, pterygium, corneals opacity; skin ulceration with purulent discharge or exudation; pruritus.

Usage and dosage Appropriate quantity for external use.

Storage Preserve in a dry place.

Galla Chinensis
(五倍子, Wubeizi)

Chinese Gall

Chinese Gall is the gall produced mainly by parasitic

aphids of *Melaphis chinensis* (Bell) Baker on the leaf of *Rhus chinensis* Mill., *Rhus potaninii* Maxim. or *Rhus punjabensis* Stew. var. *sinica* (Diels) Rehd. et Wils. (Fam. Anacardiaceae). The drug is collected in autumn, boiled in water for a moment or steamed until its outer surface shows grey so as to kill the aphids, and then taken out. According to its form the drug is divided into "Dubei" and "Jiaobei".

Description *Dubei* Oblong or spindle-globular, 2.5-9 cm long, 1.5-4 cm in diameter. Externally greyish-brown, slightly pubescent. Texture hard and fragile, easily broken, fracture horny, lustrous, gall walls 0.2-0.3 cm thick, inner surface smooth and showing black-brown killed aphids and grey-powdery excreta. Odour, characteristic; taste, astringent.

Jiaobei Rhombic with irregular-corniform branchings and distinct pubescences, gall walls relatively thin.

Identification To 0.5 g of the powder add 5 ml methanol, ultrasonicate for 15 minutes, filter and the filtrate is used as the test solution. Prepare a solution of *Galla Chinensis* reference drug in the same manner as the reference drug solution. Dissolve gallic acid CRS in mathanol to produce a solution containing 1 mg per ml as the reference solution, Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of chloroform, ethyl formate and formic acid (5 : 5 : 1) as the mobile phase. Apply separately to the plate 2 μl each of the solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot obtained with the reference drug solution and the reference solution.

Water Carry out the determination of water (Appendix Ⅸ H, method 1), not more than 12.0 per cent.

Total ash not more than 3.5 per cent (Appendix Ⅸ K).

Assay ***tanninoids*** Weigh accurately 0.2 g of the powder (pass through No. 4 sieve), carry out the determination of tanninoids (Appendix Ⅹ B).
It contains not less than 50.0 per cent of tanninoids, calculated with reference to the dried drug.

galic acid Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use a column packed with octadecylsilane bonded silica gel as the stationary phase and the mixture of methanol and 0.1% phosphoric acid (15 : 85) as mobile phase. As detector a spectrophotometer set at 273 nm. The number of the theoretical plates of the column is not less than 3000, calculated with the reference to the peak of galic acid.

Reference solution dissolve a quantity of galic acid, accurately weighed, in 50% methanol to produce a methanol solution containing 0.04 mg of galic acid per ml, and mix well.

Test solution To 0.5 g of the powder (pass through No. 4 sieve), accurately weighed, add accurately 50 ml of 4 mol/L hydrochloric acid, hydrolysed on a water bath for 3.5 hour, cool, filter, measure accurately 1 ml of the successive filtrate in a 100 ml volumetric flask, dilute with 50% methanol to volume, mix well.

Procedure Inject accurately 10 μl of the reference solution and of the test solution respectively into the column, and calculate the contents.
It contains not less than 50.0 per cent hydrolysed galic acid ($C_7H_6O_5$), calculated with reference to the dried drug.

Processing Break and eliminate foreign matter.

Action To remove *heat* from the lung, arrest cough, diarrhea, excessive sweating, bleeding and exudations.

Indications Cough and expectoration due to *heat* in the lung; chronic cough, chronic dysentery and diarrhea, night sweating, hematochezia, hemorrhoidal bleeding, traumatic bleeding, abscess, sores and skin lesions with exudation; diabetes.

Usage and dosage 3-6 g; appropriate quantity for external use.

Storage Preserve in a ventilated and dry place, protected from pressure.

Ganoderma
(灵芝, Lingzhi)

Glossy Ganoderma

Ganoderma is the dried sporophore of *Ganoderma lucidum* (Leyss. Ex Fr.) Karst. or *Ganoderma sinensis* Zhao, Xu et Zhang. (Fam. Polyporaceae). The drug is collected all the year, removed from foreign matter, attached rotten wood, sand or the lower stipe of the culture matrix, dried in the shade or stove at 40-50℃.

Description *Ganoderma lucidum* Outline firmbriate, pileus reniform, semi-rounded or subrounded, 10-18 cm in diameter, 1-2 cm thick. Shell hard, yellowish-brown to redish-brown, lustrous, with circular arris-ed stripe and radiate wrinkle, edge thin and even, frequently incurved slightly. The inner part white to brownish. Stip cylinder, laterally grown, few leaning grown, 7-15 cm long, 1-3.5 cm in diameter, reddish-brown to purplish brown, luminous. Spore small and fine, yellowish-brown. Odour, slightly aromatic, taste, bitter and puckery.

Ganoderma sinensis Shell purplish-black, with lacquer-like lustre. Sporophore rusty-brown. Stip 17-23 cm long.

Cultivated Ganoderma Sporophore relatively sturdy, plump, 1-22 cm in diameter, 1.5-4 cm thick. Shell frequently coated with a large of yellowish-brown powder-like spores.

Identification (1) Powder: pale brown, dark brown, yellowish-brown. Hyphae scattered or grouped, colourless or pale brown, slim, slightly curved, branched, 2.5-6.5 μm in diameter. Spores brown, ovate, apex even, external walls colourless, inner walls with protuberance, 8-12 μm long, 5-8 μm wide.
(2) To 2 g of the coarse powder add 30 ml of methanol, heat and reflux for 30 minutes, filter, evaporate the filtrate to dryness, add 2 ml of methanol to dissolve the residue, and use it as the test solution. Prepare a solution of Ganoderma reference drug in the same manner, and use it as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃)ethyl formate and formic acid (15 : 5 : 1, upper layer) as the mobile phase. Apply separately to the plate 4 μl each of the two solutions. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 17.0 per cent.

Total ash Not more than 3.2 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 0.5 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of water-soluable extractives (Appendix Ⅹ A), not less than 3.0 per cent.

Assay *Reference solution* Weigh accurately a quantity of anhydrous dextrose CRS, dried previously to constant weight at 105℃, in a volumetric flask, dissolve and dilute with water to volume, and mix well to produce a solution containing 0.1 mg per ml as the reference solution.

Calibration standard Measure accurately 0.2, 0.4, 0.6, 0.8, 1.0, and 1.2 ml of the reference solution respectively into a 10 ml stopper test tube and add to a total of 2.0 ml with water, Measure accurately 6 ml of the solution of anthrone sulphate (dissolve 0.1 g of anthrone, accurately weighed, to 100 ml of 80% sulfuric acid, and mix well), mix well, heat on a water bath for 15 minutes, cool on an ice water bath for 15 minutes. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), perform a black determination with the relative test solution, measure the absorbance at 625 nm and plot the standard curve, using the absorbance as ordinate and the concentration as abscissa.

Test solution Weigh accurately 2 g of the powder into a Soxhlet's extractor, extract with 90 ml of water under reflux on an electric heated thermostat until the extract colourless, transfer the extract to a 100 ml volumetric flask, dilute with water to volume, and mix well. Measure accurately 10 ml, add 150 ml of ethanol and mix well, cool at 4℃ for 12 hours, removal of the flask, centrifuge, and discard the upper layer of the clarified liquid. Dissolve the residue with water and transfer it to 50 ml volumetric flask, dilute with water to volume, and mix well.

Procedure Measure accurately 2 ml of the test solution, into a 10 ml stopper test tube, carry out the procedure as described under calibration standard, beginning at the words "measure accurately 6 ml of …", measure the absorbance at 625 nm and read out the weight of anhydrous dextrose (mg) in the test solution from the standard curve, and calculate the content of polysaccharides of Ganoderma.

It contains not less than 0.50 per cent of polysaccharides of Ganoderma, calculated as anhydrous dextrose ($C_6H_{12}O_6$) with reference to the dried drug.

Action To replenish *qi* and ease the mind, relieve cough and asthma.

Indications Dizziness, insomnia, palpitation, shortness of breath, asthenic cough and asthma.

Usage and dosage 6-12 g.

Storage Preserve in a dry place, protected from mould and moth.

Gecko
(蛤蚧, Gejie)

Tokay Gecko

Tokay Gecko is the dried body of *Gekko gecko* Linnaeus (Fam. Gekkonidae). The animal is captured all the year round, removed from the viscera, wiped, opened with bamboo piece to make the whole body flattened and straight, and dried at a low temperature.

Description Flattened slice in shape, head, neck and trunk 9-18 cm long, head and neck about one third as long as snout-vent length; dorsum and abdomen 6-11 cm wide; tail 6-12 cm long. Head somewhat flat triangular, two eyes deeply sunken into holes. Tiny teeth present in the mouth at the margin of the jaw, heteromorphic large tooth lacking. Snout hemicycle, rostral not contacting with nostril, but contact with nasal; 1 piece of supranasal at each side, 12 to 14 pairs of upper labial, 21 pieces of lower labial (including mentals). Trunk elliptic, abdomen thin, dorsum greyish-black or silver-grey with yellowish-white or greyish-green spots scattered or concentrated to indistinct patterns. Vertebrae and ribs of both sides projecting. Four limbs all having 5 digits, bearing suckers at the base, and traces of web between the digits. Tail narrow and strong, caudal vertebrae barely visible. Ground colour of the tail similar to that of the dorsum, with 6-7 distinct silver-grey circular band. Whole body densely covered with rounded or polygonal and somewhat lustrous tiny scales. Odour, stinking; taste, slightly salty.

Processing *Gecko* Eliminate head, legs and scales, cut into small pieces.

Gecko (*processed with wine*) Soak the pieces of Gecko with yellow rice wine, dry at a low temperature.

Action To reinforce the function of the lung and the kidney, to relieve asthma, and to promote virility and replenish essence.

Indications Dyspnea or asthma in a deficiency syndrome; cough and hemoptysis in consumptive diseases; impotence, seminal emission.

Usage and dosage 3-6 g, mostly in forms of pills, powder or medicinal wine.

Storage Preserve in tightly closed wood boxes, usually mixed with Pericarpium Zanthoxyli, stored in a cool and dry place, protected from moth.

Gypsum Fibrosum
(石膏, Shigao)

Gypsum

Gypsum is a plaster stone of sulfates of plaster stone group, containing mainly hydrated calcium sulfate ($CaSO_4 \cdot 2H_2O$). The drug is collected, removed from foreign matter.

Description Fibrous aggregates in long, plate-shaped or irregular pieces; white, greyish-white or pale yellow, sometimes translucent; texture soft and heavy, longitudinally cut surface with silky lustre. Odour, slight; taste, weak.

Identification (1) Ignite a piece of the drug (about 2 g) in a test tube covered with a pored cork stopper; the moisture is produced on the tube wall and the small piece turns to opaque.

(2) To 0.2 g of the powder add 10 ml of dilute hydrochloric acid TS, heat to dissolve, the solution yields the reactions characteristic of calcium salts and sulfates (Appendix Ⅳ).

Heavy metals Boil 8 g of the drug in 4 ml of glacial acetic acid and 96 ml of water for 10 minutes, cool, add water to

the original volume, filter. Using 25 ml of the filtrate, carry out the limit test for heavy metals (Appendix Ⅸ E, method 1), not more than 10 ppm.

Arsenic To 1 g of the drug, add 5 ml of hydrochloric acid, and add water to 23 ml, heat to dissolve, cool, carry out the limit test for arsenic (Appendix Ⅸ F, method 2), not more than 2 ppm.

Assay Weigh accurately about 0.2 g of the fine powder to a conical flask, add 10 ml of dilute hydrochloric acid TS, heat to dissolve, add 100 ml of water and 1 drop of methyl red IS, add dropwise potassium hydroxide TS until the solution turns to pale yellow, then add an excess of 5 ml. Add a small quantity of calcein indicator mixture, titrate with disodium edetate (0.05 mol/L) VS until the yellowish-green fluorescence disappears and the colour turns to orange. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 8.608 mg of $CaSO_4 \cdot 2H_2O$.
It contains not less than 95.0 per cent of hydrous calcium sulfate ($CaSO_4 \cdot 2H_2O$).

Processing *Gypsum* Wash clean, dry, break to pieces and eliminate foreign matter, then grind to coarse powder.

Action To remove *heat*, quench *fire*, ease the mind, and relieve thirst.

Indications Febrile diseases due to exogenous pathogenic factors with high fever and dire thirst; asthma and cough caused by *heat* in the lung; headache and toothache caused by exuberant *fire* in the stomach.

Usage and dosage 15-60 g, decocted first.

Storage Preserve in a dry place.

Gypsum Fibrosum Praeparatum (煅石膏, Duanshigao)

Calcined Gypsum

Calcined Gypsum is the processed product of Gypsum.

Processing Calcine the clean Gypsum as described under the method for calcining openly (Appendix Ⅱ D) to porous.

Description White powder or porous masses, showing slightly red lustre on surface, opaque. Texture soft and relatively light, easily broken, powdered in kneading. Odour less; taste, weak.

Heavy metals Carry out the method as described under Gypsum Fibrosum, not more than 10 ppm.

Assay Weigh accurately 0.15 g of the fine powder, carry out the test method as described under Gypsum Fibrosum, begining at "to a conical flask, add 10ml of dilute hydrochloric acid TS". Each ml of disodium edetate (0.05mol/L) VS is equivalent to 6.807 mg of $CaSO_4$.
It contains not less than 92 per cent of calcium sulfate [1 g of calcium sulfate ($CaSO_4$) is equivalent to 1.26 g of hydrous calcium sulfate ($CaSO_4 \cdot 2H_2O$)].

Action To expel *dampness*, promote growth of fissues, curing sores, to arrest bleeding.

Indications Chronic ulcer, eczema, itching, and scaldes and unhealed wounds, and traumatic bleeding.

Usage and dosage Ground into powder for external application.

Storage Preserve in a dry place.

Haematitum (赭石, Zheshi)

Hematite

Hematite is a mineral of oxides of corundum group, containing mainly ferric oxide (Fe_2O_3). The drug is collected, removed from foreign matter.

Description Aggregates, fish-egg like, bean-shaped, reniform, frequently in irregular flattened masses. Dark brownish-red or greyish-black; streak cherry-red or reddish-brown, some with lustre of metal. Many rounded bulges occurring on one surface, commonly known as "Ding-tou", and hollows of the same size corresponding in position to "Ding-tou" occurring on the other surface. Texture heavy and hard, fracture showing stratification. Odour, slight; taste, weak.

Identification Place 0.1 g of the powder in a test tube, add 2 ml of hydrochloric acid, shake and allow to stand. To 2 drops of the supernatant, add 2 drops of ammonium thiocyanate TS, a blood-red colour is produced immediately. To another 2 drops of the supernatant, add 1-2 drops of potassium ferrocyanide TS, a blue precipitate is produced, which turns to brown on adding 5-6 drops of 25% sodium hydroxide solution.

Assay Weigh accurately about 0.25 g of the fine powder, carry out the Assay described under Magnetitum. It contains not less than 45.0 per cent of iron (Fe).

Processing *Haematitum* Eliminate foreign matter, break to pieces.

Haematitum (calcined) Calcine the clean Haematitum as described under the method for calcining and quenching (Appendix Ⅱ D) to red thoroughly, quench with vinegar and then grind into coarse powder, using 30 kg of vinegar per 100 kg of Haematitum.

Action To subdue hyperactivity of the liver, relieve vomiting, belching and hiccuping, and arrest bleeding.

Indications Vertigo, tinnitus, vomiting, belching, hiccuping, dyspnea, spitting of blood, epistaxis, abnormal uterine bleeding.

Usage and dosage 9-30 g, decocted first.

Precaution Used with caution in pregnancy.

Halloysitum Rubrum (赤石脂, Chishizhi)

Red Halloysite

Red Halloysite is a mineral of silicates of polyhydrate kaolinite group, containing mainly hydrated aluminium silicate [$Al_4(Si_4O_{10})(OH)_8 \cdot 4H_2O$]. The drug is collected, removed from foreign matter.

Description Aggregates of masses, irregular pieces, pink, red to purplish-red, with patterns alternated with red and white. Texture soft, easily broken. Fracture with waxy lustre, highly hygroscopic. Odour, clay-like; taste, weak, no sandy sensation on chewing.

Processing *Halloysitum Rubrum* Eliminate foreign matter, break or grind to powder.

Halloysitum Rubrum (calcined) To the fine powder add vinegar, stir well and make strips, cut into sections, dry, calcine as described under the method of calcining openly (Appendix Ⅱ D) to red thoroughly. Break to pieces before use.

Action To astringe the intestine, arrest bleeding, and promote growth of new tissues.

Indications Chronic diarrhea, chronic dysentery; hematochezia; abnormal uterine bleeding, leukorrhagia; external use for ulcers difficult to heal, eczema with exudation.

Usage and dosage 9-12 g; appropriate quantity is ground into powder for topical application.

Precaution Incompatible with Cortex Cinnamomi.

Storage Preserve in a dry place, protected from moisture.

Herba Abri
(鸡骨草, Jigucao)

Canton Love-pea Vine

Canton Love-pea Vine is the dried herb of *Abrus cantoniensis* Hance (Fam. Leguminosae). The drug is collected all the year round, removed from soil, and dried.

Description Roots mostly conical, the upper part thick and the lower part thin, branched, varying in length, 0.5-1.5 cm in diameter. Externally greyish-brown, rough, with fine, longitudinal striations, rootlets extremely slender, some fallen off or with remainings; texture hard. Stems caespitose, 50-100 cm long, about 0.2 cm in diameter; greyish-brown to purplish-brown, branchlets slender, sparsely pubescent. Leaves pinnately compound, alternate, leaflets in 8-11 pairs, mostly fallen off, oblong, 0.8-1.2 cm long, apex truncate, mucronulate, the lower surface with pronated hairs. Odour, slightly aromatic; taste, slightly bitter.

Identification (1) Powder: Greyish-green. Non-glandular hairs unicellular, acute or acuminate at the apex, 60-970 μm long, 12-22 μm in diameter, walls 3-6 μm thick, with distinct striations and warty prominences. Stomata paracytic. Fibre bundles surrounded by cells containing prisms of calcium oxalate, forming crystal fibres, walls of crystal cells irregularly thickened. Stone cells subrounded, subsquare or oblong, 16-40 μm in diameter, some with slightly thickened walls. Cork cells yellowish-brown. Prisms of calcium oxalate 5-11 μm in diameter.

(2) To 10 g of the coarse powder add 100 ml of 70% ethanol, heat under reflux on a water bath for 30 minutes and filter. Divide the filtrate into two portions, and evaporate to dryness. Dissolve one portion of the residue in 10 ml of water, filter, to 2 ml of the filtrate add 2 ml of 0.1% solution of ferric chloride in glacial acetic acid, shake well, add 2 ml of sufuric acid slowly along the wall, a reddish-brown colour is produced immediately at the junction of the two layers.

(3) To another portion of the residue obtained under Identification test (2), add 10 ml of 1% hydrochloric acid solution to dissolve and filter. To the residue add 10 ml of 10% sodium hydroxide solution, heat under reflux on a water bath for 30 minutes and allow to cool, transfer the mixture to a separator, extract with 20 ml of ether, separate the ether layer and evaporate to dryness, dissolve the residue in 1 ml of glacial acetic acid, add 1 ml of a mixture containing 19 portions of acetic anhydride and 1 portion of sulfuric acid, a yellow colour is produced and changes gradually to a dull green colour.

Water Not more than 15.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 7.5 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol as the solvent, not less than 6.0 per cent

Processing Eliminate foreign matter and legumes, and cut into sections.

Action To remove toxic *heat*, stagnant relieve the depressed *liver-qi* and alleviate pain.

Indications Jaundice with hypochondriac distress and epigastric distension and pain; acute and chronic hepatitis; mastitis.

Usage and dosage 15-30 g.

Storage Preserve in a dry place.

Herba Agrimoniae
(仙鹤草, Xianhecao)

Hairyvein Agrimonia Herb

Hairyvein Agrimonia Herb is the dried aerial part of *Agrimonia pilosa* Ledeb. (Fam. Rosaceae). The drug is collected in summer and autumn when foliage branch growing luxuriantly, removed from foreign matter, and dried.

Description 50-100 cm long, with white hairs. The lower part of stem cylindrical, 4-6 mm in diameter, reddish-brown, the upper part square, the four sides slightly depressed, greenish-brown, furrowed longitudinally and ridged, nodose; texture light and hard, easily broken, fracture hollowed. Leaves odd-pinnate, alternate, dark green, crumpled and rolled; texture fragile, easily broken; leaflets of two sizes, the small leaflets interposed between the large ones at the leaf axis, the ones at the apex relatively large, when whole, ovate or long-elliptical, acute at the apex, cuneate at the base, margin serrate; stipules 2, amplexicaul, oblique-ovate. Raceme slender, the lower part of calyx tubular, with hooked bristles at the upper part of calyx tube, 5-lobed at the apex, petals yellow. Odour, slight; taste, slightly bitter.

Identification Powder: Dark green. The cells of upper epidermis polygonal and the walls of lower epidermis sinuous, stomata anomocytic or anisocytic. Non-glandular hairs unicellular, varying in length, walls thickened and lignified, with warty prominences, and sparsely with spiral striations. Small glandular hairs composed of an ovoid, 1-4 celled head and a 1-2 celled stalk; a few glandular scales present, composed of an unicellular head, up to 68 μm in diameter, containing volatile oil drops, and an unicellular stalk. Clusters of calcium oxalate fairly abundant, 9-50 μm in diameter.

Processing Remove the remains of roots and foreign matter, wash clean, soften briefly, cut into sections and dry.

Action To arrest bleeding, stop malarial attacks, cure dysentery, and counteract toxicity.

Indications Hemoptysis, hematemesis, abnormal uterine bleeding; malaria; dysentery with bloody stools; overstrain; boils and sores; pudental itching in leukorrhalgia.

Usage and dosage 6-12 g; appropriate quantity for external use.

Storage Preserve in a ventilated and dry place.

Herba Andrographis (穿心莲, Chuanxinlian)

Common Andrographis Herb

Common Andrographis Herb is the dried aerial part of *Andrographis paniculata* (Burm. f.) Nees (Fam. Acanthaceae). The drug is collected in early autumn when foliage branch growing luxuriantly, and dried in the sun.

Description Stems square and frequently branched, 50-70 cm long, nodes slightly swollen; texture fragile, easily broken. Leaves simple, opposite, short petioled or nearly sessile; lamina crumpled and easily broken, when whole, lanceolate or ovate-lanceolate, 3-12 cm long, 2-5 cm wide, with acuminate apex and cuneate-decurrent base, margin entire or undulate; the upper surface green, the lower surface greyish-green, glabrous on both surfaces. Odour, slight; taste, extremely bitter.

Identification (1) Transverse section of leaf: Upper epidermal cells subsquare or rectangular, lower epidermal cells relatively small, both surfaces with crystal cells containing rounded, long-elliptical or clavate cystoliths. Glandular scales and sometimes non-glandular hairs visible. Palisade 1-2 layers of cells, across the upper part of midrib; spongy cells arranged loosely. Vascular bundles of midrib collateral and grooved, crystal cells occurring above the xylem.

Surface view of leaf: Enlarged crystal cells occurring in the upper and lower epidermis, containing large conchoidal cystoliths, up to 36 μm in diameter and 180 μm long, with a hilum-shaped scar in the large end, concentric striations wavy. Stomata more frequent on the lower epidermis, diacytic, sometimes anomocytic, subsidiary cells significantly varying in size. Head of glandular scales oblate, 4,6 (8)-celled, up to 40 μm in diameter, stalk very short. Non-glandular hairs 1-4 celled, up to 160 μm long and 40 μm in diameter, with cuticular striations on the surface.

(2) Use the test solution obtained under the Assay as the test solution. To 0.5 g of Herba Andrographis reference drug add 30 ml of ethanol, ultrasonicate for 30 minutes, filter and concentrate the filtrate to about 5 ml as the reference drug solution. Dissolve dehydroandrographolide CRS and andrographolide CRS in dehydrated ethanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, ethyl acetate and methanol (4 : 3 : 0.4) as the mobile phase. Apply separately to the plate 6 μl of each of the test solution and the reference drug solution and 4 μl of the reference solution. After developing and removal of the plate, dry in air, examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference solution and the reference drug solution. Spray with a mixture of 2% solution of 3,5-dinitro-benzoic acid in ethanol and 2 mol/L potassium hydroxide solution (mixed in equal portions before use), examine in daylight immediately. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference solution and the reference drug solution.

Leaves Not less than 30 per cent.

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using ethanol as the solvent, not less than 8.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (52 : 48) as the mobile phase. As detector a spectrophotometer set at 225 nm for andrographolide and 254 nm for dehydroandrographolide. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peaks of andrographolide and dehydroandrographolide.

Reference solution Dissolve a quantity of andrographolide CRS and dehydroandrographolide CRS, accurately weighed, in methanol to produce two solutions containing 0.1 mg of each per ml.

Test solution Weigh accurately 0.5 g of the powder (through No. 4 sieve), add accurately 25 ml of 40% methanol, weigh, macerate for 1 hour and ultrasonicate (power 250 W, frequency 33 kHz) for 30 minutes, weigh again and compensate the loss of the weight with methanol, mix well and filter. Apply accurately 10 ml of the successive filtrate to a small column (1.5 cm in inner diameter) packed with neutral aluminium oxide (200-300 mesh, 5 g), elute with 15 ml of methanol. Collect the eluate in a 50 ml volumetric flask, dilute with methanol to volume, and mix well.

Procedure Inject accurately 5 μl of each of the test solution and the reference solution, respectively, into the column, and calculate the content.

It contains not less than 0.80 per cent of total amount of andrographolide ($C_{20}H_{30}O_5$) and dehydroandrographolide ($C_{20}H_{28}O_4$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, cut into sections and dry.

Action To remove *heat*, counteract toxicity, and reduce swelling.

Indications Influenza with fever, sore throat, ulcers in the mouth or on the tongue; acute or chronic cough; colitis, dysentery; urinary infection with difficult painful urination; carbuncles, sores, venomous snake bite.

Usage and dosage 6-9 g; appropriate quantity for external use.

Storage Preserve in a dry place.

Preparation Common Andrographis Tablets.

Herba Ardisiae Japonicae (矮地茶, Aidicha)

Japanese Ardisia Herb

Japanese Ardisia Herb is the dried herb of *Ardisa*

japonica (Thunb.) Blume (Fam. Myrsinaceae). The drug is collected in summer and autumn when foliage branch growing luxuriantly, removed from soil, and dried.

Description Rhizomes cylindrical, sparsely with rootlets. Stems somewhat flattened-cylindrical, slightly twisted, 10-30 cm long, 0.2-0.5 cm in diameter; externally reddish-brown, with fine longitudinal striations, leaf scars and nodes; texture hard, easily broken. Leaves alternate, gathered at the tip of stems, lamina slightly crumpled or broken, when whole, ellipsoid, 3-7 cm long, 1.5-3 cm wide, greyish-green, dark brown or pale reddish-brown; acute at the apex, cuneate at the base, margin serrulate; texture nearly leathery. Drupe, red and spheroidal, at the apex of stem occasionally. Odour, slight; taste, slightly astringent.

Identification (1) Transverse section of stem: The walls of epidermal cells thickened, with glandular hairs; cork visible in old stems. Cortex relatively broad, several layers of collenchymatous cells occurring in the outer part of cortex; some cells containing prisms of calcium oxalate; and with secretory cavities. Endodermis distinct. Phloem fairly narrow, a few of fibres at the outside of phloem. Cambium indistinct. Cells of xylem lignified, vessels arranged in single row. Pith relatively large, with secretory cavities. Parenchymatous cells containing prisms of calcium oxalate and starch granules, some containing brown masses.
Surface view of leaf: The anticlinal walls of epidermal cells sinuous; stomata anisocytic, and anomocytic occasionally. Glandular scales with a head consisting of 8-10 cells and an unicellular stalk.
Powder: Dark brown. Spiral vessels relatively frequent, 7.5-25 μm in diameter. Secretory cavities mostly broken, some cavities containing yellowish-brown secretory contents, and some secretory cells containing brown contents. Fibres thick-walled. Prisms of calcium oxalate 7.5-26 μm in diameter. Glandular hairs with a 2-celled head and an unicellular stalk. Stomata anisocytic. Brown masses visible. Starch granules ovate-rounded or rounded, 3.8-23 μm in diameter, hilum dotted or cleft; compound granules consisting of 2-3 components.
(2) To 0.2 g of the powder add 20 ml of methanol, ultrasonicate for 30 minutes, cool, and filter. Concentrate the filtrate to 1 ml as the test solution. Dissolve bergenin CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, and methanol (5 : 4 : 2) as the mobile phase. Apply separately to the plate 3 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with a mixture of 1% ferric chloride solution and 1% potassium ferricyanide solution (1 : 1). The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (20 : 80) as the mobile phase. As detector a spectrophotometer set at 275 nm. The number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of bergenin.

Reference solution Dissolve a quantity of bergenin CRS, accurately weighed, in methanol to produce a solution containing 50 μg of bergenin per ml.

Test solution Weigh accurately 0.2 g of the coarse powder in a conical flask. Add accurately 20 ml of methanol, weigh, ultrasonicate (power 200 W, frequency 40 kHz) for 40 minutes, cool, weigh again, replenish the loss of the weight with methanol, mix well and filter.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.50 per cent of bergenin ($C_{14}H_{16}O_9$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, take out, stand and remove from water, cut into sections, and dry.

Action To resolve phlegm and relieve cough, remove dampness and promote blood circulation.

Indications Acute and chronic cough, bloody phlegm, jaundice due to *damp-heat*, and traumatic injuries.

Usage and dosage 15-30 g.

Storage Preserve in a cool and dry place.

Herba Aristolochiae (天仙藤, Tianxianteng)

Dutchmanspipe Vine

Dutchmanspipe Vine is the dried aerial part of *Aristolochia debilis* Sieb. et Zucc. or *Aristolochia contorta* Bge. (Fam. Aristolochiaceae). The drug is collected in autumn, removed from foreign matter, and dried in the sun.

Description Stems slenderly cylindrical, slightly twisted, 1-3 mm in diameter; externally yellowish-green or pale yellowish-brown, with longitudinal ridges and nodes, internodes varying in length; texture fragile, easily broken, fracture exhibiting several vascular bundles of variable size. Leaves alternate, mostly crumpled and broken, when whole, deltoid-narrow-ovate or deltoid-broad-ovate, and cordate at the base; dark green or pale yellowish-brown; basal ones obviously veined, slenderly petioled. Odour, delicately aromatic; taste, weak.

Identification Transverse section of stem: Epidermal cells subsquare, covered with cuticle. Cortex relatively narrow. Pericyclic fibres with 6-10 and more layers, connected in a ring, walls thickened outside and thinned gradually in the inner part. Vascular bundles, several in variable size. Cambium in a ring. Vessels subrounded, 10-170 μm in diameter. Medullated.

Processing Eliminate foreign matter, cut into sections.

Action To promote the flow of *qi* and blood, and induce urination.

Indications Pricking pain in the epigastrium; arthralgia; edema of pregnancy.

Usage and dosage 4.5-9 g.

Storage Preserve in a dry place, protected from mould.

Herba Artemisiae Annuae (青蒿, Qinghao)

Sweet Wormwood Herb

Sweet Wormwood Herb is the dried aerial part of *Artemisia annua* L. (Fam. Compositae). The drug is collected in autumn at flowering, removed from older stem, and dried in the shade.

Description Stems cylindrical, frequently branched at the upper part, 30-80 cm long, 2-6 mm in diameter; externally yellowish-green or brownish-yellow, with longitudinal ridges; texture slightly hard, easily broken, fracture medullated in the centre. Leaves alternate, dark green or brownish-green, rolled and crumpled, easily broken, when whole, 3-pinnatipartite, the segments and smaller segments oblong or long-elliptical, pubescent on both surfaces. Odour, characteristically aromatic; taste, slightly bitter.

Identification To 3 g of the powder add 50 ml of petroleum ether (60-90℃), heat under reflux for 1 hour, filter, evaporate the filtrate to dryness, dissolve the residue in 30 ml of *n*-hexane. Extract with three 10-ml quantities of 20% acetonitrile solution, evaporate the combined extracts to dryness. Dissolve the residue in 0.5 ml of ethanol as the test solution. Dissolve artemisinin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ether (3 : 2) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots clear. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 14.0 per cent (Appendix Ⅸ H, method 1).

Tatal ash Not more than 8.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the cold maceration method), using anhydrous ethanol as the solvent, not less than 1.9 per cent.

Processing Eliminate foreign matter, spray with water, soften briefly, cut into sections, and dry in the sun.

Action To remove summer-heat, relieve consumptive fever, and stop malarial attacks.

Indications Fever caused by summer-heat; afternoon fever in deficiency *of yin* or in consumptive diseases; malaria with chills and fever; jaundice.

Usage and dosage 6-12 g, added to the decoction when it is nearly done.

Storage Preserve in a cool and dry place.

Herba Artemisiae Scopariae (茵陈, Yinchen)

Virgate Wormwood Herb

Virgate Wormwood Herb is the dried aerial part of *Artemisia scoparia* Waldst. et Kit. or *Artemisia capillaris* Thunb. (Fam. Compositae). The drug is collected in spring when the seedling is 6-10 cm high, or in autumn when the bud is forming, removed from foreign matter and older stem, and dried in the sun. The drug collected in spring is known as "Mianyinchen" and that collected in autumn is known as "Yinchenhao".

Description *Mianyinchen* Mostly rolled into masses, greyish-white, or greyish-green, densely covered with white pubescences throughout, soft like a nap. Stems thin and small, 1.5-2.5 cm long, 1-2 mm in diameter, longitudinal striations distinct after removing the white pubescences on the surface; texture fragile, easily broken. Leaves petioled, when whole, 1-3 pinnatipartisect, lamina 1-3 cm long, about 1 cm wide; segments ovoid or slightly oblanceolate, stripe-shaped, apex acute. Odour, delicately aromatic; taste, slightly bitter.

Yinchenhao Stems cylindrical, frequently branched, 30-100 cm long, 2-8 mm in diameter; externally pale purple or purple, striated longitudinally, pubescent; texture light, fragile, fracture almost white. Leaves densely gathered, or mostly fallen off. Basal leaves 2-3 pinnatipartite, segments stripe-shaped or finely stripe-shaped, densely covered with white pubescences on both surfaces; cauline leaves 1-2 pinnatipartisect, amplexicaul at the base, segments filamentous; capitulum ovoid, mostly gathered in conical, 1.2-1.5 mm long, 1-1.2 mm in diameter, short petioled; involucres 3-4 layers, ovoid, bracts 3-lobed; the outer female flowers 6-10, some times up to 15, the inner bisexual flowers 2-10; achenes oblong, yellowish-brown. Odour, aromatic; taste, slightly bitter.

Processing Eliminate remains of roots and foreign matter, rub or cut into pieces. For Mianyinchen, sift to remove dust.

Action To remove *damp-heat* and relieve jaundice.

Indications Infectious icteric hepatitis; sores with exudation and itching.

Usage and dosage 6-15 g; for external use, a decoction is made for fumigation and washing.

Storage Preserve in a cool and dry place, protected from moisture.

Herba Belladonnae (颠茄草, Dianqiecao)

Belladonna Herb

Belladonna Herb is the dried herb of *Atropa belladonna* L. (Fam. Solanaceae). The drug is collected from flowering to fruiting, removed from thick stem and soil, cut into section, and dried.

Description Roots cylindrical, 5-15 mm in diameter, externally pale greyish-brown, with longitudinal wrinkles; old roots ligneous, rootlets easily broken, fracture even,

bark narrow, greyish-white, wood broad, brownish-yellow, cambium ring obvious. Pith white. Stems flattened-cylindrical, 3-6 mm in diameter, externally yellowish-green, with fine longitudinal wrinkles and fine dotted leniticels sparsely, hollowed, young stems pubescent. Leaves often crumpled and broken, when whole, ovate-elliptical, yellowish-green to dark brown. Calyx with five lobes, corolla campanulate. Fruits spheroidal, 5-8 mm in diameter, with long stalk and numerous seeds. Odour, slight; taste, slightly bitter and pungent.

Identification (1) Powder: Pale green or pale brownish-green. Sandy crystals of calcium oxalate numerous, 3-10 μm in diameter, some sandy crystal cells containing cluster of crystals, 15-28 μm in diameter. Leaf epidermal cells with sinuous anticlinal walls and striated cuticle; stomata anisocytic. Glandular hairs, with an unicellular head and a 2-4 celled stalk, or with a 5-6 celled head and an unicellular stalk. Starch granules abundant, subrounded, cucullate or polygonal, 8-26 μm in diameter, hilum pointed or cleft, with distinct striations in large granules. Bordered pitted and reticulate vessels, 24-40 μm in diameter. Wood fibres, sinuous stone cells of testa and pollen grains visible.
(2) To 4 g of the powder add 15 ml of ethanol, shake for 15 minutes and filter. Evaporate the filtrate to dryness, add 2 ml of sulfuric acid solution (1→100), filter after stirring. Make the filtrate alkaline with ammonia TS, then extract with 2 ml of chloroform, separate the chloroform solution and evaporate to dryness. The residue yields the characteristic reactions of tropane alkaloids (Appendix Ⅳ).
(3) To 2 g of the powder add 2 ml of concentrated ammonia TS, mix well, add 25 ml of chloroform, shake well, allow to stand overnight and filter. Evaporate the filtrate to dryness, dissolve the residue in 0.5 ml of chloroform as the test solution. Dissolve atropine sulfate CRS and scopolamine hydrobromide CRS in methanol to produce a mixture containing 4 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, methanol and concentrated ammonia TS (17 : 2 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the test solution and the reference solution. After developing and removal of the plate, dry in air. Spray with dilute potassium iodobismuthate TS. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Foreign matter Not more than 4 per cent of leaves with abnormal colour (yellow, brown or almost black); not more than 3 per cent of stems with a diameter exceeding 1 cm (Appendix Ⅸ A).

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Assay Place about 10 g of moderately coarse powder, accurately weighed, in a Soxhlet's extractor, add a quantity of a mixture of 10 ml of ethanol, 8 ml of concentrated ammonia TS and 20 ml of ether, and allow to stand for 12 hours. Heat under reflux with 70 ml of ether for 3 hours until complete extraction of the alkaloids is effected. Evaporate the extract to remove most of ether on a water bath, transfer to a separator and extract the solution with several 10-ml portions of sulfuric acid solution (0.5 mol/L), until complete extraction of the alkaloids is effected. Combine the acid solutions and extract with several 10-ml portions of chloroform, until the chloroform layer is colourless. Combine the chloroform solutions, and extract with 10 ml of sulfuric acid solution (0.5 mol/L). Discard the chloroform solution, combine the above acid solutions, filter, wash the filter with sulfuric acid solution (0.5 mol/L). Combine washings and filtrate, make the solution alkaline by adding excess of concentrated ammonia TS, and extract rapidly with several quantities of chloroform, until complete extraction of the alkaloids is effected. If emulsification is produced, several drops of ethanol may be added. Wash the chloroform solutions consequently with the same portion of 10 ml of water, and discard the washings. Combine the chloroform solutions, evaporate to dryness on a water bath, add 3 ml of ethanol, evaporate to dryness again and dry at 80℃ for 2 hours. Add 2 ml of chloroform to the residue, and dissolve the residue by gentle heating if necessary. Add accurately 20 ml of sulfuric acid (0.01 mol/L) VS, heat on a water bath to remove chloroform, allow to cool, add 1-2 drops of methyl red IS and titrate with sodium hydroxide (0.02 mol/L) VS. Each ml of sulfuric acid (0.01 mol/L) VS is equivalent to 5.788 mg of hyoscyamine ($C_{17}H_{23}NO_3$).
It contains not less than 0.30 per cent of total alkaloids, calculated as hyoscyamine ($C_{17}H_{23}NO_3$), with reference to the dried drug

Action Anticholinergics.

Storage Preserve in a dry place.

Preparation (1) Belladonna Extract
(2) Belladonna Liquid Extract
(3) Belladonna Tincture

Herba Centellae
(积雪草, Jixuecao)

Asiatic Pennywort Herb

Asiatic Pennywort Herb is the dried herb of *Centella asiatica* (L.) Urb. (Fam. Umbelliferae). The drug is collected in summer and autumn, removed from soil, and dried in the sun.

Description Frequently crumpled into masses. Roots cylindrical, 2-4 cm long, 1-1.5 mm in diameter, externally pale yellow or greyish-yellow. Stems slender and curved, yellowish-brown, finely striated longitudinally, frequently with fibrous roots on the nodes. Leaves mostly crumpled and broken, when whole, subrounded or reniform, 1-4 cm in diameter, greyish-green, margin roughly crenate; petioles 3-6 cm long, twisted. Umbels axillary, small. Cremocarps oblate, with distinctly prominent, longitudinal ridges and fine reticulate striations, fruit stalks very short. Odour, slight; taste, weak.

Identification (1) Transverse section of stem: Epidermal cells subround or subsquare, occurring 2-4 layers of collenchymatous cells beneath. Collateral vascular bundles 6-7; slightly lignified fibre groups occurring in the outside of phloem. Fascicular cambium of 2-3 layers of small cells; xylem vessels radically arranged. Pith large. Secretory canals observed in cortex and rays, 23-24 μm in diameter, composed of 5-7 secretory cells.
Surface view of leaf: Upper and lower epidermal cells polygonal, stomata anomocytic or anisocytic, more frequently observed on the lower epidermis.
(2) Heat under reflux 1 g of the powder with 25 ml of ethanol for 30 minutes, filter, evaporate the filtrate to dryness. Dissolve the residue in 20 ml of water, extract with two 15-ml quantities of *n*-butanol saturated with water by shaking, combine the *n*-butanol extracts, wash with 15 ml of water saturated with *n*-butanol, discard the water solution, and evaporate the *n*-butanol solution to dryness.

Dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of asiaticoside CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (7 : 3 : 0.5) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Tatal ash Not more than 13.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.5 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol TS as the solvent, not less than 25.0 per cent.

Processing Eliminate foreign matter, wash clean, cut into sections, and dry in the sun.

Action To remove *heat* and *dampness*, to counteract *toxicity*, and reduce swelling.

Indications Jaundice caused by *damp-heat*; heat-stroke with diarrhea; urolithiasis and hematuria; carbuncles and boils, traumatic injuries.

Usage and dosage 15-30 g; or 30-60 g of the fresh herb.

Storage Preserve in a dry place.

Herba Centipedae (鹅不食草, Ebushicao)

Small Centipeda Herb

Small Centipeda Herb is the dried herb of *Centipeda minima* (L.) A. Br. et Aschers. (Fam. Compositae). The drug is collected at flowering in summer and autumn, removed from soil, and dried in the sun.

Description Tangled into masses. Rootlets fine, pale yellow. Stems slender, frequently branched; texture fragile, easily broken, fracture yellowish-white. Leaves small, nearly sessile; lamina mostly crumpled and broken, when whole, spatulate, externally greyish-green or brown, margin 3-5 dentate. Capitulum yellow or yellowish-brown. Odour, slightly aromatic, irritant on smelling longer; taste, bitter, slightly pungent.

Identification Powder: Greyish-green to greyish-brown. Epidermal cells of stem rectangular or subpolygonal, walls slightly thickened, with indistinct cuticular striations on the surface, stomata visible. Epidermal cells of leaf subpolygonal, anticlinal walls thin and sinuous in surface view, stomata anomocytic, subsidiary cells 4-6. Glandular hairs paramecium-like in surface view, cells arranged in pairs, containing yellow contents. Epidermal cells of corolla yellow, rectangular or subpolygonal in surface view, projected to be tomentellate with cuticular striations on the surface. Non-glandular hairs on the epidermis of corolla biseriate, one unicellular, slightly short, the other bicellular, the base cell slightly short, hooked or rolled at the apex and with fine cuticular striations on the surface of 2/3 of upper part. Pollen grains pale yellow, subrounded, 15-22 μm in diameter, with 3 germinal furrows, exine spiny.

Total ash Not more than 17.0 per cent (Appendix Ⅸ K).

Processing Eliminate foreign matter, cut into sections and dry.

Action To relieve nasal obstruction and cough.

Indications Headache, cough, expectoration and nasal obstruction in colds; sinusitis with nasal discharge.

Usage and dosage 6-9 g; appropriate quantity for external use.

Storage Preserve in a ventilated and dry place.

Herba Cichorii Radix Cichorii (菊苣, Juju)

Chicory herb; Chicory root

Chicory Herb and Chicory Root is the aerial part or root of *Cichorium glandulosum* Boiss. et Hoet or *Cichorium intybus* L. (Fam. Compositae), habitually used by the Uygur nationality. Chicory Herb is collected in summer and autumn; Chicory Root is collected in later autumn, removed from soil and foreign matter, and dried in the sun.

Description *Herb of Cichorium glandulosum* Stems cylindrical, slightly curved, externally greyish-green or purplish, with longitudinal ridges, pubescent or setaceous; fracture yellowish-white, hollowed. Leaves mostly broken, greyish-green, pubescent on both surfaces; intact leaves at the middle part of stem oblong, sessile, half amplexicaul, become smaller gradually upwards, amplexicaul in ear shape, margin spiny. Capitulum 5-13 arranged into short raceme. Involucre campanulate, 5-6 mm in diameter; bracts 2 layers, outer layer slightly short or nearly equal in length, pubescent; ligulate florets blue. Achenes obovate, with ridges and sinuous striations, apex truncate, covered with scaly aigrets, 0.8-1 mm long, brown or dark brown, with densely distributed dark brown spots. Odour, slight; taste, salty and slightly bitter.

Root of Cichorium glandulosum Main roots conical, with branched roots and numerous rootlets, 10-20 cm long, 0.5-1.5 cm in diameter, externally brownish-yellow, with fine irregular longitudinal wrinkles. Texture hard, uneasily broken; fracture yellowish-white at the outside, almost white in the centre, sometimes hollowed. Odour, slight; taste, bitter.

Herb of Cichorium intybus Stems nearly glabrous. Cauline leaves sparse, oblong-lanceolate. Capitulum sparse, clustered; the outer bracts shorter than the inners, glabrous or sparsely pubescent at the apex. Achenes scaly, aigrets short, 0.2-0.3 mm long.

Root of Cichorium intybus Sometimes 2-3 branched at the upper part, externally greyish-brown to brown, rough, with deep longitudinal striations, outer bark often fallen off, showing brown to dark brown inside. Branch roots and rootlets seldom. Flexible on chewing.

Identification (1) Transverse section of stem:

Cichorium glandulosum Epidermis sometimes with polycellular glandular hairs. Collenchymatous cells occurring under

epidermis at the ridges, with yellowish-brown contents; Casparian dots on endodermis distinct, pericycle fibres underdeveloped, vascular bundles collateral, about 20-25, cambium distinct; vessels subround, scattered singly or several arranged in rings, 8-50 μm in diameter.

Cichorium intybus Pericycle fibres relatively developed, vessels several or ten and more grouped, and arranged in rings interruptedly.

Transverse section of root:

Cichorium glandulosum Cork consisting of 2-3 layers of cells, brownish-yellow; phloem ray in single row; cambium distinct, xylem vessels scattered or 2-6 radically arranged, xylem rays 1-6 cells wide, thin-walled, pits distinct.

Cichorium intybus Cortex narrow; about half of the transverse section occupied by xylem.

(2) Ultrasonicate 1 g of the powder with 30 ml of petroleum ether (60-90℃) for 30 minutes, filter, remain the residue for the next test and evaporate the filtrate to dryness, dissolve the residue in 1 ml of a mixture of ethyl acetate and methanol (1 : 1) as the test solution. Prepare a solution with 1 g of Herba Cichorii or Radix Cichorii reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and dichloromethane (1 : 4) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Ultrasonicate the drug residue obtained under Identification (2), removed of petroleum ether, with 30 ml of ethyl acetate for 30 minutes, filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of a mixture of ethyl acetate and methanol (1 : 2) as the test solution. Prepare a solution with 1 g of Herba Cichorii or Radix Cichorii reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of dichloromethane and methanol (9 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Then spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear, the spots showing same colour.

Water Not more than 10.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using 55% ethanol as the solvent, not less than 10.0 per cent.

Processing Eliminate foreign matter, and cut into sections.

Action To remove *heat* from the liver, stimulate bile secretion, promote digestion and whet appetite, and cause diuresis.

Indications Jaundice caused by *damp-heat*; epigastric pain with impairment of appetite; edema with oliguria.

Usage and dosage 9-18 g.

Storage Preserve in a cool and dry place.

Herba Cirsii
(小蓟, Xiaoji)

Field Thistle Herb

Field Thistle Herb is the dried aerial part of *Cirsium setosum* (Willd.) MB. (Fam. Compositae). The drug is collected in summer and autumn at flowering, removed from foreign matter, and dried in the sun.

Description Stems cylindrical, sometimes branched at the upper part, 5-30 cm long, 2-5 mm in diameter; externally greyish-green or purplish, with longitudinal ridges and white pubescences; texture fragile, easily broken, fracture hollowed. Leaves alternate, sessile or short petioled; lamina crumpled or broken, when whole, long-elliptical or oblong-lanceolate, 3-12 cm long, 0.5-3 cm wide; margin entire or serrulate to pinnatipartite, the tips of serrations spinescent; the upper surface greenish-brown and the lower surface greyish-green, white-pubescent on both surfaces. Capitulum solitary or several terminal, involucres campanulate, bracts 5-8 layers, yellowish-green; flowers purplish-red. Odour, slight; taste, slightly bitter.

Identification (1) Surface view of leaf: The upper epidermal cells polygonal, with straight anticlinal walls and markedly striated cuticle; the lower epidermal cells with sinuous walls; stomata and non-glandular hairs occurring on both surfaces. Stomata anomocytic or anisocytic. Non-glandular hairs 3-10 or more celled, with a slender whip-shaped apical cell, shrunken and twisted. Mesophyll cells containing crystals of calcium oxalate, mostly raphides.

(2) To 1 g of the powder add 10 ml of methanol, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Prepare a solution with 1 g of Herba Cirsii reference drug in the same manner as the reference drug solution. Dissolve rutin CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide as the coating substance and a mixture of ethyl acetone, butanone, ethanol, and water (1 : 3 : 3 : 13) as the mobile phase, Apply separately to the film 2 μl of each of the above three solutions. After developing and removal of the film, dry in air. Spray with aluminium trichloride TS, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution.

Foreign matter Not more than 2 per cent (Appendix Ⅹ A).

Water Not more than 12.0 per cent. (Appendix Ⅸ H, method 1).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol TS as the solvent, not less than 19.0 per cent.

Processing *Herba Cirsii* Eliminate foreign matter, wash clean, soften briefly, cut into sections and dry.

Herba Cirsii (*carbonized*) Stir-bake the sections of *Herba Cirsii* as described under the method for carbonizing by stir-baking (Appendix Ⅱ D) until it becomes blackish-brown.

Action To arrest bleeding by reducing *heat* in blood, and remove blood stasis and reduce swelling.

Indications Epistaxis, spitting of blood, hematuria, hematochezia, abnormal uterine bleeding, traumatic bleeding; carbuncles and sores.

Usage and dosage 4.5-9 g; appropriate quantity of the fresh herb pounded for topical application.

Storage Preserve in a ventilated and dry place.

Herba Cirsii Japonici (大蓟, Daji)

Japanese Thistle Herb

Japanese Thistle Herb is the dried aerial part of *Cirsium japonicum* DC. (Fam. Compositae). The drug is collected at flowering in summer and autumn, removed from foreign matter, and dried in the sun.

Description Stems cylindrical, base up to 1.2 cm in diameter; externally greenish-brown or dark brown, with several longitudinal ridges and filamentous hairs; fracture greyish-white, pith lax or hollowed. Leaves crumpled, mostly broken, when whole, lamina oblanceolate or obovate-elliptical, pinnatipartite, margin with unequal spines; the upper surface greyish-green or yellowish-brown and the lower surface lighter in colour, with greyish-white filamentous hairs on both surfaces. Capitulum terminal, globose or elliptical, involucre yellowish-brown, feathery pappus greyish-white. Odour, slight; taste, weak.

Identification (1) Surface view of leaf: The upper epidermal cells polygonal; the lower epidermal cells subrectangular, anticlinal walls sinuous. Stomata anomocytic or anisocytic, subsidiary cells 3-5. Non-glandular hairs 4-18 celled, the apical cells slender and twisted, about 7 μm in diameter, walls with crisscross striated cuticle.
(2) To 1 g of the powder add 10 ml of methanol, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Prepare a solution with 1 g of Herba Cirsii Japonici reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide as the coating substance and a mixture of acetyl acetone, butanone, ethanol and water (1∶3∶3∶13) as the mobile phase. Apply separately to the film 1-2 μl of each of the above two solutions. After developing and removal of the film, dry in air. Spray with aluminium trichloride TS, and dry in air. Examine under ultraviolet light at 365 nm. The main fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Foreign matter Not more than 2 per cent. (Appendix Ⅸ A).

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol TS as the solvent, not less than 15.0 per cent

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% phosphoric acid solution (21∶79) as the mobile phase. As detector a spectrophotometer set at 330 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of pectolinarin.

Reference solution Dissolve a quantity of pectolinarin CRS, accurately weighed, in 70% ethanol to produce a solution containing 55 μg of pectolinarin per ml as the reference solution.

Test solution Weigh accurately 0.5 g of the coarse powder (through No. 3 sieve) in a conical flask. Add accurately 100 ml of 70% ethanol, weigh, heat under reflux on a water bath for 1 hour, cool, weigh again, replenish the loss of the weight with 70% ethanol, mix well and filter.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.20 per cent of pectolinarin ($C_{28}H_{34}O_{15}$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash or soften, cut into sections, and dry at a lower temperature.
The sections in 1.5-2 cm, externally greenish-brown, with several longitudinal ridges and filamentous hairs; fracture greyish-white, pith lax or hollowed. Leaves crumpled, mostly broken, margin with unequal spines; with greyish-white filamentous hairs on both surfaces. Capitulum mostly broken. Odour, slight; taste, weak.
Carry out Identification test (2) described as above, showing the same result. Carry out the Water described as above, not more than 13.0 per cent. Carry out the Assay described as above, it contains not less than 0.20 per cent of pectolinarin ($C_{28}H_{34}O_{15}$), calculated with reference to the dried drug.

Action To arrest bleeding by reducing *heat* in blood, remove blood stasis, and reduce swelling.

Indications Epistaxis, spitting of blood, hematuria, hematochezia, abnormal uterine bleeding, traumatic bleeding; carbuncles and sores.

Usage and dosage 9-15 g; appropriate quantity of the fresh herb is pounded into paste and applied topically.

Storage Preserve in a ventilated and dry place.

Herba Cirsii Japonici Carbonisatus (大蓟炭, Dajitan)

Carbonized Japanese Thistle Herb

The drug is the processed Herba Crisii Japonici.

Procedure Carbonize by stir-baking the sections of Herba Cirsii Japonici as described under the method for carbonizing by stir-baking (appendix Ⅱ D) until the surface of the drug becomes charred black.

Description Sections 1.5-2 cm long. Externally black. Texture lax and fragile, fracture brownish-black. Odour, agreeable burnt smelling.

Identification To 2 g of the powder add 30 ml of 70% ethanol, ultrasonicate for 30 minutes, and filter. Evaporate

the filtrate to dryness, and dissolve the residue in 2 ml of 70% ethanol as the test solution. Prepare a solution with 1 g of Herba Cirsii Japonici reference drug and 10 ml of 70% ethanol in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide as the coating substance and a mixture of acetone and water (1 : 1) as the mobile phase. Apply separately to the film 1-2 μl of each of the above two solutions. After developing and removal of the film, dry in air. Spray with 0.1% aluminium trichloride in ethanol, and dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Not more than 10.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 15.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 4.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), not less than 13.0 per cent.

Indications Epistaxis, hematemesis, hematuria, hemafacia, metrorrhagia, and traumatic bleeding.

Usage and dosage 5-10 g, mostly used in the form of pills or powder.

Storage Preserve in a cool and dry place.

Herba Cissampelotis (亚乎奴, Yahunu)

Common Cissampelos Herb

Common Cissampelos Herb is the dried whole plant of *Cissampelos pareira* L. var. *hirsuta* (Buch. ex DC.) Forman (Fam. Menispermaceae), commonly used by the Dai nationality. The drug is collected in spring and summer, removed from soil, and dried in the sun.

Description Roots flattened-cylindrical, mostly curved, varying in length, about 1 cm in diameter; externally brown or dark brown, with wrinkles and rootlet scars; fracture withered. Stolons cylindrical, nodes slightly swollen, usually bearing root scars or rootlets; externally brown, internodes showing twisted-revolving longitudinal furrows, easily broken, dusting on breaking, fracture with radiate striations, twinning stems slender, branched, externally yellowish-brown tomentose. Leaves alternate, petioled, nearly peltate; lamina mostly crumpled, when whole, cordate-oblate, retuse and mucronulate at the apex, sparsely white pubescent on the upper surface and densely brownish-yellow tomentose on the lower surface. Odour, slight; taste, bitter and slightly sweet.

Identification (1) Powder: Greyish-brown. Starch granules abundant, simple grains rounded, semirounded or polygonal, 2-21 μm in diameter, hilum pointed or cleft; compound granules of 2-4 components. Stone cells numerous, pale yellow, subsquare, elliptical or polygonal, 30-65 μm in diameter; and subfusiform, 80-180 μm long. Bordered pitted vessels 24-140 μm in diameter. Fibres slender, up to 1000 μm long, about 24 μm in diameter, walls thickened and lignified. Prisms of calcium oxalate relatively few, very small. Non-glandular hairs 1-5 celled, 220-1260 μm long. (2) Macerate 5 g of the powder with 40 ml of ethanol for 2 hours and filter. Evaporate about 20 ml of the filtrate to dryness, dissolve the residue in dilute acetic acid, add a quantity of water and transfer to a separator. Make alkaline with ammonia TS and extract with chloroform. Separate the chloroform solution and extract with dilute acetic acid. To 2 ml of the acetic acid solution, add 2 drops of mercuric potassium iodide TS; a reddish-brown precipitate is produced. To another 2 ml of acetic acid solution, add 2 drops of potassium iodobismuthate TS; a reddish-brown precipitate is produced.

Action To reduce swelling and pain, arrest bleeding, and promote the growth of new tissues.

Indications Traumatic swelling, pain and bleeding.

Usage and dosage For traumatic swelling and pain, appropriate quantity of the dried powder is applied topically after mixing with alcohol or egg white; for traumatic bleeding, appropriate quantity of the dried powder is applied externally, 1 time a day.

Storage Preserve in a dry place.

Herba Cistanches (肉苁蓉, Roucongrong)

Desertliving Cistanche

Desertliving Cistanche is the dried fleshy stem with scales of *Cistanche deserticola* Y. C. Ma or *Cistanche tubulosa* (Schrenk) Wight (Fam. Orobanchaceae). The drug is collected before or at emerging in spring, removed from the inflorescences, cut into sections, and dried in the sun.

Description *Herb of Cistanche deserticola* Flattened-cylindrical, slightly curved, 3-15 cm long, 2-8 cm in diameter. Externally dark brown or greyish-brown, densely covered with imbricated fleshy scales, the apex of scales usually broken. Texture heavy, hard and slightly pliable, uneasily broken, fracture dark brown, with brownish dotted vascular bundles, arranged in sinuous rings. Odour, slight; taste, sweet and slightly bitter.

Herb of Cistanche tubulosa Subfusiform, flattened-fusiform, and flattened-cylindrical, slightly curved, 5-25 cm long, 2.5-9 cm in diameter. Externally dark brown. Fracture granular, greyish-brown, scattered with dotted vascular bundles.

Identification To 1 g of the powder add 20 ml of methanol, ultrasonicate for 15 minutes, and filter. Evaporate the filtrate to almost dryness, dissolve the residue in 2 ml of methanol as the test solution. Dissolve echinacoside CRS and verbascoside CRS in methanol to produce solutions containing 1 mg of each per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide as the coating substance and a mixture of methanol, acetic acid and water (2 : 1 : 7) as the mobile phase. Apply separately to the film 2 μl of each of the above three solutions. After developing and removal of the film, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Water Not more than 10.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.5 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the cold maceration method), using ethanol as the solvent, not less than 28.0 per cent.

Assay ***Herb of Cistanche deserticola*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, methanol and 1% solution of acetic acid (10 : 15 : 75) as the mobile phase. As detector a spectrophotometer set at 334 nm. The number of theoretical plates of the column is not less than 4000, calculated with reference to the peak of echinacoside.

Reference solution Dissolve a quantity of echinacoside CRS and verbascoside CRS, accurately weighed, in the mobile phase to produce two solutions containing 0.14 mg of echinacoside and 0.10 mg of verbascoside per ml as the reference solutions.

Test solution Weigh accurately 0.5 g of the coarse powder (through No. 4 sieve) in a 50 ml amber volumetric flask. Add accurately 25 ml of the mobile phase, weigh, and macerate for 30 minutes. Ultrasonicate (power 230 W, frequency 35 kHz) for 40 minutes, cool, weigh again, replenish the loss of the weight with the mobile phase, mix well and centrifuge, filter the supernatant with a 0.45 μm film membrane, store the filtrate in an amber flask as the test solution.

Procedure Inject accurately 2-10 μl of the reference solutions and 10-20 μl of the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.30 per cent of the total amount of echinacoside ($C_{35}H_{46}C_{20}$), and verbascoside ($C_{29}H_{36}O_{15}$), calculated with reference to the dried drug.

Herb of Cistanche tubulosa Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 1% solution of formic acid (28 : 5 : 71.5) as the mobile phase. As detector a spectrophotometer set at 330 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of echinacoside.

Reference solution Dissolve a quantity of echinacoside CRS, accurately weighed, in 60% methanol in an amber volumetric flask to produce a solution containing 0.2 mg of echinacoside per ml as the reference solution.

Test solution Weigh accurately 1 g of the coarse powder (through No. 4 sieve) in a 100 ml amber volumetric flask. Add accurately 50 ml of 50% methanol, stopper well, weigh, and macerate for 30 minutes. Ultrasonicate (power 230 W, frequency 35 kHz, below 50℃) for 50 minutes, cool, weigh again, replenish the loss of the weight with 50% methanol, mix well and filter, and store the filtrate in an amber flask.

Procedure Inject accurately 10 μl of the reference solution and 5-10 μl of the test solution, respectively, into the column, and calculate the content.
It contains not less than 1.0 per cent of echinacoside ($C_{35}H_{46}C_{20}$), calculated with reference to the dried drug.

Processing *Herb of Cistanche deserticola* (*sliced*) Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices and dry.
Slices irregular, about 3 mm thick. Externally brown or greyish-brown. Sometimes bearing fleshy scales. Cut surface yellowish-brown, greyish-brown or brown, with pale brown or brownish-yellow dotted vascular bundles, arranged irregularly in sinuous rings or scattered in stripes.
Odour, slight; taste, sweet and slightly bitter.
Carry out Identification test described as above, using 1.5 g, showing the same result.

Herb of Cistanche deserticola (*processed with wine*) Stew or steam the slices as described under the method for stewing with wine or steaming with wine (Appendix Ⅱ D) until the wine absorbed entirely.

Herb of Cistanche tubulosa (*sliced*) Eliminate foreign matter, wash clear, soften thoroughly, cut into thick slices and dry.
Slices irregular, about 3 mm thick. Externally brown to dark brown, cut surface scattered with dotted vascular bundles.

Action To reinforce the kidney, replenish *essence* and blood, and induce laxation.

Indications Impotence, infertility; general weakness with aching of the lower back and knees; constipation.

Usage and dosage 6-9 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Herba Clinopodii (断血流, Duanxueliu)

Clinopodium Herb

Clinopodium Herb is the dried aerial part of *Clinopodium polycephalum* (Vaniot) C. Y. Wu et Hsuan or *Clinopodium chinensis* (Benth.) O. Kuntze (Fam. Labiatae). The drug is collected before flowering in summer, removed from soil, and dried in the sun.

Description Stems square, furrowed on four sides, branches opposite, 30-90 cm long, 1.5-4 mm in diameter, the upper part densely covered with greyish-white pubescences, the lower part sparsely pubescent or nearly glabrous, internodes 2-8 cm long, externally greyish-green or greenish-brown; texture fragile, easily broken, fracture uneven, medullated or hollowed in the centre. Leaves opposite, petioled, mostly crumpled and broken, when whole, ovate, 2-5 cm long, 1.5-3.2 cm wide, margin sparsely serrate, the upper surface greenish-brown, the lower surface greyish-green, both surfaces densely covered with white pubescences. Odour, slightly aromatic; taste, astringent and slightly bitter.

Identification (1) Surface view of leaf: Anticlinal walls of epidermal cells sinuous; stomata diacytic; non-glandular hairs slender, numerous, 1-9-celled, up to 1440 μm long, some basal cells expanded, up to 102 μm in diameter, cells of the middle part 10-55 μm in diameter, some cells constricted and with warty prominences on the surface; glandular scales with a 7-11-celled head, up to 60 μm in diameter, and an unicellular, very short stalk; small glandular hairs with an unicellular head, about 20 μm in diameter, and an unicellular stalk.
(2) Heat under reflux 1 g of the powder with 10 ml of methanol for 30 minutes, filter. Evaporate the filtrate to

dryness, dissolve the residue in 10 ml of water. Extract with two 10-ml quantities of ether by shaking, discard the ether solutions. Extract with two 10-ml quantities of *n*-butanol saturated with water by shaking, combine the *n*-butanol extracts, evaporate to dryness, and dissolve the residue in 1 ml of methanol. Apply the solution to a small column (1.0-1.5 cm in inner diameter) packed with neutral aluminium oxide (100-120 mesh, 5 g). Elute with 40 ml of 40% methanol, collect the eluate and evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve buddlejasaponin Ⅳ b CRS in methanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol, glacial acetic acid and water (7 : 2.5 : 1 : 0.5) as the mobile phase. Apply separately to the plate 4 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 110℃ to the spots clear. A brownish-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. Examine under ultraviolet light at 365 nm, the spots showing same brownish-red fluorescence.

Water Not more than 10.0 per cent (Appendix Ⅸ H, method 1).

Tatal ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Processing Eliminate foreign matter, soften briefly with water, cut into sections, and dry in the sun.

Action To arrest bleeding.

Indications Excessive menstrual blood, hematuria, epistaxis, gingival bleeding, traumatic bleeding; hemorrhage from hysteromyoma.

Usage and dosage 9-15 g; appropriate quantity is ground into powder or the fresh herb is pounded into paste for topical application.

Storage Preserve in a dry place, protected from moisture.

Preparation Clinopodium Tablets.

Herba Commelinae (鸭跖草, Yazhicao)

Common Dayflower Herb

Common Dayflower Herb is the dried aerial part of *Commelina communis* L. (Fam. Commelinaceae). The drug is collected in summer and autumn, and dried in the sun.

Description Up to 60 cm long, yellowish-green or yellowish-white, relatively smooth. Stems with longitudinal ridges, about 2 mm in diameter, frequently branched or with fibrous roots, nodes slightly swollen, internodes 3-9 cm long; texture soft, fracture medullated in the centre. Leaves alternate, frequently crumpled and broken, when whole, lamina ovate-lanceolate or lanceolate, 3-9 cm long, 1-2.5 cm wide; apex acute, margin entire, base decurrent, forming membranous sheath and amplexicaul, veins parallel. Flowers often fallen off, involucre spathe-like, cordate, both sides divided; petals crumpled, blue. Odour, slight; taste, weak.

Identification Surface view of leaf: Non-grandular hairs of two types, both bicellular, one type short conical, 45-60 μm long, walls relatively thick, basal cell about 45 μm in diameter, apical cell short pointed; another type clavate, basal cell 45-60 μm long, walls slightly thick, apical cell relatively long, the apex obtusely rounded, thin-walled, often fallen off. Needle crystals of calcium oxalate abundant, up to 74 μm long.

Processing Eliminate foreign matter, wash clean, cut into sections, and dry in the sun.

Action To remove toxic *heat*, and cause diuresis.

Indications Upper respiratory infection with high fever and sore throat; edema, acute urinary infection with painful difficult urination; carbuncles and boils.

Usage and dosage 15-30 g; 60-90 g of the fresh herb; appropriate quantity for external use.

Storage Preserve in a ventilated and dry place, protected from mould.

Herba Corydalis Bungeanae (苦地丁, Kudiding)

Bunge Corydalis Herb

Bunge Corydalis Herb is the dried herb of *Corydalis bungeana* Turcz. (Fam. Papaveraceae). The drug is collected at flowering and fruiting in summer and autumn, removed from foreign matter, and dried in the sun.

Description Crumpled to masses, 10-30 cm long. Main roots conical, externally brownish-yellow. Stems slender, frequently branched, externally greyish-green or yellowish-green, with 5 longitudinal ridges; texture soft, fracture hollowed. Leaves mostly crumpled and crumbled, dark green or greyish-green, When whole, lamina bi-or tri-pinnatisect. Flowers seldom, corolla labiate, with hypanthium, pale purple. Capsules flat-long-elliptical, legume-like. Seeds flat-cordate, black, lustrous. Odour, slight; taste, bitter.

Identification (1) Transverse section of stem: Epidermal cells of 1 layer, subround, covered with thick cuticle; stomata sunken. Parenchymatous cells of cortex irregular, occurring 7-10 layers of collenchymatous cells in ridges. Pericycle 1-2 layers of fibres, arranged in a cycle; fibres in ridges crescent-shaped. Collateral vascular bundles occurring at ridges, phloem narrow, xylem composed of vessels, tracheids, fibres and parenchymatous cells. Pith retatively large, hollowed in the centre.

(2) Macerate 0.5 g of the powder, moistened with concentrated ammonia TS, with 10 ml of chloroform, stand overnight and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of chloroform as the test solution. Dissolve corynoline CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 0.4% solution of sodium hydroxide as the coating substance and a mixture of cyclohexane, chloroform and methanol (7 : 2 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with dilute bismuth potassium iodide TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the

reference solution.

Foreign matter Not more than 2 per cent (Appendix Ⅸ A).

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Extractives Carry out the method for determination of water-soluble extractives (Appendix Ⅹ A, the hot extraction method), not less than 18.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.015 mol/L phosphate BS (Dissolve 1.58 g of potassium dihydrogen phosphate and 0.76 g of dipotassium hydrogen phosphate in 1000 ml of water, mix well, and adjust the pH value to 6.7 with sodium hydroxide TS) (70 : 30) as the mobile phase. As detector a spectrophotometer set at 289 nm. The number of theoretical plates of the column is not less than 6000, calculated with reference to the peak of corynoline.

Reference solution Dissolve a quantity of corynoline CRS, accurately weighed, in methanol to produce a solution containing 40 μg per ml.

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve) to a stopper conical flask, add accurately 25 ml of methanol, weigh, macerate for 1 hour, ultrasonicate (power 250 W, frequency 33 kHz) for 30 minutes, allow to cool, weigh again, compensate the loss of the weight with methanol, mix well, filter, use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the test solution and the reference solution, respectively, into the column, and calculate the content.

It contains not less than 0.14 per cent of corynoline ($C_{21}H_{21}O_5N$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, cut into sections, and dry.

Action To clear toxic *heat* and treat carbuncles.

Indications Swollen and painful throat, furunculosis, back carbuncle, mumps and erysipelas.

Usage and dosage 9-15 g; appropriate quantity for external use, decocted for washing.

Storage Preserve in a dry place.

Herba Cynomorii (锁阳, Suoyang)

Songaria Cynomorium Herb

Songaria Cynomorium Herb is the dried fleshy stem of *Cynomorium songaricum* Rupr. (Fam. Cynomoriaceae). The drug is collected in spring, removed from inflorescence, cut into section, and dried in the sun.

Description Flat cylindrical, slightly curved, 5-15 cm long, 1.5-5 cm in diameter. Externally brown or dark brown, rough, with distinct longitudinal furrows and irregular pits, sometimes with remains of triangular, dark brown scales. Texture heavy and hard, uneasily broken, fracture pale brown or brown, with yellow, triangular vascular bundles. Odour, slight; taste, sweet and astringent.

Identification (1) To 1 g of the powder add 10 ml of water, macerate for 30 minutes, filter, use the filtrate as the test solution. Dissolve proline CRS in water to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and a mixture of *n*-propanol, glacial acetic acid, ethanol and water (4 : 1 : 1 : 2) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with isatin TS solution, heat at 100℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Ultrasonicate 1 g of the powder with 20 ml of ethyl acetate for 30 minutes, filter, concentrate the filtrate to 1 ml as the test solution. Dissolve oleanolic acid CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and formic acid (20 : 4 : 0.5) as the mobile phase. Apply separately to the plate 10 μl of the test solution and 4 μl of the reference solution. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat to the spots clear. A purplish-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Foreign matter Not more than 2 per cent (Appendix Ⅸ A).

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 14.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.5 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using ethanol as the solvent, not less than 14.0 per cent.

Processing Wash clean, soften thoroughly, cut into thin slices and dry.

Action To reinforce *kidney-yang*, replenish *essence* and blood, and relax bowels.

Indications Aching and weakness of the lower back and knees, impotence, spermatorrhea, constipation.

Usage and dosage 5-9 g.

Storage Preserve in a ventilated and dry place.

Herba Desmodii Styracifolii (广金钱草, Guangjinqiancao)

Snowbellleaf Tickclover Herb

Snowbellleaf Tickclover Herb is the dried aerial part of *Desmodium styracifolium* (Osb.) Merr. (Fam. Leguminosae). The drug is collected in summer and autumn, removed from foreign matter, and dried in the sun.

Description Stems cylindrical, up to 1 m long, densely covered with yellow spreading pubescences; texture slightly fragile, fracture medullated in the centre. Leaves alternate,

leaflets 1-3, rounded or oblong, 2-4 cm in diameter; retuse at the apex, cordate or obtusely rounded at the base, margin entire; the upper surface yellowish-green or greyish-green, glabrous, the lower surface densely covered with greyish-white tomenta, lateral veins pinnate; petiole 1-2 cm long; stipules 2, lanceolate, about 8 mm long. Odour, slightly aromatic; taste, slightly sweet.

Identification To 5 g of the powder add 100 ml of ethanol, heat under reflux for 30 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 30 ml of hot water, cool, and filter. Extract the filtrate with two 30-ml quantities of ethyl acetate, combine the ethyl acetate extracts and evaporate to dryness. Dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Prepare a solution with Herba Desmodii Styracifolii reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide as the coating substance and a mixture of toluene, ethyl acetate and formic acid (75 : 24 : 10) as the mobile phase. Apply separately to the film 2 μl of each of the above two solutions. After developing and removal of the film, dry in hot air. Spray with aluminium trichloride TS. Examine under ultraviolet light at 365 nm. The three main greenish-yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Extractives Carry out the method for determination of water-soluble extractives (Appendix Ⅹ A, the cold maceration method), not less than 5.0 per cent.

Processing Eliminate foreign matter, cut into sections, and dry in the sun.

Action To remove *damp-heat*, induce urination and relieve dysuria.

Indications Urination disturbance caused by *damp-heat* or urolithiasis accompanied with difficult painful urination; edema with oliguria; jaundice with dark urine.

Usage and dosage 15-30 g.

Storage Preserve in a dry place.

Preparation Shilintong Tablets

Herba Dianthi (瞿麦, Qumai)

Lilac Pink Herb

Lilac Pink Herb is the dried aerial part of *Dianthus superbus* L. or *Dianthus chinensis* L. (Fam. Caryophyllaceae). The drug is collected at flowering and fruiting in summer and autumn, removed from foreign matter, and dried.

Description *Herb of Dianthus superbus* Stems cylindrical, branched at the upper part, 30-60 cm long; externally pale green or yellowish-green, glabrous, nodes distinct, slightly swollen, fracture hollowed. Leaves opposite, mostly crumpled, lamina linear or linear-lanceolate when spread out. The tops of branches bearing flowers and fruits, calyx tubular, 2.7-3.7 cm long; bracts 4-6, broadly ovate, about 1/4 in length of calyx tube; petals brownish-purple or brownish-yellow, rolled, deeply laciniate at the apex. Capsules cylindrical, as long as persistent calyx. Seeds minute, numerous. Odour, slight; taste, weak.

Herb of Dianthus chinensis Calyx tubes 1.4-1.8 cm long, bracts about 1/2 in length of calyx tube; petals shallowly toothed at the apex.

Identification To 0.5 g of the powder add 10 ml of water, heat for 10 minutes, filter while hot, and cool. Place 2 ml of the filtrate into a stopper test tube, shake vigorously for 1 minute; the persisting foam is produced, lasting for about 10 minutes.

Processing Eliminate foreign matter, wash clean, soften briefly, cut into sections and dry.

Action To relieve dysuria, and stimulate menstrual blood flow.

Indications Urinary infection and urolithiasis with difficult painful urination or hematuria; amenorrhea.

Usage and dosage 9-15 g.

Precaution Contraindicated in pregnancy.

Storage Preserve in a ventilated and dry place.

Herba Ecliptae (墨旱莲, Mohanlian)

Yerbadetajo Herb

Yerbadetajo Herb is the dried aerial part of *Eclipta prostrata* L. (Fam. Compositae). The drug is collected at flowering, and dried in the sun.

Description White pubescent wholly. Stems cylindrical, with longitudinal ridges, 2-5 mm in diameter; externally greenish-brown or dark green. Leaves opposite, almost sessile, lamina crumpled and rolled or broken, when whole, long-lanceolate, margin entire or shallowly dentate, dark green. Capitulum 2-6 mm in diameter. Achenes elliptical and flattened, 2-3 mm long, brown or pale brown. Odour, slight; taste, slightly salty.

Identification (1) Infuse in water and rub the stems and leaves, a dark green colour is produced.
(2) Surface view of leaf: Non-glandular hairs frequently 3-celled, 260-700 μm long, basal cells slightly inflated, middle cells relatively long, walls thickened with distinct prominent warts, apical cells sharply acute and short, subtriangular. Stomata anomocytic, with 3-4 subsidiary cells.
(3) To 1 g of the powder add 20 ml of ethanol, macerate for 2 hours, ultrasonicate for 30 minutes, filter. Evaporate the filtrate to dryness. Dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Prepare a solution with 1 g of Herba Ecliptae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately to the plate 4 μl of each of the above two solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Processing Eliminate foreign matter, wash briefly, cut into sections, and dry in the sun.

Action To reinforce the liver and the kidney, and arrest bleeding by removing *heat* from blood.

Indications Looseness of teeth, premature greying of hair and beard; dizziness, tinnitus, aching and weakness of the

lower back and knees; spitting blood, epistaxis, hematuria and diarrhea with bloody stools due to *heat* in blood; abnormal uterine bleeding, traumatic bleeding.

Usage and dosage 6-12 g; appropriate quantity of the fresh herb for external use.

Storage Preserve in a ventilated and dry place.

Herba Ephedrae (麻黄, Mahuang)

Ephedra

Ephedra is the dried herbaceous stem of *Ephedra sinica* Stapf, *Ephedra intermedia* Schrenk et C. A. Mey. or *Ephedra equisetina* Bge. (Fam. Ephedraceae). The drug is collected in autumn, and dried in the sun.

Description *Herb of Ephedra sinica* Slenderly cylindrical, infrequently branched, 1-2 mm in diameter. Some with a few brown woody stems. Externally pale green to yellowish-green, with fine longitudinal ridges, slightly rough. Nodes distinct, internodes 2-6 cm long. Scaly leaves on the nodes membranous, 3-4 mm long, with 2 lobes (rarely 3), acutely triangular, apex greyish-white, reversed, base tubular and reddish-brown in colour. Texture light, fragile, and easily broken, fracture slightly fibrous with greenish-yellow edge and subrounded reddish-brown pith. Odour, slightly aromatic; taste, astringent and slightly bitter.

Herb of Ephedra intermedia Frequently branched, 1.5-3 mm in diameter, rough. membranous scaly leaves 2-3 mm long, with 3 lobes (rarely 2), apex acute. Fracture showing a triangular rounded pith.

Herb of Ephedra equisetina Frequently branched, 1-1.5 mm in diameter, without rough feeling. Internodes 1.5-3 cm long. Membranous scaly leaves 1-2 mm long, with 2 lobes (rarely 3), the upper part short-triangular, greyish-white, apex infrequently reversed, base brownish-red to brownish-black.

Identification (1) Transverse section of stem:

Herb of Ephedra sinica Epidermis covered with thick cuticle; ridges relatively dense, with waxy warty protrudings and sunken stomata located between two ridges. Hypodermal fibre bundles located in ridges, with thickened and unlignified walls. Cortex relatively broad, fibre bundles scattered. Pericycle fibre bundles crescent. Collateral vascular bundles 8-10. Cambium ring subrounded. Xylem triangular. Pith parenchymatous cells containing brown masses; occasionally showing perimedullary fibres. Outer walls of epidermal cells, cortex parenchymatous cells and fibres occurring numerous fine sandy crystals or prisms of calcium oxalate.

Herb of Ephedra intermedia Vascular bundles 12-15. Cambium ring subtriangular. Perimedullary fibres scattered in bundles or singly.

Herb of Ephedra equisetina Vascular bundles 8-10. Cambium ring subrounded. Perimedullary fibres absent.

(2) To 0.2 g of the powder, add 5 ml of water and 1-2 drops of dilute hydrochloric acid, boil for 2-3 minutes and filter. Transfer the filtrate to a separator, add several drops of ammonia TS to make alkaline and extract with 5 ml of chloroform. Transfer the chloroform solution into 2 tubes. To one tube add ammoniated cupric chloride TS and carbon disulfide, 5 drops of each, shake well and allow to stand, the chloroform layer becomes deep yellow; to another tube add 5 drops of chloroform instead of carbon disulfide as a blank, shake well, the chloroform layer is colourless or slightly yellow.

(3) To 1 g of the powder add several drops of concentrated ammonia TS and 10 ml of chloroform, heat under reflux for 1 hour and filter. Evaporate the filtrate to dryness, add 2 ml of methanol to the residue, shake well, filter, and use the filtrate as the test solution. Dissolve ephedrin hydrochloride CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and concentrated ammonia TS (20 : 5 : 0.5) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions, after developing and removal of the plate, dry in air. Spray with ninhydrin TS and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Foreign matter Not more than 5 per cent (Appendix Ⅸ A).

Water Not more than 9.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% phosphoric acid solution (9 : 87) as the mobile phase. As detector a spectrophotometer set at 207 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of ephedrin hydrochloride.

Reference solution Weigh accurately 10 mg of ephedrin hydrochloride CRS to a 100 ml volumetric flask and dilute with methanol to volume. Transfer accurately 2 ml of the solution to a 25 ml volumetric flask, dilute with the mobile phase to volume, mix well as the reference solution (containing 8 μg per ml).

Test solution Weigh accurately 0.2 g of the fine powder to a stopper conical flask, add accurately 25 ml of methanol, weigh, ultrasonicate for 45 minutes (power, 160 W; frequency, 50 kHz), allow to cool, weigh again and compensate the loss of the weight with methanol, shake well and filter. Apply accurately 1 ml of the successive filtrate to a small column (1 cm in inner diameter) packed with neutral aluminium oxide (100-200 mesh, 1.5 g), elute with 50% methanol. Collect about 9 ml of the eluate in a 10 ml volumetric flask, add 1 drop of phosphoric acid, dilute with 50% methanol to volume, mix well.

Procedure Inject accurately 10-20 μl of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 1.0 per cent of ephedrin hydrochloride ($C_{10}H_{15}NO \cdot HCl$), calculated with reference to the dried drug.

Processing *Herba Ephedrae* Remove the woody stems, roots and foreign matter, and cut into sections.

Herba Ephedrae (processed with honey) Stir-bake the sections of Herba Ephedrae as described under the method for stir-baking with honey (Appendix Ⅱ D) until it is not sticky to fingers, using 20 kg of refined honey per 100 kg of Herba Ephedrae.

Action To induce perspiration to expel *cold*, relieve

asthma, and cause diuresis.

Herba Ephedrae (processed with honey) To moisten the *lung* and relieve cough.

Indications Common cold of the *wind-cold* syndrome marked by chill and mild fever, headache, stuffy and running nose, general aching, absence of sweating; edema in acute nephritis; bronchial asthma.

Herba Ephedrae (processed with honey) Cough in common cold at the later stage when chill is absent.

Usage and dosage 2-9 g.

Storage Preserve in a ventilated and dry place, protected from moisture.

Herba Epimedii (淫羊藿, Yinyanghuo)

Epimedium Herb

Epimedium Herb is the dried aerial part of *Epimedium brevicornum* Maxim., *Epimedium sagittatum* (Sieb. et Zucc.) Maxim., *Epimedium pubescens* Maxim., *Epimedium wushanense* T. S. Ying or *Epimedium koreanum* Nakai (Fam. Berberidaceae). The drug is collected in summer and autumn when foliage branch growing luxuriantly, removed from thick stalk and foreign matter, and dried in the sun or in the shade.

Description *Herb of Epimedium brevicornum* Stems slenderly cylindrical, about 20 cm long, externally yellowish-green or pale yellow, lustrous. Cauline leaves opposite, double ternately compound; leaflets ovate, 3-8 cm long, 2-6 cm wide; apex slightly acute, terminal leaflets cordate at the base, bilateral leaflets relatively small, oblique-cordate, the outer side relatively large, auriculate, margin with yellow and thorny serrulations; the upper surface yellowish-green, the lower surface greyish-green, main veins 7-9, occurring sparsely slender hairs at the base, thin veins prominent on both surfaces, reticulated veins distinct; petiolules 1-5 cm long. Lamina subleathery. Odour, slight; taste, slightly bitter.

Herb of Epimedium sagittatum Leaves terrately compound, leaflets long-ovoid to ovoid-lanceolate, 4-12 cm long, 2.5-5 cm wide; acuminate at the apex; bilateral leaflets distinctly oblique at the base, the outer side arrow-shaped. The lower surface sparsely covered with thick, short and pronated hairs or nearly glabrous. Lamina leathery.

Herb of Epimedium pubescens The lower surface of lamina and petioles densely covered with flossy pubescences.

Herb of Epimedium wushanense Leaflets lanceolate to narrowly lanceolate, 9-23 cm long, 1.8-4.5 cm wide; acuminate or long-acuminate at the apex, margin thorny-dentate, basal lobes of the bilateral leaflets oblique, the inside lobes small and rounded, the outside lobes large, triangular, acuminate. The lower surface tomentose or bare.

Herb of Epimedium koreanum Leaflets relatively large, 4-10 cm long, 3.5-7 cm wide, long-acuminate at the apex. Lamina relatively thin.

Identification To 0.5 g of the powder add 10 ml of ethanol, macerate warmly for 30 minutes, filter, evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ethanol as the test solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica H mixed with sodium carboxymethylcellulose as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (10 : 1 : 1 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the test solution and the reference solution obtained under Assay of icariine. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The dark red fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. Spray with aluminium chloride TS, examine again under ultraviolet light at 365 nm, the spots turn to orange-red.

Foreign matter Not more than 3 per cent (Appendix Ⅸ A).

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the cold maceration method), using dilute ethanol TS as the solvent, not less than 15.0 per cent.

Assay ***Total flavones*** Transfer accurately 0.5 ml of the test solution obtained under the determination for icarrine to a 50 ml volumetric flask, add methanol to volume, mix well as the test solution. Dissolve icariine CRS in methanol to produce a solution containing 10 μg per ml as the reference solution. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance of the test solution and the reference solution at 270 nm, calculate the content.

It contains not less than 5.0 per cent of total flavones, calculated as icariine ($C_{33}H_{40}O_{15}$), with reference to the dried drug.

Icariine Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixtrue of acetonitrile and water (30 : 70) as the mobile phase. As detector a spectrophotometer set at 270 nm. The number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of icariine.

Reference solution Dissolve icariine CRS in methanol to produce a solution containing 0.1 mg per ml as the reference solution.

Test solution Weigh accurately 0.2 g of the leaf powder (through No. 3 sieve) in a stopper conical flask, add accurately 20 ml of dilute ethanol, weigh, ultrasonicate for 1 hour, weigh again and compensate the loss of the weight with dilute ethanol, mix well, filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and caculate the content.

It contains not less than 0.50 per cent of icariine ($C_{33}H_{40}O_{15}$), calculated with reference to the dried drug.

Processing *Herba Epimedii* Eliminate foreign matter, pick the leaves, spray with water, soften slightly, cut into slivers and dry.

Herba Epimedii (stir-baked) Stir-bake the slivers of Herba Epimedii with refined suet by gentle heating until an evenly lustre is produced, remove and cool. Using 20 kg of refined suet per 100 kg of Herba Epimedii.

Action To reinforce *kidney-yang*, strengthen the tendons and bones, and relieve rheumatic condition.

Indications Impotence, seminal emission, weakness of the limbs; rheumatic or rheumatoid arthralgia with numbness and muscle contracture; climacteric hypertension.

Usage and dosage 3-9 g.

Storage Preserve in a ventilated and dry place.

Herba Equiseti Hiemalis (木贼, Muzei)

Common Scouring Rush Herb

Common Scouring Rush Herb is the dried aerial part of *Equisetum hiemale* L. (Fam. Equisetaceae). The drug is collected in summer and autumn, removed from foreign matter, and dried in the sun or in the shade.

Description Long tubular, unbranched, 40-60 cm long, 0.2-0.7 cm in diameter. Externally greyish-green or yellowish-green, with 18-30 longitudinal ridges and numerous fine, shiny warts on the ridges; nodes distinct, internodes 2.5-9 cm long, with tubular scaly leaves on the nodes, the base and teeth of leaf sheath blackish-brown, the middle part pale brownish-yellow. Texture light, fragile, easily broken, fracture hollowed, with numerous, small rounded cavities on edge. Odour, slight; taste, sweet and weak, slightly astringent, sandy when chewing.

Identification (1) Transverse section of stem: Epidermal cells of 1 layer, covered with cuticle. Surface with sunken grooves and protuberant ridges. Transparent silica protuberances 2, on the ridge, and sunken stomata 2, located in each groove. Cortex parenchyma occurring inside epidermis; sclerenchyma occurring inside ridges and inserting into cortex parenchyma, in cuneate shape. Sclerenchyma located in grooves, of 1-2 layers. cortex parenchymatous cells long cylindrical or subrounded, an empty lumen located in grooves. Endodermis of 2 layers, outer one in sinuous ring, and inner one in rounded ring. Casparian dots distinct and visible in both layers. Vascular bundles collateral, located between two layers of endodermis, and beneath the ridges, a centre lumen occurring in inner part of each vascular bundle, pith parenchymatous cells located inside endodermis, and flattened and shrunken, pith lumen in centre.

(2) To 1 g of the powder add 25 ml of 75% methanol and 1 ml of hydrochloric acid, heat under reflux for 1 hour, and filter. Dissolve the residue in 10 ml of water, extract with two 10-ml quantities of ethyl acetate, combine the ethyl acetate extracts and evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve kaempferol CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of cyclohexane, ethyl acetate and formic acid (8 : 4 : 0.4) as the mobile phase. Apply separately to the plate 5 μl of the test solution and 2 μl of the reference solution. After developing and removal of the plate, dry in air. Spray with 5% aluminium trichloride in ethanol, examine under ultraviolet light at 365 nm immediately. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 13.0 per cent (Appendix IX H, method 1).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix X A, the hot extraction method), not less than 5.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and systm suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.4% phosphoric acid solution (50 : 50) as the mobile phase. As detector a spectrophotometer set at 365 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of kaempferol.

Reference solution Weigh accurately 10 mg of kaempferol CRS in a 100 ml volumetric flask, dilute with 75% methanol to volume, and mix well. Accurately measure 2 ml in a 10 ml volumetric flask, dilute with 75% methanol to volume, and mix well (containing 20 μg of kaempferol per ml).

Test solution Weigh accurately 0.75 g of the coarse powder (through No. 3 sieve) in a stopper conical flask. Add accurately 50 ml of 75% methanol, weigh, heat on a water bath for 1 hour, cool, weigh again, replenish the loss of the weight with 75% methanol, mix well and filter. Measure accurately 20 ml of the successive filtrate, add accurately 5 ml of hydrochloric acid, heat on a water bath for 1 hour, and cool. Transfer to a 50 ml volumetric flask, dilute with 75% methanol to volume and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 0.20 per cent of kaempferol ($C_{15}H_{10}O_6$), calculated with reference to the dried drug.

Processing Remove the withered stems and remained roots, spray with water, soften briefly, cut into sections, and dry.

Action To dispel *wind-heat* and remove nebula.

Indications Conjunctival congestion caused by *wind-heat*, lacrimination induced by irritation of the *wind*, nebula.

Usage and dosage 3-9 g.

Storage Preserve in a dry place.

Herba Erigerontis (灯盏细辛, Dengzhanxixin)

Shortscape Fleabane Herb

Shortscape Fleabane Herb is the dried herb of *Erigeron breviscapus* (Vant.) Hand.-Mazz. (Fam. Compositae). The drug is collected in summer and autumn, removed from foreign matter, and dried in the sun.

Description 15-25 cm long. Rhizomes 1-3 cm long, 2-5 mm in diameter, externally uneven, with numerous fine cylindrical rootlets, about 1 mm in diameter, pale brown to yellowish-brown. Stems cylindrical, 14-22 cm long, 1-2 mm in diameter, yellowish-green to pale brown, with fine longitudinal ridge lines and white pubescences; texture fragile, fracture yellowish-white, medullated or hollowed. Basal leaves crumpled and crumbled, when whole, obovate-lanceolate, spatulate, broadly lanceolate or broadly obovate, 1.5-9 cm long, 0.5-1.3 cm wide, yellowish-green, apex obtuse, with a short tine and a narrow-

decurrent base, margin entire; cauline leaves alternate, lanceolate, amplexicaul at the base. Capitulum acrogenous. Achenes flat-obovate. Odour, slight; taste, slightly bitter.

Identification (1) Surface view of leaf: The walls of epidermal cells sinuous, with cutin striation, stomata anomocytic. Non-glandular hairs 1-8-celled, 180-560 μm long. Glandular hairs with a 1-4-celled head and an uni- or poly-cellular stalk.
(2) The retention time of one peak in the chromatogram obtained under the Assay corresponds to that of the reference.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 15.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 8.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using ethanol as the solvent, not less than 7.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.1% phosphoric acid solution (40 : 60) as the mobile phase. As detector a spectrophotometer set at 335 nm. The number of theoretical plates of the column is not less than 5000, calculated with reference to the peak of scutellarin.

Reference solution Dissolve a quantity of scutellarin, accurately weighed, in methanol to produce a solution containing 0.1 mg per ml.

Test solution Weigh accurately 0.5 g of the coarse powder to a Soxhlet's extractor, add appropriate quantity of chloroform, heat under reflux until the extractive colourless, discard the chloroform extract. After expel the solvent, transfer the residue and the filter in a stopper conical flask, add accurately 50 ml of methanol, weigh, stand for 1 hour, heat on a water bath for 1 hour, allow to cool, weigh again, and compensate the loss of the weight with methanol, mix well, filter. Accurately measure 25 ml of the successive filtrate, evaporate to dryness, dissolve the residue in methanol and transfer to a 10 ml volumetric flask, dilute with methanol to volume, mix well.

Procedure Inject accurately 5-10 μl of each of the test solution and the reference solution, respectively, into the column, and calculate the content.
It contains not less than 0.30 per cent of scutellarin ($C_{21}H_{18}O_{12}$), calculated with reference to the dried drug.

Action To expel *wind* and disperse *cold*, promote blood circulation to dredge meridians, and stop pain.

Indications Arthralgia due to *wind*, *cold* or *dampness*, apoplexy, constriction in the chest with heart pain; toothache; common cold.

Usage and dosage 9-15 g. Powder form taken with steamed egg soup, or appropriate quantity for external use.

Storage Preserve in a dry place.

Herba Erodii Herba Geranii (老鹳草, Laoguancao)

Common Heron's Bill Herb, Wilford Granesbill Herb

Common Heron's Bill Herb or Wilford Granesbill Herb is the dried aerial part of *Erodium stephanianum* Willd., *Geranium wilfordii* Maxim. or *Geranium carolinianum* L. (Fam. Geraniaceae). The former is known as "Changzui Laoguancao" (Laoguancao with a long mouth, Herba Erodii) and both of the latter are known as "Duanzui Laoguancao" (Laoguancao with a short mouth, Herba Geranii). The drug is collected in summer and autumn when the fruit is nearly ripe, tied up in bundles, and dried in the sun.

Description *Herb of Erodium stephanianum* Stems 30-50 cm long, 3-7 mm in diameter, frequently branched, nodes swollen; externally greyish-green or purplish, longitudinally furrowed and sparsely pubescent; texture fragile, fracture yellowish-white, sometimes hollowed. Leaves opposite, slenderly petioled; lamina rolled and crumpled, fragile and easily broken, when whole, bipinnatipartite, lobes lanceolate-linear. Fruits oblong, 0.5-1 cm long, persistent style 2.5-4 cm long, beak-shaped, sometimes 5-lobed, spirally rolled. Odourless; taste, weak.

Herb of Geranium wilfordii Stems relatively thin, slightly short. Lamina rounded, 3- or 5-parted, lobes relatively broad, margin incised. Fruits globose, 0.3-0.5 cm long. Style 1-1.5 cm long, sometimes 5-lobed and rolled upwards to be umbellate.

Herb of Geranium carolinianum Lamina palmatisect, 5-7 parted, lobes stripe-shaped and 3-5 parted.

Foreign matter Not more than 2 per cent (Appendix Ⅸ A).

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of water-soluble extractives (Appendix Ⅹ A, the hot extraction method), not less than 18.0 per cent.

Processing Eliminate remains of roots and foreign matter, wash briefly, cut into sections, and dry in the sun.

Action To remove obstruction of *channels* and *collaterals*, relieve rheumatic condition, and arrest diarrhea.

Indications Rheumatic or rheumatoid arthralgia, numb and immobilized body; diarrhea, dysentery.

Usage and dosage 9-15 g.

Storage Preserve in a cool and dry place.

Preparation Common Heron's Bill Ointment.

Herba Eupatorii (佩兰, Peilan)

Fortune Eupatorium Herb

Fortune Eupatorium Herb is the dried aerial part of *Eupatorium fortunei* Turcz. (Fam. Compositae). The drug is collected in summer and autumn respectively, removed from foreign matter, and dried in the sun.

Description Stems cylindrical, 30-100 cm long, 2-5 mm in diameter; externally yellowish-brown or yellowish-green, sometimes purplish, with distinct nodes and longitudinal ridges; texture fragile, fracture white or hollowed in pith. Leaves opposite, petioled, lamina mostly crumpled and broken, greenish-brown; the entire ones trifid or not divided, the middle segments of trifid ones relatively large, when whole, lanceolate or oblong-lanceolate, base narrow, margin serrate; the not-divided ones, when whole, ovate, ovate-lanceolate or elliptical. Odour, aromatic; taste, slightly bitter.

Identification To 1 g of the powder add 15 ml of petroleum ether (30-60℃), ultrasonicate for 10 minutes, filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of petroleum ether (30-60℃) as the test solution. Prepare a solution with 1 g of Herba Eupatorii reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃) and ethyl acetate (19 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with 2% vanillin in sulfuric acid, heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Processing Eliminate foreign matter, wash clean, soften briefly, cut into sections, and dry in the sun.

Action To resolve *damp*, invigorate the function of the *spleen* and improve appetite by its spicy fragrance, and to expel *summer heat* from the body surface.

Indications Accumulation of *dampness* in the spleen and stomach, marked by stuffiness in the epigastrium, nausea, sweet taste and sticky sensation in the mouth, foul breath and salivation; afflications due to summer-heat and *dampness* marked by distension in the head and stuffiness in the chest.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place.

Herba Euphorbiae Humifusae (地锦草, Dijincao)

Creeping Euphorbia

Creeping Euphorbia is the dried herb of *Euphorbia humifusa* Willd. or *Euphorbia maculata* L. (Fam. Euphorbiaceae). The drug is collected in summer and autumn, removed from foreign matter, and dried in the sun.

Description *Herb of Euphorbia humifusa* Frequently crumpled and curved. Roots slender. Stems thin, furcate-branched, externally purplish-red, glabrous or sparsely white pubescent; texture fragile, easily broken, fracture yellowish-white, hollowed in the centre. Leaves simple, opposite, with pale red and short petioles or almost sessile; lamina mostly crumpled or fallen off, when whole, long-elliptic, 5-10 mm long, 4-6 mm wide; green or purplish-red, frequently glabrous or sparsely pubescent; apex obtusely rounded, base oblique, margin serrulate or slightly sinuous. Cup-shaped cyme axillary, small. Capsules triangular-spherical, externally smooth. Seeds small, ovoid, brown. Odour, slight; taste, slightly astringent.

Herb of Euphorbia maculata Leaves with red spots on the upper surface, capsules sparsely white pubescent.

Identification (1) Powder: Greenish-brown. Outer walls of the leaf epidermal cells papillary. Surrounding cells of the fine vein ends in mesophyll arranged radiately. Non-glandular hairs 3-8-celled, about 14 μm in diameter, mostly broken.

(2) To 1 g of the powder add 50 ml of 80% methanol, heat under reflux for 1 hour, cool, and filter. Evaporate the filtrate to dryness, dissolve the residue in 60 ml of a mixture of water and ether (1 : 1), stand to two layers separated, and discard the ether solution. Extract the water solution with two 20-ml quantities of ether, discard the ether solutions, to water solution add 5 ml of hydrochloric acid, heat on a water bath for 1 hour, and cool immediately. Extract the water solution with two 20-ml quantities of ether, combine the ether solutions, wash with 30 ml of water, and discard the washing. Expel the ether solution to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve quercetin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and formic acid (5 : 4.5 : 0.5) as the mobile phase. Apply separately to the plate 10 μl of the test solution and 2 μl of the reference solution. After developing and removal of the plate, dry in air. Spray with 3% aluminium trichloride in ethanol, heat at 105℃ for several minutes, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Foreign matter Not more than 3 per cent (Append Ⅸ A).

Water Not more than 10.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 12.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using 75% ethanol as the solvent, not less than 18.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.4% phosphoric acid solution (50 : 50) as the mobile phase. As detector a spectrophotometer set at 360 nm. The number of theoretical plates of the column is not less than 2500, calculated with reference to the peak of quercetin.

Reference solution Dissolve a quantity of quercetin CRS, accurately weighed, in 80% methanol to produce a solution containing 20 μg of quercetin per ml as the reference solution.

Test solution Weigh accurately 1.5 g of the coarse powder (through No. 3 sieve) in a stopper conical flask. Add accurately 50 ml of 80% methanol, weigh, heat on a water bath for 1.5 hour, cool, weigh again, replenish the loss of the weight with 80% methanol, mix well and filter. Measure accurately 20 ml of the successive filtrate, add accurately 7 ml of 25% hydrochloric acid, heat on a water bath at 85℃ for 30 minutes, cool immediately. Transfer to a 50 ml volumetric flask, dilute with methanol to volume and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.10 per cent of quercetin ($C_{15}H_{10}O_7$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, spray with water, soften briefly, cut into sections, and dry in the sun.

Action To remove toxic *heat* and to arrest bleeding by reducing *heat* in blood.

Indications Dysentery, diarrhea, hemoptysis, hematuria, hematochezia, abnormal uterine bleeding, boils and carbuncles.

Usage and dosage 9-20 g; or 30-60 g of the fresh herb; appropriate quantity for external use.

Storage Preserve in a ventilated and dry place.

Herba Glechomae (连钱草, Lianqiancao)

Longtube Ground Ivy Herb

Longtube Ground Ivy Herb is the dried aerial part of *Glechoma longituba* (Nakai) Kupr. (Fam. Labiatae). The drug is collected from spring to autumn, removed from foreign matter, and dried in the sun.

Description 10-20 cm long, sparsely pubescent. Stems square, slender and twisted; externally yellowish-green or purplish-red, bearing adventitious roots at nodes; texture fragile, easily broken, fracture often hollowed. Leaves opposite, mostly crumpled, when whole, reniform or subcordate, 1-3 cm long, 1.5-3 cm wide, greyish-green or greenish-brown, margin crenate; petioles slender, 4-7 cm long. Verticillasters axillary, corolla bilabiate, up to 2 cm long. Odour, aromatic on rubbing; taste, slightly bitter.

Identification (1) Powder: Greyish-green., non-glandular hairs multicellular, 1 to several cells frequently shrunken, and some non-glandular hairs unicellular and conical. Glandular scales with a head of 8 cells. Small glandular hairs with an unicellular head and an unicellular stalk. The walls of leaf lower epidermis cells sinuous. Stomata diacytic. The anticlinal walls of leaf upper epidermal cells sinuous, with relatively fine and dense cuticular striations. Spiral vessels and reticulate vessels 20-30 μm in diameter.
(2) To 2 g of the powder add 25 ml of methanol, heat under reflux for 30 minutes, filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of a mixture of dehydrated ethanol and chloroform (3 : 2) as the test solution. Dissolve ursolic acid CRS in dehydrated ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica H mixed with sodium carboxymethylcellulose solution containing 0.1 mol/L sodium dihydrogen phosphate as the coating substance and a mixture of toluene, ethyl acetate and formic acid (20 : 4 : 0.5) as the mobile phase. Apply separately to the plate 2-4 μl of the test solution and 2 μl of the reference solution. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 110℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Foreign matter Not more than 2 per cent (Appendix Ⅸ A).

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 13.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol TS as the solvent, not less than 25.0 per cent.

Processing Eliminate foreign matter, wash clean, cut into sections and dry.

Action To relieve dysuria, remove toxic *heat*, eliminate blood stasis, and reduce swelling.

Indications Acute urinary infection, urolithiasis; acute jaundice; painful swelling in sores and carbuncles; traumatic injuries.

Usage and dosage 15-30 g; appropriate quantity of the dried herb is decocted for wash or the fresh herb is pounded into paste for topical application.

Storage Preserve in a dry place, protected from mould.

Herba Houttuyniae (鱼腥草, Yuxingcao)

Heartleaf Houttuynia Herb

Heartleaf Houttuynia Herb is the fresh or dried aerial part of *Houttuynia cordata* Thunb. (Fam. Saururaceae). The fresh drug is collected all the year round. The dried drug is collected in summer when the foliage branch growing luxuriantly and with numerous spikes, removed from foreign matter, and dried in the sun.

Description *Fresh herb of Houttuynia cordata* Stems cylindrical, 20-45 cm long, 2.5-4.3 mm in diameter; the upper part green or purplish-red, the lower part white; nodes distinct, with rootlets on the nodes of lower part, glabrous or sparsely pubescent. Leaves alternate, lamina cordate, 3-10 cm long, 3-11 cm wide, apex acuminate, margin entire; the upper surface yellow, densely distributed glandular dots, the lower surface often purplish-red; petioles slender, accreted with stipule at the base, forming a sheath. Spike terminal. Odour, fishy; taste, astringent.

Dried herb of Houttuynia cordata Stems flat-cylindrical, twisted, externally brownish-yellow, with several longitudinal ridges; texture fragile and easily broken. Lamina rolled and crumpled, when whole, cordate, the upper surface dark

yellowish-green to dark brown, the lower surface greyish-green or greyish-brown. Spike terminal, yellowish-brown.

Identification (1) Place a quantity of the dried herb powder into a test tube, press tightly with a glass rod, add a few drops of fuchsine-sulfurous acid TS to moisten the powder at the upper part, stand for a moment. Observe through the tube wall, the moistened powder shows a pink or reddish-violet colour.
(2) Carry out the method for determination of volatile oil (Appendix Ⅹ D). Heat slowly 25 g of the dried herb or 125 g of the fresh herb (cut into pieces) with 1 ml of ethyl acetate to boil and keep gentle boiling for 4 hours, allow to cool for half hour, use the ethyl acetate solution as the test solution. Dissolve methylnonylketone CRS in ethyl acetate to produce a solution containing 10 μg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately to the plate 5 μl of the test solution and 2 μl of the reference solution. After developing and removal of the plate, dry in air, spray with dinitrohydrazine TS. The yellow spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water *Dried herb of Houttuynia cordata* Not more than 15.0 per cent (Appendix Ⅸ H, method 1).

Acid-insoluble ash *Dried herb of Houttuynia cordata* Not more than 2.5 per cent (Appendix Ⅸ K).

Extractives *Dried herb of Houttuynia cordata* Carry out the method for determination of water-soluble extractives (Appendix Ⅹ A, the cold maceration method), not less than 10.0 per cent.

Processing *Fresh herb of Houttuynia cordata* Eliminate foreign matter.

Dried herb of Houttuynia cordata Eliminate foreign matter, wash clean rapidly, cut into sections, and dry in the sun.

Action To remove toxic *heat*, promote drainage of pus, and relieve dysuria.

Indications Lung abscess with purulent expectoration; *heat* in the lung with cough and dyspnea; acute dysentery; acute urinary infection; carbuncles and sores.

Usage and dosage 15-25 g, boiled briefly; 30-50 g of the fresh herb decocted or pounded to make juice for oral administration. Appropriate quantity is pounded into paste for topical application or a decoction is made fumigation and wash.

Storage Dried herb: preserve in a dry place; Fresh herb: preserve in a cool and moist place.

Preparation Heartleaf Houttuynia Injection

Herba Hyperici Perforati (贯叶金丝桃, Guanyejinsitao)

Common St. John'swort Herb

Common St. John's wort Herb is the dried aerial part of *Hypericum perforatum* L. (Fam. Guttiferae). The drug is collected in summer and autumn at flowering, and dried in the shade or baked at a lower temperature.

Description Stems cylindrical, 10-100 cm long, frequently branched, with a longitudinal ridge on two sides of stems and branches respectively, small branches slender, opposite and axillary. Leaves simple, opposite, sessile and amplexicaul, lamina lanceolate or long-elliptic, 1-2 cm long, 0.3-0.7 cm wide, scattered with transparent or black glandular spots throughout, mostly on edge of lamina or nearly at apex. Cyme terminal, flowers yellow, calyx 5, and petals 5, long-rounded or lanceolate, with black glandular spots at the edges; stamens numerous, gathered into 3 bundles, style 3. Odour, slight; taste, slightly bitter and astringent.

Identification (1) Surface view of leaf: The cells of upper epidermis polygonal, with beaded walls, the cells of lower epidermis polygonal, anticlinal walls sinuous, somewhat beaded, stomata paracytic or anomocytic. Black glandular spots consisting of a mass of secretory cells, contents of cells red; translucent glandular spots with structure of rounded secretory sacs, surrounded by a layer of epithelium cells containing oily contents.
(2) To 0.1 g of the powder add 10 ml of methanol, ultrasonicate for 10 minutes, and filter. Evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution with 0.1 g of Herba Hyperici Perforati reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate and formic acid (25 : 1) as the mobile phase. Apply separately to the plate 2 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Examine under ultraviolet at 365 nm immediately. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(3) Dissolve hyperoside CRS and rutin CRS in methanol to produce two solutions containing 0.5 mg of each per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of dichloromethane, methanol and formic acid (20 : 5 : 1) as the mobile phase. Apply separately to the plate 2 μl of each of the test solution obtained under Identification (2) and the above two reference solutions. After developing and removal of the plate, dry in air. Spray with a solution of 1% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% phosphoric acid solution (16 : 84) as the mobile phase. As detector a spectrophotometer set at 360 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of hyperoside.

Reference solution Dissolve a quantity of hyperoside CRS, accurately weighed, in methanol to produce a solution containing 32 μg of hyperoside per ml.

Test solution Weigh accurately 0.4 g of the coarse powder (through No. 3 sieve) in a stopper conical flask. Add accurately 50 ml of 60% ethanol, weigh, heat on a water bath for 1 hour, cool, weigh again, replenish the loss of

the weight with 60% ethanol, mix well and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.10 per cent of hyperoside ($C_{21}H_{20}O_{12}$), calculated with reference to the dried drug.

Action To soothe the liver to remove stagnancy of *liver-qi*, clear *heat* and eliminate *dampness*, reduce swelling and relieve pain.

Indications Depression due to stagnancy of liver-qi, swollen and painful joints, and difficulty in micturition.

Usage and dosage 2-3 g.

Herba Inulae (金沸草, Jinfeicao)

Inula Herb

Inula Herb is the dried aerial part of *Inula linariifolia* Turcz. or *Inula japonica* Thunb. (Fam. Compositae). The drug is collected in summer and autumn, and dried in the sun.

Description *Herb of Inula linariifolia* Stems cylindrical, branched at the upper part, 30-70 cm long, 0.2-0.5 cm in diameter; externally greenish-brown or dark brown, sparsely pubescent, with numerous fine longitudinal striations; texture fragile, fracture yellowish-white, pith hollowed. Leaves alternate, stripe-shaped or stripe-lanceolate, 5-10 cm long, 0.5-1 cm wide; acute at the apex, amplexicaul at the base, margin entire, edge curved; nearly glabrous on the upper surface, pubescent on the lower surface. Capitulum terminal, 0.5-1 cm in diameter, aigret white, about 0.2 cm long. Odour, slight; taste, slightly bitter.

Herb of Inula japonica Lamina oblong-lanceolate, 1-2.5 cm wide, edge not curved. Capitulum relatively large, 1-2 cm in diameter, aigret about 0.5 cm long.

Processing Eliminate foreign matter, wash briefly, cut into sections, and dry.

Action To relieve cough and dyspnea, and eliminate retained phlegm.

Indications Cough in common cold with retention of phlegm marked by dyspnea, profuse expectoration and feeling of stuffiness in the chest; external use in pyogenic infection of the skin.

Usage and dosage 4.5-9 g; appropriate quantity of the fresh herb is pounded into juice for topical application.

Storage Preserve in a dry place.

Herba Lamiophlomis (独一味, Duyiwei)

Common Lamiophlomis Root

Common Lamiophlomis Root is the dried herb of *Lamiophlomis rotata* (Benth.) Kudo (Fam. Labiatae), commonly used by the Tibertan nationality. The drug is collected at fruitage in autumn, washed clean, and dried in the sun.

Description Roots and rhizomes cylindrical, 1-4 cm long, 0.7-1.6 cm in diameter; externally yellowish-brown, with longitudinal furrows or wrinkles. Leaves alternatively opposite in lotus-shape, crumpled; when whole, lamina fan-shaped or triangular-ovate, 4-12 cm long, 5-15 cm wide, obtuse or rounded at the apex, shallowly cordate or decurrent into broadly cuneate at the base, margin rounded serrate, the upper surface greenish-brown, crumpled and uneven, the lower surface greyish-green; vein fan-shaped, veinlet reticulate and prominent; petiole broad and flattened. Infructescence somewhat tower-shaped or short conical, 3-6 cm long; persistent calyx brown, and tubularly campanulate, with 5 longitudinal ridges, the apex of calyx 5-toothed, with long spines. Small nutlets obovate-triangular. Odour, slight; taste, slightly astringent, and bitter.

Identification (1) Powder: Dark brown. Non-glandular hairs numerous, 2-3-celled, 10-15 μm in diameter, walls relatively thickened, with warty prominences. Mesophyll cells irregular, containing numerous needle crystals of calcium oxalate, 7-10 μm long. Stomata diacytic or anisocytic. Fibres long spindle-shaped, pit canals transverse and lobed.
(2) To 1 g of the powder add 10 ml of ethanol, heat under reflux for 15 minutes, and filter, use the filtrate as the test solution. Prepare a solution with 1 g of Herba Lamiophlomis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (4 : 1) as the mobile phase. Apply separately to the plate 5-10 μl of the test solution and 5 μl of the reference drug solution. After developing and removal of the plate, dry in air. Spray with phosphomolybdic acid TS, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 12.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 4.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using 70% ethanol as the solvent, not less than 20.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.4% phosphoric acid solution (55 : 45) as the mobile phase. As detector a spectrophotometer set at 350 nm. The number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of luteolin.

Reference solution Dissolve a quantity of luteolin CRS, accurately weighed, in methanol to produce a solution containing 20 μg per ml.

Test solution Weigh accurately 1 g of the coarse powder (through No. 3 sieve) in a stopper conical flask. Add accurately 25 ml of 2.5 mol/L hydrochloric acid in methanol, weigh, heat on a water bath for 30 minutes, cool, weigh again, replenish the loss of the weight with 2.5 mol/L hydrochloric acid in methanol, mix well and filter. Measure accurately 2 ml of the successive filtrate to a 10 ml volumetric flask, dilute with methanol to volume and mix well.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.15 per cent of luteolin ($C_{15}H_{10}O_6$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, cut into pieces.

Action To promote blood flow to stop bleeding, eliminate *wind*, relieve pain and cure impetigo.

Indications Traumatic injuries and bleeding, rheumatic arthralgia and impetigo.

Usage and dosage 2-3 g.

Storage Preserve in a ventilated and dry place.

Herba Leonuri
(益母草, Yimucao)

Motherwort Herb

Motherwort Herb is the fresh or dried aerial part of *Leonurus japonicus* Houtt. (Fam. Labiatae). The fresh herb is collected from spring when seedling to early summer before flowering; The dried herb is collected in summer when foliage branch growing luxuriantly before or at the beginning of flowering, dried in the sun or dried after cutting into sections.

Description *Fresh herb of Leonurus japonicus* Herb in seedling absent of stem, basal leaves rounded-cordate, margin 5-9 lobated, lobes 2-3 serrated. Stems before flowering square, frequently branched at the upper part, furrowed longitudinally on 4 sides, 30-60 cm long, 0.2-0.5 cm in diameter; externally dark green; texture fresh and tender, fracture medullated in the centre. Leaves alternately opposite, petioled, lamina dark green, texture fresh and tender, occurring juice on being crumpled. The lower leaves palmately ternate, the upper leaves pinnatipartite or pinnatilobately ternate, lobes entire or slightly serrate. Odour, slight; taste, slightly bitter.

Dried herb of Leonurus japonicus Stems externally greyish-green or yellowish-green; texture light and pliable, fracture medullated in the centre. Lamina greyish-green, mostly crumpled and broken, easily fallen off. Verticillaster axillary, florets pale purple, calyx tubular, corolla bilabiated. Cutting sections about 2 cm long.

Identification (1) Transverse section of stem: Epidermal cells covered with cuticle at outer walls, pubescent, glandular scales with a 4-, 6- or 8-celled head and an unicellular stalk; non-glandular hairs 1- to 4-celled. Hypodermal collenchymatous cells abundant in the angular region. Cortex consisting of several layers of parenchymatous cells; endodermis distinct. Pericyclic fibre bundles slightly lignified. Phloem relatively narrow. Xylem well developed in the angular region. Meddulary parenchymatous cells relatively large. Parenchymatous cells containing minute needle crystals of calcium oxalate and small prisms. Cortex parenchymatous cells near epidermis containing chromoplasts for the fresh herb.
(2) To 3 g of the powder (pulverized after drying for the fresh herb) add 30 ml of ethanol, heat under reflux for 1 hour, allow to cool, filter, and concentrate the filtrate to 5 ml. Apply the concentrate to a small column (10 mm in internal diameter) packed with 0.5 g of activated charcoal and 2 g of neutral aluminium oxide (100-120 mesh), elute with 30 ml of ethanol and evaporate the eluate to dryness. Dissolve the residue in 0.5 ml of ethanol as the test solution. Dissolve stachydrine hydrochloride CRS in ethanol to produce a solution containing 5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of *n*-butanol, hydrochloric acid and water (4 : 1 : 0.5) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air, spray with dilute potassium iodobismuthate TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water *Dried herb of Leonurus japonicus* Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Total ash *Dried herb of Leonurus Japonicus* Not more than 11.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash *Dried herb of Leonurus japonicus* Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives *Dried herb of Leonurus japonicus* Carry out the method for determination of water-soluble extractives (Appendix Ⅹ A, the hot extraction method), not less than 15.0 per cent.

Assay *Dried herb of Leonurus japonicus* Weigh accurately about 1 g of the powder (through No. 2 sieve), in a stopper conical flask, add 50 ml of ethanol, heat on a water bath for 1.5 hours, allow to cool and filter. Wash the residue and the flask several times with 50 ml of ethanol, filter. Combine the filtrate and washings, evaporate to dryness. Dissolve the residue in ethanol, transfer to a 10 ml volumetric flask, dilute with ethanol to volume, mix well and centrifuge (5000 r/min, 5 minutes), use the supernatant as the test solution. Dissolve stachydrine hydrochloride CRS, previously dried 3 hours at 105℃ and accurately weighed, in ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅸ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of ethyl acetate, *n*-butanol and hydrochloric acid (1 : 8 : 3) as the mobile phase. Apply accurately to the plate 8 μl of the test solution, 3 μl and 8 μl of the reference solution alternatively. After developing and removal of the plate, dry in air, heat at 105℃ for 15 minutes, allow to cool, and spray with a mixed solution of dilute potassium iodobismuthante TS and 1% ferric chloride TS (10 : 1) to the spots clear, dry in air. Cover the plate with a glass plate of same size, fix up with adhesive plaster. Carry out the method for thin layer chromatography (Appendix Ⅵ A, thin layer chromatography scanning method), scan at the wavelength of $\lambda s = 510$ nm. Measure the integration values of absorbance from the test solution and the reference solution respectively, and calculate the content.
It contains not less than 0.50 per cent of stachydrine hydrochloride ($C_7H_{13}NO_2 \cdot HCl$), calculated with reference to the dried drug.

Processing *Fresh Motherwort Herb* Eliminate foreign matter, wash clean rapidly.

Dried Motherwort Herb Eliminate foreign matter, wash clean rapidly, soften thoroughly, cut into sections, and dry.

Action To regulate menstruation by activating blood circulation, and induce urination.

Indications Menstrual disorders, dysmenorrhea, amenorrhea, incessant drippling of lochia; edema and oliguria such as edema in acute nephritis.

Usage and dosage 9-30 g of the dried herb; 12-40 g of the fresh herb.

Precaution Contraindicated in pregnancy.

Storage Preserve the dried drug in a dry place; and the fresh herb in a cool and moist place.

Preparation (1) Extractum Leonuri Liquidum
(2) Extractum Leonuri Inspissatum

Herba Lobeliae Chinensis (半边莲, Banbianlian)

Chinese Lobelia Herb

Chinese Lobelia Herb is the dried herb of *Lobelia chinensis* Lour. (Fam. Campanulaceae). The drug is collected in summer, removed from soil, washed clean, and dried in the sun.

Description Usually winded up into masses. Rhizomes 1-2 mm in diameter, externally pale brownish-yellow, smooth or finely striated longitudinally. Roots slender, yellow, bearing lateral rootlets. Stems slender, branched, greyish-green, with obvious nodes, some bearing fibrous roots. Leaves alternate, sessile, lamina mostly crumpled, greenish-brown, when whole, narrowly lanceolate, 1-2.5 cm long, 2-5 mm wide, margin sparsely and shallowly serrate. Pedicels slender, flowers small, solitary and axillary, corolla tubular at the base, 5-lobed at the upper part, oblique on one side, pale purplish-red, with white pubescences inside the corolla tube. Odour, slight, characteristic; taste, slightly sweet and pungent.

Identification (1) Powder: Greyish-greenish-yellow or pale brownish-yellow. The anticlinal walls of leaf epidermal cells slightly sinuous, stomata anomocytic, subsidiary cells 3-7. Spiral vessels and reticulate vessels frequently visible, 7-34 μm in diameter. Clusters of calcium oxalate frequently occurring beside vessels, sometimes arranged in rows. Laticiferous vessels visible, containing granular and oily contents. Parenchymatous cells containing inulin.
(2) To 1 g of the powder add 50 ml of methanol, ultrasonicate for 30 minutes, cool and filter. Evaporate the filtrate to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Prepare a solution with 1 g of Herba Lobeliae Chinensis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅳ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (9 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. Examine in daylight and under ultraviolet light at 365 nm respectively. The spots or fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots or fluorescent spots in the chromatogram obtained with the reference drug solution.

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Extractives Carry out the method for determination of water-soluble extractives (Appendix Ⅹ A, the hot extraction method), not less than 35.0 per cent.

Processing Eliminate foreign matter, wash clean, cut into sections and dry in the sun.

Action To induce urination, and to remove toxic *heat*.

Indications Anasarca and ascites; carbuncles, boils and snake or insect bite; ascites in late schistomiasis.

Usage and dosage 9-15 g.

Storage Preserve in a dry place.

Herba Lophatheri (淡竹叶, Danzhuye)

Lophatherum Herb

Lophatherum Herb is the dried stem and leaf of *Lophatherum gracile* Brongn. (Fam. Gramineae). The drug is collected before the rachis emerges in summer and dried in the sun.

Description 25-75 cm long. Stems cylindrical, nodiferous, externally yellowish-green, fracture hollowed. Leaf sheaths dehiscent. Lamina lanceolate, some crumpled and rolled, 5-20 cm long, 1-3.5 cm wide; surface pale green or yellowish-green, veins parallel, bearing lateral veinlets, forming rectangular reticulate venation, more distinct on the lower surface. Texture light, pliable. Odour, slight; taste, weak.

Identification Surface view of leaf: Epidermal cells of the upper epidermis rectangular or subsquare, with sinuous anticlinal walls, showing rounded palisade cells beneath. The long cells and short cells of the lower epidermis alternately arranged or several connected; the long cells rectangular, with sinuous anticlinal walls; the short cells dumb-bell shaped, being silica cells and suberized cells, a string of short cells occurring near veins. Stomata numerous, guard cells dumb-bell shaped, subsidiary cells subrounded-triangular. Non-glandular hairs of three types, one type unicellular, long, the other unicellular, short conical, occasionally with the third type, bicellular, short and small.

Processing Eliminate foreign matter, and cut into sections.

Action To remove *heat*, ease the mind and induce urination.

Indications Fidgetness and thirst in febrile diseases; dysuria with dark urine and painful urination, ulcers in the mouth or on the tongue.

Usage and dosage 6-9 g.

Storage Preserve in a dry place.

Herba Lycopi (泽兰, Zelan)

Hirsute Shiny Bugleweed Herb

Hirsute Shiny Bugleweed Herb is the dried aerial part of *Lycopus lucidus* Turcz. var. *hirtus* Regel (Fam. Labiatae). The drug is collected in summer and autumn when foliage branch growing luxuriantly, and dried in the sun.

Description Stems square, infrequently branched, shallowly furrowed longitudinally on four sides, 50-100 cm long, 2-6 mm in diameter; externally yellowish-green or purplish, nodes apparently purple, white-tomentose; texture fragile, fracture yellowish-white, pith hollowed. Leaves opposite, short petioled; lamina mostly crumpled, when whole, lanceolate or oblong, 5-10 cm long; the upper surface

blackish-green, the lower surface greyish-green and densely glandular-dotted, pubescent on both surfaces; apex acute, margin serrate. Flowers, aggregated in leaf axils in verticillate cymes, corolla mostly fallen off, bracts and calyx persistent, yellowish-brown. Odour, slight; taste, weak.

Identification To 1 g of the powder add 30 ml of acetone, heat under reflux for 30 minutes, and filter. Evaporate the filtrate to dryness, to the residue add 10 ml of petroleum ether (30-60℃) and macerate for about 2 minutes. Pour out the petroleum ether and evaporate the solution to dryness. Dissolve the residue in 2 ml of dehydrated ethanol as the test solution. Dissolve ursolic acid CRS in dehydrated ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform, ethyl acetate and formic acid (20 : 5 : 8 : 0.1) as the mobile phase. Apply separately to the plate 2-4 μl of the test solution and 2 μl of the reference solution. After developing and removal of the plate, dry in air. Spray with 10% solution of sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Processing Eliminate foreign matter, wash briefly, soften thoroughly, cut into sections and dry.

Action To activate blood circulation and eliminate blood stasis, and to induce diuresis.

Indications Menstrual disorders, amenorrhea, dysmenorrhea, postpartum abdominal pain due to blood stasis; edema.

Usage and dosage 6-12 g.

Storage Preserve in a ventilated and dry place.

Herba Lycopodii (伸筋草, Shenjincao)

Common Clubmoss Herb

Common Clubmoss Herb is the dried herb of *Lycopodium japonicum* Thunb. (Fam. Lycopodiaceae). The drug is collected in summer and autumn when foliage branch growing luxuriantly, removed from foreign matter, and dried in the sun.

Description Stolons slender cylindrical, slightly curved, up to 2 m long, 1-3 mm in diameter, with yellowish-white rootlets underneath. Erect stems bifurcated. Leaves densely growing on the stems, spirally arranged, crumpled and curved, linear or needle-shaped, 3-5 mm long, yellowish-green to pale yellowish-brown, glabrous, aristate at the apex, margin entire, easily broken. Texture soft, fracture pale yellow in bark and whitish in wood. Odour, slight; taste, weak.

Identification (1) Transverse section of stem: Epidermal cells of 1 layer. Cortex broad, scattered with leaf trace bundles, occurring 10-20 or more layers of sclerenchymatous cells below the epidermis and outside the stele respectively, and 3-5 layers of parenchymatous cells with slightly thickened walls between them; endodermis indistinct. Pericycle consisting of several layers of parenchymatous cells, bundles of xylem irregularly stripe-shaped or branched, intermingled with bundles of phloem, some cells containing yellowish-brown contents.

(2) To 1 g of the powder add 15 ml of ether, allow to macerate overnight, filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of anhydrated ethanol as the test solution. Prepare a solution with 1 g of Herba Lycopodii reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using sillica gel G as the coating substance and a mixture of chloroform and methanol (40 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with 5% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Processing Eliminate foreign matter, wash clean, cut into sections, and dry.

Action To relieve rheumatic condition and muscular contracture.

Indications Arthralgia with immobilized joints.

Usage and dosage 3-12 g.

Storage Preserve in a dry place.

Herba Lysimachiae (金钱草, Jinqiancao)

Christina Loosestrife

Christina Loosestrife is the dried herb of *Lysimachia christinae* Hance (Fam. Primulaceae). The drug is collected in summer and autumn, removed from foreign matter, and dried in the sun.

Description Frequently twisted into masses, glabrous or sparsely pubescent. Stems twisted, externally brown or dark brownish-red, striated longitudinally, stem nodes of the lower part sometimes with rootlets, fracture solid. Leaves opposite, mostly crumpled, when whole, broadly ovate or cordate, 1-4 cm long, 1-5 cm wide, base slightly concave, margin entire; the upper surface greyish-green or dark brown, the lower surface pale in colour, midrib distinctly prominent, after soaking in water, the black or brown stripes visible under the light; petioles 1-4 cm long. Some with flowers, yellow, solitary and axillary, long-petioled. Capsules globose. Odour, slight; taste, weak.

Identification (1) Transverse section of stem: Epidermal cells covered with cuticle, glandular hairs sometimes found, with an unicellular head and a 1-2-celled stalk. Cortex broad, sometimes cells containing reddish-brown secretion; secretory canals scattered, surrounded by 5-10 secretory cells, containing reddish-brown lumpy secretion. Endodermis distinct. Pericyclic fibres arranged in an interrupted ring, walls slightly lignified. Phloem narrow. Xylem ringed. Pith usually hollowed. Parenchymatous cells containing starch granules.

Surface view of leaf: Glandular hairs reddish-brown, with a subrounded unicellular head, about 25 μm in diameter, and an unicellular stalk. Secretory canals scattered throughout mesophyll, about 45 μm in diameter, containing reddish-brown secretion. For sparsely pubescent ones, nonglandular hairs visible on the surface of stems and leaves, 1-17-celled, straight or curved, some cells shrunken, 59-1070 μm long, 13-53 μm in diameter at the base, finely striated on the surface, containing yellowish-brown contents.

(2) To 1 g of the powder add 50 ml of 80% methanol, heat under reflux for 1 hour, cool, and filter. Evaporate the filtrate to dryness. Dissolve the residue in 10 ml of water, extract with two 10-ml quantities of ether, and discard the ether solutions. To the water solution add 10 ml of dilute hydrochloric acid, heat on a water bath for 1 hour, cool immediately, and extract with two 20-ml quantities of ethyl acetate, combine the ethyl acetate extracts, and wash with 30 ml of water, discard the washing. Evaporate the ethyl acetate extract to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve quercetin CRS and kaempferol CRS in methanol to produce a mixture containing 0.5 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl formate and formic acid (10 : 8 : 1) as the mobile phase. Apply separately to the plate 5 μl of the test solution and 2 μl of the reference solution. After developing and removal of the plate, dry in air. Spray with 3% aluminium trichloride in ethanol, heat at 105℃ for several minutes, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Foreign matter Not more than 8 per cent (Appendix Ⅸ A).

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 13.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 5.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using 75% ethanol as the solvent, not less than 8.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.4% phosphoric acid solution (50 : 50) as the mobile phase. As detector a spectrophotometer set at 360 nm. The number of theoretical plates of the column is not less than 2500, calculated with reference to the peak of quercetin.

Reference solution Dissolve a quantity of quercetin CRS and kaempferol CRS, accurately weighed, in 80% methanol to produce a solution containing 4 μg of quercetin and 20 μg of kaempferol per ml as the reference solution.

Test solution Weigh accurately 1.5 g of the coarse powder (through No. 3 sieve) in a stopper conical flask. Add accurately 50 ml of 80% methanol, weigh, heat on a water bath for 1 hour, cool, weigh again, replenish the loss of the weight with 80% methanol, mix well and filter. Measure accurately 25 ml of the successive filtrate, add accurately 5 ml of hydrochloric acid, heat on a water bath at 90℃ for 1 hour, cool immediately. Transfer to a 50 ml volumetric flask, dilute with 80% methanol to volume and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.10 per cent of the total amount of quercetin ($C_{15}H_{10}O_7$), and kaempferol ($C_{15}H_{10}O_6$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash briefly, cut into sections, and dry in the sun.

Action To remove *damp-heat*, relieve dysuria, and reduce swelling.

Indications Acute urinary infection or urolithiasis with difficult painful urination; jaundice with dark urine, hepatic or biliary calculus; carbuncles, sores, venomous snake bite.

Usage and dosage 15-60 g of the dried herb or 30-120 g of the fresh herb.

Storage Preserve in a dry place.

Herba Menthae (薄荷, Bohe)

Peppermint

Peppermint is the dried aerial part of *Mentha haplocalyx* Briq. (Fam. Labiatae). The drug is collected in summer and autumn when foliage branch growing luxuriantly or in the third round of flowering, collected in several times on fine days, and dried in the sun or in the shade.

Description Stems square, with opposite branches, 15-40 cm long, 2-4 mm in diameter; externally purplish-brown or pale green, the angular regions pubescent, internodes 2-5 cm long; texture fragile, fracture white, pith hollowed. Leaves opposite, short petioled, lamina crumpled and rolled, when whole, broadly lanceolate, long-elliptical or ovate, 2-7 cm long, 1-3 cm wide; the upper surface dark green and the lower surface greyish-green, sparsely pubescent, bearing concavely dotted glandular scales. Verticillaster axillary, calyx campanulate, with five terminal teeth, corolla pale purple. Odour, characteristic and aromatic after rubbing; taste, pungent and cool.

Identification (1) Surface view of leaf: Glandular scales with a 8-celled head, up to 90 μm in diameter, and an unicellular stalk; small glandular hairs with an unicellular head and an unicellular stalk. Non-glandular hairs 1-8 celled, often curved, walls thickened, and slightly warty. Stomata diacytic, numerous on the lower surface.
(2) To the oily matter obtained from the microsublimation of the leaf powder add 2 drops of sulfuric acid and a small quantity of vanillin crystal, a yellow to orange-yellow colour is produced, turning to purplish-red on adding 1 drop of water.
(3) To 0.5 g of the powder add 5 ml of petroleum ether (60-90℃), stopper well, shake for several minutes, allow to stand for 30 minutes, filter and use the filtrate as the test solution. Dissolve menthol CRS in petroleum ether to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and ethyl acetate (19 : 1) as the mobile phase. Apply separately to the plate 10-20 μl of the test solution and 10 μl of the reference solution. After developing and removal of the plate, dry in air. Spray with a mixture of vanillin in sulfuric acid TS and ethanol (2 : 8). Heat at 100℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Leaves Not less than 30 per cent.

Assay Carry out the method for determination of volatile oil (Appendix Ⅹ D). To a sufficient quantity of 5 mm long short sections, add 600 ml of water per 100 g, boil gently for 3 hours, and determine the content of volatile oil.

It contains not less than 0.80 per cent (ml/g) of volatile oil.

Processing Remove the old stems and foreign matter, spray with a small quantity of water, soften briefly, cut into short sections, and dry at a low temperature in time.
Mostly short sections, 5-8 mm long, dark green, purplish-brown or greyish-brown. Carry out the method for determination of volatile oil as described under the Assay.
It contains not less than 0.4 per cent (ml/g) of volatile oil.

Action To expel *wind-heat* from the head and eyes, and promote eruptions.

Indications Headache in influenza, upper respiratory infection and other epidemic febrile diseases at the initial stage; inflammation of eyes, sore throat, ulcers in the mouth; rubella measles; discomfort and distension in the chest and hypochondriac regions.

Usage and dosage 3-6 g, added to the decoction when it is nearly done.

Storage Preserve in a cool and dry place.

Herba Moslae
(香薷, Xiangru)

Chinese Mosla

Chinese Mosla is the dried aerial part of *Mosla chinensis* Maxim. or *Mosla chinensis* 'Jiangxiangru' (Fam. Labiatae). The former is called as 'Qingxiangru' and the later is called as 'Jiangxiangru'. The drug is collected on fine days of summer when foliage branch growing luxuriantly and flowers in full blossom, removed from foreign matter, and dried in the shade.

Description *Qingxiangru* 30-50 cm long, the basal part purplish-red, the upper part yellowish-green or pale yellow, whole plant densely white pubescent. Stems square, subround at base, 1-2 mm in diameter, nodes distinct, internodes 4-7 cm long; texture fragile, easily broken. Leaves opposite, mostly crumpled or fallen off, when whole, lamina long-ovate or lanceolate, dark green or yellowish-green, margin 3-5 sparsely lobed. Spike terminal and axillary; bracts round-ovate or reversed round-ovate, fallen off or remained; calyx persistent, campanulate, pale purplish-red or greyish-green, apex 5-lobed, densely pubescent. Nutlets 4, 0.7-1.1 mm in diameter, subspherical, with reticulate striations. Odour, intensely aromatic; taste, cool and slightly pungent.

Jiangxiangru 55-66 cm long. Externally yellowish-green, texture soft. Lamina margin 5-9 sparsely lobed. Nutlets 0.9-1.4 mm in diameter, with sparse reticulate striations.

Identification (1) Surface view of leaf:

Qingxiangru The upper epidermal cells polygonal, anticlinal walls sinuous and slightly thickened, glandular scales with a 8-celled head and an unicellular stalk, 36-74-80 μm in diameter; walls of the lower epidermal cells not thickened, glandular sales 70-80 μm in diameter. Stomata diacytic, more frequently observed on the lower surface. Non-glandular hairs on the upper and lower epidermis mostly 2-celled, the upper cells frequently hook-like, warty protrudings distinct. Pericarpial epidermis with sockets densely, cells in the sockets flat and densely arranged.

Jiangxiangru Glandular scales on the upper epidermis 90 μm in diameter; non-glandular hairs 2-3-celled, the lower cells longer than the upper cells, warty protrudings indistinct, basal cells of non-glandular hairs 5-6, with beaded-thickened anticlinal walls. Pericarpial epidermal cells polygonal, densely with hollowed reticulations. Small glandular hairs visible. Fibre bundles reticulately arranged.
(2) Dissolve volatile oil obtained under the Assay in ether to produce a solution containing 3 μl per ml as the test solution. Dissolve thymol CRS and carvacrol CRS in ether to produce two solutions containing 1 mg of each per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and toluene as the mobile phase. Apply separately to the plate 5 μl of each of the above three solutions. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Assay ***Volatile oil*** Carry out the method for determination of volatile oil (Appendix Ⅹ D), add 800 ml of water per 100 g of the herb (in 1 cm sections), keep gentle boiling for 4 hours. Not less than 0.60 per cent (ml/g).

Thymol and carvacrol Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and sytem suitability Use 10% polyethylene glycol (PEG) -20M as the stationary phase; maintain the column temperature at 190℃. The number of theoretical plates of the column is not less than 1700, calculated with reference to the peak of thymol.

Reference solution Weigh accurately 15 mg of thymol CRS and carvacrol CRS respectively, to a 50 ml volumetric flask, dissolve and dilute with anhydrous ethanol to volume, mix well.

Test solution Weigh accurately 2 g of the powder (through No. 2 sieve), to a stopper conical flask, add accurately 20 ml of anhydrous ethanol, weigh, shake for 5 minutes, macerate overnight, ultrasonicate (power 250 W, frequency 50 kHz) for 15 minutes, allow to cool, weigh again and compensate the loss of the weight with anhydrous ethanol, mix well, filter with a dried filter containing 1 g of activated charcoal, use the successive filtrate as the test solution.

Procedure Inject accurately 2 μl of each of the test solution and the reference solution, respectively, into the column, and calculate the content.
It contains not less than 0.16 per cent of the total amount of thymol ($C_{10}H_{14}O$) and carvacrol ($C_{10}H_{10}O$), calculated with reference to the dried drug.

Processing Remove remains of roots and foreign matter, cut into sections.

Action To induce diaphoresis, regulate the function of the spleen and the stomach, and remove *dampness* through diuresis.

Indications Attack by summer heat and *dampness* manifested by chills and fever, headache, abdominal pain, vomiting, diarrhea, oliguria and absence of sweating.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place.

Herba Orostachyis Fimbriati
(瓦松, Wasong)

Fimbriate Orostachys Herb

Fimbriate Orostachys Herb is the dried aerial part of *Orostachys fimbriatus* (Turcz.) Berg. (Fam. Crassulaceae). The drug is collected at flowering in summer and autumn, removed from root and foreign matter, and dried in the sun.

Description Stems slenderly cylindrical, 5-27 cm long, 2-6 mm in diameter, externally greyish-brown, with numerous protuberant remains of leaf base, and distinct longitudinal ridge lines. Leaves mostly fallen off, crumbled or crumpled, greyish-green. Panicle spike-like, florets white or pink, pedicel about 5 mm long. Texture light and fragile, easily broken. Odour, slight; taste, sour.

Foreigh matter Not more than 2.0 per cent (Appendix Ⅸ A).

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using ethanol as the solvent, not less than 3.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.5% phosphoric acid solution (47 : 53) as the mobile phase. As detector a spectrophotometer set at 360 nm. The number of theoretical plates of the column is not less than 4000, calculated with reference to the peak of quercetin.

Reference solution Dissolve a quantity of quercetin CRS and kaempferol CRS, accurately weighed, in methanol to produce a mixture containing 10 μg of quercetin and 20 μg of kaempferol per ml respectively.

Test solution Weigh accurately 1 g of the powder (through No. 3 sieve), to a stopper conical flask, add accurately 50 ml of a mixture of methanol and 25% hydrochloric acid solution (4 : 1), weigh, heat on a water bath for 1 hour, cool immediately, weigh again, compensate the loss of the weight with methanol, mix well, filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 10-20 μl of the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.020 per cent of the total amount of quercetin ($C_{15}H_{10}O_7$) and kaempferol ($C_{15}H_{10}O_6$), calculated with reference to the dried drug.

Processing Eliminate remains of roots and foreign matter, cut into sections.

Action To stop bleeding, clear toxin, and cure sores.

Indications Bloody dysentery, hemafecia, unhealed ulcer.

Usage and dosage 3-9 g; appropriate quantity for external use.

Storage Preserve in a ventilated and dry place.

Herba Plantaginis
(车前草, Cheqiancao)

Plantain Herb

Plantain Herb is the dried herb of *Plantago asiatica* L. or *Plantago depressa* Willd. (Fam. Plantaginaceae). The drug is collected in summer, removed from soil, and dried in the sun.

Description *Herb of Plantago asiatica* Roots fascicled, fibrous. Leaves basal, long petioled; lamina crumpled, when whole, ovate-elliptical or broadly ovate, 6-13 cm long, 2.5-8 cm wide; externally greyish-green or blackish-green, with 5-7 distinct arched veins; obtuse or acute at the apex, broadly cuneate at the base, margin entire or irregularly sinuate-dentate. Spikes several, with a long scape. Capsules circumscissile, calyx persistent. Odour, slightly aromatic; taste, slightly bitter.

Herb of Plantago depressa Main roots straight and long. Lamina relatively narrow, long-elliptical or elliptical-lanceolate, 5-14 cm long, 2-3 cm wide.

Identification Surface view of leaf:

Herb of Plantago asiatica The epidermal cells of both surfaces subrectangular, the upper epidermal cells with striated cuticle. Stomata anomocytic, subsidiary cells 3-4. Glandular hairs with an elliptical head of 2 cells, and an unicellular stalk. Non-glandular hairs infrequent, 2-5 celled, 100-320 μm long, with slightly thickened and faintly warty walls.

Herb of Plantago depressa Non-glandular hair 3-7 celled, 350-900 μm long.

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 15.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 5.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of water-soluble extractives (Appendix Ⅹ A, the hot extraction method), not less than 14.0 per cent

Processing Eliminate foreign matter, wash clean, cut into sections, and dry in the sun.

Action To remove *heat* and induce urination, promote expectoration, reduce *heat* in blood and counteract *toxicity*.

Indications Edema with oliguria; urinary infection with difficult painful urination; diarrhea caused by *summer-dampness*; cough caused by *phlegm-heat*; spitting of blood, epistaxis; carbuncles and sores.

Usage and dosage 9-30 g; or 30-60 g of the fresh herb decocted or pounded to obtain the juice for oral administration; appropriate quantity of the fresh herb is pounded into paste and applied topically.

Storage Preserve in a ventilated and dry place.

Herba Pogostemonis (广藿香, Guanghuoxiang)

Cablin Patchouli Herb

Cablin Patchouli Herb is the dried aerial part of *Pogostemon cablin* (Blanco) Benth. (Fam. Labiatae). The drug is collected when foliage branch growing luxuriantly, exposed to the sun in day and closed tightly at night repeatly until completely dried.

Description Stems somewhat square, frequently branched, branches slightly curved, 30-60 cm long, 2-7 mm in diameter; externally pubescent; texture fragile, easily broken, fracture medullated in the centre; old stems subcylindrical, 1-1.2 cm in diameter, covered with greyish-brown cork. Leaves opposite, crumpled into masses, when whole, ovate or elliptical, 4-9 cm long, 3-7 cm wide; greyish-white pubescent on both surfaces; apex short-acute or obtuse-rounded, base cuneate or obtusely rounded, margin irregularly serrate; petioles slender, 2-5 cm long, pubescent. Odour, aromatic, characteristic; taste, slightly bitter.

Identification (1) Powder of the leaf: Pale brown. Epidermal cells irregular, stomata diacytic. Non-glandular hairs 1 to 6-celled, straight or curved at the apex, up to 590 μm long, walls spinulous, some cells containing yellowish-brown masses. Glandular scales with an unicellular head, frequently window-shaped or cleft in surface view, 37-70 μm in diameter, and an unicellular, very short stalk. Intercellular glandular hairs occurring in the intercellular spaces of the palisade or parenchyma, with an unicellular head, irregularly saccular, 13-50 μm in diameter, up to about 113 μm long, and an unicellular, short stalk. Small glandular hairs with a bicellular head and a 1-3-celled, very short stalk. Needle crystals of calcium oxalate minute, scattered in mesophyll cells, up to about 27 μm long.

(2) Weigh sufficient quantity of the coarse powder, carry out the following tests with the volatile oil obtained as described under determination of volatile oil (Appendix Ⅹ D).

Dilute 0.5 ml of the volatile oil to 5 ml with ethyl acetate, as the test solution. Dissolve patchouli alcohol CRS in ethyl acetate to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃), ethyl acetate and glacial acetic acid (95 : 5 : 0.2) as the mobile phase. Apply separately to the plate 1-2 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with 5% ferric chloride in ethanol. The chromatogram obtained with the test solution shows a yellow spot; heat to the spots clear, a purplish-blue spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Foreign matter Not more than 2 per cent (Append Ⅸ A).

Water Not more than 14.0 per cent (Appendix Ⅸ H, method 2),

Total ash Not more than 11.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 4.0 per cent (Appendix Ⅸ K).

Leaves Not less than 20 per cent.

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the cold maceration method), using ethanol as the solvent, not less than 2.5 per cent.

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and suitability Use a HP-5 capillary column (30 m × 0.32 mm × 0.25 μm); initial temperature at 150℃, maintain 23 minutes, then increase at 8℃ per minute to 280℃ and maintain 2 minutes. The injector temperature is 280℃; and the detector temperature is 280℃; The flow ratio is 20 : 1. The number of theoretical plates of the column is not less than 50000, calculate with reference to the peak of patchouli alcohol.

Correction factor Dissolve a quantity of *n*-octadecane, accurately weighed, in *n*-hexane to produce a solution containing 15 mg per ml as the internal standard solution. Dissolve 30 mg of patchouli alcohol CRS, accurately weighed, in a 10 ml volumetric flask, add accurately 1 ml of the internal standard solution, dilute with *n*-hexane to volume and mix well. Inject accurately 1 μl of the solution into column, calculate the correction factor for patchouli alcohol.

Procedure Weigh accurately 3 g of the coarse powder (through No. 4 sieve) in a conical flask. Add 50 ml of chloroform, ultrasonicate 3 times, 20 minutes each time, filter, combine the filtrate and evaporate to dryness, dissolve the residue in *n*-hexane in a 5 ml volumetric flask, add accurately 0.5 ml of the internal standard solution, add *n*-hexane to volume, and mix well. Inject accurately 1 μl of the solution into column and calculate the content.

It contains not less than 0.10 per cent of patchouli alcohol. ($C_{15}H_{26}O$), calculated with reference to the dried drug.

Processing Remove the remains of roots and foreign matter, collect the leaves, sift and set aside. Wash the stems clean, soften thoroughly, cut into sections and dry in the sun, then mix with the leaves.

Action To resolve *damp*, whet appetite, arrest vomiting, and release the exterior and expel *summer-dampness*.

Indications stuffiness in the epigastrium and vomiting due to *dampness* in the spleen and stomach; constriction in the chest and lassitude due to summer-dampness, abdominal pain, vomiting; sinusitis with headache due to cold, *dampness* and *summer-heat*.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place, protected from moisture.

Herba Polygoni Avicularis (萹蓄, Bianxu)

Common Knotgrass Herb

Common Knotgrass Herb is the dried aerial part of *Polygonum aviculare* L. (Fam. Polygonaceae). The drug is collected in summer when leaf growing luxuriantly, removed from root and foreign matter, and dried in the sun.

Description Stems cylindrical and somewhat flattened, branched, 15-40 cm long, 2-3 mm in diameter. Externally greyish-green or brownish-red, with fine and slightly prominent longitudinal striations; nodes slightly swollen, with pale brown membranous stipulate sheaths, internodes about 3 cm long; texture hard, easily broken, fracture with

a white pith. Leaves alternate, almost sessile or short petioled; lamina frequently fallen off, crumpled or broken, when whole, lanceolate, margin entire, both surfaces brownish-green or greyish-green. Odour, slight; taste, slightly bitter.

Identification (1) Powder: Greyish-green. The epidermal cells on both surfaces of leaf with almost straight anticlinal and striated periclinal walls. Stomata mostly anisocytic, with 3 subsidiary cells. The transverse view of mesophyll showing isobilateral, parenchymatous cells containing clusters of calcium oxalate, 18-43 μm in diameter.
(2) To 5 g of the powder add 100 ml of 70% ethanol and 5 ml of hydrochloric acid, heat under reflux for 3 hours, filter, use the filtrate as the test solution. Dissolve quercitin CRS in ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B) using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and a mixture of toluene, ethyl acetate and formic acid (5 : 2 : 1) as the mobile phase. Apply separately to the plate 5 μl of the test solution and 1 μl of the reference solution. After developing and removal of the plate, dry in air. Spray with 1% aluminium trichloride solution. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Processing Eliminate foreign matter, wash clean, cut into sections and dry.

Action To relieve dysuria, kill fungi and trichomonad and alleviate itching.

Indications Urinary infection with difficult painful urination, passage concentrated reddened urine and dribbling of urine after urination; eczema; vulval itching with morbid leukorrhea.

Usage and dosage 9-15 g; for external use, appropriate quantity is decocted for irrigation.

Storage Preserve in a dry place.

Herba Portulacae (马齿苋, Machixian)

Purslane Herb

Purslane Herb is the dried aerial part of *Portulaca oleracea* L. (Fam. Portulacaceae). The drug is collected in summer and autumn, removed from remains of roots and foreign matter, washed clean, steamed briefly or treated with boiling water, and then dried in the sun.

Description Mostly crumpled and rolled into masses. Stems cylindrical, up to 30 cm long, 1-2 mm in diameter; externally yellowish-brown, distinctly furrowed longitudinally. Leaves opposite or alternate, easily broken, when whole, obovate, 1-2.5 cm long, 0.5-1.5 cm wide; greenish-brown, obtuse or slightly notched at the apex, margin entire. Flowers small, 3-5, terminal at branchlets, petals 5, yellow. Capsules conical, about 5 mm long, with many minute seeds. Odour, slight; taste, slightly sour.

Identification To 2 g of the powder add 15 ml of hydrochloric acid solution in ethanol (1→20), heat under reflux for 10 minutes, and filter when hot. To 2 ml of the filtrate, add 1 ml of 3% sodium carbonate solution, heat for 3 minutes on a water bath, cool in ice-water, add a small quantity of activated charcoal, stir and filter. To the filtrate add 2 drops of freshly prepared diazotized *p*-nitroaniline TS, a red colour is produced.

Processing Eliminate foreign matter, wash clean, soften briefly, cut into sections, and dry in the sun.

Action To remove toxic *heat*, and arrest bleeding.

Indications Dysentery with bloody stools; boils and sores, eczema, erysipelas; snake or insect bite; hematochezia, hemorrhoidal bleeding, abnormal uterine bleeding.

Usage and dosage 9-15 g of the dried herb or 30-60 g of the fresh herb; appropriate quantity is pounded into paste for topical application.

Storage Preserve in a ventilated and dry place, protected from moisture.

Herba Potentillae Chinensis (委陵菜, Weilingcai)

Chinese Cinquefoil

Chinese Cinquefoil is the dried herb of *Potentilla chinensis* Ser. (Fam. Rosaceae). The drug is collected in spring before sprouting of stems, removed from soil, and dried in the sun.

Description Roots cylindrical or subconical, slightly twisted, sometimes branched, 5-17 cm long, 0.5-1 cm in diameter; externally dark brown or dark purplish-red, striated longitudinally, the coarse outer bark easily exfoliated, root stocks slightly swollen; texture hard, easily broken, bark in fracture thin, dark brown, easily separated from wood, rays arranged radially. Leaves basal, odd-pinnate, petioled; leaflets narrowly long-elliptical, margin pinnatipartite, the lower surface and petiole densely covered with greyish-white pubescences. Odour, slight; taste, astringent and slightly bitter.

Identification (1) Powder: Greyish-brown. Non-glandular hairs numerous, unicellular, straight or curved, some twisted into a mass, slender, 7-37 μm in diameter, up to about 4000 μm long, with thickened walls. Mesophyll cells containing clusters of calcium oxalate, 6-65 μm in diameter, and small prisms occasionally observed. Wood fibres long fusiform, 7-14 μm in diameter, walls slightly thickened and pit cannals distinct. Cork cells subpolygonal or flat-rectangular, containing yellowish-brown contents.
(2) To 1 g of the powder add 10 ml of petroleum ether (60-90℃), macerate warmly for 3 hours, filter, evaporate the filtrate to dryness, add 10 ml of ethanol to dissolve the residue, filter, and concentrate the filtrate to about 1 ml as the test solution. Prepare a solution with 1 g of Herba Potentillae Chinensis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of toluene, ethyl formate and formic acid (5 : 4 : 1) as the mobile phase. Apply separately to the plate 6 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with a mixture of 2% ferric chloride solution and potassium ferricyanide TS mixed in equal portions. The blue spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into sections, and dry in the sun.

Action To remove toxic *heat* and *heat* in blood, and relieve dysentery.

Indications Dysentery with bloody stools, chronic dysentery; hemorrhoidal bleeding; carbuncles and sores.

Usage and dosage 9-15 g; appropriate quantity of the fresh herb is decocted for wash or pounded into paste for topical application.

Storage Preserve in a ventilated and dry place.

Herba Pyrolae (鹿衔草, Luxiancao)

Pyrola Herb

Pyrola Herb is the dried herb of *Pyrola calliantha* H. Andres or *Pyrola decorata* H. Andres (Fam. Pyrolaceae). The drug is collected all the year round, removed from foreign matter, dried in the sun until the leaf relatively soft, piled up until the leaf turns purplish-brown, and dried in the sun.

Description Rhizomes slender. Stems cylindrical or with longitudinal ridges, 10-30 cm long. Leaves basal, long-ovate or subrounded, 2-8 cm long, dark green or purplish-brown, apex rounded or slightly acute, margin entire or sparsely serrulate, edges slightly curved, the upper surface sometimes bearing white stripes along the veins, the lower surface sometimes covered with white powder. Racemes, flowers 4-10 or more, half-nodding, calyx 5, tongue-shaped or ovate-oblong; petals 5, deciduous, stamens 10, anthers with small angles at the base, dehiscing by terminal pores; style exerted, with a prominent and ring-shaped stigma disk. Capsules oblate, 7-10 mm in diameter, 5-dehiscent longitudinally, with spider-thread-shaped hairs on the edges of segments. Odour, slight; taste, weak, slightly bitter.

Identification Transverse section of leaf: Epidermal cells of the upper and lower epidermis subsquare, covered with cuticle. Stomata visible on the lower epidermis, collenchymatous cells 5-7 layers occurring on the inner side of lower epidermis, and 1-3 layers occurring on the inner side of upper epidermis. Palisade cells indistinct, spongy cells subrounded, containing clusters of calcium oxalate. The vascular bundles of midrib collateral, xylem crescent, phloem narrow, parenchymatous cells containing reddish brown or brownish-yellow substances.

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Processing Eliminate foreign matter, and cut into sections.

Action To relieve rheumatic conditions, strengthen the tendons and bones, and arrest bleeding.

Indications Arthralgia weakness of the lower back and knees; menorrhagia; chronic phthisical cough.

Usage and dosage 9-15 g.

Storage Preserve in a dry place, protected from moisture.

Herba Sarcandrae (肿节风, Zhongjiefeng)

Glabrous Sarcandra Herb

Glabrous Sarcandra Herb is the dried herb of *Sarcandra glabra* (Thunb.) Nakai (Fam. Chloranthaceae). The drug is collected in summer and autumn, removed from foreign matter, and dried in the sun.

Description 50-120 cm long. Rhizomes relatively large, with numerous rootlets. Stems cylindrical, frequently branched, 0.3-1.3 cm in diameter; externally dark green to dark brown, with distinct fine longitudinal striations, longitudinal lenticels scattered, nodes swollen; texture fragile, easily broken, fracture medullated or hollowed. Leaves opposite, lamina ovate-lanceolate to ovate-elliptical, 5-15 cm long, 3-6 cm wide; externally green, greenish-brown to dark brown or brownish-red, glabrous, margin roughly serrate, the tips of serrations with blackish-brown glandular bodies, petiole about 1 cm long; texture nearly leathery. Spikes terminal, frequently branched. Odour, slightly aromatic; taste, slightly pungent.

Identification (1) Transverse section of stem: Epidermal cells subrectangular or oblong, covered with cuticle, edge obtusely dentate. Cortex cells 10 or more layers, the outer part occurring 2-3 layers of collenchymatous cells, parenchymatous cells in the inner part containing brownish-yellow contents, stone cells scattered singly or grouped. Pericyclic fibre bundles crescent, arranged in an interrupted ring, lignified. Phloem narrow. Xylem tracheids numerous, rays 2-8 cells wide. Parenchymatous cells of pith relatively large, sometimes stone cells visible, scattered singly or grouped.

Surface view of leaf: The anticlinal walls of epidermal cells sinuous or slightly straight, stomata slightly sunken, anomocytic.

(2) Place 0.5 g of the powder into a test tube, add a small quantity of zinc powder and 2 drops of 5% ammonium chloride solution. Heat gently to dryness, cover the tube mouth with a piece of filter paper moistened with a benzene solution containing 0.5% *p*-dimethylaminobenzaldehyde and 20% trichloroacetic acid, continue heating for about 1 minute, a pink to purple colour is produced on filter paper.

(3) To 2 g of the powder add 50 ml of water, ultrasonicate for 30 minutes, filter, extract the filtrate with two 25-ml quantities of ethyl acetate, combine the extracts and evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution with 2 g of Herba Sarcandrae reference drug in the same manner as the reference drug solution. Dissolve isofraxidin CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of toluene, ethyl acetate and formic acid (9 : 4 : 1) as the mobile phase. Apply separately to the plate 4 μl of each of the above three solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference solution and the reference drug solution. The spot corresponding to the spot in the chromatogram obtained with the reference solution becomes

to yellowish-green on exposure to ammonia vapour for 10 minutes.

Water Not more than 15.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of water-soluble extractives (Appendix Ⅹ A, the hot extraction method), not less than 10.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% phosphoric acid solution (20 : 80) as the mobile phase. As detector a spectrophotometer set at 344nm. The number of theoretical plates of the column is not less than 1200, calculated with reference to the peak of isofraxidin.

Reference solution Dissolve a quantity of isofraxidin CRS, accurately weighed, in methanol to produce a solution containing 4 μg per ml as the reference solution.

Test solution Weigh accurately 0.4 g of the powder (through No. 3 sieve) into a 100 ml volumetric flask, add 90 ml of water, allow to stand overnight. Ultrasonicate for 1.5 hours (power, 300W; frequency, 25kHz), cool, dilute with water to volume, shake thoroughly and filter. Measure accurately 25 ml of the successive filtrate, concentrate to almost dryness and add about 5 ml of water to dissolve, transfer to a separator. Extract with five 10-ml quantities of chloroform, combine the chloroform extracts and evaporate to dryness, dissolve the residue in methanol, transfer to a 10 ml volumetric flask, dilute with methanol to volume, and mix well.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.020 per cent of isofraxidin ($C_{11}H_{10}O_5$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into sections, and dry in the sun.

Action To reduce *heat* in the blood, activate blood circulation and remove ecchymoses, expel *wind* and remove obstruction from meridians.

Indications Purpura due to *heat* in the blood, impediment disease with pain due to *wind-dampness*, traumatic injuries.

Usage and dosage 9-30 g.

Storage Preserve in a ventilated and dry place.

Preparation (1) Glabrous Sarcandra Tablets.
(2) Glabrous Sarcandra Injection.
(3) Xuekang Oral Liquid.

Herba Saururi
(三白草, Sanbaicao)

Chinese Lizardtail Herb

Chinese Lizardtail Herb is the dried aerial part of *Saururus chinensis* (Lour.) Baill. (Fam. Saururaceae). The drug is collected all the year round, washed clean, and dried in the sun.

Description Stems cyclindrical, with four longitudinal furrows, one of them relatively broad. Fracture yellow, fibrous and hollow. Leaves simple, alternate, lamina ovate or ovate-lanceolate, 4-15 cm long, 2-10 cm wide, acuminate at apex, cordate at base, margin entire, 5-nerved at base, petiole relatively long, with longitudinal wrinkles. Racemes at the apex of branch, opposite to leaves, flowers small, dark brown. Capsules subspheroidal. Odour, slight; taste, weak.

Identification (1) Surface view of leaf: The cells of upper and lower epidermis somewhat polygonal, cuticle striations distinct, oil cells scattered in epidermis, rounded, 32-44 μm in diameter, and containing yellow oil drops. The upper epidermis without stomata, stomata numerous in lower epidermis, anomocytic, with glandular hairs, 2-3 celled, 40-70 μm long, and 12-16 μm in diameter of base.
Transverse section of stem: Epidermal cells subsquare. Collenchymatous cells of hypodermis mainly occurring under the ridges. Pericycle fibres of 3-4 rows, arranged in ring. Aerenchyma visible in cortex, consisting of subrounded parenchymatous cells, reticucately arranged, with large intercellular space, cortex scattered with oil cells and secretory ducts, oil cells containing oil drops, secretory ducts containing pale brown contents. Vascular bundles collateral, surrounded by fibre bundles, fibre bundles in the outer part arranged in an interrupted ring. Pith broad, aerenchyma visible; oil cells scattered. Clusters of calcium oxalate frequently occurring in parenchymatous cells, 12-25 μm in diameter.
(2) To 2 g of the powder add 10 ml of petroleum ether (60-90℃), macerate overnight, filter. and allow to dry spontaneously, a specific aromatic odour is produced. Add 1% vanillin in sulfuric acid, a red colour appears, which turns to bluish-purple on standing.
(3) To 2 g of the powder add 30 ml ethanol, heat under reflux for 1 hour, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 2 ml of ethanol as the test solution. Prepare a solution with 2 g of Herba Saururi reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and acetone (5 : 2) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The main fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Foreign matter Not more than 3 per cent (Appendix Ⅸ A).

Water Not more than 15.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 11.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 4.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol TS as the solvent, not less than 10.0 per cent.

Processing Eliminate foreign matter, wash clean, cut into sections, dry in the sun.

Action To remove toxic *heat*, and induce urination.

Indications Dysuria with painful difficult urination, urinary infection, nephritic edema; morbid leukorrhea; external use for boils, sores and eczema.

Usage and dosage 15-30 g; appropriate quantity of the fresh herb is pounded into paste for topical application.

Storage Preserve in a cool and dry place.

Herba Saussureae Involucratae (天山雪莲, Tianshan Xuelian)

Snow Lotus Herb

Snow Lotus Herb is the dried aerial part of *Saussurea involucrate* (Kar. et Kir.) Sch. Bip. (Fam. Compositae), habitually used by the Uygur nationality. The drug is collected at flowering in summer and autumn, and dried in the shade.

Description Stems cylindrical, 2-48 cm long, 0.5-3 cm in diameter, externally yellowish-green or yellowish-brown, sometimes purplish, with longitudinal ridges; fracture hollowed. Cauline leaves densely arranged, sessile, with remains after fallen off; When whole, lamina ovate-oblong or broadly lanceolate, pubescent on the two surfaces, with teeth and hairs on margin, midrib distinct. Capitulum acrogenous, without stalk, 10-42 densely gathered in spherical shape, bracts long-ovate or ovate, sessile, sunken in the centre like a ship, membranous and translucent; involucre 3-4 layers, lanceolate, in equal length, the outer layer mostly purplish-brown, the inner layer brownish-yellow or yellowish-white; florets tubular, purplish-red; stigma bilobate. Achenes cylindrical, with longitudinal ridges and 2 layers of feather-like pappi. Texture light and fragile. Odour, slightly aromatic; taste, slightly bitter.

Identification (1) Powder: yellowish-grey to yellowish-green. Glandular hairs pestle-like, head and stalk mostly 2-celled. Non-glandular hairs frequently polycellular or unicellular, basal cells subrectanglar, Apical cells relatively slender or twisted, 40-300 μm long. Pollens spherical, 45-68 μm in diameter, with thorny exine and 3 furrows. Stomata anomocytic. Pappi branched, in several rows. Fragments of stigma with thorny or villiform protuberances. (2) Ultrasonicate 0.5 g of the powder with 20 ml of methanol for 10 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution with 0.5 g of Herba Saussureae Involucratae reference drug in the same manner as the reference drug solution. Dissolve rutin CRS and chlorogenic acid CRS in methanol to produce two solutions containing 5 mg and 2 mg per ml, respectively, as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of ethyl acetate, butanone, formic acid and water (10 : 6 : 1 : 2) as the mobile phase. Apply separately to the plate 3-5 μl of each of the above four solutions. After developing and removal of the plate, dry in air. Spray with a 1% solution of sodium nitrite in 1% methanol, heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solutions.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 12.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using 70% ethanol as the solvent, not less than 15.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.4% phosphoric acid (38 : 62) as the mobile phase. As detector a spectrophotometer set at 340 nm, maintain the column temperature at 40℃. The number of theoretical plates of the column is not less than 8000, calculated with reference to the peak of rutin.

Reference solution Dissolve a quantity of rutin CRS (dried previously to constant weight at 120℃) and chlorogenic acid CRS, accurately weighed, in 1 ml of 50% methanol to produce a mixture containing 80 μg of rutin and 60 μg of chlorogenic acid per ml respectively.

Test solution Weigh accurately 1 g of the powder (through No. 3 sieve), to a stopper conical flask, add accurately 50 ml of 50% methanol, weigh. Ultrasonicate for 10 minutes, allow to cool, weigh again, compensate the loss of the weight with 50% methanol, mix well, filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the test solution and the reference solution, respectively, into the column, and calculate the content.

It contains not less than 0.15 per cent of anhydrous rutin ($C_{27}H_{30}O_{16}$) and 0.15 per cent of chlorogenic acid ($C_{16}H_{18}O_9$), calculated with reference to the dried drug.

Uygur medicine:

Action To invigorate the kidney and promote blood flow, strong bones and muscles, nourish nerves, and regulate body fluids.

Indications Rheumatic arthritis, joint pain, cough due to pulmonary cold, nephros and hypogastrium psychroalgia, leukorrhagia.

Chinese medicine:

Action To warm the kidney to invigorate *yang*, expel *wind* and eliminate *dampness*, and promote blood flow to dredge meridians.

Indications Arthralgia due to *wind*, *cold* and *dampness*, rheumatoid arthritis, psychroalgia in the lower abdomen and irregular menstruation.

Usage and dosage 3-6 g, prepared into an oral decoction or infusion with wine; appropriate quantity for external use.

Precaution Contraindicated in pregnancy.

Storage Preserve in a cool and dry place.

Herba Schizonepetae (荆芥, Jingjie)

Fineleaf Schizonepeta Herb

Fineleaf Schizonepeta Herb is the dried aerial part of *Schizonepeta tenuifolia* Briq. (Fam. Labiatae). The drug is collected in summer and autumn when the tops of the flowering stems are in bloom and spikes keep green in colour, removed from foreign matter, and dried in the sun.

Description Stems square, branched at the upper part, 50-

80 cm long, 2-4 mm in diameter; externally yellowish-green or pale purplish-red, pubescent; texture light and fragile, fracture almost white. Leaves opposite, mostly fallen off, lamina 3-5 pinnatipartite, the lobes slender. Spike verticillasters terminal, 2-9 cm long, about 7 mm in diameter. Corolla mostly fallen off, persistent calyx campanulate, 5-toothed at the apex, pale brown or yellowish-green, pubescent; nutlets brownish-black. Odour, aromatic; taste, slightly astringent, pungent and cool.

Identification (1) Powder: Yellowish-brown. Epidermal cells of persistent calyx with deeply sinuous anticlinal walls. Glandular scales with a 8-celled head, 96-112 μm in diameter, and an unicellular stalk, brownish-yellow. Small glandular hairs with a 1-2 celled head and an unicellular stalk. Non-glandular hairs 1-6 celled, mostly with warty walls. Cells of exocarp polygonal in surface view, with mucilaginous walls, and containing brown contents. Stone cells of endocarp pale brown, with deeply sinuous anticlinal walls, and densely pitted. Fibres 14-43 μm in diameter, with straight or slightly sinuous walls.
(2) To 0.8 g of the coarse powder, add 20 ml of petroleum ether (60-90℃), stopper tightly, shake frequently, and allow to stand overnight. Filter and evaporate the filtrate to 1 ml as the test solution. Prepare a solution with 0.8 g of Herba Schizonepetae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H as the coating substance and a mixture of *n*-hexane and ethyl acetate (17 : 3) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with a 5% vanillin solution in 5% solution of sulfuric acid in ethanol, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Assay ***Volatile oil*** Carry out the method for determination of volatile oil (Appendix Ⅹ D).
It contains not less than 0.60 per cent (ml/g) of volatile oil.

Pulegone Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (80 : 20) as the mobile phase. As detector a spectrophotometer set at 252 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of pulegone.

Reference solution Dissolve a quantity of pulegone CRS, accurately weighed, in methanol to produce a solution containing 10 μg per ml.

Test solution Weigh accurately 0.5 g of the powder (through No. 2 sieve), to a stopper conical flask, ultrasonicate with 10 ml of methanol (power, 250 W; frequency, 50 kHz) for 20 minutes, filter. Ultrasonicate the residue and the filter paper with additional 10 ml of methanol in the same manner, filter and wash twice with a quantity of methanol. Combine the filtrate and washings to a 25 ml volumetric flask, dilute with methanol to volume, mix well, filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.020 per cent of pulegone ($C_{10}H_{16}O$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, spray with water, wash clean, soften thoroughly, bake at 50℃ for 1 hour, cut into sections, and dry in the sun.
Small sections about 5 mm long, in various shapes. Stems square, externally pale yellowish-green or pale purplish-red, pubescent; texture light and fragile, fracture almost white. Leaves opposite, lamina fragments irregular. Spike verticillasters mostly broken, corolla mostly fallen off. Nutlets brownish-black. Odour, aromatic; taste, slightly astrigent, pungent and cool.
Carry out the test (2) under Identification, showing same result. Carry out Assay as the above, it contains not less than 0.30 per cent (ml/g) of volatile oil and not less than 0.020 per cent of pulegone ($C_{10}H_{16}O$).

Action To induce diaphoresis, to dispel *wind*, and to promote eruptions.

Indications Common cold, headache, measles rubella, sores at the early stage.
Carbonized Herba Schizonepetae: Hematochezia, abnormal uterine bleeding, fainting after delivery due to excessive bleeding.

Usage and dosage 4.5-9 g.

Storage Preserve in a cool and dry place.

Herba Schizonepetae Carbonisatum (荆芥炭, Jingjietan)

Carbonized Fineleaf Schizonepeta Herb

Carbonized Fineleaf Schizonepeta Herb is the product of processed Fineleaf Schizonepeta Herb.

Preparation Stir-bake the sections of Herba Schizonepetae as described under the method for carbonizing by stir-baking (Appendix Ⅱ D) until its surface becomes charred-black and inside becomes charred-yellow, take out, dry in the air.

Description The sections irregular in shape, about 5 mm long, surface dark-brown. Stems square; texture light and fragile, fracture charred-brown. Leaves opposite, mostly fallen off. Corolla mostly fallen off, persistent calyx campanulate, 5-toothed at the apex. Odour, slightly aromatic; taste, bitter and pungent.

Identification Cells of exocarp polygonal in surface view, with mucilaginous walls, and containing brown contents. Stone cells of endocarp pale brown, with deeply sinuous anticlinal walls, and densely pitted. Fibre bundles with straight or slight sinuous walls.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 2).

Total ash Not more than 11.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using 70% ethanol as the solvent, not less than 8.0 per cent.

Indications Hemafecia, metrorrhagia or metrostaxis, and postpartum anemic fainting.

Action To astringe and arrest bleeding.

Usage and dosage 5-10 g.

Storage Preserve in a cool and dry place.

Herba Scutellariae Barbatae (半枝莲, Banzhilian)

Barbated Skullcup Herb

Barbated Skullcup Herb is the dried herb of *Scutellaria barbata* D. Don (Fam. Labiatae). The drug is collected in summer and autumn when foliage branch growing luxuriantly, washed clean, and dried in the sun.

Description 15-35 cm long, glabrous or sparsely pubescent on the floral axis. Roots slender. Stems fascicled, relatively thin, square; externally dark purple or brownish-green. Leaves opposite, short petioled; lamina mostly crumpled, when whole, triangular-ovate or lanceolate, 1.5-3 cm long, 0.5-1 cm wide; obtuse at the apex, broadly cuneate at the base, entire or indistinctly crenate; the upper surface dark green, the lower surface greyish-green. Flowers, solitary in leaf axis of the upper part of the branches, lobes of calyx obtuse or slightly rounded; corolla bilabiate, brownish-yellow or pale bluish-purple, about 1.2 cm long, pubescent. Fruits oblate, pale brown. Odour, slight; taste, slightly bitter.

Assay ***Total flavones*** *Reference solution* Weigh accurately 10 mg of scutellarin CRS, dried previously to constant weight at 105℃, to a 50 ml volumetric flask, add methanol to volume and mix well (containing 0.2 mg of scutellarin per ml).

Standard calibration Measure accurately 0.4, 0.8, 1.2, 1.6 and 2.0 ml of the reference solution respectively into 10 ml volumetric flasks, add methanol to volume and mix well. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 335 nm, taking methanol as a blank, plot the standard curve, using absorbance as ordinate and concentration as abscissa.

Procedure Measure accurately 1 ml of methanol solution obtained under the Assay of Scutellarin, extracted in Soxhelt's extractor and diluted to 100 ml, into a 50 ml volumetric flask, dilute with methanol to volume. Carry out the method described under standard calibration beginning at the words "taking methanol as a blank", measure the absorbance, read out the weight of scutellarin (mg) in the test solution from the standard curve, and calculate.

It contains not less than 1.50 per cent of total flavones, calculated as scutellarin ($C_{21}H_{18}O_{12}$), with reference to the dried drug.

Scutellarin Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and acetic acid (35∶61∶4) as the mobile phase. As detector a spectrophotometer set at 335 nm. The number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of scutellarin.

Reference solution Weigh accurately 8 mg of scutellarin CRS into a 100 ml volumetric flask, dilute with the mobile phase to volume, mix well (containing 80 μg of scutellarin per ml).

Test solution Weigh accurately about 1 g of the powder (through No. 3 sieve) to a Soxhelt's extractor, add petroleum ether (60-90℃) and heat under reflux until the extract becomes colourless. Discard the petroleum ether solution, expel petroleum ether of the residue, add methanol and continue heating under reflux until the methanol extract becomes colourless. Transfer the methanol extract to a 100 ml volumetric flask and add methanol to volume. Measure accurately 25 ml of the above solution, evaporate to dryness, dissolve the residue in 20% methanol, transfer to a 25 ml volumetric flask, dilute to volume, mix well, filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 0.20 per cent of scutellarin ($C_{21}H_{18}O_{12}$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, and cut into sections.

Action To remove toxic *heat*, and induce urination.

Indications Boils, sores, swelling and pain of the throat, venomous snakebite, traumatic injuries; edema; jaundice.

Usage and dosage 15-30 g; or 30-60 g of the fresh herb; appropriate quantity is pounded into paste and applied topically.

Storage Preserve in a dry place.

Herba Sedi (垂盆草, Chuipencao)

Stringy Stonecrop Herb

Stringy Stonecrop Herb is the fresh or dried herb of *Sedum sarmentosum* Bunge (Fam. Crassulaceae). The drug is collected in summer and autumn, removed from foreign matter, used freshly, or dried.

Description Stems slender, over 20 cm long, some nodes bearing slender adventitious roots. Leaves whorled in 3, oblanceolate to oblong, green, fleshy, 1.5-2.8 cm long, 3-7 mm wide, nearly acute at the apex, sharply narrow at the base, calcarate. Odour, slight; taste, slightly bitter.

Identification Transverse section of stem: Epidermal cells rectangular, outer walls thickened, cortex of about 10 layers of parenchymatous cells. Vascular cylinder small, vascular bundles collateral, vessels subrounded. Pith triangular, cells polygonal, walls strongly thickened and non-lignified. Cells near phloem and pith cells containing reddish-brown secretion.

Water (dried herb) Not more than 13.0 per cent (Appendix Ⅸ H, method 2).

Acid-insoluble ash (dried herb) Not more than 5.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of water-soluble extractives (Appendix Ⅹ A, the hot extraction method), not less than 20.0 per cent.

Processing Eliminate foreign matter, cut into sections for the dried herb.

Action To remove *damp-heat*, and to counteract toxicity.

Indications Jaundice with oliguria caused by *damp-heat*, acute and chronic hepatitis; carbuncles and sores.

Usage and dosage 250 g of the fresh herb or 15-30 g of the dried herb.

Storage The fresh herb to be collected at using. Preserve the dried herb in a dry place.

Herba Selaginellae (卷柏, Juanbai)

Spikemoss

Spikemoss is the dried herb of *Selaginella tamariscina* (Beauv.) Spring or *Selaginella pulvinata* (Hook. et Grev.) Maxim. (Fam. Selaginellaceae). The drug is collected all the year round, removed from fibrous roots and soil, and dried in the sun.

Description *Herb of Selaginella tamariscina* Crumpled into fisted masses, 3-10 cm long, Branches fascicled, flat and branched, green or brownish-yellow, curved inward, densely growing scaly leaflets, long-aristate at the apex, central leaves (ventral leaves) 2 lines, ovate-oblong, arranged obliquely upward, margin membranous, irregularly serrulate. Dorsal leaves (lateral leaves), membranous margin of dorsal surface frequently brownish-black. Fibrous roots remained at the base, brown to dark brown, scattered or clustered in short rods. Texture fragile, easily broken. Odour, slight; taste, weak.

Herb of Selaginella pulvinata Most of fibrous roots scattered. Central leaves (ventral leaves) 2 lines, ovate-lanceolate, arranged straightly upward. Leaves unsymmetrical, the inner side relatively straight, the outer side frequently thickened by folding inward, margin entire.

Identification To 2 g of the powder add 50 ml of methanol, heat under reflux for 1 hour, filter, evaporate the filtrate to dryness, and dissolve the residue in 3 ml of dehydrated ethanol as the test solution. Prepare a solution with 2 g of Herba Selaginellae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of isopropanol, concentrated ammonia TS and water (13 : 1 : 1) as the mobile phase. Apply separately to the plate 3 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with 2% aluminium trichloride in methanol, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Processing *Herba Selaginellae* Eliminate remained fibrous roots and foreign matter, wash clean, cut into sections, and dry in the sun.

Herba Selaginellae (carbonized) Stir-bake the clean Herba Selaginellae as described under the method for carbonizing by stir-baking (Appendix Ⅱ D) until a charred-black colour is produced externally.

Action To promote blood circulation and stimulate menstruation.

Herba Selaginellae (carbonized) To remove blood stasis and arrest bleeding.

Indications Amenorrhea, dysmenorrhea, masses in the abdomen.

Herba Selaginellae (carbonized) Spitting of blood, abnormal uterine bleeding, hematochezia, prolapse of rectum.

Usage and dosage 4.5-9 g.

Precaution Be cautious about pregnant women.

Storage Preserve in a dry place.

Herba Siegesbeckiae (豨莶草, Xixiancao)

Siegesbeckia Herb

Siegesbeckia Herb is the dried aerial part of *Siegesbeckia orientalis* L., *Siegesbeckia pubescens* Makino or *Siegesbeckia glabrescens* Makino. (Fam. Compositae). The drug is collected in summer and autumn before or at flowering, removed from foreign matter, and dried in the sun.

Description Stems subsquare, frequently branched, 30-110 cm long, 0.3-1 cm in diameter; externally greyish-green, yellowish-brown or purplish-brown, with longitudinal furrows and fine striations, covered with grey pubescences; nodes distinct, slightly swollen; texture fragile, easily broken, fracture yellowish-white or greenish; pith broad, almost white, hollowed. Leaves opposite, lamina frequently crumpled and rolled, when whole, ovate, greyish-green, margin obtusely serrate; both surfaces with white pubescences, trinervious. Some bearing yellow capitulum; involucre spatulate. Odour, slight; taste, slightly bitter.

Identification Ultrasonicate 1 g of the powder with 10 ml of methanol for 15 minutes, filter, use the filtrate as the test solution. Dissolve kirenol CRS in methanol to produce a solution containing 0.1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (4 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid, heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (25 : 75) as the mobile phase. As detector a spectrophotometer set at 215 nm, The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of kirenol.

Reference solution Dissolve a quantity of kirenol CRS, accurately weighed, in methanol to produce a solution containing 0.5 mg per ml.

Test solution Weigh accurately 1 g of the powder (through No. 3 sieve), to a Soxhlet's extractor, heat under reflux with 150 ml of petroleum ether (60-90℃) for 3 hours. Take out the filter canister, expel the solvent, and place in a conical flask. Add accurately 50 ml of methanol, weigh, heat under reflux for 2 hours, allow to cool, weigh again, and compensate the loss of the weight with methanol, mix well, filter, use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of the test solution and the reference solution, respectively, into the column, and calculate the content.

It contains not less than 0.050 per cent of kirenol ($C_{20}H_{34}O_4$),

calculated with reference to the dried drug.

Processing *Herba Siegesbeckiae* Eliminate foreign matter, wash clean, soften slightly, cut into sections, and dry.

Herba Siegesbeckiae (*processed with wine*) Steam the sections of *Herba Siegesbeckiae* thoroughly as described under the method for steaming with wine (Appendix Ⅱ D), using 20 kg of yellow rice wine per 100 kg of *Herba Siegesbeckiae*.

Action To relieve rheumatic conditions, improve the motility of joints, and counteract *toxicity*.

Indications Rheumatic arthralgia with aching and weakness of the lower back and knees, numbness of limbs; hemiplegia; rubella, sores with exudation.

Usage and dosage 9-12 g.

Storage Preserve in a ventilated and dry place.

Preparation Siegesbeckia Pills

Herba Spirodelae (浮萍, Fuping)

Common Ducksmeat Herb

Common Ducksmeat Herb is the dried herb of *Spirodela polyrrhiza* (L.) Schleid. (Fam. Lemnaceae). The drug is collected from June to September, washed clean, removed from foreign matter, and dried in the sun.

Description Flat thallophyte, ovoid or ovate, 2-5 mm in diameter on the long side. The upper surface pale green to greyish-green, with an eccentric small pit, margin entire or slightly curved. The lower surface purplish-green to purplish-brown, with several fibrous roots. Texture light, easily broken when twisted. Odour, slight; taste, weak.

Action To dispel *wind-heat*, promote eruptions, and induce urination.

Indications Measles without adequate eruptions, urticaria within itching; edema with oliguria.

Usage and dosage 3-9 g; appropriate quantity is decocted for wash or immersion.

Storage Preserve in a ventilated and dry place, protected from moisture.

Herba Swertiae Mileensis (青叶胆, Qingyedan)

Mile Swertia Herb

Mile Swertia Herb is the dried herb of *Swertia mileensis* T. N. Ho et W. L. Shih (Fam. Gentianaceae). The drug is collected at flowering and fruiting in autumn, removed from soil, and dried in the sun.

Description 15-45 cm long. Roots long conical, 2-7 cm long, about 0.2 cm in diameter, some branched. Externally yellow or yellowish-brown. Stems quadrangular, bearing extremely narrow wings on the ridges, 1-2 mm in diameter; externally yellowish-green or yellowish-brown, frequently reddish-purple at the lower part, fracture hollowed. Leaves opposite, sessile; mostly crumpled or broken, when whole, stripe-shaped or narrow-lanceolate, 1-4 cm long, 2-7 mm wide. Cymes conical, calyx 4, stripe-shaped, yellowish-green; corolla 4-partite, yellow, segments ovate-lanceolate, bearing 2 glandular pits inside the base; stamens 4; capsules narrowly ovoid, seed numerous, small, brown. Odour, slight; taste, bitter.

Identification (1) Powder: Green or yellowish-green. Stone cells subrounded, subrectangular, elongated stripe-shaped or fusiform, sometimes prominent or elongated at one end, 100-120 μm long, 40-50 μm in diameter, lignified, walls 5-10 μm thick, pit canals distinct. Fibres long-fusiform, 180-220 μm long, 8-10 μm in diameter, lignified, walls about 2.5 μm thick, with distinct pit canals. Walls of the upper epidermal cells of the leaf sinuous; cuticle striations of the lower epidermal cells indistinct, stomata numerous, anisocytic or anomocytic. Crystals of calcium oxalate frequently occurring in rods, needles or plates in the mesophyll cells. Pollen grains rounded, 30-37 μm in diameter, with 3 germinal furrows and finely reticulated striations.

(2) To 5 g of the powder add 45 ml of methanol, heat under reflux for 30 minutes and filter. Apply 1 drop of the filtrate to filter paper, dry, add 1 drop of aluminium trichloride TS and allow to dry, examine under ultraviolet light at 365 nm, a greenish-yellow fluorescence is produced.

(3) To 2 ml of the filtrate obtained under Identification test (2) add 2-3 drops of 7% solution of hydroxylamine hydrochloride in methanol and 2-3 drops of 10% solution of potassium hydroxide in methanol, heat slightly on a water bath; allow to cool, adjust the pH value to 3-4 with dilute hydrochloric acid and filter. Add 1-2 drops of ferric chloride TS to the filtrate, a purple colour is produced.

(4) Concentrate the remaining filtrate obtained under Identification test (2) to about 10 ml as the test solution. Dissolve oleanolic acid CRS in methanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and glacial acetic acid (12 : 4 : 0.5) as the mobile phase. Apply separately to the plate 2 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol and heat at 105℃ to the spots clear. A purplish-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(5) Apply 1 ml of the test solution obtained under Identification test (4) to a neutral aluminium oxide column (100-200 mesh, 1 g, about 5 mm in inner diameter), elute with about 2 ml of methanol. Evaporate the eluate to dryness, dissolve the residue in 2 ml of methanol as the test solution. Dissolve swertiamarin CRS in methanol to produce a solution containing 8 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of chloroform and methanol (17 : 3) as the mobile phase. Apply separately to the plate 1-2 μl of each of the above two solutions. After developing and removal of the plate, dry in air and examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Processing Eliminate foreign matter, spray with water, soften briefly, cut into sections, and dry in the air.

Action To increase the flow of bile, and remove *heat-dampness*.

Indications Jaundice with dark urine; acute urinary infetion with difficult painful urination.

Usage and dosage 10-15 g.

Precaution Be cautious about patients with *deficiency-cold*.

Storage Preserve in a ventilated and dry place.

Preparation Mile Swertia Tablets

Herba Taraxaci
(蒲公英, Pugongying)

Dandelion

Dandelion is the dried herb of *Taraxacum mongolicum* Hand. -Mazz., *Taraxacum sinicum* Kitag. or several other species of the same genus (Fam. Compositae). The drug is collected from spring to autumn at the early stage of flowering, removed from foreign matter, washed clean and dried in the sun.

Description Crumpled and rolled masses. Roots conical, frequently curved, 3-7 cm long; externally brown, crumpled; the root stock with brown or yellowish-white hairs, some fallen off. Leaves basal, frequently crumpled and broken, when whole, oblanceolate, greenish-brown or dark grey; apex acute or obtuse; margin lobate or pinnatifid; base becoming narrow downwards to petiole-shape; midrib of lower surface distinct. Pedicels 1 or more, each with a capitulum on the top; involucre several layers, the inner layer relatively long; corolla yellowish-brown or pale yellowish-white. Some showing numerous long-elliptical achenes with white aigrets. Odour, slight; taste, slightly bitter.

Identification (1) Surface view of leaf: The epidermal cells on both surfaces with sinuous anticlinal walls, cuticle striations distinct or sparsely visible. Both surfaces bearing nonglandular hairs, 3-9 celled, 17-34 μm in diameter, apical cells extremely long, crumpled to whip-shape or fallen off. Stomata, more frequently occurring on the lower surface, anomocytic or anisocytic, with 3-6 subsidiary cells; mesophyll containing fine crystals of calcium oxalate. Laticiferous tubes occurring alongside the veins.
Transverse section of root: Cork consisting of several layers of brown cells. Phloem broad, groups of laticiferous tubes arranged in several interrupted rings. Cambium in ring. Xylem relatively small, with indistinct rays; vessels relatively large, scattered. Parenchymatous cells containing inulin.
(2) To 1 g of the powder add 20 ml of methanol, heat under reflux for 30 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 10 ml of water, filter, extract the filtrate with two 20-ml quantities of ethyl acetate, combine the ethyl acetate solutions and evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve caffeic acid CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of ethyl acetate, formic acid and water (7 : 2.5 : 2.5) as the mobile phase. Apply separately to the plate 6 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. A fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octabecylsilane bonded silica gel as the stationary phase and a mixture of methanol and phosphate BS (dissolve 1.56 g of sodium dihydrogen phosphate in 1000 ml of water, adjust the pH value to 3.8-4.0 with 1% phosphoric acid solution) (23 : 77) as the mobile phase. As detector a spectrophotometer set at 323 nm, maintain the column temperature at 40 ℃. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of caffeic acid.

Reference solution Place 7.5 mg of caffeic acid CRS, previously dried to constant weight at 110℃ and accurately weighed, in a 50 ml volumetric flask, dissolve in methanol and dilute to volume, mix well. Transfer accurately 2 ml of the above solution to a 10 ml volumetric flask, dilute with methanol to volume, mix well (30 μg per ml).

Test solution Weigh accurately 1 g of the powder in a 50 ml stopper conical flask, add accurately 10 ml of a solution of 5% formic acid in methanol, stopper well, shake thoroughly, weigh, ultrasonicate for 30 minutes (power 250 W, frequency 40 kHz), cool, weigh again and compensate the loss of the weight with a solution of 5% formic acid in methanol, shake thoroughly, centrifuge, filter the supernatant with a 0.45 μm filter membrane, store the filtrate in a brown volumetric flask as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 5-20 μl of the test solution, respectively into the column, and caculate the content.
It contains not less than 0.02 per cent of caffeic acid ($C_9H_8O_4$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, cut into sections, and dry in the sun.

Action To remove toxic *heat*, reduce swelling and nodulation, and relieve dysuria.

Indications Boils and sores, mastitis lymphadenitis, inflammation of eyes, sore throat, lung abscess, appendicitis, jaundice caused by *damp-heat*, urinary infection with difficult painful urination.

Usage and dosage 9-15 g; appropriate quantity of the fresh herb is pounded into paste for to-pical application or made into hot decoction for fumigation and irrigation.

Storage Preserve in a ventilated and dry place, protected from moisture and moth.

Herba Taxilli
(桑寄生, Sangjisheng)

Chinese Taxillus Herb

Chinese Taxillus Herb is the dried branch, with leaf, of *Taxillus chinensis* (DC.) Danser (Fam. Loranthaceae). The drug is collected in winter and spring, removed from thick stem, cut into section, and dried or dried after steaming.

Description Branches cylindrical, 3-4 cm long, 0.2-1 cm in diameter. Externally reddish-brown or greyish-brown, with fine longitudinal wrinkles and numerous fine prominent brown lenticels, some young branches with dark brown pubescences; texture hard, fracture irregular, bark reddish-brown, wood pale in colour. Leaves frequently rolled, short petioled, when whole, ovate or elliptical, 3-8 cm long, 2-5 cm wide, externally yellowish-brown, young

leaves covered with fine pubescences, apex obtusely rounded, base rounded or broadly cuneate, margin entire; texture leathery. Odour, slight; taste, astringent.

Identification (1) Transverse section of stem: Epidermal cells sometimes remained. Cork cells 10 or more layers, some containing brown contents. Cortex narrow, groups of stone cells occurring in older stem, parenchymatous cells containing brown contents. Groups of stone cells and fibre bundles existing in pericycle, arranged in an interrupted ring. Phloem extremely narrow, rays with scattered stone cells. Fascicular cambium distinct. Xylem rays 1-4 cells wide, stone cells occurring near pith; vessels scattered singly or 2-3 aggregated in groups. Groups of stone cells occurring in pith and the parenchymatous cells containing brown contents. Some stone cells containing prisms of calcium oxalate or brown contents.
Powder: Pale yellowish-brown. Stone cells subsquare, subrounded, occasionally branched, in some cells, walls thickened on 3 sides and thin on one side, containing prisms of calcium oxalate. Fibres in bundles, about 17 μm in diameter. Bordered pitted, reticulated and spiral vessels frequently observed. Fragments of branched asteriate hairs rare.
(2) To 5 g of the powder add 60 ml of a mixture of methanol and water (1 : 1), heat under reflux for 1 hour, filter while hot, evaporate the filtrate to about 20 ml, dilute with 10 ml of water, add about 0.5 ml of dilute sulfuric acid, boil under reflux for 1 hour, extract with two 30-ml quantities of ethyl acetate by shaking, evaporate the combined ethyl acetate solution to about 1 ml as the test solution. Dissolve quercitin CRS in ethyl acetate to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 0.5% sodium hydroxide solution as the coating substance and a mixture of toluene (saturated with water), ethyl formate and formic acid (5 : 4 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with a 5% solution of aluminium trichloride in ethanol, examine under ultraviolet light at 365 nm. A fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Cardiac glycoside To 10 g of the coarse powder add 50 ml of 80% ethanol, heat under reflux for 30 minutes, filter, evaporate the filtrate to dryness on a water bath, dissolve the residue in 10 ml of hot water, filter, extract the filtrate with four 15-ml quantities of ether by shaking, discard the ether layer. To the water solution, add saturated lead acetate solution until the precipitate is completed, filter, to the filtrate add 10 ml of ethanol, then add saturated sodium sulfate solution to remove the lead ion, filter, extract the filtrate with three 15-ml quantities of chloroform by shaking, evaporate the combined chloroform solution to 1 ml. Drop the concentrated solution on a filter paper, dry, drop alkaline 3,5-dinitrobenzoic acid solution (mix 1 ml of dinitrobenzoic acid TS and 1 ml of sodium hydroxide TS) on the paper, no purplish-red colour appears.

Processing Eliminate foreign matter, wash briefly, soften thoroughly, cut into thick slices, and dry.

Action To reinforce the liver and the kidney, strengthen the tendons and bones, relieve rheumatic conditions, and to prevent abortion.

Indications Rheumatic or rheumatoid arthralgia with aching and weakness of the lower back and knees; abnormal uterine bleeding, menorrhagia; uterine bleeding during pregnancy, threatened abortion; hypertension.

Usage and dosage 9-15 g.

Storage Preserve in a dry place, protected from moth.

Herba Verbenae (马鞭草, Mabiancao)

European Verbena Herb

European Verbena Herb is the dried aerial part of *Verbena officinalis* L. (Fam. Verbenaceae). The drug is collected at flowering, from June to August, removed from foreign matter, and dried in the sun.

Description Stems square, frequently branched, with longitudinal furrows on the four sides, 0.5-1 m long; externally greenish-brown, rough; texture hard and fragile, fracture medullated or hollowed. Leaves opposite, crumpled and mostly broken, greenish-brown, when whole, lamina 3-partite, margin serrate. Spikes slender; with numerous small flowers. Odour, slight; taste, bitter.

Identification (1) Powder: Greenish-brown. Epidermal cells of stems long polygonal or subrectangular, anticlinal walls mostly straight, stomata visible. The lower epidermal cells of leaves with sinuous anticlinal walls, stomata anomocytic or anisocytic, subsidiary cells 3-5. Glandular scales with a 4-celled head, 23-58 μm in diameter, and an unicellular stalk. Non-glandular hairs unicellular. Pollen grains subrounded or subrounded-triangular, 24-35 μm in diameter, exine smooth, with 3 germinal apertures.
(2) To 2 g of the powder add 60 ml of 80% methanol, heat under reflux for 1 hour, filter, and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of methanol as the test solution. Prepare a solution with 2 g of Herba Verbenae reference drug in the same manner as the reference drug solution. Dissolve ursolic acid CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, methanol and isopropanol (16 : 0.5 : 0.25) as the mobile phase. Apply separately to the plate 2-4 μl of each of the above three solutions. After developing and removal of the plate, dry in air. Spray with a mixture of vanillin ethanol solution (1→100) and a water solution of perchloric acid (3→100) (mix in equal portions before use), heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference solution and the reference drug solution.

Assay Weigh accurately about 1 g of the coarse powder into a stopper conical flask, add accurately 30 ml of dehydrated ethanol, weigh, ultrasonicate for 1.5 hours, allow to cool, weigh again and compensate the loss of the weight with dehydrated ethanol, shake thoroughly, filter. Measure accurately 15 ml of the successive filtrate, evaporate to dryness, macerate the residue with two 15-ml quantities of petroleum ether (30-60℃) for about 2 minutes each time, discard the petroleum ether solutions. Dissolve the residue in a quantity of dehydrated ethanol by gentle heating and transfer to a 5 ml volumetric flask, dilute with dehydrated ethanol to volume, mix well as the test solution. Dissolve a quantity of ursolic acid CRS, accurately weighed, in dehydrated ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B) using silica gel G as the coating substance and a mixture of cyclohexane,

chloroform, ethyl acetate and glacial acetic acid (20 : 5 : 8 : 0.1) as the mobile phase. Apply separately to the plate 2 μl of the test solution, 1 μl and 2 μl of the reference solution. After developing and removal of the plate, dry in air, spray with a 10% solution of sulfuric acid in ethanol, heat at 110℃ to the spots clear. Cover the plate with a piece of glass in same size, and fix with tape. Carry out the method for thin layer chromatography (thin layer chromatographic scanning method) (Appendix Ⅵ B), scan at the wavelengths 525 nm (λ_S) and 700 nm (λ_R). Determine the integrated absorbance value of the test solution and that of the reference solution, and calculate the content.

It contains not less than 0.36 per cent of ursolic acid ($C_{30}H_{48}O_3$), calculated with reference to the dried drug.

Processing Eliminate the remains of roots and foreign matter, wash clean, soften briefly, cut into sections, and dry in the sun.

Action To promote the flow of blood and to relieve blood stasis, to malarial attacks, counteract *toxicity*, and to irduce urination.

Indications Masses in the abdomen; amenorrhea and dysmenorrhea; malaria; inflammation of the throat, carbuncles, boils, acute infection of the urinary tract; edema.

Usage and dosage 4.5-9 g.

Storage Preserve in a dry place.

Herba Violae
(紫花地丁, Zihuadiding)

Tokyo Violet Herb

Tokyo Violet Herb is the dried herb of *Viola yedoensis* Makino (Fam. Violaceae). The drug is collected in spring and autumn, removed from foreign matter, and dried in the sun.

Description Frequently crumpled into masses. The main roots long-conical, 1-3 mm in diameter, pale yellowish-brown, with fine longitudinal wrinkles. Leaves basal, greyish-green, when whole, lanceolate or ovate-lanceolate, 1.5-6 cm long, 1-2 cm wide; apex obtuse, base truncate or somewhat cordate, margin obtusely serrate, both surfaces pubescent; petioles slender, 2-6 cm long, the upper part with distinct narrow wings. Pedicels slender; petals 5, purple or pale brown; hypanthium slender tubular. Capsules elliptical or 3-splitted; seeds numerous, pale brown. Odour, slight; taste, slightly bitter and sticky.

Identification (1) Transverse section of leaf: The upper epidermal cells relatively large, tangentially elongated, the outer walls thickened and the inner walls mucilaginous, frequently swollen into semi-circle; the lower epidermal cells relatively small, occasionally occurring mucilage cells; the upper and lower epidermis bearing unicellular non-glandular hairs, 32-240 μm long, 24-32 μm in diameter, with short cuticle striations. Palisade cells 2-3 layers; spongy cells subcircular, containing cluster of calcium oxalate, 11-40 μm in diameter. Midrib vascular bundles collateral, the inner side of the upper and lower epidermis occurring 1-2 layers of collenchymatous cells.

(2) To 2 g of the powder add 20 ml of methanol, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness, add 10 ml of warm water to the residue, stir to dissolve, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution with 2 g of Herba Violae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and formic acid (5 : 3 : 1) as the mobile phase. Apply separately to the plate 5-10 μl of the test solution and 5 μl of the reference drug solution. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. Three main fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Processing Eliminate foreign matter, wash clean, cut into pieces and dry.

Action To remove toxic *heat*, cool blood and to reduce swelling.

Indications Carbuncles, boils, erysipelas and other cutaneous and subcutaneous pyogenic infections; venomous snake-bite.

Usage and dosage 15-30 g; appropriate quantity of the fresh herb is pounded into paste and applied topically.

Storage Preserve in a dry place.

Herba Visci
(槲寄生, Hujisheng)

Coloured Mistletoe Herb

Coloured Mistletoe Herb is the dried stem and branch with leaf of *Viscum colouratum* (Komar.) Nakai (Fam. Loranthaceae). The drug is collected from winter to spring, removed from thick stem, cut into section, and dried or dried after steaming.

Description Stems cylindrical, 2-5 branched in fork shape, about 30 cm long, 0.3-1 cm in diameter; externally yellowish-green, golden-yellow or yellowish-brown, with longitudinal wrinkles; nodes swollen, with branches or scars of branches. Texture light and fragile, easily broken; fracture uneven, bark yellow, wood pale yellow, rays radial, pith often inclined to one side. Leaves opposite on the tips of branches, easily fallen off, sessile; lamina long-elliptical-lanceolate, 2-7 cm long, 0.5-1.5 cm wide; apex obtusely rounded, base cuneate, margin entire; externally yellowish-green, with fine wrinkles, quinquenervis, the middle 3 distinct. Texture leathery. Berry spherical, crumpled. Odour, slight; taste, slightly bitter, sticky on chewing.

Identification (1) Transverse section of stem: Epidermal cells rectangular, the outer walls covered with yellowish-green cuticle, 19-80 μm thick. Cortex relatively broad, fibres of several tens in bundles, slightly lignified; stone cells of old stems numerous, scattered singly or in groups. Phloem relatively narrow, with stone cells scattered in old stems. Cambium indistinct. Xylem rays with scattered fibre bundles; vessels surrounded by numerous fibres and a few heterogeneous cells. Pith distinct. Parenchymatous cells containing clusters of calcium oxalate and a few prisms.

Powder of stem: Pale yellow. Fragments of epidermis yellowish-green, cells subsquare, stomata visible. Fibres in bundles, 10-34 μm in diameter, walls relatively thickened, somewhat sinuous and slightly lignified. Heterogeneous cells irregular, walls relatively thickened, slightly lignified, with big lumen. Clusters of calcium oxalate 17-45 μm in diameter; prisms a few, 8-30 μm in diameter. Stone cells subsquare, subpolygonal or irregular, 42-102 μm in diameter.

(2) To 1-2 g of the herb, cut into pieces, add 30 ml of

ethanol, heat under reflux for 30 minutes, cool, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Prepare a solution with 1.5 g of Herba Visci reference drug in the same manner as the reference drug solution. Dissolve oleanolic acid CRS in dehydrated ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of toluene, ethyl acetate and glacial acetic acid (8 : 2 : 0.1) as the mobile phase. Apply separately to the plate 4 μl of each of the test solution and the reference drug solution and 2 μl of the reference solution. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 80℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference solution and the reference drug solution. Examine under ultraviolet light at 365 nm, show same fluroscent spots.

Foreign matter Not more than 2 per cent (Appendix IX A).

Water Not more than 12.0 per cent (Appendix IX H, method 1).

Total ash Not more than 9.0 per cent (Appendix IX K).

Acid-insoluble ash Not more than 2.5 per cent (Appendix IX K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix X A, the hot extraction method), using ethanol as the solvent, not less than 20.0 per cent.

Assay Weigh accurately 1 g of the coarse powder into a stopper conical flask, add accurately 30 ml of a solution of hydrochloric acid-ethanol (1→10), weigh, ultrasonicate for 1.5 hours, cool, weigh again and compensate the loss of the weight with hydrochloric acid-ethanol (1→10) solution, shake thoroughly, filter. Measure accurately 15 ml of the successive filtrate, concentrate to about 5 ml and add 10 ml of water. Transfer to a separator and extract with five quantites of chloroform (20, 20, 20, 15, 15 ml), evaporate the combined chloroform extracts to dryness. Dissolve the residue in 5 ml of chloroform and apply to a neutral aluminium oxide column (5 g, 100-200 mesh, 0.9 cm in internal diameter), pre-elute with 30 ml of a mixture of chloroform and methanol (80 : 1), discard the eluate. Elute with 50 ml of a mixture of chloroform and methanol (20 : 1), collect the eluate and evaporate to dryness, dissolve the residue in dehydrated ethanol and transfer to a 5 ml volumetric flask, dilute with dehydrated ethanol to volume, shake well as the test solution. Dissolve a quantity of oleanolic acid CRS, accurately weighed, in dehydrated ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform, ethyl acetate and glacial acetic acid (20 : 5 : 8 : 0.1) as the mobile phase. Apply separately to the plate 5 μl of the test solution, 2 μl and 4 μl of the reference solution. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 110℃ to the spots clear. Cover the plate with a piece of glass in same size, and fix with tape. Carry out the method for thin layer chromatography (Appendix VI B thin layer chromatographic scanning method), scan at the wavelengths 520 nm (λ_S) and 700 nm (λ_R). Determine the integrated absorbance value of the test solution and that of the reference solution, and calculate the content.

It contains not less than 0.17 per cent of oleanolic acid ($C_{30}H_{48}O_3$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash briefly, soften thoroughly, cut into thick slices, and dry.

Action To relieve rheumatic conditions, reinforce the liver and the kidney, to strengthen tendons and bones, and prevent abortion.

Indications Rheumatic arthralgia, aching and weakness of the lower back and knees; threatened abortion.

Usage and dosage 9-15 g.

Storage Preserve in a dry place, protected from moth.

Hippocampus
(海马, Haima)

Sea Horse

Sea Horse is the dried body of *Hippocampus kelloggi* Jordan et Snyder, *Hippocampus histrix* Kaup, *Hippocampus kuda* Bleeker, *Hippocampus trimaculatus* Leach or *Hippocampus japonicus* Kaup (Fam. Syngnathidae). The drug is collected in summer or autumn, washed and dried in the sun; or removed from the skin and the viscera, then dried in the sun.

Description *Body of Hippocampus kelloggi* Long flattened and curved; about 30 cm long. Externally yellowish-white, with corrugated segment stripes and short spines. Head somewhat in the shape of a horse head, with a crown-like protuberance and a long tubular snout. Mouth small, toothless; eyes deeply sunken. Trunk seven-ridged, tail four-ridged, tapered and coiled. Texture light and hard, bony. Odour, slightly stinking; taste, slightly salty.

Body of Hippocampus histrix 15-20 cm long. The spines at the head and the segments of the body thin and pointed.

Body of Hippocampus kuda 20-30 cm long, blackish-brown.

Body of Hippocampus trimaculatus A black spot occurring at basal part of the short spines of the first, fourth and seventh segments of the lateral dorsal part.

Body of Hippocampus japonicus Small, 7-10 cm long, blackish-brown. Both segment stripes and short spines fine.

Processing Eliminate dust and scraps. Break to pieces or pulverize before use.

Action To warm the *kidney* and promote virility, to reduce nodulation, and to induce subsidence of swelling.

Indications Impotence; enuresis; dyspnea in *deficiency* syndrome of the *kidney*; mass in the abdomen; traumatic injuries; external use for carbuncles and boils.

Usage and dosage 3-9 g; for external use, appropriate quantity to be ground into powder and applied topically.

Storage Preserve in a cool and dry place, protected from moth.

Hirudo
(水蛭, Shuizhi)

Leech

Leech is the dried body of *Whitmania pigra*

Whitman, *Hirudo nipponica* Whitman or *Whitmania acranulata* Whitman (Fam. Hirudinidae). The drug is collected in summer or autumn, scalded to death with boiling water, dried in the sun or at a low temperature.

Description *Body of Whitmania pigra* Flattened spindle-shaped, with a large number of segments, 4-10 cm long, 0.5-2 cm wide. Dorsal side blackish-brown, slightly convex, 5 longitudinal stripes formed by black speckles visible when immersed in water; ventral side even, brownish-yellow; lateral sides brownish-yellow. Anterior end somewhat pointed, posterior end blunt, with a sucker at the anterior and posterior ends respectively, the anterior sucker inconspicuous, the posterior sucker larger. Texture fragile, easily broken, fracture gelatinous. Odour, slightly stinking.

Body of Hirudo nipponica Flattened cylindric, body usually curved and turned round, 2-5 cm long, 0.2-0.3 cm wide.

Body of Whitmania acranulata Narrow and flattened, 5-12 cm long, 0.1-0.5 cm wide.

Identification To 1 g of the power add 5 ml of ethanol, ultrasonicate for 15 minutes, filter and use the filtrate as the test solution. Prepare a solution of 1 g of Hirudo reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and acetyl acetate (4 : 1) as the mobile phase. Apply separately 5 μl of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% solution of sulfuric acid in ethanol and heat at 105℃ to spots clear. The purple spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solutions. Examine under ultraviolet light at 365 nm. The orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 18.0 per cent.

Total ash Not more than 10.0 per cent (Appendix Ⅸ K)

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol as solvent, not less than 15.0 per cent.

Assay Weigh accurately 1 g of the powder (through No. 3 sieve), add 5 ml of 0.9% sodium chloride, mix well, macerate for 30 minutes with shaking frequently, centrifuge. Measure accurately 100 μl of the supernatant to a test tube (10 mm × 100 mm), add 200 μl of a buffer, containing 0.5% ox fibrinogen, of trihydroxylmethylaminomethane and hydrochloric acid (mix 25 ml of trihydroxylmethylamino methane (0.2 mol/L) and 40 ml of hydrochloric acid (0.1 mol/L), add water to 100 ml, adjust to pH 7.4), and mix well. Dropwise and slowly add (5 μl per minute, shaking gently when dripping) the solution of thrombin containing 40 unit per ml on a water bath at 37 ± 0.5 ℃ to coagulated. Wrtie down the volume of the consumed thrombin, and calculated as the followed formula: $U = C_1 V_1 / C_2 V_2$

U: active unit of thrombin per g (U/g);
C_1: concentration of thrombin solution (μ/ml);
C_2: concentration of test solution (g/ml);
V_1: consumed volume of thrombin (μl);
V_2: adding volume of test solution (μl);

The volume neutralized one unit of thrombin is one active unit of antithrombin.

It contains not less than 16.0 U of antithrombin per g.

Processing *Hirudo* Wash clean, cut into sections, and dry.

Hirudo (scalded) Scald sections of the clean Hirudo with talc powder as described under the method for scalding (Appendix Ⅱ D) until it becomes slightly expanded.

Action To eliminate blood stasis and to stimulate menstruation discharge.

Indications Masses in the abdomen, amenorrhea due to stagnation of blood; traumatic injuries.

Usage and dosage 1.5-3 g.

Precaution Contraindicated in pregnancy.

Storage Preserve in a dry place, protected from moth.

Hydrargyri Oxydum Rubrum (红粉, Hongfen)

Red Mercuric Oxide

The drug is red mercuric oxide (HgO).

Description Orange-red slices or powdery crystals. One side of the slices smooth and somewhat lustrous, another side relatively coarse, powder orange. Texture hard and fragile. Odour, slight; Gradually darkened on exposing to light.

Identification To 0.5 g of the drug add 10 ml of water, stir well, add dropwise a quantity of hydrochloric acid to dissolve, the solution yields the reactions characteristic of mercury salts (Appendix Ⅳ).

Mercurous Dissolve 0.5 g of the drug in 25 ml of dilute hydrochloric acid, the solution shows slight turbidity.

Chloride Dissolve 0.5 g of the drug in a quantity of water and 3 ml of nitric acid, add water to about 40 ml, carry out the limit test for chlorides (Appendix Ⅸ C). Any turbidity is not more intense than a reference solution prepared with 3 ml of standard solution of sodium chloride (0.006%).

Assay Dissolve about 0.2 g of the drug, accurately weighed, in 25 ml of dilute nitric acid. Add 80 ml of water and 2 ml of ammonium ferric sulfate IS, and titrate with ammonium thiocyanate (0.1 mol/L) VS. Each ml of ammonium thiocyanate (0.1 mol/L) VS is equivalent to 10.83 mg of mercuric oxide (HgO).

It contains not less than 99.0 per cent of mercuric oxide (HgO).

Action To drain pus, remove putrid tissues and to promote growth of new tissues.

Indications Carbuncles, sores, chancre and other malignant boils with dark-coloured putrid tissues, formation of fistulae or sinuses, constant purulence, and unhealed wounds.

Usage and dosage For external use only; appropriate quantity of very fine powder is used alone or mixed with other ingredients and made into powder or medicated threads.

Precaution Avoid oral administration because of its toxicity. Persistent external use is also prohibited.

Storage Preserve in a well closed container, protected from light and stored in a dry place.

Indigo Naturalis
(青黛, Qingdai)

Natural Indigo

Natural Indigo is the dried powder or mass prepared from the leaf or the stem and leaf of *Baphicacanthus cusia* (Nees) Bremek. (Fam. Acanthaceae), *Polygonum tinctorium* Ait. (Fam. Polygonaceae) or *Isatis indigotica* Fort. (Fam. Cruciferae).

Description A deep blue powder, light and puffy or irregular and porous masses, finely powdered on twisting. Odour, slightly grassy; taste, weak.

Identification (1) Burn gently a small quantity of the powder, a purplish-red smoke is produced.
(2) To a small quantity of the powder, add nitric acid dropwise, a brownish-red or yellowish brown colour is produced with effervescence.
(3) To 50 mg of the drug add 5 ml of chloroform, stir well and filter, the filtrate used as the test solution. Dissolve indigo CRS and indirubin CRS in chloroform to prepare a solution containing 1 mg of each per ml, used as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene-chloroform-acetone (5∶4∶1) as the mobile phase. Apply separately to the plate 5-10 μl of each of the two solutions. After developing and removal of the plate, dry it in air. The blue spot and pale purplish-red spot in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Water Carry out the determination of water (Appendix Ⅸ H, method 1), not more than 7.0 per cent caculated with reference to the dried drug.

Water-soluble pigment Shake 0.5 g of the powder with 10 ml of water and allow to stand for a moment; the water layer shows no deep blue colour.

Assay ***Indigo*** *Reference preparation* Sulfonate 20 mg of indigo CRS, accurately weighed, in a flask by adding 15 ml of sulfuric acid slowly and with constant stirring gently on a water bath at 80℃ for 1 hour. Allow to cool, transfer the solution slowly to a 200 ml volumetric flask containing a quality of water. Wash the flask and the residue with water. Combine the washing to the volumetric flask, add water to volume and mix well. Filter and discard the initial filtrate. Measure accurately 5 ml of the successive filtrate to a 50 ml volumetric flask, add water to volume and mix well (containing 10 μg of indigo per ml).

Preparation of standard curve Measure accurately 1, 2, 3, 4, and 5 ml of the reference solution respectively into a 10 ml volumetric flask, add water to volume and mix well. Carry out the method for spectrophotometry (Appendix Ⅴ A). Measure the absorbance at 610 nm and plot the standard curve, using absorbance as ordinate and concentration as abscissa.

Procedure Weigh accurately 0.4 g of the fine powder, carry out the procedure as described under "*Reference preparation*", beginning at the words "in a flask..." to "discard the initial filtrate. Measure accurately 5 ml of the successive filtrate". Transfer the filtrate to a 50 ml or 100 ml volumetric flask (adjust the absorbance to be within 0.20-0.45), add water to volume and mix well. Measure the absorbance at 610 nm and read out the weight of indigo (μg) in the test solution from the standard curve, and calculate the percentage content of $C_{16}H_{10}N_2O_2$.
It contains not less than 2.0% of indigo, calculated with reference to the dried drug.

Indirubin Weigh accurately 1.5 g of the fine powder in a stopper conical flask, accurately add 50 ml of trichloromethane, weigh, heat under reflux on a water bath, cool, weigh again, replenish the loss of the solvent with trichloromethane, mix well, filter, and use the successive filtrate as the test solution. Weigh accurately a quantity of indirubin CRS, add trichloromethane to produce a solution containing 0.07 mg of indirubin per ml, mix well, as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and benzene, trichloromethane, and acetone (5∶4∶1) as the mobile phase, apply accurately to the plate 2 μl and 4 μl of the test solution, 1 μl and 3 μl of the reference solution alternatively. After developing and removal of the plate, dry in air, cover a glass plate with same size on the plate, and fix with adhesive. Carry out the thin layer chromatographic scanning method (Appendix Ⅵ B), scan at the wavelength of λs = 540 nm, λr = 700 nm. Measure the integration values of the absorbance from the test solution and the reference solution respectively, and calculate the content.
It contains not less than 0.13 per cent of indirubin ($C_{16}H_{10}N_2O_2$), calculated with reference to the dried drug.

Action To remove *toxic-heat*, cool blood, and relieve convulsion.

Indications Eruptive epidemic diseases; spitting of blood and epistaxis due to *heat* in the blood, chest pain and hemoptysis; ulcers in the mouth; mumps; pharyngitis, karyngitis; infantile convulsion.

Usage and dosage 1.5-3 g, used as an ingredient in pills or powder, appropriate quantity for external use.

Storage Preserve in a dry place.

Lapis Chloriti (青礞石, Qingmengshi)

Chlorite Schist

Chlorite Schist is a black mica schist or a carbonate schist of chlorite mica of metamorphic group. The drug is collected, removed from foreign matter.

Description *Black mica schist* Aggregates of scales or slices, in irregular flattened masses or long oblique masses, without distinct angularity; brownish-black or greenish-black, with glassy lustre. Texture soft, easily broken, fracture distinctly sliced. Powder of greenish-black scales (black mica), with star-like flash. Odour, slight; taste, weak.

Carbonate schist of chlorite mica Sliced or granular, aggregates grey or greenish-grey, intermingled with silvery or pale yellow scales, lustrous. Texture soft, easily broken. Powder of greyish-green scales (chlorite mica) and granules (mainly carbonate salts), scales with star-like flash, bubbling with dilute hydrochloric acid TS, and intensified on heating. Odour, slight; taste, weak.

Processing *Chlorite Schist* Eliminate foreign matter, pound to pieces.
Chlorite Schist (calcined) Calcine the clean chlorite schist as described under the method of calcining openly (Appendix Ⅱ D) to red thoroughly.

Action To eliminate phlegm to relieve cough and dyspnea, subdue the hyperactivity of the liver and arrest convulsion.

Indications Cough and dyspnea due to retained phlegm; epilepsy, mania, restlessness with distress in the chest, convulsion.

Usage and dosage 3-6 g, usually used as an ingredient in pills or powder for oral administration.

Storage Preserve in a dry place.

Lapis Micae Aureus (金礞石, Jinmengshi)

Mica-schist

Mica-schist is a rock schist or black mica schist of metamorphic group. The drug is collected, removed from foreign matter.

Description Aggregates of scales, in irregular masses or pieces, pieces 1-8 mm in diameter, masses 2-10 cm in diameter, 0.6-1.5 cm thick, without distinct angularity, brownish-yellow or yellowish-brown, with golden-yellow or silvery-white lustre. Texture fragile, easily broken to little flashy golden yellow pieces on twisting, with satiny feeling. Odour, slight; taste, weak.

Identification Heat a small quantity of the pieces on an iron plate, breaking in layers or small pieces and expanding 2-5 times in size, some scales curved like a leech, the colour pales, the weight decreases and floats on water.

Processing *Mica-schist* Eliminate foreign matter.

Mica-schist (calcined) Calcine the clean mica-schist as described under the method for calcining openly (Appendix Ⅱ D) to red thoroughly.

Action To eliminate phlegm and to relieve cough and dyspnea, subdue hyperactivity of the liver and arrest convulsions.

Indications Cough and dyspnea due to retention of sticky phlegm, irritability and constriction in the chest; epilepsy, mania, convulsion.

Usage and dosage 3-6 g, mostly used as an ingredient in pills or powder.

Storage Preserve in a dry place.

Lasiosphaera seu Calvatia (马勃, Mabo)

Puff-ball

Puff-ball is the dried sporophore of *Lasiosphaera fenzlii* Reich., *Calvatia gigantea* (Batsch ex Pers.) Lloyd or *Calvatia lilacina* (Mont. et Berk.) Lloyd (Fam. Lycoperdaceae). The drug is collected in summer and autumn when ripe, removed from adhering soil, and dried.

Description *Sporophore of Lasiosphaera fenzlii* Oblate or subspheroid, without sterile base, 15-20 cm in diameter. The outer covering greyish-brown to yellowish-brown, papery and often broken into pieces or all falling off. Fruiting body greyish-brown or brownish, closed, elastic, internally showing greyish-brown cotton-fibre-like filaments on tearing. The spores pully and unctuous to the touch. Odour, dusty; tasteless.

Sporophore of Calvatia gigantea Sterile base very small or absent. The remains of covering consisting of yellowish-brown membranous exoperidium and relatively thick greyish-yellow endoperidium, smooth, hard and fragile, falling off in pieces. Fruiting body pale bluish-brown and unctuous to the touch.

Sporophore of Calvatia lilacina Top-like or pressed to be oblate, 5-12 cm in diameter, sterile base well-developed. Covering thin, 2-layered, purplish-brown, coarsely shrivelled, with circular depressions, turned outward, top broken into small patches or partially falling off. Fruiting body purple.

Identification (1) Place the sample over a flame and shake slightly, the fine sparks are observed immediately, after going out, much white and dense smoke is produced.
(2) *Sporophore of Lasiosphaera fenzlii* Powder: Grey-brown. Capillitium long, brownish, branched, interwoven each other, 2-4.5 μm in diameter, thick-walled. Spores brown, globoid, 4.5-5 μm in diameter, with minute spines, 1.5-3 μm long.

Sporophore of Calvatia gigantea Powder: Pale bluish-brown. Capillitium slightly branched, rarely septate, 2.5-6 μm in diameter. Spores pale bluish-yellow, smooth or sometimes finely warted, 3.5-5 μm in diameter.

Sporophore of Calvatia lilacina Powder: Greyish-purple. Capillitium branched, septate, 2-5 μm in diameter, thick-walled. Spores 4-5.5 μm in diameter with minute spines.
(3) Moisten 1 g of the broken pieces in 8 ml of each of ethanol and sodium hydroxide solution (0.1 mol/L), dry at a low temperature, ignite gently and incinerate at 700℃, cool. Dissolve the residue in 10 ml of water, filter, the filtrate yields the reactions characteristic of phosphates (Appendix Ⅳ).
(4) To 1 g of the broken bits, add 40 ml of dichloromethane,

heat under reflux on a water bath for 1 hour, cool, and filter. Evaporate the filtrate to dryness, to the residue add 1 ml of dichloromethane as the test solution. Prepare a solution of 1 g of Lasiosphaera seu Calvatia reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and hexamethylene-acetone-ether (10∶1∶2) as the mobile phase, apply separately to the plate 5 μl of each the two solutions. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The main spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference solution.

Water Carry out the determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent.

Total ash Not more than 15.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 10.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using dilute ethanol TS as the solvent, not less than 8.0 per cent.

Processing Eliminate foreign matter, and break to pieces.

Action To remove *heat* from the *lung* and ease sore throat, and arrest bleeding.

Indications Sore throat, cough and hoarseness caused by *wind-heat* in the *lung*; epistaxis and traumatic bleeding in external application.

Usage and dosage 1.5-6 g; appropriate quantity is applied topically.

Storage Preserve in a dry place, protected from dust.

Lignum Aquilariae Resinatum (沉香, Chenxiang)

Chinese Eaglewood Wood

Chinese Eaglewood Wood is the resin containing wood of *Aquilaria sinensis* (Lour.) Gilg (Fam. Thymelaeaceae). The drug is collected all the year round, removed from the part without resin, and dried in shade.

Description In irregular lumps and flakes, or helmet-shaped, sometimes in shreds. Externally lumpy, with scars of knife cutting, and showing a few of holes, and streaks formed by black-brown resin alternating with yellowish-white wood. Surface of holes and depressions mostly rottenwood-like. Texture relatively compact, fracture splintery. Odour, aromatic; taste, bitter.

Identification (1) Transverse section: Rays 1-2 cells wide, filled with brown resin. Vessels round-polygonal, 42-128 μm in diameter, someones containing brown resin. Xylary fibres polygonal, 20-45 μm in diameter, with slightly thickened and lignified walls. Interxylary phloem elongated-elliptical or strip-shaped, usually intersecting with rays, and the cells with thin and non-lignified walls, containing brown resin; a few of fibres scattered, some parenchymatous cells containing prisms of calcium oxalate.
(2) Microsublime the ethanol-soluble extractives obtained under Extractives, a yellowish-brown oily substance with strongly aromatic odour is produced. To the oily substance add 1 drop of hydrochloric acid, a small quantity of vanillin and 1-2 drops of ethanol, a cherry-red colour is gradually produced, and darkened on standing.

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using ethanol as the solvent, not less than 10.0 per cent.

Processing Eliminate the white and rottenwood, split to small pieces; break to tiny pieces or pulverize to fine powder for use.

Action To promote the flow of *qi* and relieve pain, arrest vomiting by warming the stomach, and relieve dyspnea.

Indications Distension and pain in the chest and abdomen; vomiting or hiccuping due to *cold* in the stomach; dyspnea and adverse of qi in *kidney-deficiency* syndrome.

Usage and dosage 1.5-4.5 g, decocted later.

Storage Preserve in a well closed container, stored in a cool and dry place.

Lignum Dalbergiae Odoriferae (降香, Jiangxiang)

Rosewood

Rosewood is the dried heart wood of trunk and root of *Dalbergia odorifera* T. Chen (Fam. Leguminosae). The drug is collected all the year round, removed from the sap wood, and dried in the shade.

Description In subcylindrical or irregular pieces. Externally purplish-red or reddish-brown, cut surface with dense striations. Texture hard, oily. Odour, slightly aromatic; taste, slightly bitter.

Identification (1) Powder: Brownish-purple or yellowish-brown. Bordered pitted vessels very large, up to about 300 μm in diameter when intact, mostly broken, with large and distinct bordered pits, containing reddish-brown or yellowish-brown contents. Fibres in bundles, brownish-red, 8-26 μm in diameter, highly thick-walled, some fibre bundles surrounded by cells containing prisms of calcium oxalate, forming crystal fibres, walls of crystal cells unequally lignified and thickened. Prisms of calcium oxalate 6-22 μm in diameter. Xylary rays 1-2 cells wide, up to 15 cells high, walls slightly thickened, with relatively dense pits. Pigment masses reddish-brown, yellowish-brown or pale yellow.
(2) Heat under reflux 2 g of the powder in 20 ml of ether for 30 minutes, filter, expel ether of the filtrate, dissolve the residue in 1 ml of ethanol as the test solution. Prepare a solution with 2 g of Lignum Dalbergiae Odoriferae reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ether and chloroform (7∶2∶1) as the mobile phase. Apply separately to the plate 2 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with a mixture of 1% vanillin surfuric acid solution and dehydrated ethanol (1∶9), heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(3) Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance

and a mixture of toluene and ethyl acetate (2∶1) as the mobile phase. Apply separately to the plate 2 μl of each of the test solution and the reference drug solution obtained under Identification test (2). After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using ethanol as the solvent, not less than 8.0 per cent.

Processing Eliminate foreign matter, split to small pieces, and pulverize to fine powder or cut into slices.

Action To relieve pain by promoting circulation of *qi* and blood, and arrest bleeding.

Indications Epigastric pain, costal and hypochondriac pain due to stagnancy of *qi* of the liver, angina pectoris, traumatic injuries and bleeding.

Usage and dosage 9-15 g, decocted later; for external use, appropriate quantity is ground into fine powder and applied topically.

Storage Preserve in a cool and dry place.

Lignum Santali Albi (檀香, Tanxiang)

Sandalwood

Sandalwood is the dried heart wood of trunk of *Santalum album* L. (Fam. Santalaceae).

Description In cylindrical woody segments, someones slightly curved, varying in length, usually about 1 m long, 10-30 cm in diameter. Externally pale yellow or yellowish-brown, fine and smooth, sometimes with nodal scars or longitudinal cracks, transversely cut surface brownish-yellow, showing oil stains, brown annual rings distinct or indistinct, longitudinally cut surface showing straight striations. Texture compact, uneasily broken. Odour, aromatic, strongly aromatic on burning; taste, weak, slightly pungent on chewing.

Identification (1) Transverse section: Vessels scattered singly, 2-3 aggregated occasionally. Xylary rays consisting of 1-2 rows of radially elongated cells. The differences between woody fibre and fibre tracheid indistinct. Xylary parenchymatous cells scattered singly or several aggregated, some containing prisms of calcium oxalate. Oil drops visible in vessels, ray cells and xylary parenchymatous cells.
(2) To the volatile oil obtained under the Assay, add ether to produce a solution containing 10 μl per ml as the test solution. Dissolve santalol CRS in ether to produce a solution containing 5 μl per ml (or to the volatile oil of Indian sandalwood add ether to produce a solution containing 10 μl per ml) as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (85∶15) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After devoloping and removal of the plate, dry in air. Spray with *p*-dimethylaminobenzaldehyde solution (dissolve 0.25 g of *p*-dimethylaminobenzaldehyde in 50 g of glacial acetic acid, add 5 g of 85% phosphoric acid and 20 ml of water, mix well), heat at 80-90℃ to the spots clear. The purplish-blue spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 2).

Assay Carry out the method for the determination of volatile oil (Appendix Ⅹ D), using 30 g of the shavings (1 mm thick).
It contains not less than 3.0 per cent of volatile oil (ml/g).

Processing Eliminate foreign matter, cut into slices or saw into small sections, and split to small pieces.

Action To promote the flow of *heart-qi*, warm the spleen and stomach, whet appetite, and relieve pain.

Indications Pectoral and abdominal pain due to stagnation of *qi* with cold; epigastric pain, loss of appetite; angina pectoris in coronary heart disease.

Usage and dosage 2-5 g.

Storage Preserve in a cool and dry place.

Lignum Sappan (苏木, Sumu)

Sappan Wood

Sappan Wood is the dried heart wood of *Caesalpinia sappan* L. (Fam. Leguminosae). The drug is collected mostly in autumn, removed from the white sap wood and dried.

Description Long cylindrical or semicylindrical owing to cutting lengthwise, 10-100 cm long, 3-12 cm in diameter. Externally yellowish-red to brownish-red, with traces of knife cutting, usually showing longitudinal cracks. Texture compact and hard. Transversely cut surface somewhat lustrous, annual rings distinct, sometimes dark brown, loose and bright-dotted pith visible. Odour, slight; taste, slightly astringent.

Identification (1) Transverse section: Rays 1-2 cells wide. Vessels up to about 160 μm in diameter, usually containing yellowish-brown or reddish-brown contents. Xylary fibres mostly polygonal, with extremely thickened walls. Parenchymatous cells in xylem thick-walled and lignified, sometimes containing prisms of calcium oxalate. Parenchymatous cells in pith irregularly polygonal, varying in size, walls slightly lignified and pitted.
(2) To 10 g of the powder add 50 ml of water, shake and stand for 4 hours, filter, the filtrate showing orange red, and a yellowish-green fluorescence is produced under ultravoilet light at 365 nm. To 5 ml of the filtrate add 2 drops of sodium hydroxide TS, a scarlet colour is produced, and a blue fluorescence is produced under ultraviolet light at 365 nm. The solution gives an orange colour on acidifying with hydrochloric acid and shows a yellowish-green fluorescence under ultraviolet light at 365 nm.
(3) To 1 g of the powder add 10 ml of ethanol, ultrasonicate for 30 minutes, filter, use the filtrate as the test solution. Prepare a solution with 1 g of Lignum Sappan reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, acetone and formic acid (8∶4∶1) as the mobile phase. Apply separately to the plate 2 μl of

each of the above two solutions. After developing and removal of the plate, dry in air, and examine in daylight 12 hours later. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Carry out the water for determination of water (Appendix Ⅸ H, method 2), not more than 12.0 per cent.

Extractives Carry out the hot extraction method for determination of ethanol soluble extractives (Appendix Ⅹ A), using dilute ethanol TS as the solvent, not more than 10.0 per cent.

Processing Saw into sections about 3 cm long, then split to pieces or pulverize to coarse powder.

Action To promote blood circulation and remove blood stasis, and to cause subsidence of swelling and relieve pain.

Indications Amenorrhea, dysmenorrhea, blood stasis after delivery; pricking pain in the chest and abdomen, traumatic swelling and pain.

Usage and dosage 3-9 g.

Precaution Used with caution in pregnancy.

Storage Preserve in a dry place.

Limonitum
(禹余粮，Yuyuliang)

Limonite

Limonite is a mineral of limonite of hydroxides, containing mainly basic ferric oxide [FeO(OH)]. The drug is collected, and removed from foreign matter.

Description Aggregates of masses, irregularly rhombic. 5-10 cm long, 1-3 cm thick. Externally reddish-brown, greyish-brown or pale brown, often uneven or with yellow powder attached. Fracture mostly showing layered striations alternated with dark brown and pale brown or pale yellow, the layers varying in hardness, the soft part can be cut with nail. Texture hard and heavy. Odour, slight; tasteless, no sandy feeling on chewing.

Identification To 0.1 g of the powder add 2 ml of hydrochloric acid, shake, allow to stand, the supernatant yields the reactions characteristic of ferric and ferrous salts (Appendix Ⅳ).

Processing *Limonitum* Eliminate foreign matter, wash clean, and dry.

Limonitum (calcined) Calcine the clean pieces of Limonitum as described under the method for calcining and quenching (Appendix Ⅱ D) to red thoroughly, using 30 kg of vinegar per 100 kg of Limonitum.

Action To relieve diarrhea and arrest bleeding as an astringent.

Indications Chronic diarrhea, chronic dysentery; abnormal uterine bleeding, morbid leukorrhea.

Usage and dosage 9-15 g, to be decocted or made into pills or powder.

Precaution Used with caution in pregnancy.

Storage Preserve in a dry place.

Magnetitum
(磁石，Cishi)

Magnetite

Magnetite is a mineral of oxides of spinel group, containing mainly ferroferric oxide (Fe_3O_4). The drug is collected, removed from foreign matter.

Description Aggregates of masses, in irregular masses, or slightly subsquare, frequently with angularities. Greyish-black or brown; streak black, with lustre of metal. Texture hard and heavy, fracture uneven. Magnetic. Odour, earthy; tasteless.

Identification To 0.1 g of the powder add 2 ml of hydrochloric acid, shake, allow to stand. The supernatant yields the reactions characteristic of ferric and ferrous salts (Appendix Ⅳ).

Assay Heat to boil gently about 0.25 g of the fine powder, accurately weighed, in 15 ml of hydrochloric acid and 3 ml of 25% potassium fluoride solution in conical flask, covered with a watch glass. Add dropwise 6% stannous chloride solution, shake constantly until the drug is decomposed completely with only white residue left at the bottom of the flask. Stop to heat, wash the watch glass and the inner walls of the flask with a small quantity of water, and add dropwise 6% stannous chloride solution while hot until a pale yellow colour is produced (if stannous chloride is in excess, add dropwise potassium permanganate TS until a pale yellow colour is produced). Add 100 ml of water and 15 drops of 25% sodium tungstate solution, and add dropwise 1% titanium chloride solution until a blue colour is produced, then add dropwise and cautiously potassium dichromate (0.01667 mol/L) VS until the blue colour disappears. Add immediately 10 ml of a mixture of sulfuric acid, phosphoric acid and water (2 : 3 : 5) and 5 drops of sodium diphenylamine sulfonate IS, and titrate with potassium dichromate (0.01667 mol/L) VS until the colour turns to stable bluish-purple. Each ml of potassium dichromate (0.01667 mol/L) VS is equivalent to 5.585 mg of iron (Fe).

It contains not less than 50.0 per cent of iron (Fe).

Processing *Magnetitum* Eliminate foreign matter, pound to pieces.

Magnetitum (calcined) Calcine the clean Magnetitum as described under the method for calcining and quenching (Appendix Ⅱ D) to red thoroughly, quench with vinegar and grind to coarse powder, using 30 kg of vinegar per 100 kg of Magnetitum.

Action To subdue hyperactivity of the liver, improve hearing and eyesight, anchor the mind, and alleviate dyspnea.

Indications Dizziness, blurring of vision, tinnitus, impairment of hearing, palpitation, insomnia, dyspnea due to diminished function of the kidney.

Usage and dosage 9-30 g, decocted first.

Storage Preserve in a dry place.

Margarita
(珍珠, Zhenzhu)

Pearl

Pearl is the pearl formed in such bivalve as *Pteria martensii* (Dunker) (Fam. Peteriidae), *Hyriopsis cumingii* (Lea) or *Cristaria plicata* (Leach) (Fam. Unionidae), etc., when it is irritated by foreign substance. The drug is collected from the animal, washed and dried.

Description Subspheroidal, oblong, ovoid or clavate, 1.5-8 mm in diameter. Externally whitish, light pink, light yellowish-green or light blue, translucent, smooth or slightly uneven with characteristic lustre. Texture hard, laminating veins on broken surface. Odour, slight; tasteless.

Identification (1) Powder: Whitish. Irregular pieces, translucent, with rainbow like lustre. Granular in surface view, piled up by several to tens of thin layers, laminae densely arranged, dense laminated lines or finely undulated-striations can be seen. The ground slices marked with concentric striations.
(2) To the powder add dilute hydrochloric acid, a lot of bubbles are produced immediately, filter, the filtrate yields the reactions characteristic of calcium salts (Appendix Ⅳ).
(3) Examine the drug under ultraviolet light at 365 nm, pale bluish-violet or bright yellowish-green fluorscence is shown, usually relatively bright in the peripheral zone.

Processing *Margarita* Wash clean and dry.

Powder of Margarita Take clean Margarita, grind and make it into finest powder as described under the method for levigation (Appendix Ⅱ D).

Action To anchor the mind, eliminate corneal opacity, counteract *toxicity* and promote the growth of new tissues.

Indications Palpitation and insomnia; convulsion, epilepsy; nebula; skin ulcerations difficult to heal.

Usage and dosage 0.1-0.3 g, mostly used as an ingredient in pills or powder; appropriate quantity for external use.

Storage Preserve in well closed containers.

Medulla Junci
(灯心草, Dengxincao)

Common Rush

Common Rush is the dried stem pith of *Juncus effusus* L. (Fam. Juncaceae). The stem is collected from late summer to autumn, dried in the sun, the pith is taken out, straightened and ligated into small bundle.

Description Slenderly cylindrical, up to 90 cm long, 0.1-0.3 cm in diameter. Externally white or pale yellowish—white, with fine longitudinal striations. Texture light, soft, slightly elastic, easily broken, fracture white. Odour, slight; tasteless.

Identification (1) Powder: Almost white. Parenchymatous cells stellate, connecting with the branches to form air cavities in triangular or quadrilateral shape; branches 4-8, 5-15 μm long, 5-12 μm wide, walls slightly thickened, fine pits occasionally observed, connected walls thin, sometimes beaded.
(2) Heat under reflux 1 g of the powder with 10 ml of methanol, cool, filter, evaporate the filtrate to dryness, wash the residue with 2 ml of ether, discard the ether solution, dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution with 1 g of Medulla Junci reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (10:7) as the mobile phase. Apply separately to the plate 3-5 μl of the test solution and 3 μl of the reference drug solution. After developing and removal of the plate, dry in air. Spray with phosphomolybdic acid TS, heat at 105℃ to the spots clear. The main spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), using 0.5 g of the drug, not more than 11.0 per cent.

Extractives Take 0.5 g of the drug, carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol TS as the solvent, not less than 5.0 per cent.

Processing *Medulla Junci* Eliminate foreign matter, and cut into sections.

Medulla Junci (carbonized) Calcine the clean Medulla Junci as described under the method for carbonizing by calcining (Appendix Ⅱ D).

Action To eliminate excessive *heart-qi*, and induce urination.

Indications Fidgetness and insomnia with oliguria and painful difficult urination or with ulceration in the mouth or on the tongue.

Usage and dosage 1-3 g.

Storage Preserve in a dry place.

Medulla Stachyuri
Medulla Helwingiae
(小通草, Xiaotongcao)

Stachyurus or Japanese Helwingia Pith

Stachyurus or Japanese Helwingia Pith is the dried stem pith of *Stachyurus himalaicus* Hook. f. et Thoms., *Stachyurus chinensis* Franch. (Fam. Stachyuraceae) or *Helwingia japonica* (Thunb.) Dietr. (Fam. Cornaceae). The stem is collected in autumn, cut into sections, the pith is taken out when fresh, straightened and dried in the sun.

Description *Pith of Stachyurus chinensis and Stachyurus himalaicus* Cylindrical, 30-50 cm long, 0.5-1 cm in diameter. Externally white or pale yellow, without striations. Texture light, lax and soft, deformed when kneaded, elastic, easily broken, fracture even and without hollow, silvery. Unctuous on touching after soaking. Odour, slight and tasteless.

Pith of Helwingia japonica Surface with shallow longitudinal striations. Texture relatively hard, uneasily

deformed when kneaded. Not unctuous on touching after soaking.

Identification Transverse section:
Pith of Stachyurus chinensis and Stachyurus himalaicus All composed of rounded, elliptical or polygonal parenchymatous cells, sparsely pitted; mucilage cells scattered. *Pith of Stachyurus chinensis* with a few of clusters of calcium oxalate, and *Pith of Stachyurus himalaicus* without clusters.

Pith of Helwingia japonica Parenchymatous cells with relatively distinct pits, containing colourless liquid drops and a few of clusters of calcium oxalate; mucilage cells absent.

Processing Eliminate foreign matter and cut into sections.

Action To remove *heat*, induce urination, and promote lactation.

Indications Oliguria, urinary infection; galactostasis.

Usage and dosage 2.5-4.5 g.

Storage Preserve in a dry place.

Medulla Tetrapanacis (通草, Tongcao)

Ricepaperplant Pith

Ricepaperplant Pith is the dried stem pith of *Tetrapanax papyriferus* (Hook.) K. Koch (Fam. Araliaceae). The stem is collected in autumn, cut into sections. The pith is taken out when fresh, straightened, and dried in the sun.

Description Cylindrical, 20-40 cm long, 1-2.5 cm in diameter. Externally white or pale yellow, with shallow longitudinal furrows. Texture light, soft and loose, slightly elastic, easily broken, fracture even, with silvery lustre, with a hollow, 0.3-1.5 cm in diameter, or translucent membrane in the middle, arranged in scalariform in longitudinally cut surface, solid ones visible occasionally. Odour, slight; taste, weak.

Identification Transverse section: All composed of elliptic, subrounded or subpolygonal parenchymatous cells. The outer cells relatively small, pits obvious. Someones containing clusters of calcium oxalate, 15-64 μm in diameter.

Processing Eliminate foreign matter, cut into thick slices.

Action To remove *heat*, induce urination, and stimulate lactation.

Indications Dysuria with difficult painful urination; edema and oliguria; lack of milk secretion.

Usage and dosage 3-5 g.

Precaution Used with caution in pregnancy.

Storage Preserve in a dry place.

Mel (蜂蜜, Fengmi)

Honey

Honey is a saccharine fluid deposited by *Apis cerana* Fabricus or *Apis mellifera* Linnaeus (Fam. Apidae). The drug is collected from spring to autumn, and filtered.

Description Translucent, lustrous and viscid, white to pale yellow or orange yellow to yellowish-brown, white granular crystals gradually separated out on keeping or on cooling. Odour, aromatic; taste, very sweet.

Relative density Dissolve any crystal on a water bath at a temperature below 60℃, if the crystal has separated out in the samples examined, mix well. Cool to 25℃ and carry out the method for the determination of relative density (Appendix Ⅶ A), not less than 1.349.

Acidity Mix 10 g with 50 ml of freshly boiled and cooled water, add 2 drops of phenolphthalein IS and 4 ml of sodium hydroxide solution (0.1 mol/L), and a pink colour is produced, persisting for 10 seconds.

Starch and dextrin Boil 2 g with 10 ml of water, cool, add 1 drop of iodine TS, and no blue, green or reddish-brown colour is produced.

5-(Hydroxyl methyl) furfural Place 5.0 g, weighed accurately, in a 50 ml volumetric flask, add 0.5 ml of each of 15 % potassium ferrocynide solution and 30 % zinc acetate solution, dilute with water to volume (add 1 drop of ethanol if the froth is produced), and mix well. Filter with the dry filter paper, discard the initial filtrate, and transfer separately 5 ml of each of the filtrate, measured accurately, to two tubes with stopper. To one tube add 5.0 ml of water and mix well as the test solution. To another tube add 5.0 ml of 0.2% sodium hydrogen sulfite solution as the blank solution. Carry out the method for ultraviolet spetrophotometry and colourimetry (Appendix Ⅴ A), and measure the absorbance at 284 nm and 336 nm.
The value of subtraction between two absorbances is not more than 0.34.

Assay *Standardization of alkaline cupric tartrate TS* Place about 0.5 g of glucose, previously dried to 105℃ to constant weight and accurately weighed, in a 100 ml volumetric flask. Add water to dissolve, dilute with water to volume, and mix well. Place 20 ml, accurately measured, of alkaline cupric tartrate TS in a conical flask, heat and keep to boil gently. Titrate with the above glucose solution until the blue colour almost disappears. Boil for further 1 minute, add 1 drop of 1% methylene blue solution and continue to titrate slowly until the blue colour disappears. Estimate the approximate volume (ml) of glucose solution required for the titration. Transfer 20 ml, accurately measured, of alkaline cupric tartrate TS to another conical flask, add the glucose solution from a burette until about 1 ml before the end point is reached. Carry out the previous titration beginning at the words "heat and keep to boiling gently...". Calculate the weight of anhydrous glucose (g) equivalent to 1 ml of alkaline cupric tartrate TS.

Procedure Place about 1 g, accurately weighed, in a 250 ml volumetric flask. Add water to dissolve dilute with water to volume, mix well and transfer to a burette. Carry out the titration described under the standardization of alkaline cupric tartrate TS, beginning at the words "transfer 20 ml, accurately measured, of alkaline cupric tartrate TS,...". Calculate the content of reducing sugar as follows:

$$\%\ \text{of reducing sugar} = \frac{\dfrac{\text{Weight (g) of anhydrous glucose equivalent to each ml of alkaline cupric tartrate TS} \times 20}{\text{Sample weight (g)}}}{\dfrac{250}{\text{Volume (ml) consumed in the titration}}} \times 100\%$$

It contains not less than 64.0 per cent of reducing sugar.

Action To reinforce the spleen and stomach, relieve

dryness, and pain, and counteract *toxicity*.

Indications Epigastric pain alleviated after meals or by pressing; dry cough; constipation; external use for sores, scalds and burns.

Usage and dosage 15-30 g.

Storage Preserve in a cool place.

Mirabilitum Praeparatum (西瓜霜, Xiguashuang)

Mirabilite Preparation

Mirabilite Preparation is prepared from the ripped flesh fruit of *Citrullus lanatus* (Thunb.) Mansfeld. (Fam. Cucurbitaceae) and glauber's salt by processing with frost-like powder making.

Description A almost white or yellowish-white crystalline powder. Odour, slight; taste, salty.

Identification The aqueous solution yields the characteristic reactions of sodium salts and sulfates (Appendix Ⅳ).

Heavy metals To 1.0 g of the drug, carry out the limit test for heavy metals (Appendix Ⅸ E, method 2), not more than 10 ppm.

Arsenic To 0.20 g of the drug, dissolved in 23 ml of water, add 5 ml of hydrochloric, heat to dissolve, cool, carry out the limit test for arsenic (Appendix Ⅸ F, method 1), not more than 10 ppm.

Assay Dissolve about 0.4 g of the drug, weighed accurately, in 150 ml of water, constantly shaking for 10 minutes, filter, wash the precipitate with 50 ml of water divided into three times, filter, and merge together the filtrates, add I ml of hydrochloric acid, boil, and add about 20 ml of hot barium chloride TS with constant stirring until no more precipitate is produced. Heat on a water bath for 30 minutes, stand for 1 hour, filter through an ashless filter paper or a tared sintered glass filter. Wash the precipitate with water for several times until the washings show no reaction characteristic of chloride. Dry and ignite the precipitate to constant weight. Weigh accurately, multiply the weight by 0.6086 to obtain the content of sodium sulfate (Na_2SO_4).

It contains not less than 95.0 per cent of sodium sulfate (Na_2SO_4), calculated with reference to the dried drug.

Action To clear *heat* and purge *fire*, reduce swelling and relieve pain.

Indications Swollen and painful throat, laryngalgia and aphtha.

Usage and dosage Appropriate quantity for oral taking or in powder form for external use.

Storage Preserve in tightly closed containers, stored in a dry place.

Moschus (麝香, Shexiang)

Musk

Musk is the dried secretion of the musk sac of adult male *Moschus berezovskii* Flerov, *Moschus sifanicus* Przewalski or *Moschus moschiferus* Linnaeus (Fam. Cervidae). Usually the wild musk deer is hunted from winter to next spring. The musk sac is cut off, dried in air, which is known as "Maokeshexiang" (musk with hairy sac). The musk sac is opened, removed from the sac wall, the drug thus obtained is known as "Shexiangren (musk)". For the domestic musk deer, the "Shexiangren" is taken from the musk sac directly, dried in air or in desiccator.

Description *Maokeshexiang* In oblate or subellipsoidal sac, 3-7 cm in diameter, 2-4 cm thick. The skin of the opening side leathery, brown, slightly even, with dense white or greyish-brown short hairs around the centre from both sides. A small sac opening located in the centre. The skin of the other side is brown and slight purple dermal membrane, slightly shrunken, muscle fibers occasional found, slightly elastic. After opening of the sac, the middle dermal membrane brown or greyish-brown, translucent; the inner dermal membrane brown, with granular or powdery "Shexiangren", a small amount of thin hairs and dropped inner membrane, [commonly known as "Yinpi" (silver membrane)].

Shexiangren For samples taken from the wild musk deer, texture soft, oily and lax; the irregularly spheroidal or granules commonly known as "Dangmenzi" (dangmen granule), the surface usually purplish-black, oily and bright, with slight pocked stripes, fracture dark brown or yellowish-brown. The powder usually brown or yellowish-brown, with a small amount of dropped inner membrane and thin hairs. For the samples taken from the domestic musk deer, granular, in short strips or irregular masses; the surface uneven, purplish-black or dark brown, oily and slightly lustrous, with a small amount of hairs and dropped inner membrane. Odour, characteristic and strongly aromatic; taste, slightly pungent, bitter and salty.

Identification (1) Insert a specially made grooved needle into "Maokeshexiang" from the sac opening, turn the needle to get "Shexiangren", and observe immediately. The "Shexiangren" in the groove swells gradually, and gets beyond the surface of the groove. This phenomenon is commonly known as"over the groove". "Shexiangren" oily, granules lax, without acute angle. Odour, strong aromatic. No foreign matter such as fibres etc. or unusual odour.

(2) Put a small amount of "Shexiangren" powder in palm, moisten the powder by water. The powder can be rubbed into a ball with hands, disintegrate when gently kneaded by fingers. It does not stick or stain the hand or bond into masses.

(3) Ignite small amount of "Shexiangren" in a red-hot crucible. The substance cracks at first, then melts and swells to form pearl-like foam with strongly characteristic and aromatic odour. No burnt smell of hairs or flesh and flame or spark is observed. The residue shows white or greyish-white in colour.

(4) "Shexiangren" powder brown or yellowish-brown. In translucent or transparent masses aggregated from numerous amorphus granules, pale yellow or pale brown; with cubic, cylindrical, octahydronal or irregular crystals embedded or scattered in the mass; rounded oil drops visible, hairs and inner membrane tissues occasional.

(5) Carry out the test under Assay, the retention time of the peak in the chromatogram obtained with the test solution corresponds with that in the chromatogram obtained with the reference solution.

Foreign matter No animal or plant tissues, minerals or other fales substance; no mildewing allowable.

Loss on drying Weigh accurately 1 g of the drug, dry to

constant weight in vacuum over phosphorus pentoxide in a desiccator, loses not more than 35.0 per cent of its weight (Appendix Ⅸ G).

Total ash Carry out the method for determination of ash (Appendix Ⅸ K), using 0.2 g of the drug, weighed accurately, not more than 6.5 per cent, calculated with reference to the dried drug.

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use 2% phenylmethyl polysiloxane (OV-17) as the stationary phase; maintain the column temperature at 200±10℃. The number of theoretical plates of the column is not less than 1500, calculated with the reference to the peak of muscone.

Reference solution Dissolve a quantity of muscone CRS, weigh accurately, in dehydrated ethanol to produce a solution containing 1.5 mg per ml.

Test solution Weigh accurrately 0.2 g of the powder obtained under the test of Loss on drying, add accurately 2 ml of dehydrated ethanol, stopper tightly, and shake. Allow to stand for 1 hour, filter and use the filtrate.

Procedure Inject accurately 2 μl of each of the reference solution and the test solution, respectively, into the column, determine and calculate the content.
It contains not less than 2.0 per cent of muscone ($C_{16}H_{30}O$), calculated with reference to the dried drug.

Processing Remove the sac wall of "Maokeshexiang", take out the "Shexiangren" and eliminate foreign matter. Pulverize before use.

Action To restore consciousness, activate blood circulation and stimulate menstruation, cause subsidence of swelling, and relieve pain.

Indication Loss of consciousness in febrile diseases, stroke, syncope and attack by noxious factors; amenorrhea, masses in the abdomen; dystocia; sudden attack of precordial and abdominal pain; carbuncles, lymphadenitis; sore throat; traumatic pain; numbness and pain in arthritis.

Usage and dosage 0.03-0.1 g, mostly used as an ingredient in pills or powder; appropriate quantity for external use.

Precaution Contraindicated in pregnancy.

Storage Preserve in well closed containers, stored in a cool and dry place, protected from light, moisture and moth.

Mylabris
(斑蝥, Banmao)

Blister Beetle

Blister Beetle is the dried body of *Mylabris phalerata* Pallas or *Mylabris cichorii* Linnaeus (Fam. Meloidae). The drug is collected in summer or autumn, suffocated or scalded by boiling water to death, and dried in the sun.

Description *Body of Mylabris phalerata* Oblong, 1.5-2.5 cm long, 0.5-1 cm wide. The head and the mouth parts curved downward, with a pair of relatively large compound eyes and a pair of antennae which usually fallen off. A pair of leathery elytra on the dorsum, black, with three yellow or brownish-yellow transverse stripes; a pair of transparent brownish membrane-like hind wings beneath the elytra. The thorax and abdomen pitch-black, with three pairs of legs at the thorax. Odour, characteristic stinking.

Body of Mylabris cichorii Body size relatively small, 1-1.5 cm long.

Identification To 3 g of the powder add 20 ml of chloroform, shake, macerate for 2 hours, and filter. Evaporate the filtrate to dryness, wash the residue with three 5-ml quantities of petroleum ether (30-60℃), carefully discard the supernatant. Dissolve the residue in 1 ml of chloroform as the test solution. Dissolve cantharidin CRS in chloroform to produce a solution containing 5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and acetone (98:2) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 0.1% solution of bromocresol virid in ethanol and heat to the spots distinct. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use 3.5 % SE-30 as the stationary phase; maintain the column temperature at 175±10 ℃. The number of theoretical plates of the column is not less than 2600, calculated with the reference to the peak of cantharidin.

Reference solution Dissolve a quantity of cantharidin CRS, accurately weighed, in chloroform to produce a solution containing 1 mg per ml as the reference solution. Dilute if necessary.

Test solution Weigh accurately about 1 g of the coarse powder in a stoppered conical flask, add 30 ml of chloroform, shake for 15 minutes, allow to stand for 6 hours, and filter. Transfer the filtrate to a 50 ml volumetric flask, wash the residue and the filter paper with chloroform, combine the washings to the same flask. Dilute with chloroform to volume, and mix well.

Procedure Inject accurately 2 μl of each of the reference solution and the test solution, respectively, into the column, determine and calculate the content.
It contains not less than 0.35 per cent of cantharidin ($C_{10}H_{12}O_4$).

Processing *Mylabris* Eliminate the foreign matter.

Mylabris (prepared with rice) Stir-bake clean Mylabris with rice until the colour of rice becomes yellowish-brown, take out, eliminate the head, wings and legs. To each 10 kg of Mylabris add 2 kg of rice.

Action To eliminate blood stasis and masses and ulcers, and induce blisters to get rid of toxins.

Indications Masses in the abdomen, cancer, chronic tinea, scrofula, vegetation, abscesses without diabrosis, malignant sore and slough.

Usage and dosage 0.03-0.06 g, mostly used as an ingredient in pills or powder after processed; for external use, appropriate quantity is ground into powder or steeped into wine or vinegar or prepared into ointment for topical application.

Precaution Very poisonous. Be cautious for oral administration. Contraindicated in pregnancy.

Storage Preserve in a ventilated dry place, protected from moth.

Natrii Sulfas
(芒硝，Mangxiao)

Sodium Sulfate

Sodium Sulfate is a crystalline substance purified from a mineral of sulfates of Glauber's salts group, containing mainly hydrated sodium sulfate ($Na_2SO_4 \cdot 10H_2O$).

Description Prismatical, rectangular or irregular masses, and granules. Colourless and transparent, or almost white and translucent. Texture fragile and easily broken, fracture with glassy lustre. Odour, slight; taste, salty.

Identification The aqueous solution yields the reactions characteristic of sodium salts and sulfates (Appendix Ⅳ).

Iron and Zinc Dissolve 5 g of the drug in 20 ml of water, add 2 drops of nitric acid, boil for 5 minutes, neutralize with sodium hydroxide TS, then add 1 ml of dilute hydrochloric acid TS, 1 ml of potassium ferrocyanide TS and a quantity of water to 50 ml, mix well. Allow to stand for 10 minutes, no turbidity or blue colour is produced.

Magnesium Dissolve 2 g of the drug in 20 ml of water, add 1 ml of each of ammonia TS and disodium hydrogen phosphate TS, no turbidity is produced within 5 minutes.

Loss on drying When dried to constant weight at 105℃, loses 51.0-57.0 per cent of its weight (Appendix Ⅸ G).

Heavy metals Dissolve 2.0 g of the drug in 2 ml of dilute acetic acid TS, add a quantity of water to 25 ml, carry out the limit test for heavy metals (Appendix Ⅸ E, method 1), not more than 10 ppm.

Arsenic Dissolve 0.20 g of the drug in 23 ml of water, add 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix Ⅸ F), not more than 10 ppm.

Assay Dissolve about 0.4 g of the drug, weighed accurately, in 200 ml of water, add 1 ml of hydrochloric acid, boil, and add about 20 ml of hot barium chloride TS with constant stirring until no more precipitate is produced. Heat on a water bath for 30 minutes, stand for 1 hour, filter through an ashless filter paper or a tared sintered glass filter. Wash the precipitate with water for several times until the washings show no reactions characteristic of chloride. Dry and ignite the precipitate to constant weight. Weigh accurately, multiply the weight by 0.6086 to obtain the content of sodium sulfate (Na_2SO_4).
It contains not less than 99.0 per cent of sodium sulfate (Na_2SO_4), calculated with reference to the dried drug.

Action To relax bowels and purge *heat*, and remove *fire* and cause subsidence of swelling.

Indications Constipation and abdominal pain caused by excessive *heat*; appendicitis.
External use: Mastitis; painful swollen hemorrhoids.

Usage and dosage 6-12 g, dissolved in decoction for oral administration; appropriate quantity for external use.

Precaution Contraindicated in pregnancy. Incompatible with Rhizoma Sparganii.

Storage Preserve in a well closed container, stored at a temperature below 30℃, protected from efflorescing.

Natrii Sulfas Exsiccatus
(玄明粉，Xuanmingfen)

Exsiccated Sodium Sulfate

Exsiccated Sodium Sulfate is obtained from Glauber's salt by efflorescencing, containing mainly sodium sulfate (Na_2SO_4).

Description A white powder; odour, slight; taste, salty; hygroscopic.

Identification The aqueous solution yields the characteristic reactions of sodium salts and sulfates (Appendix Ⅳ).

Iron and Zinc, Magnesium Carry out the tests described under Natrii Sulfas, using a half quantity, comply with the requirements.

Heavy metals Dissolve 1.0 g of the powder in 2 ml of dilute acetic acid TS, add a quantity of water to 25 ml. Carry out the limit test for heavy metals (Appendix Ⅸ E, method 1), not more than 20 ppm.

Arsenic Dissolve 0.10 g of the powder in 23 ml of water, and add 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix Ⅸ F), not more than 20 ppm.

Assay Weigh accurately about 0.3 g of the powder, previously dried at 105℃ to constant weight, carry out the assay described under Natrii Sulfas.
It contains not less than 99.0 per cent of sodium sulfate (Na_2SO_4), calculated with reference to the dried drug.

Action To relax the bowels and purge *heat*, and remove *fire* and cause the subsidence of swelling.

Indications Constipation and abdomal pain caused by excessive *heat*.
External use: Sore throat, ulcers on the mouth and tongue, swelling and pain of the gums, conjunctivitis, carbuncles, erysipelas.

Usage and dosage 3-9 g; for external use, appropriate quantity is dissolved in water for washing or ground into powder for insufflation into the mouth or throat.

Precaution Contraindicated in pregnancy.

Storage Preserve in a tightly closed container, protected from moisture.

Nidus Vespae
(蜂房，Fengfang)

Honeycomb

Honeycomb is the honeycomb of *Polistes olivaceous* (DeGeer), *Polistes japonicus* Saussure or *Parapolybia varia* Fabricius (Fam. Vespidae). The drug is collected in autumn or winter, dried in the sun, or steamed briefly, removed from dead wasps and pupae, and dried in the sun.

Description In disc-shaped or irregular flattened pieces, some nearly lotus receptacle-shaped, varying in size. Externally greyish-white or greyish-brown. Ventral side with numerous regular hexagonal openings of cells, the openings 3-4 mm or 6-8 mm in diameter; dorsal side with 1 or several black short stalks. Texture light and tenacious,

slightly elastic. Odour, slight; taste, pungent and weak. The honeycomb of fragile or hard in texture should not be used for medicine.

Processing Eliminate foreign matter, cut into pieces.

Action To dispel *wind*, counteract *toxicity*, kill microorganisms, and relieve itching.

Indications Toothache due to caries; sores, ulcers, mastitis, scrofula; ringworms, tinea unguium.

Usage and dosage 3-5 g; for external use, appropriate quantity is ground into powder and applied topically after mixed with oil or made into a decoction for gargling and washing.

Storage Preserve in a ventilated dry place, protected from pressure and moth.

Nodus Nelumbinis Rhizomatis (藕节, Oujie)

Lotus Rhizome Node

Lotus Rhizome Node is the dried node of *Nelumbo nucifera* Gaertn. (Fam. Nymphaeaceae). The drug is collected in autumn and winter, cut off, washed clean, dried in the sun, and removed from rootlet.

Description Shortly cylindrical, slightly swollen at middle, 2-4 cm long, 2 cm in diameter. Externally greyish-yellow to greyish-brown, with remains of rootlets and rootlets scars, and occasionally with remains of dark reddish-brown scale leaves. Both ends having residual lotus rhizomes, wrinkled and longitudinal-striated externally. Texture hard, fracture with numerous subrounded pores. Odour, slight; taste, slightly sweet and astringent.

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Processing *Nodus Nelumbinis Rhizomatis* Eliminate foreign matter, wash clean and dry.

Nodus Nelumbinis Rhizomatis (carbonized) Stir-bake the clean *Nodus Nelumbinis Rhizomatis* as described under the method for carbonizing by stir-baking (Appendix Ⅱ D) until the surface is charred and the inner part becomes yellowish-brown.

Action To arrest bleeding and remove blood stasis.

Indications Hematemesis, hemoptysis, hematuria, abnormal uterine bleeding.

Usage and dosage 9-15 g.

Storage Preserve in a dry place, protected from moisture and moth.

Nux Prinsepiae (蔾仁, Ruiren)

Hedge Prinsepia Nut

Hedge Prinsepia Nut is the dried ripe kernel of *Prinsepia uniflora* Batal. or *Prinsepia uniflora* Batal var. *serrata* Rehd. (Fam. Rosaceae). The drug is collected in summer to autumn when the fruit is ripe, removed from sarcocarp, washed clean, and dried in the sun.

Description Subovoid, slightly flattened, 7-10 mm long, 6-8 mm wide, 3-5 mm thick. Externally pale yellowish-brown or dark brown, reticulated furrows distinct, sometimes with remains of brown sarcocarp; apex acute, slightly asymmetric on both sides. Texture hard. Seed flattened-ovoid, testa thin, pale brown or reddish-brown, easily stripped; cotyledons 2, milky-white, oily. Odour, slight; taste, slightly bitter.

Processing Eliminate foreign matter, wash clean, dry in the sun. Break to pieces before use.

Action To nourish the liver and improve eyesight, and dispel *wind-heat*.

Indications Conjuntivitis and blepharitis marginalis with impaired vision and photophobia.

Usage and dosage 5-9 g.

Storage Preserve in a dry place.

Omphalia
(雷丸, Leiwan)

Thunder Ball

Thunder Ball is the dried sclerotium of *Omphalia lapidescens* Schroet. (Fam. Polyporaceae). The drug is collected in autumn, washed clean, and dried in the sun.

Description Subspheroid or irregular masses, 1-3 cm in diameter. Externally blackish-brown or greyish-brown, with somewhat prominent and fine reticulate striations. Texture hard, uneasily broken; fracture uneven, white or pale greyish-yellow, powdery or granular, often with yellowish-brown marble-like striations. Odour, slight; taste, slightly bitter, with a sensation of granule and slightly viscose on chewing but without residue.
If the fracture shows brown and horny, it can not be used medicinally.

Identification (1) Powder: Pale grey. Hyphae sticked together, forming irregular masses, varying in size, colourless, a few yellowish-brown or brownish-red. Scattered hyphae short, with branches, about 4 μm in diameter. Prisms of calcium oxalate fine, up to about 8 μm in diameter, some gathered in groups. Abundant needle crystals observed after adding sulfuric acid.
(2) To a small quantity of blackish-brown hyphae scraped from the outer part add 1 drop of sodium hydroxide TS, a cherry-red colour is produced, which turns to yellow on acidifying with hydrochloric acid.

Processing Wash clean, dry in the sun and break into pieces. Do not boil or bake at a high temperature.

Action To kill parasites and promote digestion.

Indications Taeniasis, ancylostomiasis, ascariasis; intestinal parasitosis with abdominal pain or with infantile malnutrition.

Usage and dosage 15-21 g of powdered Omphalia, taken with boiled water after meals, 2-3 times daily on 3 consecutive days.

Storage Preserve in a cool and dry place.

Ophicalcitum
(花蕊石, Huaruishi)

Ophicalcite

Ophicalcite is a serpentine marble of metamorphic group. The drug is collected, removed from foreign matter.

Description Aggregates of granular and dense masses, irregular pieces, with sharpless angularities, white or pale greyish-white, intermingled with spotty or striped serpentine, pale green or pale yellow, commonly known as "Caiyun" (colourful stains). Star-like flashing observed against the light. Texture heavy and hard, uneasily broken. Odour, slight; taste, weak.

Processing *Ophicalcitcum* Wash clean. dry, pound to pieces.

Ophicalcitum (calcined) Calcine the clean Ophicalcitum as described under the method of calcining openly (Appendix Ⅱ D) to red thoroughly.

Action To remove *stagnation of blood* and arrest bleeding.

Indications Hemoptysis, hematemesis, traumatic bleeding and pain.

Usage and dosage 4.5-9 g, ground into powder for oral administration; appropriate quantity for external use.

Storage Preserve in a dry place.

Oviductus Ranae
(哈蟆油, Hamayou)

Forest Frog's Oviduct

Forest Frog's Oviduct is the dried oviduct of female *Rana temporaria chensinensis* David (Fam. Ranidae). The drug is collected and dried.

Description In irregular lump, crooked and overlapped, 1.5-2 cm long, 1.5-5 mm thick; the surface yellowish-white, with fatty lustre, occasionally with greyish-white thin membranous dry skin, with satiny greasy feeling. The volume can expand when soaked in lukewarm water. Odour, stinking; taste, slightly sweet and slimy on chewing.

Swelling capacity Break the drug into pieces of about 3 mm in diameter, dry at 80℃ for 4 hours. Weigh 0.2 g, carry out the method for determination of expansibility (Appendix Ⅸ O), shake once an hour in the first 6 hours, allow it to stand for 18 hours, decant the water, read out the expanded volume of the sample, and calculate.
The swelling capacity of the drug is not less than 55.

Action To replenish *kidney-essence*, nourish *yin*, and moisten the lung.

Indications Listlessness, palpitation, insomnia and night sweating in debilitated patients or in convalescence; hemoptysis in phthisis.

Usage and dosage 5-15 g, taken after soaked with water and stewed, or after made into pills.

Storage Preserve in a ventilated dry place, protected from moisture and moth.

Oötheca Mantidis
(桑螵蛸, Sangpiaoxiao)

Mantis Egg-Case

Mantis Egg-Case is the dried egg capsule of *Tenodera sinensis* Saussure, *Statilia maculata* (Thunberg) or *Hierodula patellifera* (Serville) (Fam. Mantidae), commonly known as "Tuanpiaoxiao", "Changpiaoxiao", and "Heipiaoxiao", respectively. The drug is collected from late autumn to next spring, removed from foreign matter, killed eggs by steaming, and dried.

Description *Tuanpiaoxiao* Somewhat cylindric or semi-spheroidal, consisting of many layers of thin overlapping membranous slices, 2.5-4 cm long, 2-3 cm wide. Externally pale yellowish-brown, the upper side with inconspicuous ribbon-like ridge, the bottom side even or

grooved. Texture light, lax and tenacious. The outer part of the transverse cut surface spongy, the inner part with numerous radially arranged cells each with a minute ellipsoidal egg, eggs dark brown, lustrous. Odour, slightly stinking; taste, weak or slightly salty.

Changpiaoxiao Somewhat slat-shaped, narrow at one end, 2.5-5 cm long, 1-1.5 cm wide. Externally greyish-yellow, the upper side with conspicuous ribbon-like ridge, each side of the ridge with one dark brown shallow groove and oblique striations. Texture hard and fragile.

Heipiaoxiao Somewhat tetragonal, 2-4 cm long, 1.5-2 cm wide. Externally greyish-brown, the upper side with conspicuous ribbon-like ridge, each side of the ridge with oblique striations, the caudal end slightly curved upward. Texture hard and tenacious.

Processing Eliminate foreign matter, steam thoroughly, dry. Cut into pieces before use.

Action To tonify the kidney, arrest spontaneous emission, arrest polyuria, and cure turbid urine.

Indications Nocturnal emission, spermatorrhea, enuresis, frequent urination, turbid discharge with urine.

Usage and dosage 5-9 g.

Storage Preserve in a ventilated dry place, protected from moth.

Pericarpium Arecae (大腹皮, Dafupi)

Areca Peel

Areca Peel is the dried pericarp of *Areca catechu* L. (Fam. Palmae). The drug is collected from winter to the next spring when the fruit is unripe, dried after boiled, cut longitudinally into two valves. The pericarp is peeled and known as "Dafupi". The ripe fruit is collected from late spring to early autumn when the fruit is ripe, dried after boiling. The pericarp is peeled, tapped to loosen, dried in the sun and known as "Dafumao".

Description *Dafupi* Somewhat elliptical or long-ovate gourd-shaped, 4-7 cm long, 2-3.5 cm wide, 0.2-0.5 thick. Epicarp deep brown to blackish, with irregular longitudinal wrinkles and raised transverse lines on the surface; style scars at apex and a fruit stalk and remains of calyx at the base. Endocarp dented, brown or deep brown, smooth and hard shell-shaped. Texture light and hard, mesocarp fibres visible torn longitudinally. Odour, slight; taste, slightly astringent.

Dafumao Somewhat elliptical or gourd-shaped. Epicarp mostly lost or remained. Mesocarp fibres yellowish-white or pale brown. Texture lax and soft. Endocarp hard shell-shaped, yellowish-brown or brown, inner surface smooth, sometimes broken in longitudinal. Odour, slight; taste, weak.

Identification Powder: Yellowish-white or yellowish-brown. Mesocarp fibres in bundles, fine and long, 8-15 μl in diameter, slightly lignified, pits visible; surrounding cells of fibre bundles containing silica body, cluster-shaped, about 8 μm in diameter. Endocarp cells irregular polygonal, subrounded or elliptical, 48-88 μm in diameter, and pits visible.

Water Carry out the determination of water (Appendix Ⅸ H, method 1); not more than 12.0 per cent.

Processing *Dafupi* Eliminate foreign matter, wash clean, cut into sections, and dry.

Dafumao Eliminate the foreign matter, wash clean and dry.

Action To check upward perverted flow of *qi*, relieve abdominal distension, and induce urination.

Indications Stagnation of *qi* due to accumulation of *damp* marked by epigastric and abdominal distension, difficult bowel movements, edema of the legs and oliguria.

Usage and dosage 4.5-9 g.

Storage Preserve in a dry place.

Pericarpium Citri Reticulatae (陈皮, Chenpi)

Dried Tangerine Peel

Dried Tangerine Peel is the dried pericarp of the ripe fruit of *Citrus reticulata* Blanco or its cultivars (Fam. Rutaceae). The drug is subdivided into

two classes, known respectively as "Chenpi", and "Guang Chenpi". The pericarp is peeled off when the fruit is ripe and dried in the sun or at a low temperature.

Description *Chenpi* often peeled in several lobes connecting at the base, or in irregular slices, 1-4 mm thick. Outer surface orange-red to reddish-brown, with fine wrinkles and sunken oil cavity spots; inner surface pale yellowish-white, rough, bearing yellowish-white or yellowish-brown vein-like vascular bundles. Texture slightly hard and fragile. Odour, aromatic; taste, pungent and bitter.

Guang Chenpi often in three lobes connected at the base, regular in shape and even in thickness, about 1 mm thick. The sunken oil cavity spots relatively large, transparent when observed against light. Texture slightly soft.

Identification (1) Powder: Yellowish-white to yellowish-brown. Parenchymatous cells of mesocarp numerous, cells irregular, with unevenly thickened walls, sometimes beaded. Epidermal cells of pericarp polygonal, subsquare or rectangular in surface view, anticlinal walls thickened, stomata subrounded, 18-26 μm in diameter, subsidiary cells indistinct; covered with cuticle in lateral view and the outer radial wall thickened. Numerous prisms of calcium oxalate containing in parenchymatous cells of the mesocarp, polygonal, rhombic or biconical, 3-34 μm in diameter, 5-53 μm long; sometimes two parallel polygonal crystals or 3-5 prisms occurring in one cell. Crystals of hesperidin mostly present in parenchymatous cells, yellow or colourless, in spheroid or amorphous masses, some crystals with radial striations. Spiral, pitted and reticulated vessels and tracheids small.

(2) To 0.3 g of the powder add 10 ml of methanol, heat under reflux for 20 minutes, filter. Condense 5 ml of the filtrate, to about 1 ml as the test solution. Dissolve hesperidin CRS in methanol to produce a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing 0.5% solution of sodium hydroxide as the coating substance and a mixture of ethyl acetate-methanol-water (100∶17∶13) as the mobile phase. Apply separately 2 μl each of the two solutions to the plate. After developing about 3 cm and removal of the plate, dry in air, and then use toluene-ethyl acetate-formic acid-water (20∶10∶1∶1) as the mobile phase, after developing 8 cm and removal of the plate, dry in air. Spray with a solution of aluminum chloride TS. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with reference solution under ultraviolet light at 365 nm.

Water Carry out the method for the determination of water (Appendix Ⅳ H method 2), not more than 13.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol-acetic acid-water (35∶4∶61) as the mobile phase. As detector a spectrophotometer set at 283 nm. The number of theoretic plates of the column is not less than 2000, calculated with the reference to the peak of hesperidin.

Reference solution Dissolve a quantity of hesperidin, accurately weighed, in methanol to produce a solution containing 0.4 mg per ml and mix well.

Test solution Weigh accurately 1 g of the coarse powder in a Soxhlet's extractor, add 80 ml of petroleum ether (boiling range 60-90℃), heat under reflux on a water bath for 2-3 hour. Discard the petroleum ether extract and evaporate the residue to dryness, add 80 ml of methanol, further heat under reflux until the extract solution is colourless, cool and filter. Transfer the filtrate to a 100 ml of a volumetric flask, wash the container with a small quantity of methanol for several times, filter the washings to the same flask, dilute with methanol to volume, and mix well.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution, separately into the column, determine and calculate the content.

It contains not less than 3.5 per cent of hesperidin ($C_{28}H_{34}O_{15}$) with reference to the dried drug.

Processing Eliminate foreign matter, spray with water, soften thoroughly, cut into slivers, dry in the shade.

Action To regulate the flow of *qi*, invigorate the spleen function, eliminate *damp*, and resolve phlegm.

Indications Distension and fullness in the chest and epigastrium with anorexia, vomiting and diarrhea; cough with copious phlegm.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place, protected from mould and moth.

Note: The main varieties include *Citrus reticulata* "Chachi" (Guang Chenpi), *Citrus reticulata* "Dahongpao", *Citrus reticulata* "Unshiu" and *Citrus reticulata* "Tangerina".

Pericarpium Citri Reticulatae Viride (青皮, Qingpi)

Green Tangerine Peel

Green Tangerine Peel is the dried pericarp of the young or immature fruits of *Citrus reticulata* Blanco and its cultivars (Fam. Rutaceae). The fallen young fruit is collected in May and June, dried in the sun and known commonly as "Geqingpi". The immature friut is collected in July and August, cut longitudinally into four-valved but connected at the base, removed from the emergence completely and dried in the sun, and known commonly as "Sihuaqingpi".

Description *Sihuaqingpi* Pericarp cut into four prolateel-liptic lobes, long-elliptical, 4-6 cm long, 0.1-0.2 cm thick. The outer surface greyish-green or blackish-green, with numerous oil cavities; the inner surface almost white or yellowish-white, rough, with yellowish-white or yellowish-brown veins. Texture, slightly hard, easily broken, fracture showing 1-2 layers of oil cavities at the outer part. Odour, aromatic; taste, bitter and pungent.

Geqingpi Subspheroidal, 0.5-2 cm in diameter. Externally greyish-green or blackish-green, slightly rough, with numerous fine and sunken oil cavities. Remains of style, slightly projecting at the apex, and a rounded scar of fruit stalk at the base. Texture, hard, fractured pericarp yellowish-white or pale yellowish-brown, 1-2 mm thick, with 1-2 layers of oil cavities at the outer part. Pulp vescles 8-10, pale brown. Odour, delicately aromatic; taste, sour, bitter and pungent.

Identification (1) *Sihuaqingpi* Powder: Greyish-green or pale greyish-brown. Parenchyma of mesocarp numerous, irregular, walls slightly thickened, some beaded, Epidermal cells of pericarp polygonal or subsquare in surface view, anticlinal walls thickened, stomata oblong, 20-28 μm

in diameter, subsidiary cells 5-7; covered with cuticle in lateral view, the outer radial walls slightly thickened. Prisms of calcium oxalate occurring in parenchymatous cells adjacent to the epidermis, polygonal, rhombic, or square, 8-28 μm in diameter, 24-32 μm long. Crystals of hesperidin brownish-yellow, hemispherical, subrounded or in irregular masses. Spiral and reticulated vessels small.

Geqingpi Epidermal cells of pulp vesicle narrowly prolate, walls thin, some slightly sinuous, containing prisms of calcium oxalate, also containing crystals of hesperidin.

(2) To 0.3 g of the powder add 10 ml of methanol, heat under reflux for 20 minutes, filter. Take 5 ml of the filtrate concentrated to about 1 ml, as the test solution and a saturated solution of hesperidin CRS in methanol as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G prepared with 0.5% sodium hydroxide solution as the coating substance and a mixture of ethyl acetate-methanol-water (100∶17∶13) as the mobile phase. Apply separately to the plate 2 μl of each of the two solutions. After developing for about 3 cm and removal of the plate, dry in air, and then using the upper layer of methylbenzene-ethyl acetate-methanoic acid-water (20∶10∶1∶1) as the mobile phase, after developing for about 8 cm and removal of the plate, dry in air, spray with aluminium chloride TS. Examine under ultraviolet light at 365 nm after the methanol evaporated. The fluorescent spot in the chromatogram obtained with the test solution is observed, corresponding in position and colour to the spot in the chromatogram obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol-water (25∶75) as the mobile phase. As detector a spectrophotometer set at 284 nm. The number of theoretical plates of the column is not less than 1000, calculated with the reference to the peak of hesperidin.

Reference solution Weigh accurately a quantity of hesperidin CRS, add methanol to prepare a solution containing 0.1 mg per ml.

Test solution Weigh accurately 0.2 g of the powder in a 50 ml volumetric flask, add 30 ml of methanol, ultrasonicate for 30 minutes, allow to cool, add methanol to the volume, mix well, filter, collect 2 ml of the successive filtrate in a 5 ml volumetric flask, add methanol to the volume, mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution respectively into the column, determine and calculate the content.

It contains not less than 5.0 per cent of hesperidin ($C_{28}H_{34}O_{15}$).

Processing *Pericarpium Citri Reticulatae Viride* Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices or slivers, dry in the sun.

Pericarpium Citri Reticulatae Viride (processed with vinegar) Stir-bake the slices or slivers of Pericarpium Citri Reticulatae Viride, as described under the method for stir-baking with vinegar (Appendix Ⅱ D), to slightly yellow, using 15 kg of vinegar per 100 kg of Pericarpium Citri Reticulatae Viride.

Action To soothe the liver, disintegrate stagnated *qi*, and remove retained food.

Indications Distending pain in the chest and costal regions; hernia; mass formation in the breast, mastitis; abdominal pain due to retention of undigested food.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place.

Pericarpium Granati (石榴皮, Shiliupi)

Pomegranate Rind

Pomegranate Rind is the dried pericarp of *Punica granatum* L. (Fam. Punicaceae). The drug is collected in autumn when the fruit is ripe, and dried in the sun.

Description Irregularly slices or gourd-shaped, varying in size, 1.5-3 mm thick. The outer surface reddish-brown, brownish-yellow or dark brown, somewhat lustrous, rough, with numerous warty protuberances. Some with raised tubular persistent calyx and a stout and short fruit stalk or its scar. The inner surface yellow or reddish-brown, with raised reticulated remains of fruit stalk. Texture hard and fragile, fracture yellow, somewhat granular. Odour, slight; taste, bitter and astringent.

Identification (1) Transverse section: Exocarp cells 1 row, arranged relatively compact, covered with cuticle. Mesocarp slightly thick, parenchymatous cells containing starch granules and clusters or prisms of calcium oxalate; stone cells single, subrounded, rectangular or irregular, and rarely branched, walled thick. Endocarp cells relatively small, containing starch granules and crystals of calcium oxalate, and stone cells relatively small.

Powder: Reddish-brown. Stone cells subrounded, rectangular or irregular, rarely branched, 27-102 μm in diameter, thick-walled with fine and close pit canals and a large lumen, some containing brown contents. Epidermal cells subsquare or subrectangular, with slightly thickened walls. Clusters of calcium oxalate 10-25 μm in diameter, prisms infrequent. Spiral and reticulate vessels 12-18 μm in diameter. Starch granules subrounded, 2-10 μm in diameter.

(2) Heat 1 g of the powder in 10 ml of water on a water bath at 60℃ for 10 minutes and filter while hot. To 1 ml of the filtrate, add 1 drop of 1% solution of ferric chloride in ethanol; a dark green colour is produced immediately.

Foreign matter Not more than 6% (Appendix Ⅸ A).

Assay Weigh accurately about 0.4 g of the powder (through No. 3 sieve), carry out the method for determination of Tanninoids (Appendix Ⅹ B).

It contains not less than 10.0 per cent of tanninoids, calculated with reference to the dried drug.

Processing *Pericarpium Granati* Eliminate foreign matter, wash clean, cut into pieces, and dry.

Pericarpium Granati (carbonized) Stir-bake the pieces of Pericarpium Granati as described under the method for carbonizing by stir-baking (Appendix Ⅱ D) until the outer surface is charred and the inner surface turns brown.

Action To check diarrhea, bleeding and expel intestinal parasites.

Indications Protracted diarrhea, chronic dysentery; hematochezia, prolapse of the rectum; abnormal uterine bleeding, leukorrhalgia; intestinal parasitosis with abdominal pain.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place.

Pericarpium Papaveris (罂粟壳, Yingsuqiao)

Poppy Capsule

Poppy Capsule is the dried pericarp of ripe fruit of *Papaver somniferum* L. (Fam. Papaveraceae). The drug is collected in autumn when the fruit is ripe and juiceremoved, broken, removed from seeds, branches, and dried.

Description Ellipsoidal or bottle-like ovoid, mostly broken to pieces, 1.5-5 cm in diameter, 3-7 cm long. Outer surface yellowish-white, pale brown to pale purple, smooth, somewhat lustrous, with longitudinal or transverse cutting scars. At the apex bearing 6-14 remains of stigmate, arranged radially, dish-shaped, and a short stalk at the base. Inner surface pale yellow, somewhat lustrous, with longitudinally arranged brownish-yellow false septa, bearing numerous slightly prominent and brown dots. Texture light and fragile. Odour, slightly aromatic; taste, slightly bitter.

Identification (1) Powder: Yellowish-white. The outer epidermal cells of pericarp subpolygonal or subsquare in surface view, 20-50 μm in diameter, walls thickened, some lumina containing pale yellow contents. The inner epidermal cells of pericarp elongated polygonal, rectangular or linear in surface view, 20-65 μm in diameter, 25-230 μm long, anticlinal walls thickened, pits and pit canals distinct, sometimes striations visible. Parenchymatous cells of pericarp subrounded or oblong, walls slightly thickened. Vessels mostly reticulated or spiral, 10-70 μm in diameter. Phloem fibres elongated fusiform, 20-30 μm in diameter, walls slightly thickened, oblique pits distinct, some pits crossed, V-shaped or crisscross-shaped. Laticiferous tubes linear, walls thickened, containing pale yellow contents.
(2) To 1 g of the powder add 10 ml of ethanol, macerate by warming for 30 minutes, filter. Transfer 0.5 ml of the filtrate to a 25 ml volumetric flask, dilute to volume with ethanol. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), the light absorption exhibits a maximum at 283 nm.
(3) To 2 g of the powder add 20 ml of methanol, heat under reflux for 30 minutes, filter while hot, evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve morphine CRS, codeine phosphate CRS and papaverine hydrochloride CRS in methanol to produce a mixed solution containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 2% sodium hydroxide solution as the coating substance and a mixture of toluene-acetone-ethanol-strong ammonia TS (20:20:3:1) as the mobile phase. Apply separately to the plate 2-4 μl each of the two solutions. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution. Then spray with dilute potassium iodobismuthate TS and ethanolic sodium nitrite TS successively. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Foreign matter Not more than 2 per cent (Appendix Ⅸ A).

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Acid-insoluble ash Not more than 1.5 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), not less than 13.0 per cent, using a 20% of ethanol as the solvent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, 0.01 mol/L dipotassium hydrogen phosphate and 0.05 mol/L heptane sodium sulfonate (20:40:40) as the mobile phase. As detector a spectrophotometer set at 220 nm. The number of theoretical plates of the column is not less than 1000, calculated with the reference to the peak of morphine.

Reference solution Weigh accurately a quantity of morphine CRS, previously dried to constant weight at 105℃, in a brown volumetric flask, add 20% methanol of 5% acetic acid to prepare a reference solution containing 24 μg of morphine per ml.

Test solution Weigh accurately 0.5 g of powder (pass through No. 3 sieve) in a 50 ml volumetric flask, add accurately 20 ml of 20% methanol of 5% acetic acid, stopper tightly, weigh, ultrasonicate for 30 minutes, take out and allow to cool, weigh again and replenish the loss of the solvent with 20% methanol of 5% acetic acid, mix well and stand, filter through millipore membrane (0.45 μm), collect the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution respectively into the column, determine and calculate the content.
It contains 0.06-0.40 per cent of morphine calculated with reference to the dried drug.

Processing *Pericarpium Papaveris* Eliminate foreign matter, break to pieces, wash clean, soft thoroughly, and cut into slivers.

Pericarpium Papaveris (*stir-baked with vinegar*) Stir-bake the clean slivers of Pericarpium papaveris as described under the method for stir-baking with vinegar (Appendix Ⅱ D) to dryness.

Pericarpium Papaveris (*stir-baked with honey*) Stir-bake the clean slivers of Pericarpium Papaveris as described under the method for stir-baking with honey (Appendix Ⅱ D) to unsticky after cooling.

Action To relieve cough, arrest diarrhea, and alleviate pain.

Indications Chronic cough; chronic diarrhea with prolapse of the rectum; epigastric and abdominal pain.

Usage and dosage 3-6 g.

Precaution Long-term administration is prohibited for addiction. Contraindicated for children.

Storage Preserve in a dry place, protected from moth.

Pericarpium Trichosanthis (瓜蒌皮, Gualoupi)

Snakegourd Peel

Snakegourd Peel is the dried pericarp of ripe fruit of

Trichosanthes kirilowii Maxim. or *Trichosanthes rosthornii* Harms (Fam. Cucurbitaceae). The drug is collected in autumn when the fruit is ripe, cut, removed from sarcocarp and seed, and dried in the shade.

Description Two to several valves with involute edge, 6-12 cm long. The outer surface orange-red or orange-yellow, shrunken, sometimes with remains of fruit stalk; the inner surface yellowish-white. Texture relatively fragile, easily broken. Odour, caramel like; taste, weak, slightly sour.

Identification Dry the drug at 60℃, pulverize. To about 2 g of the coarse powder add 20 ml of ethanol, ultrasonicate for 15 minutes, filter, evaporate the filtrate to dryness, add 2 ml of methanol to dissolve the residue, and use as the test solution. Prepare a solution of 2 g of Pericarpium Trichosanthis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃)-ethyl acetate (4∶1) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with a 5% solution of vanillin in sulfuric acid and heat with hot wind to the spots distinct. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Processing Wash clean, dry for a moment, cut into slivers, and dry in the sun.

Action To remove *heat* and resolve *phlegm*, and promote the flow of *qi* in the chest.

Indications Cough with yellowish sticky expectoration, oppressed feeling in the chest and costal pain.

Usage and dosage 6-9 g.

Precaution Incompatible with Radix Aconiti and homologous drugs.

Storage Preserve in a cool and dry place, protected from mould and moth.

Pericarpium Zanthoxyli (花椒, Huajiao)

Pricklyash Peel

Pricklyash Peel is the dried pericarp of ripe fruit of *Zanthoxylum schinifolium* Sieb. et Zucc. or *Zanthoxylum bungeanum* Maxim. (Fam. Rutaceae). The drug is collected in autumn when ripe, dried in the sun, removed from seed and foreign matter.

Description *Pericarp of Zanthoxylum Schinifolium* Mostly 2-3 small follicles, apocarpous at the upper part, grouped on a fruit stalk; follicles spherical, spliting along the ventral suture, 3-4 mm in diameter. Outer surface greyish-green or dark green, scattered with numerous oil dots and fine reticulated and raised wrinkles; inner surface almost white, smooth. Endocarp commonly separated from exocarp at the base. Remains of seed ovoid, 3-4 mm long, 2-3 mm in diameter, externally black, lustrous. Odour, aromatic; taste, slightly sweet and pungent.

Pericarp of Zanthoxylum Bungeanum Most follicles singly, 4-5 mm in diameter, outer surface purplish-red or brownish-red, scattered with numerous warty oil dots, 0.5-1 mm in diameter, translucent when observed against light; inner surface yellowish. odour, strongly aromatic; taste, lastingly pungent and numb.

Identification To 2 g of the coarse powder add 10 ml of ether, shake well, macerate over night, filter, evaporate the filtrate to about 1 ml as the test solution. Prepare a solution of 2 g of Pericarpium Zanthoxyli reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane-ethyl acetate (4∶1) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the red fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Assay Carry out the method for determination of volatile oil (Appendix Ⅹ D), not less than 1.5 per cent of volatile oil (ml/g).

Processing *Pericarpium Zanthoxyli* Remove seeds, fruit stalks and other foreign matter.

Pericarpium Zanthoxyli (*stir-baked*) Stir-bake the clean Pericarpium Zanthoxyli as described under the method for simple stir-baking (Appendix Ⅱ D) to scented.

Action To warm the spleen and the stomach and relieve pain, kill parasites, and relieve itching.

Indications Epigastric pain with cold sensation, vomiting and diarrhea; abdominal pain due to intestinal parasitosis; ascariasis. External use for itching in eczema.

Usage and dosage 3-6 g; for external use, appropriate quantity is decocted for washing.

Storage Preserve in a ventilated and dry place.

Periostracum Cicadae (蝉蜕, Chantui)

Cicada Slough

Cicada Slough is the slough of the nymph of *Cryptotympana pustulata* Fabricius (Fam. Cicadidae) during emergence. The drug is collected in summer or autumn, removed from mud and sand, dried in the sun.

Description Slightly ellipsoidal and curved, about 3.5 cm long, 2 cm wide. Externally yellowish-brown, translucent, lustrous. The head with a pair of filiform antennae, usually dropped, compound eyes projected. The anterior end of the frons projected, mouth and snout developed, labrum short and wide, labium extended into a tube. The dorsal surface of the thorax crisscross split, margins curved inward. Each side of the dorsum bearing two small wings. The ventral surface bearing three pairs of legs, covered with yellowish-brown minute hairs. The abdomen obtuse rounded, 9 segments. Texture light, hollowed, fragile. Odour, slight; taste, slight.

Processing Eliminate foreign matter, wash clean and dry in the sun.

Action To dispel *wind-heat*, ease sore throat, promote eruptions, remove nebula, and arrest spasm.

Indications Common cold due to *wind-heat* sore throat, hoarseness; measles with inadequate eruptions; urticaria

with itching; inflammation of the eyes with nebula; convulsion, tetanus.

Usage and dosage 3-6 g.

Storage Preserve in a dry place, protected from pressure.

Periostracum Serpentis (蛇蜕, Shetui)

Snake Slough

Snake Slough is the dried epidermal membrane of *Elaphe taeniura* Cope, *Elaphe carinata* (Guenther) or *Zaocys dhumnades* (Cantor) (Fam. Colubridae). The drug is collected from the end of spring to early summer or the beginning of winter, removed from soil and sand, dried.

Description Cylindrical, usually flattened and shrunken, snake-shaped while intact, over 1 m in length. Dorsal surface silvery-grey or light greyish-brown, lustrous, scale marks rhombic or elliptic, joins between the scale marks white, somewhat wrinkled or concave. Ventral surface milky-white or slightly yellow, scale marks rectangular, imbricate. Light, texture slightly flexible, lubricant and elastic on touching, with a rustling sound when gently rubbed with hand. Odour, slightly stinking; taste, weak or slightly salty.

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Processing *Periostracum Serpentis* Eliminate foreign matter, cut into sections.

Periostracum Serpentis (*processed with wine*) Stir-bake the sections of Periostracum Serpentis, as described under the method for stir-baking with wine (Appendix Ⅱ D) to dry, using 15 kg of yellow rice wine per 100 kg of Periostracum Serpentis.

Action To arrest convulsion, counteract *toxicity*, and remove nebula.

Indications Infantile convulsion; nebula; inflammation of the throat, boils; cutaneous itching.

Usage and dosage 2-3 g; or 0.3-0.6 g, ground into powder for oral administration.

Storage Preserve in a dry place, protected from moth.

Petiolus Trachycarpi (棕榈, Zonglu)

Fortune Windmillpalm Petiole

Fortune Windmillpalm Petiole is the dried petiole of *Trachycarpus fortunei* (Hook. f.) H. Wendl. (Fam. Palmae). The drug is collected from the old decurrent petiole and sheath, removed from palm fibre, and dried in the sun.

Description Long plate-shaped, one end narrow and thick, another one broad and thin, varying in size. Externally reddish-brown, rough, with longitudinal wrinkles; prominent fibres distinct on one surface, both sides of fibres bearing numerous brown hairs. Texture hard and pliable, uneasily broken, fracture fibrous. Odour, slight; taste, weak.

Identification To 1 g of the powder add 20 ml of water, heat for 5 minutes, filter, dilute the filtrate to 20 ml with water. To 1 ml of the filtrate add 2-3 drops of ferric chloride TS, a dirty green flocculent precipitate is produced. To another 1 ml of the filtrate add 3 drops of sodium chloride in gelatin TS, a white turbidity is produced.

Processing *Petiolus Trachycarpi* Eliminate foreign matter, wash clean, and dry.

Petiolus Trachycarpi (*carbonized*) Carbonize the clean Petiolus Trachycarpi as described under the method for carbonizing by calcining (Appendix Ⅱ D).

Action To arrest bleeding.

Indications Spitting of blood, epistaxis, hematuria, hematochezia, abnormal uterine bleeding.

Usage and dosage 3-9 g, commonly used after processed.

Storage Preserve in a dry place.

Pheretima (地龙, Dilong)

Earthworm

Earthworm is the dried body of *Pheretima aspergillum* (E. Perrier), *Pheretima vulgaris* Chen, *Pheretima guillelmi* (Michaelsen) or *Pheretima pectinifera* Michaelsen (Fam. Megascolecidae). The former is known as "Guang Dilong", the latter three are known as "Hu Dilong". Guang Dilong is collected from spring to autumn, Hu Dilong is collected in summer, the abdomen is cut open immediately after captured, removed from the viscera and soil, washed clean, dried in the sun or at a low temperature.

Description *Guang Dilong* In slat-shaped thin slices, curved, margin somewhat rolled, 15-20 cm long, 1-2 cm wide, with segments throughout the body. The outer surface brown to purplish-grey on the dorsal part, pale yellowish-brown on the abdomen part; the clitellum at the 14-16th segments, relatively bright, commonly known as "Baijing" (white neck). Tapered at the anterior part, blunt and rounded at the caudal end. The setae coarse and stiff, slightly light in colour. Male opening on a small protuberance of setae ring at the ventral side of segment 18, outer margin with several rings of shallow skin fold, inner setae ring raised, 1 or 2 ranks of small papillae on both sides of the anterior part, each side 10-20, varying in number. Two pairs of seminal receptacle openings located on an elliptical protuberance between segment 7/8-8/9, occupying about 5/11 girth of the segment. Texture light and leathery, uneasily broken. Odour, stinking; taste, slightly salty.

Hu Dilong 8-15 cm long, 0.5-1.5 cm wide, the whole body consisting of segments, dorsal part brown to yellowish-brown, ventral part light yellowish-brown; 3 pairs of seminal receptacle openings located between 6/7-8/9 segment. The clitellum at segments 14-16, bright. A pair of male openings on segment 18. The male copulatory cavity of *Pheretima vulgaris* can turn out completely, in the shape of cauliflower or penis; that of *Pheretima guillelmi* longitudinal opened slit-like; 1 or many papillae the male openings of *Pheretima pectinifera* with 1 or more papillae at the inner side.

Identification (1) Powder: Pale grey or greyish-yellow. Obliquely striated muscle fibres colourless or pale brown, muscle fibres scattered or twisted each other into flaky, mostly curved slightly, 4-26 μm in diameter, margin usually uneven. Epidermal cells brownish-yellow, cell boundary indistinct, containing dark brown pigment granules. Setae rarely visible, usually broken and scattered, pale brown or yellowish-brown, 24-32 μm in diameter, tip mostly blunt, some with longitudinal slits.
(2) To 1 g of the powder add 10 ml of water, heat to boil, cool, centrifuge and use the supernatant as the test solution. Dissolve lysine CRS, leucine CRS and valine CRS in water separately to produce three solutions each containing 1 mg, 1 mg and 0.5 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-butanol, glacial acetic acid and water (4∶1∶1) as the mobile phase. Apply 3 μl of the above four solutions to the plate. After developing and removal of the plate, dry in air. Spray with ninhydrin TS and heat at 105℃ to spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.
(3) To 1 g of the power add 20 ml of chloroform, ultrasonicate for 20 minutes, filter, and evaporate the filtrate to dryness on a water bath. Dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 1 g of Pheretima reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene and water (9∶1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Foreign matter Not more than 6 per cent (Appendix Ⅸ A).

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 12.0 per cent.

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 5.0 per cent (Appendix Ⅸ K).

Heavy metals Carry out the limit test for heavy metals (Appendix Ⅸ E, method 2), using 1g, not more than 30 ppm.

Extractives Carry out the method for determination of water-soluble extractives (Appendix Ⅹ A, the hot extraction method), not less than 16.0 per cent.

Processing Eliminate foreign matter, wash clean, cut into sections and dry.

Action To clear *heat*, arrest convulsion, remove obstruction from the collaterals, relieve asthma, and cause urination.

Indications High fever with impaired consciousness, convulsion; arthralgia, numbness of limbs, hemiplegia; cough and asthma due to *heat* in the lung; edema and oliguria; hypertension.

Usage and dosage 4.5-9 g.

Storage Preserve in a ventilated dry place, protected from mould and moth.

Placenta Hominis (紫河车, Ziheche)

Human Placenta

Human Placenta is the dried placenta of a healthy woman. The fresh placenta is removed from amnion and umbilical cord, washed repeatedly until free from blood, steamed or boiled in water for a moment, and dried.

Description Rounded or dish-shaped ellipsoidal, 9-15 cm in diameter, varying in thickness, yellow or yellowish-brown; one side uneven, with irregular stripes; the other side relatively smooth, often with remnant of the umbilical cord; fine blood vessels scattered around. Texture hard and fragile. Odour, stinking.

Processing Eliminate dust and scraps, break to pieces or grind to fine powder.

Action To warm the kidney, replenish vital essence, *qi* and blood.

Indications Emaciation, tidal fever, night sweating, cough, dyspuea and anorexia in consumptive diseases; impotence, seminal emission; infertility; lack of lactation.

Usage and dosage 2-3 g, ground into powder for oral administration.

Storage Preserve in a dry place, protected from moth.

Plumula Nelumbinis (莲子心, Lianzixin)

Lotus Plumule

Lotus Plumule is the dried young cotyledon and radicle of the ripe seed of *Nelumbo nucifera* Gaertn. (Fam. Nymphaeaceae). The drug is taken out of the seed and dried in the sun.

Description Fine-cylindrical, 1-1.4 cm long, about 0.2 cm in diameter. The young cotyledons green, one long and the other one short, curved to arrow-shaped, apex folded downwards, a fine plumule visible between the two cotyledons. Radicle cylindrical, about 3 mm long, yellowish-white. Texture fragile, easily broken, fracture showing several small pits. Odour, slight; taste, bitter.

Identification (1) Powder: Greyish-green. Epidermal cells subrectangular, radially prolonged, thin-walled. Mesophyll cells subrounded, thin-walled, containing numerous starch granules and green pigments. Radicle cells rectangular, arranged tidily, walls extremely thin, and some cells containing fatty oil droplets. The tissue of young buds showing relatively large cell spaces.
(2) To 2 g of the powder add 30 ml of methanol, ultrasonicated for 30 minutes, filter, evaporate the filtrate to dryness, add 1 ml of methanol to dissolve the residue as the test solution. Dissolve liensinine perchlorate CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the methanol for thin layer chromatography (Appendix Ⅵ B), using a silica gel G and a mixture of chloroform, ethyl acetate and diethylamine (5∶4∶1) as the mobile phase. Apply separately to plate 4 μl of each of the two solutions. After developing and removal of

the plate, dry in air, spray with dilute potassium iodobismuthate TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H, method 1), not more than 12.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, 0.015 mol/L of dodecyl sodium sulfonate (dissolve 0.41 g of dodecyl sodium sulfonate in 100 ml water) and glacial acetic acid (56∶43∶1) as the mobile phase. As detector a spectrophotometer set at 282 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of limensinine.

Reference solution Weigh accurately a quantity of liensinine perchlorate CRS, add methanol to prepare a solution containing 25 μg per ml. (weight of liensinine=weight of liensinine perchlorate/1.3587).

Test solution Weigh accurately about 0.5 g of the powder (pass through No. 4 sieve) in a flask, add accurately 25 ml of 2% hydrochloric acid of methanol, weigh, heat under reflux for 30 minutes, allow to cool, weigh again and replenish the loss of the solvent with 2% hydrochloric acid of methanol, filter, collect accurately the successive filtrate 5 ml in a 10 ml volumetric flask, add mobile phase to volume, mix well as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and test solution respectively into the column, determine and calculate the content.
It contains not less than 0.20 per cent of liensinine ($C_{37}H_{42}N_2O_6$), calculated with reference to the dried drug.

Action To remove *heat* from the heart and anchor the mind, restore the coordination between the heart and the kidney, check seminal emission, and arrest bleeding.

Indications Impaired consciousness and delirium due to invasion of the pericardium by heat; insomnia and seminal emission due to breakdown of the coordination between the heart and the kidney; hemoptysis due to *heat* in blood.

Usage and dosage 2-5 g.

Storage Preserve in a ventilated dry place, protected from mould and moth.

Pollen Pini (松花粉, Songhuafen)

Pine Pollen

Pine Pollen is the dried pollen of *Pinus massoniana* Lamb., *Pinus tabulaeformis* Carr. or several other plants of the same genus (Fam. Pinaceae). The drug is collected at early stage of flowering in spring, dried in the sun, and removed from foreign matter.

Description Fine powder yellowish. Texture light, easily flying up, with lubricant feeling when twisted. Odour, slight; taste, weak.

Identification Powder: Pollen grains elliptical, 45-55 μm long, 29-40 μm in diameter, surface smooth, bearing an inflated air sac on both sides, the walls of air sacs with distinct reticulate striations, the meshes polygonal.

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Action To remove dampness and stop bleeding.

Indications Eczema, impetigo, erosion of the skin with exudation, traumatic bleeding, diaper dermatitis.

Usage and dosage Appropriate quantity is spread over the lesion.

Storage Preserve in a dry place, protected from moisture.

Pollen Typhae (蒲黄, Puhuang)

Cattail Pollen

Cattail Pollen is the dried pollen of *Typha angustifolia* L., *Typha orientalis* Presl or other plants of the same genus (Fam. Typhaceae). Yellow male inflorescence is gathered in summer, dried in the sun and ground. The drug is collected by sifting.

Description Yellow powder. Texture light, capable of floating on water, with satiny feeling when twisted and easily adsorbed on fingers. Odour, slight; taste, weak.

Identification (1) Powder: Yellow. Pollen grains subrounded or elliptical, 17-29μm in diameter, exine with reticulate sculptures, with convex wavy or gear shape contour line, single pore indistinct.
(2) To 2 g of the powder add 30 ml of 80% ethanol, heat under reflux for 1 hour, filter and evaporate the filtrate to dryness. Dissolve the residue in 10 ml of ethyl acetate by heating, filter, concentrate the filtrate to about 2 ml as the test solution. Dissolve isorhamnetin CRS in ethyl acetate to produce a solution of 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of toluene, ethyl acetate and formic acid (5∶2∶1) as the mobile phase. Apply separately to the plate 10-15 μl of the test solution and 5 μl of the reference solution. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.
(3) To 2 g of the powder add 50 ml of 80% ethanol, macerate for 24 hours, filter and evaporate the filtrate to dryness. Dissolve the residue in 5 ml of water, filter. Extract the filtrate with two 5-ml quantity of butanol saturated with water. Combine the extracts and evaporate to dryness. Dissolve the residue in 2 ml of ethanol as the test solution. Dissolve isorhamnetin-3-*O*-neohesperidoside CRS and typhaneoside CRS in ethanol to produce solutions containing 1 mg of each per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5∶3∶1∶1) as the mobile phase. Apply separately to the plate 5-10 μl of the test solution and 5 μl of each of the reference solutions. After developing and removal of the plate, dry in air, and examine under ultra-

violet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference solution.

Foreign matter Not more than 10 per cent (Appendix Ⅸ A).

Water Not more than 13.0 per cent (Appendix Ⅸ H, method 1).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using ethanol as the solvent, not less than 15.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (15∶85) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of isorhamnetin-3-o-neohesperidoside.

Reference solution Dissolve a quantity of isorhamnetin-3-o-neohesperidoside CRS, accurately weighed, in methanol to produce a solution of 50 μg per ml.

Test solution To 0.5 g of the drug, accurately weighed, in a 50 ml volumetric flask, add 45 ml of methanol, ultrasonicate (power 250 W, frequency 20 kHz) for 30 minutes, cool, add methanol to volume, shake thoroughly. Filter and use the successive filtrate as the test solution.

Procedure Inject respectively 10 μl of the reference solution and 20 μl of the test solution, accurately measured, into the column, determine and calculate the content.
It contains not less than 0.10 per cent of isorhamnetin-3-o-neohesperidoside ($C_{28}H_{32}O_{16}$), calculated with reference to the dried drug.

Processing *Pollen Typhae (unprocessed)* Pulverize and sift.

Pollen Typhae (carbonized) Stir-bake the clean Pollen Typhae as described under the method for carbonizing by stir-baking (Appendix Ⅱ D) until it becomes brown in colour.

Action To arrest bleeding, remove blood stasis, and relieve stranguria.

Indications Hematemesis, epistaxis, hemoptysis, abnormal uterine bleeding, traumatic bleeding; amenorrhea, dysmenorrhea, pricking pain in the epigastrium, traumatic swelling and pain; blood stranguria with pain.

Usage and dosage 5-9 g, decocted with wrapping; for external use, appropriate quantity is applied topically.

Precaution Used with caution in pregnancy.

Storage Preserve in a ventilated and dry place, protected from moisture and moth.

Polyporus
(猪苓, Zhuling)

Chuling

Chuling is the dried sclerotium of *Polyporus umbellatus* (Pers.) Fires (Fam. Polyporaceae). The drug is collected in spring and autumn, removed from soil, and dried.

Description Strip-shaped, subrounded or compressed-lumped, sometimes branched, 5-25 cm long, 2-6 cm in diameter. Externally black, greyish-black or brownish-black, crumpled or warty. Light. Texture, hard, fracture whitish or yellowish-white, somewhat granular. Odour, slight; taste, weak.

Identification (1) Section: All consisting of densely interweaved hyphae. The outer layer 27-54 μm thick, hyphae brown, uneasily separated; the inner hyphae colourless, sinuous, 2-10 μm in diameter, sometimes septa visible, with branches or tubercular swellings. Numerous prisms of calcium oxalate among the hyphae, mostly in octahedron cubes, regular double-conical octahedrons or irregular polyhedrons, 3-60 μm in diameter, up to 68 μm long, sometimes with several crystals aggregated.
(2) Boil 1 g of the powder with 10 ml of dilute hydrochloric acid on a water bath for 15 minutes, and stir; a viscose is produced. To a small quantity of powder, add a quantity of sodium hydroxide solution (1∶5) and stir; a suspension is produced.

Total ash Not more than 12.0 per cent (Appendix Ⅸ K).

Processing Eliminate foreign matter, soak in water, wash clean, soften thoroughly, cut into thick slices, and dry.

Action To induce urination and remove *damp*.

Indications Oliguria, edema, diarrhea, dysuria, leukorrhalgia.

Usage and dosage 6-12 g.

Storage Preserve in a ventilated and dry place.

Poria
(茯苓, Fuling)

Indian Bread

Indian Bread is the dried sclerotium of the fungus, *Poria cocos* (Schw.) Wolf (Fam. Polyporaceae). The drug is collected mostly in July to September, removed from soil, piled up, spread, and air-dried on the surface. Repeat this operation for several times until wrinkles appears and the inside water evaporated, then dried in the shade. It is known as "Fulingge". Or the fresh sclerotium is cut and dried in the air. According to the cut portions, and known as "Fulingpi" and "Fulingkuai", respectively.

Description *Fulingge* Subglobose, ellipsoid, oblate or irregular-shaped, variable in size. The outer skin thin and rough, brown to blackish-brown, conspicuously shrivelled and striated. Texture hard and compact, fracture granular, some cracked, the outer layer pale brown, inner part white, rarely reddish, some showing the penetrating roots of pine in the centre. Odour, slight; taste, weak and sticky when chewed.

Fulingpi (pared skin of Poria) Variable in form and size. Externally brown to blackish-brown, internally white or pale brown. Relatively loose and soft, slightly elastic.

Fulingkuai (peeled and sliced Poria) Occurring in pieces or slices, variable in size. White, pale red or pale brown.

Identification (1) Powder: Greyish-white. Irregularly granular masses and branched masses colourless, dissolved gradually on mounting in chloral hydrate solution. Hyphae colourless or pale brown, slender, slightly curved,

branched, 3-8 μm (rarely up to 16 μm) in diameter.
(2) Heat under reflux 1 g of the powder in 10 ml of acetone for 10 minutes, filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of glacial acetic acid, add 1 drop of sulfuric acid; a pale red colour is produced, which turns to pale brown colour.
(3) To a few slices or small quantity of powder add 1 drop of iodine potassium iodide TS, a deep red colour is produced.

Water Carry out the determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent.

Total ash Not more than 4.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Processing Soak Poria in water, wash clean and steam briefly after softened. Cut into the skin, pieces, and thick slices separately in time, and then dry.

Action To cause urination, invigorate the spleen function, and calm the mind.

Indications Edema with oliguria; dizziness and palpitation caused by retained phlegm and morbid fluid; diminished function of the spleen marked by anorexia, loose stools or diarrhea; restlessness and insomnia.

Usage and dosage 9-15 g.

Storage Preserve in a dry place, protected from moisture.

Propolis
(蜂胶, Fengjiao)

Propolis

Propolis is the gum secreted by *Apis mellifera* L. (Fam. Apidae). The drug is collected from the bees-box in summer, removed from foreign matter.

Description Irregularly granular or fragment, mostly brownish-yellow, dark brown or greyish-brown, lustrous. Texture lax below 20℃, and gradually softening above 30℃ in the temperature Odour, aromatic; taste, bitter and pungent.

Identification To 0.5 g of powder, add 20 ml of methanol, ultrasonicate for 20 minutes, and filter, use the filtrate as the test solution. Dissolve chrysin CRS and galangin CRS in methanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of chloroform, methanol and butanone (9.4∶0.3∶0.3) as the mobile phase. Apply separately 5 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a aluminium chloride TS. Examine under ultraviolet light at 365nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Loss on Drying The powder is dried in a vacuum desiccator to constant weight, loses not more than 2.0 per cent (Appendix Ⅸ G).

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 6.0 per cent (Appendix Ⅸ K).

Oxidation time Weigh accurately 1.0 g of the powder, in a stopper conical flask, add accurately 25 ml of ethanol, stopper tightly, shake for 60 minutes, and add accurately 100 ml of water, mix well, filter. Measure accurately 0.5 ml of the successive filtrate to a 50 ml of volumetric flask, dilute with water to volume, and mix well. Measure accurately 10.0 ml of the dilute solution to a stopper conical flask, add accurately 2 ml of 20% solution of sulfuric acid, shake for 1 minute, add accurately 0.05 ml of potassium permanganate VS (0.02 mol/L), and record the time with a chronometer at the same time. When the purpure of the liquid faded away, stop the clock. The recorded time is the oxidation time. It is not more than 22 seconds.

Extractives Carry out the cold maceration method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using ethanol as the solvent, not less than 50.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of methanol and 0.15% solution of phosphoric acid (64∶36) as the mobile phase. As detector a spectrophotometer set at 268 nm. The number of theoretical plates of the column is not less than 6000, calculated with the reference to the peak of chrysin CRS.

Reference solution Weigh accurately 15 mg of chrysin CRS and 10 mg of galangin CRS, dissolve in methanol in a 50 ml volumetric flask respectively, dilute with methanol to volume, and mix well. Accurately measure 1 ml of separate solutions in a 10 ml volumetric flask respectively, dilute with methanol to volume, and mix well.

Test solution Weigh accurately 0.1 g of the coarse powder (pass through No. 4 sieve) to a Soxhlet's extractor, add 100 ml of acetone, heat under reflux on a water bath until to the extract solution colourless, concentrate the extract to almost dryness. Dissolve the residue with methanol, transfer to a 100 ml volumetric flask and dilute with methanol to volume, mix well.

Procedure Inject accurately 10 μl of the reference solution and the test solution into the column respectively, determine, and calculate the content.
It contains not less than 2.0 per cent of chrysin ($C_{15}H_{10}O_4$) and not less than 1.0 per cent of galangin ($C_{15}H_{10}O_5$), calculated with reference to the dried drug.

Processing *Propolis (processing with wine)* Crush lumps of Propolis to powder, dissolve it in ethanol, filter, evaporate the filtrate to dryness, and dry in air.

Action To resist bacteria and relieve inflammation, regulate immunity, resist oxygenation, and accelerate tissue healing.

Indications Used as an adjuvant for high lipemia and diabetes.

Usage and dosage 0.2-0.6 g, appropriate quantity for external use.

Precaution Used with caution for an allergy to this drug.

Storage Preserve in a cool and dry place.

Pseudobulbus Cremastrae seu Pleiones
(山慈菇, Shancigu)

Appendiculate Cremastra Pseudobulb or Common Pleione Pseudobulb

Appendiculate Cremastra Pseudobulb or Common

Pleione Pseudobulb is the dried pseudobulb of *Cremastra appendiculata* (D. Don) Makino, *Pleione bulbocodioides* (Franch.) Rolfe or *Pleione yunnanensis* Rolfe (Fam. Orchidaceae). The former is known as "Maocigu", and the latter two are known as "Bingqiuzi". The drug is collected in summer and autumn, removed from the aerial part and soil, sorted according to size, steamed thoroughly with boiling water, and dried.

Description *Maocigu* Irregularly oblate or conical, top gradually protruding, base with rootlet scars, 1.8-3 cm long, the swollen part 1-2 cm in diameter. External yellowish-brown or brown, with longitudinal wrinkles and furrows, and exhibiting 2-3 slight prominent and ringed nodes with remainings of some filiform fibres, derived from the withering and decaying scaly leaves. Texture hard, not easily broken, fracture greyish-white or yellowish-white, slightly horny, Odour, slight; taste, weak and sticky.

Bingqiuzi Conical, bottleneck-like or in irregular masses, 1-2 cm in diameter, 1.5-2.5 cm high. Top acuminate, the broken tip dish-shaped, base swollen and rounded-flattened, dented at middle, with 1-2 ringed nodes, mostly inclined to one side. Externally yellowish-white for the peeled drug and brownish for the unpeeled, smooth with irregular wrinkles. Fracture yellowish, horny and translucent.

Identification Transverse section: *Maocigu* The outermost consisting of a layer of flattened epidermal cells, 2-3 layers of sclerenchymatous cells beneath, yellowish, the innermost consisting of large subrounded parenchymatous cells containing mucilage and starch granules. Parenchymatous cells near the epidermis containing raphides of calcium oxalate, 70-150 μm long. Vascular bundles scattered, collateral.

Bingqiuzi Epidermal cells tangentially elongated, starch granules occurring in small parenchymatous cells, fibres of vascular bundle sheath crescent, occasionally double-crescent.

Processing Eliminate foreign matter, soak for about 1 hour, soften thoroughly, cut into thin slices, and dry, or dry after washing. Pound to pieces before use.

Action To remove *toxic-heat*, and resolve *phlegm* to disintegrate lumps.

Indications Carbuncles, boils, scrofula, subcutaneous nodules; snake and insectbite.

Usage and dosage 3-9 g; appropriate quantity for external use.

Storage Preserve in a dry place.

Pulvis Fellis Suis (猪胆粉, Zhudanfen)

Pig Gall Powder

Pig Gall Powder, is the dried bile of *Sus scrofa domestica* Brisson (Fam. Suidae).

Processing Take pig bile, filter, dry and pulverize.

Description Yellow, greyish-yellow powder. Odour, slightly stinking. Taste, bitter, easily moistened.

Identification Carry out the method for thin layer chromatography (Appendix Ⅵ B). using silica gel G as the coating substance and the upper layer of a freshly prepared mixture of isooctane, ether, glacial acetic acid, *n*-butanol and water (10∶5∶5∶3∶1) as the mobile phase. Apply separately to the plate 2 μl each of the test solution and the reference solution of hyodeoxycholic acid both obtained under Assay. After developing and removal of the plate, dry in air, spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to visualize clearly. Examine under daylight and ultraviolet light at 365 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Fellis Bovis, Fellis Caprae seu Ovis Take 0.1 g each of Fellis Bovis reference drug and Fellis Caprae seu Ovis reference drug, produce two reference drug solutions in the same manner as preparation of the test solution under Assay, beginning at the words" add 5 ml of 10% solution of sodium hydroxide...". Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, apply separately to the plate 2 μl each of the test solution obtained under Assay and the above two reference drug solutions. Developing and visualizing in the same manner as described under the test of Identification. The spots in the chromatogram obtained with the test solution should not be corresponding in position and colour to the spots in the chromatogram obtained with the reference drug solutions.

Reducing sugars Dissolve 10 mg of the powder in 2 ml of water, add several drops of α-naphthol in ethanol (1→50), mix well, add dropwise 0.5 ml of sulfuric acid along the tube wall, a purplish-red ring is not visible at the junction of the two layers.

Foreign organic matter Dissolve 10 mg of the powder in 2 ml of water, centrifuge or filter. Examine the residue under the microscope. No plant, animal tissues or starch is visible.

Water Weigh accurately 0.3 g of the powder, carry out the method for determination of water (Appendix Ⅸ H, method 3), not more than 10.0 per cent.

Assay Weigh accurately 0.1 g of the fine powder, add 5 ml of 10% solution of sodium hydroxide, heat at 120℃ for 4 hours, allow to cool. Add dropwise hydrochloric acid to adjust to pH 2-3, mix well. Extract with four 10-ml quantities of ethyl acetate, combine the extracts and evaporate to dryness. Dissolve the residue in ethanol, transfer to a 10 ml volumetric flask, dilute with ethanol to volume, mix well, used as the test solution. Weigh accurately a quantity of hyodeoxycholic acid CRS, previously dried over phosphorous pentoxide in vaccum for 24 hours, dissolve in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a freshly prepared mixture of isooctane, ether, glacial acetic acid, *n*-butanol and water (10∶5∶5∶3∶1) as the mobile phase. Apply separately to the plate 1 μl of the test solution, 1 μl and 3 μl of the reference solution alternatively. After developing and removal of the plate, dry in air, spray with a 10% solution of sulfuric acid in ethanol and heat at 105℃ to visualize clearly. Cover the plate with a piece of glass of the same size and fix up the edge with tape. Carry out the method for thin layer chromatography (thin layer chromatographic scanning method, Appendix Ⅵ B), scan at wavelength of λ_S = 375 nm, λ_R = 650 nm. Measure the integration values of absorbance of the test solution and the reference solution, calculate the content.

It contains not less than 16.0 per cent of hyodeoxycholic acid ($C_{24}H_{40}O_4$), calculated with reference to the dried drug.

Action To remove *toxic-heat*, moisten *dry* and relieve cough and asthma.

Indications Dryness and thirst in febrile diseases inflammation of the eye; acute pharyngitis; jaundice; whooping cough; asthma; diarrhea and dysentery; constipation; carbuncle and boils.

Usage and dosage 0.3-0.6 g, take infused, or used in pills and powder. Appropriate quantity is mixed with water for topical application.

Storage Preserve in tightly closed container, protected from light and stored in a cool and dry place.

Pulvis Talci
(滑石粉, Huashifen)

Talc Powder

Talc Powder is a powder prepared from talc by sorting, cleaning, pulverizing and drying.

Description A white or almost white, fine, sandless powder, unctuous on touching. Odour, slight; and tasteless. Insoluble in water and dilute solutions of hydrochloric acid and sodium hydroxide.

Identification Complies with Identification tests (1) and (2) described under Talcum.

Acidity or alkalinity Boil 10 g of the powder with 50 ml of water for 30 minutes, supplement the water loss in evaporation frequently, cool, filter, the filtrate is neutral to litmus paper.

Water-soluble matter Boil 5 g of the powder with 30 ml of water for 30 minutes, compensate the water loss in evaporation frequently, cool, filter. Wash the residue with 5 ml of water. Combine the washings with the filtrate and evaporate to dryness, then dry at 105℃ for 1 hour. The residue is not more than 5 mg (0.1 per cent).

Acid-soluble matter Macerate 1 g of the powder in 20 ml of dilute hydrochloric acid TS, at 50℃ for 15 minutes, filter. To 10 ml of the filtrate, add 1 ml of dilute sulfuric acid TS, evaporate to dryness and ignite to constant weight. The residue is not more than 7.5 mg (1.5 per cent).

Ferric salt Boil 10 g of the powder with 30 ml of water for 30 minutes, compensate the water loss in evaporation frequently, cool, filter. To the filtrate add 1 ml of dilute hydrochloric acid TS and 1 ml of potassium ferrocynide TS, no blue colour is produced immediately.

Loss on ignition Ignite the powder to constant weight at 600-700℃, loses not more than 5.0 per cent of its weight.

Action and indications As described under Talcum.

Usage and dosage 10-20 g; decocted with wrapping; appropriate quantity for external use.

Storage Preserve in a well closed container.

Pyritum
(自然铜, Zirantong)

Pyrite

Pyrite is a mineral of sulfides of pyrite group, containing mainly iron sulfide (FeS_2). The drug is collected, and removed from foreign matter.

Description Cube-like crystals, aggregated in dense masses, externally bright pale yellow, with lustre of metal, some yellowish-brown or dark brown, without lustre of metal. Streaks greenish-black or brownish-red. Texture heavy and hard or slightly fragile, easily broken. Fracture yellowish-white, with lustre of metal, or brown, with silvery sparkle.

Identification To 1 g of the powder add 4 ml of dilute hydrochloric acid TS, shake and filter. The filtrate yields the reactions characteristic of ferric salts (Appendix Ⅳ).

Processing *Pyritum* Eliminate foreign matter, wash clean, dry. Break to pieces before use.

Pyritum (calcined) Calcine the clean Pyritum as described under the method for calcining openly (Appendix Ⅱ D) to dark red, quench with vinegar until the colour of the surface turns to blackish-brown, lustre disappears and the texture becomes loose, using 30 kg of vinegar per 100 kg of Pyritum.

Action To eliminate blood stasis, promote healing of fracture and to relieve pain.

Indications Traumatic swelling and pain, bone fracture.

Usage and dosage 3-9 g, mostly used as an ingredient in pills or powder, or decocted first. Appropriate quantity for external use.

Storage Preserve in a dry place.

Radix Achyranthis Bidentatae (牛膝, Niuxi)

Twotoothed Achyranthes Root

Twotoothed Achyranthes Root is the dried root of *Achyrantes bidentata* Bl. (Fam. Amaranthaceae). The drug is collected in winter when the aerial part is withered, removed from rootlet and soil, tied up in a small bundle, sun-dried to be wrinkled externally, cut evenly at the summit, and then dried thoroughly.

Description Slender cylindrical, straight or slightly curved, 15-70 cm, 0.4-1 cm in diameter. Externally greyish-yellow or pale brown, with slightly twisted and fine longitudinal wrinkles, transverse lenticel-like protrudings and sparse rootlet scars. Texture hard and fragile, easily broken, softened when moistened, fracture even, pale brown, slightly horny and oily. Xylem of vascular bundles in the centre relatively large, yellowish-white, the outside scattered with many spotted vascular bundles arranged in 2-4 whorls. Odour, slight; taste, slightly sweet, somewhat bitter and astringent.

Identification (1) Transverse section: Cork consisting of several layers of flattened cells, tangentially elongated. Phelloderm relatively narrow. Collateral vascular bundles arranged in 2-4 interrupted whorls, relatively small in the outermost whorl, some only 1 to several vessels, cambium nearly in a ring, vascular bundles relatively large inward; xylem consisting of vessels and small xylem fibres, aggregated into 2-3 groups in the central. Parenchymatous cells containing sand crystals of calcium oxalate.
(2) To 2 g of the powder add 20 ml of ethanol, heat under reflux for 40 minutes, and allow to stand. To 10 ml of the supernatant liquid add 1 ml of hydrochloric acid, heat under reflux for 1 hour, concentrate to about 5 ml, add 10 ml of water, extract with 20 ml of petroleum ether (60-90℃). Evaporate the extract to dryness, dissolve the residue in 2 ml of ethanol as the test solution. Dissolve oleanolic acid CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform and methanol (40∶1) as the mobile phase. Apply separately to the plate 10-20 μl of the test solution and 10 μl of the reference solution. After developing and removal of the plate, dry in air, spray with phosphomolybdic acid TS, and heat at 110℃ to the spots distinct. The blue spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent.

Total ash Not more than 9.0 per cent (Appendix Ⅸ D).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using *n*-butanol saturated with water as the solvent, not less than 6.5 per cent.

Processing *Radix Achyranthis Bidentatae* Eliminate foreign matter, wash clean, soften thoroughly, remove remains of rhizomes, cut into sections, and dry in the sun.

Radix Achyranthis Bidentatae (*processed with wine*) Stir-bake the sections of Radix Achyranthis Bidentatae as described under the method for stir-baking with wine (Appendix Ⅱ D) to dryness.

Action To replenish the liver and the kidney, strengthen the tendons and bones, eliminate *blood stagnation* and stimulate menstruation, and lead blood to flow downward.

Indications Aching of the lumbar and knee joints with weakness in the legs; amenorrhea with mass formation in the abdomen; dizziness due to hyperactivity of the liver.

Usage and dosage 4.5-9 g.

Precaution Used with caution in pregnancy.

Storage Preserve in a cool and dry place, protected from moisture.

Radix Aconiti (川乌, Chuanwu)

Common Monkshood Mother Root

Common Monkshood Mother Root is the dried parent root tuber of *Aconitum carmichaeli* Debx. (Fam. Ranunculaceae). The drug is collected from late June to early August, removed from daughter root, rootlet and soil, and dried in the sun.

Description Irregularly conical, slightly curved, apex often with remains of stem, mostly swollen to one side in the middle, 2-7.5 cm long, 1.2-2.5 cm in diameter. Externally brown or greyish-brown, shrunken, with tuberculate rootlets and scars of daughter roots. Texture campact, fracture whitish or greyish-yellow, cambium ring polygonal. Odour, slight; taste, pungent and numb.

Identification (1) Transverse section: Metaderm consisting of brown suberized cells; stone cells occasional in cortical parenchyma, singly scattered or in groups, subrectangular, square or long-elliptical, with a large lumen; endodermis indistinct. Sieve tube groups scattered in phloem; fibre bundles occasional in the inner part of phloem. Cambium ring subpolygonal, one or more abnormal vascular bundles occasional present in the inner or the outer side. Vessels in xylem consisting of several rows, arranged radially or in V-shape. Pith distinct. Parenchymatous cells filled with starch granules.
Powder: Greyish-yellow. Simple starch granules spheroidal, elongated rounded or reniform, 3-22 μm in diameter; compound granules consisting of 2-15 components. Stone cells nearly colourless or pale yellowish-green, subrectangular, subsquare, polygonal or oblique at one side, 49-117 μm in diameter, 113-280 μm long, walls 4-13 μm thick, the thick-walled stone cells distinctly striated and thin pitted. Cells of metaderm brown, some walls unevenly thickened, some appearing tubercular and projecting into lumen. Bordered pitted vessels pale yellow, 29-70 μm in diameter, the ends truncate or acute, perforated at the end walls or side walls, some vessel elements thick and short, tortuous or connected vertically and horizontally.
(2) To about 5 g of the powder add 30 ml of ether and 3 ml of ammonia TS, macerate for 1 hour, shake frequently, and filter. Evaporate 6 ml of the filtrate to dryness, add 10 drops of 7% solution of hydroxylamine hydrochloride in

methanol and 2 drops of 0.1% solution of thymolphthalein in methanol, add dropwise a saturated solution of potassium hydroxide in methanol until the colour turns blue, and add 4 drops again, heat on a water bath for 1 minute, cool in cold water, adjust to pH 2-3 with dilute hydrochloric acid, then add 1-2 drops of ferric chloride TS and 1 ml of chloroform, shake, a violet colour is produced in the upper layer.

(3) To 0.5 g of the powder add 10 ml of ether and 0.5 ml of ammonia TS, shake for 10 minutes and filter. Extract the filtrate by shaking in a separating funnel with 20 ml of 0.25 mol/L solution of sulfuric acid. Dilute a quantity of the acid solution with water. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), the maximum absorption exhibits at 231 nm.

Total ash Not more than 9.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Processing *Radix Aconiti* (*unprocessed*) Eliminate foreign matter. Break to pieces before use.

Action To relieve rheumatic conditions and alleviate pain by warming *meridians*.

Indications Joint pain in rheumatic or rheumatoid arthritis, epigastric pain with cold sensation, or abdominal colic due to cold, also used as an analgesic.

Usage and dosage Usually used after processed.

Precaution Be cautious about the unprocessed root taken orally. Incompatible with Bulbus Fritillariae, Rhizoma Pinelliae, Rhizoma Bletillae, Radix Ampelopsis, Radix Trichosanthis and Fructus Trichosanthis.

Storage Preserve in a ventilated dry place, protected from moth.

Radix Aconiti Kusnezoffii (草乌, Caowu)

Kusnezoff Monkshood Root

Kusnezoff Monkshood Root is the dried root tuber of *Aconitum kusnezoffii* Reichb. (Fam. Ranunculaceae). The drug is collected in autumn when the aerial part is withered, removed from rootlet, soil, and dried.

Description Irregularly long-conical, slightly curved, 2-7 cm long, 0.6-1.8 cm in diameter. Apex usually with remains of stem and a few adventitious root bases, sometimes apex bearing a withered bud at one side and a circular or oblate base of adventitious root at the other side. Externally greyish-brown or blackish-brown, shrivelled, with longitudinal wrinkles, dotted rootlet scars and several tubercular lateral roots. Texture hard, fracture greyish-white or dark grey, with fissures, cambium ring polygonal or subrounded, pith relatively large or hollowed. Odour, slight; taste, pungent and numb.

Identification (1) Transverse section: Metaderm consisting of 7-8 layers of brownish-yellow suberized cells; cortex with stone cells, single or 2-5 grouped, subrectangular, square or oblong, lumina large, endodermis distinct. Phloem broad, usually with irregular clefts, groups of sieve-tubes abundant. Cambium ring irregularly polygonal or subrounded. Vessels in xylem in 1-4 rows or several in grouped, located inside each angle of the cambium, some containing brownish-yellow contents. Pith relatively large. Parenchymatous cells filled with starch granules.

Powder: Greyish-brown. Simple starch granules subrounded, 2-23 μm in diameter; compound granules consisting of 2-16 components. Stone cells colourless, but brown on adhering to the fragments of metaderm, subsquare, subrectangular, subrounded, fusiform or elongated rectangular, 20-133-234 μm in diameter, up to 465 μm long, walls varying in thickness, the thick-walled cells distinctly striated and finely pitted, some containing brown contents. Cells of metaderm brown, subsquare or long-polygonal in surface view, walls unevenly thickened, some appearing tubercular and projecting into lumen.

(2) To 0.5 g of the powder add 10 ml of ether and 0.5 ml of ammonia TS, shake for 10 minutes, filter. Extract the filtrate by shaking in a separating funnel with 20 ml of sulfuric acid solution (0.25 mol/L). Dilute a quantity of the acidic solution with water, carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), the solution exhibits the maxima absorption at 231 nm and 275 nm.

(3) To 1 g of the coarse powder add 15 ml of ether and 1 ml of ammonia TS, macerate for 1 hour with constant shaking, filter. Evaporate 5 ml of the filtrate to dryness. To the residue add 5 drops of 7% solution of hydroxylamine hydrochloride in methanol and 1 drop of 0.1% solution of thymolphthalein in methanol, add dropwise saturated solution of potassium hydroxide in methanol until the colour turns blue, and add in excess of 2 drops, heat on a water bath at 60℃ for 1-2 minutes, cool in cold water, adjust to pH 2-3 with dilute hydrochloric acid, then add 1 drop of ferric chloride TS and 1 drop of chloroform, shake, a violet colour is produced in the upper layer.

Foreign matter Not more than 5 per cent (Appendix Ⅸ A).

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Processing *Radix Aconiti Kusnezoffii* (*unprepared*) Eliminate foreign matter, wash clean, and dry.

Action To relieve rheumatic conditions, warm the *meridians* and alleviate pain.

Indications Rheumatic and rheumatoid arthralgia; precordial and abdominal pain with cold sensation; abdominal colic caused by cold; anaethesia also used as an analgesic.

Usage and dosage Usually used after processed.

Precaution Be cautious about the unprocessed root taken orally. Incompatible with Bulbus Fritillariae, Rhizoma Pinelliae, Rhizoma Bletillae, Radix Ampelopsis, Radix Trichosanthis, and Fructus Trichosanthis.

Storage Preserve in a ventilated dry place, protected from moth.

Radix Aconiti Kusnezoffii Praeparata (制草乌, Zhicaowu)

Prepared Kusnezoff Monkshood Root

The drug is the processed Radix Aconiti Kusnezoffii.

Processing Grade Radix Aconiti Kusnezoffii according to size. Macerate it in water until there is no dry core. Take out, boil in water until there is no white core in the larger root and the taste becomes slightly numb. After removal, allow it to dry in air appropriately, cut into slices, and dry.

Description Irregularly rounded or nearly triangular slices.

Externally dark brown, with a greyish-white polyangular cambium ring, dotted vascular bundles and clefts; the edges wrinkled or curved. Texture fragile. Odour, slight; taste, slightly pungent and numb.

Identification Complies with the test (2) of Identification described under Radix Aconiti Kusnezoffii.

Diester-alkaloids Complies with the test for diester-alkaloids described under Radix Aconiti Preparata.

Assay Carry out the Assay described under Radix Aconiti Preparata, it complies with the requirements.

Action and indications As described under Radix Aconiti Kusnezoffii.

Usage and dosage 1.5-3 g; decocted first or for a long time.

Precaution and Storage As described under Radix Aconiti Praeparata.

Radix Aconiti Lateralis Praeparata (附子, Fuzi)

Prepared Common Monkshood Daughter Root

Prepared Common Monkshood Daughter Root is the processed daughter root of *Aconitum carmichaeli* Debx. (Fam. Ranunculaceae). The drug is collected in late June to early August, removed from the parent root, rootlet and soil. It is known as "Nifuzi", which can be processed into the following commercial varieties:

(1) Select the large and uniform Nifuzi, wash clean and soak over night in edible mother liquor of mineral salt preparation. Add salt, soak and take it out to sun-dry and air-dry every day. Gradually prolong the time for dryness until a lot of salt is crystallized on the surface of the drug and its texture becomes hard. It is known as "Yanfuzi".
(2) Grade Nifuzi according to size, wash clean and soak in edible mother liquor of mineral salt preparation for several days. Boil in the infusion thoroughly. Take out, rinse in water, cut longitudinally into slices about 0.5 cm in thickness. Soak and rinse in water once again. Stain the slices dark brown and steam them until the slices turn to be oily and lustrous. Bake the slices to half-dryness, and then sun-dry or bake to complete dryness. It is known as "Heishunpian".
(3) Select the Nifuzi of uniform size, wash clean and soak in edible mother liquor of mineral salt preparation for several days, Boil in the infusion thoroughly. Take out, peel the bark and cut longitudinally into slices about 0.3 cm in thickness. After soaking and rinsing in water, take out, steam thoroughly, sun-dry to dryness. It is known as "Baifupian".

Description *Yanfuzi* (*salted aconite daughter root*) Conical, 4-7 cm long, 3-5 cm in diameter. Externally greyish-black, covered with fine powder of salt, topped with depressed bud scars and encircled with tubercled short rootlets or rootlet scars. Texture heavy. Transversely cut surface greyish-brown, showing small clefts filled with fine powder of salt and a polyangular cambium ring, and vascular bundles arranged irregularly inside the ring. Odour, slight; taste, salty, numb and pungent.

Heishunpian (*black slice*) Longitudinal slices, the upper portion wide and the lower portion narrow, 1.7-5 cm long, 0.9-3 cm wide, 0.2-0.5 cm thick. The outer bark blackish-brown, cut surface dark yellow, oily and lustrous, translucent and showing longitudinal vascular bundles. Texture hard and fragile. Fracture horny. Odour, slight; taste, weak.

Baifupian (*white slice*) Without outer bark, yellowish-white, translucent, about 3 mm thick.

Identification To 4 g of the coarse powder of Heishunpian or Bai Fupian add 30 ml of ether and 5 ml of ammonia TS, shake for 20 minutes, filter. Transfer the filtrate to a separating funnel, extract with 20 ml of sulfuric acid solution (0.25 mol/L), separate the acid solution. Carry out the method for ultraviolent spectrophotometry and colourimetry (Appendix Ⅴ A), the light absorption exhibits maxima at 231 nm and 274 nm.

Limit test for Aconitine Weigh 20 g of the coarse powder of Hei Shunpian, Bai Fupian or Dan Fupian to a stoppered conical flask, add 150 ml of ether, shake for 10 minutes, then add 10 ml of ammonia TS, shake for 30 minutes, allow to stand for 1-2 hours. Evaporate the ether layer to dryness. Dissolve the residue in 2 ml of absolute ethanol as the test solution. Dissolve aconitine CRS in absolute ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using alkaline aluminium oxide as the coating substance and a mixture of *n*-hexane and ethyl acetate (1∶1) as the mobile phase. Apply separately to the plate 6 μl of the test solution and 5 μl of the reference solution. After developing and removal of the plate, spray with a mixture of two equal volumes of potassium iodide-iodine TS and potassium iodobismuthate TS. The size of the spot in the chormatogram obtained with the test solution is less than the corresponding spot in the chromatogram obtained with the reference solution, or no spot reveals in the chromatogram obtained with the test solution.

Processing *Fupian* "Heishunpain" and "Baifupian" are used directly.

Danfupian Blanch "Yanfuzi" with water, 2-3 times a day until all salt is rinsed out. Boil together with Radix Glycyrrhizae, black beans and water until the centre of the cut surface is devoid of white core and the cut slice is numbless to the tongue. Remove Radix Glycyrrhizae and black beans, cut the drug into slices, and dry.
To each 100 kg of "Yanfuzi", add 5 kg of Radix Glycyrrhizae and 10 kg of black beans.

"Fupian" (*processed*) Scald "Fupian" with sand as described under the method for scalding (Appendix Ⅱ D) until it is inflated and slightly discoloured.

Action To cause restoration from collapse, reinforce *fire* and *yang*, and dispel *wind*, *cold* and *damp*.

Indications Collapse with cold limbs and faint pulse due to prostration of *yang*; impotence, *cold* in uterus; cold pain in the heart and abdomen, vomiting and diarrhea due to deficiency and *cold*; edema from *yin-cold*; afflictions from external pathogenic factors due to *yang* insufficiency; arthralgia.

Usage and dosage 3-15 g.

Precaution Contraindicated in pregnancy. Incompatible with Rhizoma Pinelliae, Fructus Trichosanthis, Bulbus Fritillariae, Radix Ampelopsis and Rhizoma Bletillae.

Storage Preserve "Yanfuzi" in well closed container, stored in a cool and dry place. Preserve "Heishunpian" and "Baifupian" in a dry place, protected from moisture.

Radix Aconiti Praeparata (制川乌, Zhichuanwu)

Prepared Common Monkshood Mother Root

The drug is the processed Radix Aconiti.

Processing Grade clean Radix Aconiti according to size, macerate in water until there is no dry core. Take them out, boil in water for 4 to 6 hours (or steam for 6 to 8 hours) until there is no white core in the relatively large and solid root and the taste becomes slightly numb. After removal, dry in the air appropriately, cut into slices, and dry.

Description Irregular or elongated triangular slices. Externally dark brown or yellowish-brown, with a greyish-brown cambium ring. Texture light and fragile, fracture lustrous. Odour, slight; taste, slightly numb.

Identification Complies with Test (3) of Identification described under Radix Aconiti.

Diester alkaloids *Reference solution* Weigh accurately 20 mg of aconitine CRS to a 10 ml volumetric flask, dissolve in absolute ethanol, and dilute to the volume.

Calibration standard Transfer accurately 0.25, 0.50, 1.0, 1.5, 2.0, 2.5 ml of the reference solution to 25 ml volumetric flasks respectively, add absolute ethanol to 2.5 ml, add accurately 1.5 ml of alkaline hydroxylamine hydrochloride TS respectively, and mix well. Warm on a water bath at 60-65℃ for 10 minutes and allow to cool. Add 13 ml of ferric perchlorate TS, mix well, and stand for 5 minutes. Then add accurately 8 ml of perchloric acid TS, dilute with ferric perchlorate TS to volume, mix well, and allow to stand for 15 minutes. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), using the mixture of corresponding solvents as the blank, measure the absorbance at 520 nm, and plot the standard curve, using absorbance as ordinate and concentration as abscissa.

Procedure Weigh accurately 10 g of the coarse powder to a stopper conical flask, add 50 ml of ether and 4 ml of ammonia TS, stopper and shake thoroughly, allow to stand overnight and filter. Shake the drug residue with 50 ml of ether for 1 hour, and filter. Wash the residue with 3-4 quantities, each of 15 ml, of ether, and filter. Combine the filtrate and washings, and evaporate to dryness at a lower temperature. Dissolve the residue in 2 ml of chloroform, and transfer to a separating funnel. Wash the container with several 3-ml quantities of chloroform, and combine the washings to the separating funnel. Extract with three 5 ml quantities of sulfuric acid (0.05 mol/L), wash each acid solution by shaking with the same 10 ml of chloroform, successively, combine the acid solutions, adjust to pH 9 with ammonia TS, and extract with three 10-ml quantities of chloroform, wash each chloroform solution by shaking with the same 20 ml of water, combine the chloroform solutions, evaporate to dryness at a lower temperature. Dissolve the residue in a quantity of absolute ethanol, transfer to a 5 ml volumetric flask, wash the container in portions with absolute ethanol, combine the washings to the volumetric flask, dilute with absolute ethanol to volume, mix well. Transfer accurately 2.5 ml of each of the above solution and absolute ethanol (blank solution) to 25 ml volumetric flasks respectively. Measure the absorbance, as described under Calibration Standard, beginning at the words "add accurately 1.5 ml of alkaline hydroxylamine hydrochloride TS". Read out and calculate the weight (μg) of diester-alkaloids in the test solution from the standard curve.

It contains not more than 0.15 per cent of diesteralkaloids, calculated as aconitine ($C_{34}H_{47}NO_4$).

Assay Weigh accurately 10 g of the powder, carry out the method described under the procedure of Diester alkaloids, using a mixture of ether and chloroform (3∶1) instead of ether, beginning at the words "add 50 ml of ether" to "combine the filtrate and washings, evaporate to dryness at a lower temperature". Dissolve the residue in 5 ml of the mixture of ether and chloroform (3∶1), evaporate to dryness. Dissolve the residue again in 5 ml of ethanol, add 15 ml of sulfuric acid (0.01 mol/L) VS, accurately measured, 15 ml of water and 3 drops of methyl red IS, and titrate with sodium hydroxide (0.02 mol/L) VS until a yellow colour is produced. Each ml of sulfuric acid (0.01 mol/L) VS is equivalent to 12.9 mg of aconitine ($C_{34}H_{47}NO_{11}$).

It contains not less than 0.20 per cent of alkaloide, calculated as aconitine ($C_{34}H_{47}NO_{11}$).

Action and indications As described under Radix Aconiti.

Usage and dosage 1.5-3 g, decocted first or for a long time.

Precaution Used with caution in pregnancy. Incompatible with Bulbus Fritillariae, Rhizoma Pinelliae, Rhizoma Bletillae, Radix Ampelopsis, Radix Trichosanthis and Fructus Trichosanthis.

Storage Preserve in a ventilated dry place, protected from moth.

Radix Adenophorae (南沙参, Nanshashen)

Fourleaf Ladybell Root

Fourleaf Ladybell Root is the dried root of *Adenophora tetraphylla* (Thunb.) Fisch. or *Adenophora stricta* Miq. (Fam. Campanulaceae). The drug is collected in spring and autumn, removed from rootlet, washed, deprived of the coarse bark while still fresh, washed again, and dried.

Description Conical or cylindrical, slightly curved, 7-27 cm long, 0.8-3 cm in diameter. Externally yellowish-white or pale brownish-yellow, usually exhibiting patches of bark in depressions, mostly with deeply depressed transverse striations appearing interrupted-annulated at the upper part and with longitudinal striations and furrows at the lower part. Apex bearing one or two rhizomes. Texture light and spongy, easily broken, fracture uneven, yellowish-white, much cleft. Odour, slight; taste, sweetish.

Identification (1) Powder: Greyish-yellow. Cork stone cells subrectangular, sliver-shaped, subrounded or subpolygonal, 18-155 μm long, 18-61 μm wide, some anticlinal walls beaded. Articulate laticiferous tubes often linked reticularly. Inulins fan-shaped, subrounded or irregular.

(2) Heat 2 g of the coarse powder in 20 ml of water on a water bath for 10 minutes, and filter. To 2 ml of the filtrate add 2-3 drops of 5% solution of α-naphthol in ethanol, mix well, then add 0.5 ml of sulfuric acid slowly along the tube wall: a purplish-red ring is produced at the junction of the liquids. Heat another 2 ml of the filtrate with 4-5 drops of alkaline cupric tartrate TS on a water bath for 5 minutes, a reddish-brown precipitate is produced.

(3) To 2 g of the powder add 30 ml of methanol, heat under

reflux for 1 hour, filter, and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 2 g of Radix Adenophorae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and formic acid (9∶1∶2) as the mobile phase. Apply separately to the plate 2-5 μl of the test solution and 3 μl of the reference drug solution. After developing and removal of the plate, dry in air. Spray with phosphomolybdic acid TS, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H, Method 1), not more than 15.0 per cent.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method as described under the determination of ethanol-soluble extractives (Appendix Ⅹ A), using dilute ethanol as the solvent, not less than 30.0 per cent.

Processing Remove rhizomes, wash, soften thoroughly, cut into thick slices, and dry.

Action To nourish *yin* and remove *heat* from the lung, resolve *phlegm*, and reinforce *qi*.

Indications Dry cough due to *lung-dryness*; chronic cough from *yin* deficiency; cough with sticky phlegm, insufficient *qi* and *yin*; fever and thirst.

Usage and dosage 9-15 g.

Precaution Incompatible with Rhizoma et Radix Veratri.

Storage Preserve in a ventilated dry place, protected from moth.

Radix Ampelopsis (白薇, Bailian)

Japanese Ampelopsis Root

Japanese Ampelopsis Root is the dried root tuber of *Ampelopsis japonica* (Thunb.) Makino (Fam. Vitaceae). The drug is collected in spring and autumn, removed from rootlet and soil, cut into longitudinal segments or oblique slices, and dried in the sun.

Description Longiluminal segments oblong or nearly fusiform, 4-10 cm long, 1-2 cm in diameter; edges usually rolled inwards, a raised ridge occurring at the centre. The outer bark reddish-brown, with longitudinal wrinkles, transverse fine striations and transverse elongated lenticels, easily detachable in flakes, the exposed layer reddish-brown. Oblique slices ovate, 2.5-5 cm long, 2-3 cm wide, cut surface whitish or pale reddish-brown, exhibiting radial lines, edges relatively thick, slightly raised upward or slightly curved. Texture light, hard and fragile, easily broken, dusting on breaking. Odour, slight; taste, sweetish.

Identification (1) Powder: Pale reddish-brown. Starch granules single, oblong, long-ovoid, reniform or irregular, 3-13 in diameter, hilum indistinct; compound granules less. Needles of calcium oxalate 86-169 μm long, scattered or grouped into bundles in mucilage cells. Clusters of calcium oxalate 25-78 μm in diameter, with broad and large angles. Bordered pitted vessels 35-60 μm in diameter.

(2) To 2 g of the powder add 30 ml of ethanol, heat under reflux for 1 hour, filter, and evaporate to dryness. Dissolve the residue in 2 ml of ethanol as the test solution. Prepare a solution of 2 g of Radix Ampelopsis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (6∶1) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Foreign matter Not more than 3.0 per cent (Appendix Ⅸ A).

Water Carry out the method for the determination of water (Appendix Ⅸ H, Method 1), not more than 15.0 per cent.

Total ash Not more than 12.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Extractives Carry out the cold maceration extraction method as described under the determination of ethanol-soluble extractives (Appendix Ⅹ A), using 25% ethanol as the solvent, not less than 18.0 per cent.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry.

Action To remove *toxic-heat*, cure carbuncles, and reduce nodules.

Indications Carbuncle, deep-rooted abscesses, scrofula, scalds and burns.

Usage and dosage 4.5-9 g; appropriate quantity is decocted for washing or ground into fine powder for topical application.

Precaution Incompatible with Radix Aconiti and allied drugs.

Storage Preserve in a ventilated dry place, protected from moth.

Radix Angelicae Dahuricae (白芷, Baizhi)

Dahurian Angelica Root

Dahurian Angelica Root is the dried root of *Angelica dahurica* (Fisch. ex Hoffm.) Benth. et Hook. f. or *Angelica dahurica* (Fisch. ex Hoffm.) Benth. et Hook. f. var. *formosana* (Boiss.) Shan et Yuan (Fam. Umbelliferae). The drug is collected in summer or autumn when leaves turn yellow, removed from rootlet and soil, and dried in the sun or at a lower temperature.

Description Long-conical, 10-25 cm long, 1.5-2.5 cm in diameter. Externally greyish-brown or yellowish-brown, the root stock obtusely quadrangular or subrounded, with longitudinal wrinkles, rootlet scars and lenticel-like transverse protrudings, some of them arranged in 4

longitudinal rows. Apex with dented stem scars. Texture compact, fracture white or greyish-white and starchy, cambium ring brown, subsquare or subrounded, scattered with many brown oil dots in bark. Odour, aromatic; taste, pungent and bitterish.

Identification To 0.5 g of the powder add 10 ml of ether, soak for 1 hour and shake frequently, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve imperatorin CRS and isoimperatorin CRS in ethyl acetate to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with carboxymethylcellulose sodium as the coating substance and a mixture of petroleum ether (30-60℃) and ether (3∶2) as the mobile phase. Apply separately 4 μl of each of the two solutions to the plate. After developing below 25℃ and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 2), not more than 14.0 per cent.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.5 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol as the solvent, not less than 15.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (55∶45) as the mobile phase. As detector a spectrophotometer set at 300 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of imperatorin.

Reference solution Weigh accurately a quantity of imperatorin CRS, dissolve in methanol to produce a solution containing 10 μg per ml.

Test solution Weigh accurately 0.4 g of the powder to a 50 ml volumetric flask, add 45 ml of methanol, ultrasonicate for 1 hour, cool and dilute with methanol to volume, mix well and filter.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.080 per cent of imperatorin ($C_{16}H_{14}O_4$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, grade according to size, soak briefly, soften thoroughly, cut into thick slices, and dry.

Action To dispel *wind*, remove *damp*, clear nasal obstruction, relieve pain, and promote the subsidence of swelling and drain pus.

Indications Common cold and headache, particularly pain in supra-orbital ridge, and stuffy nose; sinusitis; toothache; leukorrhalgia; swelling and abscesses.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place, protected from moth.

Radix Angelicae Pubescentis (独活, Duhuo)

Doubleteeth Pubescent Angelica Root

Doubleteeth Pubescent Angelica Root is the dried root of *Angelica pubescens* Maxim. f. *biserrata* Shan et Yuan (Fam. Umbelliferae). The drug is collected in early spring before sprouting, or in the end of autumn when stem and leaves wither, removed from rootlet and soil, baked to half-dryness, piled up for 2-3 days to soften, and then baked to dryness.

Description Somewhat cylindrical, with 2-3 or more branches at the lower part, 10-30 cm long. Root stock enlarged, conical, with abundant transverse wrinkles, 1.5-3 cm in diameter, apex exhibiting remains of stems and leaves or sunken spots. Externally greyish-brown or dark brown, longitudinally wrinkled, with transverse lenticel-like protrudings and slightly prominent scars of rootlets. Texture relatively hard, soft when moistened; fracture showing bark greyish-white, scattered with abundant brown oil cavities, wood greyish-yellow to yellowish-brown, and cambium ring brown. Odour, characteristic and aromatic; taste, bitter and pungent, slightly numb.

Identification (1) Transeverse section: Cork consisting of several layers of cells. Phelloderm narrow, with fewer oil cavities. Phloem broad, occupying about 1/2 the radius of root; oil cavities relatively abundant, arranged in several rings, up to 153 μm tangentially, surrounded by 6-10 secretory cells. Cambium in a ring. Xylem ray 1-2 rows of cells wide. Vessels sparse, up to 84 μm in diameter, frequently arranged singly and radially. Parenchymatous cells containing starch granules.
(2) To 2 g of the powder add 10 ml of ether, macerate overnight and filter. Evaporate the filtrate to dryness, dissolve the residue in 2 ml of chloroform as the test solution. Prepare a solution of 2 g of Radix Angelicae Pubescentis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane, benzene and ethyl acetate (2∶1∶1) as the mobile phase. Apply separately to the plate 2 μl of each of the two solutions. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Extractives Ether-soluble extractives: Weigh accurately about 2 g of the powder (through No. 4 sieve), previously dried over phosphorous pentoxide for 48 hours, to a 100 ml conical flask, add 70 ml of ether and several glass beads. Heat under reflux to slightly boil for 4 hours, cool and filter. Wash the flask and residue with a quantity of ether. Combine the washings and filtrate to a 100 ml volumetric flask, add ether to volume, mix well. Transfer accurately 50 ml of the solution to an tared evaporating dish. Expel the ether and dry it over phosphorous pentoxide for 24 hours. Weigh accurately and quickly.
It contains not less than 3.0 per cent of ether-soluble extractives.

Assay Carry out the method for high performance liquid

chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (60 : 40) as the mobile phase. As detector a spectrophotometer set at 322 nm. The number of theoretical plates of the column is not less than 6000, calculated with the reference to the peak of osthole.

Reference solution Weigh accurately a quantity of osthole CRS, dissolve in methanol to produce a solution containing 50 μg per ml.

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve) to a stoppered conical flask, add accurately 20 ml of methanol, and weigh. Ultrasonicate (power 300 W, frequency 15 kHz) for 30 minutes, cool and weigh again, replenish the loss of solvent with methanol, mix well and filter. Transfer accurately 5 ml of the successive filtrate to a 20 ml volumetric flask, dilute to volume with methanol and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 0.50 per cent of osthole ($C_{15}H_{16}O_3$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thin slices, and dry in the sun or at a lower temperature.

Action To relieve rheumatic conditions, and remove obstruction from the meridians and relieve pain.

Indications Rheumatic arthritis with pain in the lower back and knees; headache due to wind retention in the *shaoyin meridian*.

Usage and dosage 3-9 g.

Storage Preserve in a dry place, protected from mould and moth.

Radix Angelicae Sinensis (当归, Danggui)

Chinese Angelica

Chinese Angelica is the dried root of *Angelica sinensis* (Oliv.) Diels (Fam. Umbelliferae). The drug is collected in late autumn, removed from rootlet and soil, slightly dried and tied up in small bundles, placed on a shelf and smoke-dried.

Description Somewhat cylindrical, 3-5 or more branched at the lower part, 15-25 cm long. Externally yellowish-brown to brown, longitudinally wrinkled and transversely lenticel-like protruded. Root stocks (Guitou) 1.5-4 cm in diameter, annulated, apex obtuse and rounded, showing purple or yellowish-green remains of stems and leaf sheaths; main roots (Guishen) lumpy on the surface; branching roots (Guiwei) 0.3-1 cm in diameter, the upper portion thick and the lower portion thin, mostly twisted and exhibiting a few rootlet scars. Texture flexible, fracture yellowish-white or yellowish-brown, bark thick, showing some clefts and numerous brown dotted secretory cavities, wood paler in colour, cambium ring yellowish-brown. Odour, strongly aromatic; taste, sweet, pungent and slightly bitter.

It is not used medicinally if the roots become woody, withered and not oily, or greenish-brown on the fracture.

Identification (1) Transverse section: Cork cells in several layers. Phelloderm narrow, scattered with a few oil cavities. Phloem broad, more cleft, oil cavities and oil tubes subrounded, 25-160 μm in diameter, relatively large on the outer side, gradually becoming small inwards, surrounded by 6-9 secretory cells. Cambium in a ring. Xylem rays 3-5 rows of cells wide; vessels singly scattered, or 2-3-grouped, arranged radially; parenchymatous cells containing starch granules.

Powder: Yellowish-brown. Parenchymatous cells in phloem fusiform, walls slightly thickened, with very fine oblique crisscross striations, sometimes thin transverse septa visible. Scalariform and reticulate vessels frequent, up to 80 μm in diameter. Sometimes fragments of oil cavities visible.

(2) To 0.5 g of the powder add 20 ml of ether, ultrasonicate for 10 minutes and filter. Evaporate the filtrate to dryness and dissolve the residue in 1 ml of ethanol as the test solution. Prepare a solution of 0.5 g of Radix Angelicae Sinensis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (4 : 1) as the mobile phase. Apply separately to the plate 10 μl of the above two solutions. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution.

(3) To 3 g of the powder add 50 ml of 1% solution of sodium bicarbonate, ultrasonicate for 10 minutes, and centrifuge. Adjust the supernatant to pH 2-3 with dilute hydrochloric acid, extract by shaking with two 20-ml quantities of ether, combine the ether extracts and evaporate to dryness. Dissove the residue in 1 ml of methanol as the test solution. Dissolve a quantity of ferulic acid CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate and formic acid (4 : 1 : 0.1) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 2), not more than 12.0 per cent.

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using 70% ethanol as the solvent, not less than 45.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.085% solution of phosphoric acid (17 : 83) as the mobile phase. As detector a spectrophotometer set at 316 nm, maintain the column temperature at 35℃. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of ferulic acid.

Reference solution Weigh accurately 10 mg of ferulic acid CRS, dissolve in 70% methanol in a 50 ml brown volumetric

flask and dilute to volume. Measure accurately 3 ml in a 50 ml brown volumetric flask, dilute with 70% methanol to volume to produce a solution containing 12 μg per ml, and mix well.

Test solution Weigh accurately 0.2 g of the powder (through No. 3 sieve) to a stopper conical flask, accurately add 20 ml of 70% methanol, stopper tightly and weigh. Heat under reflux for 30 minutes, cool and weigh again, replenish the loss of solvent with 70% methanol, mix well and stand. Filter the supernatant through the millipore (0.45 μm), use the successive filtrate as the test solution.

Procedure Accurately inject 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.050 per cent of ferulic acid ($C_{10}H_{10}O_4$), calculated with reference to the dried drug.

Processing *Radix Angelicae Sinensis* Eliminate foreign matter, wash clean, soften thoroughly, cut into thin slices, and dry in the sun or at a lower temperature.

Radix Angelicae Sinensis (*stir-baked with wine*) Stir-bake the slices of Radix Angelicae Sinensis as described under the method for stir-baking with wine (Appendix Ⅱ D) to dryness.
Subround or irregular slices, with brown rings in the cut surface. Texture flexible, deep yellow in colour, with burnt stains. Taste, sweet, slightly bitter; odour strongly aromatic and wine-like.

Action To enrich blood, activate blood circulation, regulate menstruation, relieve pain, and relax bowels.

Radix Angelicae Sinensis (*stir-baked with wine*) To activate blood circulation and stimulate menstruation.

Indications Anemia with dizziness and palpitation; menstrual disorders, amenorrhea, dysmenorrhea; constipation; rheumatic arthralgia; traumatic injuries; carbuncles, boils and sores.

Radix Angelicae Sinensis (*stir-baked with wine*) Amenorrhea, dysmenorrhea, rheumatic arthralgia, traumatic injuries.

Usage and dosage 6-12 g.

Storage Preserve in a cool and dry place, protected from moisture and moth.

Preparation Chinese Angelica Liquid Extract

Radix Ardisiae Crenatae (朱砂根, Zhushagen)

Coral Ardisia Root

Coral Ardisia Root is the dried root of *Ardisia crenata* Sims (Fam. Myrsinaceae). The drug is collected in autumn and winter, washed clean, and dried in the sun.

Description Cylindrical, slightly curved, 5-30 cm long, 0.2-1 cm in diameter, densely growing on the slightly swelled rhizomes. Externally greyish-brown or chocolate brown, longitudinal wrinkles visible, bearing transverse or annular cracked traces, bark easily separated from wood. Texture hard and fragile, easily broken, fracture uneven; bark thick, whitish or pink, scattered purplish-red dots in the outside, known as "vermilion dots" (zhushadian in Chinese); wood yellowish-white, uneven. Odour, slight; taste, slightly bitter, irritated to tongue.

Identification (1) Transverse section: Cork of 3-10 layers of subsquare cells, arranged in order, scattered stone cells in the inside. Cortex broad, consisting of 10 or more layers of subrounded parenchymatous cells, some containing reddish-brown masses. Endodermis distinct, with Casparian dots, cells containing reddish-brown contents. Pericyclic stone cells arranged in a interrupted ring. Phloem narrow. Fascicular cambium ring distinct. Xylem well developed, vessels mostly radially arranged in single rows, some containing yellowish-brown contents; rays 2-4 rows of cells wide. Parenchymatous cells containing starch granules.
Powder: Yellowish-brown. Cork cells subsquare, walls slightly thick, arranged in order. Bordered pitted vessels frequent, 24-95 μm in diameter. Xylem fibres slender, about 11 μm in diameter. Stone cells subsquare or irregular rectangular, 112-160 μm in long diameter, 44-110 μm in short diameter, pit canals distinct, some with striations, lumen relatively large. A great deal of brown masses visible. Starch granules abundant, subrounded, helmet-shaped or irregular, 4-36 μm in diameter, hilum distinct, dotted, clefted or V-shaped, striations indistinct; compound granules consisting of 2-4 component granules.
(2) To 0.2 g of the powder add 20 ml of methanol, ultrasonicate for 30 minutes, cool, filter, evaporate the filtrate to about 1 ml as the test solution. Dissolve bergenin CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate and methanol (5∶4∶2) as the mobile phase. Apply separately to the plate 3 μl of each of the above two solutions. After developing and removal of the plate, dry in air, spray with a mixture of 1% ferric chloride solution and 1% potassium ferricyanide solution (1∶1). The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H, Method 1), not more than 13.0 per cent.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (25∶75) as the mobile phase. As detector a spectrophotometer set at 275 nm. The number of theoretical plates of the column is not less than 1500, calculated with the reference to the peak of bergenin.

Reference solution Dissolve a quantity of bergenin CRS, accurately weighed, in methanol to produce a solution containing 50 μg per ml as reference solution.

Test solution Weigh accurately 0.2 g of the powder to a stopper conical flask, accurately add 20 ml of methanol, stopper tightly and weigh. Ultrasonicate (power 200 W, frequency 40 kHz) for 40 minutes, cool, weigh again, replenish the loss of the solvent with methanol, mix well and filter. Measure accurately 5 ml of successive filtrate to a 10 ml volumetric flask, dilute to volume with methanol, and mix well.

Procedures Inject accurately 5 μl of each of the reference solution and the test solution respectively, into the column, determine and calculate the content.
It contains not less than 1.5 per cent of bergenin ($C_{14}H_{16}O_9$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash, clean, soften thoroughly, cut into sections, and dry.

Action To clear *toxicity* and reduce swelling, promote blood circulation to kill pain, and expel *wind* and *dampness*.

Indications Swelling and painful throat, rheumatic arthralgia, and traumatic injuries.

Usage and dosage 3-9 g.

Storage Preserve in a dry place.

Radix Arnebiae (紫草, Zicao)

Arnebia Root

Arnebia Root is the dried root of *Arnebia euchroma* (Royle) Johnst. or *Arnebia guttata* Bunge (Fam. Boraginaceae). The drug is collected in spring or autumn, removed from soil, and dried.

Description *Root of Arnebia euchroma* Irregularly long-cylindrical, frequently twisted, 7-20 cm long, 1-2.5 cm in diameter. Externally purplish-red or purplish-brown; bark lax, striped-lamellar, usually marked with more than 10 layers overlapped, easily exfoliated. Apex sometimes bearing branched remains of a stem. Light, texture lax and soft, easily broken, fracture uneven, wood relatively small, yellowish-white or yellow. Odour, characteristic; taste, slightly bitter, and astringent.

Root of Arnebia guttata Conical or cylindrical, twisted, 6-20 cm long, 0.5-4 cm in diameter. Root stock slightly stout, apex bearing one or more remains of a stem, covered with short and stiff hairs. Externally purplish-red or deep purple, bark slightly thin, usually marked with several layers overlapped, easily exfoliated. Texture hard and fragile, easily broken, fracture even, bark purplish-red; wood relatively small, yellowish-white. Odour, characteristic; taste, astringent.

Identification (1) Place 0.5 g of the powder in a test tube, heat at the bottom, a red gas is produced, and reddish-brown oil drops are condensed on the wall of the test tube.
(2) To 0.5 g of the powder add 20 ml of petroleum ether (60-90℃), ultrasonicate for 20 minutes and filter. Concentrate the filtrate to about 1 ml as the test solution. Prepare a solution of 0.5 g of Radix Arnebiae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, toluene, ethyl acetate and formic acid (5∶5∶0.5∶0.1) as the mobile phase. Apply separately to the plate 4 μl of each of the above two solutions. After developing and removal of the plate, dry in air. The purple spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution; and the colour of spots turn to blue after spraying with a 10% solution of potassium hydroxide in methanol.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent.

Assay ***Total pigments of hydroxynaphthaquinone*** Weigh accurately 0.5 g of the powder (through No. 3 sieve), previously dried at 50℃ for 3 hours, to a 100 ml volumetric flask, add ethanol to volume, shake constantly for 4 hours, filter, measure accurately 5 ml of the successive filtrate to a 25 ml volumetric flask, dilute with ethanol to volume and mix well. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 516 nm, calculate the content of shikonin ($C_{16}H_{16}O_5$), taking 242 as the value of A (1%, 1 cm).
It contains not less than 0.80 per cent of total pigments of hydroxynaphthaquinone, calculated as shikonin ($C_{16}H_{16}O_5$).

Alkannin Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, water and formic acid (700∶300∶0.5) as the mobile phase. As detector a spectrophotometer set at 275 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of β,β′-dimethylacrylalkanin.

Reference solution Weigh accurately a quantity of β,β′-dimethylacrylalkanin CRS, dissolve in ethanol to produce a solution containing 0.1 mg per ml.

Test solution Weigh accurately 0.5 g of the powder (through No. 4 sieve) to a stopper conical flask, add accurately 25 ml of petroleum ether (60-90℃), and weigh. Ultrasonicate (power 250 W, frequency 33 kHz) for 30 minutes, cool and weigh again, replenish the loss of solvent with petroleum ether (60-90℃), mix well and filter. Measure accurately 10 ml of the successive filtrate, evaporate to dryness, dissolve the residue with the mobile phase and transfer to a 10 ml volumetric flask, dilute to volume with the mobile phase and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.30 per cent of β,β′-dimethylacrylalkanin ($C_{16}H_{16}O_5$), calculated with reference to the dried drug.

Processing *Root of Arnebia euchroma* Eliminate foreign matter, cut into thick slices or sections.

Root of Arnebia guttata Eliminate foreign matter, wash clean, soften thoroughly, cut into thin slices and dry.

Root of Arnebia euchroma (*sliced*) Occurring in irregular cylindrical sections or slat-shaped slices, 1-2.5 cm in diameter, purplish-red or purplish-brown. Bark dark purple. Wood in cylindrical sections relatively small, yellowish-white or yellow.

Root of Arnebia guttata (*sliced*) Occurring in irregular cylindrical sections or slate-shaped slices, someone has short hard hairs, 0.5-4 cm in diameter, purplish-red or purplish-black. Bark dark purple. Wood is relatively small, yellowish white or yellow.
Carry out the method of determination of total pigments of hydroxynaphthaquinone as described under Assay, it contains not less than 0.80 per cent of total pigments of hydroxynaphthaquinone, calculated as shikonin ($C_{16}H_{16}O_5$).
Carry out the method for determination of β,β′-dimethylacrylalkanin as described under Assay, it contains not less than 0.30 per cent of β,β′-dimethylacrylalkanin ($C_{16}H_{16}O_5$).

Action To remove *heat* from blood, promote blood circulation, counteract *toxicity*, and facilitate eruptions.

Indications Purpura dark in colour due to exuberant *toxic-heat* in blood; measles with inadequate eruptions; sores; eczema; scalds and burns.

Usage and dosage 5-9 g; appropriate quantity is stewed into soft extract or soaked in vegetable oil and applied topically.

Storage Preserve in a dry place.

Radix Asparagi
(天冬, Tiandong)

Cochinchinese Asparagus Root

Cochinchinese Asparagus Root is the dried root tuber of *Asparagus cochinchinensis* (Lour.) Merr. (Fam. Liliaceae). The drug is collected in autumn and winter, washed clean, removed from stem base and rootlet, boiled or steamed until the centre of the drug is devoid of white core, peeled while hot, washed clean, and then dried.

Description Long fusiform, somewhat curved, 5-18 cm long, 0.5-2 cm in diameter. Externally yellowish-white to yellowish-brown, translucent, smooth or with deep and shallow longitudinal wrinkles, patches of the outer peel in greyish-brown colour occasionally found. Texture hard or tough and sleek, mucilaginous, fracture horny, stele yellowish-white. Odour, slight; taste, sweet and slightly bitter.

Identification Transverse section: Sometimes with remains of velamen. Cortex broad, with stone cells on the outer part, scattered or arranged in an interrupted ring, stone cells pale yellowish-brown, elongated-rectangular, long-elliptical or subrounded, 32-110 μm in diameter, walls thickened, with very fine and dense pits and pit-canals; mucilage cells scattered, raphides of calcium oxalate occurring in elliptical mucilage cells, 40-99 μm long. Endodermis distinct. Phloem strands and xylem strands 31-135, respectively, arranged alternatively, a few vessels developing towards the pith. Pith cells also containing raphides.

Water Not more than 16.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method described under the determination of ethanol-soluble extractives (Appendix Ⅹ A), using dilute ethanol as the solvent. Not less than 80.0 per cent.

Processing Eliminate foreign matter, wash clean rapidly, cut into thin slices, and dry.

Action To replenish *yin*, promote body fluid secretion and moisten the *lung*.

Indications Dryness of the *lung* marked by dry cough, or paroxysmal cough with sticky sputum, dry throat, thirst, and constipation.

Usage and dosage 6-12 g.

Storage Preserve in a ventilated dry place, protected from mould and moth.

Radix Astragali
(黄芪, Huangqi)

Milkvetch Root

Milkvetch Root is the dried root of *Astragalus membranaceus* (Fisch.) Bge. var. *mongholicus* (Bge.) Hsiao or *Astragalus membranaceus* (Fisch.) Bge. (Fam. Leguminosae). The drug is collected in spring or autumn, removed from rootlet and root stock, dried in the sun.

Description Cylindrical, some branched, upper part relatively thick, 30-90 cm long, 1-3.5 cm in diameter. Externally pale brownish-yellow or pale brown, with irregular, longitudinal wrinkles or furrows. Texture hard and tenacious, uneasily broken, fracture highly fibrous and starchy, bark yellowish-white, wood pale yellow, with radiate striations and fissures, the centre part of old root occasionally rotten-wood-shaped, blackish-brown or hollowed. Odour, weak; taste, slightly sweet and slightly bean-like on chewing.

Identification (1) Transverse section: Cork consisting of many rows of cells. Phelloderm of 3-5 rows of collenchymatous cells. Outer part of phloem rays often curved and fissured; fibres in bundles, walls thickened and lignified or slightly lignified, arranged alternately with sieve tube groups; stone cells sometimes visible near phelloderm. Cambium in a ring. Xylem vessels scattered singly or 2-3 aggregated in groups; wood fibres existing among vessels; sometimes stone cells visible in rays, singly or 2-4 in groups. Parenchymatous cells containing starch granules.
Powder: Yellowish-white. Fibres in bundles or scattered, 8-30 μm in diameter, thick-walled, with longitudinal fissures on the surface, the primary walls often separated from the secondary walls, both ends often broken to tassel-like, or slightly truncated. Bordered-pitted vessels colourless or orange, bordered pits arranged closely. Stone cells occasionally visible, rounded, oblong or irregular, slightly thick-walled.
(2) To 3 g of the powder add 20 ml of methanol and heat under reflux on a water bath for 1 hour and filter. Apply the filtrate to a prepared neutral aluminium oxide column (100-120 mesh, 5 g, 10-15 mm in inner diameter) and elute with 100 ml of 40% methanol, collect the eluate and evaporate it on a water bath to dryness. Dissolve the residue in 30 ml of water and extract by shaking with two 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol solutions and wash with two 20-ml quantities of water. Discard the water solution and evaporate the *n*-butanol solution to dryness on a water bath. Dissolve the residue in 0.5 ml of methanol as the test solution. Dissolve astragaloside Ⅳ CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B) using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13∶7∶2) as the mobile phase. Apply separately to the plate 2 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with 10% solution of sulfuric acid in ethanol, and heat at 105℃ to the spots distinct. A brown spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. Examine under ultraviolet light at 365 nm, the same orange-yellow fluorescent spots are shown in both chromatogams.
(3) To 2 g of the powder, add 30 ml of ethanol, heat under reflux for 20 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 15 ml of 0.3% solution of sodium hydroxide and filter. Adjust the filtrate to pH 5-6 with dilute hydrochloric acid, extract with 15 ml of ethyl acetate by shaking, separate the ethyl acetate solution and filter through a filter paper covered with a quantity of anhydrous sodium sulfate. Evaporate the filtrate to dryness and dissolve the residue in 1 ml of ethyl acetate as the test

solution. Prepare a solution of Radix Astragali reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (10∶1) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air, expose to ammonia vapour and examine under ultraviolet light at 365 nm. The main fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Heavy metals and harmful elements Carry out the methods for determinations of lead, cadmium, arsenic, mercury and copper (Appendix Ⅸ B, atomic absorption spectrophotometry, or inductively coupled plasma mass spectrometry), not more than 5 ppm of lead, 0.3 ppm of cadmium, 2 ppm of arsenic, 0.2 ppm of mercury and 20 ppm of copper.

Residual organochlorine pesticides Carry out the method for determination of organochlorine pesticides residue (Appendix Ⅸ Q), hexachlorocyclohexane (total BHC) is not more than 0.2 ppm, chlorophenothane (total DDT) is not more than 0.2 ppm, pentachloride nitrobenzene (PCNB) is not more than 0.1 ppm.

Extractives Carry out the cold extraction method as described under the determination of water-soluble extractives (Appendix Ⅹ A), not less than 17.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (32∶68) as the mobile phase. Using an evaporative light scattering detector. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of astragaloside Ⅳ.

Reference solution Weigh accurately a quantity of astragaloside Ⅳ CRS, dissolve in methanol to produce a solution containing 0.5 mg per ml.

Test solution Weigh accurately 4 g of the powder to a Soxhlet's extractor, add 40 ml of methanol, macerate overnight, add again an appropriate quantity of methanol, heat under reflux on a water bath for 4 hours, concentrate the extracts to dryness. Add 10 ml of water and slightly heat to dissolve the residue, extract by shaking with four 40-ml quantities of *n*-butanol saturated with water, combine the extracts and wash with two 40-ml quantities of ammonia TS. Discard the ammonia solutions and evaporate the *n*-butanol extracts to dryness, dissolve the residue in 5 ml of water and cool. Apply it to a column (1.5 cm in inner diameter, 12 cm in length) packed with D101 macroporous resin, elute with 50 ml of water, 30 ml of 40% ethanol, 80 ml of 70% ethanol successively, discard the water and 40% ethanol eluates, collect the 70% ethanol eluates and evaporate to dryness. Dissolve the residue in methanol, transfer to a 5 ml volumetric flask, dilute with methanol to volume and mix well.

Procedure Inject accurately 10 μl, 20 μl of the reference solution and 20 μl of the test solution, respectively, into the column, and calculate the content, using a calibration equation of logarithm alteration of two external standards. It contains not less than 0.040 per cent of astragaloside Ⅳ ($C_{41}H_6O_{14}$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, grade according to size, wash clean, soften thoroughly, cut into thick slices and dry.

Action To reinforce *qi* and strengthen the superficial resistance, induce urination and promote drainage of pus and growth of new tissue.

Indications Deficiency of *qi* with lack of strength, anorexia and loose stools, sinking of *spleen-qi* manifested by chronic diarrhea, prolapse of the rectum, hemafacia and abnormal uterine bleeding; spontaneous sweating due to weakened superficial resistance; edema due to deficiency of *qi*; abscesses difficult to burst or heal; anemia; wasting-thirst caused by internal heat; albuminuria in chronic nephritis; diabetes.

Usage and dosage 9-30 g.

Storage Preserve in a ventilated dry place, protected from moisture and moth.

Radix Astragali Praeparata cum Melle (炙黄芪, Zhihuangqi)

Prepared Milkvetch Root

Prepared Milkvetch Root is the processed Radix Astragali.

Procedure Stir-bake the slices of Radix Astragali as described under the method for stir-baking with honey (Appendix Ⅱ D) until no more sticky to fingers.

Description Rounded or elliptical slices, 0.8-3.5 cm in diameter, 0.1-0.4 cm in thickness. Externally pale brownish-yellow or pale brown, slightly lustrous, wrinkled and furrowed longitudinally. Cut surface pale yellow in bark and yellow in wood, striated radiately and fissured, sometimes the central part rotten-wood-shaped, blackish-brown or hollowed. Odour, honeyed-fragrant; taste, sweet, slightly sticky and bean-like on chewing.

Identification Carry out the method as described under the test (2) of Identification for Radix Astragali, it shows the same result.

Total ash Not more than 4.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Assay Weigh accurately 4 g of the powder, carry out the method as described under Assay for Radix Astragali. It contains not less than 0.030 per cent of astragaloside Ⅳ ($C_{41}H_{68}O_{14}$), calculated with reference to the dried drug.

Action To reinforce *qi* and invigorate the function of the spleen.

Indications Deficiency of *qi* with lack of strength, anorexia and loose stools.

Usage and dosage As described under Radix Astragali.

Storage As described under Radix Astragali.

Radix Aucklandiae
(木香, Muxiang)

Common Aucklandia Root

Common Aucklandia Root is the dried root of *Aucklandia lappa* Decne. (Fam. Compositae). The drug is collected in winter or spring, removed from soil and rootlet, cut into section, and the large one further longitudinally cut into pieces, dried, and removed from the rough outer bark by dashing.

Description Cylindrical or semicylindrical, 5-10 cm long, 0.5-5 cm in diameter. Externally yellowish-brown to greyish-brown, with distinct wrinkles, longitudinal furrows and lateral root scars. Texture hard, uneasily broken, fracture greyish-brown to dark brown, the outer layer greyish-yellow or brownish-yellow, cambium ring brown, having radial lines and scattered brown dotted oil cavities. Odour, characteristic and aromatic; taste, slightly bitter.

Identification (1) Powder: Yellowish-green. Inulin more frequent, with radial striations. Xylem fibres mostly in bundles, long fusiform, 16-24 μm in diameter, pit apertures horizontal-slited, crisscross or V-shaped. Reticulated vessels more frequent, bordered pitted vessels visible, 30-90 μm in diameter. Fragments of oil cavities visible, containing yellow or brown contents.

(2) To 0.5 g of the powder add 10 ml of chloroform and ultrasonicate for 30 minutes, filter, use the filtrate as the test solution. Dissolve dehydrocostuslactone CRS and costunolide CRS separately in chloroform to produce two solutions, each containing 0.5 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform and cyclohexane (5∶1) as the mobile phase. Apply separately 5 μl of each of the above three solutions to the plate. After developing and removal of the plate, dry it in air, spray with a 1% solution of vanillin in sulfuric acid and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Total ash Not more than 4.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (65∶35) as the mobile phase. As detector a spectrophotometer set at 225 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of costunolide.

Reference solution Weigh accurately a quantity of costunolide CRS and dehydrocostuslactone CRS, add methanol to produce a mixture containing 0.1 mg of each per ml as the reference solution.

Test solution Weigh accurately 0.3 g of the powder (through No. 4 sieve) to a stoppered conical flask, add accurately 50 ml of methanol, tightly stopper and weigh. Macerate overnight, ultrasonicate (power, 250 W; frequency, 50 kHz) for 30 minutes, cool and weigh again, replenish the loss of solvent with methanol, mix well and filter.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 1.8 per cent of the total amount of costunolide ($C_{15}H_{20}O_2$) and dehydrocostuslactone ($C_{15}H_{18}O_2$), calculated with reference to the dried drug.

Processing *Radix Aucklandiae* Eliminate foreign matter, wash clean, soak briefly, soften thoroughly, cut into thick slices, and dry in the shade.

Occurring in subrounded thick slices, 15-30 mm in diameter. Externally greyish-brown or brownish-yellow, the centre marked with chrysanthemum-flower-like radial lines and dark brown or greyish-brown annulations at intervals; oil dots (oil cavities) brown and scattered throughout; the peripheral outer layer yellowish-brown to greyish-brown, wrinkled longitudinally. Texture hard. Odour, characteristic aromatic; taste, bitter.

Radix Aucklandiae (*roasted*) Spread undried Radix Aucklandiae on paper made of straw and pile up consecutively in style of covering one layer of the drug with one layer of paper in a wired shallow basket, roast on a coke stove or in a drying shed until the volatile oil is absorbed by paper, and take out.

Action To relieve pain by promoting the flow of *qi*, and to improve digestion by reinforcing the spleen function.

Radix Aucklandiae (*roasted*) To check diarrhea.

Indications Distending pain in the chest and epigastria; tenesmus in dysentery; indigestion with anorexia.

Radix Aucklandiae (*roasted*) Diarrhea with abdominal pain.

Usage and dosage 1.5-6 g.

Storage Preserve in a dry place, protected from moisture.

Radix Bupleuri
(柴胡, Chaihu)

Chinese Thorowax Root

Chinese Thorowax Root is the dried root of *Bupleurum chinense* DC. or *Bupleurum scorzonerifolium Willd.* (Fam. Umbelliferae). According to the difference of the origin and description, the former is known as "Beichaihu" (Northern Chinese Thorowax Root), and the later is known as "Nanchaihu" (Southern Chinese Thorowax Root). The drug is collected in spring or autumn, removed from the aerial part and soil, and dried.

Description *Beichaihu* Cylindrical or elongated conical, 6-15 cm long, 0.3-0.8 cm in diameter. Root stock expanded, apex remained with 3-15 stem-bases or short fibrous leaf-bases, branched at the lower part. Externally blackish-brown or light brown, with longitudinal wrinkles, rootlet scars and lenticel-like protrudings. Texture hard and tenacious, uneasily broken, fracture laminated-fibrous, bark light brown, wood yellowish-white. Odour, slightly aromatic; taste, slightly bitter.

Nanchaihu Relatively thin, conical. Apex with numerous hairy fibres from withered leaves, usually not branched or slightly branched at the lower part. Externally reddish-brown or blackish-brown, with dense and transverse annulations near the root stock. Texture slightly soft, easily broken, fracture slightly even, non-fibrous. Odour, rancid.

Identification To 0.5 g of the powder, add 20 ml of methanol, ultrasonicate for 10 minutes and filter. Concentrate the filtrate to about 5 ml as the test solution. Prepare a solution of 0.5 g of Radix Bupleuri reference drug in the same manner as the reference drug solution. Dissolve saikosaponin a CRS and saikosaponin d CRS in ethanol to produce a mixture containing 0.5 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, ethanol and water (8∶2∶1) as the mobile phase. Apply separately to the plate 5 μl of each of the above three solutions. After developing and removal of the plate, dry in air, spray with a 2% solution of *p*-dimethylaminobenzaldehyde in 40% solution of sulfuric acid, heat at 60℃ to the spots clear. Examine in daylight and under ultraviolet light at 365 nm. The spots and the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots and the fluorescent spots obtained with the reference drug solution and the reference solution.

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method described under the determination of ethanol-soluble extractive (Appendix Ⅹ A), using ethanol as solvent, not less than 11.0 per cent.

Processing *Radix Bupleuri* Remove from foreign matter and remains of stems, wash clean, soften thoroughly, cut into thick slices, and dry.

Radix Bupleuri (*processed with vinegar*) Stir-bake the slices of Radix Bupleuri as described under the method for stir-baking with vinegar (Appendix Ⅱ D) to dryness.

Action To release both exterior and interior, soothe the liver, and elevate *yang*.

Indications Common cold with fever; alternate chills and fever such as malaria; distending pain in the chest and hypochondriac regions; menstrual disorders; prolapse of the uterus, prolapse of the rectum.

Usage and dosage 3-9 g.

Precaution The dried rhizome of *Bupleurum longiradiatum* Turcz., covered with numerous annular nodes externally, is poisonous and can not be used as Radix Bupleuri.

Storage Preserve in a ventilated dry place, protected from moth.

Radix Changii (明党参, Mingdangshen)

Medicinal Changium Root

Medicinal Changium Root is the dried root of *Changium smyrnioides* Wolff (Fam. Umbelliferae). The drug is collected in April and May, removed from rootlet, washed clean, treated with boiling water until the cut surface is devoid of a white core, then taken out to scrape off the outer bark, and dried after rinsing.

Description Slenderly cylindrical, long fusiform or irregularly stripe-shaped, 6-20 cm long, 0.5-2 cm in diameter. Externally yellowish-white or brownish, smooth or with longitudinal furrows and rootlet scars, some showing reddish-brown mottles. Texture hard and fragile, fracture horny, bark relatively thin, yellowish-white, sometimes easily separated from the whitish wood. Odour, slight; taste, weak.

Identification To 1 g of the powder add 20 ml of dilute ethanol, ultrasonicate for 20 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of acidic dilute ethanol (adjust to pH 2-3 with dilute hydrochloric acid) as the test solution. Prepare a solution of 1 g of Radix Changii reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-butanol, glacial acetic acid and water (19∶5∶5) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing for twice, ascending firstly to 5 cm and secondly to 10 cm, removal of the plate, dry in a current of hot air, spray with ninhydrin TS, and heat to visualize clearly. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Extractive Carry out the cold maceration method under the determination of water-soluble extractives (Appendix Ⅹ A), not less than 20.0 per cent.

Processing Wash clean, soften thoroughly, cut into thick slices, and dry.

Action To moisten the lung and resolve *phlegm*, nourish *yin* and regulate the function of the stomach, subdue hyperactivity of the liver, and counteract *toxicity*.

Indications Cough caused by *heat* in the lung; vomiting, regurgitation, anorexia and dryness of the mouth; bloodshot eyes and vertigo; boils and sores.

Usage and dosage 6-12 g.

Storage Preserve in a ventilated dry place, protected from moisture and moth.

Radix Codonopsis (党参, Dangshen)

Tangshen

Tangshen is the dried root of *Codonopsis pilosula* (Franch.) Nannf., *Codonopsis pilosula* Nannf. var. *modesta* (Nannf.) L. T. Shen or *Codonopsis tangshen* Oliv. (Fam. Campanulaceae). The drug is collected in autumn, washed clean, and dried in the sun.

Description *Root of Codonopsis pilosula* Long cylindrical, slightly curved, 10-35 cm long, 0.4-2 cm in diameter. Externally yellowish-brown to greyish-brown, with numerous warty prominent stem scars and buds on the root stock, and the apex of each stem scar sunkenly dotted; dense transverse annulations occurring below the root stock, gradually sparse downwards, some up to half length of the root while the transverse annulations rare or absent in some cultivars; whole root showing longitudinal wrinkles and scattered transverse lenticel-like protrudings, frequently with blackish-brown gelatinous substances at the fractured area of the rootlet. Texture slightly hard or tenacious, fracture somewhat even, cleft or striated radially, bark pale yellowish-white to pale brown, wood pale yellow. Odour, characteristic and aromatic; taste, sweetish.

Root of Codonopsis pilosula var. modesta 10-35 cm long, 0.5-2.5 cm in diameter. Externally yellowish-white to pale yellow, dense transverse annulations occurring below the

root stock, frequently up to over half length of the root. Fracture more cleft, bark greyish-white to pale brown.

Root of Codonopsis tangshen 10-45 cm long, 0.5-2 cm in diameter. Externally greyish-yellow to yellowish-brown, with distinctly longitudinal wrinkles. Texture slightly soft and campact, fracture less cleft, bark yellowish-white.

Identification (1) Transverse section: Cork of several up to over ten rows of cells, stone cells present at the outer side, single or grouped. Phelloderm narrow. Phloem broad, often with cracks at the outer side, and with pale yellow laticiferous tube groups scattered throughout and frequently alternated with sieve tube groups. Cambium in a ring. Xylem vessels singly scattered or aggregated in groups, arranged radially. Parenchymatous cells containing inulin.

(2) To 1 g of the powder add 25 ml of methanol, ultrasonicate for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of water and apply to a cartridge containing about 500 mg of a suitable octadecylsilyl silica gel for chromatography, washed previously with 10 ml of methanol followed by 10 ml of 20% solution of methanol, elute with 5 ml of 20% methanol, followed by 5 ml of methanol. Collect the methanol eluate and concentrate to about 1 ml as the test solution. Dissolve a quantity of lobetyolin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-butanol, glacial acetic acid and water (7∶1∶0.5) as the mobile phase. Apply separately to the plate 6 μl of each of the test solution and the reference drug solution. After developing and removal of the plate, dry in air, spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ for 5 minutes. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution.

Extractives Carry out the hot extraction method as described under the determination of ethanol-soluble extractive (Appendix Ⅹ A), using 45% ethanol as solvent, not less than 55.0 per cent.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry.

Action To reinforce *qi* and invigorate the function of the spleen and the lung.

Indications Hypofunction of the spleen and the lung manifested by shortness of breath, cough, palpitation, anorexia, loose stools; wasting-thirst caused by internal heat.

Usage and dosage 9-30 g.

Precaution Incompatible with Rhizoma et Radix Veratri.

Storage Preserve in a ventilated dry place, protected from moth.

Radix Curcumae (郁金, Yujin)

Turmeric Root Tuber

Turmeric Root Tuber is the dried root tuber of *Curcuma wenyujin* Y. H. Chen et C. Ling, *Curcuma longa* L., *Curcuma kwangsiensis* S. G. Lee et C. F. Liang, or *Curcuma phaeocaulis* Val. (Fam. Zingiberaceae). The drugs derived from the former two are known as "Wenyujin" and "Huangsiyujin", respectively, and the drugs derived from the others are known as "Guiyujin" or "Lüsiyujin", respectively, according to different appearance. The drug is collected in winter when stem and leaves wither, removed from soil and rootlet, steamed or boiled thoroughly, and dried.

Description *Wenyujin* Oblong or ovoid, slightly compressed or curved, the two ends tapering, 3.5-7 cm long, 1.2-2.5 cm in diameter. Externally pale brown or greyish-brown, with irregular longitudinal wrinkles, the raised longitudinal wrinkles pale in colour. Texture campact, fracture greyish-brown and horny. Endodermis ring distinct. Odour, slightly aromatic; taste, slightly bitter.

Huangsiyujin Fusiform, sometimes slender at one end, 2.5-4.5 cm long, 1-1.5 cm in diameter. Externally brownish-grey or greyish-yellow, with fine wrinkles. Fracture orange, but edges brownish-yellow to brownish-red. Odour, aromatic; taste, pungent.

Guiyujin Long conical or oblong, 2-6.5 cm long, 1-1.8 cm in diameter. Externally with sparse and shallow wrinkles or relatively coarse reticulate wrinkles. Odour, slight; taste, slightly pungent, bitter.

Lüsiyujin Long ellipsoid, rather stout, 1.5-3.5 cm long, 1-1.2 cm in diameter. Odour, slight; taste weak.

Identification Transverse section:

Wen Yujin Epidermal cells sometimes remaining, the outer walls slightly thickened. Velamen narrow, composed of 4-8 layers of cells with slightly sinuous and thin walls, regularly arranged. Cortex 1/2 as wide as the diameter of the root, oil cells poorly visible, endodermis distinct. In stele, phloem bundles and xylem bundles 40-55, respectively, arranged alternatively, Vessels 2-4 in a xylem bundle and xylem fibres slightly lignified, vessels polygonal, thin-walled. 20-90 μm in diameter. Gelatinized strach granules in parenchymatous cells visible.

Huangsiyujin The walls of the inner most layer of velamen cells thickened. Sometimes xylem vessels and fibres arranged in a continuous ring, oil cells numerous, pigment cells scattered throughout parenchyma.

Guiyujin The walls of velamen cells occasionally thickened, the inner side of velamen showing 1-2 rows of sclerenchymatous cells arranged in a ring, with distinct striations. Vessels subrounded, up to 160 μm in diameter.

Lüsiyujin Cortex at the outside of stele frequently exhibiting pigment cells. Phloem bundles shrivelled, xylem bundles, 64-72, vessels flattened.

Water Carry out the determination of water (Appendix Ⅸ H, method 2), not more than 15.0 per cent.

Total ash Not more than 9.0 per cent (Appendix Ⅸ K).

Processing Wash clean, soften thoroughly, cut into thin slices, and dry; or wash clean, dry, and then break to pieces.

Action To promote the flow of *qi*, eliminate *blood stagnation*, clear the heart, remove depression by regulating *qi*, and promote bile flow to relieve jaundice.

Indications Amenorrhea, dysmenorrhea, distending or pricking pain in the chest and abdomen; impairment of consciousness in febrile diseases, epilepsy, mania; jaundice with dark urine.

Usage and dosage 3-9 g.

Storage Preserve in a dry place, protected from moth.

Radix Cyathulae (川牛膝, Chuanniuxi)

Medicinal Cyathula Root

Medicinal Cyathula Root is the dried root of *Cyathula officinalis* Kuan (Fam. Amaranthaceae). The drug is collected in autumn and winter, removed from root stock, rootlet and soil, baked or sun-dried to half-dryness, pilled up to be softened, and then baked or sunned to be dried completely.

Description Subcylindrical, somewhat twisted, slightly tapering downward or less-branched, 30-60 cm long, 0.5-3 cm in diameter. Externally yellowish-brown, with longitudinal wrinkles, rootlet scars and numerous transverse lenticel-like protrusions. Texture tenacious, uneasily broken, fracture pale yellow or brownish-yellow, showing dotted vascular bundles arranged in several concentric circles. Odour, slight; taste sweet.

Identification Transverse section: Cork consisting of several layers of cells. Phelloderm narrow. Vascular cylinder large, tertiary vascular bundles collateral, interruptedly arranged in 4-11 whorls, intrafascicular cambium at the inner side visible; vessels singly scattered in xylem, lignified, arranged radially; xylary fibres rather developed, sometimes tangentially elongated or arranged in an interrupted ring, secondary vascular system usually separated into 2-9 strands at the central, sometimes sparsely scattered vessels visible in the centre of root. Parenchymatous cells containing sand crystals and prisms of calcium oxalate.
Powder: Brown. Sand crystals and prisms of calcium oxalate scattered or filled in parenchymatous cells. Bordered pitted vessels 10-80 μm in diameter, pits rounded or elongated transversely, alternative closely arranged, some vessel elements fusiform at the ends. Fibres slat-shaped, curved, tapering towards the end, 8-25 μm in diameter, walls 3-5 μm thick, pits simple oblique or V-shaped, sometimes showing bordered pits, pit apertures crisscross, pit-canals distinct, dense or sparse.

Water Carry out the method for the determination of water (Appendix Ⅸ H, Method 1), not more than 16.0 per cent.

Total ash Not more than 8.0 per cent (Appendix Ⅸ K), using the granules of the diameter less than 3 mm.

Acid-insoluble ash Not more than 1.5 per cent (Appendix Ⅸ K), using the granules of the diameter less than 3 mm.

Extractives Carry out the cold extraction method as described under the determination of water-soluble extractives (Appendix Ⅹ A), using the granules of the diameter less than 3 mm. Not less than 65.0 per cent.

Processing *Radix Cyathulae* Eliminate foreign matter and root stock, wash clean, soften thoroughly, cut into thin slices, and dry.
In rounded slices, 0.1-0.2 cm thick, 0.5-3 cm in diameter. Externally greyish-brown, cut surfaces pale yellow or brownish-yellow. Numerous yellow dotted vascular bundles visible.

Radix Cyathulae (*stir-baked with wine*) Stir-bake slices of Radix Cyathulae as described under the method for stir-baking with wine (Appendix Ⅱ D) to dryness.

Action To eliminate blood stasis and stimulate menstruation, ease tension of joints, induce urination and relieve stranguria.

Indications Amenorrhea with mass formation in the lower abdomen; placenta retention after childbirth, arthralgia, weakness or contracture of the legs; hematuria; blood stranguria.

Usage and dosage 4.5-9 g.

Precaution Contraindicated in pregnancy.

Storage Preserve in a cool and dry place, protected from moisture.

Radix Dichroae (常山, Changshan)

Antifeverile Dichroa Root

Antifeverile Dichroa Root is the dried root of *Dichroa febrifuga* Lour. (Fam. Saxifragaceae). The drug is collected in autumn, removed from rootlet, washed clean, and dried in the sun.

Description Cylindrical, often twisted or branched, 9-15 cm long, 0.5-2 cm in diameter. Externally brownish-yellow, with fine longitudinal striations, the outer bark easily exfoliated, exposing pale yellow wood. Texture hard, uneasily broken, dusting on breaking; transversely cut surface yellowish-white, rays whitish, arranged radiately. Odour, slight; taste, bitter.

Identification (1) Transverse section: Cork consisting of several layers of cells. Phelloderm narrow, a few cells containing resinous masses or raphides of calcium oxalate. Phloem narrow, raphides of calcium oxalate numerous. Cambium in an irregular, wavy ring. Xylem occupying the main part, completely lignified, rays varying in width; vessels polygonal, singly scattered or aggregated, some containing yellow tyloses. Parenchymatous cells containing starch granules.
(2) Heat under reflux 2 g of the powder with 10 ml of 70% ethanol for 15 minutes, allow to cool and filter. Evaporate the filtrate to dryness, add 2 ml of 1% hydrochloric acid solution to the residue, stir and filter. To the filtrate add 2 drops of potassium iodobismuthate TS, a brownish-red precipitate is produced.

Processing *Radix Dichroae* Eliminate foreign matter, grade according to size, soak in water, soften thoroughly, cut into thin slices, and dry in the sun.

Radix Dichroae (*stir-baking*) Stir-bake the slices of Radix Dichroae as described under the method for simple stir-baking (Appendix Ⅱ D) until the colour deepens.

Action To stop malaria, and eliminate phlegm.

Indication Malaria.

Usage and dosage 5-9 g.

Precaution Vomiting is it's side effect; overdosage should be avoided. Used with caution in pregnancy.

Storage Preserve in a ventilated and dry place.

Radix Dipsaci
(续断, Xuduan)

Himalayan Teasel Root

Himalayan Teasel Root is the dried root of *Dipsacus asperoides* C. Y. Cheng et T. M. Ai; (Fam. Dipsacaceae). The drug is collected in autumn, removed from the root stock and rootlet, baked to half-dryness, piled up until a green colour is developed inside, and then baked to dryness.

Description Cylindrical, somewhat flattened, some slightly curved, 5-15 cm long, 0.5-2 cm in diameter. Externally greyish-brown or yellowish-brown, with slightly twisted or obviously twisted longitudinal wrinkles and furrows, showing transversal lenticel-like cicatrices and sparse rootlet scars. Texture soft and hardened after long storage, easily broken, fracture uneven, bark dark green or brown, the outer part brown or pale brown; wood yellowish-brown, vessel bundles arranged radially. Odour, slightly aromatic; taste, bitter, slightly sweet, then astringent.

Identification (1) Transverse section: Cork consisting of several layers of cells. Phelloderm narrow. Groups of sieve tubes sparsely scattered in phloem. Cambium ring distinct or less distinct. Xylem ray broad, vessels dense near the cambium and lessened inward, often singly scattered or 2-4-grouped. Pith small, and mostly absent in small roots. Parenchymatous cells containing clusters of calcium oxalate. Powder: Yellowish-brown, clusters of calcium oxalate fairly abundant, 15-50 μm in diameter, scattered throughout or embedded in shrunken parenchymatous cells, sometimes several clusters arranged in a dense slat in shape. The walls of fusiform parenchymatous cells slightly thickened, with fine, oblique crisscross striations. Bordered pits and reticulated vessels up to 72 (-90) μm in diameter. Cork cells pale brown, subrectangular, subsquare polygonal or long-polygonal in surface view, with thin walls.

(2) Stir well 3 g of the powder with 4 ml of strong ammonia TS, stand for 1 hour, add 30 ml of chloroform and ultrasonicate for 30 minutes, filter. Extract the filtrate by shaking with 30 ml of hydrochloric acid solution (4→100) in portions, adjust the extract to pH 10 with strong ammonia TS and extract by shaking with 20 ml of chloroform in portions. Combine the chloroform extracts, concentrate to about 0.5 ml as the test solution. Prepare a solution of 3 g of Radix Dipsaci reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 2% sodium hydroxide solution as the coating substance and a mixture of benzene and dehydrated ethanol (9∶2) as the mobile phase. Apply separately to the plate 10 μl of each of the two solutions. After developing and removal of the plate, spray with dilute potassium iodobismuthate TS and then a 5% solution of sodium nitrite in 70% ethanol, stand for a moment. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) To 0.2 g of the powder add 15 ml of methanol, ultrasonicate for 30 minutes and filter. Evaporate the filtrate to dryness and dissolve the residue in 2 ml of methanol as the test solution. Dissolve a quantity of asperosaponin Ⅵ CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of *n*-butanol, acetic acid and water (4∶1∶5) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air, spray with a 10% solution of sulfuric acid in ethanol and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 10.0 per cent.

Total ash Not more than 12.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.5 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of water-soluble extractives (Appendix Ⅹ A, the hot extraction method), not less than 45.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (30∶70) as the mobile phase. As detector a spectrophotometer set at 212 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of asperosaponin Ⅵ.

Reference solution Weigh accurately a quantity of asperosaponin Ⅵ CRS, dissolve in methanol to produce a solution containing 1.5 mg per ml. Measure accurately 1 ml in a 10 ml volumetric flask, dilute with the mobile phase to volume and mix well.

Test solution Weigh accurately 0.5 g of the fine powder to a stopper conical flask, add accurately 25 ml of methanol, tightly stopper and weigh. Ultrasonicate (power, 100 W; frequency, 40 kHz) for 30 minutes, cool and weigh again, replenish the loss of solvent with methanol, mix well and filter. Measure accurately 5 ml of the successive filtrate in a 50 ml volumetric flask, dilute with the mobile phase to volume and mix well.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 2.0 per cent of asperosaponin Ⅵ ($C_{47}H_{76}O_{18}$), calculated with reference to the dried drug.

Processing *Radix Dipsaci* (*sliced*) Wash clean, soften thoroughly, cut into thin slices, and dry.

Subrounded or elliptical. In cut surface, bark dark green or brown, wood greyish-yellow or yellowish-brown, showing radial lines consisting of vessel groups, the part of cambium exhibiting a dark-coloured ring. Carry out the method of Extractives mentioned above, containing not less than 45.0 per cent.

Radix Dipsaci (*processed with wine*) Stir-bake the slices of Radix Dipsaci as described under the method for stir-baking with wine (Appendix Ⅱ D) to be blackish.

Radix Dipsaci (*processed with salt-water*) Stir-bake the slices of Radix Dipsaci as described under the method for stir-baking with salt-water (Appendix Ⅱ D) to dryness.

Action To replenish the liver and the kidney, strengthen tendons and bones, heal bone fractures, and arrest abnormal uterine bleeding.

Indications Aching and weakness of the loins and knees; rheumatic arthralgia, abnormal uterine bleeding or menorrhalgia, uterine bleeding during pregnancy; traumatic injuries.

Radix Dipsaci (processed with wine): Usually used in impediment disease due to *wind-dampness*; traumatic injuries.
Radix Dipsaci (processed with salt-water): Usually used in aching and weakness of the lower back and knees.

Usage and dosage 9-15 g.

Storage Preserve in a dry place, protected from moth.

Radix Echinopsis (禹州漏芦, Yuzhou loulu)

Globethistle Root

Globethistle Root is the dried root of *Echinops latifolius* Tausch. or *Echinops grijisii* Hance (Fam. Compositae). The drug is collected in spring or autumn, removed from rootlet, and dried.

Description Subcylindrical, slightly tortuous, 10-25 cm long, 0.5-1.5 cm in diameter. Externally greyish-yellow or greyish-brown. wrinkled longitudinally, top with brown fibrous rigid hairs. Texture hard, uneasily broken, fracture showing brown in bark and yellow alternating with black radial striations in wood. Odour, slightly; taste, slightly astringent.

Identification Powder: Brownish-yellow. Phloem fibres in bundles, 20-42 μm in diameter, with thickened walls, the interspaces of cells containing brown resinous substances. Xylem fibres slender, acuminate at two ends, 12-30 μm in diameter, walls relatively thick. Bordered pitted vessels and reticulated vessels more frequent, 20-120 μm in diameter. Stone cells less frequent, subrounded, rectangular or square, 35-150 μm in diameter, markedly striated and pitted-canalled. The interspaces of stone cells containing brown resinous substances. Inulin visible.

Water Carry out the method for the determination of water (Appendix Ⅸ H, Method 1), not more than 13.0 per cent.

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 4.5 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol as solvent, not less than 13.0 per cent.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry.

Action To remove *heat* and counteract *toxicity*, drain pus, stop bleeding, eliminate carbuncles, and promote lactation.

Indications Sores, carbuncles, mastitis, galactostasis, scrofula, pyogenic skin infection.

Usage and dosage 4.5-9 g.

Precaution Contraindicated in pregnancy.

Storage Preserve in a ventilated and dry place.

Radix et Rhizoma Asari (细辛, Xixin)

Manchurian Wildginger root

Manchurian Wildginger root is the dried root and rhizome of *Asarum heterotropoides* Fr. Schmidt var. *mandshuricum* (Maxim.) Kitag., *Asarum sieboldii* Miq. var. *seoulense* Nakai or *Asarum sieboldii* Miq. (Fam. Aristolochiaceae). The former two are known as "Liaoxixin". The drug is collected at fruiting stage in summer or at early autumn, removed from aerial part and soil, and dried in the shade.

Description *Radix of Asarum heterotropoides* var. *mandshuricum* Usually rolled into a mass. Rhizomes horizontal growing, irregular cylindrical, short-branched, 1-10 cm long, 2-4 mm in diameter; externally greyish-brown, rough, with ringed nodes, internodes 2-3 mm long, with dish-like stem scars at the top of branches. Roots slender, densely occuring at nodes, 10-20 cm long, 1 mm in diameter; externally greyish-yellow, smooth or longitudinally wrinkled, with fibrous roots or scars. Texture fragile, easily broken, fracture even, yellowish-white or white. Odour, pungent and aromatic; taste, pungent with tongue-numbing feeling.

Radix of Asarum sieboldii var. *seoulense* Rhizomes 1-5 mm in diameter, internodes 0.1-1 cm long.

Radix of Asarum sieboldii Rhizomes 5-20 cm long, 1-2 mm in diameter, internodes 0.2-1 cm long. Odour and taste relatively weak.

Total ash Not more than 12.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for determination of volatile oil (Appendix Ⅹ D).
It contains not less than 2.0 per cent (ml/g) of volatile oil.

Processing Eliminate foreign matter, spray with water, soften briefly, cut into sections and dry in the shade.

Action To dispel *wind-cold*, relieve nasal obstruction, alleviate pain and remove retained morbid fluid.

Indications Common cold, headache, toothache; sinusitis with nasal obstruction; rheumatic arthralgia; cough and dyspnea due to retention of *phlegm* and morbid fluid.

Usage and dosage 1-3 g; appropriate quantity for external use.

Precaution Incompatible with Rhizoma et Radix Veratri.

Storage Preserve in a cool and dry place.

Radix et Rhizoma Asteris (紫菀, Ziwan)

Tatarian Aster Root

Tatarian Aster Root is the dried root and rhizome of *Aster tataricus* L. f. (Fam. Compositae). The drug is collected in spring or autumn, removed from the knotty rhizome and soil, braided and dried in the sun, or dried in the sun directly.

Description Rhizomes in irregular masses, varying in size,

apex with remains of stems and leaves. Texture slightly hard. Numerous rootlets fasciculated on rhizomes, 3-15 cm long, 0.1-0.3 cm in diameter, frequently braided; externally purplish-red or greyish-red, with longitudinal wrinkles. Texture flexible. Odour, slightly aromatic; taste, sweet and slightly bitter.

Identification (1) Transverse section of root: Epidermal cells frequently withered or sometimes sloughing off, containing purplish-red pigments. Hypodermal cells one layer, somewhat elongated tangentially, some containing purplish-red pigments, lateral and inner walls slightly thickened. Cortex broad, with intercellular spaces; secretory ducts 4-6, in the inner side of cortex; endodermis distinct. Stele small; xylem somewhat polygonal; each of phloem bundles alternating with the arc of xylem respectively; the centre usually showing a pith.
Rhizomes: Epidermis with glandular hairs; cortex scattered with stone cells and sclerenchymatous cells. Parenchymatous cells of root and rhizome containing inulin, sometimes containing clusters of calcium oxalate.
(2) To 1 g of the powder add 30 ml of petroleum ether (60-90℃), heat under reflux for 30 minutes, filter and concentrate the filtrate to 1 ml as the test solution. Dissolve a quantity of shionone CRS in chloroform to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (9:1) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 2, 4-dinitrophenylhydrazine TS. A yellow spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Total ash Not more than 15.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 8.0 per cent (Appendix Ⅸ K)

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (96 : 4) as the mobile phase. As detector a spectrophotometer set at 200 nm, maintain the column temperature at 40℃. The number of theoretical plates of the column is not less than 3500, calculated with the reference to the peak of shionone.

Reference solution Weigh accurately a quantity of shionone CRS, dissolve in acetonitrile to produce a solution containing 0.1 mg per ml.

Test solution Weigh accurately 1 g of the powder (through No. 3 sieve) to a stopper conical flask, add accurately 20 ml of methanol and weigh. Warmly macerate for 1 hour at 40℃, ultrasonicate (power, 250 W; frequency, 40 kHz) for 15 minutes, take out, cool and weigh again, replenish the loss of solvent with methanol and mix well.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.10 per cent of shionone ($C_{30}H_{50}O$), calculated with reference to the dried drug.

Processing *Radix Asteris* Eliminate foreign matter, wash clean, soften briefly, cut into thick slices, and dry.

Radix Asteris (stir-baked with honey) Stir-bake the slices of Radix Asteris as described under the method of stir-baking with honey (Appendix Ⅱ D) until no more sticky to fingers.

Action To eliminate phlegm and relieve cough.

Indications Acute or chronic cough and dyspuea with copious phlegm; hemoptysis in consumptive diseases.

Usage and dosage 5-9 g.

Storage Preserve in a cool and dry place, protected from moisture.

Radix et Rhizoma Clematidis (威灵仙, Weilingxian)

Chinese Clematis Root

Chinese Clematis Root is the dried root and rhizome of *Clematis chinensis* Osbeck, *Clematis hexapetala* Pall. or *Clematis manshurica* Rupr. (Fam. Ranunculaceae). The drug is collected in autumn, removed from soil, and dried in the sun.

Description *Root of Clematis chinensis* Rhizomes cylindrical, 1.5-10 cm long, 0.3-1.5 cm in diameter; externally pale brownish-yellow, crowned by remains of stems, the lower part bearing numerous rootlets. Texture relatively tough, fracture fibrous. Roots slender cylindrical, somewhat curved, 7-15 cm long, 1-3 mm in diameter; externally blackish-brown, longitudinally fine-wrinkled, sometimes showing yellowish-white wood when bark falling off. Texture hard and fragile, easily broken, fracture showing bark relatively broad, wood yellowish and slightly square, often with cleft between bark and wood. Odour, slight; taste, weak.

Root of Clematis hexapetala Rhizomes short cylindrical, 1-4 cm long, 0.5-1 cm in diameter. Roots 4-20 cm long, 1-2 mm in diameter; externally brown to brownish-black, wood in fracture subrounded. Taste, salty.

Root of Clematis manshurica Rhizomes cylindrical, 1-11 cm long, 0.5-2.5 cm in diameter. Roots relatively dense, 5-23 cm long, 1-4 mm in diameter; externally brownish-black, wood in fracture subrounded. Taste, pungent.

Identification (1) Transverse section of root:

Root of Clematis chinensis The outer walls of epidermal cells thickened, brownish-black. Cortex broad, consisting of parenchymatous cells, exodermis cells tangentially elongated; endodermis distinct. The outer side of phloem usually exhibiting fibre bundles and stone cells, fibres 18-43 μm in diameter. Cambium distinct. Xylem completely lignified. Parenchymatous cells containing starch granules.

Root of Clematis hexapetala Exodermis cells mostly radially elongated and the adjacent 1-2 rows of cells with slightly thickened walls; the outer side of phloem without fibre bundles and stone cells.

Root of Clematis manshurica Exodermis cells radially elongated, slightly tangentially elongated in the older roots; occasionally the outer side of phloem exhibiting fibre bundles and stone cells.
(2) To 1 g of the powder add 50 ml of ethanol, heat under reflux for 2 hours and filter. Concentrate the filtrate to about 20 ml, add 3 ml of hydrochloric acid and heat under reflux for 1 hour, add 10 ml of water, cool, extract by shaking with 25 ml of petroleum ether (60-90℃), and evaporate the petroleum ether extract to dryness. Dissolve the residue in 10 ml of dehydrated ethanol as the test solution. Dissolve a

quantity of oleanolic acid CRS in dehydrated ethanol to produce a solution containing 0.45 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and formic acid (20∶3∶0.2) as the mobile phase. Apply separately to the plate 3 μl of each of the above two solutions. After developing in a chamber previously saturated with the mobile phase for 30 minutes, removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference drug solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent.

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method as described under the determination of ethanol-soluble extractives (Appendix Ⅹ A), using ethanol as the solvent, not less than 15.0 per cent.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into sections, and dry.

Action To relieve rheumatic conditions, remove obstruction of collaterals, and alleviate pain.

Indications Rheumatic or rheumatoid arthralgia with numbness of limbs, muscle contracture and immobilized limbs; fish bone stuck in the throat.

Usage and dosage 6-9 g.

Storage Preserve in a dry place.

Radix et Rhizoma Cynanchi Atrati (白薇, Baiwei)

Blackend Swallowwort Root

Blackend Swallowwort Root is the dired root and rhizome of *Cynanchum atratum* Bge. or *Cynanchum versicolour* Bge. (Fam. Asclepiadaceae). The drug is collected in spring or autumn, washed clean, and dried.

Description Rhizomes thick and short, knotty, mostly tortuous. Some rounded stem scars occurring at the upper part and numerous slender roots fascicled bilaterally at the lower part. Roots 10-25 cm long, 1-2 mm in diameter. Externally brownish-yellow. Texture fragile, easily broken, fracture yellowish-white in bark and yellow in wood. Odour, slight; taste, slightly bitter.

Identification (1) Transverse section: Epidermal cells 1 layer, only some remains existed. Hypodermal cells 1 layer, slightly radial elongated; secretory cells rectangular or slightly bended, containing yellowish secretion. Cortex broad, endodermis distinct. Xylem cells all lignified, vessels mostly at laterals and fibres at centre. Parenchymatous cells containing clusters of calcium oxalate and numerous of starch granules.
Powder: Greyish-brown. Clusters of calcium oxalate relatively numerous, 7-45 μm in diameter. Secretory cells subrectangular, often containing yellowish secretion. Xylem fibres 160-480 μm long, 14-24 μm in diameter. Stone cells 40-50 μm long, 10-30 μm in diameter. Vessels mostly reticulated or bordered pitted thickened. Single starch granules 4-10 μm in diameter, hilum pointed, slit-shaped or three-forked; compound granules of 2-6 components.

(2) To 1 g of the powder add 30 ml of methanol, ultrasonicate for 20 minutes, cool, filter, and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 1 g of Radix Cynanchi Atrati reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of *n*-butanol, ethyl acetate and water (4∶1∶5) as the mobile phase. Apply separately to the plate 2 μl of each of the two solutions. After developing and removal of the plate, dry in air. Spray with a solution of sulfuric acid in ethanol (1→10) and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Foreign matter Not more than 4.0 per cent (Appendix Ⅸ A).

Water Carry out the method for the determination of water (Appendix Ⅸ H, Method 1), not more than 11.0 per cent.

Total ash Not more than 13.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 4.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method as described under the determination of ethanol-soluble extractives (Appendix Ⅹ A), using dilute ethanol as the solvent, not less than 19.0 per cent.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into sections, and dry.

Action To remove *heat* from blood, relieve dysuria, and counteract *toxicity* and cure sores.

Indications Fever due to invasion of *yin* system by *warm* pathogenic factors or *yin-deficiency*, bone-steaming, tidal fever, or fever due to *blood-deficiency* after childbirth, heat stranguria, blood stranguria, carbuncles and other subcutaneous pyogenic infections.

Usage and dosage 4.5-9 g.

Storage Preserve in a ventilated dry place.

Radix et Rhizoma Cynanchi Paniculati (徐长卿, Xuchangqing)

Paniculate Swallowwort Root

Paniculate Swallowwort Root is the dried root and rhizome of *Cynanchum paniculatum* (Bge.) Kitag. (Fam. Asclepiadaceae). The drug is collected in autumn, removed from foreign matter, and dried in the shade.

Description Rhizomes irrgeular cylindrical, knotty, 0.5-3.5 cm long, 2-4 mm in diamter. Sometimes apex with remains of stem, slenderly cylindrical, about 2 cm long, 1-2 mm in diameter, fracture hollowed; the nodes of rhizome surrounded by numerous roots. Roots slenderly cylindrical, curved, 10-16 cm long, 1-1.5 mm in diameter. Externally pale yellowish-white to pale brownish-yellow, or brown; with fine longitudinal wrinkles and fibrous roots. Texture fragile, easily broken, fracture starchy, bark whitish or yellowish-white, cambium ring pale brown, wood small. Odour, aromatic; taste, pungent and cool.

Identification To 1 g of the powder add 10 ml of ether, stopper tightly, shake for 10 minutes and filter. Evaporate

the filtrate to dryness, dissolve the residue in 1 ml of acetone as the test solution. Dissolve paeonol CRS in acetone to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (3∶1) as the mobile phase. Apply separately to the plate 5 μl of the test solution and 10 μl of the reference solution. After developing and removal of the plate, dry in air, and spray with a 5% solution of ferric chloride in ethanol acidified with hydrochloric acid, heat to the spots distinct. The bluish-brown spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 2), not more than 15.0 per cent.

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 5.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using ethanol as the solvent, not less than 10.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (45∶55) as the mobile phase. As detector a spectrophotometer set at 274 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of paeonol.

Reference solution Weigh accurately a quantity of paeonol CRS, dissolve in methanol to produce a solution containing 20 μg per ml.

Test solution Weigh accurately 0.5 g of the coarse powder to a stopper conical flask, accurately add 50 ml of methanol and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, cool and weigh again, replenish the loss of solvent with methanol, mix well and filter. Measure accurately 1 ml of the successive filtrate to a 10 ml volumetric flask, dilute with methanol to volume, and mix well.

Procedure Accurately inject 10 μl of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 1.3 per cent of paeonol ($C_9H_{10}O_3$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean rapidly, cut into sections, and dry in the shade.

Action To relieve rheumatic conditions, and arrest pain and itching.

Indications Rheumatic arthralgia, epigastric pain and distension, toothache, lower back pain, traumatic injuries; urticaria, eczema.

Usage and dosage 3-12 g, decocted for a short time only.

Storage Preserve in a cool and dry place.

Radix et Rhizoma Ephedrae (麻黄根, Mahuanggen)

Ephedra Root

Ephedra Root is the dried root and rhizome of *Ephedra sinica* Stapf or *Ephedra intermedia* Schrenk et C. A. Mey. (Fam. Ephedraceae). The drug is collected in the late autumn, removed from remains of stem, rootlet and soil, and dried in the sun.

Description Cylindrical, slightly curved, 8-25 cm long, 0.5-1.5 cm in diameter. Externally reddish-brown or greyish-brown, with longitudinal wrinkles and scars of rootlets. The outer bark rough, easily exfoliated. Rhizomes with nodes, internodes 0.7-2 cm long, externally with transversally elongated lenticel-like protrudings. Texture light, hard and fragile, fracture yellowish-white in bark, pale yellow to yellow in wood, showing radial rays, with a pith in the centre. Odour, slight; taste, slightly bitter.

Identification Transverse section of root: Cork consisting of about 10 or more layers of cells, with rhytidome outside. Phelloderm consisting of several layers of parenchymatous cells, containing sand crystals of calcium oxalate, scattering fibre bundles and stone cells. Phloem narrow. Cambium in a ring. Xylem well developed, consisting of vessels, tracheids and xylem fibres; rays broad, containing sand crystals of calcium oxalate. Sometimes pith with fibres; parenchymatous cells with pits. Rays of rhizome relatively narrow.

Powder: Brownish-red or brownish-yellow. Cork cells rectangular, brown, containing sand crystals of calcium oxalate. Most fibres scattered singly, 20-25 μm in diameter, walls thickened and lignified, with distinct oblique pits. Spiral and reticulated vessels 30-50 μm in diameter, the perforated plates of vessel members with numerous rounded pores. Sometimes stone cells visible, oblong, fibrous or branched, 20-50 μm in diameter, thick-walled. Parenchymatous cells in pith subsquare, subrectangular or subrounded, walls slightly thickened, with pits. Parenchymatous cells containing sand crystals of calcium oxalate.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry.

Action To arrest perspiration.

Indications Spontaneous sweating, night sweating.

Usage and dosage 3-9 g; for external use, appropriate quantity is ground into powder and applied to the skin.

Storage Preserve in a dry place.

Radix et Rhizoma Gentianae (龙胆, Longdan)

Chinese Gentian

Chinese Gentian is the dried root and rhizome of *Gentiana manshurica* Kitag., *Gentiana scabra* Bge., *Gentiana triflora* Pall. or *Gentiana ringescens* Franch. (Fam. Gentianaceae). The former three are known as "Longdan" and the later is

known as "Jianlongdan". The drug is collected in spring and autumn, washed clean and dried.

Description *Longdan* Rhizomes irregularly lump-shaped, 1-3 cm long, 0.3-1 cm in diameter; externally dark greyish-brown or dark brown, the upper part with stem scars or remains of stem bases, surroundings and the lower part bearing numerous slender roots. Roots cylindrical, slightly twisted, 10-20 cm long, 2-5 mm in diameter; externally pale yellow or yellowish-brown, mostly the upper part exhibiting obvious transverse wrinkles, the lower part narrower and marked with longitudinal wrinkles and rootlet scars. Texture fragile, easily broken, fracture slightly even, bark yellowish-white or yellowish-brown, wood paler in colour and appearing dotted-ringed. Odour, slight; taste, rather bitter.

Jianlongdan Externally without transverse wrinkles, the outer layer membranaceous, easily falling off, wood yellowish-white, easily separated from bark.

Identification (1) Transverse section:

Longdan Epidermal cells sometimes found, the outer walls relatively thick. Cortex narrow; cells of exodermis subsquare, walls slightly thick, suberized; cells of endodermis elongated tangentially, each cell divided by longitudinal walls into several subsquare small cells. Phloem broad and cleft. Cambium less distinct. Vessels 3-10 grouped. Pith distinct. Parenchymatous cells containing minute needles of calcium oxalate.

Jianlongdan The tissues outside the endodermis mostly falling off. Vessels in xylem well developed and evenly and densely distributed. Pith absent.
Powder: Yellowish-brown.

Longdan Cells of exodermis spindle-shaped in surface view, each cell divided by transverse walls into several small rectangular cells. Cells of endodermis subrectangular in surface view, fairly large, periclinal walls showing minute transverse striations, each cell divided by longitudinal septa walls into several small polisade-like cells, mostly longitudinal septa beaded. Parenchymatous cells containing minute needle crystals of calcium oxalate. Reticulated and scalariform vessels up to about 45 μm in diameter.

Jianlongdan Exodermis absent. Cells of endodermis subsquare or subrectangular, transverse striations of the periclinal walls relatively thick and dense, some up to 3 μm thick, each cell divided into several small palisade-like cells, septa slightly thickened or beaded.
(2) Macerate 0.5 g of the powder in 5 ml of methanol for 4-5 hours, filter, concentrate the filtrate to about 2 ml and use it as the test solution. Dissolve gentiopicrin CRS in methanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of ethyl acetate, methanol and water (20:2:1) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate, develop twice in the mobile phase. After developing and removal of the plate, dry in air, examine under ultraviolet light at 254 nm. A spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Total ash Not more than 7 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (3:7) as the mobile phase. As detector a spectrophotometer set at 270 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of gentiopicrin.

Internal standard solution Weigh accurately a quantity of caffeine CRS, add methanol to produce a solution containing 0.4 mg per ml.

Procedures Weigh accurately a quantity of gentiopicrin CRS, dissolve in methanol to produce a solution con-taining 1 mg per ml. Measure accurately 5 ml of the solution and the internal standard solution, respectively, and mix well. Accurately inject 10 μl of the mixture solution into column and record the chromatogram. Weigh accurately 0.5 g of the medium powder in a stopper conical flask, add accurately 10 ml of methanol and allow to stand for 12 hours, shake constantly. Measure accurately 2 ml of the supernatant to a 10 ml volumetric flask, add accurately 2 ml of the internal standard solution, dilute with methanol to volume, mix well. Accurately inject 10 μl into the column, calculated the content with corrected internal standard method according to the peak area.
It contains not less than 1.0 per cent of gentiopicrin ($C_{16}H_{20}O_9$).

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into sections, and dry.

Action To eliminate *damp-heat* and quench *fire* of the liver and gallbladder.

Indications Jaundice caused by *damp-heat*; swelling and itching of the vulva with leukorrhalgia; prolonged erection; eczema accompanied with itching; bloodshot eyes, poor hearing, pain in the costal regions and bitter taste in the mouth; convulsion.

Usage and dosage 3-6 g.

Storage Preserve in a dry place.

Radix et Rhizoma Ginseng (人参, Renshen)

Ginseng

Ginseng is the dried root of *Panax ginseng* C. A. Mey. (Fam. Araliaceae). The drug derived from the cultivated form is known as "Yuanshen" (garden ginseng) and the drug derived from the wild origin is known as "Shanshen" (wild ginseng). The drug is collected in autumn and washed clean. Sun-dried or bake-dried Yuanshen is known as "Shengshaishen" (sun-dried ginseng). Sun-dried Shanshen is known as "Shengshai-shanshen" (sun-dried wild ginseng).

Description Main roots fusiform or cylindrical, 3-15 cm long, 1-2 cm in diameter; externally greyish-yellow, the upper part or entire root exhibiting sparse, shallow, interrupted and coarse transverse-striations and distinct longitudinal wrinkles; the lower part bearing 2-3 branch roots and numerous slender rootlets with inconspicuous minute tubercles. Rhizomes (Lutou) 1-4 cm long, 0.3-1.5 cm in diameter, mostly constricted and curved, bearing adventitious roots (Ding) and showing sparse depressed-circular stem scars (Luwan). Texture relatively hard, fracture yellowish-white, starchy, cambium ring brownish-yellow, bark exhibiting yellow-brown dotted resin canals and radial clefts. Odour, characteristic; taste, slightly bitter and sweet.
Alternatively, main roots as long as or shorter than

rhizome, cylindrical, rhomboid or V-shaped, 1-6 cm long; externally greyish-yellow, longitudinally wrinkled, the upper or middle-lower part with annulations, branch roots mostly 2, rootlets less and slender, orderly arranged and showing some distinct warts. Rhizomes slender, a kew stout, the upper part exhibiting sparse or dense deep depressed stem scars, adventitious roots relatively thin, mostly reclinate.

Identification (1) Transverse section: Cork consisting of several rows of cells. Phelloderm narrow. Phloem showing clefts in the outer part, and parenchymatous cells densely arranged and scattered with resin canals containing yellow secretions in the inner part. Cambium in a ring. Xylem rays broad, vessels singly scattered or grouped, interruptedly arranged radially, occasionally accompanied by non-lignified fibres. Parenchymatous cells containing clusters of calcium oxalate.

Powder: Yellowish-white. Fragments of resin canals containing yellow masses of secretion. Clusters of calcium oxalate 20-68 μm in diameter, with acute angles. Cork cells subsquare or polygonal with sinuous walls. Reticulated and scalariform vessels 10-56 μm in diameter. Starch granules fairly abundant, simple granules subspheroidal, semi-circular or irregular poly-gonal, 4-20 μm in diameter, hilum pointed or slit-shaped; compound granules of 2-6 components.

(2) To 1 g of the powder add 40 ml of chloroform, heat under reflux on a water bath for 1 hour, discard the chloroform layer, evaporate the residue to dryness. Moisten the residue with 0.5 ml of water, add 10 ml of *n*-butanol saturated with water, ultrasonicate for 30 minutes. To the supernatant liquid add 3 volumes of ammonia TS, mix well, stand for demixing. Evaporate the supernatant liquid to dryness, dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 1 g of Radix et Rhizoma Ginseng reference drug in the same manner as the reference drug solution. Dissolve ginsenosides Rb_1 CRS, Re CRS, Rf CRS and Rg_1 CRS in methanol to produce a mixture containing 2 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance (500 μm thick) and the lower layer of a mixture of chloroform, ethyl acetate, methanol and water (15∶40∶22∶10), standing below 10℃, as the mobile phase. Apply separately to the plate 1-2 μl of each of the above three solutions. After developing and removal of the plate, dry in air, spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to visualize clearly. Examine in daylight and under ultraviolet light at 365 nm. The spots or fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots or fluorescent spots in the chromatogram obtained with the reference drug solution and the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 12.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, acetonitrile as the mobile phase A and water as the mobile phase B, elute in gradient as the following:

Time (min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0-35	19	81
35-55	19→29	81→71
55-70	29	71
70-100	29→40	71→60

As detector a spectrophotometer set at 203 nm. The number of theoretical plates of the column is not less than 6000, calculated with the reference to the peak of ginsenoside Rg_1.

Reference solution Dissolve ginsenosides Rg_1 CRS, Re CRS, Rf CRS and Rb_1 CRS, accurately weighed, in methanol to produce a mixture containing 0.2 mg of each per ml as the reference solution.

Test solution Weigh accurately 1 g of the powder (through No. 4 sieve) to a Soxhlet's extractor, add 40 ml of chloroform, heat under reflux on a water bath for 3 hours, discard the chloroform solution, expel the solvent from the residue. Transfer it with the filter paper tube into a 100 ml conical flask. Accurately add 50 ml of *n*-butanol saturated with water, tightly stopper, allow to stand overnight, ultrasonicate (power, 250 W; frequency, 50 kHz) for 30 minutes and filter. Evaporate accurately 25 ml of the successive filtrate to dryness in an evaporating dish, dissolve the residue in methanol, transfer to a 5 ml volumetric flask, dilute with methanol to volume and mix well.

Procedure Inject accurately 10 μl of the reference solution and 10-20 μl of the test solution, respectively, into the column, and calculate the content.

It contains not less than 0.30 per cent of the total amount of gensenoside Rg_1 ($C_{42}H_{72}O_{14}$) and ginsenoside Re ($C_{48}H_{82}O_{18}$), and not less than 0.20 per cent of gensenoside Rb_1 ($C_{54}H_{92}O_{23}$), calculated with reference to the dried drug.

Processing Soften thoroughly, cut into thin slices, and dry, or pulverize or break to pieces before use.

Action To reinforce *qi*, rescue collapse and restore the normal pulse, to benefit the spleen and lung, promote the production of body fluids, and anchor the mind.

Indications Fainting in debilitated patients marked by cold limbs and faint pulse, hypofunction of the spleen with loss of appetite, cough and dyspnea due to hypofunction of the lung, thirst due to impairment of body fluids, wasting-thirst caused by internal *heat*, general weakness from chronic diseases, palpitation, insomnia, impotence or cold in the uterus; heart failure, cardiogenic shock.

Usage and dosage 3-9 g, decocted separately and taken after mixed in a decoction or 2 g, taken after ground into powder, twice a day.

Precaution Incompatible with Rhizoma et Radix Veratri.

Storage Preserve in a well closed container, stored in a cool and dry place, protected from moth.

Radix et Rhizoma Ginseng Rubra (红参, Hongshen)

Red Ginseng

Red Gingseng is the steamed and dried root of the cultivar of *Panax ginseng* C. A. Mey. (Fam. Araliaceae). The drug is collected in autumn, washed clean, steamed, and dried.

Description Main roots fusiform, cylindrical or flat squared

columnar, 3-10 cm long, 1-2 cm in diameter. Externally translucent, reddish-brown, occasionally exhibiting a few dark yellowish-brown patches, furrowed longitudinally, wrinkled and with rootlet scars; the upper part sometimes exhibiting interrupted indistinct annulations, the lower part bearing 2-3 twisted and intersected branch roots and curved rootlets or just showing remains of rootlets. Rhizomes 1-2 cm long, showing several depressed-circular stem scars (Luwan), some bearing 1-2 entire or broken adventitious roots (Ding). Texture hard and fragile, fracture even, horny. Odour delicate fragrant and characteristic; taste, sweet and slight bitter.

Identification (1) Carry out the method of test (1) for Identification in the monograph of Radix et Rhizoma Ginseng. It shows the same characteristics except the starch granule.

(2) Carry out the method of test (2) for Identification in the monograph of Radix Ginseng. It shows the same result.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 12.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, acetonitrile as the mobile phase A and water as the mobile phase B, elute in gradient as the following:

Time (min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0-35	19	81
35-55	19→29	81→71
55-70	29	71
70-100	29→40	71→60

As detector a spectrophotometer set at 203 nm. The number of theoretical plates of the column is not less than 6000, calculated with the reference to the peak of ginsenoside Rg_1.

Reference solution Dissolve ginsenosides Rg_1, Re and Rb_1 CRS, accurately weighed, in methanol to produce a mixture containing 0.5, 0.3 and 0.5 mg of each per ml as the reference solution.

Test solution Weigh accurately 1 g of the powder (through No. 4 sieve) to a Soxhlet's extractor, add 40 ml of chloroform, heat under reflux on a water bath for 3 hours, discard the chloroform solution, expel the solvent from the residue. Transfer it with the filter paper tube to a stoppered conical flask, accurately add 50 ml of *n*-butanol saturated with water, tightly stopper, allow to stand overnight, ultrasonicate (power, 250 W; frequency, 50 kHz) for 30 minutes and filter. Evaporate accurately 25 ml of the successive filtrate to dryness in an evaporating dish, dissolve the residue in methanol, transfer to a 5 ml volumetric flask, dilute with methanol to volume and mix well.

Procedure Inject accurately 10 μl of the reference solution and 10-20 μl of the test solution, respectively, into the column, and calculate the content.

It contains not less than 0.25 per cent of the total amount of ginsenoside Rg_1 ($C_{42}H_{72}O_{14}$), ginsenoside Re ($C_{48}H_{82}O_{18}$), and not less than 0.20 per cent of ginsenoside Rb_1 ($C_{54}H_{92}O_{23}$), calculated with reference to the dried drug.

Processing Soften thoroughly, cut into thin slices, and dry. Break to pieces before use.

Action Replenish vital essence, promote blood circualtion and relieve collapse, reinforce *qi* and stop bleeding.

Indications Fainting in debilitated patients, cool limbs and weak pulse, abnormal uterine bleeding due to failure of *qi* to control blood, cardiac failure and cardiogenic shock.

Usage and dosage 3-9 g.

Precaution Incompatible with Rhizoma et Radix Veratri.

Storage Preserve in well closed containers, stored in a cool and dry place, protected from moth.

Radix et Rhizoma Glycyrrhizae (甘草, Gancao)

Liquorice Root

Liquorice Root is the dried root and rhizome of *Glycyrrhiza uralensis* Fisch., *Glycyrrhiza inflata* Bat. or *Glycyrrhiza glabra* L. (Fam. Leguminosae). The drug is collected in spring or autumn, removed from rootlet, and dried in the sun.

Description *Root of Glycyrrhiza uralensis* Roots cylindrical, 25-100 cm long, 0.6-3.5 cm in diameter. The outer bark loose or tight. Externally reddish-brown or greyish-brown, obviously longitudinally wrinkled, furrowed, lenticel-like protruded, and with sparse rootlet scars. Texture compact, fracture slightly fibrous, yellowish-white, starchy, cambium ring distinct, rays radiate, some with clefts. Rhizomes cylindrical, externally with bud scars, pith present in the centre of fracture. Odour, slight; taste, sweet and characteristic.

Root of Glycyrrhiza inflata Roots and rhizomes woody and stout, some branched, the outer bark rough, mostly greyish-brown. Texture compact, lignified fibres abundant, and less starchy. Rhizomes with more and large adventitious buds.

Root of Glycyrrhiza glabra Texture of root and rhizomes relatively compact, some branched, the outer bark not rough, mostly greyish-brown, lenticels small and indistinct.

Identification (1) Transverse section: Cork consisting of several layers of brown cells. Phelloderm relatively narrow. Phloem rays broad, mostly curved, frequently with clefts; most phloem fibres in bundles, unlignified or slightly lignified, surrounded by parenchymatous cells containing prisms of calcium oxalate; sieve tube tissue often pressed to be collapsed. Fascicular cambium distinct. Xylem rays 3-5 cells wide; vessels frequent, up to 160 μm in diameter; xylem fibres in boundles, surrounded by parenchymatous cells containing prisms of calcium oxalate. Roots without pith at the centre; rhizomes possessing pith at the centre.

Powder: Brownish-yellow. Fibres in bundles, 8-14 μm in diameter, thick-walled, slightly lignified, surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Prisms of calcium oxalate frequent. Bordered pitted vessels large, reticulated vessels rare. Cork cells reddish-brown, polygonal, slightly lignified.

(2) To 1 g of the powder, add 40 ml of ether, heat under reflux on a water bath for 1 hour, filter. Heat the residue under reflux in 30 ml of methanol on a water bath for 1 hour and filter. Evaporate the filtrate to dryness and dissolve the residue in 40 ml of water. Extract the aqueous solution with three 20-ml quantities of *n*-butanol. Combine the *n*-butanol solutions, wash with water for 3 times and evaporate on a water bath to dryness, dissolve the residue in 5 ml of methanol as the test solution. Prepare a solution of 1 g of Radix et Rhizoma Glycyrrhizae reference drug in the same

manner as the reference drug solution. Dissolve ammonium glycyrrhizinate CRS in methanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 1% solution of sodium hydroxide as the coating substance and a mixture of ethyl acetate, formic acid, glacial acetic acid and water (15∶1∶1∶2) as the mobile phase. Apply separately to the plate 1-2 μl of each of the three solutions. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol. Heat at 105℃ to visualize clearly, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with test solution correspond in position and colour to the spots obtained with the reference drug solution; an orange fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Carry out the method for Determination of water (Appendix Ⅸ H, method 1), not more than 12.0 per cent.

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Heavy metals and harmful elements Carry out the methods, for determinations of lead, cadmium, arsenic, mercury and copper (Appendix Ⅸ B, atomic absorption spectrophotometry, or inductively coupled plasma mass spectrometry), not more than 5 ppm of lead, 0.3 ppm of cadmium, 2 ppm of arsenic, 0.2 ppm of mercury and 20 ppm of copper.

Residual organochlorine pesticides Carry out the method for determination of organochlorine pesticides residue (Appendix Ⅸ Q), hexachlorocyclohexane (total BHC) is not more than 0.2 ppm, chlorophenothane (total DDT) is not more than 0.2 ppm, pentachloride nitrobenzene (PCNB) is not more than 0.1 ppm.

Assay ***Glycyrrhizic acid*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, 0.2 mol/L solution of ammonium acetate and glacial acetic acid (67∶33∶1) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of ammonium glycyrrhizate.

Reference solution Weigh accurately 10 mg of ammonium glycyrrhizate CRS in a 50 ml volumetric flask, dissolve with the mobile phase and dilute to volume, mix well (0.2 mg per ml, 0.1959 mg calculated for glycyrrhizic acid).

Test solution Weigh accurately 0.3 g of the medium powder in a 50 ml volumetric flask, add 45 ml of the mobile phase and ultrasonicate for 30 minutes (power, 250 W; frequency, 20 kHz), take out and cool, dilute with the mobile phase to volume and mix well, filter, use the filtrate as the test solution.

Procedure Accurately inject 10 μl of each of the reference solution and the test solution, respectively, into the column, determine and calculate the content.
It contains not less than 2.0 per cent of glycyrrhizic acid ($C_{42}H_{62}O_{16}$), calculated with reference to the dried drug.

Glycyramarin Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.5% solution of glacial acetic acid (1∶4) as the mobile phase. As detector a spectrophotometer set at 276 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of glycyramarin.

Reference solution Weigh accurately a quantity of glycyramarin CRS, dissolve in methanol to produce a solution containing 20 μg per ml.

Test solution Weigh accurately 0.2 g of the powder (through No. 3 sieve) to a conical flask, accurately add 10 ml of 70% ethanol and weigh. Ultrasonicate (power, 300 W; frequency, 25 kHz) for 30 minutes, take out and weigh again, replenish the loss of weight with 70% ethanol and filter. Measure accurately 5 ml of the successive filtrate in a 100 ml volumetric flask, dilute to volume with 20% acetonitrile and mix well.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution, respectivelty, into the column, and calculate the content.
It contains not less than 1.0 per cent of glycyramarin ($C_{21}H_{22}O_9$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry.

Action To reinforce the function of the spleen and replenish *qi*, remove *heat* and counteract *toxicity*, dispel phlegm and relieve cough, alleviate spasmodic pain, and moderate drug actions.

Indications Hypofunction of the spleen and the stomach marked by lassitude and weakness; cardiac palpitation and shortness of breath; cough with much phlegm; spasmodic pain in the epigastrium, abdomen and limbs; carbuncles and sores, also used for reducing the toxic or drastic actions of other drugs.

Usage and dosage 1.5-9 g.

Precaution Incompatible with Radix Euphorbiae Pekinensis, Flos Genkwa and Radix Kansui.

Storage Preserve in a ventilated and dry place, protected from moth.

Preparation Liquorice Extract

Radix et Rhizoma Glycyrrhizae Praeparata cum Melle (炙甘草, Zhigancao)

Prepared Liauorice Root

The drug is the processed Radix Glycyrrhizae.

Procedure Stir-bake the slices of Radix Glycyrrhizae as described under the method for stir-baking with honey (Appendix Ⅱ D) until it becomes yellow to deep yellow and not sticky to the fingers, take out and cool in the air.

Description Occurring in subrounded or elliptical slices, externally reddish-brown or greyish-brown, slightly lustrous, cut surface yellow to deep yellow, cambium ring distinct, rays radiate. Texture slightly sticky. Odour, with agreeable burnt smelling; taste, sweet.

Identification Carry out the method as described under Identification test (2) in the monograph of Radix glycyrrhizae, it shows the same result.

Water Carry out the method for Determination of water

(Appendix Ⅸ H, method 1). Not more than 10.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Action To invigorate the function of *spleen* and stomach, to reinforce *qi* and promote blood circulation.

Indications Deficiency of *spleen* and stomach, lassitude, palpitation, arrhythmia.

Usage and dosage As described under Radix Glycyrrhizae.

Precaution As described under Radix Glycyrrhizae.

Storage As described under Radix Glycyrrhizae.

Radix et Rhizoma Nardostachyos (甘松, Gansong)

Nardostachys Root

Nardostachys Root is the dried root and rhizome of *Nardostachys chinensis* Batal. or *Nardostachys jatamansi* DC. (Fam. Valerianaceae). The drug is collected in spring and autumn, removed from soil and foreign matter, and dried in the sun or in the shade.

Description Subconical, mostly tortuous, 5-18 cm long. Rhizomes short and small, top with the remains of stem and leaves, long and narrow membranaceous-flaky or fibrous. Outer layer blackish-brown, inner layer brown or yellow. Root simple or multiple joined, branched or juxtaposed, 0.3-1 cm in diameter. Externally brown, shrunken, with rootlets. Texture lax and fragile, easily broken, fracture rough, bark dark brown, usually splintery, wood yellowish-white. Odour, characteristic; taste, bitter and pungent, with a cooling sensation.

Identification Powder: Dark brown. Stone cells subrounded or irregularly polygonal, occasionally long slat-shaped, single or grouped, 33-64 μm in diameter, 200 μm or more long, walls fairly thickened, colourless, lumen narrow. Scalariform or reticulated vessels 7-40 μm in diameter, small scalariform vessels in bundle, sometimes accompanied by slender xylary fibres. Cork cells mostly irregularly polygonal, walls dark brown, relatively thin, lumen containing yellow to brownish-yellow volatile oil. Fragments of residual basal leaves numerous, cells rectangular or elongated polygonal, yellowish to brown, 20-31 μm in diameter, 50-90 μm long, walls beaded and thickened. The cells of another fragments long slat-shaped, up to 200 μm long, sometimes walls beaded and thickened.

Assay Carry out the method for the determination of volatile oil (Appendix Ⅹ D).
It contains not less than 2.0 per cent (ml/g) of volatile oil.

Action To regulate the flow of *qi* and relieve pain, and to invigorate the spleen function.

Indications Epigastric and abdominal distension with anorexia and vomiting; external use for toothache and swollen feet.

Usage and dosage 3-6 g; for external use, appropriate quantity is made into infusion for gargle, or made into decoction for washing, or ground into powder for topical application.

Storage Preserve in a cool and dry place, protected from moisture and moth.

Radix et Rhizoma Notoginseng (三七, Sanqi)

Sanchi

Sanchi is the dried root of *Panax notoginseng* (Burk.) F. H. Chen (Fam. Araliaceae). The drug is collected before flowering in autumn, washed clean, graded into main root, branch root and rhizome, and dried. The branch root is known as "Jintiao" and rhizome is known as "Jiankou".

Description Main roots subconical or cylindrical, 1-6 cm long, 1-4 cm in diameter. Externally greyish-brown or greyish-yellow with interrupted longitudianl wrinkles and branch root scars. Stem scars at the apex surrounded by warty protrudings. Texture heavy and campact, fracture greyish-green, yellowish-green or greyish-white, wood slightly radially arranged. Odour, slight; taste, bitter but afterwards sweetish.

Jintiao Cylindrical or conical, 2-6 cm long, the upper end 0.8 cm in diameter, the lower end 0.3 cm in diameter.

Jiankou Irregularly shrunken lump-shaped or slat-shaped, externally with several conspicuous stem scars and annulations; fracture greyish-green or greyish-white in the centre and deep green or grey at the margin.

Identification (1) Powder: Greyish-yellow. Starch granules fairly abundant, simple granules spherical, semispherical or round-polygonal, 4-30 μm in diameter; compound granules of 2-10 or more components. Fragments of resin canals containing yellow secretion. Scalariform, reticulated and spiral vessels 15-55 μm in diameter. Clusters of calcium oxalate infrequent, 50-80 μm in diameter.
(2) To 0.5 g of the powder add 5 drops of water, stir well, add 5 ml of *n*-butanol saturated with water, stopper tightly, shake for about 10 minutes. Allow to stand for 2 hours, centrifuge. To the supernatant solution, add 3 volumes of water saturated with *n*-butanol, mix well and stand to demix (centrifuge if necessary). Evaporate the *n*-butanol solution to dryness in an evaporation dish. Dissolve the residue in 1 ml of methanol as test solution. Dissolve ginsenoside Rb_1 CRS, ginsenoside Re CRS, notoginsenoside R_1 CRS and ginsenoside Rg_1 CRS in methanol to produce a mixture containing 0.5 mg of each per ml as reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, ethyl acetate, methanol and water (15 : 40 : 22 : 10), standed below 10℃, as the mobile phase. Apply separately to the plate 1 μl of each of the two solutions. After developing and removal of the plate, dry in air. Spray with a solution of sulfuric acid in ethanol (1→10) and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution. Or examine under ultraviolet light at 365 nm, both chromatograms show the same fluorescent spots.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 14.0 per cent.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot

extraction method), using methanol as the solvent, not less than 16.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, acetonitrile as the mobile phase A and water as the mobile phase B, elute in gradient as the following:

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0-12	19	81
12-60	19→36	81→64

As detector a spectrophotometer set at 203 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of notoginsenoside R_1.

Reference solution Dissolve ginsenosides Rg_1, Rb_1 CRS and notoginsenoside R_1 CRS, accurately weighed, in methanol to produce a mixture containing 0.4, 0.4 and 0.1 mg of each per ml as the reference solution.

Test solution Weigh accurately 0.6 g of the powder (through No. 4 sieve), accurately add 50 ml of methanol, weigh and allow to stand overnight. Heat under reflux to slightly boil on a water bath at 80℃ for 2 hours, cool and weigh again, replenish the loss of solvent with methanol and mix well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 5.0 per cent of the total amount of ginsenoside Rg_1 ($C_{42}H_{72}O_{14}$), ginsenoside Rb_1 ($C_{54}H_{92}O_{23}$) and notoginsenoside R_1 ($C_{47}H_{80}O_{18}$), calculated with reference to the dried drug.

Processing *Powder of Radix Notoginseng* Wash Radix Notoginseng clean, dry, and pulverize to fine powder.

Action To eliminate blood stasis, arrest bleeding, cause subsidence of swelling and alleviate pain.

Indications Hemoptysis, hematemesis, epistaxis, hematochezia, abnormal uterine bleeding, traumatic bleeding; pricking pain in the chest and abdomen, traumatic swelling and pain.

Usage and dosage 3-9 g; ground into powder and taken with water, 1-3 g each time; appropriate quantity for external use.

Precaution Used with caution in pregnancy.

Storage Preserve in a cool and dry place, protected from moth.

Radix et Rhizoma Rhei (大黄, Dahuang)

Rhubarb

Rhubarb is the dried root and rhizome of *Rheum palmatum* L., *Rheum tanguticum* Maxim. ex Balf. or *Rheum officinale* Baill. (Fam. Polygonaceae). The drug is collected in late autumn when stem and leaves are withered or in next spring just before budding, removed from rootlet and the outer bark, cut into segment or section, either stringed together to be dried, or dried directly.

Description In subcylindrical, conical, ovoid or irregular pieces, 3-17 cm long, 3-10 cm in diameter. Externally yellowish-brown to reddish-brown when peeled, sometimes whitish reticulations and scattered star spots (abnormal vascular bundles) visible, occasionally with brownish-black patches of cork, mostly with a hole through which the string passed, and coarse wrinkles. Texture campact, sometimes rather loose and soft in the centre, fracture reddish-brown or yellowish-brown, granular. Pith of the rhizome broad, with star spots arranged in a ring or irregularly scattered. Wood of the root well developed, lined radially, cambium ring distinct, without star spots. Odour, delicately aromatic; taste bitter and slightly astringent, sticky and gritty on chewing.

Identification (1) Transverse section: Most cork and phelloderm of root removed. In phloem, sieve tube groups distinct, parenchyma well developed. Cambium in a ring. Xylem with relatively dense rays, 2-4 cells wide, containing brown masses; vessels unlignified, usually single or several grouped, sparsely arranged. Parenchymatous cells containing clusters of calcium oxalate and abundant starch granules.

Pith of rhizome broad, usually showing mucilage cavities, containing reddish-brown masses; abnormal vascular bundles scattered, cambium in a ring, xylem at the outside and phloem at the inside. Rays stellately radiated.

Powder: Yellowish-brown. Clusters of calcium oxalate 20-160 μm, sometimes up to 190 μm in diameter. Bordered-pitted, reticulated, spiral and annular vessels unlignified. Starch granules fairly abundant, single granules subspheroidal or polygonal, 3-45 μm in diameter, hilum stellate; compound granules consisting of 2-8 components.

(2) Sublime a small quantity of the powder, rhombic needles or feathery crystals are visible.

(3) Macerate 0.1 g of the powder in 20 ml of methanol for 1 hour, and filter. Evaporate 5 ml of the filtrate to dryness, dissolve the residue in 10 ml of water, add 1 ml of hydrochloric acid, heat under reflux on a water bath for 30 minutes and cool immediately. Extract by shaking with two 20-ml quantities of ether, combine the ether extracts, evaporate to dryness and dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Dissolve rhein CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel-H mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15:5:1) as the mobile phase. Apply separately to the plate 4 μl of each of the above three solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The five orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution; the orange fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. The spot becomes red on exposure to ammonia vapour.

Rhaponticin Macerate warmly 0.2 g of the powder in 2 ml of methanol for 10 minutes, and cool. Apply 10 μl of the supernatant to a piece of filter paper, and develop using 45%

ethanol as mobile phase. After developing and removal of the paper, dry in air and allow to stand for 10 minutes. Examine under ultraviolet light at 365 nm; a persistent bright violet fluorescence is not shown.

Loss on drying When dried at 105℃ for 6 hours, loses not more than 15.0 per cent of its weight (Appendix Ⅸ G).

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 0.8 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of water-soluble extractives (Appendix X A, the hot extraction method), not less than 25.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.1% phosphoric acid (85∶15) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of emodin.

Reference solution Weigh accurately a quantity of aloe-emodin CRS, rhein CRS, emodin CRS, chrysophanol CRS and physcion CRS, respectively, dissolve in methanol to produce five solutions containing 80 μg of each of aloe-emodin, rhein, emodin, chrysophanol per ml and 40 μg of physcion per ml. Measure accurately 2 ml of each above solutions to produce a mixture containing 16 μg of aloe-emodin, rhein, emodin, chrysophanol and 8 μg of physcion per ml.

Test solution Weigh accurately 0.15 g of the powder (through No. 4 sieve) to a stopper conical flask, accurately add 25 ml of methanol and weigh. Heat under reflux on a water bath for 1 hour, cool, weigh again, replenish the loss of solvent with methanol, mix well and filter. Measure accurately 5 ml of successive filtrate in a flask, expel the solvent, add 10 ml of 8% solution of hydrochloric acid, ultrasonicate for 2 minutes, add 10 ml of chloroform. Heat under reflux for 1 hour, cool, transfer to a separating funnel, wash the flask with a small quantity of chloroform and combine the washings to the separating funnel. Separate the chloroform layer, extract the acid solution again with three 10-ml quantities of chloroform, combine the chloroform extracts and recover the chloroform in vacuum to dryness. Dissolve the residue in methanol and transfer to a 10 ml volumetric flask, dilute with methanol to volume and mix well.

Procedure Accurately inject 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 1.5 per cent of the total amount of aloe-emodin ($C_{15}H_{10}O_5$), rhein ($C_{15}H_8O_6$), emodin ($C_{15}H_{10}O_5$), chrysophanol ($C_{15}H_{10}O_4$) and physcion ($C_{16}H_{12}O_5$), calculated with reference to the dried drug.

Processing *Radix et Rhizoma Rhei* Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices or pieces, and dry in the air.

Radix et Rhizoma Rhei (*processed with wine*) Stir-bake the slices of Radix et Rhizoma Rhei as described under the method for stir-baking with wine (Appendix Ⅱ D) to dryness.

Radix et Rhizoma Rhei (*prepared*) Stew or steam the pieces of Radix et Rhizoma Rhei as described under the method for stewing or steaming with wine (Appendix Ⅱ D) until the drug darkens thoroughly.

Radix et Rhizoma Rhei (*carbonized*) Stir-bake the slices of Radix et Rhizoma Rhei as described under the method for carbonizing by stir-baking (Appendix Ⅱ D) until the outer surface is charred and the inner turns to be dark brown.

Action To purge fire and dredge intestines, reduce *heat* in blood and counteract *toxicity*, and eliminate blood stasis and stimulate menstruation.

Radix et Rhizoma Rhei (*stir-baked with wine*) To remove toxic *heat* from the blood in the upper portion of the body.

Radix et Rhizoma Rhei (*prepared*) To purge *heat* and remove toxic substances, but with less effect.

Radix et Rhizoma Rhei (*carbonized*) To reduce *heat* in blood, remove blood stasis, and arrest bleeding.

Indications Fever with constipation, retention of feces and abdominal pain; dysentery; jaundice caused by *damp-heat*; haematemesis, epistaxis, inflammation of eyes and sore throat due to *heat* in blood; appendicitis with abdominal pain; boils, sores and abscess; amenorrhea due to blood stasis; traumatic injuries; hemorrhage from the upper gastrointestinal tract; external use for scalds and burns.

Radix et Rhizoma Rhei (*stir-baked with wine*) Inflammation of the eye, swelling of the throat and painful swelling of the gums.

Radix et Rhizoma Rhei (*prepared*) Boils, sores and abscess.

Radix et Rhizoma Rhei (*carbonized*) Hemorrhage due to stagnation and *heat* in the blood.

Usage and dosage 3-30 g, not to be decocted for a long time if it is used for catharsis; for external use, appropriate quantity to be ground into powder for topical application after mixing with liquid.

Precaution Used with caution in pregnancy.

Storage Preserve in a ventilated and dry place, protected from moth.

Preparation Rhubarb Liquid Extract

Radix et Rhizoma Rhodiolae Crenulatae (红景天, Hongjingtian)

Bigflower Rhodiola Root

Bigflower Rhodiola Root is the dried root and rhizome of *Rhodiola crenulata* (Hook. f. et Thomas.) H. Ohba (Fam. Crassulaceae). The drug is collected in autumn when the scape is withered, removed from coarse bark, washed clean, and dried in the sun.

Description Rhizome cylindrical, stout, slightly curved, few branched, 5-20 cm long, 2.9-4.5 cm in diameter. Externally brown or chocolate brown, coarse, wrinkled, a layer of yellow membranous epidermis with cerise decorative pattern visible when baring the outer epidermis; some old scapes persisted, base bearing triangular or ovate membranous scales; internode irregular, fracture cerise to purplish-red, with a ring; texture light and lax. Tap root cylindrical, stout, about 20 cm long and 1.5 cm in diameter at the upper part, lateral root 10-30 cm long; fracture orange-red or purplish-red, some with cracks. Odour,

aromatic; taste, firstly slightly bitter and astringent, then sweet.

Identification (1) Transverse section of root: Cork of 5-8 layers of cells. Phelloderm cells elliptic or subrounded. Stele very broad, numerous vascular bundles arranged in 2-4 rings, outer ring consisting of collateral vascular bundles and relatively large, other 2-3 rings of amphivasal type and gradually smaller toward inside.
Transverse section of rhizome: Two to three rings of cork layer presented in old rhizome and absent in young rhizomes. Stele very broad, scattering vascular bundles; collateral vascular bundles radially arranged in a ring in the outer side, phloem relatively narrow, xylem vessels 5 to several grouped and sparsely arranged, rays of 2-4 rows of cells; amphivasal vascular bundles inside, stellately arranged.
(2) Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the lower layer of a mixture of chloroform, methanol, acetone and water (6∶3∶1∶1) as the mobile phase. Apply separately to the plate 10 μl of each of the reference solution and the test solution both obtained under Assay. After developing 18 cm and removal of the plate, dry it in air, expose to iodine vapour until the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H, Method 1), not more than 12.0 per cent.

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method as described under the determination of ethanol-soluble extractives (Appendix X A), using 70% ethanol as the solvent, not less than 22.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (15∶85) as the mobile phase. As detector a spectrophotometer set at 275 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of salidroside.

Reference solution Dissolve salidroside CRS, accurately weighed, in methanol to produce a solution containing 0.5 mg per ml as reference solution.

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve) to a stopper conical flask, accurately add 10 ml of methanol and weigh. Ultrasonicate for 30 minutes, cool, weigh again, make up the loss of the solvent with methanol and mix well. Filter and use the successive filtrate as the test solution.

Procedures Inject accurately 10 μl of each of the reference solution and the test solution respectively, into the column, determine and calculate the content.
It contains not less than 0.50 per cent of salidroside ($C_{14}H_{20}O_7$), calculated with reference to the dried drug.

Processing Remove from fibrous roots, eliminate foreign matter, cut into slices, and dry.

Action To reinforce qi, promote blood flow and relieve asthma.

Indications Constriction in the chest with heart pain, apoplexy, lassitude, and asthma.

Usage and dosage 3-6 g.

Storage Preserve in a ventilated and dry place, protected from moisture and moth.

Radix et Rhizoma Rubiae (茜草, Qiancao)

Indian Madder Root

Indian Madder Root is the dried root and rhizome of *Rubia cordifolia* L. (Fam. Rubiaceae). The drug is collected in spring or summer, removed from soil, and dry.

Description Rhizomes nodular, marked with numerous fascicled roots varying in thickness. Roots cylindrical, somewhat curved, 10-25 cm long, 0.2-1 cm in diameter; externally reddish-brown or dark brown, with fine lingitudinal wrinkles and a few rootlet scars; the place where the outer bark has exfoliated appearing yellowish-red. Texture fragile, easily broken, fracture even, bark narrow and purplish-red, wood broad, pale yellowish-red, exhibiting numerous pores of vessels. Odour, slight; taste, bitterish with an irritating sensation to tongue when chewed for a long time.

Identification (1) Transverse section of root: Cork cells 6-12 layered, containing brown contents. Parenchymatous cells in phelloderm sometimes containing reddish-brown granules. Cells in phloem relatively small. Cambium ring less distinct. The majority of root occupied by wood, completely lignified, xylem rays indistinct. Parenchymatous cells containing raphides of calcium oxalate.
(2) Shake 0.2 g of the powder with 5 ml of ether for several minutes and filter. To the filtrate add 1 ml of sodium hydroxide TS, shake and allow to stand. The water layer shows a red colour; the ether layer is colourless, examine the ether layer under ultraviolet light at 365 nm, a sky-blue fluorescence is shown.
(3) Place 0.5 g of the powder to a conical flask, add 10 ml of methanol, ultrasonicate for 30 minutes and filter. Concentrate the filtrate to about 1 ml as the test solution. Prepare a reference solution of 0.5 g of Radix Rubiae reference drug in the same manner. Dissolve a quantity of rubimaillin CRS in methanol to produce a reference solution containing 2.5 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (60-90℃) and acetone (4∶1) as the mobile phase. Apply separately 5 μl of each of the three solutions to the plate. After developing and removal of the plate, dry it in air and examine under ultraviolet light at 365 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 12.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and tetrahydrofuran (310∶90∶3) as the mobile phase. The wavelength of the detector is 250 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of rubimaillin.

Reference solution Weigh accurately a quantity of rubimaillin CRS, dissolve in methanol to produce a solution containing 80 μg per ml.

Test solution Weigh accurately 0.2 g of the powder to a conical flask, add 25 ml of methanol and weigh, macerate overnight, ultrasonicate for 30 minutes, allow to cool, weigh again and replenish the loss of the solvent with methanol and mix well. Filter and use the successive filtrate as the test solution.

Procedures Accurately inject 5 μl of each of the reference solution and the test solution, respectively, into the column, calculate the content.
It contains not less than 0.40 per cent rubimaillin ($C_{17}H_{15}O_4$), calculated with reference to the dried drug.

Processing *Radix Rubiae* Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices or sections, and dry.

Radix Rubiae (carbonized) Stir-bake the slices or the sections of Radix Rubiae as described under the method for carbonizing by stir-baking (Appendix Ⅱ D) until the outer part is charred.

Action To remove *heat* from blood and arrest bleeding, eliminate blood stasis, and to stimulate menstruation.

Indications Spitting of blood, epistaxis, abnormal uterine bleeding, traumatic bleeding; amenorrhea; arthralgia, traumatic swelling and pain.

Usage and dosage 6-9 g.

Storage Preserve in a dry place.

Radix et Rhizoma Salviae Miltiorrhizae (丹参, Danshen)

Danshen Root

Danshen Root is the dried root and rhizome of *Salvia miltiorrhiza* Bge. (Fam. Labiatae). The drug is collected in spring or autumn, removed from soil, and dried.

Description Rhizomes short and stout, sometimes with remains of a stem at the apex. Several roots, long cylindrical, slightly curved, some branched and with rootlets, 10-20 cm long, 0.3-1 cm in diameter. Externally brownish-red or dark brownish-red, rough, longitudinally wrinkled. The bark of old roots loose, mostly purplish-brown, usually scaling off. Texture hard and fragile, fracture loose, cleft or slightly even and dense, with brownish-red bark and greyish-yellow or purplish-brown wood, showing bundles of vessels, yellowish-white, arranged radially. Odour, slight; taste, slightly bitter and astringent.
Cultivars relatively stout, 0.5-1.5 cm in diameter. Externally reddish-brown, longitudinally wrinkled, the bark closely adhering to wood and uneasy to be scaled off. Texture compact, fracutre relatively even, slight horny.

Identification (1) Shake 1 g of the powder with 5 ml of ether, stand for 1 hour, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 1 g of Radix et Rhizoma Salviae Miltiorrhizae reference drug in the same manner as the reference drug solution. Dissolve tanshinone ⅡA CRS in ethyl acetate to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and ethyl acetate (19:1) as the mobile phase. Apply seperately to the plate 5 μl of each of the three solutions. After developing and removal of the plate, dry it in air. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution; and a dark-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) To 0.2 g of the powder add 25 ml of 75% methanol, heat under reflux for 1 hour and filter. Evaporate the filtrate to 1 ml as the test solution. Dissolve a quantity of salvianolic acid B CRS in 75% methanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of toluene, chloroform, ethyl acetate, methanol and formic acid (2:3:4:0.5:2) as the mobile phase. Apply separately to the plate 5 μl of the above two solutions. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 13.0 per cent.

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Extractives *Water-soluble extractives* Carry out the method for determination of water-soluble extractives (Appendix Ⅹ A, cold maceration method), not less than 35.0 per cent.

Ethanol-soluble extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, hot extraction method), using ethanol as the solvent, not less than 15.0 per cent.

Heavy metals and harmful elements Carry out the methods for determination of lead, cadmium, arsenic, mercury and copper (Appendix Ⅸ B, atomic absorption spectrophotometry or inductively coupled plasma mass spectrometry), not more than 5 ppm of lead, 0.3 ppm of cadmium, 2 ppm of arsenic, 0.2 ppm of mercury and 20 ppm of copper.

Assay ***Tanshinone ⅡA*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (75:25) as the mobile phase. As detector a spectrophotometer set at 270 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of tanshinone ⅡA.

Reference solution Accurately weigh 10 mg of tanshinone ⅡA CRS to a 50 ml amber volumetric flask. Dissolve and dilute with methanol to volume and mix well. Accurately measure 2 ml to a 25 ml amber volumetric flask, dilute with methanol to volume, and mix well (containing 16 μg of tanshinone ⅡA per ml).

Test solution Weigh accurately 0.3 g of the powder (through a No. 3 sieve) to a stopper conical flask. Add accurately 50 ml of methanol, and weigh. Heat under reflux for 1 hour, cool, weigh again, make up the loss of weight with methanol, mix well and filter, use the successive filtrate as the test solution.

Procedures Accurately inject 5 μl of each of the reference

solution and the test solution, respectively, into the column, determine and calculate the content.
It contains not less than 0.2 per cent of tanshinone ⅡA ($C_{19}H_{18}O_3$).

Salvianolic acid B Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, acetonitrile, formic acid and water (30 : 10 : 1 : 59) as the mobile phase. As detector a spectrophotometer set at 286 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of salvianolic acid B.

Reference solution Weigh accurately a quantity of salvianolic acid B CRS, dissolve in 75% methanol to produce a solution containing 0.14 mg per ml.

Test solution Weigh accurately 0.2 g of the powder (through No. 3 sieve) to a stopper conical flask, accurately add 50 ml of 75% methanol and weigh. Heat under reflux for 1 hour, cool and weigh again, replenish the loss of solvent with 75% methanol, mix well and filter.

Procedure Accurately inject 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 3.0 per cent of salvianolic acid B ($C_{36}H_{30}O_{16}$), calculated with reference to the dried drug.

Processing *Radix et Rhizoma Salviae Miltiorrhizae* Remove foreign matter and remains of stems, wash clean, soften thoroughly, cut into thick slices, and dry.

Radix et Rhizoma Salviae Miltiorrhizae (processed with wine) Stir-bake the slices of Radix Salviae Miltiorrhizae as described under the method for stir-baking with wine (Appendix Ⅱ D) to dryness.

Action To remove blood stasis and relieve pain, promote the flow of blood and stimulate menstruation, and clear *heart-fire* and remove restlessness.

Indications Menstrual disorders, amenorrhea, dysmenorrhea; mass formation in the abdomen; pricking pain in the chest and abdomen, pain in acute arthritis and subcutaneous infection; fidgets and insomnia; hepatosplenomegaly; angina pectoris.

Usage and dosage 9-15 g.

Precaution Incompatible with Rhizoma et Radix Veratri.

Storage Preserve in a dry place.

Radix et Rhizoma seu Caulis Acanthopanacis Senticosi (刺五加, Ciwujia)

Manyprickle Acanthopanax

Manyprickle Acanthopanax is the dried root and rhizome or stem of *Acanthopanax senticosus* (Rupr. et Maxim.) Harms (Fam. Araliaceae). The drug is collected in spring or autumn, washed clean, and dried.

Description Rhizomes irregular, nodular cylindrical, 1.4-4.2 cm in diameter. Root cylindrical, mostly tortuous, 3.5-12 cm long, 0.3-1.5 cm in diameter. Externally greyish-brown or blackish-brown, rough, with fine longitudinal furrows and wrinkles, bark relatively thin, sometimes exfoliated, the exposed surface appearing greyish-yellow. Texture hard, fracture yellowish-white, fibrous. Odour, characteristic and aromatic; taste, slightly pungent, somewhat bitter and astringent.
Stems long cylindrical, much-branched, varying in length, 0.5-2 cm in diameter. Externally pale grey, the old branches greyish-brown, furrowed longitudinally, spineless; the young branches yellowish-brown, densely spiculate. Texture hard, uneasily broken, fracture showing thin bark, yellowish-white, wood being broad, pale yellow, and pith at the centre. Odour, slight; taste slight pungent.

Identification (1) Transverse section of root: Cork cells of ten or more layers. Phelloderm thin, scattered with secretory canals; most of parenchymatous cells containing clusters of calcium oxalate, 11-64 μm in diameter. The outside of phloem scattered with more fibre bundles, which lessen inwards; secretory canals subrounded or elliptical, 25-51 μm long radially, 48-97 μm long tangentially; parenchymatous cells containing clusters. Cambium in a ring. The majority of root occupied by xylem, rays 1-3 rows of cells wide; vessels relatively thin-walled, mostly several grouped; xylem fibres well developed.
Transverse section of rhizome: Fibre bundles in phloem much more than those in root; pith visible.
Transverse section of stem: Pith well developed.
(2) To 5 g of the powder add 50 ml of 75% ethanol, heat under reflux for 1 hour, filter and evaporate the filtrate to dryness, dissolve the residue with 10 ml of water in a separating funnel, extract with two 5-ml quantities of chloroform, combine the chloroform solutions, evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 5 g of Radix et Rhizoma seu Caulis Acanthopanacis Senticosi reference drug in the same manner as the reference drug solution. Dissovle isofraxidin CRS, in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform and methanol (19:1) as the mobile phase. Apply 10 μl each of the three solutions separately to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spot in the chromatogram obtained with the drug reference solution. A blue spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 10.0 per cent.

Total ash Not more than 9.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using methanol as the solvent, not less than 3.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (20:80) as the mobile phase. As detector a spectrophotometer set at 265 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of syringoside.

Reference solution Weigh accurately a quantity of syringoside CRS, dissolve in methanol to produce a solution

containing 80 μg per ml.

Test solution Weigh accurately 2 g of the coarse powder to a stopper conical flask, add accurately 25 ml of methanol, and weigh. Ultrasonicate (power 250 W, frequency 33 kHz) for 30 minutes, cool and weigh again, replenish the loss of solvent with methanol and mix well, filter through the millipore (0.45 μm), use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.
It contains not less than 0.050 per cent of syringoside ($C_{17}H_{24}O_9$), calculated with reference to the dried drug.

Action To reinforce *qi*, invigorate the function of the spleen and the kidney, and anchor the mind.

Indications Hypofunction of the spleen and the kidney marked by general weakness, lassitude, anorexia, aching of the loins and knees; insomnia and dream-disturbed sleep.

Usage and dosage 9-27 g.

Storage Preserve in a ventilated dry place, protected from moisture.

Preparation Manyprickle Acanthopanax Extract.

Radix et Rhizoma Sophorae Tonkinensis (山豆根, Shandougen)

Vietnamese Sophora Root

Vietnamese Sophora Root is the dried root and rhizome of *Sophora tonkinensis* Gagnep. (Fam. Leguminosae). The drug is collected in autumn, removed from foreign matter, washed clean, and dried.

Description Rhizomes irregular nodular, bearing remains of stems at the apex and several roots at the lower part. Roots long-cylindrical, usually branched, varying in length, 0.7-1.5 cm in diameter; externally brown to dull brown, with irregular longitudial wrinkles and transverse elongated lenticel-like protrusions. Texture hard, uneasily broken, fracture brownish in bark and pale yellow in wood. Odour, bean-like; taste very bitter.

Identification (1) Transverse section: Cork consisting of several to 10 or more layers of cells. The outer 1-2 rows of cells in phelloderm containing prisms of calcium oxalate, forming an interrupted ring of crystal cells, with lignified and thickened walls. Fibre bundles scattered in phelloderm and phloem. Cambium in a ring. Xylary developed, rays 1-8 cells wide; vessels subrounded, mostly singly scattered or in groups of 2 or more, some containing yellowish-brown contents; xylary fibres grouped and scattered. Parenchymatous cells filled with starch granules, a few cells containing prisms.
(2) Shake 0.5 g of the coarse powder with 10 ml of chloroform and 0.2 ml of strong ammonia TS for 15 minutes, filter, evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of chloroform as the test solution. Dissolve matrine CRS and oxymatrine CRS in chloroform to prepare a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, methanol and strong ammonia TS (4:1:0.1) as the mobile phase. Apply separately to the plate 1-2 μl of the test solution and 4-6 μl of the reference solution. After developing and removal of the plate, dry in air, spray with dilute potassium iodobismuthate TS. The orange-yellow spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Assay Place about 0.5 g of the coarse powder, weighed accurately, to a Soxhlet's extractor, add dropwise 1 ml of a mixture of absolute ethanol and strong ammonia TS (3:2) to moisten, stand for 30 minutes, and heat under reflux with 80 ml of chloroform for 4 hours. Recovering the chloroform, concentrate the extract to dryness, dissolve the residue in methanol and transfer to a 5 ml volumetric flask, dilute with methanol to volume, mix well and filter, use the filtrate as the test solution. Dissolve oxymatrine CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, methanol and strong ammonia TS (4:1:0.1) as the mobile phase. Apply accurately to the plate 2-6 μl of the test solution and 2 μl and 4 μl of the reference solution alternatively. After developing in a chamber pre-saturated with the mobile phase for 30 minutes, remove the plate, dry it in air. Spray with dilute potassium iodobismuthate TS, cover the plate with a piece of glass of the same size and fix up the edge with tape. Carry out the method for thin layer chromatography (thin layer chromatographic scanning method, Appendix VI B), scan at the wavelength of $\lambda_S = 520$ nm, $\lambda_R = 650$ nm. Measure the integration value of the absorbance from the test solution and the reference solution, respectively, and calculated the content.
It contains no less than 0.40 per cent of oxymatrine ($C_{15}H_{24}N_2O_2$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, soak, wash clean, soften thoroughly, cut into thick slices, and dry in the sun.

Action To remove *toxic-heat*, promote the subsidence of swelling, and ease throat.

Indications Sore throat and painful swollen gums due to accumulation of *toxic-heat*.

Usage and dosage 3-6 g.

Storage Preserve in a dry place.

Radix Euphorbiae Pekinensis (京大戟, Jingdaji)

Peking Euphorbia Root

Peking Euphorbia Root is the dried root of *Euphorbia pekinensis* Rupr. (Fam. Euphorbiaceae). The drug is collected in autumn and winter, washed clean and dried in the sun.

Description Irregularly long conical, slightly curved, usually branched, 10-20 cm long, 1.5-4 cm in diameter. Externally greyish-brown or brown, rough, exhibiting longitudinal wrinkles, transverse lenticel-like protrusions and branch-root scars. Apex slightly expanded, with numerous stem bases and bud scars. Texture hard, uneasily broken, fracture whitish or pale yellow, fibrous. Odour, slight; taste, slightly bitter and astringent.

Identification (1) Powder: Pale yellow. Simple starch granules subspheroid or ovoid, 3-15 μm in diameter, hilum pointed or slit-shaped; compound granules of 2-3

components. Clusters of calcium oxalate 19-40 μm in diameter. Bordered pitted and reticulated vessels more commonly found, 26-50 μm in diameter. Fibres individual or in bundles, walls relatively thick and non-lignified. Non-articulate laticiferous tubes mostly broken, containing yellow minute latex granules.

(2) Take 2 hand made thin slices of the drug, to one slice add 1 drop of glacial acetic acid and sulfuric acid respectively, observe under a microscope, a red colour is produced at the laticiferous-tubes of phloem, which gradually disappears in 5 minutes; to another slice add potassium hydroxide TS, a brownish-yellow colour is produced.

Processing *Radix Euphorbiae Pekinensis* Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry.

Radix Euphorbiae Pekinensis (*processed with vinegar*) Boil the clean Radix Euphorbiae as described under the method of boiling with vinegar (Appendix Ⅱ D) until vinegar is exhausted. Use 30 kg of vinegar per 100 kg of Radix Euphorbiae Pekinensis.

Action To cause drastic purgation.

Indications Anasarca, hydrothorax and ascites with dyspnea, constipation and oliguria.

Usage and dosage 1.5-3 g.

Precaution Contraindicated in pregnancy. Incompatible with Radix Glycyrrhizae.

Storage Preserve in a dry place, protected from moth.

Radix Gentianae Macrophyllae (秦艽, Qinjiao)

Largeleaf Gentian Root

Largeleaf Gentian Root is the dried root of *Gentiana macrophylla* Pall., *Gentiana straminea* Maxim., *Gentiana crassicaulis* Duthie ex Burk. or *Gentiana dahurica* Fisch. (Fam. Gentianaceae). According to the description the former three species are known as "Qinjiao" and "Mahuajiao", respectively. The latter is known as "Xiaoqinjiao". The drug is collected in spring and autumn, removed from soil; "Qinjiao" and "Mahuajiao" are softened in the sun, either piled up until the drug becomes reddish-yellow or greyish-yellow on the surface, spread out and dried in the sun, or dried in the sun directly after collecting; as for "Xiaoqinjiao", the black bark is rubbed off while fresh and dried in the sun.

Description *Qinjiao* Subcylindrical, the upper part thick and the lower part thin, twisted, 10-30 cm long, 1-3 cm in diameter. Externally yellowish-brown or greyish-yellow, with longitudinal or twisted wrinkles. Remains of stem bases and fibrous pericladium occurring at the apex. Texture hard and fragile, easily broken, fracture slight oily, bark yellow or brownish-yellow, wood yellow. Odour, characteristic; taste, bitter and slightly astringent.

Mahuajiao Subconical, frequently expanded by some small roots gathered, up to 7 cm in diameter. Externally dark brown, rough, with fissures, showing reticulated pits. Texture lax and fragile, easily broken, fracture frequently rotten-wood-shaped.

Xiaoqinjiao Subconical or subcylindrical, 8-15 cm long, 0.2-1 cm in diameter. Externally brownish-yellow. Main root frequently 1, having fibrous pericladia on the remains of stem bases, often branched at the lower part. Fracture yellowish-white.

Identification (1) Macerate 2 g of the coarse powder in 30 ml of a mixture of chloroform, methanol and strong ammonia TS (75∶25∶5) for 2 hours and filter. Concentrate the filtrate on a water bath to about 1 ml, add 2 ml of hydrochloric acid solution (1 mol/L) and continue to evaporate the chloroform, cool and filter. Transfer the filtrate to two test tubes, to one tube add mercuric potassium iodide TS, a pale yellowish-white precipitate is produced; to another tube add potassium iodobismuthate TS, a brownish-red precipitate is produced.

(2) Examine the fracture under an ultraviolet light at 365 nm, a yellowish-white or golden yellow fluorescence is shown.

Extractives Carry out the hot maceration method as described under the determination of ethanol-soluble extractives (Appendix Ⅹ A), using ethanol as the solvent, not less than 24.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (1∶4) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of gentiopicrin.

Reference solution Weigh accurately a quantity of gentiopicrin CRS, dissolve in methanol to produce a solution containing 0.5 mg per ml as the reference solution.

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve), add 20 ml of methanol, heat under reflux on a water bath for 30 minutes, cool and filter. Evaporate the filtrate under reduced pressure to dryness. Dissolve the residue with a quantity of methanol, filter, transfer to a 50 ml volumetric flask and dilute with methanol to volume, mix well. Accurately measure 1 ml into a 5 ml volumetric flask, dilute with methanol to volume, and mix well.

Procedures Accurately inject 10 μl of each of the reference solution and the test solution, respectively, into the column, determine and calculate the content.

It contains not less than 2.0 per cent of gentiopicrin ($C_{16}H_{20}O_9$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dried in the sun.

Action To relieve rheumatic conditions, and remove *damp-heat*.

Indications Rheumatic or rheumatoid arthrits with muscular contracture and severe joint pain; fever recurring in the afternoon, fever in infants with malnutrition.

Usage and dosage 3-9 g.

Storage Preserve in a ventilated and dry place.

Radix Glehniae (北沙参, Beishashen)

Coastal Glehnia Root

Coastal Glehnia Root is the dried root of *Glehnia*

littoralis Fr. Schmidt ex Miq. (Fam. Umbelliferae). The drug is collected in summer and autumn, removed from rootlet, washed clean, partially dried in the air, treated with boiling water, peeled and dried, or dried immediately after washing.

Description Slenderly cylindrical, branching occasionally, 15-45 cm long, 0.4-1.2 cm in diameter. Externally yellowish-white, slightly rough, occasionally with patches of cork adhering, or yellowish-brown when unpeeled, finely wrinkled longitudinally, and with brownish-yellow spotted rootlet scars. Top usually with yellowish-brown remains of rhizome. The upper part somewhat thin, the middle part relatively thick, and the lower part tapering. Texture fragile, easily broken, fracture yellowish-white in bark and yellow in wood. Odour, characteristic; taste, sweetish.

Identification Transverse section: Phelloderm of several layers of parenchymatous cells, scattered with secretory canals. Cork visible when unpeeled. Phloem broad, rays distinct, sieve tube groups collapsed in the outer part and appearing as a narrow band; secretory canals scattered, 20-65 μm in diameter, containing yellowish-brown secretion, surrounded by 5-8 secretory cells. Cambium in a ring. Xylem rays 2-5 cells wide; most vessels arranged in V-shape; parenchymatous cells containing gelatinized starch granules.

Processing Remove remains of stems and foreign matter, soften slightly, cut into sections, and dry.

Action To replenish *yin* of the lung and stomach, remove *heat* from the lung, and promote production of body fluids.

Indications Dry cough caused by *heat* in the *lung*; bloody sputum in phthisis; thirst in febrile diseases.

Usage and dosage 4.5-9 g.

Precaution Incompatible with Rhizoma et Radix Veratri.

Storage Preserve in a ventilated and dry place, protected from moth.

Radix Hedysari (红芪, Hongqi)

Manyinflorescenced Sweetvetch Root

Manyinflorescenced Sweetvetch Root is the dried root of *Hedysarum polybotrys* Hand. -Mazz. (Fam. Leguminosae). The drug is collected in spring or autumn, removed from rootlet and root stock, and dried in the sun.

Description Cylindrical, less branched, upper end slightly thick, 10-50 cm long, 0.6-2 cm in diameter. Externally reddish-brown, tinged with greyish, with longitudinal wrinkles, transversely elongated lenticel-like protrusions and a few rootlet scars, outer layer easily stripped off, the exposed layer yellowish. Texture hard and tough, uneasily broken, fracture fibrous and starchy, yellowish-white in bark and yellowish-brown in wood, rays radial, cambium ring brownish. Odour, slight; taste sweetish, slightly bean-like on chewing.

Identification (1) Transverse section: Cork consisting of 6-8 layers of cells. Phelloderm narrow, with 2-4 layers of collenchymatous cells at the outside. Phloem broader, cleft outside, fibres in bundles scattered, with thickened walls, slightly lignified; phloem rays often curved outside. Cambium in a ring. Vessels in xylem singly scattered or 2-3 cells grouped, surrounded by xylary fibres. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate.

Powder: Yellowish-brown. Fibres in bundles, 5-22 μm in diameter, with thickened walls, slightly lignified, surrounded by a sheath of parenchymatous cells containing calcium oxalate prisms, forming crystal fibres, the walls of crystal cells unevenly thickened. Prisms of calcium oxalate 7-14 μm in diameter, up to 22 μm long. Bordered pitted vessels up to 145 μm in diameter. Simple starch granules subrounded or ovoid-rounded, 2-19 μm in diameter; compound granules of 2-8 components.

(2) Place 5 g of the powder into a Soxhlet's extractor, heat under reflux in 80 ml of petroleum ether (60-90℃) on a water bath for 4 hours. Transfer the extract to a separating funnel, extract by shaking with 3 quantities (20 ml, 20 ml and 10 ml) of a 1% solution of potassium carbonate, combine the potassium carbonate solutions, adjust to pH 1-2 with dilute hydrochloric acid and extract with three 20-ml quantities of ether, combine the ether solutions and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 5 g of Radix Hedysari reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃), ethyl acetate and benzene (3∶2∶2) as the mobile phase. Apply separately to the plate 10 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with a 1% solution of vanillin in sulfuric acid. The pink spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Extractives Carry out the method for Determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using 45% ethanol as the solvent, not less than 30.0 per cent.

Processing Eliminate foreign matter, grade according to size, wash clean, soften thoroughly, cut into thick slices, and dry.

Action To reinforce *qi* and strengthen the superficial resistance, induce urination, promote the drainage of pus and the growth of new tissues.

Indications Deficiency of *qi* with lack of strength, anorexia and loose stools; sinking of *spleen-qi* marked by protracted diarrhea and prolapse of the rectum; hematochezia and abnormal uterine bleeding; spontaneous sweating due to weakened superficial resistance; edema due to deficiency *of qi*; unruptured abscesses; anemia; diabetes; albuminuria in chronic nephritis.

Usage and dosage 9-30 g.

Storage Preserve in a ventilated and dry place, protected from moisture and moth.

Radix Hedysari Praeparata cum Melle (炙红芪, Zhihongqi)

Prepared Manyinflorescenced Sweetvetch Root

The drug is the processed Radix Hedysari.

Procedure Stir-bake the slices of Radix Hedysari as described under the method for stir-baking with honey (Appendix Ⅱ D) until no more sticky to fingers.

Description Occurring in rounded or elliptical thick slices, 0.4-1.5 cm in diameter, 1-2 mm thick. Externally reddish-

brown, slightly lustrous, wrinkled longitudinally and remained with a few rootlet scars. The surface of slice often showing some twisted clefts, bark pale yellow, cambium ring pale brown, wood pale yellowish-brown, showing radial striations. Odour, honeyed-fragrant; taste, sweet; slightly sticcky, and bean-like on chewing.

Identification Use 7 g of the powder, carry out the method as described under the test (2) of Identification for Radix Hedysari. It shows the same results.

Extractives Carry out the method as described under the Extractives for Radix Hedysari. It contains not less than 40.0 per cent.

Action To invigorate the function of spleen and stomach.

Indications *Qi-deficiency*, lassitude, anorexia, diarrhea.

Usage and dosage, Storage As described under Radix Hedysari.

Radix Inulae (土木香, Tumuxiang)

Inula Root

Inula Root is the dried root of *Inula helenium* L. (Fam. Compositae). The drug is collected in autumn, removed from soil, and dried in the sun.

Description Conical, slightly curved, 5-20 cm long. Externally yellowish-brown or dark brown, with longitudinal wrinkles and rootlet scars. Root stock large, with sunken stem scars and remains of leaf sheath at apex, surrounded by cylindrical rootlets. Texture hard, uneasily broken, fracture slightly even, yellowish-white to pale greyish-yellow, showing dented-dotted oil cavities. Odour, slightly aromatic; taste, bitter and pungent.

Identification (1) Transverse section: Cork consisting of several layers of cells. Phloem broad. Cambium ring less distinct. Xylem rays 6-25 cells wide; vessels sparse, singly scattered or several aggregated in groups, radiately arranged; xylary fibres rare, in bundles, surrounding the vessels at the centre of xylem. Parenchymatous cells containing inulin. Oil cavities scattered in phloem and xylem, 80-300 μm in diameter.
Powder: Pale yellowish-brown. Inulin abundant, colourless, in irregular pieces. Reticulated vessels 30-100 μm in diameter. Cork cells polygonal, yellowish-brown. Xylary fibres long-fusiform, with oblique ends and oblique pits.
(2) To 0.5 g of the powder add 4 ml of methanol, tightly stoppered, shake, allow to stand for 30 minutes, and filter, use the filtrate as the test solution. Dissolve alantolactone CRS and isoalantolactone CRS in methanol to produce a mixture containing 2 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 0.25% silver nitrate solution as the coating substance and a mixture of petroleum ether (60-90℃), benzene and ethyl acetate (5 : 1 : 1) as the mobile phase. Apply separately to the plate 5 μl each of the two solutions. After developing (protected from light) and removal of the plate, dry in air. Spray with a 5% solution of anisaldehyde in sulfuric acid, heat to the spots distinct. The two bluish-violet spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into slices, and dry in the sun.

Action To invigorate the *spleen* and regulate the function of the *stomach*, to relieve the depression of the *liver qi*, to alleviate pain, and to prevent abortion.

Indications Distending pain in the chest, hypochondria and epigastrium, vomiting and diarrhea; bruise or sudden sprain of the chest with pain during breathing; threatened abortion.

Usage and dosage 3-9 g, mostly used in pills or powder.

Storage Preserve in a cool and dry place.

Radix Isatidis (板蓝根, Banlangen)

Isatis Root

Isatis Root is the dried root of *Isatis indigotica* Fort. (Fam. Cruciferae). The drug is collected in autumn, removed from soil, and dried in the sun.

Description Cylindrical, slightly tortuous, 10-20 cm long, 0.5-1 cm in diameter. Externally greyish-yellow or brownish-yellow, wrinkled longitudinally and lenticellate horizontally, with rootlets or rootlet scars. Root stock slightly expanded, exhibiting dark green or dark brown petiole-bases arranged in whorls, and dense tubercles. Texture compact and soft, fracture yellowish-white in bark and yellow in wood. Odour, slight; taste, sweetish then bitter and astringent.

Identification (1) Transverse section: Cork consisting of several rows of cells. Phelloderm narrow. Phloem broad, rays distinct. Cambium in a ring. Xylem vessels yellow, subrounded, up to 80 μm in diameter; xylary fibres in bundles. Parenchymatous cells containing starch granules.
(2) Observe the decoction under an ultraviolet light at 365 nm, a blue fluorescence is shown.
(3) To 0.5 g of the powder, add 20 ml of dilute ethanol, ultrasonicate for 20 minutes and filter, evaporate the filtrate to dryness. Dissolve the residue with 1 ml of dilute ethanol as the test solution. Dissolve arginine CRS in dilute ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxmethylcellulose as the coating substance and a mixture of *n*-butanol, glacial acetic acid and water (19:5:5) as the mobile phase. Apply separately 1-2 μl of each of the two solutions to the plate (dry in air). After developing and removal of the plate, dry under a current of hot air, spray with ninhydrin TS, heat at 105℃ to the spots clear. The spot in the chromatography obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Water Not more than 15.0 per cent (Appendix Ⅸ H, method 1).

Extractives Carry out the hot extraction method as described under the determination of ethanol-soluble extractives (Appendix Ⅹ A), using 45% ethanol as solvent, not less than 25.0 per cent.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry.

Action To remove *toxic-heat*, reduce *heat* in blood, and ease sore throat.

Indications Eruptive epidemic diseases with dark red or purplish tongue; mumps; pharyngitis, laryngitis, scarlet fever; erysipelas; carbuncles.

Dosage 9-15 g.

Storage Preserve in a dry place, protected from mould and moth.

Radix Kansui (甘遂, Gansui)

Gansui Root

Gansui Root is the dried tuber root of *Euphorbia kansui* T. N. Liou ex T. P. Wang (Fam. Euphorbiaceae). The drug is collected before flowering in spring or after the aerial part withering in autumn, removed from the outer bark by dasking, and dried in the sun.

Description Ellipsoid or long cylindrical or moniliform, 1-5 cm long, 0.5-2.5 cm in diameter. Externally whitish or yellowish-white, with brown patches of cork adhering at depression. Texture fragile, easily broken, fracture starchy and white, wood slightly radial-striated; long cylindrical tubers appearing more fibrous. Odour, slight; taste, sweetish and pungent.

Identification (1) Powder: Whitish. Starch granules fairly abundant, simple granules spherical or hemispherical, 5-34 μm in diameter, hilum pointed, slit-shaped or stellate; compound granules of 2-8 components. Non-articulated laticiferous tubes containing yellowish minute granular substances. Thick-walled cells rectangular, fusiform, subtriangular or polygonal, walls slightly lignified or non-lignified. Bordered pitted vessels more frequent, usually accompanied with fibre bundles.
(2) To 1 g of the powder add 10 ml of ethanol, ultrasonicate for 30 minutes and filter. Evaporate the filtrate to dryness and dissolve the residue in 1 ml of ethanol as the test solution. Prepare a solution of 1 g of Radix Kansui reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of toluene and acetone (10∶0.6) as the mobile phase. Apply separately to the plate 2 μl of each of the above two solutions. After developing and removal of the plate, dry it in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 12.0 per cent.

Total ash Not more than 3.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol as the solvent, not less than 18.0 per cent.

Processing *Radix Kansui* (*unprepared*) Eliminate foreign matter, wash clean, and dry in the sun.

Radix Kansui (*stir-baked with vinegar*) Stir-bake Radix Kansui as described under the method of stir-baking with vinegar (Appendix Ⅱ D) to dryness, using 30 kg of vinegar per 100 kg of Radix Kansui.

Action To cause drastic purgation and expel retained water.

Indications Anasarca, hydrothorax or ascites with dyspnea, constipation and oliguria.

Usage and dosage 0.5-1.5 g, mostly used in pills or powder after processing.

Precaution Contraindicated in pregnancy. Incompatible with Radix Glycyrrhizae.

Storage Preserve in a ventilated dry place, protected from moth.

Radix Knoxiae (红大戟, Hongdaji)

Knoxia Root

Knoxia Root is the dried root of *Knoxia valerianoides* Thorel et Pitard (Fam. Rubiaceae). The drug is collected in autumn and winter, removed from rootlet, washed clean, treated with boiling water for a moment, and dried.

Description Somewhat fusiform, occasionally branched, somewhat curved, 3-10 cm long, 0.6-1.2 cm in diameter. Externally reddish-brown, rugged, with twisted longitudinal wrinkles. Usually with a small stem scar at the upper end. Texture compact, fracture reddish-brown in bark and brownish-yellow in wood. Odour, slight; taste, sweetish and slightly pungent.

Identification (1) Transverse section: Cork consisting of several layers of cells. Phloem broad. Cambium in a ring. In xylem, groups of vessels arranged interruptedly and radially, consisting of several rows of vessels near cambium, in ward vessels gradually arranged in one row or scattered singly, rays broad. Parenchyma scattered with the mucilage cells containing raphides of calcium oxalate and secretory cells containing reddish-brown secretion.
(2) Boil 1 g of the powder in a test tube with 10 ml of water for 10 minutes, and filter. To the filtrate add 1 drop of sodium hydroxide TS; a cherry red colour is produced, which turns to orange yellow on acidifying with hydrochloric acid.
(3) Macerate 3 g of the powder in 30 ml of methanol for 1 hour, filter and evaporate the filtrate to dryness. Dissolve the residue in 10 ml of water, add 1 ml of hydrochloric acid, heat under reflux on a water bath for 30 minutes, cool immediately, extract by shaking with two 20-ml quantities of chloroform, combine the chloroform extracts, evaporate to dryness. Dissolve the residue in 1 ml of absolute ethanol as the test solution. Prepare a solution of 3 g of Radix Knoxiae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15∶5∶1) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air, expose to ammonia vapor and examine in daylight. The major spots in the chromatogram obtained with the test solution correspond in position and colour to the major spots in the chromatogram obtained with the reference drug solution.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry.

Action To cause drastic purgation and expel retained water, and counteract *toxicity* and induce subsidence of swelling and nodulation.

Indications Hydrothorax and ascites with constipation and oliguria; carbuncles, sores, scrofula.

Usage and dosage 1.5-3 g.

Storage Preserve in a cool and dry place.

Radix Linderae
(乌药, Wuyao)

Combined Spicebush Root

Combined Spicebush Root is the dried root tuber of *Lindera aggregata* (Sims) Kosterm. (Fam. Lauraceae). The drug is collected all the year round, removed from rootlet, washed clean, either sliced while fresh and then dried in the sun or sun-dried directly.

Description Mostly spindle-shaped, slightly curved, some constricted in the middle to be moniliform, 6-15 cm long, 1-3 cm in diameter. Externally yellowish-brown, with longitudinal wrinkles and sparse rootlet scars. Texture hard. Slices up to 0.2-2 mm thick, transversely cut surface yellowish-white or yellowish-brown, rays radiate, annual rings visible, deeper in colour in the middle part. Odour, aromatic; taste, bitterish and pungent, with a cooling sensation.
Old and not spindle-shaped tap roots can not be used medicinally.

Identification (1) Powder: Yellowish-white. Starch granules fairly abundant, simple granules subspherical, oblong or ovoid, 4-39 μm in diameter, hilum Y-shaped, V-shaped or cleft; compound granules consisting of 2-4 components. Xylary fibres yellowish, mostly in bundles, 20-30 μm in diameter, walls about 5 μm in thickness, with simple pits, lumina filled with starch granules. Phloem fibres nearly colourless, long spindle-shaped, mostly single and scattered, 15-17 μm in diameter, walls very thick, with indistinct pit canals. Bordered pitted vessels up to about 68 μm in diameter, with closely arranged bordered pits. Cell walls of xylem rays slightly thickened, densely pitted. Oil cells oblong, containing brown secretion.
(2) Macerate 1 g of the powder in 30 ml petroleum ether (30-60℃) for 30 min, ultrasonicate for 10 min (keep the temperature of the water bath lower than 30℃) and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml ethyl acetate as the test solution. Prepare a solution of Radix Linderae reference drug in the same manner as the reference drug solution. Dissolve linderalactone CRS in ethyl acetate to produce a solution containing 0.75 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ D), using silica gel H as the coating substance and toluene and ethyl acetate (15∶1) as the mobile phase. Apply separately 4 μl test solution and reference drug solution, 3 μl reference solutionto the plate. After developing and removal of the plate, dry in air, spray with a 1% solution of vanillin in sulfuric acid. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (56∶44) as the mobile phase. As detector a spectrophotometer set at 235 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of linderalactone.

Reference solution Weigh accurately 10 mg of linderalactone CRS to a 100 ml volumetric flask, dissolve with methanol and dilute to volume, mix well. Transfer accurately 10 ml to a 25 ml volumetric flask and dilute with methanol to volume, mix well (40 μg of linderalactone per ml).

Test solution Place 1 g of the coarse powder, weighed accurately, into a Soxhlet's extractor, extract with 50 ml of ether for 4 hours, evaporate the extract to dryness. Dissolve the residues with several small quantities of methanol and transfer to a 50 ml volumetric flask, dilute with methanol to volume, mix well and filter, use the successive filtrate as the test solution.

Procedures Accurately inject 10 μl of each of the reference solution and the test solution, respectively, into the column, determine and calculate the content.
It contains not less than 0.030 per cent of linderane ($C_{15}H_{16}O_4$), calculated with reference to the dried drug.

Processing Eliminate foreign matter; for the unsliced drug, remove rootlets, grade according to size, soften thoroughly, cut into thin slices, and dry.

Action To smooth the flow of *qi* and relieve pain, and warm and tonify the kidney and urinary bladder.

Indications Distending pain in the chest and abdomen accompanied with dyspnea; enuresis and frequency of urination due to hypofunction of the urinary bladder; hernia; dysmenorrhea.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place, protected from moth.

Radix Liriopes
(山麦冬, Shanmaidong)

Liriope Root Tuber

Liriope Root Tuber is the dried root tuber of *Liriope spicata* (Thunb.) Lour. var. *prolifera* Y. T. Ma or *Liriope muscari* (Decne.) Bailey (Fam. Liliaceae). The drug is collected in early summer, washed clean, exposed to strong sunlight repeatedly and piled up until almost dried, removed from fibrous root, and dried.

Description *Root of Liriope spicata* Fusiform, the two ends tapering, 1.2-3 cm long, 0.4-0.7 cm in diameter. Externally pale yellow to brownish-yellow, with irregular longitudinal wrinkles. Texture flexible, but hard and fragile after drying, fracture pale yellow to brownish-yellow, horny, stele small. Odour, slight; taste, sweet, sticky on chewing.

Root of Liriope muscari Slightly compressed, 2-5 cm long, 0.3-0.8 cm in diameter, with coarse longitudinal lines. Taste, sweet and slightly bitter.

Identification (1) Transverse section: *Root of Liriope muscari* Epidermis consisting of 1 layer of parenchymatous cells. Velamen of 1 layer of cells. Cortex broad, parenchymatous cells containing raphides of calcium oxalate, 27-60 μm long; endodermal cells with thickened and lignified walls, passage cells found, 1-2 layers of stone cells lying at the outside of endodermis, with thickened inner and lateral

walls, finely and densely pitted. Stele fairly small, phloem bundlles 7-15, each located between 2 xylem arms, respectively, the lignified cells in the inner side of xylem bundles linking up to a ring. Pith small, parenchymatous cells subrounded.

Root of Liriope muscari Velamen of 3-6 layers of lignified cells, raphides 25-46 μm long, the outside of endodermis showing 1 layer of stone cells, phloem bundles 16-20.
(2) View the thin piece under the ultraviolet light at 365 nm, a fluorescence with light blue colour appears.

Extractives Carry out the cold extraction method as described under the determination for water-soluble extractives (Appendix Ⅹ A), not less than 75.0 per cent.

Processing Eliminate foreign matter, wash clean, and dry.

Action To nourish *yin* and promote production of body fluids, moisten the lung, cool and refresh the heart.

Indications Dry cough caused by *lung-yin* deficiency, cough in consumptive diseases, fluid deficiency and thirst, dysphoria and insomnia, constipation due to fluid deficiency in intestines.

Usage and dosage 9-15 g.

Storage Preserve in a cool and dry place, protected from moisture.

Radix Morindae Officinalis (巴戟天, Bajitian)

Morinda Root

Morinda Root is the dried root of *Morinda officinalis* How (Fam. Rubiaceae). The drug is collected all the year round, removed from rootlet, dried in the sun partially, beaten gently to be compressed, and then dried in the sun.

Description Compressed-cylindrical, somewhat curved, varying in length, 0.5-2 cm in diameter. Externally greyish-yellow or dark grey, with longitudinal wrinkles and transverse cracks, some bark transversely broken and wood exposed. Texture tough, fracture bark thick, purple or purplish, easily separated from wood. Wood hard, yellowish-brown or yellowish-white, 1-5 mm in diameter. Odour, slight; taste, sweetish and slightly astringent.

Identification (1) Transverse section: Cork of several rows of cells. Stone cells single or several in groups in the outer part of phelloderm, interruptedly arranged in a ring. Parenchymatous cells containing raphides of calcium oxalate, arranged tangentially. Phloem broad, parenchymatous cells in the inner part containing raphides of calcium oxalate, arranged axially. Cambium distinct. Vessels in xylem single or 2-3 in group, arranged radially, up to 105 μm in diameter; xylem fibres developed; xylem rays 1-3 rows of cells wide; non-lignified wood parenchymatous cells found occasionally.
Powder: Purplish or purplish-brown. Stone cells yellowish, subrounded, subsquare, subrectangular, elongated or irregular-shaped, some of them tapered at one end, 21-96 μm in diameter, walls up to 39 μm thick, some with distinct striations, pits and pit-canals, some stone cells large and slightly thick-walled. Needle crystals of calcium oxalate mostly in raphides, up to 184 μm long. Bordered pitted vessels pale yellow, up to 105 μm in diameter, with fine and dense bordered pits. Fibre tracheids long-fusiform, bordered pits relatively large, pit apertures obliquely slit-shaped, V-shaped and cross-shaped.
(2) To 2.5 g of the powder add 25 ml of ethanol, heat under reflux for 1 hour, cool and filter. Evaporate the filtrate to about 1 ml as the test solution. Prepare a solution of 2.5 g of Radix Morindae Officinalis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of toluene, ethyl acetate and formic acid (8∶2∶0.1) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Spray with a 5% solution of sodium hydroxide to the spots clear, the spots in both chromatograms show the same colours.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 0.80 per cent (Appendix Ⅸ K).

Extractives Carry out the cold extraction method as described under the determination for water-soluble extractives (Appendix Ⅹ A), not less than 50.0 per cent.

Processing *Radix Morindae Officinalis* Eliminate foreign matter.

Radix Morindae Officinalis (*removed from wood*) Steam the clean Radix Morindae Officinalis as described under the method for steaming (Appendix Ⅱ D), remove the woody cores while hot, cut into sections, and dry.

Radix Morindae Officinalis (*processed with salt*) Steam the clean Radix Morindae Officianlis as described under the method for steaming with salt-water (Appendix Ⅱ D), until it is steamed thoroughly, remove the woody cores while hot, cut into sections and dry.

Radix Morindae Officinalis (*prepared*) Break Radix Glycyrrhizae to pieces and boil with some water. Remove the residue, add clean Radix Morindae Officinalis to the decoction and mix well, boil the mixture thoroughly as described under the method for boiling (Appendix Ⅱ D), remove the woody cores, cut into sections and dry, using 6 kg of Radix Glycyrrhizae per 100 kg of Radix Morindae Officinalis.

Action To reinforce *kidney-yang*, strengthen the tendons and the bones, and relieve rheumatic conditions.

Indications Impotence, seminal emission, infertility, menstrual disorders, pain and cold feeling in the lower abdomen; rheumatic arthralgia; atrophic tendons and bones.

Usage and dosage 3-9 g.

Storage Preserve in a ventilated dry place, protected from mould and moth.

Radix Ophiopogonis (麦冬, Maidong)

Dwarf Lilyturf Tuber

Dwarf Lilyturf Tuber is the dried root tuber of *Ophiopogon japonicus* (Thunb.) Ker-Gawl. (Fam. Liliaceae). The drug is collected in summer, washed clean, sun-dried and piled up

repeatedly until nearly dry, removed from rootlet, and dried.

Description Fusiform, with two ends slightly tapering, 1.5-3 cm long, 3-6 mm in diameter. Externally yellowish-white, finely wrinkled longitudinally. Texture tough, fracture yellowish-white, translucent, stele small. Odour, slightly aromatic; taste, sweetish and bitterish.

Identification (1) Transverse section: Epidermis consisting of 1 layer of cells. Velamen of 3-5 layers of lignified cells. Cortex broad, scattered with mucilage cells containing raphides of calcium oxalate, some needles up to 10 μm in diameter; endodermis with passage cells, endodermal cells with evenly thickened and lignified walls, and a layer of stone cells lying at the outside of endodermis, the inner and lateral walls thickened, finely and dosely pitted. Stele relatively small. Phloem bundles 16-22. Vessels, tracheids, fibres and lignified parenchymatous cells in the inner side of xylem bundles linking up to a ring. Pith small, parenchymatous cells subrounded.
(2) To 2 g, cut into pieces, add 20 ml of a mixture of chloroform and methanol (7 : 3), macerate for 3 hours, ultrasonicate for 30 minutes, cool and filter. Evaporate the filtrate to dryness, and dissolve the residue in 0.5 ml of chloroform as the test solution. Prepare a solution of 2 g of Radix Ophiopogonis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of toluene, methanol and glacial acetic acid (80 : 5 : 0.1) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air, examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H, method 1), not more than 18.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 0.8 per cent (Appendix Ⅸ K).

Extractives Carry out the cold extraction method as described under the determination for water-soluble extractive (Appendix Ⅹ A), not less than 60.0 per cent.

Processing Eliminate foreign matter, wash clean, soften thoroughly, press to be flattened, and dry.

Action To nourish *yin* and promote the production of body fluids, moisten the lung, and anchor the mind.

Indications Dry cough, phthisical cough; thirst due to impairment of body fluids; fidgets and insomnia; wasting-thirst caused by internal *heat*; constipation; diphtheria.

Usage and dosage 6-12 g.

Storage Preserve in a cool and dry place, protected from moisture.

Radix Paeoniae Alba
(白芍, Baishao)

White Peony Root

White Peony Root is the dried root of *Paeonia lactiflora* Pall. (Fam. Ranunculaceae). The drug is collected in summer or autumn, washed clean, removed from two ends and rootlet, either peeled after boiling in water or boiled after peeling, and dried in the sun.

Description Cylindrical, straight or slightly curved, two ends truncate, 5-18 cm long, 1-2.5 cm in diameter. Externally whitish or pale reddish-brown, glossy or with longitudinal wrinkles, rootlet scars and occasional remains of brown cork. Texture compact, uneasily broken, fracture relatively even, whitish or pale brownish-red, cambium ring distinct and rays radial. Odour, slight; taste, slightly bitter and sour.

Identification (1) Powder: Yellowish-white. Masses of gelatinized starch granules fairly abundant. Clusters of calcium oxalate 11-35 μm in diameter, packed in parenchymatous cells, often arranged in a row, or several ones in a cell. Bordered pitted or reticulated vessels 20-65 μm in diameter. Fibres long fusiform, 15-40 μm in diameter, walls thickened, slightly lignified and large round-pitted.
(2) Shake 0.5 g of the powder with 10 ml of ethanol for 5 minutes and filter. Evaporate the filtrate to dryness and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40:5:10:0.2) as the mobile phase. Apply separately to the plate 10 μl of each of the two solutions. After developing and removal of the plate, dry in air and spray a with 5% solution of vanillin in sulfuric acid, heat to the spots distinct. The bluish-purple spot in the chromatogram obtained with the test solution corresponds in position and colour with the spot in the chromatogram obtained with the reference solution.

Heavy metals and harmful elements Carry out the methods for determinations of lead, cadmium, arsenic, mercury and copper (Appendix Ⅸ B, atomic absorption spectrophotometry, or inductively coupled plasma mass spectrometry), not more than 5 ppm of lead, 0.3 ppm of cadmium, 2 ppm of arsenic, 0.2 ppm of mercury and 20 ppm of copper.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% solution of phosphoric acid (14 : 86) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of paeoniflorin.

Reference solution Weigh accurately a quantity of paeoniflorin CRS, dissolve in methanol to produce a solution containing 60 μg per ml.

Test solution Weigh accurately 0.1 g of the powder to a 50 ml volumetric flask, add 35 ml of dilute ethanol, ultrasonicate (power, 240 W; frequency, 45 kHz) for 30 minutes, cool and dilute with dilute ethanol to the volume, mix well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectivelty, into the column, and calculate the content.
It contains not less than 1.6 per cent of paeoniflorin ($C_{23}H_{28}O_{11}$), calculated with reference to the dried drug.

Processing *Radix Paeoniae Alba* Wash, soften thoroughly, cut into thin slices, and dry.

Radix Paeoniae Alba (stir-baked) Stir-bake the slices of Radix Paeoniae Alba as described under the method of simple stir-baking (Appendix Ⅱ D) until it becomes yellowish.

Radix Paeoniae Alba (stir-baked with wine) Stir-bake the slices of Radix Paeoniae Alba as described under the method of stir-baked with wine (Appendix Ⅱ D) until it becomes yellowish.

Action To subdue hyperactivity of the liver and relieve pain, nourish blood and regulate menstruation, and check excessive perspiration.

Indications Headache and dizziness; costal and abdominal pain; spasmodic pain of limbs; anemia; menstrual disorders; spontaneous sweating and night sweating.

Usage and dosage 6-15 g.

Precaution Incompatible with Rhizoma et Radix Veratri.

Storage Preserve in a dry place, protected from moth.

Radix Paeoniae Rubra (赤芍, Chishao)

Red Peony Root

Red Peony Root is the dried root of *Paeonia lactiflora* Pall. or *Paeonia veitchii* Lynch (Fam. Ranunculaceae). The drug is collected in spring and autumn, removed from rhizome, rootlet and dried in the sun.

Description Cylindrical, somewhat curved, 5-40 cm long, 0.5-3 cm in diameter. Externally brown, rough, longitudinally furrowed and wrinkled, and showing rootlet scars and transverse elongated lenticel-like protrusions, sometimes the outer bark easily exfoliated. Texture hard and fragile, easily broken, fracture chalk-white or pink, bark narrow, wood with distinct radial striations, sometimes with clefts. Odour, slight; taste, somewhat bitter, sour and astringent.

Identification (1) Transverse section: Cork consisting of a few layers of brown cells. Parenchymatous cells in cortex elongated tangentially. Phloem relatively narrow. Cambium in a ring. Xylem rays relatively broad, vessels arranged radially, accompanied by wood fibres. Parenchymatous cells containing clusters of calcium oxalate and starch granules.
(2) To 0.5 g of the powder add 10 ml of ethanol, shake thoroughly for 5 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 2 ml of ethanol as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin-layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40∶5∶10∶0.2) as the mobile phase. Apply separately to the plate 4 μl of each of the two solutions. After developing and removal of the plate, dry in air. Spray with a 5% solution of vanillin in sulfuric acid, heat to the spots clear. The blue-purple spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.05 mol/L potassium dihydrogen phosphate (40∶65) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of paeoniflorin.

Reference solution Weigh accurately a quantity of paeoniflorin CRS, previously dried over phosphorous pentoxide under reduced pressure for 36 hours, dissolve in methanol to produce a solution containing 0.5 mg per ml.

Test solution Weigh accurately 0.5 g of the coarse powder to a stopper conical flask, accurately add 25 ml of methanol and weigh, macerate for 4 hours, ultrasonicate for 20 minutes, allow to cool, weigh again, replenish the loss of the solvent and mix well, filter, use the filtrate as the test solution.

Procedures Accurately inject 10 μl of each of the reference solution and the test solution, respectively, into the column, determine and calculate the content.
It contains not less than 1.8 per cent of paeoniflorin ($C_{23}H_{28}O_{11}$).

Processing Eliminate foreign matter. Grade according to size, wash clean, soften thoroughly, cut into thick slices, and dry.
Occurring in subrounded slices, 0.5-3 cm in diameter, 0.3-0.5 cm thick, edge brown, cut surface yellowish-white or pink, bark narrow, wood radial-striated distinctly, sometimes cleft. Carry out the method of Assay mentioned above, containing not less than 1.5 per cent of paeoniflorin ($C_{23}H_{28}O_{11}$).

Action To remove *heat* from blood, eliminate blood stasis, and relieve pain.

Indications Maculation in epidemic diseases; spitting of blood, epistaxis; inflammation of the eye; pain in the chest and costal regions; amenorrhea, dysmenorrhea; mass formation in the abdomen; traumatic injuries; boils and sores.

Usage and dosage 6-12 g.

Precaution Incompatible with Rhizoma et Radix Veratri.

Stroage Preserve in a ventilated dry place.

Radix Panacis Quinquefolii (西洋参, Xiyangshen)

American Ginseng

American Ginseng is the dried root of *Panax quinquefolium* L. (Fam. Araliaceae). All the comme-rcial supplies are obtained from cultivated forms. The drug is collected in autumn, washed clean, and dried in the sun or at a lower temperature.

Description Fusiform, cylindrical or conical, 3-12 cm in length, 0.8-2 cm in diameter. Externally pale yellowish-brown or yellowish-white, exhibiting transverse-striations and linear lenticel-like protrudings, and showing fine and dense longitudinal wrinkles, and rootlet scars. The middle and lower part of the main root with 1 to several lateral roots, mostly broken off. Sometimes, the upper part with rhizome (lutou) showing distinct annulations, rounded or semi-rounded stem scars (luwan), and bearing adventitious roots (Ding) or broken off. Texture heavy and hard, uneasily broken, fracture even, yellowish-white, slightly starchy, bark exhibiting yellowish-brown dotted resin canals, cambium ring brownish-yellow, wood exhibiting

less distinct radiate striations. Odour, slight and characteristic; taste, slightly bitter and sweet.

Identification To 1 g, in powder, add 25 ml of methanol, heat under reflux for 1 hour, allow to cool, filter, evaporate the filtrate to dryness. Dissolve the residue in 20 ml of water, extract by shaking with two 10-ml quantities of ether. Discard the ether extract, extract the water layer with three 15-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extracts, wash with two 10-ml quantities of water. Separate the *n*-butanol layer, evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 1 g of Radix Panacis Quinquefolii reference drug in the same manner as the reference drug solution. Dissolve separately a quantity of pseudoginsenoside F_{11} CRS, ginsenosides Rb_1, Re, Rg_1 CRS in methanol to produce four solutions each containing 2 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, ethyl acetate, methanol and water (15∶40∶22∶10, standing for 12 hours at 5-10℃) as the mobile phase. Apply separately to the plate 2 μl of each of the above six solutions. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots distinct. Examine in daylight and under ultraviolet light at 365 nm. The spots or fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and reference solutions.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 13.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Radix Ginseng Use 1 g of Radix Ginseng reference drug, carry out the method described under the test of Identification to produce a reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13∶7∶2, standing for 12 hours at 5-10℃) as the mobile phase. Apply separately to the plate 2 μl of each of the test solution obtained under the test of Identification and the above reference drug solution. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to spots distinct. Examine in daylight and ultraviolet light at 365 nm. The chromatogram obtained with the test solution should not be completely same as the chromatogram obtained with the reference drug solution.

Heavy metals and harmful elements Carry out the methods for determinations of lead, cadmium, arsenic, mercury and copper (Appendix Ⅸ B, atomic absorption spectrophotometry, or inductively coupled plasma mass spectrometry), not more than 5 ppm of lead, 0.3 ppm of cadmium, 2 ppm of arsenic, 0.2 ppm of mercury and 20 ppm of copper.

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using ethanol as the solvent, not less than 30.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, acetonitrile as the mobile phase A and 0.1% solution of phosphoric acid as the mobile phase B, elute in gradient as the following:

Time (min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0-25	19→20	81→80
25-60	20→40	80→60
60-90	40→55	60→45
90-100	55→60	45→40

As detector a spectrophotometer set at 203 nm, maintain the column temperature at 40℃. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of ginsenoside Rb_1.

Reference solution Dissolve ginsenosides Rg_1, Re and Rb_1 CRS, accurately weighed, in methanol to produce a mixture containing 0.1, 0.4 and 1.0 mg of each per ml as the reference solution.

Test solution Weigh accurately 1 g of the powder (through No. 3 sieve) to a stoppered conical flask, accurately add 50 ml of *n*-butanol saturated with water and weigh. Heat under reflux on a water bath for 1.5 hours, cool and weigh again, replenish the loss of solvent with *n*-butanol saturated with water, mix well and filter. Evaporate accurately 25 ml of the successive filtrate to dryness in an evaporating dish, dissolve the residue in 50% methanol, transfer to a 10 ml volumetric flask, dilute with 50% methanol to volume and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 2.0 per cent of the total amount of ginsenoside Rg_1 ($C_{42}H_{72}O_{14}$), ginsenoside Re ($C_{48}H_{82}O_{18}$) and ginsenoside Rb_1 ($C_{54}H_{92}O_{23}$), calculated with reference to the dried drug.

Processing Remove rhizome (Lutou), soften thoroughly, cut into thin slices, dry, or pound to pieces before use.

Action To tonify *qi* and nourish *yin*, remove *heat* and promote the production of body fluids.

Indications Used for deficiency of *qi* and *yin*, internal-*heat*, cough and asthma, bloody phlegm, *fire* in the deficiency syndrome, dysphoria and tiredness, diabetes, dry and thirsty mouth and throat.

Usage and dosage 3-6 g.

Precaution Incompatible with Rhizoma et Radix Veratri.

Storage Preserve in well closed containers, stored in a cool and dry place, protected from moth.

Radix Peucedani (前胡, Qianhu)

Hogfennel Root

Hogfennel Root is the dried root of *Peucedanum praeruptorum* Dunn (Fam. Umbelliferae). The drug is collected in winter to next spring, when stem and leaves wither or before floral stem grows, removed from rootlet, washed clean and dried in the sun or at a lower temperature.

Description Irregular cylindrical, conical or fusiform,

slightly twisted, the lower part frequently branched, 3-15 cm long, 1-2 cm in diameter. Externally blackish-brown or greyish-yellow, frequently with stem scars and fibrous remains of pericladia at the root stock, with numerous fine annular striations at the upper end, and longitudinal furrows or wrinkles and transverse lenticel-like cicatrices at the lower part. Texture relatively flexible, hard when dried, easily broken, fracture uneven, pale yellowish-white, numerous brownish-yellow oily spots scattered in bark, cambium ring brown, rays radiated. Odour, aromatic; taste, slightly bitter and pungent.

Identification To 0.5 g of the powder, add, 10 ml of chloroform, ultrasonicate for 10 minutes and filter. Evaporate the filtrate to dryness, and dissolve the residue in 5 ml of methanol as the test solution. Dissolve a quantity of praeruptorin A CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel GF_{254} as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (3:1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Water Carry out the method for determination of water (Appendix IX H, method 1), not more than 12.0 per cent.

Total ash Not more than 8.0 per cent (Appendix IX K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix IX K).

Extractives Carry out the cold maceration method as described under the determination of ethanol-soluble extractives (Appendix X A), using dilute ethanol TS as the solvent; not less than 20.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (75:25) as the mobile phase. As detector a spectrophotometer set at 321 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of praeruptorin A.

Reference solution Weigh accurately a quantity of praeruptorin A CRS, dissolve in methanol to produce a solution containing 50 μg per ml.

Test solution Weigh accurately 0.5 g of the powder to a stopper conical flask, add accurately 25 ml of chloroform and weigh. Ultrasonicate (power 250 W, frequency 33 kHz) for 10 minutes, cool and weigh again, replenish the loss of solvent with chloroform, mix well and filter. Evaporate accurately 5 ml of the successive filtrate to dryness, dissolve the residue in methanol, transfer to a 25 ml volumetric flask, dilute with chloroform to volume and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 0.90 per cent of praeruptorin A ($C_{21}H_{22}O_7$), calculated with reference to the dried drug.

Processing *Radix Peucedani* Eliminate foreign matter, wash clean, soften thoroughly, cut into thin slices, and dry in the sun.

Radix Peucedani (processed with honey) Stir-bake the slices of Radix Peucedani as described under the method for stir-baking with honey (Appendix II D) until not sticky to fingers.

Action To dispel *wind* and remove *heat*, and relieve cough and resolve phlegm.

Indications Cough and dyspnea in respiratory tract infection with expectoration of copious or yellowish sticky.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place, protected from mould and moth.

Radix Physochlainae (华山参, Huashanshen)

Funneled Physochlaina Root

Funneled Physochlaina Root is the dried root of *Physochlaina infundibularis* Kuang (Fam. Solanaceae). The drug is collected in spring, removed from rootlet, washed clean, and dried in the sun.

Description Long conical or cylindrical, slightly curved, some branched, 10-20 cm long, 1-2.5 cm in diameter. Externally brownish, showing yellowish-white transverse lenticel-like protrusions, rootlet scars and longitudinal wrinkles, appearing annulated rings on the upper part. At the top usually showing 1 to several rhizomes exhibiting some stem scars and warts. Texture hard, fracture whitish or yellowish-white, bark narrow, wood broad, with fine and dense striations arranged radially. Odour, tobacco-like; taste, bitterish and slight numb.

Identification (1) Transverse section: Cork of several to over 10 layers of cells, the outermost ones yellowish-brown. Cambium ring distinct. Xylem occupying the majority of a root, vessels several in group, some of them accompanied by fine sieve tubes, known as interxylary phloem. Xylary parenchyma and rays showing cells containing sand crystals. Sometimes vessels and groups of vessels near the centre surrounded by several up to more than 10 layers of brown, flattened and suberized cells, containing yellowish-brown contents. Parenchymatous cells filled with starch granules, some containing sand crystals of calcium oxalate.

Powder: Greyish-white. Starch granules fairly abundant, simple granules subspheroidal or hemispheroidal, 3-15 μm in diameter, hilum pointed, cleft or Y-shaped, compound granules of 2-4 components. Sand crystals mostly embedded in parenchymatous cells. Reticulated vessels 17-85 μm in diameter.

(2) To 4 g of the fine powder add 15 ml of 85% ethanol, shake for 15 minutes and filter. Evaporate the filtrate to dryness, add 2 ml of 1% sulfuric acid solution, stir and filter. Adjust the filtrate to alkaline by adding ammonia TS, then extract by shaking with 2 ml of chloroform. Evaporate the chloroform extract to dryness, to the residue add 5 drops of fuming nitric acid, evaporate to dryness, cool, add 3-4 drops of ethanolic potassium hydroxide TS and a small piece of potassium hydroxide; a violet colour is produced.

(3) Moisten 1 g of the medium powder with 2 ml of the mixture of strong ammonia TS-ethanol (1:1), and add 20 ml of chloroform, heat under reflux on a water bath for 1 hour, and filter. Evaporate the filtrate carefully to dryness, and add chloroform to 1 ml as the test solution. Dissolve atropine sulfate CRS, scopolamine hydrobromide CRS, anisodamine hydrobromide CRS, and scopoletin CRS in ethanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the

coating substance and a mixture of ethyl acetate, methanol and strong ammonia TS (17 : 2 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The bluish-white fluorenscent spot (scopoletin) in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution. Spray successively with potassium iodobismuthate TS and ethanolic sodium nitrite TS. The four brown spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Assay *Reference solution* Weigh accurately atropine sulfate CRS, dried previously to constant weight at 120℃, add water to prepare a solution equalling to 75 μg of hyoscyamine per ml as the reference solution.

Test solution Weigh accurately 0.25 g of the midium powder to a stopper conical flask, add accurately 25 ml of citric acid-sodium dihydrogen phosphate BS (pH 4.0), shake for 5 minutes, and allow to stand overnight. Filter with dried filter paper, use the successive filtrate as the test solution.

Procedure Measure accurately 2 ml of each of the test and reference solution to separating funnels respectively, to each funnel add accurately 10 ml of citric acid-sodium dihydrogen phosphate BS (pH 4.0) and 2 ml of 0.04% bromocresol green solution prepared with the above BS separately, mix well, extract by shaking with 10 ml of chloroform for 5 minutes. After demixing, separate the chloroform layer, filter with the filter paper moisten with chloroform to 25 ml volumetric flasks respectively. Extract again with three 5-ml quantities of chloroform, filter to the same flasks in portions, wash the filter paper with chloroform and filter into the flasks, dilute to volume. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ B), measure the absorbance at 415 nm, respectively, and calculate.

It contains not less than 0.20 per cent of alkaloids, calculated as hyoscyamine ($C_{17}H_{23}NO_3$).

Processing Eliminate foreign matter, wash clean, and dry. Break to pieces before use.

Action To relieve asthma and cough, and to induce sedation.

Indications Cough and asthma with thin expectoration; palpitation and insomnia.

Usage and dosage 0.1-0.2 g.

Precaution Overdosage may cause intoxication. Contraindicated for patients with glaucoma. Used with caution in pregnancy and in the patients with marked prostatomegaly.

Storage Preserve in a ventilated dry place, protected from moth.

Preparation Funneled Physochlaina Tablets

Radix Phytolaccae (商陆, Shanglu)

Pokeberry Root

Pokeberry Root is the dried root of *Phytolacca acinosa* Roxb. or *Phytolacca americana* L. (Fam. Phytolaccaceae). The drug is collected from autumn to next spring, removed from rootlet and soil, cut into slice or piece, and dried in the sun or in the shade.

Description Irregular slices or pieces cut transversely or longitudinally, varying in thickness. The outer bark greyish-yellow or greyish-brown. Transversely cut pieces tortuous, with shrunken edges, 2-8 cm in diameter. Cut surface pale yellowish-brown or yellowish-white, wood prominent, forming several bulged concentric rings. Longitudinally cut pieces curved or rolled, 5-8 cm long, 1-2 cm wide, wood showing parallel, bulged stripes. Texture hard. Odour, slight; taste, slightly sweet and numb after chewing for a long time.

Identification Transverse section of root:

Root of Phytolacca acinosa Cork consisting of several to over 10 layers of cells; cortex narrow. Fibro-vascular tissue forming tertiary structure, with several concentric cambium rings, each having dozens of vascular bundles. Phloem at the outer side of vascular bundles, xylem at the inner side, woody fibres numerous, often several ones grouped or around the vessels. Parenchymatous cells containing raphides of calcium oxalate, a few containing prisms or clusters of calcium oxalate, also containing starch granules. Powder: Greyish-white. Needle crystals of calcium oxalate in bundles or scattered throughout, needle crystals fine, raphides 40-72 μm long; prisms or clusters of calcium oxalate observed. woody fibres mostly in bundles, 10-20 μm in diameter, walls thickened or slightly thickened with numerous X-shaped pits. Cork cells brownish-yellow, rectangular or polygonal, some containing granules. Starch granules simple, subrounded or oblong, 3-28 μm in diameter, hilum cleft-like, pointed, stellate, and V-shaped, striations indistinct; compound granules rare, of 2-3 components.

Root of Phytolacca americana Raphides of calcium oxalate relatively long, up to 96 μm; prisms and clusters absent.

Foreign matter Not more than 2 per cent (Appendix Ⅸ A).

Water Carry out the method for the determination of water (Appendix Ⅸ H, Method 1), not more than 13.0 per cent.

Acid-insoluble ash Not more than 2.5 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of water-soluble extractives (Appendix Ⅹ A, the cold extraction method), not less than 10.0 per cent.

Processing *Radix Phytolaccae* Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices or pieces, and dry.

Radix Phytolaccae (*processed with vinegar*) Stir-bake the clean Radix Phytolaccae as described under the method for stir-baking with vinegar (Appendix Ⅱ D) to dryness, using 30 kg of vinegar per 100 kg of Radix Phytolaccae.

Action To cause drastic purgation and induce urination, counteract *toxicity*, and reduce nodulation.

Indications Anasarca with oliguria and constipation; external use for carbuncles and sores.

Usage and dosage 3-9 g; for external use appropriate quantity of the fresh root is pounded into paste, or the dried root is ground into powder and applied topically.

Precaution Contraindicated in pregnancy.

Storage Preserve in a dry place, protected from mould and moth.

Radix Platycodonis (桔梗, Jiegeng)

Platycodon Root

Platycodon Root is the dried root of *Platycodon grandiflorum* (Jacq.) A. DC. (Fam. Campanulaceae). The drug is collected in spring and autumn, washed clean, removed from rootlet, peeled when fresh or unpeeled, and dried.

Description Cylindrical or slightly fusiform, gradually becoming tapering downwards, some branched, slightly twisted, 7-20 cm long, 0.7-2 cm in diameter. Externally white or pale yellowish-white, or yellowish-brown to greyish-brown when unpeeled; longitudinally twisted-furrowed, with transverse lenticel-like scars and branch root scars, and with transverse striations at the upper part. Sometimes the apex showing a relatively short or inconspicuous rhizome, which is marked by several crescent-shaped stem scars. Texture fragile, fracture uneven, cambium ring brown, bark whitish, with cleft, wood pale yellowish-white. Odour, slight; taste, slightly sweet and then bitter.

Identification (1) Transverse section: Cork cells remaining occasionally, showing cork layers when unpeeled, cork cells containing small prisms of calcium oxalate. Phelloderm narrow, often with clefts. Phloem scattered with laticiferous tube groups, walls somewhat thickened, containing fine granular yellowish brown contents. Cambium in a ring. Xylem vessels singly scattered or aggregated in groups of several vessels, arranged radiately. Parenchymatous cells containing inulin.
(2) Mount the section of dried drug with dilute glycerin, examine microscopically, fan-shaped or subrounded crystals of inulin are visible.
(3) To 1 g of the powder, add 20 ml of the mixture of 7% ethanolic sulfuric acid and water (1∶3), heat under reflux for 3 hours and allow to cool. Extract with 2 quantities, each of 20 ml, of chloroform. Combine the chloroform extracts and wash it with 30 ml of water, discard the washings. Dehydrate the chloroform solution with anhydrous sodium sulfate and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 1 g of Radix Platycodonis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and ether (1∶1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% solution of sulfuric acid in ethanol and heat at 105℃ until the spots appear distinctly. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Assay Weigh accurately about 4 g of the powder to a Soxhlet's extractor, macerate in 25 ml of methanol for 15 hours, add further 25 ml of methanol, heat under reflux for 6 hours, allow to stand over night, filter. Evaporate the filtrate to 15-20 ml, cool, add 50 ml of ether, shake and allow to stand. Discard the supernatant solution and dissolve the precipitate on heating with 20, 10 and 5 ml of methanol successively, cool, filter. Combine the methanol solutions, concentrate to 15-20 ml, cool, add 50 ml of ether, shake, then treat in the same manner. Combine the methanol solutions, transfer to a tared evaporating dish, evaporate to dryness on a water bath, dry at 105℃ to constant weight, calculate the content of total Platycodon saponins.
It contains not less than 6.0 per cent of total Platycodon saponins.

Processing Eliminate the foreign matter, wash clean, soften thoroughtly, cut into thick slices, and dry.
Occurring in oblique elliptical or irregular thin slices, mostly peeled off or occasionally with patches of cork adhering. In cut surface bark pale yellowish-white, a cambium ring distinct, brownish, wood broad, much cleft. Texture fragile, easily broken. Carry out the method of Assay mentioned above, containing not less than 5.5 per cent of total platycodon saponins.

Action To relieve cough, ease sore throat, and promote phlegm expectoration and drainage of pus.

Indications Cough with much phlegm, sore throat, hoarseness; pulmonary abscesses with pus running abscess difficult to burst after suppuration.

Usage and dosage 3-9 g.

Storage Preserve in a ventilated dry place, protected from moth.

Radix Polygalae (远志, Yuanzhi)

Thinleaf Milkwort Root

Thinleaf Milkwort Root is the dried root of *Polygala tenuifolia* Willd. or *Polygala sibirica* L. (Fam. Polygalaceae). The drug is collected in spring or autumn, removed from rootlet and soil, and dried in the sun.

Description Cylindrical, somewhat curved, 3-15 cm long, 3-8 mm in diameter. Externally greyish-yellow to greyish-brown, with dense and dented transverse wrinkles, longitudinal wrinkles and fissures, old roots with dense and deeply dented transverse wrinkles, somewhat nodular. Texture hard and fragile, easily broken, fracture brownish-yellow in bark, yellowish-white in wood, bark easily separating from wood. Odour slight; taste, bitter and slightly pungent, with an irritative sensation in the throat on chewing.

Identification (1) Transverse section: Cork of 10 or more rows of cells. Phelloderm of 20 or more rows of parenchymatous cells, tangentially cleft. Phloem relatively broad, usually radial cleft. Cambium in a ring. Xylem well-developed, all lignified, rays 1-3 rows of cells wide. Parenchymatous cells mostly containing fatty oil drops; some containing clusters and prisms of calcium oxalate.
(2) To 1 g of the powder add 20 ml of hydrochloric acid in absolute ethanol (10 → 100), heat under reflux for 30 minutes, allow to cool and filter. Add 30 ml of water in the filtrate, extract by shaking with two 20-ml quantities of chloroform, combine chloroform extracts and evaporate to dryness. Dissolve the residue in 1 ml of ethyl acetate, centrifuge, use the supernatant as the test solution. Prepare a solution of 1 g of Radix Polygalae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and formic acid (14∶4∶0.5) as the mobile phase. Apply separately to the plate 2 μl of each of

the two solutions. After developing and removal of the plate, dry in air, spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to visualize clearly. The major spots in the chromatogram obtained with the test solution correspond in position and colour to the major spots in the chromatogram obtained with the reference drug solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 12.0 per cent.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.5 per cent (Appendix Ⅸ K).

Extractives Weigh accurately 4 g of the coarse powder, add 40 ml of petroleum ether (30-60℃), heat under reflux for 1 hour, filter and wash the drug residue with a quantity of petroleum ether (30-60℃), discard the petroleum ether solution and evaporate the drug residue to dryness. Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using 70% ethanol as the solvent, not less than 20.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.2% solution of phosphoric acid (70∶30) as the mobile phase. As detector a spectrophotometer set at 210 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of polygalacic acid.

Reference solution Weigh accurately a quantity of polygalacic acid CRS, dissolve in methanol to produce a solution containing 80 μg per ml.

Test solution Weigh accurately 1 g of the powder (through No. 4 sieve) to a Soxhlet's extractor, macerate with a quantity of methanol for 30 minutes and heat under reflux on a water bath for 5 hours. Evaporate the extracts to dryness, add 20 ml of 10% solution of hydrochloric acid to the residue and heat slightly to dissolve, hydrolyze on a water bath for 2 hours, take out, cool and filter. Wash the precipitate with water to neutral, dissolve the residue with methanol and transfer to a 100 ml volumetric flask, dilute with methanol to volume and mix well.

Procedure Inject accurately 10 μl of the reference solution and 5-10 μl of the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.70 per cent of polygalacic acid ($C_{29}H_{44}O_6$), calculated with reference to the dried drug.

Processing *Radix Polygalae* Eliminate foreign matter, wash briefly, soften thoroughly, cut into sections, and dry.

Radix polygalae (prepared) Decoct Radix Glycyrrhizae with a quantity of water, remove the residue. Add clean Radix Polygalae, decoct gently until the liquid is exhausted, and dry, using 6 kg of Radix Glycyrrhizae for 100 kg of Radix Polygalae.

Action To anchor the mind, promote phlegm expectoration, and to cause subsidence of swelling.

Indications Insomnia, dream-disturbed sleep, forgetfulness, palpitation, and trance due to incoordination between the heart and kidney; cough with sputum difficult to expectorate; boils and sores, swelling and pain in the breast.

Usage and dosage 3-9 g.

Storage Preserve in a ventilated dry place.

Preparation Thinleaf Milkwort Liquid Extract

Radix Polygoni Multiflori (何首乌, Heshouwu)

Fleeceflower Root

Fleeceflower Root is the dried root tuber of *Polygonum multiflorum* Thunb. (Fam. Polygonaceae). The drug is collected in autumn and winter when leaves wither, removed from two ends, washed clean, and the large one cut into pieces, and then dried.

Description Mass or irregular fusiform, 6-15 cm long, 4-12 cm in diameter. Externally reddish-brown, shrunken and uneven, shallowly grooved, with transverse elongated lenticel-like protrusions and fine rootlet scars. Texture heavy, compact, uneasily broken, fracture pale yellowish-brown or reddish-brown, starchy, bark exhibiting 4-11 subrounded rings of abnormal vascular bundles, forming brocaded patterns, wood in central part relatively large, some having a woody core. Odour, slight; taste, bitterish, sweetish and astringent.

Identification (1) Transverse section: Cork consisting of several layers of cells, filled with brown contents. Phloem relatively broad, scattered with 4-11 subrounded abnormal vascular bundles of collateral type, vessels rare. In the central part of a root cambium in a ring; vessels in xylem less, surrounded by some tracheids and a few xylem fibres. Parenchymatous cells containing starch granules, and clusters of calcium oxalate.
Powder: Yellowish-brown. Simple starch granules subrounded, 4-50 μm in diameter, hilum V-shaped, stellate or Y-shaped, striations of large ones fairly distinct; compound granules of 2-9 components. Clusters of calcium oxalate 10-80 (160) μm in diameter, and clusters jointed with prisms occasionally found. Brown cells subrounded or elliptical, walls slightly thickened, lumina filled with yellowish-brown, brown or reddish-brown contents, and containing starch granules; bordered pitted vessels 17-178 μm in diameter. Brown masses scattered, varying in shape, size and colour.
(2) To 0.25 g of the powder add 50 ml of ethanol, heat under reflux on a water bath for 1 hour, and filter. Concentrate the filtrate to 3 ml, used as the test solution. Prepare a solution of 0.25 g of Radix Polygoni Multiflori reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and a mixture of benzene and ethanol (2∶1) as the mobile phase. Apply separately to the plate 2 μl of each of the two solutions in strips. After developing about 3.5 cm from the base line and removal of the plate, dry in air, then develop again using a mixture of benzene and dehydrated ethanol (4∶1) as the second mobile phase; after developing over a path of about 7 cm, removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent strips in the chromatogram obtained with the test solution correspond in position and colour to the strips in the chromatogram obtained with the reference drug solution. Then spray with phosphomolybdic acid solution in sulfuric acid (dissolve 2 g phosphomolybdic acid in 20 ml of water, add 30 ml of sulfuric acid slowly, and mix well) and heat gently, examine immediately under ultraviolet light at 365 nm. The strips in the chromatogram obtained with the test solution correspond in position and colour to the strips in the

chromatogram obtained with the reference drug solution.

Assay Operate protected from light. Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (25 : 75) as the mobile phase. As detector a spectrophotometer set at 320 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of 2,3,5,4′-tetrahydroxystilbene-2-*O*-β-D-glucoside.

Reference solution Weigh accurately a quantity of 2,3,5,4′-tetrahydroxystibene-2-*O*-β-D-glucoside CRS, dissolve in dilute ethanol to produce a solution containing 0.2 mg per ml as the reference solution.

Test solution Weigh accurately 0.2 g of the powder (through No. 4 sieve) to a conical flask, add accurately 25 ml of dilute ethanol and weigh, heat under reflux on a water bath for 30 minutes, allow to cool, weigh again, replenish the loss of the solvent and mix well, then filter the supernatant with millipore (0.45 μm).

Procedures Accurately inject 10 μl of each of the reference solution and the test solution, respectively, into the column, determine and calculate the content.
It contains not less than 1.0 per cent of 2,3,5,4′-tetrahydroxystibene-2-*O*-β-D-glucoside ($C_{20}H_{22}O_9$).

Processing Eliminate foreign matter, wash, macerate, soften thoroughly, cut into thick slices or sections, and dry.

Action To counteract *toxicity*, cure carbuncles, and relax bowels.

Indications Lymphadentitis, carbuncles, urticaria with itching; constipation; hyperlipemia.

Usage and dosage 6-12 g.

Storage Preserve in a dry place, protected from moth.

Radix Polygoni Multiflori Praeparata cum Succo Glycines Sotae (制何首乌, Zhiheshouwu)

Prepared FLeeceflower Root

The drug is the processed Radix Polygoni Multiflori.

Procedure Mix the slices or pieces of Radix Polygoni Multiflori thoroughly with black bean juice. Carry out the stewing method (Appendix II D) in a suitable non-ferrous container until the juice is exhausted or carry out the steaming method (Appendix II D), steam it alone or steam it after being mixed with black bean juice to a brown colour on all sides, dry in the sun to partial dryness, then cut into slices and dry.
For each 100 kg of slice (piece) of Radix Polygoni Multiflori use 10 kg of black bean.
Preparation of black bean juice: Boil 10 kg of black bean in a sufficient quantity of water for about 4 hours and stew to get about 15 kg of juice. Boil the bean residue again in water for about 3 hours and stew to get about 10 kg of juice. Combine to get about 25 kg of the black bean juice.

Description Irregularly shrunken pieces or slices, about 1 cm thick. Externally dark brown or brown, uneven. Texture hard, fracture horny, brown or black. Odour slight; taste, slightly sweet, bitter and astringent.

Identification Complies with test (2) of Identification described under Radix Polygoni Multiflori.

Water Carry out the method for determination of water (Appendix IX H, method 1), not more than 12.0 per cent.

Total ash Not more than 9.0 per cent (Appendix IX K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix IX K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix X A, the hot extraction method), using ethanol as the solvent, not less than 5.0 per cent.

Assay Operate protected from light. Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (5:15) as the mobile phase. As detector a spectrophotometer set at 320 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of 2,3,5,4′-tetrahydroxystilbene-2-O-β-D-glucoside.

Reference solution Weigh accurately a quantity of 2,3,5,4′-tetrahydroxy-stilbene-2-O-β-D-glucoside CRS, dissolve in dilute ethanol to produce a solution containing 0.2 mg per ml.

Test solution Weigh accurately 0.2 g of the powder (through No. 4 sieve) to a stopper conical flask, add accurately 25 ml of dilute ethanol and weigh. Heat under reflux for 30 minutes, cool and weigh again, replenish the loss of solvent with dilute ethanol and mix well. Filter the supernatant with millipore film (0.45 μm), use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.70 per cent of 2,3,5,4′-tetrahydroxystilbene-2-O-β-D-glucoside ($C_{20}H_{22}O_9$), calculated with reference to the dried drug.

Action To replenish the liver and the kidney with vital essence and blood, blacken hair, and strengthen the tendons and bones.

Indications Anemia; dizziness and tinnitus; premature greying of hair and beard; soreness and weakness of the loins and the knees; abnormal uterine bleeding and leukorrhalgia; general debility in chronic malaria; hyper-lipemia.

Usage and dosage As described under Radix Polygoni Multiflori.

Storage As described under Radix Polygoni Multiflori.

Radix Pseudostellariae (太子参, Taizishen)

Heterophylly Falsestarwort Root

Heterophylly Falsestarwort Root is the dried root tuber of *Pseudostellaria heterophylla* (Miq.) Pax ex Pax et Hoffm. (Fam. Caryophyllaceae). The drug is collected in autumn when most of the aerial parts wither, washed clean, removed from rootlet, either treated with boiling water for a

moment and then dried in the sun, or dried in the sun directly.

Description Slenderly fusiform or slat-shaped, slightly curved, 3-10 cm long, 2-6 mm in diameter. Externally yellowish-white, relatively smooth but slightly wrinkled longitudinally, with rootlet scars at dents. Apex with stem scars. Texture hard and fragile, fracture even, yellowish-white and horny, or whitish and starchy. Odour, slight; taste, sweetish.

Identification (1) Transverse section: Cork consisting of 2-4 rows of subsquare cells. Phelloderm thin, only consisting of several rows of parenchymatous cells, elongated tangentially. Phloem narrow, with broad rays. Cambium in a ring. The majority of root occupied by xylem, vessels sparse and arranged radially, primary xylem occurring triarch to tetrarch. Parenchymatous cells packed with starch granules and clusters of calcium oxalate.
(2) Macerate warmly 1 g of the powder in 10 ml of methanol, shake for 30 minutes, filter, concentrate the filtrate to 1 ml, used as the test solution. Prepare a solution of 1 g of Radix Pseudostillaria reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of *n*-butanol, glacial acetic acid and water (4 : 1 : 1) as the mobile phase. Apply separately 1 μl of each of the two solutions to the plate. After developing in a chamber pre-equilibrated with mobile phase for 15 minutes and removal of the plate, dry in air, spray with 0.2% ninhydrin ethanol solution, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in colour and position to the spots in the chromatogram obtained with the reference drug solution.

Action To replenish *qi* and invigorate the spleen function, and promote production of body and moisten the lung.

Indications Hypofunction of the spleen with lassitude and anorexia; debility and deficiency of *qi* and *yin* marked by spontaneous sweating and thirst during convolescence, dry cough due to dryness of the lung.

Usage and dosage 9-30 g.

Storage Preserve in a ventilated dry place, protected from moisture and moth.

Radix Puerariae Lobatae (葛根, Gegen)

Kudzuvine Root

Kudzuvine Root is the dried root of *Pueraria lobata* (Willd.) Ohwi (Fam. Leguminosae), commonly known as "ye-ge". The drug is collected in autumn and winter, often cut into thick slices or pieces when fresh, and dried.

Description In rectangular thick slices cut longitudinally or small square pieces, 5-35 cm long, 0.5-1 cm thick. The outer bark pale brown, with longitudinal wrinkles, rough, cut surface yellowish-white, showing indistinct striations. Texture pliable and strongly fibrous. Odour, slight; taste, slightly sweetish.

Identification (1) Powder: Pale brown. Starch granules simple granules spheroidal, semi-rounded or polygonal, 3-37 μm in diameter, hilum pointed, cleft or stellate, compound granules of 2-10 components. Fibres mostly in bundles, walls thickened and lignified, surrounded by parenchymatous cells mostly containing prisms of calcium oxalate, forming crystal fibres; crystal cells with lignified and thickened walls. Stone cells infrequently visible, subrounded or polygonal, 38-70 μm in diameter. Bordered pitted vessels relatively large, pits hexagonal or elliptical, arranged very densely.
(2) Macerate 0.8 g of the powder in 10 ml of methanol for 2 hours, filter and evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of methanol as test solution. Dissolve puerarin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, methanol and water (7 : 2.5 : 0.25) as the mobile phase. Apply in strip separately to the plate 10 μl of each of the two solutions. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent strip in the chromatogram obtained with the test solution corresponds in position and colour to the fluorescent strip in the chromatogram obtained with the reference solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H, method 1), not more than 14.0 per cent.

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (25 : 75) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of puerarin.

Reference solution Place 10 mg of puerarin CRS, weighed accurately, to a 25 ml volumetric flask, add 30% ethanol to volume and mix well. Measure accurately 2 ml of the solution to a 10 ml volumetric flask, dilute with 30% ethanol to volume and mix well (80 μg of puerarin per ml).

Test solution Weigh accurately 0.1 g of the powder (through No. 3 sieve) to a conical flask. Add accurately 50 ml of 30% ethanol and weigh. Heat under reflux on a water bath for 30 minutes, cool, and weigh again, replenish the loss of the solvant with 30% ethanol and mix well. Filter and use the successive filtrate as the test solution.

Procedures Accurately inject 10 μl of each of the reference solution and the test solution, respectively, into the column, determine and calculate the content.
It contains not less than 2.4 per cent of puerarin ($C_{21}H_{20}O_9$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick pieces, and dry in the sun.

Action To relieve fever, to promote the production of body fluid, to facilitate eruption, and to arrest diarrhea.

Indications Fever, headache and painful stiffness of the nape in exogenous affections, thirst, diabetes, measles with inadequate eruption, acute dysentery or diarrhea, stiff and painful nape in hypertension.

Usage and dosage 9-15 g.

Storage Preserve in a ventilated dry place, protected from moth.

Radix Puerariae Thomsonii
(粉葛，Fenge)

Thomson Kudzuvine Root

Thomson Kudzuvine Root is the dried root of *pueraria thomsonii* Benth. (Fam. Leguminosae). The drug is collected in autumn and winter, removed from outer bark, partially dried, cut into sections or further halved longitudinally, or obliquely cut into thick slices or pieces, and dried.

Description Cylindrical, subfusiform or semi-cylindrical, 12-15 cm long, 4-8 cm in diameter; some in longitudinally or obliquely cut thick slices, varying in size. Externally yellowish-white or pale brown, or greyish-brown when unpeeled. Heavy, texture hard and starchy, Transversely cut surface showing pale brown concentric rings formed by fibres, longitudinally cut surface showing several longitudinal striations formed by fibres. Odour, slight, taste slightly sweet.

Identification (1) Powder: Yellowish-white. Starch granules abundent, simple granules spheroidal, semi-rounded or polygonal, 3-37 μm in diameter, hilum pointed, cleft or stellate; compound granules of 2-10 components. Fibres mostly in bundles, walls thickened and lignified, surrounded by cells mostly containing prisms of calcium oxalate, forming crystal fibres; crystal cells with lignified and thickened walls. Stone cells infrequently visible, subrounded or polygonal, 38-70 μm in diameter. Bordered pitted vessels relatively large, pits hexagonal or elliptical, arranged very densely.

(2) Macerate 0.8 g of the powder in 10 ml of methanol for 2 hours, filter and evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of methanol as the test solution. Dissolve puerarin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, methanol and water (7∶2.5∶0.25) as the mobile phase. Apply in strip separately to the plate 10 μl of each of the two solutions. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent strip in the chromatogram obtained with the test solution corresponds in position and colour to the fluorescent strip in the chromatogram obtained with the reference solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H, method 1), not more than 14.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (25∶75) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of puerarin.

Reference solution Weigh accurately 10 mg of puerarin CRS to a 25 ml volumetric flask, dissolve in 30% ethanol and dilute to volume, and mix well. Measure accurately 2 ml of the solution to a 10 ml volumetric flask, dilute with 30% ethanol to volume and mix well (80 μg puerarin per ml).

Test solution Weigh accurately 0.8 g of the powder (through No. 3 sieve) to a conical flask, accurately add 50 ml of 30% ethanol and weigh. Heat under reflux on a water bath for 30 minutes, cool, and weigh again, replenish the loss of the solvent with 30% ethanol and mix well. Filter and use the successive filtrate as the test solution.

procedures Inject accurately 10 μl of each of the reference solution and the test solution respectively, into the column, determine and calculate the content.

It contains not less than 0.30 per cent of puerarin ($C_{21}H_{20}O_9$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughy, cut into thick slices, and dry in the sun.

Action To release muscles and subside fever, encourage production of body fluids, induce eruptions, elevate *spleen-yang* to arrest diarrhea.

Indications Fever, headache, stiff neck, thirsty, diabetes, measles with inadequate eruptions, dysentery, diarrhea due to exogenous pathogenic factors; stiff neck from hypertension.

Usage and dosage 9-15 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Radix Pulsatillae
(白头翁，Baitouweng)

Chinese Pulsatilla Root

Chinese Pulsatilla Root is the dried root of *Pulsatilla chinensis* (Bge.) Regel (Fam. Ranunculaceae). The drug is collected in spring or autumn, removed from soil, and dried.

Description Subcylindrical or conical, slightly tortuous, 6-20 cm long, 0.5-2 cm in diameter. Externally yellowish-brown or brown, irregularly and longitudinally wrinkled or furrowed, bark easily exfoliated, the exposed wood yellow, some exhibiting reticulated fissures and cracks, usually with decayed depressed holes near root stock. Root stock slightly swollen, white-tomentose, some showing sheathlike pedicel bases. Texture hard and fragile, fracture yellowish-white or pale yellowish-brown in bark and pale yellow in wood. Odour, slight; taste, slightly bitter and astringent.

Identification (1) Powder: Greyish-brown. Phloem fibres fusiform or spindle-shaped, 100-390 μm long, 16-42 μm in diameter, with lignified walls. Non-glandular hairs unicellular, 13-33 μm in diameter, the base slightly inflated, the walls mostly lignified, some showing spiral or doublespiral striations. Bordered pitted, reticulated and spiral vessels 10-72 μm in diameter.

(2) To 4 g of the powder add 20 ml of ethanol, heat under reflux for 1 hour, filter. Concentrate the filtrate to about 6 ml, cool, add appropriate quantity of acetone, a precipitate is produced. Filter and tranfer about 5 mg of the precipitate to a test tube, add 1 ml of acetic anhydride to dissolve, then add 1 ml of sulfuric acid along the tube wall, a red or red-violet colour is produced at the junction of the two liquids.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thin slices, and dry.

Action To remove *toxic heat* and relieve bloody dysentery.

Indications Amoebic dysentery; pudendal itching with excessive leukorrhea.

Usage and dosage 9-15 g.

Storage Preserve in a ventilated dry place.

Radix Ranunculi Ternati (猫爪草, Maozhaocao)

Catclaw Buttercup Root

Catclaw Buttercup Root is the dried root tuber of *Ranunculus ternatus* Thunb. (Fam. Ranunculaceae). The drug is collected in spring and autumn, removed from rootlet and soil, and dried in the sun.

Description Fusiform, mostly 5-6 fascicled like a cat's claw, 3-10 mm long, 2-3 mm in diameter, apex with yellowish-brown remains of stem and stem scars. Externally yellowish-brown or greyish-yellow, gradually darkening on long storage, with slightly longitudinal wrinkles and some dotted rootlets scars and residual rootlets. Texture compact, fracture whitish or yellowish-white, hollowed or solid, starchy. Odour, slight; taste, slightly sweet.

Identification Transverse section: Epidermal cells tangentially elongated, yellowish-brown, some differentiated into epidermal hairs, slightly lignified. Cortex consisting of 20-30 rows of cells, walls slightly thickened and pitted; endodermis distinct. Stele small, xylem and phloem 2 strands each, arranged alternatively. Parenchymatous cells filled with starch granules.

Action To dissolve lumps and cause subsidence of swelling.

Indications unruptured scrofula; tuberculosis of lymph nodes.

Usage and dosage 15-30 g; up to 120 g when used alone.

Storage Preserve in a ventilated and dry place, protected from moth.

Radix Rehmanniae (地黄, Dihuang)

Rehmannia Root

Rehmannia Root is the fresh or dried root tuber of *Rehmannia glutinosa* Libosch. (Fam. Scrophulariaceae). The drug is collected in autumn, removed from root stock, rootlet and soil, used either in fresh state or baked to almost dry. The former is known as "Xian Dihuang" (Fresh Rehmannia Root) and the latter is known as "Sheng Dihuang" (Unprocessed Rehmannia Root).

Description *Xian Dihuang* Fusiform or slat-shaped, 8-24 cm long, 2-9 cm in diameter. The outer bark thin, externally pale reddish-yellow, with curved longitudinal wrinkles, bud scars, elongated transverse lenticel-like protrudings and irregular scars. Texture fleshy, easily broken, fracture showing a pale yellowish-white bark with orange-red oil dots scattered, and a yellowish-white wood with vessels arranged radially. Odour, slight; taste, slightly sweet and bitterish.

Sheng Dihuang Mostly in irregular masses or oblong, swollen in the centre, slightly tapering at both ends, 6-12 cm long, 3-6 cm in diameter. Some small, slat-shaped, slightly compressed or twisted. Externally brownish-black or brownish-greyish, heavily shrunken, with irregular transverse wavy lines. Texture heavy, soft and tenacious, uneasily broken, fracture brownish-black or jet-black, lustrous, viscous, Odour, slight; taste, slightly sweet.

Identification (1) Transverse section: Cork consisting of several layers of cells. In phelloderm parenchymatous cells loosely arranged; scattered with more secretory cells, containing orange-yellow oil droplets; stone cells occasionally found. Phloem relatively broad, secretory cells less. Cambium in a ring. Xylem rays broad, vessels sparse, arranged radially. Powder: Dark brown. Cork cells brownish. Parenchymatous cells subrounded, containing subrounded nuclei. Secretory cells mostly similar to ordinary parenchymatous cells in shape, containing orange or orange-red oil droplets. Bordered pitted and reticulated vessels up to about 92 μm in diameter.
(2) To 2 g of the powder add 20 ml of methanol, heat under reflux on a water bath for 1 hour, cool, filter, concentrate the filtrate to 5 ml used as the test solution. Dissolve catalpol CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (14 : 6 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air, spray with anisaldehyde TS, heat at 105℃ to the spots distinct. A spot in the chromatogram obtained with the test solution corresponds in colour and position to spot in the chromatogram obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent in Sheng Dihuang.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of water extractives (Appendix Ⅹ A, the cold maceration method), not less than 65.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% solution of phosphoric acid (1 : 99) as the mobile phase. As detector a spectrophotometer set at 210 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of catalpol.

Reference solution Weigh accurately a quantity of catalpol CRS, dissolve in the mobile phase to produce a solution containing 10 μg per ml.

Test solution Cut a quantity of Sheng Dihuang into small pieces (about 5 mm×5 mm), dry under reduced pressure at 80℃ for 24 hours and grind into coarse powder. Weigh accurately 0.4 g to a stoppered conical flask, add accurately 25 ml of methanol and weigh. Heat under reflux for 1.5 hours, cool and weigh again, replenish the loss of solvent with methanol, mix well and filter. Evaporate accurately 10 ml of the successive filtrate nearly to dryness, dissolve the residue in the mobile phase, transfer to a 10 ml volumetric flask, dilute with the mobile phase to volume and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.20 per cent of catalpol ($C_{15}H_{22}O_{10}$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, cover to soften, cut into thick slices, and dry.

Action *Fresh Radix Rehmanniae* To remove *heat* and promote the production of body fluids, reduce *heat* in blood, and arrest bleeding.

Radix Rehmanniae (*unprocessed*) To reduce *heat* in blood, nourish *yin* and promote the production of body fluids.

Indications *Fresh Radix Rehmanniae* Impairment of *yin* in febrile diseases marked by deep red tongue and thirst; skin eruptions and maculation; spitting of blood, epistaxis; sore throat.

Radix Rehmanniae (*unprepared*) Febrile diseases with deep red tougue and thirst; deficiency of *yin* with internal *heat*; consumptive fever; wasting-thirst caused by internal *heat*; spitting of blood, epistaxis; skin eruptions and maculation.

Usage and dosage *Fresh Radix Rehmanniae* 12-30 g.

Radix Rehmanniae (*unprocessed*) 9-15 g.

Storage Fresh Rehmannia Root is embedded in sand and protected from freezing; unprocessed Rehmannia Root is preserved in a ventilated dry place, protected from mould and moth.

Radix Rehmanniae Praeparata (熟地黄, Shudihuang)

Prepared Rehmannia Root

The drug is the processed Radix Rehmanniae.

Procedure (1) Stew the Radix Rehmanniae as described under the method for stewing with wine (Appendix Ⅱ D) until the wine is absorbed entirely, take out, dry in the sun until the mucilage in bark is slightly dried, cut into thick slices or pieces, and dry thoroughtly.
To each 100 kg of Radix Rehmanniae add 30-50 kg of yellow rice wine.
(2) Steam the Radix Rehmanniae as described under the method for steaming (Appendix Ⅱ D) until it becomes blackish and shiny, take out, dry in the sun to be eighty percent dried, cut into thick slices or pieces, and dry thoroughly.

Description Occuring in irregular slices and pieces, broken lumps, varying in size and thickness. Externally jet-black, lustrous, more sticky. Texture soft and flexible, uneasily broken, fracture jet-black, lustrous. Odour, slight; taste, sweet.

Identification To 1 g of the powder add 10 ml of ethanol, macerate for 24 hours, filter, and use the filtrate as the test solution. Dissolve 5-(hydroxy methyl) furfural CRS in ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin-layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of petroleum ether (60-90°C) and ethyl acetate (1 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm, the spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent in Shu Dihuang.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of water extractives (Appendix Ⅹ A, the cold maceration method), not less than 65.0 per cent.

Action To nourish *yin* and replenish blood, reinforce essence and marrow.

Indications *Yin-deficiency* of liver and kidney, aching and weakness of the loins and knees, hectic fever and bone-steaming, night sweating, seminal emission, internal heat and thirst. Anemia with sallow complexion, palpitation, menoxenia, abnormal uterine bleeding, dizziness, tinnitus, grey hair and beard when young.

Usage and dosage 9-15 g.

Storage Preserve in a ventilated and dry place.

Radix Rhapontici (漏芦, Loulu)

Uniflower Swisscentaury Root

Uniflower Swisscentaury Root is the dried root of *Rhaponticum uniflorum* (L.) DC. (Fam. Compositae). The drug is collected in spring and autumn, removed from rootlet and soil, and dried in the sun.

Description Conical or flatted lumps, mostly twisted, varying in length, 1-2.5 cm in diameter. Externally greyish-brown or dark brown, rough, with longitudinal furrows and rhombic, reticulate clefts. Outer bark easily exfoliated. Root stock swollen, with the remains of stems and scaly leaf bases, top with greyish-white pubescences. Texture light, fragile, easily broken, fracture irregular, greyish-yellow, cleft, greyish-black or brownish-black in the centre. Odour, characteristic; taste, slightly bitter.

Identification (1) Transverse section: Epidermis mostly falled off. Metaderm of several to 20 or more layers of brown cells with slightly thicked, lignified or suberized walls. Phloem relatively broad, rays wide. Cambium in a ring. Xylem vessels abundant, the large vessel groups alternated with the small vessel groups, rays often with radial cracks, sometimes stellate clefts at centre surrounded by suberized cells. Parenchyma possessing secretory canals containing reddish-brown secretion.
Powder: Brown. Reticulate and bordered pitted vessels abundant, about 133 μm in diameter. Secretory canals sliver-shaped, 24-68 μm in diameter, containing reddish-brown secretion. Non-glandular hairs of root stock lignified, 0.5-4 mm long, 20-30 μm in diameter. Cells of metaderm subsquare or rectangular, walls slightly thicked, reddish-brown, lignified or suberized.
(2) To 1 g of the powder add 20 ml of methanol, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 1 g of Radix Rhapontici reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and butanone (4 : 1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained from the test solution correspond in colour and position to the spots in the

chromatogram obtained from the reference drug solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H, Method 1), not more than 15.0 per cent.

Extractives Carry out the hot maceration extraction method as described under the determination of ethanol-soluble extractives (Appendix Ⅹ A), using dilute ethanol as the solvent, not less than 8.0 per cent.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry in the sun.

Action To remove *toxic-heat* for treating subcutaneous infection, promote lactation, and relieve muscular contracture.

Indications Mastitis with swelling and pain, carbuncles, scrofula and ulcers; galactostasis; arthritis with ankylosis.

Usage and dosage 5-9 g.

Precaution Used with caution in pregnancy.

Storage Preserve in a ventilated and dry place.

Radix Sanguisorbae (地榆, Diyu)

Garden Burnet Root

Garden Burnet Root is the dried root *Sanguisorba officinalis* L. or *Sanguisorba officinalis* L. var. *longifolia* (Bert.) Yu et Li (Fam. Rosaceae). The latter is commonly known as "Miandiyu". The drug is collected in spring during budding or in autumn after withering, removed from rootlet, washed clean, dried; or cut into slices while fresh, and dried.

Description *Root of Sanguisorba officinalis* Irregular fusiform or cylindrical, slightly curved or twisted, 5-25 cm long, 0.5-2 cm in diameter. Externally greyish-brown to brown, rough, with longitudinal wrinkles. Texture hard, fracture relatively even, pink or pale yellow, wood approximately arranged radially. Odour, slights; taste, slightly bitter and astringent.

Root of Sanguisorba officinalis var. *longifolia* Long-cylindrical, slightly curved or twisted, growing on the stout rhizomes. Externally reddish-brown or brownish-purple, with fine longitudinal wrinkles. Texture hard and tenacious, fracture yellowish-brown or reddish-brown, bark with numerous yellowish-white or yellowish-brown woolly fibres. Odourless; taste, slightly bitter and astringent.

Identification (1) Transverse section:

Root of Sanguisorba officinalis Cork of several layers of brown cells. Phelloderm cells oblong. Phloem with cracks. Cambium ring distinct. Xylem vessels arranged radially, fibres non-lignified, primary xylem distinct. Parenchymatous cells containing clusters and fine prisms of calcium oxalate as well as starch granules.

Root of Sanguisorba officinalis var. *longifolia* Numerous fibres, singly or grouped, existed in the inside of cortex and phloem. Phloem rays distinct. Xylem fibres infrequent.

Powder of root of Sanguisorba officinalis Greyish-yellow to brownish-yellow. Clusters of calcium oxalate numerous, with obtuse angles, 18-65 μm in diameter. Starch granules numerous, mostly single granules, 11-25 μm long, 3-9 μm in diameter, subrounded, broad ovate or irregular, hilum mostly slit-shaped, striations indistinct. Cork cells yellowish-brown, rectangular, some lumina containing yellowish-brown masses or oily dripped contents. Vessels mostly reticulated or bordered pitted thickened, 13-60 μm in diameter. Fibers relatively less, singly or grouped, slender, 5-9 μm in diameter, non-lignified, pits indistinct. Prisms of calcium oxalate 5-20 μm in diameter.

Powder of root of Sanguisorba officinalis var. *longifolia* Reddish-brown. Phloem fibers numerous, singly or grouped, walls thickened, 7-26 mm in diameter, relatively long, non-lignified.

(2) To 2 g of the powder, add 50 ml of water and heat to boil for 30 minutes, allow to cool, centrifuge for 10 minutes. Extract the supernatant by shaking with two 15-ml quantities of ether saturated with hydrochloric acid, combine the ether solutions and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve gallic acid CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of toluene (saturated with water), ethyl acetate and formic acid (6 : 3 : 1) as the mobile phase. Apply separately 2-4 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with a 1% solution of ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H, Method 1), not more than 14.0 per cent.

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Assay Weigh accurately 0.4 g of the powder (through No. 4 sieve), carry out the method for the determination of tanninoids (Appendix Ⅹ B). It contains not less than 10.0 per cent of tanninoids, calculated with reference to the dried drug.

Processing *Radix Sanguisorbae* Eliminate foreigh matter; for the drug not sliced, wash clean, remove remains of stems, soften thoroughly, cut into thick slices, and dry.

Radix Sanguisorbae (carbonized) Stir-bake the slices of Radix Sanguisorbae as described under the method for carbonizing by stir-baking (Appendix Ⅱ D) until the outer part is charred while its inner part becomes brown.

Action To arrest bleeding by dispelling *heat* from blood, and counteract *toxicity* and cure sores.

Indications Hematochezia, hemorrhoidal bleeding, bloody dysentery, abnormal uterine bleeding; scalds and burns; carbuncles, boils and sores.

Usage and dosage 9-15 g; for external use, appropriate quantity is ground into powder and applied topically.

Storage Preserve in a ventilated dry place, protected from moth.

Radix Saposhnikoviae (防风, Fangfeng)

Divaricate Saposhnikovia Root

Divaricate Saposhnikovia Root is the dried root of

Saposhnikovia divaricata (Turcz.) Schischk. (Fam. Umbelliferae). The drug is collected in spring or autumn before growing of the flowering-stem, removed from the rootlet and soil, and dried in the sun.

Description Long conical or long cylindrical, gradually tapering towards the lower part, some slightly tortuous, 15-30 cm long, 0.5-2 cm in diameter. Externally greyish-brown, rugged, with longitudinal wrinkles, numerous transverse-elongated lenticel-like protrudings and dotted raised rootlet scars. Root stock with obvious dense annulations, some annulations marked by brown hair-like remains of leaf bases. Texture light, easily broken, fracture uneven, bark brownish and cracked, wood yellowish. Odour, characteristic; taste, sweetish.

Identification (1) Transverse section: Cork consisting of 5-30 layers of cells. Phelloderm narrow and showing larger elliptical vittae. Phloem broader, scattered with numerous subrounded vittae surrounded by 4-8 secretory cells, gold secretion visible in vittae; rays mostly curved and becoming cleft in the outer part. Cambium distinct. Xylem vessels fairly abundant, arranged radially. Pith present at root stock, stone cells in parenchyma occasionally visible.

Powder: Brownish. Vattae 17-60 μm in diameter, filled with gold secretion. Vascular bundles of leaf bases usually accompanied by fibre bundles. Reticulated vessels 14-85 μm in diameter. Stone cells infrequent, yellowish-green and oblong or subrectangular, with thicker walls.

(2) To 1 g of the powder add 20 ml of acetone, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethanol as the test solution. Prepare a solution of 1 g of Radix Saposhnikoviae reference drug in the same manner as the reference drug solution. Dissolve a quantity of prim-*O*-glucosylcimifugin CRS and 5-*O*-methylvisamminoside CRS in ethanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of chloroform and methanol (4 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the three solutions. After developing and removal of the plate, dry in air, examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 10.0 per cent.

Total ash Not more than 6.5 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.5 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using ethanol as the solvent, not less than 13.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (40 : 60) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 12000, calculated with the reference to the peak of prim-*O*-glucosylcimifugin.

Reference solution Weigh accurately a quantity of prim-*O*-glucosylcimifugin CRS and 5-*O*-methylvisamminoside CRS, respectively, add methanol to produce two solutions each containing 60 μg per ml as the reference solutions.

Test solution Weigh accurately 0.25 g of the fine powder to a stopper conical flask, accurately add 10 ml of methanol and weigh, heat under reflux on a water bath for 2 hours, cool and weigh again, replenish the loss of the solvent with methanol, mix well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 3 μl of each of the reference solutions and 2 μl of the test solution, respectively, into the column, and calculate the content.

It contains not less than 0.24 per cent of the total amount of prim-*O*-glucosylcimifugin ($C_{22}H_{27}O_{11}$) and 5-*O*-methylvisamminoside ($C_{22}H_{28}O_{10}$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry.

Action To induce diaphoresis, to dispel *wind*, to alleviate rheumatic condition, and to relieve spasm.

Indications Headache in colds; urticaria; rheumatic arthralgia; tetanus.

Usage and dosage 4.5-9 g.

Storage Preserve in a cool and dry place, protected from moth.

Radix Scrophulariae (玄参, Xuanshen)

Figwort Root

Figwort Root is the dried root of *Scrophularia ningpoensis* Hemsl. (Fam. Scrophulariaceae). The drug is collected in winter when stem and leaves wither, removed from rhizome, bud, rootlet and soil, dried in the sun or baked to be half-dried, piled up for 3-6 days, processed for several times until dried completely.

Description Subcylindrical, slightly thick at the middle part or thick at the upper part and slender at the lower part, sometimes slightly curved, 6-20 cm long, 1-3 cm in diameter. Externally greyish-yellow or greyish-brown, with irregular longitudinal grooves, transverse lenticel-like protrudings, sparse transverse fissures and numerous rootlet scars. Texture compact, uneasily broken, fracture black, somewhat lustrous. Odour, characteristic resembling caramel; taste, sweetish and slightly bitter.

Identification (1) Transverse section. Cortex relatively broad, stone cells scattered singly or 2-5 in groups, polygonal, subrounded or subsquare, with thicker walls and distinct striations. Phloem rays much cleft. Cambium in a ring. Xylem rays broad, also much cleft; vessels less, subpolygonal, up to 113 μm in diameter, accompanied with wood fibres. Parenchymatous cells containing nucleus-like substance.

(2) To 2 g of the powder add 10 ml of methanol and macerate for 1 hour, ultrasonicate for 15 minutes, filter and use the filtrate as the test solution. Dissolve harpagide CRS and harpagoside CRS in ethanol to produce a mixture each containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-butanol, acetic acid and water (7 : 1 : 2) as the mobile phase. Apply separately to the plate 3 μl of each of the above two solutions. After developing in a chamber pre-saturated with the mobile phase for 15 minutes, removal of

the plate, dry in air, spray with vanillin in sulfuric acid TS and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H), not more than 12.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.8 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of water-soluble extractives (Appendix Ⅹ A, the hot extraction method), not less than 60.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, acetonitrile as the mobile phase A and 1% solution of acetic acid as the mobile phase B, elute in gradient as the following:

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0-20	20→50	80→50

As detector a spectrophotometer set at 278 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of harpagoside.

Reference solution Weigh accurately a quantity of harpagoside CRS, previously dried for 24 hour under reduced pressure, dissolve with 30% methanol to produce a solution containing 10 μg per ml.

Test solution Weigh accurately 0.5 g of the powder to a stopper conical flask, accurately add 50 ml of 30% methanol, and weigh. After macerating for 1 hour, ultrasonicate (power 500 W, frequency 40 kHz) for 30 minutes, cool and weigh again, replenish the loss of solvent with 30% methanol and mix well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.050 per cent of harpagoside ($C_{24}H_{30}O_{11}$), calculated with reference to the dried drug.

Processing Eliminate remains of rhizomes and foreign matter, wash clean, soften thoroughly, cut into thin slices and dry; or soak briefly in water, steam thoroughly, air-dry briefly, then cut into thin slices, and dry completely.

Action To reduce *heat* from blood, nourish *yin*, quench *fire*, and counteract *toxicity*.

Indications Febrile diseases with impairment of *yin* manifested by deep red tongue and dire thirst, or with eruptions; constipation due to impairment of body fluids; phthisis with cough; conjunctivitis, sore throat, scrofula, diphtheria, boils and sores.

Usage and dosage 9-15 g.

Precaution Incompatible with Rhizoma et Radix Veratri.

Storage Preserve in a dry place, protected from mould and moth.

Radix Scutellariae (黄芩, Huangqin)

Baical Skullcap Root

Baical Skullcap Root is the dried root of *Scutellaria baicalensis* Georgi (Fam. Labiatae). The drug is collected in spring or autumn, removed from rootlet and soil, dashed to peel the rugged outer bark after being sun-dried, and then dried thoroughly.

Description Conical, twisted, 8-25 cm long, 1-3 cm in diameter. Externally brownish-yellow or dark yellow, bearing sparse warty traces of rootlets, the upper part rough, with twisted longitudinal wrinkles or irregular reticula, the lower part with longitudinal striations and fine wrinkles. Texture hard and fragile, easily broken, fracture yellow, reddish-brown in the centre; the central part of an old root dark brown or brownish-black, withered or hollowed. Odour, slight; taste, bitter.
Cultivar roots slender, mostly branched. Externally yellowish-brown, outer bark closely adhering to wood, with relatively thin longitudinal wrinkles. Fracture yellow or yellowish, slightly horny. Taste bitterish.

Identification (1) Powder: Yellow. Phloem fibres scattered singly or in bundles, fusiform, 60-250 μm long, 9-33 μm in diameter, thick-walled, with fine pit-canals. Stone cells subrounded, subsquare or rectangular, relatively thick-walled or heavily thick-walled. Cork cells brownish-yellow, polygonal. Reticulated vessels numerous, 24-72 μm in diameter. Wood fibres frequently broken, about 12 μm in diameter, sparsely with oblique pits. Starch granules abundant, simple granules spheroidal, 2-10 μm in diameter, hilum distinct, compound granules composed of 2-3 components.
(2) To 1 g of the powder, add 30 ml of a mixture of ethyl acetate and methanol (3 : 1), heat under reflux for 30 minutes, cool and filter. Evaporate the filtrate to dryness, dissolve the residue in 5 ml of methanol and use the supernatant as the test solution. Prepare a solution of 1 g of Radix Scutellariae reference drug in the same manner as the reference drug solution. Dissolve baicalin CRS, baicalein CRS and wogonin CRS separately in methanol to produce three solutions containing 1 mg, 0.5 mg and 0.5 mg per ml respectively, as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide as the coating substance and a mixture of toluene, ethyl acetate, methanol, and formic acid (10 : 3 : 1 : 2) as the mobile phase. Apply separately to the plate 2 μl of each of the test solution and the reference drug solution and 1 μl of the reference solution. After developing in a chamber previously saturated with the mobile phase for 30 minutes, removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution. The three dark spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference solutions.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 12.0 per cent.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol as the solvent, not less than 40.0 per cent.

Assay Carry out the method for high performance liquid

chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (47 : 53 : 0.2) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin CRS, dried in vaccum at 60℃ for 4 hours, dissolve in methanol to produce a solution containing 60 μg per ml as the reference solution.

Test solution Weigh accurately 0.3 g of medium powder, add 40 ml of 70% ethanol, heat under reflux on a water bath for 3 hours, cool, and filter. Transfer the filtrate to a 100 ml volumetric flask, wash both the container and the residue for several times with a small volume of 70% ethanol, and filter the washings into the same flask. Dilute with 70% ethanol to volume, and mix well. Accurately measure 1 ml to a 10 ml volumetric flask, dilute with methanol to volume, and mix well.

Procedures Accurately inject 10 μl of each of the reference solution and the test solution, respectively, into the column, determine and calculate the content.

It contains not less than 9.0 per cent of baicalin ($C_{21}H_{18}O_{11}$), calculated with reference to the dried drug.

Processing *Radix Scutellariae* Eliminate foreign matter, boil for 10 minutes, take out, soften thoroughly, or steam for half an hour, take out, then cut into thin slices and dry, protecting from exposure to strong sunlight.

Occurring in subrounded or irregular thin slices; externally yellowish-brown to brown; cut surface yellowish-brown or yellowish-green, striated radially.

Carry out the methods as described under Identification test (1) and (2), show the same results. Carry out the method as described under Assay mentioned above, it contains not less than 8.0 per cent of baicalin ($C_{21}H_{18}O_{11}$), calculated with reference to the dried drug.

Radix Scutellariae (processed with wine) Stir-bake the slices of Radix Scutellariae as described under the method for stir-baking with wine (Appendix II D) to dryness.

Occurring in subrounded or irregular thin slices; externally brown; cut surface yellowish-brown, striated radially, showing less burnt patches, sometimes appearing brown in the centre.

Carry out the method according to Assay mentioned above, not less than 8.0 per cent of baicalin ($C_{21}H_{18}O_{11}$), calculated with reference to the dried drug.

Action To remove *damp-heat*, quench *fire* and counteract *toxicity*, arrest bleeding, and prevent abortion.

Indications Oppressed feeling in the chest, nausea and vomiting in epidemic febrile diseases caused by *damp-heat* or *summer-heat*; feeling of stuffiness in the abdomen, acute dysentery or jaundice caused by *damp-heat*; cough due to *heat* in the lung; high fever with dire thirst; spitting of blood and epistaxis due to *heat* in blood; carbuncles and sores; threatened abortion.

Usage and dosage 3-9 g.

Storage Preserve in a ventilated dry place, protected from moisture.

Radix Semiaquilegiae (天葵子, Tiankuizi)

Muskroot-like Semiaquilegia Root

Muskroot-like Semiaquilegia Root is the dried root tuber of *Semiaquilegia adoxoides* (DC.) Makino (Fam. Ranunculaceae). The drug is collected in early summer, washed clean, dried and removed from rootlet.

Description Irregularly short-cylindrical, fusiform, or lump-shaped, somewhat curved, 1-3 cm long, 0.5-1 cm in diameter. Externally dark brown to greyish-black, with irregular longitudinal wrinkles, rootlets or rootlet scars. Apex usually with remains of stems or leaves, covered with several layers of yellowish-brown sheath-like scales. Texture relatively soft, easily broken, fracture whitish in bark and yellowish-white or yellowish-brown and slightly radial-striated in wood. Odour, slight; taste sweet, slightly bitter and pungent.

Identification (1) Transverse section: Cork consisting of more rows of cells containing brown contents. Phelloderm relatively narrow. Phloem broad, cambium in a ring. Xylem rays up to 20 or more rows of cells wide, vessels arranged radially. Sometimes a small pith visible.

(2) Observe the fracture under ultraviolet light at 365 nm, a yellowish-white fluorescence is shown, which becomes weak on adding acid or alkali.

(3) To 1 g of the powder add 10 ml of 70% ethanol, heat under reflux for 30 minutes, filter. Evaporate the filtrate to dryness, dissolve the residue in 5 ml of hydrochloric acid solution (1→100), filter and transfer the filtrate separately to two test tubes. In one tube add 1-2 drops of potassium iodobismuthate TS, an orange-red precipitate is produced; in another tube add 1-2 drops of silicotungstic acid TS, a yellow precipitate is produced.

Action To remove *toxic-heat* and promote the subsidence of swelling and masses.

Indications Carbuncles, boils and sores; mastitis, scrofula, venomous snake bite.

Usage and dosage 9-15 g.

Storage Preserve in a ventilated dry place, protected from moth.

Radix Sophorae Flavescentis (苦参, Kushen)

Lightyellow Sophora Root

Lightyellow Sophora Root is the dried root of *Sophora flavescens* Ait. (Fam. Leguminosae). The drug is collected in spring or autumn, removed from root stock and rootlet, washed clean and dried; or sliced while fresh, and dried.

Description Long cylindrical, usually branched in lower part, 10-30 cm long, 1-6.5 cm in diameter. Externally greyish-brown or brownish-yellow, exhibiting longitudinal wrinkles and transverse elongated lenticel-like protrudings. Outer bark thin, mostly broken and recurved, easily exfoliated, the exposed surface appearing yellow and smooth. Texture hard, uneasily broken, fracture fibrous. Slices 3-6 mm

thick; transversely cut surface yellowish-white with radial lines and cracks, some exhibiting abnormal vascular bundles arranged in concentric rings or scattered irregularly. Odour slight; taste bitter.

Identification (1) To a transverse section of the drug add several drops of sodium hydroxide TS, an orange red colour is produced in the cork and gradually becomes blood-red, lasting for a long time; no colour reaction is produced in the xylem.

(2) To 0.5 g of the powder, add 0.3 ml of strong ammonia TS and 25 ml of chloroform, allow to stand overnight and filter. Evaporate the filtrate to dryness, dissolve the residue in 0.5 ml of chloroform as the test solution. Dissolve matrine CRS and sophoridine CRS in ethanol to produce a mixture containing 0.2 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 2% solution of sodium hydroxide as the coating substance and a mixture of toluene, acetone and methanol (8 : 3 : 0.5) as the mobile phase. Apply separately to the plate 4 μl of each of the above two solutions. After developing to 8 cm and removal of the plate, dry in air, develop again using the upper layer of a mixture of toluene, ethyl acetate, methanol and water (2 : 4 : 2 : 1, keeping below 10℃) as the mobile phase. After developing and removal of the plate, dry in air. Spray with potassium iodobismuthate TS and ethanolic sodium nitrite TS successively. Two orange spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference solution.

(3) Dissolve oxymatrine CRS in ethanol to produce a solution containing 0.2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 2% solution of sodium hydroxide as the coating substance and the lower layer of a mixture of chloroform, methanol and strong ammonia TS (5 : 0.6 : 0.3, keeping below 10℃) as the mobile phase. Apply separately to the plate 4 μl of each of the test solution obtained under the test (2) of Identification and the above reference solution. After developing and removal of the plate, dry in air, spray with potassium iodobismuthate TS and ethanolic sodium nitrite TS successively. An orange spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 11.0 per cent.

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.5 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of water-soluble extractives (Appendix Ⅹ A, the cold maceration method), not less than 20.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use amino bonded silica gel as the stationary phase and a mixture of acetonitrile, dehydrated ethanol and 3% solution of phosphate acid (80 : 10 : 10) as the mobile phase. As detector a spectrophotometer set at 220 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of oxymatrine.

Reference solution Weigh accurately a quantity of matrine CRS and oxymatrine CRS, respectively, in a mixture of acetonitrile and dehydrated ethanol (80 : 20) to produce two solutions each containing 0.05 mg and 0.15 mg per ml.

Test solution Weigh accurately 0.3 g of the powder (through No. 3 sieve) to a stopper conical flask and add accurately 0.5 ml of strong ammonia TS and 20 ml of chloroform, tightly stopper and weigh. Ultrasonicate (power 250 W, frequency 33 kHz) for 30 minutes, cool and weigh again, replenish the loss of solvent with chloroform and mix well, filter. Measure accurately 5 ml of the successive filtrate and apply to a small column (1 cm in inner diameter) packed with neutral alumina (100-200 mesh, 5 g) and elute with 20-ml quantities of chloroform, a mixture of chloroform and methanol (7 : 3) successively, collect the eluates and evaporate to dryness. Dissolve the residue with small quantity of ethanol and transfer to a 10 ml volumetric flask and dilute with ethanol to volume, and mix well.

Procedure Inject accurately 5 μl of the reference solution and 5-10 μl of the test solution, respectively, into the column, and calculate the content.

It contains not less than 1.2 per cent of the total amount of matrine ($C_{15}H_{24}N_{20}$) and oxymatrine ($C_{15}H_{24}N_2O_2$), calculated with reference to the dried drug.

Processing Remove the remains of root stocks, grade according to size, wash clean, soak briefly, soften thoroughly, cut into thick slices, and dry.

Action To remove *heat* and *damp*, kill parasites, and cause urination.

Indications Acute dysentery with bloody stools; jaundice with oliguria; bloody and purulent leukorrhea; pudendal swelling and itching; eczema, sores with exudation, itching of the skin, scabies, and leprosy. External use for trichomonas vaginitis.

Usage and dosage 4.5-9 g; for external use, appropriate quantity to be decocted for washing.

Precaution Incompatible with Rhizoma et Radix Veratri.

Storage Preserve in a dry place.

Radix Stellariae (银柴胡, Yinchaihu)

Starwort Root

Starwort Root is the dried root of *Stellaria dichotoma* L. var. *lanceolata* Bge. (Fam. Caryophyllaceae). The drug is collected in spring and summer when the plant sprouts, or after autumn when stem and leaves wither; cultivar is collected in the middle of September of the third year, or in the middle of April of the fourth year, removed from remains of stem, rootlet and soil, and dried.

Description Cylindrical, occasionally branched, 15-40 cm long, 0.5-2.5 cm in diameter. Externally pale yellow or yellowish-white, with twisted, longitudinal wrinkles and scars of lateral roots, mostly with numerous pored or disc-like depressions, known as "Shayan" (sand hole), fine powder spread out from brown splits when broken at the part of "shayan". The root stock slightly inflated, with closely aggregated warty bud, stem or rhizome traces, known as "Zhenzhupan" (pearl disk). Texture hard and fragile, easily broken, fracture uneven and looser, splitted, bark fairly thin, wood with radiate striations alternating between yellow and white in colour. Odour, slight; taste, sweet.

Cultivars branched, mostly twisted in the lower part, 0.6-1.2 cm in diameter. Externally pale yellowish-brown, with fine and distinct longitudinal wrinkles, scars of rootlets

mostly appearing pitted-dented, almost without "Shayan" (sand holes). The root stock with numerous warty protrudings. Texture of fracture dense, almost not splitted, slightly starchy, wood with indistinct radiate striations. Taste sweetish.

Identification (1) Transverse section: Cork consisting of several to more than 10 layers of cells. Phelloderm narrow. Sieve tube groups of phloem distinct. Cambium in a ring. Xylem well developed, rays broad, more than 10 cells wide. Parenchymatous cells containing sand crystals of calcium oxalate, mainly in ray cells.
(2) Macerate 1 g of the powder in 10 ml of absolute ethanol for 15 minutes and filter. Examine 2 ml of the filtrate under ultraviolet light at 365 nm, a brilliant blue with slight purple fluorescence is shown.
(3) To 0.1 g of the powder, add 25 ml of methanol, ultrasonicate for 10 minutes and filter. Transfer the filtrate to a 50 ml volumetric flask, dilute with methanol to volume. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A). The solution exhibit a maximum absorption at 270 nm.

Acid-insoluble ash Not more than 5.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the cold extraction method), using methanol as solvent, not less than 20.0 per cent.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick pieces, and dry.

Action To relieve fever in *deficiency* conditions.

Indications Fever due to *deficiency* of *yin*, consumptive fever, fever in infantile malnutrition.

Usage and dosage 3-9 g.

Storage Preserve in a ventilated dry place, protected from moth.

Radix Stemonae (百部, Baibu)

Stemona Root

Stemona Root is the dried root tuber of *Stemona sessilifolia* (Miq.) Miq., *Stemona japonica* (Bl.) Miq. or *Stemona tuberosa* Lour. (Fam. Stemonaceae). The drug is collected in summer or autumn, removed from rootlet, washed clean, treated with boiling water for a moment or steamed until the centre of the cut surface is devoid of a white core, and dried in the sun.

Description *Root of Stemona sessilifolia* Fusiform, the upper end relatively slender, shrunken and curved, 5-12 cm long, 0.5-1 cm in diameter. Externally yellowish-white or pale brownish-yellow, with irregular longitudinal deep furrows, and occasionally transverse wrinkles. Texture fragile, easily broken, fracture even, horny, pale yellowish-brown or yellowish-white, bark broad, stele compressed. Odour, slight; taste, sweet and bitter.

Root of Stemona japonica Two ends slightly thinned. Externally mostly with irregular longitudianl folds and transverse wrinkles.

Root of Stemona tuberosa Long fusiform or long slat-shaped, 8-24 cm long, 0.8-2 cm in diameter. Externally yellowish-brown to greyish-brown, with shallow longitudinal wrinkles or irregular longitudinal furrows. Texture compact, fracture yellowish-white or dark brown, stele large, pith whitish.

Identification (1) Transverse section:

Root of Stemona sessilifolia Velamen of 3-4 layers of cells, walls suberized and lignified with dense and fine striations. Cortex relatively broad. In stele phloem bundles and xylem bundles 19-27, respectively, arranged alternatively, with a few non-lignified fibres in the inner side of phloem bundles; xylem bundles with 2-5 vessels, xylem fibres and tracheids, vessels subpolygonal, 48 μm in diameter, radially, occasionally penetrating into the pith. A few small fibres scattered in pith.

Root of Stemona japonica Velamen of 3-6 layers of cells. Phloem fibres lignified. Vessels up to 184 μm in diameter, radially, usually penetrating into pith, arranged in 2-3 whorls.

Root of Stemona tuberosa Velamen of 3 layers of cells, walls without fine striations, the inner walls of the inner layers heavily thickened. Fibres scattered in the outer part of cortex, subsquare, with slightly lignified walls. In stele phloem bundles 36-40. Vessels in xylem bundles rounded-polygonal, up to 107 μm in diameter. The inner sides of xylem bundles linked up with xylem fibres and slightly lignified parenchymatous cells into a ring.
(2) Heat under reflux 5 g of the powder with 50 ml of 70% ethanol for 1 hour, filter, evaporate the filtrate to remove ethanol. To the residue add strong ammonia TS, adjust to pH 10-11, extract by shaking with 5 ml of chloroform. Evaporate the chloroform solution to dryness, dissolve the residue in 5 ml of 1% hydrochloric acid solution and filter. Devide the filtrate into two portions. To one protion add 1 drop of potassium iodobismuthate TS, an orange-red precipitate is produced; to another portion add 1 drop of silicotungstic acid TS, a milky-white precipitate is produced.

Extractives Carry out the hot extraction method described under the determination of water-soluble extractives (Appendix Ⅹ A), not less than 50.0 per cent.

Processing *Radix Stemonae* Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry.
Occurring in irregular thick slices or irregular slat-shaped oblique slices; externally greyish-white or brownish-yellow, deep wrinkled longitudinally; cut surface greyish-white, pale yellowish-brown or yellowish-white, horny; bark relatively thick, stele compressed. Texture flexible and soft. Odour slight; taste sweet and bitter.

Radix Stemonae (*Stir-baked with honey*) Stir-bake the slices of Radix Stemonae as described under the method for stir-baking with honey (Appendix Ⅱ D) until it is not sticky to fingers, using 12.5 kg of refined honey for 100 kg of Radix Stemonae.
The form is similar to the slice of Radix Stemonae, but externally brownish-yellow or brown, with less burnt specks, slightly sticky. Taste sweet.

Action To moisten the lung and relieve cough, and kill insects and worms.

Radix Stemonae (*Stir-baked with honey*) To moisten the lung and relieve cough.

Indications Acute and chronic cough, cough in phthisis, whooping cough; for external use: pediculosis capitis, oxyruiasis, pudendal itching.

Radix Stemonae (*Stir-baked with honey*) Cough in phthisis.

Usage and dosage 3-9 g; for external use, appropriate quantity to be decocted with water or infused in liquor.

Storage Preserve in a ventilated dry place, protected from moisture.

Radix Stephaniae Tetrandrae (防己, Fangji)

Fourstamen Stephania Root

Fourstamen Stephania Root is the dried root of *Stephania tetrandra* S. Moore (Fam. Menispermaceae). The drug is collected in autumn, washed clean, removed from the outer coarse bark, half-dried in the sun, cut into section; the large one is cut longitudinally; and dried.

Description Irregularly cylindrical, semi-cylindrical or lump-shaped, mostly tortuous, 5-10 cm long, 1-5 cm in diameter. Externally greyish-yellow, usually exhibiting deeply depressed transverse grooves and appearing knotty-knobby at the curved part. Texture heavy and compact, fracture even, greyish-white, starchy, with sparsely arranged radial striations. Odour, slight; taste, bitter.

Identification (1)Transverse section: Remaining cork sometimes visible. Phelloderm scattered with stone cell groups, usually arranged tangentially. Phloem relatively broad. Cambium in a ring. The greater part occupied by xylem, rays wide; vessels rare, radially arranged, accompanied by wood fibres. Parenchymatous cells filled with starch granules and a few minute rod-shaped crystals of calcium oxalate.

(2) Heat under reflux 1 g of the powder with 15 ml of ethanol for 1 hour, cool, filter and evaporate the filtrate to dryness. Dissolve the residue in 5 ml of ethanol as the test solution. Dissolve tetrandrine CRS and fangchinoline CRS in chloroform to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chlorofrom, acetone and methanol (6 : 1 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air, and spray with dilute potassium iodobismuthate TS. The spots in the chromatogram obtained with the test solution correspond in position and colour with the spots in the chromatogram obtianed with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 12.0 per cent.

Total ash Not more than 4.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using methanol as the solvent, not less than 5.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, methanol, water and glacial acetic acid (40 : 30 : 30 : 1), containing 0.41 g of sodium dodecylsulphonate per 100 ml) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of tetrandrine.

Reference solution Weigh accurately a quantity of tetrandrine and fanchinoline CRS, dissolve in methanol to produce a mixture containing 0.1 mg and 0.05 mg of each per ml.

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve), add accurately 25 ml of 2% solution of hydrochloric acid in methanol, and weigh. Heat under reflux for 30 minutes, cool and weigh again, replenish the loss of solvent with 2% solution of hydrochloric acid in methanol and filter. Measure accurately 5 ml of the successive filtrate in a 10 ml volumetric flask, dilute with the mobile phase to volume and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 1.6 per cent of the total amount of tetrandrine ($C_{38}H_{42}N_2O_6$) and fanchinoline ($C_{37}H_{40}N_2O_6$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, soak briefly, wash clean, soften thoroughly, cut into thick slices, and dry.

Occurring in subrounded or broken thick slices, edges rather dark in colour, cut surface greyish-white, starchy, with sparse radial striations. Odour slight; taste bitter. Carry out the methods as described under Identification test (2), showing the same result. Carry out the method as described under Assay, not less than 1.4 per cent of the total amount of tetrandrine ($C_{38}H_{42}N_2O_6$) and fanchinoline ($C_{37}H_{40}N_2O_6$).

Action To induce urination to alleviate edema and relieve rheumatic conditions.

Indications Edema with oilguria; eczema; rheumatic arthritis; hypertension.

Usage and dosage 4.5-9 g.

Storage Preserve in a dry place, protected from mould and moth.

Radix Tinosporae (金果榄, Jinguolan)

Tinospora Root

Tinospora Root is the dried root tuber of *Tinospora sagittata* (Oliv.) Gagnep. or *Tinospora capillipes* Gagnep. (Fam. Menispermaceae). The drug is collected in autumn and winter, removed from rootlet, washed clean, and dried in the sun.

Description In irregular masses, 5-10 cm long, 3-6 cm in diameter. Externally brownish-yellow or brownish, rugged, deeply wrinkled. Texture hard, uneasily broken, transversely cut surface yellowish-white when dissected, showing vessels in groups and arranged somewhat radially, deeper in colour. Odour, slight; taste bitter.

Identification Dissolve palmatine hydrochloride CRS and jatrorrhizine hydrochloride CRS respectively in methanol to produce two solutions each containing 0.5 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and strong ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately to the plate 4 μl of each of the two reference solutions and the test solution obtained under Assay, after developing in a chamber pre-equilibrated with ammonia vapor and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in colour and position to the spots in the chromatogram obtained with the reference solutions.

Assay To 1 g of the powder, weighed accurately, add 40

ml of methanol, heat under reflux for 1 hour and filter. Wash the residue with 10 ml of methanol, combine the methanol solutions, evaporate to dryness. Dissolve the residue in a quantity of methanol, transfer to a 5 ml volumetric flask, dilute with methanol to volume, and mix well, used as the test solution. Weigh accurately a quantity of palmatine hydrochloride CRS, add methanol to produce a solution containing 0.2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanal and strong ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately to the plate 6 μl of the test solution, 2 μl and 4 μl of the reference solution alternatively. After developing in a chamber pre-equilibrated with both ammonia vapor and the mobile phase for 30 minutes, remove the plate, dry in air. Carry out the scanning method for thin layer chromatography (thin layer chromatographic scanning method, Appendix Ⅵ B), the excitation wavelength: λ=366 nm. Measure the integration values of absorbance from the test solution and the reference solution, respectively, calculate the content.

It contains not less than 0.030 per cent of palmatine hydrochloride ($C_{21}H_{22}NO_4 \cdot HCl$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, soak, soften thoroughly, cut into thick slices, and dry.

Action To remove *toxic heat*, cure sore throat to relieve pain.

Indications Swelling and pain of the throat, carbuncles and boils; diarrhea, dysentery; epigastric hot pain.

Usage and dosage 3-9 g; for external use, appropriate quantity to be ground into powder and insufflated into the throat, or to be ground together with vinegar and applied topically.

Storage Preserve in a dry place, protected from moth.

Radix Trichosanthis
(天花粉, Tianhuafen)

Snakegourd Root

Snakegourd Root is the dried root of *Trichosanthes kirilowii* Maxim. or *Trichosanthes rosthornii* Harms (Fam. Cucurbitaceae). The drug is collected in autumn and winter, washed clean, peeled, cut into segment or sliced longitudinally, and dried.

Description Irregular cylindrical, spindle-shaped, or in pieces, 8-16 cm long, 1.5-5.5 cm in diameter. Externally yellowish-white or pale brownish-yellow, with longitudinal wrinkles, rootlet scars and slightly concave transverse lenticel-like streak. Some remained with yellowish-brown outer bark. Texture compact, fracture white or yellowish, starchy, wood yellow, somewhat radially arranged in transversely cut section and striated in longitudinally cut section. Odour, slight; taste, slightly bitter.

Identification (1) Powder: Whitish. Starch granules numerous, simple granules subspheroid, semicircular or helmeted, 6-48 μm in diameter, hilum pointed, shortly cleft or V-shaped, striations faintly visible; compound granules consisting of 2 to 14 components, frequently composed of one big component and several small ones. Bordered-pitted vessels large, mostly broken, some bordered pits hexagonal or square, closely arranged. Stone cells yellowish-green, rectangular, elliptical, subsquare, polygonal or fusiform, 27-72 μm in diameter, relatively thick walled and densely fine pitted.

(2) To 2 g of the powder add 20 ml of dilute ethanol, ultrasonicate for 30 minutes, filter, use filtrate as the test solution. Dissolve L-citrulline CRS in dilute ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-butanol, dehydrated ethanol, glacial acetic acid and water (8 : 2 : 2 : 3) as the mobile phase. Apply separately 6 μl of test solution, 1 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with ninhydrin TS, dry at 105℃ until the coloured spots clearly. A spot in the chromatogram obtained with the test solution corresponds in colour and position to the spot in the chromatogram obtained with the reference solution.

Processing Soak briefly, soften thoroughly, cut into thick slices, and dry.

Action To remove *heat*, promote the production of body fluids, and facilitate the drainage of pus and the subsidence of swelling.

Indications Thirst in febrile diseases; dry cough due to *heat* in the lung; diabetes and wasting-thirst caused by internal *heat*; sores and abscess.

Usage and dosage 10-15 g.

Precaution Incompatible with Radix Aconiti and allied drugs.

Storage Preserve in a dry place, protected from moth.

Radix Vladimiriae
(川木香, Chuanmuxiang)

Common Vladimiria Root

Common Vladimiria Root is the dried root of *Vladimiria souliei* (Franch.) Ling or *Vladimiria souliei* (Franch.) Ling var. *cinerea* Ling (Fam. Compositae). The drug is collected in autumn, removed from rootlet, soil and gelatinous matter on root stock, and dried.

Description Cylindrical or semicylindrical with longitudial furrows, somewhat curved, 10-30 cm long, 1-3 cm in diameter. Externally yellowish-brown or deep brown, longitudinally wrinkled, showing numerous fine veins like vegetable sponge at the place where the outer bark fallen off; root stocks occasionally with black viscous gelatinous substance, commonly known as "oil head". Relatively light, texture hard and fragile, easily broken, fracture yellowish-white or yellow, with sparsely scattered deep yellow oil dots and some clefts, wood broad, with radial striations, sometimes the central part rotten-wood-like. Odour, slightly aromatic; taste, bitter, sticky on chewing.

Identification (1) Transverse section: Cork consisting of several layers of brown cells. Phloem ray relatively broad; sieve tube groups alternally arranged with fibre bundles radially, xylem vessel groups alternated with fibre bundles either, forming regular radiated pattern. Cambium ring undulate, fibre bundles yellow, lignified, accompanied by stone cells. Pith intact or withered. Oil cavities scattered in rays and throughout parenchyma in pith. Inulin found in parenchymatous cells.

(2) To 2 g of the powder add 20 ml of ether, ultrasonicate for 20 minutes and filter. Evaporate the filtrate to dryness, dissolve the residue with 1 ml of methanol as the test solution. Prepare a solution of Radix Vladimiriae reference

drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene and ethyl acetate (19 : 1) as the mobile phase. Apply separately 5μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with a 5% solution of vanillin in sulfuric acid and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Total ash Not more than 4.0 per cent (Appendix Ⅸ K).

Processing *Radix Vladimiriae* Eliminate foreign matter and "oil head", wash clean, soften thoroughly, cut into thick slices, and dry.

Radix Vladimiriae (*roasted*) Spread several layers of rough paper made of straw in a wired shallow basket, put a layer of the slices of Radix Vladimiriae on every layer of the paper, cover the slices with the paper, roast on a coke stove or in drying shed until the volatile oil is absorbed by paper and then take out, and dry in the air.

Action To promote the flow of *qi* to relieve pain.

Indications Distending pain in the epigastrium and abdomen with borborygmi, diarrhea, and tenesmus; discomfort in the hypochondriac regions, pain in liver and gall bladder diseases.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place.

Radix Zanthoxyli
(两面针, Liangmianzhen)

Shinyleaf Pricklyash Root

Shinyleaf Pricklyash Root is the dried root of *Zanthoxylum nitidum* (Roxb.) DC. (Fam. Rutaceae). The drug is collected all year round, washed clean, sliced or sectioned, and dried.

Description Occurring in thick slices or cylindrical sections, 2-20 cm long, 0.5-6 (10) cm thick. Externally pale brownish-yellow or pale yellow, exhibiting bright yellow or yellowish-brown subrounded lenticel-like scars. Cut surface rather smooth, bark pale brown, wood pale yellow, showing concentrical annulations and dense pores. Texture hard. Odour, slightly aromatic; taste, pungent, numb and bitter.

Identification (1) Tranverse section: Cork consisting 10-15 rows of cells. Phloem scattered with a few prisms of calcium oxalate, and oil cells, 52-122 μm in long diameter, 28-87 μm in short diameter, the outside of phloem showing some lignified fibres, single or 2-5 in groups. In xylem vessels 35-98 μm in diameter, surrounded by fibre bundles; woody rays 1-3 rows of cells in width, with simple pits. Parenchymatous cells packed with starch granules.

(2) Add 15 ml of ethanol to 1 g of the reference drug of Radix Zanthoxyli, warm macerate for 30 minutes then ultrasonicate for 30 minutes, filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and strong ammonia TS (20 : 5 : 3 : 1 : 0.12) as the mobile phase. Apply separately to the plate 2 μl of each of the reference drug solution, the test solution and the reference solution both obtained under Assay. After developing in a chamber pre-equilibrated with mobile phase for 10 minutes and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in colour and position to the spots in the chromatogram obtained with the reference drug solution, and a light yellow fluorescent spot obtained with the test solution corresponds in colour and position to the spot in the chromatogram obtained with the reference solution.

(3) Dissolve ethoxychelerythrine CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatogram (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and methanol (25 : 2 : 0.1) as the mobile phase. Apply separately to the plate 2 μl of each of the reference solution, the reference drug solution obtained under the test (2) of Identification and the test solution obtained under Assay. After developing in a chamber pre-equilibrated with mobile phase for 10 minutes and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in colour and position to the spots in the chromatogram obtained with the reference drug solution, and an orange-yellow fluorescent spot corresponds in colour and position to the spot in the chromatogram obtained with reference solution.

Zanthoxylum nitidum (Roxb.) DC. f. *fastuosum* How ex Huang Dissolve toddalolactone CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Concentrate 4 ml of the test solution obtained under Assay to about 2 ml as the test solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃), chloroform and methanol (2 : 13 : 1) as the mobile phase. Apply separately to the plate 2 μl of each of the two solutions. After developing in a chamber pre-equilibrated with mobile phase for 20 minutes and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution should not correspond in colour and position to the spot in the chromatogram obtained with the reference solution.

Extractives Carry out the method for determination of ethanol soluble extractives by hot extraction (Appendix Ⅹ A), using ethanol as the solvent, not less than 5.5 per cent.

Assay To 1 g coarse powder, weighed accurately, in a Soxhlet's extractor, extract with 100 ml of methanol under reflux until the reflux fluid becomes colourless. Concentrate the extract on a water bath to about 2 ml, transfer it into a 10 ml volumetric flask, add methanol to volume, mix well and use it as the test solution. Dissolve nitidine chloride CRS, weighed accurately, in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance, a mixture of benzene, ethyl acetate, methanol, isopropanol and strong ammonia TS (20 : 5 : 3 : 1 : 0.12) as the mobile phase. Apply alternatively 4 μl of test solution, 1 μl and 4 μl of reference solution to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. Carry out the thin layer chromatography (thin layer chromatographic scanning method, Appendix Ⅵ B), scan the chromatogram at wavelength of $\lambda_S = 300$ nm, $\lambda_R = 210$ nm, measure the integration values of absorbance from the test solution and the reference solution, and calculate the content.

It contains not less than 0.25 per cent of nitidine ($C_{21}H_{18}NO_2$),

calculated with reference to the dried drug.

Action To promote the flow of *qi* to relieve pain, eliminate blood stasis, dispel *wind* and promote blood circulation.

Indications Traumatic injuries, rheumatic arthralgia, stomachache and teethache due to stagnation of *qi* and blood, venomous snake bite; applied topically for burns and scalds.

Usage and dosage 5-10 g; appropriate quantity for external use. Abrasive powder mixed with liquid for application or simmer in water for washing the affected part.

Precaution Overdose is avoided; incompatible with sour taste food.

Storage Preserve in a dry place, protected from moisture and moth.

Ramulus Cinnamomi (桂枝, Guizhi)

Cassia Twig

Cassia Twig is the dried young branch of *Cinnamomum cassia* Presl (Fam. Lauraceae). The drug is collected in spring and summer, removed from leaf, dried in the sun, or dried in the sun after sliced.

Description Long cylindrical, much-branched, 30-75 cm long, thick end 0.3-1 cm in diameter. Externally brown to reddish-brown, with longitudinal ridges, fine wrinkles, dotted leaf-scars, branch-scars and bud-scars, lenticels dotted. Texture hard and fragile, easily broken. Slices 2-4 mm thick, cut surface showing reddish-brown in bark, yellowish-white to pale yellowish-brown in wood, pith subsquare. Odour, characteristically aromatic; taste, sweet and slightly pungent, relatively strong for bark.

Identification (1) Transverse section: Epidermis consisting of 1 layer of cells, non-glandular hairs unicellular, visible in young branches. Cork consisting of 3-5 layers of cells, the inmost cells with thickened outer walls. Oil cells and stone cells scattered in cortex. Groups of stone cells in pericycle interruptedly arranged in a ring, accompanied by fibre bundles. Secretory cells and fibres scattered in phloem. Cambium distinct. Xylem rays 1-2 cells wide, containing brown contents; vessels scattered singly or 2 to several aggregated; xylary fibres with relatively thin walls, and differentiated uneasily from xylary parenchymatous cells. In pith, the walls of cells slightly thickened and lignified. Cells of rays containing fine needle crystals of calcium oxalate.
(2) To 0.5 g of the powder add 10 ml of ethanol, stoppered tightly, macerate for 20 minutes with frequent shaking, filter, use the filtrate as the test solution. Dissolve cinnamic aldehyde CRS in ethanol to produce a solution containing 1 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (17 : 3) as the mobile phase. Apply separately to the plate 10-15 μl of the test solution and 2 μl of the reference solution. After developing and removal of the plate, dry in air, and spray with a 0.1% solution of 2,4-dinitrophenyl-hydrazine in ethanol. The orange-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 12.0 per cent (Appendix IX H, method 2).

Total ash Not more than 3.0 per cent (Appendix IX K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix X A, the hot extraction method), using ethanol as the solvent, not less than 4.0 per cent.

Processing Eliminate foreign matter, soak briefly, wash clean, soften thoroughly, cut into thin slices, and dry in air. Slices subrounded, elliptic, or sections irregular, possessing dotted lenticels and longitudinal ridges, bark reddish brown, wood yellowish-white or pale yellowish-brown, pith subrounded or slightly square.

Action To induce perspiration to release the exterior, warm the *channels* and stimulate menstruation, reinforce *yang*, relieve palpitation, and send down adverse rising *qi*.

Indications Common cold; epigastric pain with cold feeling; amenorrhea due to *cold* in blood; arthralgia; edema; cardiac palpitation; gastro-intestinal neurosis with a feeling of gas rushing up through the chest to the throat from the lower abdomen.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place.

Ramulus et Folium Picrasmae (苦木, Kumu)

Indian Quassiawood

Indian Quassiawood is the dried branch and leaf of *Picrasma quassioides* (D. Don) Benn. (Fam. Simarubaceae). The drug is collected in summer and autumn, and dried.

Description Branches cylindrical, varying in length, 0.5-2 cm in diameter; externally greyish-green or brownish-green, with fine and dense longitudinal striations and numerous dotted lenticels; texture fragile, easily broken, fracture uneven, pale yellow, the young branches pale-coloured, with relatively large pith. Leaves compound, odd-pinnate, easily falling off; leaflets elongated ovate-elliptical or ovate-lanceolate, subsessile, 4-16 cm long, 1.5-6 cm wide, apex acute, base oblique or slightly rounded, margins crenate, both surfaces usually green, sometimes the lower surface pale purplish-red, pubescent along the midrib. Odour, slight; taste, extremely bitter.

Identification (1) Powder: Yellowish-green. Upper epidermal cells of the leaf polygonal; stomata anomocytic, usually visible on the lower epidermis. Mesophyll cells frequently containing clusters of calcium oxalate, fibre bundles surrounded by parenchymatous cells containing clusters or prisms of calcium oxalate, forming crystal fibres.
(2) Macerate 1 g of the powder in 10 ml of methanol overnight, filter, evaporate the filtrate to dryness, dissolve the residue in 10 ml of methanol as the test solution. Prepare a solution with 1 g of Ramulus et Folium Picrasmae reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix VI B) using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of chloroform and methanol (85 : 15) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air, spray with modified potassium iodobismuthate TS. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Processing Eliminate foreign matter, wash the branches clean, soften thoroughly, cut into slices, and dry in the

sun; spray the leaves with clean water, moisten briefly, cut into slivers, and dry in the sun.

Action To remove *heat* and *damp*, and counteract *toxicity*.

Indications Common cold caused by *wind-heat*, painful swelling throat, diarrhea and dysentery, eczema, boils, venomous snake bite.

Usage and dosage 3-4.5 g of branch or 1-3 g of leaf; appropriate quantity for external use.

Storage Preserve in a dry place.

Ramulus Mori (桑枝, Sangzhi)

Mulberry Twig

Mulberry Twig is the dried young branch of *Morus alba* L. (Fam. Moraceae). The drug is collected from late spring to early summer, removed from leaf, and dried in the sun, or cut into slice while fresh, and dried in the sun.

Description Long cylindrical, branched occasionally, varying in length, 0.5-1.5 cm in diameter. Externally greyish-yellow or yellowish-brown, with numerous yellowish-brown dotted lenticels and fine longitudinal striations, with greyish-white and slightly semicircular leaf scars, and yellowish-brown axillary buds. Texture hard and tenacious, uneasily broken, fracture fibrous. Slices 0.2-0.5 cm thick, bark relatively narrow, wood yellowish-white, medullary rays radiate, pith white or yellowish-white. Odour, slight; taste, weak.

Identification Powder: Pale greyish-yellow. Fibres numerous, scattered singly or in bundles, pale yellow or colourless, slightly sinuous, 10-30 μm in diameter, walls thickened, 5-15 μm, lumina small. Stone cells pale yellow, subrounded or subsquare, 15-40 μm in diameter, walls thickened, 5-20 μm, lumina small. Sclerenchymatous cells grouped or scattered singly, similar to the stone cells in the shape and size, containing 1-2 prisms of calcium oxalate. Prisms included in the sclerenchymatous cells or scattered, 5-20 μm in diameter.

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix X A, the hot extraction method), using ethanol as the solvent, not less than 3.0 per cent.

Processing *Ramulus Mori* For the unsliced, wash clean, soften thoroughly, cut into thick slices, and dry in the sun.

Ramulus Mori (*Stir-baked*) Stir-bake the slices of Ramulus Mori as described under the method for simple stir-baking (Appendix II D) to a yellowish colour produced.

Action To relieve rheumatic arthralgia.

Indications Aching and numbness of joints, particularly of the shoulders and arms.

Usage and dosage 9-15 g.

Storage Preserve in a dry place.

Ramulus Uncariae cum Uncis (钩藤, Gouteng)

Gambir Plant

Gambir Plant is the dried hook-bearing branch of *Uncaria rhynchophylla* (Miq.) Jacks., *Uncaria macrophylla* Wall., *Uncaria hirsuta* Havil., *Uncaria sinensis* (Oliv.) Havil. or *Uncaria sessilifructus* Roxb. (Fam. Rubiaceae). The drug is collected in autumn and winter, removed from leaf, cut into section, and dried in the sun.

Description Cylindrical or subsquare, 2-3 cm long, 2-5 mm in diameter. Externally reddish-brown to purplish-red, with fine longitudinal striations and glabrous; or yellowish-green to greyish-brown, sometimes with white dotted lenticels, covered with yellowish-brown pubescences. Most nodes bearing with two opposite downward curved hooks (sterile peduncles), someones with a hook at one side and a raised scar at another side; hooks slightly flattened or rounded, apex acute, base relatively broad; dotted scars of falling petiole and ring-shaped scars of stipule visible on the branch connected with the hook base. Texture hard and tenacious, fracture yellowish-brown, bark fibrous, pith yellowish-white or hollowed. Odour, slight; taste, weak.

Identification Moisten 1 g of the powder with concentrated ammonia TS, add 30 ml of chloroform, extract for 30 minutes, filter, evaporate the filtrate to dryness. Dissolve the residue in 5 ml of hydrochloric acid solution (1→100), filter into three test tubes. To the first tube add 1-2 drops of potassium iodobismuthate TS; a yellow precipitate is produced; to the second tube add 1-2 drops of mercuric potassium iodide TS, a white precipitate is produced; to the third tube add 1-2 drops of silicotungstic acid TS, a white precipitate is produced.

Water Not more than 10.0 per cent (Appendix IX H, method 1).

Total ash Not more than 3.0 per cent (Appendix IX K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix X A, the hot extraction method), using ethanol as the solvent, not less than 6.0 per cent.

Action To remove *heat*, subdue hyperactivity of the liver, and arrest convulsion.

Indications Headache, dizziness, convulsion, eclampsia, hypertension.

Usage and dosage 3-12 g, added when the decoction is nearly done.

Storage Preserve in a dry place.

Realgar (雄黄, Xionghuang)

Realgar

Realgar is a mineral of sulfides of realgar group, containing mainly arsenic disulfide (As_2S_2). The drug is collected, removed from foreign matter.

Description Aggregates of lumpy or granulous masses, irregular, dark red or orange-red; streak, pale orange-red; crystal surface showing diamond-like lustre. Texture fragile, easily broken, fracture with resin-like lustre. Odour, slightly stinking characteristic; taste, weak.
Powder refined ore: In powders or powder aggregates. Texture lax and fragile, powdered on kneading. Orange-yellow, lustreless.

Identification (1) To 10 mg of the powder, moisten with water, add 2 ml of nitric acid solution saturated with potassium chlorate to dissolve, add barium chloride TS, a

large quantity of white precipitate is produced. Allow to stand, decant the supernatant acid solution, add 2 ml of water to the precipitate and shake, it is not dissolved.
(2) Melt 0.2 g of the powder in a crucible, a white or yellowish-white flame is produced with white heavy fume. Cover the crucible with a piece of glass, a white condensate is produced. Dissolve a small quantity of the condensate in water in a test tube by boiling, filter if necessary, then add several drops of hydrogen sulfide TS; a yellow colour is produced, and a yellow flocculent precipitate is produced on adding dilute hydrochloric acid TS, then add ammonium carbonate TS, the precipitate is dissolved.

Arsenic trioxide To 0.94 g of the fine powder, accurately weighed, add 20 ml of dilute hydrochloric acid TS, stir constantly for 30 minutes, filter, wash the residue with two 10-ml quantities of dilute hydrochloric acid TS by stirring for 10 minutes. Combine the filtrate and washings into a 500 ml volumetric flask, add water to volume, mix well. Measure accurately 10 ml into a 100 ml volumetric flask, dilute with water to volume, mix well. To 2 ml, accurately measured, add 5 ml of hydrochloric acid and 21 ml of water. Carry out the limit test for arsenic (Appendix Ⅸ F, method 1), any stain produced is not more intense than that produced by standard arsenic solution.

Assay Heat about 0.1 g of the powder, accurately weighed, in a 250 ml conical flask with 1 g of potassium sulfate, 2 g of ammonium sulfate and 8 ml of sulfuric acid until the solution becomes clear. Allow to cool, add 50 ml of water slowly, heat to boil gently for 3-5 minutes and allow to cool. Add 2 drops of phenolphthalein IS, neutralize with sodium hydroxide solution (40→100) until it becomes pale red, allow to cool, neutralize with sulfuric acid solution (0.25 mol/L) to colourless. Add 5 g of sodium bicarbonate, shake well, titrate with iodine (0.1 mol/L) VS, towards the end of titration, add 2 ml of starch IS, continue to titrate until a purplish-blue colour is produced. Each ml of iodine (0.1 mol/L) VS is equivalent to 5.348 mg of arsenic disulfide (As_2S_2).
It contains not less than 90.0 per cent of arsenic, calculated as arsenic disulfide (As_2S_2).

Processing *Realgar Powder* Levigate Realgar as described under the method for levigating (Appendix Ⅱ D) and dry in the shade. Carry out the above limit test for arsenic trioxide, the result complies with the requirements.

Action To counteract *toxicity*, to kill parasites, and cure malarial.

Indications Carbuncles, boils; snake-bite, insect-bite; abdominal pain due to intestinal parasitosis; infantile convulsion; malaria.

Usage and dosage 0.05-0.1 g, used in making pills or powders; for external use, appropriate quantity for fumigation or topical application.

Precaution Used with caution for oral administration, and long-term oral administration should be avoided. Contraindicated in pregnancy.

Storage Preserve in a well closed container, stored in a dry place.

Receptaculum Nelumbinis (莲房, Lianfang)

Lotus Receptacle

Lotus Receptacle is the dried receptacle of *Nelumbo nucifera* Gaertn. (Fam. Nympha eaceae). The drug is collected in autumn when the fruit is ripe, removed from the fruits, and dried in the sun.

Description Obconical or funnel-shaped, frequently dilacerate, 5-8 cm in diameter, 4.5-6 cm high. Externally greyish-brown to purplish-brown, with fine longitudinal striations and wrinkles. The top with numerous rounded hollows and the base with the remains of pedicel. Texture lax, broken fracture sponge-like, brown. Odour, slight; taste, slightly astringent.

Identification (1) Powder: Yellowish-brown. Epidermal cells polygonal in surface view, papilla double circlet-shaped. Clusters of calcium oxalate numerous, 10-54 μm in diametre. Brown cells subsquare or subrounded, walls slightly thickened, containing reddish-brown contents in lumina. Spiral and annular vessels 8-80 μm in diameter. Fibres in bundles, pitted, 11-35 μm in diameter.
(2) Macerate warmly 0.5 g of the powder in 5 ml of ethanol for several minutes and filter. To the filtrate add a small quantity of magnesium powder and 1-2 drops of hydrochloric acid; the solution turns to red gradually.

Water Carry out the method for the determination of water (Appendix Ⅸ H, method 1), not more than 14.0 per cent.

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Processing *Receptaculum Nelumbinis* Eliminate dust, and cut into pieces.

Receptaculum Nelumbinis (carbonized) Carbonize the clean Receptaculum Nelumbinis as described under the method for carbonizing by calcining (Appendix Ⅱ D).

Action To remove *blood stasis* and arrest bleeding.

Indications Abnormal uterine bleeding, hematuria, hemorrhoidal bleeding, lochiorrhea due to blood stagnation after child birth.

Usage and dosage 4.5-9 g.

Storage Preserve in a dry place, protected from moisture.

Resina Ferulae (阿魏, Awei)

Chinese Asafetida

Chinese Asafetida is the resin of *Ferula sinkiangensis* K. M. Shen or *Ferula fukanensis* K. M. Shen (Fam. Umbelliferae). The stem is incised from the upper part to the lower part at the flowering and early fruiting stages in the end of spring and early summer. The exuding emulsive resin is collected, and dried in the shade.

Description Irregular lumps or resinous substance. Colour varying in intensity, externally waxy-yellow to brownish-yellow. Lumps light, texture waxy; fracture somewhat pored; freshly cut surface pale, gradually darken on storage. Resinous substance viscid, greyish-white. odour, strongly and lastingly characteristic and alliaceous; taste, pungent, with the burning sensation on chewing.

Identification (1) Weigh accurately 0.2 g of the powder in a 25 ml volumetric flask, add dehydrated ethanol, ultrasonicate for 10 min, add dehydrated ethanol to volume, mix well, filter. Transfer 0.2 ml of the filtrate to a 50 ml volumetric flask, add dehydrated ethanol to volume, and mix well. Carry out the method for ultraviolet spectrophotometry and

colourimetry (Appendix Ⅴ A). The light absorbance of the resulting solution exhibits a maximum at 323 nm.
(2) To 0.5 g of the powder with 20 ml of dilute hydrochloric acid TS, ultrasonicate for 10 minutes, get supernatant fluid, centrifugate when necessary, extract with ether twice, 40 ml, 20 ml respectively. Combine the ether extracts, and evaporate to dryness, dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Dissolve ferulaic acid CRS in a mixture of ethanol and 5% glacial acetic acid (1 : 4) to produce a solution containing 1 mg ferulaic acid per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of hexamethylene, dichloromethane and glacial acetic acid (8 : 8 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with 1% ferric oxide in ethanol and 1% potassium ferricyanide (1 : 1) (freshly prepared). The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Water Carry out the determination of water (Appendix Ⅸ H, method 1), not more than 8.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using ethanol as the solvent, not less than 20.0 per cent.

Assay Carry out the method for determination of volatile oil (Appendix Ⅹ D), using 5-10 g. It contains not less than 10.0 per cent (ml/g) of volatile oil.

Action To remove food stagnancy, disintegrate masses, and kill worms.

Indications Stagnation of undigested meat, mass in the abdomen due to *blood stasis*, abdominal pain due to intestinal parasitonis.

Usage and dosage 1-1.5 g, usually made into pills, powder or plaster to use.

Precaution Contraindicated in pregnancy.

Storage Preserve in well closed containers, stored in a cool and dry place.

Resina Liquidambaris (枫香脂, Fengxiangzhi)

Beautiful Sweetgum Resin

Beautiful Sweetgum Resin is the dried resin of *Liquidambar formosana* Hance (Fam. Hamaelidaceae). The trunk is incised and the resin is running out in July and August. The drug is collected from October to next April, and dried in the shade.

Description Irregular pieces, pale yellow or yellowish-brown, translucent or opaque. Texture, fragile; fracture lustrous. Odour, aromatic; taste, weak.

Identification (1) Burn a small quantity of the resin, the flame has much fume with characteristic and aromatic odour.
(2) Place 50 mg in a test tube, add 5 ml of carbon tetrachloride, shake to dissolve, add 2 ml of sulfuric acid along the tube wall, a red ring is produced at the junction of the two layers.
(3) Suspend 0.2 g in 5 ml of carbon tetrachloride with shaking, add 3 ml of nitric acid, shake well gently, allow to stand until separation takes place, a pale red to reddish-orange colour is produced in the upper layer.

Action To promote blood circulation to relieve pain, counteract *toxicity*, stimulate tissue regeneration, and reduce *heat* from blood.

Indications Traumatic injuries, swelling and pain of carbuncles and boils, spitting of blood, epistaxis and traumatic hemorrhage.

Usage and dosage 1.5-3 g, used in making pills or powder; appropriate quantity for external use.

Storage Preserve in well closed containers, and stored in a cool place.

Resina Toxicodendri (干漆, Ganqi)

Dried Lacquer

Dried Lacquer is the dried purified resin of *Toxicodendron vernicifluum* (Stokes) F. A. Barkl. (Fam. Anacardiaceae). Usually the residue on the bottom of vessel containing lacquer is collected, and dried.

Description Irregular masses, dark-brown or brown, externally rough, with honeycomb-like fine pores or granular. Texture hard, uneasily broken, fracture uneven. Odour, characteristic and unpleasant.

Identification (1) Burn a small piece in a porcelain evaporating dish, dark fumes and strong lacquer odour are produced.
(2) To 1 g of the powder add 10 ml of ethanol, heat on a water bath for 5 minutes, cool and filter. To 1 ml of the filtrate, add 1-2 drops of ferric chloride TS, a dark green colour is produced.

Processing Burn Resina Toxicodendri to withered; or break to small pieces and stir-bake to withered until it gives no dark fumes, allow to cool after removal.

Action To eliminate *blood stasis*, promote digestion, and kill worms.

Indications Amenorrhea and masses in the abdomen caused by *blood stasis*; abdominal pain due to intestinal parasitosis.

Usage and dosage 2.4-4.5 g.

Precaution Used with caution in pregnancy and debility without *blood stasis*.

Storage Preserve in well closed containers, protected from fire.

Retinervus Luffae Fructus (丝瓜络, Sigualuo)

Luffa Vegetable Sponge

Luffa Vegetable Sponge is the dried vascular bundles of ripe fruit of *Luffa cylindrica* (L.) Roem. (Fam. Cucurbitaceae). The drug is collected in summer and autumn when the fruit is ripe, the

pericarp turns to yellow and the inner part withered, removed from exocarp and sarcocarp, washed clean, dried in the sun, and removed from the seed.

Description Interweaved silvery vascular bundles, mostly prolate cylindrical, somewhat curved, 30-70 cm long, 7-10 cm in diameter. Externally pale yellowish-white. Texture light, tenacious and springy, uneasily broken. 3 loculi visible, transverse section hollowed. Odour, slight; taste, weak.

Processing Remove the remained seeds and exocarp, cut into sections.

Action To remove obstruction from the collaterals, promote blood circulation, and dispel *wind*.

Indications Arthralgia with muscular contracture; distension and pain in the chest and costal regions, galactostasis.

Usage and dosage 4.5-9 g.

Storage Preserve in a dry place.

Rhizoma Acori Calami (藏菖蒲, Zangchangpu)

Tibet Sweetflag Rhizome

Tibet Sweetflag Rhizome is a drug commonly used by Tibetan nationality. It is the dried rhizome of *Acorus calamus* L. (Fam. Araceae). The drug is collected in autumn and winter, removed from fibrous roots and soil, and dried in the sun.

Description Compressed-cylindrical, slightly curved, 4-20 cm long, 0.8-2 cm in diameter. Externally greyish-brown to brown, nodes distinct, internodes 0.5-1.5 cm long, with longitudinal wrinkles, one surface with dense and rounded remains of fibrous roots; leaf scars obliquely triangular, arranged alternately, stem-base remains at the lateral surface surrounded by remains of scaly leaf bases and hairy fibrous roots. Texture hard, fracture pale brown, an endodermis ring distinct, numerous brown dotted oil cells visible. Odour, strong and characteristic; taste, pungent.

Identification (1) Transverse section: Epidermal cells subsquare, with thickened outer walls, brown. Cortex broad, scattered with fibre bundles and collateral leaf-trace bundles, arenchyma visible, loosely net-like arranged; composed of parenchymatous cells; endodermis distinct. Stele scattered with numerous amphivasal or collateral vascular bundles. Parenchyma scattered with brown oil cells, and containing starch granules.
(2) To 2 g, in powder, add 5 ml of ethanol, heat under reflux for 20 minutes, allow to cool, and use the supernatant as the test solution. Prepare a solution of 2 g of Rhizoma Acori Calami reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and chloroform as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with a 10% solution of sulfuric acid in ethanol and heat at 105℃ to the spots clear. The major spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Assay Carry out the method for determination of volatile oil (Appendix Ⅹ D).
It contains not less than 2.0 per cent (ml/g) of volatile oil.

Processing Eliminate foreign matter, cut into slices, and dry.

Action To warm the stomach, counteract inflammation and alleviate pain.

Indications Declined *yang* of stomach, indigestion, stagnated food, diphtheria and anthracnose, etc.

Usage and dosage 3-6 g.

Storage Preserve in a ventilated dry place.

Rhizoma Acori Tatarinowii (石菖蒲, Shichangpu)

Grassleaf Sweetflag Rhizome

Grassleaf Sweetflag Rhizome is the dried rhizome of *Acorus tatarinowii* Schott (Fam. Araceae). The drug is collected in autumn and winter, removed from fibrous roots and soil, and dried in the sun.

Description Compressed-cylindrical, frequently tortuous, often branched, 3-20 cm long, 0.3-1 cm in diameter. Externally brown or greyish-brown, rough, with uneven annulations, internodes 2-8 mm long, with fine longitudinal wrinkles, one surface with remains of fibrous roots or rounded root scars; leaf scars triangular, arranged alternately, some with hairy and scaly remains of leaf bases. Texture hard, fracture fibrous, whitish or reddish, an endodermis ring distinct, numerous dotted vascular bundles and brown oil cells visible. Odour, aromatic; taste, bitter and slightly pungent.

Identification (1) Transverse section: Epidermal cells with thickened outer walls, brown, some containing reddish-brown contents. Cortex broad, scattered with fibre bundles and collateral leaf-trace bundles, and each surrounded by a bundle sheath of lignified fibres, endodermis distinct. Amphivasal or collateral vascular bundles scattered throughout the stele, with less fibrous bundle sheath. Fibre bundles and bundle sheaths surrounded by cells containing prisms of calcium oxalate, forming crystal fibres. Parenchyma scattered with subrounded oil cells, and containing starch granules.
(2) To the volatile oil obtained under Assay, add petroleum ether (60-90℃) to produce a solution containing 2 μl per ml as the test solution. Prepare a solution of Rhizoma Acori Tatarinowii reference drug in the same manner as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 0.5% sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (8 : 2) as the mobile phase. Apply separately to the plate 1 μl of each of the two solutions. After developing and removal of the plate, dry in air, allow to stand for 1 hour and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Expose to iodine vapour to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for the determination of volatile oil (Appendix Ⅹ D).
It contains not less than 1.0 per cent (ml/g) of volatile oil.

Processing Eliminate foreign matter, wash clean, soften,

cut into thick slices and dry.

Action To eliminate *damp* and *phlegm*, whet appetite, and restore consciousness and improve intellegence.

Indications Stuffiness sensation in the epigastrium with anorexia; severe dysentery with total loss of appetite; impairment of consciousness in epilepsy; forgetfulness and impaired hearing.

Usage and dosage 3-9 g.

Storage Preserve in a dry place, protected from mould.

Rhizoma Alismatis (泽泻, Zexie)

Oriental Waterplantain Rhizome

Oriental Waterplantian Rhizome is the dried tuber of *Alisma orientalis* (Sam.) Juzep. (Fam. Alismataceae). The drug is collected in winter when the stem withered, washed clean, dried, and removed from the fibrous roots and coarse outer tissue.

Description Subspherical, elliptical or ovate, 2-7 cm long, 2-6 cm in diameter. Externally yellowish-white or yellowish-brown, with irregular transverse-annular shallow furrows and numerous small raised fibrous root scars, occasionally tuberculate bud scars attached to the base. Texture compact, fracture yellowish-white, starchy, with numerous small pores. Odour, slight; taste, slightly bitter.

Identification Powder: Yellowish-brown. Starch granules numerous, simple granules long-ovoid, subspherical or ellipsoid, 3-14 μm in diameter, hilum V-shaped, shortly slit-shaped or Y-shaped; compound granules of 2-3 components. Parenchymatous cells subrounded, with many elliptical pits aggvegated into pit areas. Anticlinal walls of endodermis cells sinuous, relatively thickened, lignified, with sparse and minute pit-canals. Oil cavities mostly broken, whole ones subrounded, 54-110 μm in diameter, sometimes oil drops in secretory cells visible.

Total ash Not more than 5.0 per cent (Appendix IX K).

Acid-insoluble ash Not more than 0.5 per cent (Appendix IX K).

Processing *Rhizoma Alismatis* Eliminate foreign matter, soak slightly, soften thoroughly, cut into thick slices, and dry.

Rhizoma Alismatis (Processed with salt) Stir-bake the slices of Rhizoma Alismatis as described under the method for stir-baking with salt-water (Appendix II D) to dryness.

Action To cause urination, and remove *damp-heat*.

Indications Edema with oliguria; diarrhea oliguria vertigo due to retention of morbid fluid; acute urinary infection with difficult painful urination; hyperlipemia.

Usage and dosage 6-9 g.

Storage Preserve in a dry place, protected from moth.

Rhizoma Alpiniae Officinarum (高良姜, Gaoliangjiang)

Lesser Galangal Rhizome

Lesser Galangal Rhizome is the dried rhizome of *Alpinia officinarum* Hance (Fam. Zingiberaceae). The drug is collected at the end of summer and the beginning of autumn, removed from fibrous roots and remaining leaf scales, washed clean, cut into sections, and dried in the sun.

Description Cylindrical, often curved, branched, 5-9 cm long, 1-1.5 cm in diameter. Externally brownish-red to dark brown, with fine and dense longitudinal wrinkles and greyish-brown sinuous annular nodes, internode 0.2-1 cm long, bearing round root scars on one side. Texture hard and tenacious, uneasy to break, fracture greyish-brown or reddish-brown, fibrous, stele occupying about 1/3 area of the rhizome. Odour, aromatic; taste, pungent.

Identification (1) Transverse section: The outer walls of epidermal cells thickened, some cells containing reddish-brown non-crystalline masses. Vascular bundles of leaf trace relatively abundan in cortex, collateral. Endodermis distinct. Collateral vascular bundle numerous in stele, vascular bundle sheath fibres arranged in a ring and lignified. Secretory cells abundantly scattered in parenchyma of cortex and stele, containing yellow or reddish-brown resinous contents. Parenchymatous cells filled with starch granules.
(2) Prepare a solution of 5 g of Rhizoma Alpiniae Officinarum reference drug in the same manner as described under Assay as the reference drug solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of toluene and ethyl acetate (19 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the test solution obtained under Assay and the above reference drug solution. After developing and removal of the plate, dry in air, spray with a 5% solution of vanillin in sulfuric acid, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution.

Water Carry out the method for determination of water (Appendix IX H, method 2), not more than 16.0 per cent.

Total ash Not more than 4.0 per cent (Appendix IX K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix IX K).

Assay Carry out the method for gas chromatography (Appendix VI E).

Chromatographic system and system suitability Use 10% SE-54 as the stationary phase, and maintain the column temperature at 130℃. The temperature of injection port set at 190℃ and that of detector at 230℃. The number of theoretical plates of the column is not less than 1000, calculated with the reference to the peak of cineole.

Reference solution Weigh accurately a quantity of cineole CRS, dissolve in *n*-hexane to produce a solution containing 2 mg per ml.

Test solution Weigh accurately 5 g of the powder (crushed before use and through No. 3 sieve) to a rounded bottom flask, add 200 ml of water, connect with a volatile oil determination tube, add water through the top of determination tube until overflow to the flask, add 2-3 ml of

n-hexane and connect with reflux condenser. Heat under reflux to slightly boil for 2 hours, cool, separate the *n*-hexane layer and filter through a funnel covered with 1 g of anhydrous sodium sulfate to a 5 ml volumetric flask. Wash the inner wall of the determination tube with a small quantity of *n*-hexane, combine the washings into the same volumetric flask, dilute with *n*-hexane to volume, and mix well.

Procedure Accurately inject 2 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.15 per cent of cineole ($C_{10}H_{18}O$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thin slices, and dry in the sun.

Action To dispel *cold* from the stomach, promote digestion and relieve pain.

Indications Epigastric pain with cold sensation; vomiting, belching and acid regurgitation due to *cold* in the stomach.

Usage and dosage 3-6 g.

Storage Preserve in a cool and dry place.

Rhizoma Anemarrhenae (知母, Zhimu)

Common Anemarrhena Rhizome

Common Anemarrhena Rhizome is the dried rhizome of *Anemarrhena asphodeloides* Bge. (Fam. Liliaceae). The drug is collected in spring or autumn, removed from fibrous roots and soil, dried in the sun.

Description Slat-shaped, slightly curved, somewhat compressed, branched occasionally, 3-15 cm long, 0.8-1.5 cm in diameter, with pale yellowish stem and leaf scars. Externally yellowish-brown to brown, the upper part exhibiting a concave groove and closely arranged annular nodes with dense yellowish-brown remains of leaf bases growing upward bilaterally; the lower part raised and somewhat shrivelled, exhibiting depressions or protruding dotted root scars. Texture hard, easily broken, fracture yellowish-white, Odour slight; taste, slightly sweetish, bitterish and viscous on chewing.

Identification Heat under reflux 2 g of the powder with 20 ml of ethanol for 40 minutes. To 10 ml of the supernatant add 1 ml of hydrochloric acid, heat under reflux for 1 hour and concentrate to about 5 ml. Add 10 ml of water, extract by shaking with 20 ml of benzene and evaporate the benzene extract to dryness. Dissolve the residue in 2 ml of benzene as the test solution. Dissolve sarsasapogenin CRS in benzene to produce a solution containing 5 mg per ml as the refernce solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and acetone (9 : 1) as the mobile phase. Apply separately to the plate 7 μl of each of the two solutions. After developing and removal of the plate, dry in air, and spray with a mixture of 8% solution of vanillin in absolute ethanol and sulfuric acid solution (7→10) (0.5 : 5), heat at 100℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 12.0 per cent.

Total ash Not more than 8.5 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 4.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (95 : 5) as the mobile phase. An evaporative light scattering detector is employed. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of sarsasapogenin.

Reference solution Weigh accurately a quantity of sarsasapogenin CRS, dissolve in methanol to produce a solution containing 0.3 mg per ml.

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve) to a stopper conical flask, accurately add 25 ml of ethanol, weigh and macerate overnight. Ultrasonicate (power 200 W, frequency 30 kHz) for 40 minutes, cool and weigh again, replenish the loss of weight with ethanol and mix well. Evaporate accurately 10 ml of the successive filtrate to dryness, add 10 ml of water and 1 ml of hydrochloric acid, heat under reflux for 2 hours, cool, dropwise 40% solution of sodium hydroxide by shaking to the colour of the solution changed suddenly from orange-yellow to orange-red. Extract with two 30-ml quantities of chloroform, combine the extracts and evaporate to dryness. Dissolve the residue in methanol, transfer to a 10 ml volumetric flask, dilute to volume with methanol and mix well.

Procedure Accurately inject 5 μl and 10 μl of the reference solution and 5-10 μl of the test solution, respectively, into the column, and calculate the content with the two point method of external standard and logarithmically equation.
It contains not less than 1.0 per cent of sarsasapogenin ($C_{27}H_{44}O_3$), calculated with reference to the dried drug.

Processing *Rhizoma Anemarrhenae* Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, dry and remove hairs and scraps.

Rhizoma Anemarrhenae (*processed with salt*) Stir-bake the slice of Rhizoma Anemarrhenae as described under the method for stir-baking with salt-water (Appendix Ⅱ D) until dry.
Carry out the method described under Assay above, it contains not less than 0.90 per cent of sarsasapogenin ($C_{27}H_{44}O_3$).

Action To remove *heat* and quench *fire*, and promote the production of body fluids and relieve *dryness* syndrome.

Indications Febrile diseases with high fever and dire thirst; *heat* in the lung with dry cough; consumptive fever; wasting-thirst due to internal *heat*; constipation.

Usage and dosage 6-12 g.

Storage Preserve in a ventilated and dry place, protected from moisture.

Rhizoma Anemones Raddeanae (两头尖, Liangtoujian)

Radde Anemone Rhizome

Radde Anemone Rhizome is the dried rhizome of *Anemone raddeana* Regel (Fam. Ranunculaceae). The drug is collected in summer, removed from rootlet, washed clean, and dried.

Description Long subfusiform, acute and pointed at two

ends, slightly curved and one end somewhat expanded, 1-3 cm long, 2-7 mm in diameter. Externally brown to brownish-black, with fine longitudinal wrinkles, the expanded portion usually possessing 1-3 rootlet scars appearing finned-protruding, occasionally with 3-5 indistinct annulations. Texture hard and fragile, easily broken, fracture slightly even, whitish or greyish-brown, nearly horny. Odour, slight; taste, weak and then slightly bitter and pungent.

Identification (1) Transverse section: Epidermis consisting of 1 layer of cells, tangentially elongated, outer walls thickened. Cortex of 10 or more layers of subrounded parenchymatous cells. Vascular bundles collateral, 10 or more ones arranged in a ring, phloem cells shrunken, xylem vessels 6-24, cambium indistinct. Rays broad, pith relatively large and composed of subrounded parenchymatous cells. Parenchymatous cells filled with starch granules.
Powder: Greyish-brown. Starch granules numerous, simple granules subrounded or elliptical, 2-11 μm in diameter, hilum pointed or shortly cleft-like, striations indistinct; compound granules of 2-4 components. Epidermal cells reddish-brown, yellow or bright yellow, the outer walls suberized and thickened, frequently protruding into the cells to be ridge-like or tubercular. Reticular, spiral or scalariform vesseles more frequent, 10-33 μm in diameter, some with bordered pitted vessels.
(2) Dissolve a quantity of raddeanin A CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (7 : 3 : 1) as the mobile phase. Apply separately to the plate 2 μl of each of the test solution obtained under Assay and the above reference solution. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ for 5 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 12.0 per cent.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using ethanol as the solvent, not less than 12.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, acetonitrile as the mobile phase A and 0.1% phosphoric acid as the mobile phase B, elute in gradient as the following:

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0-7	47	53
7-15	47→55	53→45

As detector a spectrophotometer set at 206 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of raddeanin A.

Reference solution Weigh accurately a quantity of raddeanin A CRS, dissolve in methanol to produce a solution containing 1 mg per ml.

Test solution Weigh accurately 5 g of the powder (through No. 3 sieve) to a Soxhlet's extractor, add an appropriate quantity of methanol and heat under reflux for 3 hours. Evaporate the extracts to dryness, dissolve the residue in 10 ml of water, extract by shaking with two quantities of ether (20-ml and 10-ml orderly), and discard the ether solutions. Extract the water layer by shaking again with five quantities of *n*-butanol saturated with water (20-ml, 20-ml, 15-ml, 15-ml and 15-ml orderly), combine the extracts and recover the *n*-butanol in vacuum to dryness. Dissolve the residue in methanol, transfer to a 10 ml volumetric flask, dilute to volume with methanol and mix well.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.20 per cent of raddeanin A ($C_{47}H_{76}O_{16}$), calculated with reference to the dried drug.

Action To relieve rheumatic conditions, and cure carbuncle.

Indications Rheumatoid arthritis with muscular contracture and joint pain; carbuncles with ulceration.

Usage and dosage 1.5-3 g; appropriate quantity for external use.

Storage Preserve in a cool and dry place.

Rhizoma Arisaematis (天南星, Tiannanxing)

Jackinthepulpit Tuber

Jackinthepulpit Tuber is the dried tuber of *Arisaema erubescens* (Wall.) Schott., *Arisaema heterophyllum* Bl. or *Arisaema amurense* Maxim. (Fam. Araceae). The drug is collected in autumn and winter when the stem and leaf are withered, removed from fibrous roots and outer tissue, and dried.

Description Oblate, 1-2 cm high, 1.5-6.5 cm in diameter. Externally whitish or brownish, relatively smooth, top with dented stem scars, encircled with numerous pitted fibrous root scars, some tubers surrounded by small oblate lateral buds. Texture hard and uneasily broken, fracuture uneven, white and starchy. Odour, acrid; taste, numb and pungent.

Identification Powder: Whitish. Starch granules mainly simple, spherical or oblong, 2-17 μm in diameter, hilum pointed, slit-shaped, large granules with faint striations; compound granules few, consisting of 2-12 components. Needle crystals of calcium oxalate scattered or in bundles embedded in mucilage cells, 63-131 μm long. Prisms of calcium oxalate mostly found in parenchymatous cells accompanied by vessels, 3-20 μm in diameter.

Processing *Rhizoma Arisaematis* Eliminate foreign matter, wash clean and dry.

Rhizoma Arisaematis (prepared) Take Rhizoma Arisaematis, graded according to size, soak in water separately, and change water 2 to 3 times a day. Add alumen after changing water if white foam is produced (to each 100 kg of Rhizoma Arisaematis add 2 kg of alumen). After soaking for a day, change water again and take out until only a slight tongue-numbing sensation tasted on the cut section. Boil the slices of Rhizoma Zingiberis and alumen in a pot with a quantity of water, then add Rhizoma Arisaematis and boil until no dry part at the centre of drug found. Take out and remove Rhizoma Zingberis, dry the drug in air to 40-60%

dryness, cut into thin slices, and dry thoroughly.
To each 100 kg of Rhizoma Arisaematis add 12.5 kg of Rhizoma Zingberis and 12.5 kg of alumen.

Action To remove *damp-phlegm*, dispel *wind* and arrest convulsion, and dissimate lumps and reduce swelling.

Indications Intractable phlegm with cough; vertigo; stroke with phlegm in the throat, deviation of the eye and mouth, and hemiplegia; epilepsy and convulsion; tetanus. External use for boils, sores, snake and insect bite.

Usage and dosage 3-9 g of the processed drug; for external use, appropriate quantity of the crude drug to be ground into powder and mixed with vinegar or liquor for topical application.

Precaution Used with caution in pregnancy.

Storage Preserve in a ventilated and dry place, protected from mould and moth.

Rhizoma Atractylodis (苍术, Cangzhu)

Atractylodes Rhizome

Atractylodes Rhizome is the dried rhizome of *Atractylodes lancea* (Thunb.) DC. or *Atractylodes chinensis* (DC.) Koidz. (Fam. Compositae). The drug is collected in spring and autumn, removed from soil, dried, and dashed to discard the fibrous roots.

Description *Rhizome of Atractylodes lancea* Irregularly moniliform or nodular-cylindrical, somewhat curved, occasionally branched, 3-10 cm long, 1-2 cm in diameter. Externally greyish-brown, wrinkled, transversly twisted-lined, with remains of rootles, and stem scars or remains of stems attached at apex. Texture compact, fracture yellowish-white or greyish-white, scattered with many orange-yellow or brownish-red oil cavities and crystallized out as white fine needle crystals after exposing for a long time. Odour, characteristic; taste, sweetish, pungent and bitter.

Rhizome of Atractylodes chinensis Knotty-lumpy or nodular-cylindrical, 4-9 cm long, 1-4 cm in diameter. Externally blackish-brown, yellowish-brown when peeled. Texture lax, fracture scattered with yellow oil cavities. Odour weakly aromatic; taste, pungent and bitter.

Identification (1) Powder: Brown. Needle crystals of calcium oxalate minute, 5-30 μm long, irregularly filled in parenchymatous cells. Fibres mostly in bundles, long fusiform, up to 40 μm in diameter, with rather thickened lignified walls. Stone cells fairly abundant, sometimes linking up with cork cells, polygonal, subrounded or subrectangular, 20-80 μm in diameter, with heavily thickened walls. Inulin frequently visible, with radial striations on surface.
(2) To 0.5 g of the powder add 2 ml of *n*-hexane, ultrasonicate for 15 minutes, filter, and use the filtrate as the test solution. Prepare a solution of 0.5g of Rhizoma Atractylodis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (20 : 1) as the mobile phase. Apply separately to the plate 2-6 μl of each of the above two freshly prepared solutions. After developing and removal of the plate, dry in air, and spray with 5% solution of *p*-dimethy laminobenzaldehyde in an ethanol solution containing 10% sulfuric acid, heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution, and a same muddy green principal spot (atractydin) is shown in both chromatograms.

Total ash Not more than 7.0 per cent (Appendix IX K).

Processing *Rhizoma Atractylodis* Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry.

Rhizoma Atractylodis (*stir-baked with bran*) Stir-bake the slices of Rhizoma Atractylodis as described under stir-baking with bran (Appendix II D) until its outer surface becomes dark yellow.
Subrounded or slat-shaped thick slices.

Action To remove *dampness* and invigorate the function of the spleen, dispel *wind-cold*, and improve eyesight.

Indications Epigastric distension and diarrhea; edema, particularly edema of the legs due to *wind-cold*; rheumatic arthralgia; common cold; night blindness.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place.

Rhizoma Atractylodis Macrocephalae (白术, Baizhu)

Largehead Atractylodes Rhizome

Largehead Atractylodes Rhizome is the dried rhizome of *Atractylodes macrocephala* Koidz. (Fam. Compositae). The drug is collected in winter while the lower leaf of the plant turns yellow and the upper leaf becomes fragile, removed from soil, baked or sunned to dryness, and then removed from fibrous root.

Description Irregularly plump masses, 3-13 cm long, 1.5-7 cm in diameter. Externally greyish-yellow or greyish-brown, with warty protrudings, interrupted longitudinal wrinkles and grooves, and scars of fibrous rootlets; remains of stems and bud scars attached to the apex. Texture hard, uneasily broken, fracture uneven, yellowish-white to brownish, scattered with brownish-yellow dotted oil cavities. The baking-dried material horny and relatively dark coloured or cracked in section view. Odour, aromatic; taste, sweet and slightly pungent, viscous on chewing.

Identification (1) Powder: Yellowish-brown. Needle crystals of calcium oxalate minute, 10-32 μm long, aggregated in parenchymatous cells, a few needle crystals up to 4 μm in diameter. Fibres yellow, mostly in bundles, long fusiform, up to about 40 μm in diameter, walls fairly thickened, lignified, with distinct pit canals. Stone cells yellowish, subrounded, polygonal, rectangular, rarely fusiform, 37-64 μm in diameter. Parenchymatous cells containing inulin with radial striations. Vessel elements short, reticulated and bordered pitted, up to 48 μm in diameter.
(2) To 0.5 g of the powder add 2 ml of *n*-hexane, ultrasonicate for 15 minutes, filter, and use the filtrate as the test solution. Prepare a solution of 0.5g of Rhizoma Atractylodis Macrocephalae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substances and a mixture of petroleum ether (60-90℃) and ethyl acetate (50 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the two solutions. After developing and removal of the plate, dry in air, and spray with 5% solution of vanillin in sulfuric acid,

heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution, and a same pink principal spot (atractylone) is shown in both chromatograms.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Degree of colouration Weigh accurately 2 g of the very coarse powder to a stoppered flask, add 50 ml of 55% ethanol, adjust to pH 2-3 with dilute hydrochloric acid, shake constantly for 1 hour and centrifuge at 4000 r/min for 15 minutes. Measure 10 ml of the supernatant and 10 ml of a reference solution (dilute a mixture of 5 ml of standard ferric chloride CS, 3 ml of standard cobaltous chloride CS and 0.6 ml of standard copper sulfate CS, to 10 ml with water) separately into two Nessler cylinder's, view vertically against a piece of white paper, the colour of the test solution should not be deeper than that of the reference solution.

Processing *Rhizoma Atractylodis Macrocephalae* Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry.

Rhizoma Atractylodis Macrocephalae (*processed with terra*) Stir-bake the slices of Rhizoma Atractylodis Macrocephalae with fine powders of Terra Flova Usta until the outer surface becomes ashen, and sift, using 20 kg of fine powder of Terra Flova Usta for 100 kg of the slices.

Rhizoma Atractylodis Macrocephalae (*processed with bran*) Cast the bran stir-baked with honey in a hot pot, add the slices of Rhizoma Atractylodis Macrocephalae while smoking, stir well until they become burnt yellow with burnt aroma, take out and sift the bran.
To each 100 kg of the slices of Rhizoma Atractylodis Macrocephalae add 10 kg of the bran stir-baked with honey.

Action To invigorate the function of the *spleen* and replenish *qi*, eliminate *dampness* by diuresis, arrest excessive perspiration, and prevent miscarriage.

Rhizoma Atractylodis Macrocephalae (*processed with terra*) To invigorate the function of the spleen and regulate the function of the spleen, and prevent miscarriage.

Indications Hypofunction of the spleen with loss of appitite, abdominal distension and diarrhea; dizziness and palpitation due to retention of phlegm and fluid; edema; spontaneous sweating; threatened abortion.

Rhizoma Atractylodis Macrocephalae (*processed with terra*) Hypofunction of the spleen with loss of appitite and diarrhea; threatened abortion.

Usage and dosage 6-12 g.

Storage Preserve in a cool and dry place, protected from moth.

Rhizoma Belamcandae (射干, Shegan)

Blackberrylily Rhizome

Blackberrylily Rhizome is the dried rhizome of *Belamcanda chinensis* (L.) DC. (Fam. Iridaceae). The drug is collected in early spring while the plant budding or in late autumn while the aerial part withering, removed from the fibrous roots and soil, and dried.

Description Irregularly nodular, 3-10 cm long, 1-2 cm in diameter. Externally yellowish-brown, dark brown or blackish-brown, shrunken, with abundantly annular striations. Several dish-shaped and sunken stem scars occurring at the upper part, stem bases remained occasionally; remains of thin roots and root scars occurring at the lower part. Texture hard, fracture yellow, granular. Odour, slight; taste, bitter and slightly pungent.

Identification (1) Transverse section: Epidermis sometimes remaining. Cork consisting of more layers of cells. Cortex sparsely scattered with leaf trace bundles; endodermis indistinct. Vascular bundles of stele amphivasal and collateral, densely arranged at the outer side. Parenchymatous cells containing prisms of calcium oxalate, starch granules and oil drops.
Powder: Orange. Prisms of calcium oxalate abundant, often broken, the intact ones 49-240(315) μm long, up to 49 μm in diameter. Simple starch granules subrounded or ellipsoidal, 2-17 μm in diameter, hilum dotted; compound granules very occasional, composed of 2-5 components. Parenchymatous cells subrounded or ellipsoidal, walls slightly thickened or beaded, with simple pits. Cork cells brown, anticlinal walls slightly sinuous, some containing brown contents.
(2) To 1 g of the powder add 10 ml of methanol, ultrasonicate for 30 minutes, filter, evaporate the filtrate to 1.5 ml as the test solution. Prepare a solution of 1 g of Rhizoma Belamcandae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide film as the stationary phase and a mixture of chloroform, butanone and methanol (3 : 1 : 1) as the mobile phase. Apply separately 1 μl of each of the above two solutions to the film. After developing and removal of the membrane, dry in air, spray with aluminum chloride TS, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in colour and position to the spots in the chromatogram obtained with the reference drug solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 10.0 per cent.

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method as described under the determination of ethanol-soluble extractives (Appendix Ⅹ A), using ethanol as solvant, not less than 18.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.2% solution of phosphoric acid (53 : 47) as the mobile phase. As detector a spectrophotometer set at 266 nm. The number of theoretical plates of the column is not less than 8000, calculated with the reference to the peak of irisflorentin.

Reference solution Weigh accurately a quantity of irisflorentin CRS, dissolve in methanol to produce a solution containing 10 μg per ml.

Test solution Weigh accurately 0.1 g of the powder (through No. 4 sieve) to a stopper conical flask, accurately add 25 ml of methanol and weigh. Heat under reflux for 1 hour, cool and weigh again, replenish the loss of weight with methanol, mix well, filter and use the successive filtrate as the test solution.

Procedure Accurately inject 10 μl of the reference solution and 10-20 μl of the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.10 per cent of the irisflorentin ($C_{20}H_{18}O_8$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thin slices, and dry.
In irregular or long slat shape, cut surface yellow or brownish-yellow.

Action To remove toxic *heat*, eliminate phlegm, and ease the sore throat.

Indications Sore throat, cough and dyspnea with expectoration of copious phlegm due to accumulation of toxic *heat*, phlegm and *fire*.

Usage and dosage 3-9 g.

Storage Preserve in a dry place.

Rhizoma Bistortae (拳参, Quanshen)

Bistort Rhizome

Bistort Rhizome is the dried rhizome of *Polygonum bistorta* L. (Fam. Polygonaceae). The drug is collected in early spring while the plant budding or in autumn just before withering, removed from soil, dried in the sun, and removed from the rootlet.

Description Compressed slat-shaped or compressed cylindrical, curved, or even curled, both ends slightly sharp or tapering towards one end, 6-13 cm long, 1-2.5 cm in diameter. Externally purplish-brown or purplish-black, rough, prominent on one side and slightly even or slightly channelled on the other side, with dense and rough annulations throughout, and showing remains of rootlets or root scars. Texture hard, fracture pale brownish-red or brownish-red, vascular bundles yellowish-white and dotted, arranged in a ring. Odour, slight; taste, bitter and astringent.

Identification (1) Powder: Pale brownish-red. Cork cells polygonal, containing brownish-red contents. Clusters of calcium oxalate fairly abundant, 15-65 μm in diameter. Bordered-pitted vessels 20-55 μm in diameter, reticulated and spiral vessels visible. Fibres long fusiform, 10-20 μm in diameter, walls relatively thickened, lignified, with distinct pit-canals. Starch granules ellipsoidal, ovoid or subspheroidal, 5-12 μm in diameter.
(2) To 0.5 g of the powder add 20 ml of methanol, ultrasonicate for 15 minutes and filter. Evaporate the filtrate to dryness and dissolve the residue in 5 ml of methanol as the test solution. Dissolve a quantity of gallic acid CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, acetone and formic acid (7 : 2 : 1) as the mobile phase. Apply separately to the plate 5 ml of the above two solutions. After developing and removal of the plate, dry in air, and expose to ammonia vapour to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent.

Total ash Not more than 9.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the cold maceration method), using ethanol as the solvent, not less than 15.0 per cent.

Processing Eliminate foreign matter, wash clean, soak slightly, soften thoroughly, cut into thin slices and dry.

Action To remove toxic *heat*, reduce swelling, and arrest bleeding.

Indications Dysentery with bloody stools, diarrhea in acute gastroenteritis, acute respiratory tract infection with cough; carbuncles, scrofula, ulcers in the mouth and on the tougue; spitting of blood, epistaxis, hemorrhoidal bleeding, venomous snake bite.

Usage and dosage 4.5-9 g; appropriate quantity for external use.

Storage Preserve in a dry place.

Rhizoma Bletillae (白及, Baiji)

Common Bletilla Tuber

Common Bletilla Tuber is the dried tuber of *Bletilla striata* (Thunb.) Reichb. f. (Fam. Orchidaceae). The drug is collected in summer and autumn, removed from fibrous roots, washed, boiled or steamed until no dry core visible, dried to half dryness in the sun, peeled to remove the outer tissue, and then dried in the sun.

Description Irregularly oblate, mostly with 2-3 claw-like branches, 1.5-5 cm long, 0.5-1.5 cm thick. Externally greyish-white or yellowish-white, possessing several concentric rings and brown dotted rootlet scars, with raised stem scars at the upper part and a trace jointing to another tuber at the lower part. Texture hard and uneasily broken, fracture whitish and horny. Odour, slight; taste, bitter and viscous on chewing.

Identification (1) Powder: Yellowish-white. The anticlinal walls of epidermal cells sinuous, slightly thickened, lignified, with distinct pit canals. Raphides of calcium oxalate occurring in large subrounded mucilage cells or scattered throughout the powder, needle crystals 18-88 μm long. Fibres in bundles, 11-30 μm in diameter, walls lignified, with V-shaped or elliptical pits. Vessels scalariform, bordered pitted and spiral, 10-32 μm in diameter. Masses of gelatinzed starch granules colourless.
(2) To 4 g of the powder add 20 ml of methanol, ultrasonicate for 30 minutes and filter. Evaporate the filtrate to dryness, dissolve the residue in 20 ml of water, add 2 ml of hydrochloric acid, heat under reflux for 30 minutes, and cool immediately. Extract by shaking with two 40-ml quantities of ether, combine the ether extracts, evaporate to dryness, and dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 2 g of Rhizoma Bletillae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately to the plate 5 μl of the test

solution and 10 μl of the reference drug solution. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.5 per cent (Appendix Ⅸ K).

Processing Wash clean, soften thoroughly, cut into thin slices, and dried in the sun.

Action To arrest bleeding, reduce swelling and the promote growth of new tissue.

Indications Hemoptysis in pulmonary tuberculosis, hematemesis in peptic ulcer, boils and sores; chapped skin.

Usage and dosage 6-15 g, or 3-6 g to be ground into powder for oral administration; appropriate quantity for external use.

Precaution Incompatible with Radix Aconiti and allied drugs.

Storage Preserve in a ventilated and dry place.

Rhizoma Bolbostematis (土贝母, Tubeimu)

Paniculate Bolbostemma

Paniculate Bolbostemma is the dried tuber of *Bolbostemma paniculatum* (Maxim.) Franquet (Fam. Cucurbitaceae). The drug is collected in autumn, washed clean, broken off, boiled until no white core visible, taken out, and dried in the sun.

Description Irregular masses varying in size. Externally pale reddish-brown or dark brown, bumpy. Texture hard, uneasily broken, fracture horny, bright and smooth. Odour, slight; taste, slightly bitter.

Identification To 0.1 g of the powder add 20 ml of 70% ethanol, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve tubeimoside A CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, ethyl acetate, methanol, formic acid and water (12 : 3 : 8 : 2 : 2) as the mobile phase. Apply separately to the plate 5 μl each of the two solutions. After developing and removal of the plate, dry in air, spray with a mixture of acetic anhydride, sulfuric acid and ethanol (1 : 1 : 10), heat at 110℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and 65% methanol as the mobile phase. As detector a spectrophotometer set at 214 nm. The number of the theoretical plates of the column is not less than 1500, calculated with reference to the peak of tubeimoside A.

Reference solution Place 10 mg of tubeimoside A CRS, previously dried in vacuum to constant weight at 105℃, weighed accurately, to a 100 ml volumetric flask, dissolve in the mobile phase, dilute to volume and mix well.

Test solution Weigh accurately 0.3 g of the powder (through No. 4 sieve) to a stopper conical flask, add accurately 50 ml of 70% ethanol and weigh, ultrasonicate for 30 minutes, weigh again, replenish the loss of the weight with 70% ethanol and mix well. Filter, evaporate exactly 25 ml of the successive filtrate on a water bath to no ethanolic smell, add 10 ml of water, transfer into a separating funnel, extract with successive quantities of 20 ml, 20 ml, 10 ml and 10 ml of *n*-butanol saturated with water. Combine the *n*-butanol solutions, evaporate to dryness, dissolve the residue in methanol and transfer to a 5 ml volumetric flask, dilute with methanol to volume and mix well.

Procedures Accurately inject 10 μl of each of the reference solution and test solution, respectively, into the column, determine and calculate the content.

It contains not less than 1.0 per cent of tubeimoside A ($C_{63}H_{98}O_{29}$), calculated with reference to the dried drug.

Action To dissipate lumps, reduce swelling, and counteract *toxicity*.

Indications Mastitis, chronic lymphadenitis, tuberculosis of cervical lymph nodes, hypertrophic rhinitis.

Usage and dosage 4.5-9 g.

Storage Preserve in a ventilated and dry place.

Rhizoma Chuanxiong (川芎, Chuanxiong)

Szechwan Lovage Rhizome

Szechwan Lovage Rhizome is the dried rhizome of *Ligusticum chuanxiong* Hort. (Fam. Umbelliferae). The drug is collected in summer when the node of stem becomes obviously swollen and purplish, removed from soil, baked gently to dryness after sun-drying, and removed from rootlets.

Description Irregular knotty and fist-like, 2-7 cm in diameter. Externally yellowish-brown, rough and shrunken, with many parallel and raised annulations, showing dent and subrounded stem scars on the top and numerous tuberculous rootlet scars on the lower part and at the nodes. Texture compact, uneasily broken, fracture yellowish-white or greyish-yellow, scattered with yellowish-brown oil dots. Cambium in an undulate ring. Odour, strongly aromatic; taste, bitter, pungent and slight numb, and with a sweet aftertaste.

Identification (1) Transverse section: Cork consisting of over 10 layers of cells. Cortex narrow, scattered with root-trace vascular bundles, and cambium distinct. Phloem broad. Cambium undulate or irregularly polygonal. Vessels in xylem polygonal or subrounded, mostly uniseriate or arranged in V-shape. Wood fibre bundles occasionally visible. Pith relatively large. Parenchyma scattered with numerous oil cavities, subrounded, elliptical or irregular, pale yellowish-brown, small near the cambium and gradually enlarged outwards; parenchymatous cells containing abundant starch granules, some cells with subrounded or clustered crystals of calcium oxalate.

Powder: Pale yellowish-brown or greyish-brown. Starch

granules abundant, single granules ellipsoidal oblong, subspheroidal, ovoid or reniform, 5-16 μm in diameter, about 21 μm long, hilum pointed, slit-shaped or V-shaped; compound granules occasionally visible, consisting of 2-4 components. Crystals of calcium oxalate occuring in parenchymatous cells, subrounded or clustered, 10-25 μm in diameter. Cork cells dark yellowish-brown, polygonal in surface view, walls slightly sinuated. Oil cavities mostly broken, fragments occasionally visible, secretory cells thin-walled, containing many oil drops. Vessels mainly spiral, and reticulated, or scalariform, 14-50 μm in diameter.

(2) Macerate 1 g of the powder in 5 ml of petroleum ether (30-60℃), shake frequently and allow to stand for 10 hours. Evaporate 1 ml of the supernatant to dryness and dissolve the residue in 1 ml of methanol. Add 2-3 drops of 2% solution of 3,5-dinitrobenzoic acid in methanol and 2 drops of saturated solution of potassium hydroxide in methanol; a purplish-red colour is produced.

(3) To 1 g of the powder add 20 ml of ether, heat under reflux for 1 hour, filter, and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of ethyl acetate as the test solution. Prepare a solution of 1 g of Rhizoma Chuanxiong reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately to the plate 1-2 μl each of the two solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution corresponds in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cnet (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using ethanol as solvent, not less than 12.0 per cent.

Processing Eliminate foreign matter, grade by size, soak briefly, wash clean, soften thoroughly, cut into thin slices, and dry.

Action To promote the flow of blood and *qi*, dispel *wind* and relieve pain.

Indications Menstrual disorders, amenorrhea, dysmenorrhea; abdominal pain with mass formation; pricking pain in the chest and costal regions; swelling and pain due to traumatic injuries; headache; rheumatic arthralgia.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place, protected from moth.

Rhizoma Cibotii (狗脊, Gouji)

Cibot Rhizome

Cibot Rhizome is the dried rhizome of *Cibotium barometz* (L.) J. Sm. (Fam. Dicksoniaceae). The drug is collected in autumn or in winter, removed from soil and dried; or removed from hard root, petiole and hairs, thickly sliced, and dried, called "Shenggoujipian"; or after steaming the drug is partially dried in the sun, cut into thick slices and dried thoroughly, called "Shugoujipian".

Description Irregularly long lump-shaped, 10-30 cm long, 2-10 cm in diameter. Externally dark brown, with remains of golden hairs; upper part exhibiting several reddish-brown woody petioles and the lower part showing remains of black fibrous roots. Texture hard, uneasily broken. Odourless; taste, weak and slight astringent.

Shenggoujipian Irregularly long slat-shaped or rounded, 5-20 cm long, 2-10 cm in diameter, 1.5-5 mm thick, transverse cut surface pale brown, relatively smooth, exhibiting a brownish-yellow raised ring or stripe of xylem at a distance of 1-4 mm from edges. Edges irregular, with remains of golden hairs occasionally; texture fragile, easily broken, starchy.

Shugoujipian Blackish-brown, texture hard.

Identification (1) Transverse section: Epidermis consisting of one layer of cells, with remains of golden non-glandular hairs. The inner of epidermis exhibiting 10 or over rows of brownish yellow sclerenchymatous cells, pits distinct. Xylem arranged in a ring, composed of tracheids, both the inner and outer parts exhibiting phloem and endodermis. Cortex and pith composed of parenchymatous cells, filling with starch granules, some with yellowish brown contents.

(2) To 2 g of the powder add 40 ml of methanol, heat under reflux for 1 hour, cool and filter. Evaporate the filtrate to dryness and dissolve the residue in 1 ml of methanol as the test solution. Dissolve protocatechuic aldehyde CRS and protocatechuic acid CRS in methanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, toluene and formic acid (5 : 6 : 3 : 1) as the mobile phase. Apply separately to the plate 5-10 μl of the test solution and 2 μl of the reference solution. After developing and removal of the plate, dry in air. Spray with a 5% solution of ferric chloride in ethanol, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 13.0 per cent.

Total ash Not more than 3.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilue ethanol as the solvent, not less than 20.0 per cent.

Processing *Rhizoma Cibotii* Eliminate foreign matter; for the drug not sliced, wash clean, soften thoroughly, cut into thick slices, and dry.

Rhizoma Cibotii (*scalded*) Scald the slices of Rhizoma Cibotii with sand as described under the method for scalding (Appendix Ⅱ D) until inflated, and after cooling remove the remainder of hairs.

Action To reinforce the liver and the kidney, to strengthen the back, and to relieve rheumatic conditions.

Indications Weakness and aching of the lower back and knees, weakness of legs, rheumatic arthralgia.

Usage and dosage 6-12 g.

Storage Preserve in a ventilated and dry place, protected from

moisture.

Rhizoma Cimicifugae
(升麻, Shengma)

Largetrifoliolious Bugbane Rhizome

Largetrifoliolious Bugbane Rhizome is the dried rhizome of *Cimicifuga heracleifolia* Kom., *Cimicifuga dahurica* (Turcz.) Maxim. or *Cimicifuga foetida* L. (Fam. Ranunculaceae). The drug is collected in autumn, removed from soil and fibrous root, and then dried in the sun.

Description Irregular long pieces, frequently branched, nodular, 10-20 cm long, 2-4 cm in diameter. Externally blackish-brown or brown, rough, with remains of many wiry fibrous roots, the upper part showing several round and hollow remains of stems, the inner walls of the hole with reticulate furrows, and the lower part lumpy, with fibrous root scars. Texture light and hard, uneasily broken, fracture uneven, cracked, fibrous, yellowish-green or yellowish-white. Odour, slight; taste, slightly bitter and astringent.

Identification To 1 g of the powder add 50 ml of ethanol, heat under reflux for 1 hour and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethanol as the test solution. Dissolve ferulic acid CRS and isoferulic acid CRS in ethanol, respectively, to produce two solutions each containing 1 mg per ml respectively as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, chloroform and glacial acetic acid (6 : 1 : 0.5) as the mobile phase. Apply separately to the plate 10 μl of each of the above three solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference solutions.

Foreign matter Not more than 5.0 per cent (Appendix Ⅸ A).

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 13.0 per cent.

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 4.0 per cent (Appendix Ⅸ K)

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol as the solvent, not less than 17.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% solution of phosphoric acid (13 : 87) as the mobile phase. As detector a spectrophotometer set at 316 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of isoferulic acid.

Reference solution Weigh accurately 10 mg of isoferulic acid CRS in a 50 ml brown volumetric flask, add 10% ethanol and dilute to volume, mix well. Transfer accurately 1 ml to a 10 ml brown volumetric flask and dilute to volume with 10% ethanol to produce a solution containing 20 μg per ml.

Test solution Weigh accurately 0.5 g of the powder (through No. 2 sieve), in a stopper conical flask, add accurately 25 ml of 10% ethanol, and weigh. Heat under reflux for 2.5 hours, cool and weigh again. Replenish the loss of weight with 10% ethanol, mix well, filter through a millipore film (0.45 μm) and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 0.10 per cent of isoferulic acid ($C_{10}H_{10}O_4$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, soak briefly, wash clean, soften thoroughly, cut into thick slices, and dry.

Action To induce perspiration and promote eruptions, to remove toxic *heat*, and elevate *yang*.

Indications Headache caused by *wind-heat*, toothache, ulcers in the mouth, sore throat; measles with inadequate eruptions and other eruptive febrile diseases; prolapse of the rectum or the uterus.

Usage and dosage 3-9 g.

Storage preserve in a ventilated and dry place.

Rhizoma Coptidis
(黄连, Huanglian)

Golden Thread

Golden Thread is the dried rhizome of *Coptis chinensis* Franch., *Coptis deltoidea* C. Y. Cheng et Hsiao or *Coptis teeta* Wall. (Fam. Ranunculaceae), commonly known as "Wei-lian", "Ya-lian" or "Yun-lian", respectively. The drug is collected in autumn, removed from rootlets and soil, and dried.

Description *Rhizome of Coptis chinensis* Mostly gathered to a cluster, curved, like "chicken's feet", single rhizome 3-6 cm long, 0.3-0.8 cm in diameter. Externally greyish-yellow or yellowish-brown, rough, bearing irregular nodular protrudings, rootlets and remains of rootlets, some internodes smooth as stem, commonly known as "Guoqiao" (bridge piece). The upper part mostly remained with brown scale leaves, apex often bearing remains of stems or petioles. Texture hard, fracture uneven, bark orange-red or dark brown, wood brightly yellow or orange-yellow, radially arranged, pith sometimes hollowed. Odour, slight; taste, very bitter.

Rhizome of Coptis deltoidea Mostly single, somewhat cylindrical, slightly curved, 4-8 cm long, 0.5-1 cm in diameter. "Guoqiao" smooth and relatively long. Apex with some remains of stems.

Rhizome of Coptis teeta Curved hook-like, mostly single, relatively small.

Identification (1) Transverse section:

Rhizome of Coptis chinensis Cork cells of several layers. Cortex broader, stone cells singly scattered or grouped. Pericycle fibres in bundles or accompanied with a few stone cells, both yellow. Collateral vascular bundles arranged in a ring. Xylem yellow, lignified, xylem fibres well developed. Pith consisting of parenchymatous cells, stone cells absent.

Rhizome of Coptis deltoidea Pith with stone cells.

Rhizome of Coptis teeta Stone cells absent from cortex, pericycle and pith.

(2) To 1 g of the coarse powder add 10 ml of ethanol, heat to boil, allow to cool, and filter. To 5 drops of the filtrate, add 1 ml of diluted hydrochloric acid TS and a samll quantity of chlorinated lime, a red colour is produced; to another 5 drops of the filtrate add 2-3 drops of 5% solution of gallic acid in ethanol, evaporate to dryness, add several drops of sulfuric acid to the residue while hot; a dark green colour is produced.

(3) To 50 mg of the powder add 5 ml of methanol, heat under reflux on a water bath for 15 minutes, filter, add methanol to 5 ml as the test solution. Prepare a solution of Rhizoma Coptidis reference drug in the same manner as the reference drug solution. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, isopropanol, methanol and water (6 : 3 : 1.5 : 1.5 : 0.3) as the mobile phase. Apply separately to the plate 1 μl of each of the three solutions. After developing in a chamber pre-equilibrated with the vapour of concentrated ammonia TS and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatogram obtained with the test solution corresponds in position and colour to the spots in the chromatogram obtained with the reference drug solution; and a yellow fluorescent spot corresponds to the spot in the chromatogram obtained with the reference solution.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Assay Weigh accurately 0.1 g of the powder to a 100 ml of volumetric flask, add 95 ml of a mixture of hydrochloric acid and methanol (1 : 100), heat on a water bath at 60℃ for 15 minutes, ultrasonicate for 30 minutes, allow to stand overnight, dilute with methanol to volume, mix well, filter, and use the filtrate as the test solution. Dissolve berberine hydrochloride CRS, weighed accurately, in methanol to produce a solution containing 0.04 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, isopropanol, methanol and water (6 : 3 : 1.5 : 1.5 : 0.3) as the mobile phase. Apply 1 μl of the test solution and 1 μl, 3 μl of the reference solution alternatively to the plate. After developing 8 cm in a chamber pre-equilibrated with the vapour of concentrated ammonia TS for 15 minutes and removal of the plate, dry in air. Carry out the method for thin layer chromatography (thin layer chromatographic scanning method, Appendix Ⅵ B), scan with fluorescence mode at the wavelength of $\lambda_{ex} = 366$ nm, determine the integration value of the fluorescent strength, and calculate the content. It contains not less than 3.6 per cent of berberine, calculated as berberine hydrochloride ($C_{20}H_{18}NO_4 \cdot HCl$).

Processing *Rhizoma Coptidis* Eliminate foreign matter, soften thoroughly, cut into thin slices, dry in air, or break to pieces before use.

Rhizoma Coptidis (*processed with wine*) Stir-bake the Rhizoma Coptidis as described under the method for stir-baking with wine (Appendix Ⅱ D) to dryness, using 12.5 kg of yellow rice wine per 100 kg of Rhizoma Coptidis.

Rhizoma Coptidis (*processed with ginger*) Stir-bake the Rhizoma Coptidis as described under the method for stir-baking with ginger juice (Appendix Ⅱ D) to dryness, using 12.5 kg of ginger per 100 kg of Rhizoma Coptidis.

Rhizoma Coptidis (*Processed with Fructus Evodiae*) Decoct Fructus Evodiae with a quantity of water, mix the decoction with Rhizoma Coptidis, until the decoction is exhausted, then stir-bake to dryness.

To each 100 kg of Rhizoma Coptidis add 10 kg of Fructus Evoidae.

Carry out the method for determination of total ash as described above, for all the processed products, not more than 4.0 per cent.

Action To remove *damp-heat*, quench *fire* and counteract *toxicity*.

Rhizoma Coptidis (*processed with wine*) To remove *fire* from the upper part of the body.

Rhizoma Coptidis (*processed with ginger*) To remove *fire* from the stomach, regulate the stomach function and relieve vomiting.

Rhizoma Coptidis (*processed with Fructus Evodiae*) To soothe the liver, regulate the stomach function and relieve vomiting.

Indications Attack by *damp-heat* manifested by stuffiness and fullness in the abdomen, vomiting and acid regurgitation, dysentery jaundice; high fever accompanied by impairmed consciousness; fidget and insomnia due to *fire*; spitting of blood and epistaxis caused by *heat* in the blood; bloodshot eyes; toothache; wastinf-thirst carbuncles and sores; external use for eczema and other skin diseases with exudation; pus from the ears.

Rhizoma Coptidis (*processed with wine*) Bloodshot eyes; ulcers in the mouth.

Rhizoma Coptidis (*processed with ginger*) Stuffiness and fullness in the abdomen with nausea and vomiting caused by *damp-heat* in combination with cold.

Rhizoma Coptidis (*processed with Fructus Evodiae*) Nausea, vomiting and acid regurgitation in disharmony of the liver and the stomach.

Usage and dosage 2-5 g; appropriate quantity for external use.

Storage Preserve in a ventilated and dry place.

Rhizoma Corydalis (延胡索, Yanhusuo)

Yanhusuo

Yanhusuo is the dried tuber of *Corydalis yanhusuo* W. T. Wang (Fam. Papaveraceae). The drug is collected in early summer when the plant is withered, removed from fibrous root, washed clean, boiled in water until no dry core visible, and dried in the sun.

Description Irregularly oblate, 0.5-1.5 cm in diameter. Externally yellow or yellowish-brown, irregularly reticulate-wrinkled. Apex with slight dented stem scar, base usually tuberculate. Texture hard and fragile, fracture yellow, horny, waxy-sheeny. Odour, slight; taste, bitter.

Identification (1) Powder: Greenish-yellow. Masses of glatinised tarch granules pale yellow or nearly colourless. Sclerenchyma in hypodermis greenish-yellow, cells polygonal, subsquare or elongated, walls slightly sinuous, lignified, some beaded, finely pitted. Sprial vessels 16-32 μm in diameter.

(2) To 1 g of the powder add 50 ml of methanol, ultrasonicate for 30 minutes and filter. Evaporate the filtrate to dryness, dissolve the residue in 10 ml of water and adjust the solution to alkaline with strong ammonia TS. Extract with three 10-ml quantities of ether, combine the ether

extracts and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 1 g of Rhizoma Corydalis reference drug in the same manner as the reference drug solution. Dissolve a quantity of tetrahydropalmatine CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with a 1% solution of sodium hydroxide as the coating substance and a mixture of toluene and acetone (9 : 2) as the mobile phase. Apply separately to the plate 2-3 μl of the above three solutions. After developing and removal of the plate, dry in air and expose to iodine vapour for 3 minutes. After expelling the iodine absorbed, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent.

Total ash Not more than 4.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.5 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, hot extraction method), using dilute ethanol as the solvent, not less than 13.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.1% solution of phosphoric acid (adjust to pH 6.0 with triethylamine) (55 : 45) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of tetrahydropalmatine.

Reference solution Weigh accurately a quantity of tetrahydropalmatine CRS, dissolve in methanol to produce a solution containing 46 μg per ml.

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve) to a flat bottom flask, accurately add 50 ml of a mixture of strong ammonia TS and methanol (1 : 20), weigh, macerate for 1 hour and then heat under reflux for 1 hour, cool and weigh again, replenish the loss of solvent with the above mixture, mix well and filter. Evaporate accurately 25 ml of the successive filtrate to dryness, dissolve the residue in methanol, transfer to a 5 ml volumetric flask, dilute with methanol to volume and mix well.

Procedure Accurately inject 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 0.050 per cent of tetrahydropalmatine ($C_{21}H_{25}NO_4$), calculated with reference to the dried drug.

Processing *Rhizoma Corydalis* Eliminate foreign matter, wash clean, dry, and cut into thick slices or break to pieces before use.

Rhizoma Corydalis (processed with vinegar) Stir-bake Rhizoma Corydalis as described under the method for stir-baking with vinegar (Appendix Ⅱ D) to dryness, or boil it as described under the method for boiling with vinegar (Appendix Ⅱ D) until the vinegar is exhausted, and cut into thick slices or break to pieces before use.

Action To promote circulation of blood and *qi* and relieve pain.

Indications Chest pain, epigastric pain; amenorrhea, dysmenorrhea, blood stasis after childbirth; traumatic swelling and pain.

Usage and dosage 3-9 g; or 1.5-3 g of powder to be swallowed at a time.

Storage Preserve in a dry place, protected from moth.

Rhizoma Corydalis Decumbentis (夏天无, Xiatianwu)

Decumbent Corydalis Rhizome

Decumbent Corydalis Rhizome is the dried tuber of *Corydalis decumbens* (Thunb.) Pers. (Fam. Papaveraceae). The drug is collected in spring and early summer after budding, removed from stem, leave and rootlets, washed clean, and dried.

Description Subspheroidal, long-rounded or irregular, 0.5-3 cm long, 0.5-2.5 cm in diameter. Externally greyish-yellow, dark green or dark brown, with numerous tubercles and indistinct fine wrinkles. Apex obtuse and rounded, showing scars of stems, surrounded by numerous pale yellow dotted leaf scars and rootlet scars. Texture hard, fracture yellowish-white or yellow, granular or horny, some individuals slightly starchy. Odour, slight; taste, bitter.

Identification (1) Macerate 4 g of the coarse powder in 25 ml of 1% solution of sodium carbonate on a nearly boiling water bath for 5 minutes, and filter. Adjust the filtrate to pH 6 with dilute hydrochloric acid TS, and extract by shaking with 15 ml of chloroform. To 2 ml of the chloroform solution add 1 ml of sulfuric acid and shake. The sulfuric acid layer shows a brownish-red colour and turns brownish-black on standing.

(2) Ultrasonicate about 4 g of the powder with 40 ml of a mixture of chloroform, methanol and strong ammonia TS (5 : 1 : 0.1) for 30 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of methanol as the test solution. Dissolve protopine CRS in chloroform to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of cyclohexane, ethyl acetate and diethylamine (16 : 3 : 1) as the mobile phase. Apply separately to the plate 5 μl each of the two solutions. After developing in a chamber pre-equilibrated with the mobile phase for 15 minutes, and removal of the plate, dry in air, spray with dilute potassium iodobismuthate TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.5 per cent (Appendix Ⅸ K)

Extractives Carry out the method for determination of water-soluble extractives (Appendix Ⅹ A, the hot extraction method), not less than 30.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a

mixture of acetonitrile and triethylamine in acetic acid solution (add 8 ml of triethylamine in 30 ml glacial acetic acid and dilute to 1000 ml with water) (18 : 82) as the mobile phase. As detector a spectrophotometer set at 289 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of protopine.

Reference solution Weigh accurately 10 mg of protopine CRS, dissolve in 5 ml of 1% solution of hydrochloric acid in a 50 ml volumetric flask, dilute with 50% methanol to volume and mix well. Transfer accurately 5 ml to a 25 ml volumetric flask and dilute to volume with 50% methanol to produce a solution containing 40 μg per ml.

Test solution Weigh accurately 0.5 g of the coarse powder, in a stopper conical flask, add accurately 50 ml of 50% methanol, and weigh. Heat under reflux for 1 hour, cool and weigh again, replenish the loss of solvent with 50% methanol and mix well. Filter through a millipore film (0.45 μm) and use the successive filtrate as the test solution.

Procedure Inject accurately 10-20 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.30 per cent of protopine ($C_{20}H_{19}NO_5$), calculated with reference to the dried drug.

Action To activate blood circulation and drain meridians, promote the flow of *qi* and relieve pain.

Indications Stoke and hemiparalysis, traumatic injuries, rheumatic arthritis, sciatica.

Usage and dosage 6-12 g, ground into powder and divided into 3 doses.

Storage Preserve in a ventilated and dry place.

Preparation Decumbent Corydalis Tablets

Rhizoma Curculiginis
(仙茅, Xianmao)

Common Curculigo Rhizome

Common Curculigo Rhizome is the dried rhizome of *Curculigo orchioides* Gaertn. (Fam. Amaryllidaceae). The drug is collected in autumn or winter, removed from caudex and fibrous roots, washed clean, and dried.

Description Cylindrycal, slightly curved, 3-10 cm long, 4-12 mm in diameter. Externally blackish-brown to brown, rugged, with pitted fibrous root scars and transversal wrinkles. Texture hard and fragile, easily broken, fracture uneven, pale brownish-white to brown and dark brown in the centre. Odour, slight aromatic; taste, bitterish and pungent.

Identification (1) Transverse section: Cork consisting of 3-10 layers of cells. Cortex broad, occasionally showing root trace vascular bundles, some marginal cells containing prisms of calcium oxalate, endodermis distinct. Stele vascular bundles amphivasal and collateral, scattered. Mucilage cells numerous, scattered in parenchyma, subrounded, 60-200 μm in diameter, containing raphides of calcium oxalate, 50-180 μm long. Parenchymatous cells filled with starch granules.

(2) Heat under reflux 2 g of the powder with 20 ml of ethanol on a water bath for 30 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethyl acetate, and use the supernatant as the test solution. Dissolve curculigoside CRS in ethyl acetate to produce a solution containing 0.1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using sillica gel G as the coating substance and a mixture of ethyl acetate, methanol and formic acid (10 : 1 : 0.1) as the mobile phase. Apply separately to the plate 2 μl of each of the two solutions. After developing and removal of the plate, dry in air, and spray with a mixture of 2% solution of potassium ferrocyanide and 2% solution of ferric chloride (1 : 1). The blue spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Foreign matter (Fibrous root and root stock) Not more than 4.0 per cent (Appendix Ⅸ A).

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 13.0 per cent.

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using ethanol as the solvent, not less than 7.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% solution of phosphoric acid (21 : 79) as the mobile phase. As detector a spectrophotometer set at 285 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of curculigoside.

Reference solution Weigh accurately a quantity of curculigoside CRS, dissolve in methanol to produce a solution containing 70 μg per ml.

Test solution Weigh accurately 1 g of the powder (through No. 3 sieve), add accurately 50 ml of methanol and weigh. Heat under reflux for 2 hours, cool and weigh again, replenish the loss of weight with methanol, mix well and filter. Evaporate accurately 20 ml of the successive filtrate to dryness, dissolve the residue in methanol, transfer to a 10 ml volumetric flask, dilute with methanol to volume and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.10 per cent of curculigoside ($C_{22}H_{26}O_{11}$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, cut into sections, and dry.

Action To reinforce *kidney-yang*, strengthen the tendons and bones, and dispel *cold-dampness*.

Indications Weakness of the legs; arthrits of the lumbar and knee joints due to affection of *cold-dampness*; watery diarrhea with aversion to cold.

Usage and dosage 3-9 g.

Storage Preserve in a dry place, protected from mould and moth.

Rhizoma Curcumae (莪术, Ezhu)

Zedoray Rhizome

Zedoray Rhizome is the dried rhizome of *Curcuma phaeocaulis* Valeton, *Curcuma kwangsiensis* S. G. Lee et C. F. Liang or *Curcuma wenyujin* Y. H. Chen et C. Ling (Fam. Zingiberaceae). The drug derived from the last species is commonly known as "Wen Ezhu". The drug is collected in winter when stem and leaves withered, washed clean, steamed or boiled thoroughly, dried in the sun or dried at a lower temperature, removed from fibrous roots and foreign matter.

Description *Rhizome of Curcuma phaeocaulis* Ovoid, elongate ovoid, conical or elongate fusiform, frequently apex obtuse, base obtuse and rounded, 2-8 cm long, 1.5-4 cm in diameter. Externally greyish-yellow to greyish-brown, the upper part conspicuously raised-annulated and with rounded and slightly dented rootlet scars, or remaining rootlets, some exhibiting a row of concave bud scars and subrounded lateral rhizome scars on two sides, respectively, and some showing knife cut traces. Texture heavy and hard, fracture greyish-brown to bluish-brown, waxy, usually attached with greyish-brown powder, bark and stele easily detachable, endodermal ring deep brown. Odour, slight aromatic; taste, slight bitter and pungent.

Rhizome of Curcuma kwangsiensis Slightly rasied-annulated, fracture yellowish-brown to brown, usually attached with pale yellow powder, endodermal ring yellowish-white.

Rhizome of Curcuma wenyujin (*wen Ezhu*) Fracture yellowish-brown to dark brown, usually attached with pale yellow to yellowish-brown powder. Odour aromatic or slightly aromatic.

Identification Transverse section: Cork consisting of several layers of cells, sometime removed, cortex scattered with leaf-trace bundles, endodermis distinct. Stele broad, vascular bundles collateral and scattered, some of them relatively small, relatively close arranged along pericycle. Parenchymatous cells filled with gelatinized starch masses, some cells containing golden oily matter scattered in parenchma.

Absorbance Weigh accurately 30 mg of the medium powder, add 10 ml of chloroform, ultrasonicate for 40 minutes or macerate for 24 hours, filter. Transfer the filtrate into a 10 ml volumetric flask, add chloroform to volume, and mix well. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), the resulting solution exhibits a maximum at 242 nm and the absorbance is not less than 0.45.

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol as solvent, not less than 7.0 per cent.

Assay Carry out the method for determination of volatile oil (Appendix Ⅹ D).
It contains not less than 1.5 per cent of volatile oil (ml/g).

Processing *Rhizoma Curcumae* Eliminate foreign matter, soak slightly, wash clean, steam to be soft, cut into thin slices, and dry.

Rhizoma Curcumae (*processed with vinegar*) Boil the Rhizoma Curcumae as described under the method for boiling with vinegar (Appendix Ⅱ D) until vinegar is absorbed entirely, cool slightly, cut into thick slices, and dry.

Action To promote the flow of *qi* and eliminate blood stasis with strong effect, and relieve pain by removing the stagnation of undigested food.

Indications Mass in the abdomen, amenorrhea due to *blood stasis*; distension and pain due to stagnation of undigested food; carcinoma of cervix at early stage.

Usage and dosage 6-9 g.

Precaution Contraindicated in pregnancy.

Storage Preserve in a dry place, protected from moth.

Rhizoma Curcumae Longae (姜黄, Jianghuang)

Turmeric

Turmeric is the dried rhizome of *Curcuma longa* L. (Fam. Zingiberaceae). The drug is collected in winter when the aerial part withers, washed clean, boiled or steamed thoroughly, dried in the sun and removed from fibrous roots.

Description Irregularly ovoid, cylindrical or fusiform, frequently curved, some shortly branched in Y-shape, 2-5 cm long, 1-3 cm in diameter. Externally dark yellow, rough, with wrinkled striations and distinct annulations, and exhibiting some rounded scars of branched rhizomes and fibrous root scars. Texture hard, uneasily broken, fracture brownish-yellow to golden-yellow, horny with wax lustre, endodermis ring distinct, scattered with dotted vascular bundles. Odour, characteristic and aromatic; taste, bitter and pungent.

Identification (1) Transverse section: Epidermal cells flattened, thin-walled. Cortex broad, scattered with leaf-trace bundles, showing 6-8 layers of flattened cork cells at the outside near the epidermis, endodermal cells with distinct Casparian dots. Pericycle consisting of 1-2 rows of parenchymatous cells. Collateral bundles scattered, some more near the pericycle and lessened inward. Parenchymatous cells packed with droplets of volatile oil, starch granules and reddish-brown pigments.
(2) To 0.2 g of the powder add 20 ml of dehydrated ethanol, shake, macerate for 30 minutes and filter. Evaporate the filtrate to dryness and dissolve the residue in 2 ml of dehydrated ethanol as the test solution. Prepare a solution of Rhizoma Curcumae Longae reference drug in the same manner as the reference drug solution. Dissolve a quantity of curcumin CRS in dehydrated ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and formic acid (96 : 4 : 0.7) as the mobile phase. Apply separately to the plate 4 μl of each of the above three solutions. After developing and removal of the plate, dry in air. Examine in daylight and under ultraviolet light at 365 nm. The spots and the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots and the fluorescent spots obtained with the reference drug solution and the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 2), not more than 16.0 per cent.

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the cold maceration method), using dilute ethanol as the solvent, not less than 12.0 per cent.

Assay Volatile oil Carry out the method for determination of volatile oil (Appendix Ⅹ D).
It contains not less than 7.0 per cent (ml/g) of volatile oil.

Curcumin Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 4% solution of acetic acid (48 : 52) as the mobile phase. As detector a spectrophotometer set at 430 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of curcumin.

Reference solution Weigh accurately a quantity of curcumin CRS, dissolve in methanol to produce a solution containing 10 μg per ml.

Test solution Weigh accurately 0.2 g of the powder to a stopper conical flask, add accurately 20 ml of methanol and weigh. Heat under reflux for 30 minutes, cool and weigh again, replenish the loss of weight with methanol, mix well and centrifuge. Measure accurately 1 ml of the supernatant to a 20 ml volumetric flask, dilute with methanol to volume and mix well.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 1.0 per cent of curcumin ($C_{21}H_{20}O_6$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, soak briefly, wash clean, soften thoroughly, cut into thick slices and dry in the sun.

Action To eliminate blood stasis, promote the flow of *qi*, stimulate menstrual discharge and relieve pain.

Indications Pricking pain in the chest and hypochondriac regions; amenorrhea; mass formation in the abdomen; rheumatic pain of the shoulders and arms; traumatic swelling and pain.

Usage and dosage 3-9 g; appropriate quantity for external use.

Storage Preserve in a cool and dry place.

Rhizoma Cyperi (香附, Xiangfu)

Nutgrass Galingale Rhizome

Nutgrass Galingale Rhizome is the dried rhizome of *Cyperus rotundus* L. (Fam. Cyperaceae). The drug is collected in autumn, burnt off the fibrous roots, boiled briefly or steamed thoroughly and dried in the sun, or dried in the sun directly.

Description Frequently fusiform, some slightly curved, 2-3.5 cm long, 0.5-1 cm in diameter. Externally dark brown or blackish-brown, longitudinally wrinkled and with 6-10 slightly prominent, annular nodes with brown fibrous roots and remaining root-scars; or slightly smooth and exhibiting indistinct annular nodes with the fibrous roots completely removed. Texture hard, fracure of steamed rhizomes appearing yellowish-brown or reddish-brown, horny; fracture of the unsteamed ones white and starchy, an endodermis ring obvious, stele darkened in colour, with scattered dotted vascular bundles. Odour, aromatic; taste, slightly bitter.

Identification (1) Powder: Pale brown. Secretory cells subrounded, 35-72 μm in diameter, containing pale yellowish-brown to reddish-brown secretion, 5-8 adjacent cells radially arranged in a circle. Epidermal cells polygonal, frequently with hypodermal fibre bundles and sclerenchymatous cells. Hypodermal fibres in bundles, dark brown or rddish-brown, 7-22 μm in diameter, walls thickened. Sclerenchymatous cells subsquare, subrounded or irregular, walls slightly thickened with pits. Stone cells rare, subsquare, subrounded or subpolygonal, walls relatvely thickened.
(2) Macerate 1 g of the powder in 5 ml of ether for 1 hour with frequent shaking, filter and evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of ethyl acetate as the test solution. Dissolve α-cyperone CRS in ethyl acetate to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substances and benzene, ethyl acetate and glacial acetic acid (92 : 5 : 5) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air and examine under ultraviolet light at 254 nm. A dark blue spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. Then spray with 2,4-dinitrophenyl hydrazine TS, the colour of the spots turns gradually orange-red on standing.

Total ash Not more than 4.0 per cent (Appendix Ⅸ K).

Processing *Rhizoma Cyperi* Remove fibrous roots and foreign matter, pound to pieces or cut into thin slices.

Rhizoma Cyperi (*processed with vinegar*) Stir-bake the pieces or slices of Rhizoma Cyperi as described under the method for stir-baking with vinegar (Appendix Ⅱ D) to dryness.

Action To remove stagnation of *qi*, regulate menstruation and relieve pain.

Indications Stagnation of the *liver-qi* characterized by distending pain in the chest, hypochondria and epigastrium, indigestion, feeling of stuffiness in the chest and epigastrium, abdominal colic, distending pain in the breast, menstrual disorders, amenorrhea or dysmenorrhea.

Usage and dosage 6-9 g.

Storage Preserve in a cool and dry place, protected from moth.

Rhizoma Dioscoreae (山药, Shanyao)

Common Yam Rhizome

Common Yam Rhizome is the dried rhizome of *Dioscorea opposita* Thunb. (Fam. Dioscoreaceae). The drug is collected in winter when the stem and leaves are withered, cut off, washed

clean and peeled outer bark and fibrous roots, and then dried. Alternatively, the large, straight and dried rhizome is sorted, soaked in clean water until no dry core visible and softened thoroughly, cut two ends to smooth plane and rubbed on a board to become cylindrical in shape, dried in the sun and finally polished. It is known as "Guang Shanyao" (Polished Common Yam Rhizome).

Description Subcylindrical, curved or somewhat flattened, 15-30 cm long, 1.5-6 cm in diameter. Externally yellowish-white or pale yellow, longitudinally furrowed and wrinkled, and bearing fibrous root scars, with occasional patches of brownish cork. Texture heavy, compact and tough; uneasily broken, fracture white and starchy. Odour, slight; taste, weak, acidulous, and viscous on chewing. Guang Shanyao is cylindrical, the two ends even, 9-18 cm long, 1.5-3 cm in diameter, externally smooth, white or yellowish-white.

Identification Powder: Whitish. Simple starch granules compressed-ovoid, deltoid-ovoid, subrounded or oblong, 8-35 μm in diameter, hilum pointed, V-shaped, crosscriss or shortly cleft, striations visible. Compound starch granules few, usually consisting of 2-3 granules. Mucilage cells containing raphides of calcium oxalate, up to 240 μm long and needle crystals 2-5 μm wide. Vessels bordered-pitted, reticulated, spiral and annular, 12-48 μm in diameter.

Processing *Rhizoma Dioscoreae* Eliminate foreign matter, grade according to size, soak and soften thoroughly, cut into thick slices, and dry.

Rhizoma Dioscoreae (*stir-baked with bran*) Stir-bake the slices of Rhizoma Dioscoreae as described under the method for stir-baking with bran (Appendix Ⅱ D) to yellowish.

Action To replenish the spleen and stomach, promote fluid secretion and benefit the lung, and strengthen the kidney and restrain seminal discharge.

Rhizoma Dioscoreae (*stir-baked with bran*) To replenish the spleen and promote the stomach function.

Indications Anorexia and chronic diarrhea due to diminished function of the spleen; cough and dyspnea due to diminished function of the lung; seminal emission, excessive leukorrhea, frequency of urination or diabetes due to deficiency of the kidney.

Rhizoma Dioscoreae (*stir-baked with bran*) Diminished function of the spleen with anorexia, diarrhea and excessive leukorrhea.

Usage and dosage 15-30 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Rhizoma Dioscoreae Hypoglaucae (粉萆薢, Fenbixie)

Hypoglaucous Collett Yam Rhizome

Hypoglaucous Collett Yam Rhizome is the dried rhizome of *Dioscorea hypoglauca* Palibin (Fam. Dioscoreaceae). The drug is collected in autumn and winter, removed from the fibrous roots, washed clean, cut into slices, and dried in the sun.

Description Occurring in irregularly thin slices, edge uneven, varying in size, about 0.5 mm thick, some with brownish-black or greyish-brown outer bark. Cut surface yellowish-white or pale greyish-brown, dotted vascular bundles scattered. Texture loose, slightly elastic, easily broken, new cut surface appearing yellowish near outer bark. Odour, slight; taste, pungent and slightly bitter.

Identification (1) Transverse section: Cork cells of more layers. Cortex narrow, cells tangentially elongated, walls slightly thickened, pits distinct, mucilage cells scattered, containing raphides of calcium oxalate. Collateral and amphivasal vascular bundles scattered in stele, parenchymatous cells with slightly thickened and pitted walls, containing starch granules.
Powder: Yellowish-white. Simple starch granules rounded, ovoid or long-elliptical, 5-32 μm in diameter, up to 40 μm long, hilum pointed or cleft-like, compound granules less frequent, mostly composed of two components. Sclerenchymatous cells abundant, walls lignified, pits distinct, some similar to stone cells, polygonal, fusiform or subrectangular, 40-80 μm in diameter, up to 224 μm long. Raphides of calcium oxalate 64-84 μm long.
(2) Macerate 10 g of the powder in 100 ml of water overnight, heat on a water bath at 60℃ for 10 minutes, filter while hot. Measure separately 2 ml of the filtrate to two test tubes. To one tube add 2 ml of sodium hydroxide TS, and to another tube add 2 ml of hydrochloric acid solution (1→20), stopper well, shake vigorously for 1 minute, the foam produced in the alkaline solution is several volumes higher than that produced in the acid solution.

Action To remove turbid *damp*, and relieve rheumatic condition.

Indications Chyluria, turbid urine mixed with whitish substance or whitish discharge from urethra, excessive leukorrhea; rheumatic arthralgia with limitation of motion and pain in the loins and knees.

Usage and dosage 9-15 g.

Storage Preserve in a ventilated and dry place.

Rhizoma Dioscoreae Nipponicae (穿山龙, Chuanshanlong)

Nippon Yam Rhizome

Nippon Yam Rhizome is the dried rhizome of *Dioscorea nipponica* Makino (Fam. Dioscoreaceae). The drug is collected in autumn or spring, washed clean, removed from fibrous roots and outer bark, dried in the sun.

Description Subcylindrical, slightly curved, 15-20 cm long, 1.0-15 cm in diameter. Externally yellowish-white or brownish-yellow, irregularly and longitudinally furrowed, bearing spinous remains of roots and protuberant stem scars on one side. Texture hard, fracture even, white or yellowish-white, scattered pale brown dotted vascular bundles. Odour, slight; taste, bitter and astringent.

Identification (1) Powder: Pale yellow. Starch granules simple, elliptical, subtriangular, conical or irregular, 3-17 μm in diameter, up to 33 μm long, hilum slit-shaped. Needles of calcium oxalate scattered, or in bundles occurring in mucilage cells, up to 110 μm long. Parenchymatous cells lignified, pale yellow or yellow, long elliptical, rectangular or rhombic, with small and sparse pits. Bordered pitted vessels 17-56 μm in diameter, pits fine and dense, elliptical.
(2) Dissolve a quantity of diosgenin CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography

(Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (20 : 0.2) as the mobile phase. Apply separately to the plate 3 μl of each of the test solution obtained under *Assay* and the above reference solution. After developing and removal of the plate, dry in air, and spray with 10% solution of phosphomolybdic acid in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H, Method 1), not more than 9.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (84 : 16) as the mobile phase. As detector a spectrophotometer set at 203 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of diosgenin.

Reference solution Dissolve a quantity of diosgenin CRS, accurately weighed, in methanol to produce a solution containing 0.5 mg per ml as reference solution.

Test solution Weigh accurately 1 g of the powder (through No. 4 sieve) to a conical flask, add 50 ml of methanol, ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, filter, and rinse the residue with 20 ml of methanol. Combine the methanol solutions and evaporate to dryness. Dissolve the residue in successive quantities of 10 ml, 5 ml and 5 ml of 3 mol/L hydrochloric acid solution, successively transfer to a conical flask, heat to hydrolyze on a water bath for 30 minutes, cool, add 30 ml of chloroform, heat under reflux for 15 minutes, repeat the extraction with chloroform in the same manner. Filter, wash the container and residue with 30 ml of chloroform, evaporate the combined extracts to dryness, dissolve the residue in methanol, transfer to a 25 ml volumetric flask, dilute to volume with methanol, and mix well.

Procedures Inject accurately 20 μl of each of the reference solution and the test solution respectively, into the column, determine and calculate the content.

It contains not less than 1.1 per cent of diosgenin ($C_{27}H_{42}O_3$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into slices, and dry.

Action To expel *wind-dampness*, relieve pain, relax muscles and tendons, promote blood circulation, relieve cough and asthma and resolve phlegm.

Indications Rheumatic arthritis, pain and numbness of the lower back and legs, Kaschin-Bek disease, injury from falling, lumbar sprain, chronic bronchitis, cough and asthma.

Usage and dosage 9-15 g. Or prepared into a medicinal wine.

Precaution Defend from anaphylaxis while crushing or processing.

Storage Preserve in a dry place.

Rhizoma Dioscoreae Septemlobae (绵萆薢, Mianbixie)

Sevenlobed Yam Rhizome

Sevenlobed Yam Rhizome is the dried rhizome of *Dioscorea septemloba* Thunb. or *Dioscorea futschauensis* Uline ex R. Kunth (Fam. Dioscoreaceae). The drug is collected in autumn and winter, removed from fibrous roots, washed clean, cut into slices, and dried in the sun.

Description Occurring in irregularly oblique slices, border uneven, varying in size, about 2-5 mm thick. Externally yellowish-brown to brownish-black, sparsely bearing remains of fibrous roots, protruding conically. Texture loose, somewhat spongy, cut surface greyish-white to pale greyish-brown, yellowish-brown spots of vascular bundle scattered. Odour, slight; taste, slightly bitter.

Identification (1) Powder: Pale yellowish-brown. Starch granules abundant, simple starch granules ovoid, ellipsoid, subspherical, triangular or irregular, some acute at one end, some knotty, 10-70 μm in diameter, hilum cleft-like, V-shaped or pointed, striations mostly indistinct. Needles of calcium oxalate in bundles, 90-210 μm long. Parenchymatous cell walls slightly thickened, pits distinct. Bordered-pitted vessels 17-84 μm in diameter, pits distinct. Cork cells brownish yellow and polygonal.

(2) To 2 g of the powder add 50 ml of methanol, heat under reflux for 1 hour and filter. Evaporate the filtrate to dryness, dissolve the residue in 25 ml of water, wash with 25 ml of ether and discard the ether solution. Add 2 ml of hydrochloric acid to the water solution, heat under reflux for 1.5 hours and cool. Extract with two 25-ml quantities of ether, combine the ether extracts, evaporate to dryness, and dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 2 g of Rhizoma Dioscoreae Septemlobae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and acetone (9 : 1) as the mobile phase. Apply separately to the plate 10 μl of the above two solutions. After developing and removal of the plate, dry in air, spray with phosphomolybdic acid TS and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 11.0 per cent.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol as the solvent, not less than 15.0 per cent.

Action To remove turbid *damp*, and relieve rheumatic condition.

Indications Gonorrhea with whitish discharge from the urethra, excessive leukorrhea; ulcers caused by *damp-heat*, arthralgia of the lumbar spine and knees.

Usage and dosage 9-15 g.

Storage Preserve in a ventilated and dry place.

Rhizoma Drynariae (骨碎补, Gusuibu)

Fortune's Drynaria Rhizome

Fortune's Drynaria Rhizome is the dried rhizome of *Drynaria fortunei* (Kunze) J. Sm. (Fam. Polypodiaceae). The drug is collected all year round, removed from soil and dried, or burned off the hairs (ramenta).

Description Flattened long slat-shaped, mostly curved, branched, 5-15 cm long, 1-1.5 cm wide, 2-5 mm thick. The surface closely covered with dark brown hairy ramenta, and the burnt ones brown or dark brown, the upper surface and both sides marked by raised or depressed circular frond scars, rarely by remains of frond-bases and fibrous roots. Texture light, fragile, easily broken, fracture reddish-brown, vascular bundles yellow dotted and arranged in a ring. Odour, slight; taste, weak and slightly astringent.

Identification Heat under reflux 0.5 g of the powder in 30 ml of methanol for 1 hour, cool, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve naringin CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of the mixture of benzene, ethyl acetate, formic acid and water (1 : 12 : 2.5 : 3) as the mobile phase. Apply separately 4 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with aluminium chloride TS, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, acetic acid and water (35 : 4 : 65) as the mobile phase. As detector a spectrophotometer set at 283 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of naringin.

Reference solution Weigh accurately 20 mg of naringin CRS, dried to constant weight at 110℃, in a 100 ml volumetric flask, dilute with methanol to volume, and mix well. Accurately measure 3 ml in a 10 ml volumetric flask, dilute with methanol to volume, and mix well (containing 60 μg of naringin per ml).

Test solution Weigh accurately 0.25 g of the coarse powder, add 30 ml of methanol, heat under reflux on a water bath for 3 hours, cool, and filter. Transfer the filtrate to a 50 ml volumetric flask, wash the container with a small quantity of methanol for several times, filter the washings to the same flask, dilute with methanol to volume, and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, determine and calculate the content.
It contains not less than 0.50 per cent of naringin ($C_{27}H_{32}O_{14}$), calculated with reference to the dried drug.

Processing *Rhizoma Drynariae* Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry.

Rhizoma Drynariae (*scalding*) Scald the clean Rhizoma Drynariae of its slices with sand as described under the method for scalding (Appendix Ⅱ D) until inflated, and strike to remove hairs.

Action To replenish the kidney, strengthen the bones, promote the healing of fracture, and relieve pain.

Indications Deficiency syndrome of the kidney marked by back pain, tinnitus, impairment of hearing and looseness of teeth; traumatic injuries, bone fracture; external use for alopecia areata, vitiligo.

Usage and dosage 3-9 g, or 6-15 g of the fresh rhizome; for external use, appropriate quantity of the fresh rhizome.

Storage Preserve in a dry place.

Rhizoma Dryopteridis Crassirhizomatis (绵马贯众, Mianmaguanzhong)

Male Fern Rhizome

Male Fern Rhizome is the dried rhizome and frond bases of *Dryopteris crassirhizoma* Nakai (Fam. Dryopteridaceae). The drug is collected in autumn, pared off frond and fibrous root, removed from soil, dried in the sun.

Description Long obovate, slightly curved, the upper end obtuse or truncate, the lower end acuminate, some cut longitudinally into two pieces, 7-20 cm long, 4-8 cm in diameter. Externally yellowish-brown to black brown, densely covered with regularly arranged frond-bases and ramenta, and with curved rootlets. The frond bases oblate rounded, 3-5 cm long, 5-10 mm in diameter, externally with longitudinal edge, texture hard and fragile, fracture slight smooth, brown, and showing 5-13 yellowish-white meristeles arranged in a ring. The outside of each frond base with three rootlets respectivly, ramenta striped lanceolate, entire, usually fallen off. Texture hard, fracture slight even, dark green to brown, with 5-13 yellowish-white meristeles arranged in a ring, relatively more leaf trace bundles scattered in the outer part. Odour characteristic; taste, firstly slight astringent and then gradually bitter or pungent.

Identification (1) Transverse section of frond base: Epidermis consisting of a layer of small cells with thickened outer walls, usually falling off, hypodermis cells consisting of 10 layers of sclerenchymatous polygonal cells, brown to dark brown. Parenchymatous cells arranged loosely, having internal unicellular glandular hairs in intercellular spaces, heads spherical or pear-shaped, containing brown contents. Amphicribral vascular bundle 5-13, arranged in a ring, each bundle surrounded by a layer of oblate and small endodermis cells, Casparian dots distinct and with oil drops scattered, the outside having 1-2 layer of pericycle parenchymatous cells containing brown contents and starch granules.
(2) To 0.5 g of the powder add 20 ml of cyclohexane, ultrasonicate for 30 minutes, use the supernatant as the test solution. Prepare a solution of Rhizoma Dryopteris Crassirhizomatis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using modified silica gel G (to each 10 g silica gel G, add 10 ml of disodium hydrogen phosphate-citric acid BS (pH 7.0), 60 mg of vitamin C and 20 ml of sodium carboxymethylcellulose solution, dry at room temperature, protected from light, activated at 50℃ for two hours before use) as the coating

substance and a mixture of *n*-hexane, chloroform and methanol (30 : 15 : 1) as the mobile phase. Apply separately 2-4 μl of each of the above two solutions to the plate. After developing over 15 cm in a chamber pre-saturated with mobile phase for 2 hours and removal of the plate, dry in air, spray immediately with 0.1% solution of fast blue BB salt in dilute ethanol, heat at 40℃ for 1 hour. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Processing Eliminate the foreign matter, spray water, wash clean, soften thoroughly, cut into thick slices, dry and sift crambs.

In irregular thick slices or pieces, externally brownish-yellow to blackish-brown. Odour characteristic; taste firstly slight astringent and then gradually bitter or pungent. Carry out the above test (2) of Identification, it shows the same result.

Action To remove *heat* and counteract *toxicity*, expel intestinal worm.

Rhizoma Dryopteris Crassirhizomae (*carbonized*) To arrest bleeding.

Indications Abdomen pain due to intestinal worms, sores.

Rhizoma Dryopteris Crassirhizomae (*carbonized*) Uterine bleeding.

Usage and dosage 4.5-9g.

Storage Preserve in a ventilated and dry place.

Rhizoma Dryopteridis Crassirhizomatis Carbonisatum (绵马贯众炭，Mianmaguanzhongtan)

Carbonized Male Fern Rhizome

The drug is the processed Rhizoma Dryopteridis Crassirhizomatis.

Procedure Stir bake the slices or pieces of Rhizoma Dryopteridis Crassirhizomatis under the method for carbonized by stir-baking (Appendix Ⅱ D) until the surface become black, spraying a little water to put out sparks, take it out and dry in air.

Description Irregular thick pieces or fragments. Externally charred black, internally charred brown. Taste astringent.

Identification To 1 g of the powder add 20 ml of cyclohexane, ultrasonicate for 30 minutes, use the supernatant as the test solution. Prepare a solution of 0.5 g of Rhizoma Dryopteris Crassirhizomatis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using modified silica gel G, (to each 10 g silica gel G, add 10 ml of disodium hydrogen phosphate-citric acid BS (pH 7), 60 mg of vitamin C and 20 ml of sodium carboxymethylcellulose solution, mix well), make the plates, dry at room temperature and protected from light, activated at 50℃ for 2 hours before use) as the coating substance and a mixture of *n*-hexane, chloroform and methanol (30 : 15 : 1) as the mobile phase. Apply separately to the plate 2-4 μl of each of the above two solutions. After developing more than 15 cm in a chamber pre-saturated with the mobile phase for 2 hours, removal of the plate, spray immediately with 0.3% solution of fast blue BB salt in dilute ethanol, and heat at 40℃ for 1 hour. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.5 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method as described under the determination of ethanol-soluble extractives (Appendix Ⅹ A), using dilute ethanol as the solvent, not less than 16.0 per cent.

Action To induce astringency to stop bleeding.

Indications Metrorrhagia or metrostaxis.

Usage and dosage 4.5-9 g.

Storage Preserve in a ventilated and dry place.

Rhizoma et Radix Baphicacanthis Cusiae (南板蓝根，Nan Banlangen)

Baphicacanthus Root

Baphicacanthus Root is the dried rhizome and root of *Baphicacanthus cusia* (Nees) Bremek. (Fam. Acanthaceae). The drug is collected in summer and autumn, deprived from the aerial part, washed clean, and dried in the sun.

Description Rhizome subrounded, mostly tortuous, branched, 10-30 cm long, 0.1-1.0 cm in diameter. Externally greyish-brown, fine wrinkled longitudinally; nodes swollen, bearing rootlets and remained with stem scars; outer bark easily exfoliated, bluish-grey. Texture hard and fragile, easily broken, fracture uneven, bark bluish-grey, wood greyish-blue to pale yellowish-brown, pith in the centre. Root varying in thickness, curved and branched, rootlets slender and flexible. Odour, slightly; taste, week.

Indentification (1) Transverse section: Cork consisting of several rows of cells, containing brown contents. Cortex broad, having serveral rows of collenchyma cells outside; endodermis distinct; stone cells visible. Phloem relatively narrow, phloem fibres more frequent. Xylem broad, all the cells in it lignified; vessels single or 2-4 in groups, arranged radially; xylem rays broad. In pith cells subrounded or polygonal, stone cells found occasionally. Some parenchymatous cells containing elliptical cystoliths.

(2) To 2 g of the powder add 20 ml of ethanol, heat under reflux for 1 hour, filter, apply several drops of filtrate to a filter paper, dry in air, examine under ultraviolet light at 365 nm, a purplish-red fluorescence appears. Evaporate the remaining filtrate to dryness, dissolve the residue in 1 ml of glacial acetic acid, add 1 ml of acetic anhydride and 1 drop of sulfuric acid, the colour of the solution turns gradually from yellow to red, purple, blue then to dark green.

(3) To 2 g of the powder add 20 ml of chloroform, heat under reflux for 1 hour, filter, concentrate the filtrate to 2 ml as the test solution. Dissolve indigotine CRS and indirubin CRS in chloroform to produce a mixture containing 1 mg of indigotine and 0.5 mg of indirubin per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, chloroform and acetone (5 : 4 : 1) as the mobile phase. Apply separately 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, examine immediately in daylight. A blue spot and a purplish-red spot in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution respectively.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 10.0 per cent (Appendix Ⅸ K).

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry.

Action To remove *heat* and counteract *toxicity*, reduce *heat* from blood.

Indications Eruptions in febrile diseases, erysipelas, influenza, epidemic meningitis.

Usage and dosage 9-15 g.

Storage Preserve in a dry place, protected from mould and moth.

Rhizoma et Radix Cynanchi Stauntonii (白前, Baiqian)

Willowleaf Swallowwort Rhizome

Willowleaf Swallowwort Rhizome is the dried rhizome and root of *Cynanchum stauntonii* (Decne.) Schltr. ex Lévl. or *Cynanchum glau-cescens* (Decne.) Hand.-Mazz. (Fam. Asclepiadaceae). The drug is collected in autumn, washed clean, and dried in the sun.

Description *Rhizome of Cynanchum stauntonii* Slenderly cylindrical, branched, somewhat curved, 4-15 cm long, 1.5-4 mm in diameter. Externally yellowish-white or yellowish-brown, obviously nodose, internodes 1.5-4.5 cm long, remains of stem at apex; Texture fragile, fracture hollowed. Numerous fine curved roots fascicled at nodes, up to 10 cm long, less than 1 mm in diameter, much-branched and appearing hairy-fibrous, usually coiled each other in a mass. Odour, slight; taste, sweetish.

Rhizome of Cynanchum glaucescens Relatively shorter and smaller, or slightly lump-shaped. Externally greyish-green or greyish-yellow, internodes 1-2 cm long. Texture relatively hard. Roots slightly curved, about 1 mm in diameter, less branched.

Identification Heat under reflux 1 g of the coarse powder with 10 ml of 70% ethanol for 1 hour and filter. Evaporate 1 ml of the filtrate to dryness, dissolve the residue in 1 ml of acetic anhydride, then add 1 drop of sulfuric acid. A reddish-violet colour is porduced for rhizome of *Cynanchi stauntonii*, which turns dull green on standing; a brownish-red colour is produced for rhizome of *Cynanchum glaucescens*, which unchanges on standing.

Processing *Rhizoma Cynanchi Stauntonii* Eliminate foreign matter, wash clean, soften thoroughly, cut into sections, and dry.

Rhizoma Cynanchi Stauntonii (*processed with honey*) Stir-bake the clean Rhizoma Cynanchi Stauntonii as described under the method of stir-baking with honey (Appendix Ⅱ D) until no more sticky to fingers.

Action To eliminate *phlegm* and relieve cough.

Indications Cough with copious expectoration and dyspnea.

Usage and dosage 3-9 g.

Storage Preserve in a ventilated and dry place.

Rhizoma et Radix Ligustici (藁本, Gaoben)

Chinese Lovage

Chinese Lovage is the dried rhizome and root of *Ligusticum sinense* Oliv. or *Ligusticum jeholense* Nakai et Kitag. (Fam. Umbelliferae). The drug is collected in autumn when stem and leaves withered or in the next spring when new growth started, removed from soil and dried.

Description *Rhizome of Ligusticum sinense* Irregulary tubercular cylindrical, somewhat twisted, branched, 3-10 cm long, 1-2 cm in diameter. Externally brown or dark brown, rough, with longitudinal wrinkles; the upper part remaining some sunken and rounded stem bases, the lower part bearing numerous dotted and prominent root scars and residual roots. Texture light, relatively hard, easily broken; fracture yellow or yellowish-white, fibrous. Odour, strongly aromatic; taste, pungent, bitter and slightly numbing.

Rhizome of Ligusticum jeholense Relatively small, rhizomes in irregular masses or columnar, with numerous slender and curved roots.

Identification Macerate 1 g of the powder in 10 ml of ether for 1 hour, then ultrasonicate for 20 minute, filter, concentrate the filtrate to 1 ml as the test solution. Prepare a solution of 1 g of Rhizoma Ligustici reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and acetone (95 : 5) as the mobile phase. Apply separately to the plate 1 μl each of the two solutions. After developing about 10 cm and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 2), not more than 10.0 per cent.

Total ash Not more than 15.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 10.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method as described under the determination of ethanol-soluble extractives (Appendix Ⅹ A), using ethanol as the solvent, not less than 9.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (40 : 60) (adjust to pH 3.5 with phosphoric acid) as the mobile phase. As detector a spectrophotometer set at 320 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of ferulic acid.

Reference solution Dissolve a quantity of ferulic acid CRS, weighed accurately, in methanol to produce a solution containing 0.15 mg per ml.

Test solution Weigh accurately 0.1 g of the coarse powder to a stopper centrifuge tube, accurately add 5 ml of methanol

and weigh. After standing overnight, ultrasonicate for 20 minutes and weigh again, replenish the loss of the solvent with methanol, centrifuge, filter the supernatant with the millipore film (0.45 μm).

Procedures Accurately inject 10 μl of each of the reference solution and the test solution, respectively, into the column, determine and calculate the content.

It contains not less than 0.050 per cent of ferulic acid ($C_{10}H_{10}O_4$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash, soften thoroughly, cut into thick slices, and dry in the sun.

Action To relieve pain by dispelling *wind*, *cold* and *damp*.

Indications Pain at the top of the head in cold; rheumatic arthralgia.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place, protected from moisture and moth.

Rhizoma et Radix Notopterygii (羌活, Qianghuo)

Incised Notopterygium Rhizome or Root

Incised Notopterygium Rhizome or Root is the dried rhizome and root of *Notopterygium incisum* Ting ex H. T. Chang or *Notopterygium forbesii* Boiss. (Fam. Umbelliferae). The drug is collected in spring and winter, removed from rootlet and soil, dried in the sun.

Description *Rhizome of Notopterygium incisum* Cylindrical and somewhat curved, 4-13 cm long, 0.6-2.5 cm in diameter. Apex with stem scars. Externally brown to blackish-brown, the place where the outer bark fallen off appearing yellow. Internodes shortened, forming dense raised annulations like a silkworm (known as Canqiang); or internodes elongated like the nodes of a bamboo (known as Zhujieqiang). Nodes exhibiting numerous dotted or tuberculate root scars and brown broken scales. Texture light and fragile, easily broken. Fracture uneven, with clefts, bark yellowish-brown to dark brown, oily, with numerous brown oil dots, wood yellowish-white with distinct rays, pith yellow to yellowish-brown. Odour, aromatic; taste, slightly bitter and pungent.

Rhizome and root of Notopterygium forbesii Rhizomes subcylindrical, bearing stems and remains of leaf sheaths. Root subconical, longitudinally wrinkled and lenticellate; externally brown, with dense annulations near rhizome, 8-15 cm long, 1-3 cm in diameter (known as Tiaoqiang). Some rhizomes large and stout, irregularly nodiform, apex bearing several stem bases, roots relatively thin (known as Datouqiang). Texture loose and fragile, easily broken. Fracture slightly even, bark pale brown, wood yellowish-white. Odour and teste relatively slight.

Extractives Carry out the hot extraction as described under the determination of ethanol-soluble extractives (Appendix X A), using ethanol as solvent, not less than 15.0 per cent.

Assay Carry out the method for determination of volatile oil (Appendix X D).

It contains not less than 2.8 per cent (m/g) of volatile oil.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry in the sun.

Action To relieve pain and rheumatic condition.

Indications Headache in common cold, rheumatic arthralgia and aching of the back and shoulders.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place, protected from moth.

Rhizoma et Radix Polygoni Cuspidati (虎杖, Huzhang)

Giant Knotweed Rhizome

Giant Knotweed Rhizome is the dried rhizome and root of *Polygonum cuspidatum* Sieb. et Zucc. (Fam. Polygonaceae). The drug is collected in spring or autumn, removed from the rootlet, washed clean, cut into short section or thick slice when fresh, and dried in the sun.

Description Mostly in cylindrical short sections or irregular thick slices, 1-7 cm long, 0.5-2.5 cm in diameter. Externally brown, showing longitudinal wrinkles and rootlet scars. In transversely cut surface, bark relatively thin, wood broad, brownish-yellow with radial rays, bark easily separated from wood. Pith in a rhizome septated or hollowed. Texture hard. Odour, slight; taste, slightly bitter and astringent.

Identification To 0.1 g of the powder add 10 ml of methanol, ultrasonicate for 15 minutes and filter. Evaporate the filtrate to dryness, dissolve the residue in 5 ml of sulfuric acid (2.5 mol/L), heat under reflux for 30 minutes and cool. Extract by shaking with two 5-ml quantities of chloroform, combine the chloroform extracts and evaporate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 0.1 g of Rhizoma Polygoni Cuspidati reference drug in the same manner as the reference drug solution. Dissolve a quantity of emodin CRS and physcion CRS in methanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately to the plate 4 μl of each of the test solution and the reference drug solution, 1 μl of the reference solution. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution, and the colour of the spots turn to red on exposure to ammonia vapour.

Water Carry out the method for determination of water (Appendix IX H, method 1), not more than 12.0 per cent.

Total ash Not more than 5.0 per cent (Appendix IX K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix IX K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix X A, the cold maceration method), using ethanol as the solvent, not less than 9.0 per cent.

Assay Emodin Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use

octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.1% phosphoric acid (80 : 20) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of emodin.

Reference solution Weigh accurately a quantity of emodin CRS, dried over phosphorous pentoxide in vacuum for 24 hours, dissolve in methanol to produce a solution containing 48 μg per ml.

Test solution Weigh accurately 0.1 g of the powder (through No. 3 sieve) to a stopper conical flask, accurately add 25 ml of chloroform and 20 ml of sulfuric acid (2.5 mol/L), and weigh. Heat under reflux on a water bath at 80℃ for 2 hours, cool and weigh again, replenish the loss of solvent with chloroform and mix well. Separate the chloroform layer and evaporate accurately 10 ml to dryness. Dissolve the residue in methanol, transfer to a 10 ml volumetric flask, dilute to volume with methanol, mix well, filter through the millipore film (0.45 μm) and use the successive filtrate as the test solution.

Procedure Accurately inject 5 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.60 per cent of emodin ($C_{15}H_{10}O_5$), calculated with reference to the dried drug.

Polydatin Operate protected from light. Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (23 : 77) as the mobile phase. As detector a spectrophotometer set at 306 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of polydatin.

Reference solution Weigh accurately a quantity of polydatin CRS, dried over phosphorous pentoxide in vaccum for 24 hours, dissolve in dilute ethanol to produce a solution containing 15 μg per ml.

Test solution Weigh accurately 0.1 g of the powder (through No. 3 sieve), add accurately 25 ml of dilute ethanol and weigh, heat under reflux for 30 minutes, cool and weigh again, replenish the loss of solvent with dilute ethanol and mix well. Filter the supernatant through millipore (0.45 μm), use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.15 per cent of polydatin ($C_{20}H_{22}O_8$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry.

Action To dispel *wind* and *damp*, eliminate blood stasis and alleviate pain, relieve cough, and resolve phlegm.

Indications Arthralgia; jaundice caused by *damp-heat*; amenorrhea; mass formation in the abdomen; cough with profuse expectoration; scalds and burns; traumatic injuries; carbuncles and sores.

Usage and dosage 9-15 g; for external use, appropriate quantity is made into decoction or ointment and applied topically.

Precaution Used with caution in pregnancy.

Storage Preserve in a dry place, protected from mould and moth.

Rhizoma Fagopyri Dibotryis (金荞麦, Jinqiaomai)

Golden Buckwheat Rhizome

Golden Buckwheat Rhizome is the dried rhizome of *Fagopyrum dibotrys* (D. Don) Hara (Fam. Polygonaceae). The drug is collected in winter, removed from stem and rootlet, washed clean, and dried.

Description In irregular masses or cylindrical, mostly with tubercular branches, sometimes with remains of stems at apex, 3-15 cm long, 1-4 cm in diameter. Externally brown, with transverse annulated-nodes and longitudinal wrinkles, scattered with numerous dotted lenticels, and showing dent and rounded root scars and remains of rootlets. Texture hard and uneasily broken, facture pale yellowish-white or pale brownish-red, radiately striated. Pith in the centre deeper in colour. Odour, slight; taste, slightly astringent.

Indetification (1) Powder: Brownish. Starch granules fairly abundant, simple granules subspheroidal, ellipsoid or ovoid, 5-48 μm in diameter, hilum pointed, stellate, slit-shaped or V-shaped, situated in the centre or close to an end, the larger granules showing striations; compound granules of 2-4 components; semi-compound granules visible. Xylem fibres in bundles, 10-38 μm in diameter, with simple oblique or cross pits. Clusters of calcium oxalate 10-62 μm in diameter. Parenchymatous cells in xylem subsquare or elliptical, 28-37 μm in diameter, up to 100 μm long, walls about 5 μm in thickness, lumina sparsely pitted. Bordered pitted vessels and reticulated vessels, 21-83 μm in diameter.
(2) To 2.5 g of the powder add 20 ml of methanol, stand for 1 hour, then heat under reflux for 1 hour, cool and filter, evaporate the filtrate to about 5 ml as the test solution. Prepare a solution of 1 g of Rhizoma Fagopyri Dibotryis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate, methanol and formic acid (1 : 2 : 0.2 : 0.1) as the mobile phase. Apply separately to the plate 5-10 μl of the test solution and 5 μl of the reference drug solution. After developing and removal of the plate, dry in air. Spray with a 25% solution of phosphomolybdic acid in ethanol, heat at 110℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol as the solvent, not less than 14.0 per cent.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry.

Action To remove *toxic-heat*, promote the discharge of pus and remove blood stasis.

Indications Lung abscess, measles, pneumonia, tonsilar peripheral abscess.

Usage and dosage 15-45 g, mixed with water or yellow wine, and simmered in an airtight container with steam for oral use.

Storage Preserve in a dry place, protected from mould and moth.

Rhizoma Gastrodiae (天麻, Tianma)

Tall Gastrodia Tuber

Tall Gastrodia Tuber is the dried tuber of *Gastrodia elata* Bl. (Fam. Orchidaceae). The drug is collected from winter to next spring, washed clean immediately, steamed thoroughly, spread out and dried at a lower temperature.

Description Ellipsoid or slat-shaped, slightly compressed, shrunken and somewhat curved, 3-15 cm long, 1.5-6 cm wide, 0.5-2 cm thick. Externally yellowish-white to pale yellowish-brown, with longitudinal wrinkles and many transverse annulations arranged by latent buds, sometimes brown funiculi visible. Apex with reddish-brown to deep brown parrot-beak-like buds or remains of stem; the lower end with a rounded scar. Texture hard and uneasily broken, fracture fairly even, yellowish-white to brownish, horny. Odour, slight; taste, sweetish.

Identification (1) Transverse section: Remains of epidermis present, hypodermis of 2-3 rows of suberized and tangentially elongated cells. Cortex consisting of over 10 rows of polygonal cells, some containing raphides of calcium oxalate. In older tubers 2-3 rows of elliptical sclerenchymatous cells present in cortex adjacent to hypodermis, with lignified and obviously pitted walls. Stele occupied the most part of rhizome, scattered small amphicribral vascular bundles, parenchymatous cells containing raphides of calcium oxalate. Powder: Yellowish-white to yellowish brown. Sclerenchymatous cells elliptical or subpolygonal, 70-180 μm in diameter, walls 3-8 μm in thickness, lignified, distinctly pitted. Needle crystals of calcium oxalate in bundles or scattered, 25-75 (93) μm long. When mounted in Smith's starch reagent, parenchymatous cells containing gelatinized polysaccharides colourless, and some cells containing long-ovoid, long-ellipsoid or subrounded granules, showing a brown or brownish-purple colour on adding iodine solution. Spiral, reticulated and annual vessels 8-30 μm in diameter.

(2) To 0.5 g of the powder, add 5 ml of 70% methanol, ultrasonicate for 30 minutes, filter and use the filtrate as the test solution. Prepare a solution of 0.5 g of Rhizoma Gastrodiae reference drug in the same manner as the reference drug solution. Dissolve gastrodin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of ethyl acetate, methanol and water (9 : 1 : 0.2) as the mobile phase. Apply separately to the plate 10 μl of the test solution and 5 μl of the reference drug solution and reference solution. After developing and removal of the plate, dry in air, spray with a 10% solution of phosphomolybdic acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution and the reference solution.

Water Carry out the method for determination of water (Appendix IX H, method 1), not more than 15.0 per cent.

Total ash Not more than 4.5 per cent (Appendix IX K).

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.05% solution of phosphoric acid (3 : 97) as the mobile phase. As detector a spectrophotometer set at 220 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of gastrodin.

Reference solution Weigh accurately a quantity of gastrodin CRS, previously dried at 80℃ for 1 hour under reduced pressure, dissolve in mobile phase to produce a solution containing 50 μg per ml.

Test solution Weigh accurately 0.8 g of the powder (through No. 4 sieve), previously dried at 80℃ under reduced pressure, to a stopper conical flask, add accurately 50 ml of dilute ethanol and weigh. Heat under reflux on a water bath for 3 hours, cool and weigh again, replenish the loss of solvent with dilute ethanol, mix well and filter. Evaporate accurately 10 ml of the successive filtrate nearly to dryness. Dissolve the residue in a mixture of acetonitrile and water (3 : 97), transfer to a 10 ml volumetric flask, dilute with the same solution to volume and mix well.

Procedure Inject accurately 10 μl of the reference solution and 5-10 μl of the test solution, respectively, into the column, and calculate the content.

It contains not less than 0.20 per cent of gastrodin ($C_{13}H_{18}O_7$), calculated with reference to the dried drug.

Processing Wash clean, soften thoroughly or steam to soften, cut into thin slices, and dry.

Action To subdue the *liver-wind* and arrest convulsion.

Indications Headache, dizziness and numbness of the limbs; infantile convulsion; epilepsy; tetanus.

Usage and dosage 3-9 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Rhizoma Homalomenae (千年健, Qiannianjian)

Obscured Homalomena Rhizome

Obscured Homalomena Rhizome is the dried rhizome of *Homalomena occulta* (Lour.) Schott (Fam. Araceae). The drug is collected in spring and autumn, washed clean, removed from the external bark, and dried in the sun.

Description Cylindrical, somewhat curved, sometimes slightly compressed, 15-40 cm long, 0.8-1.5 cm in diameter. Externally yellowish-brown to reddish-brown, rough, mostly twisted longitudinal fissures, rounded root scars and yellow needle-shaped fibre bundles visible. Texture hard and fragile, fracture reddish-brown, with numerous and distinct yellow needle-shaped fibre bundles; the other fracture with numerous pin-hole-like pores and a few yellow needle-shaped fibre bundles, showing lustrous dark brown oil dots. Odour, aromatic; taste, pungent and slight bitter.

Identification (1) Transverse section: Some cork cells remained, brown. Ground tissue scattered with large secretory cavities formed by several layers of cork cells; most secretory cells present in the outer side, containing yellow to brown secretion. Mucilage cells relatively large, containing raphides of

calcium oxalate; clusters of calcium oxalate scattered; vascular bundles collateral and amphivasal, scattered throughout. Collateral bundles usually accompanied by fibre bundles outside, isolated fibre bundle rarely found, fibre walls thickened and lignified.
(2) To 1 g of the powder add 5 ml of ether, allow to stand for 30 minutes with frequently shaking, and filter. Transfer 1 ml of the filtrate to an evaporating dish, and expel the ether. Add 1-2 drops of 1% solution of vanillin in sulfuric acid to the residue; a purplish-red or purple colour is produced.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into slices, and dry in the sun.

Action To relieve rheumatic condition and strengthen the tendons and bones.

Indications Rheumatoid arthritis with pain and cold sensation in the loins and knees, muscular contracture and numbness of the lower extremities.

Usage and dosage 4.5-9 g.

Storage Preserve in a cool and dry place.

Rhizoma Imperatae (白茅根, Baimaogen)

Lalang Grass Rhizome

Lalang Grass Rhizome is the dried rhizome of *Imperata cylindrica* Beauv. var. *major* (Nees) C. E. Hubb. (Fam. Gramineae). The drug is collected in spring or autumn, washed clean, dried in the sun, removed from fibrous root and membranous leaf sheath, and tied up in small bundle.

Description Long cylindrical, 30-60 cm long, 2-4 mm in diameter. Externally yellowish-white or yellowish, slightly lustrous, longitudinally wrinkled, nodes distinct and slightly raised, internodes varying in length, usually 1.5-3 cm long. Texture light, somewhat fragile, fracture white in bark, mostly with cracks arranged radially, stele yellowish, easily stripped from cortex. Odour, slight; taste, slightly sweetish.

Identification (1) Heat under reflux 5 g of the coarse powder with 30 ml of benzene for 1 hour, filter. Evaporate 5 ml of the filtrate to dryness, dissolve the residue in 1 ml of acetic anhydride, then add 1-2 drops of sulfuric acid; a red colour is produced, which gradually turns to violet-red, bluish-violet and dirty green colour at last.
(2) Boil 1 g of the coarse powder with 10 ml of water for 5-10 minutes, filter and concentrate the filtrate to 1 ml, add 1 ml of alkaline cupric tartarate TS, heat on a water bath; a brownish-red precipitate is produced.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Processing *Rhizoma Imperatae* Wash clean, soften briefly, cut into sections, dry, and sift.

Rhizoma Imperatae (carbonized) Stir-bake the sections of Rhizoma Imperatae as described under the method for carbonizing by stir-baking (Appendix Ⅱ D) until it becomes charred brown.

Action To arrest bleeding by reducing *heat* in blood, remove *heat*, and cause urination.

Indications Haematemesis, epistaxis and hematuria due to *heat* in the blood; febrile diseases with thirst; jaundice; urinary infection with difficult painful urination; edema in acute nephritis.

Usage and dosage 9-30 g; 30-60 g of the fresh rhizome.

Storage Preserve in a dry place.

Rhizoma Iridis Tectori (川射干, Chuanshegan)

Roof Iris Rhizome

Roof Iris Rhizome is the dried rhizome of *Iris tectorum* Maxim. (Fam. Iridaceae). The drug can be collected all the year round, removed from fibrous root and soil, and dried.

Description Irregular slug-like or conical, slightly flat, branched, 3-10 cm long, 1-2.5 cm in diameter. Externally greyish-yellowish brown or brown, with annular rings and longitudinal furrows, often bearing remains of thin roots and depressed or dotted protuberant root scars. Texture lax and fragile, easily broken, fracture yellowish-white or yellowish-brown. Odour slight, taste sweet and bitter.

Identification (1) Powder: Pale yellowish. Prisms of calcium oxalate relatively abundant, mostly broken, the intact ones 15-82 μm long (maximum 300 μm), 16-52 μm in diameter. Parenchymatous cells subrounded or ellipsoidal, walls slightly thickened or beaded, with simple pits. Cork cells polygonal in surface view, walls thin and slightly sinuous, some containing brown contents.
(2) To 1 g of the powder add 10 ml of methanol, ultrasonicate for 30 minutes, filter, concentrate the filtrate to about 1 ml as the test solution. Prepare a solution of 1 g of Rhizoma Iridis Tectori reference drug in the same manner as the reference drug solution. Dissolve belamcandin CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide film G as the coating substance and a mixture of chloroform, butanone and methanol (3∶1∶1) as the mobile phase. Apply separately to the plate 1 μl of each of the above three solutions. After developing and removal of the plate, dry in air, spray with aluminum chloride TS, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H, Method 1), not more than 15.0 per cent.

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method as described under the determination of ethanol-soluble extractives (Appendix Ⅹ A), using ethanol as the solvent, not less than 24.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.05 mol/L potassium dihydrogen phosphate solution (adjust the value of pH to 3.0 with phosphoric acid) (32∶68) as the mobile phase. As detector a spectrophotometer set at 265 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of belamcandin.

Reference solution Dissolve a quantity of belamcandin CRS,

weighed accurately, in 70% ethanol to produce a solution containing 0.02 mg per ml as reference solution.

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve) to a stoppered conical flask, accurately add 25 ml of 70% ethanol, tightly stopper and weigh. Ultrasonicate (power, 250 W; frequency, 50 kHz) for 1 hour, cool, and weigh again, replenish the loss of the solvent with 70% ethanol and mix well. Filter, measure accurately 1 ml of successive filtrate to a 50 ml volumetric flask, dilute to volume with 70% ethanol, and mix well.

Procedures Inject accurately 10 μl of each of the reference solution and the test solution respectively, into the column, determine and calculate the content.
It contains not less than 3.6 per cent of belamcandin ($C_{22}H_{24}O_{11}$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thin slices, and dry.

Action To clear *toxic-heat*, resolve *phlegm* and ease the throat.

Indications Swollen and painful throat, cough and shortness of breath with phlegm.

Usage and dosage 6-10 g.

Storage Preserve in a dry place.

Rhizoma Kaempferiae (山柰, Shannai)

Galanga Resurrectionlily Rhizome

Galanga Resurrectionlily Rhizome is the dried rhizome of *Kaempferia galanga* L. (Fam. Zingiberaceae). The drug is collected in winter, washed clean, removed from rootlet, sliced and dried in the sun.

Description Mostly in rounded or subrounded transverse cut slices, 1-2 cm in diameter, 3-5 mm thick. Externally brownish or yellowish-brown, shrunken, some with root scars or remains of rootlets; transversely cut surface whitish, starchy, usually inflated. Texture fragile, easily broken. Odour, aromatic and characteristic; taste, pungent.

Identification (1) Powder: Yellowish-white. Starch granules abundant, mainly simple, spheroid, ellipsoidal or subtriangular, mostly flattened, 5-30 μm in diameter, hilum and striations indistinct. Oil cells subrounded or elliptical, 40-130 μm in diameter, rather thin-walled, the lumen containing yellowish-green or purplish-red oil drops. Spiral vessels 18-37 μm in diameter. Coloured masses irregular, yellow or yellowish-brown.
(2) To 0.25 g of the powder add 5 ml of methanol, ultrasonicate for 10 minutes, filter and use the filtrate as the test solution. Dissolve a quantity of ethyl *p*-methoxycinnamate CRS in methanol to produce a solution of 5 mg per ml as the reference soution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel GF_{254} as the coating substance and *n*-hexane and ethyl acetate (18 : 1) as the mobile phase. Apply separately to the plate 2 μl of each of the two solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Assay Carry out the method for determination of volatile oil (Appendix X D).
It contains not less than 4.5 per cent (ml/g) of volatile oil.

Action To stimulate the functional activity of the stomach, promote digestion and relieve pain.

Indications Dyspepsia accompanied with epigastric distension, pain and cold feeling.

Usage and dosage 6-9 g.

Storage Preserve in a cool and dry place.

Rhizoma Menispermi (北豆根, Beidougen)

Asiatic Moonseed Rhizome

Asiatic Moonseed Rhizome is the dried rhizome of *Menispermum dauricum* DC. (Fam. Menispermaceae). The drug is collected in spring or autumn, removed from rootlet and soil, and dried.

Description Slenderly cylindrical, tortuous and branched, up to 50 cm long, 3-8 mm in diameter. Externally yellowish-brown to dark brown, mostly bearing numerous curved rootlets, and exhibiting prominent rootlet scars and longitudinal wrinkles, the outer layers easily exfoliated. Texture tenacious, uneasily broken, fracture uneven and fibrous, wood yellowish, arranged radially, medullated. Odour, slight; taste bitter.

Identification (1) Transverse section: Epidermal cells 1-layered, with a brownish-yellow cuticle at the outside, cork of several layers of cells. Cortex relatively broad, scattered with stone cells in the old rhizome. Pericyclic fibres arranged to be crescent. Vascular bundles collateral, ringed. Interfascicular cambium indistinct. Xylem consisting of vessels, tracheids, wood fibres and parenchymatous cells, all of them lignified. Medullated. Parenchymatous cells containing starch granules and minute crystals of calcium oxalate.
Powder: Pale brownish-yellow. Stone cells single and scattered throughout, pale yellowish, branched or irregular, 43-147 (200) μm in diameter, with a large lumen. Pericyclic fibres mostly bundled, pale yellowish, 18-34 μm in diameter, septate. Wood fibres in bundles, 10-26 μm in diameter, the walls obliquely pitted or cross-pitted. Bordered pitted vessels. Crystals of calcium oxalate minute. Starch granules about 1 μm in diameter.
(2) To 0.5 g of the powder, add 15 ml of ethyl acetate and 0.5 ml of strong ammonia TS, heat under reflux for 30 minutes and filter. Evaporate the filtrate to dryness and dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 0.5 g of Rhizoma Menispermi reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, methanol and strong ammonia TS (9 : 1 : 1 drop) as the mobile phase. Apply separately to the plate 2 μl of the above two solutions. After developing and removal of the plate, dry in air. Spray with potassium iodobismuthate TS. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Foreign matter Not more than 5 per cent (Appendix IX A).

Water Carry out the method for determination of water (Appendix IX H, method 1), not more than 12.0 per cent.

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices, and dry.

Action To remove *toxic-heat* and relieve rheumatic pain.

Indications Sore throat, colitis, dysentery, rheumatic arthralgia.

Usage and dosage 3-9 g.

Storage Preserve in a dry place.

Preparation Asiatic Moonseed Tablets

Rhizoma Panacis Japonici (竹节参, Zhujieshen)

Japanese Ginseng

Japanese Ginseng is the dried rhizome of *Panax japonicus* C. A. Mey. (Fam. Araliaceae). The drug is collected in autumn, removed from the main root, peeled, and dried.

Description Slightly cylindrical, somewhat curved, some with fleshy laternal roots, 5-22 cm long, 0.8-2.5 cm in diameter. Externally yellow or yellowish-brown, rough, with dense transverse wrinkles and root scars. Nodes conspicuous, internodes 0.8-2 cm long, each showing a dented stem scar. Texture hard, fracture yellowish-white to pale yellowish-brown, showing yellow dotted vascular bundles arranged in a ring. Odour, slight; taste, bitterish and then slightly sweet.

Identification (1) Transverse section: Cork consisting of 2-10 layers of cells. Phelloderm slightly broad, scattered with secretory canals. Vascular bundles collateral, circularly arranged. Cambium in a ring. In phloem secretory canals found occasionally. Xylem bundles somewhat in 2-4 strands arranged radially or in a row, woody fibres usually in 1-4 bundles, some accompanied by larger, lignified sclerenchymatous cells. Pith visible. Parenchymatous cells containing abundant clusters of calcium oxalate, 17-70 μm in diameter, and starch granules.
Powder: Yellowish-white to yellowish-brown. Woody fibres in bundles, about 25 μm in diameter, walls slightly thickened, pits oblique cleft-like, some crisscrossed to be V-shaped. Clusters of calcium oxalate numerous, 15-70 μm in diameter. Vessels scalariform, reticulated or bordered pitted, 20-70 μm in diameter. Resin-canal pieces occasionally found, containing yellow masses. Cork cells polygonal, rectangular or irregular, walls thickened. Starch granules abundant, mainly simple, subrounded, about 10 μm in diameter, or gelatinized.
(2) Mix well 1 g of the powder with 5-10 drops of water, add 10 ml of *n*-butanol saturated with water, stopper closely, shake for about 10 minutes, stand overnight, filter, evaporate the filtrate to dryness, heat the residue under reflux with 10 ml of a mixture of surfuric acid and 30% ethanol (1→20) for 2 hours, extract with chloroform by shaking, wash the chloroform solution with 10 ml of water and discard the washings. Evaporate the chloroform solution to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve oleanolic acid CRS, panaxadiol CRS and panaxatriol CRS in methanol to produce three solutions, containing 2 mg of oleanolic acid per ml and 0.5 mg of panaxadiol and panaxatriol per ml respectively, as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and ethyl acetate (1∶1) as the mobile phase. Apply separately to the plate 5 μl of the test solution and 1 μl of each of the reference solutions. After developing and removal of the plate, dry in air, spray with 10% solution of surfuric acid in ethanol, heat at 105℃ until the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Processing Eliminate foreign matter, pound to pieces before use.

Action To strengthen the constitution, eliminate blood stasis and relieve pain, arrest bleeding, and promote expectoration.

Indications General weakness after disease; consumptive cough with hemoptysis, cough with profuse sputum; traumatic injuries.

Usage and dosage 6-9 g.

Storage Preserve in a ventilated place, protected from moth.

Rhizoma Panacis Majoris (珠子参, Zhuzishen)

Largeleaf Japanese Ginseng Rhizome

Largeleaf Japanese Ginseng Rhizome is the dried rhizome of *Panax japonicus* C. A. Mey. var. *major* (Burk.) C. Y. Wu et K. M. Feng or *Panax japonicus* C. A. Mey. var. *bipinnatifidus* (Seem.) C. Y. Wu et K. M. Feng (Fam. Araliaceae). The drug is collected in autumn, removed from rough bark and rootlet, and dried, or dried after steamed (boiled) thoroughly.

Description Slightly spheroidal, conical or irregularly rhombic, occasionally beaded, 0.5-2.8 cm in diameter. Externally brownish-yellow or yellowish-brown, with distinct warty protrudings and wrinkles, occasionally with rounded sunken stem scars, sometimes remaining fine internodes laterally or bilaterally. Texture hard, fracture uneven, pale yellowish-white, starchy. Odour, slight; taste, bitter and slightly sweet with irritating sensation.
Steamed (or boiled) rhizomes: Fracture yellowish-white or yellowish-brown, slightly horny. Taste, slightly sweet and bitter, not irritating on chewing.

Identification (1) Transverse section: Cork consisting of several layers of cells. Cortex slightly narrow with rounded or oblong secretory ducts, 32-500 μm in diameter, surrounded by 5-18 secretory cells. Secretory ducts in phloem relatively small. Cambium ring interrupted. Xylem vessels subpolygonal, up to 76 μm in diameter, arranged radially or in V-shape, rays wide. Pith in centre. Parenchymatous cells containing starch granules and some containing clusters of calcium oxalate.
(2) Macerate 1 g of the powder in 10 ml of water overnight, then warm for 10 minutes and filter immediately. Transfer 1 ml of the filtrate to two test tubes with stopper respectively. Add 2 ml of sodium hydroxide TS to one tube and 2 ml of hydrochloric acid solution (1→20) to another, shake vigorously for 1 minute. The height of the foams produced in the acid tube is two times as high as that in the alkali tube.
(3) Shake 0.5 g of the powder with 5 ml of ethanol for 30 minutes and filter. Evaporate the filtrate to dryness, add

dropwise a saturate solution of antimony chloride in chloroform, evaporate to dryness again; a purple colour is produced.

(4) To 1 g of the powder add 5-10 drops of water, stir well. Add 10 ml of *n*-butanol solution saturated with water, stopper tightly, shake for about 10 minutes and allow to stand overnight, filter and evaporate the filtrate to dryness. To the residue, add 10 ml of a mixture of sulfuric acid and 30% ethanol (1→20), heat under reflux for 2 hours and extract with 20 ml of chloroform. Wash the chloroform extract with 10 ml of water (centrifuge if necessary), discard the washing, evaporate the chloroform extract to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve oleanolic acid CRS and panaxadiol CRS in methanol to produce a mixture containing 1.5 mg of oleanolic acid CRS and 0.5 mg of panaxadiol CRS per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and benzene and ethyl acetate (1 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air, spary with sulfuric acid solution (1→10), heat at 105℃ to the spots clear, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Processing Eliminate foreign matter, pound to pieces before use.

Action To nourish *yin* and replenish the lung, promote the flow of *qi* in *collaterals*, and to arrest bleeding.

Indications Deficiency of both *qi* and *yin* characterized by fever and thirst, cough in consumptive diseases; traumatic injuries, joint pain; hemoptysis, hematemesis, traumatic bleeding.

Usage and dosage 3-9 g; for external use, appropriate quantity is ground into powder and applied topically.

Storage Preserve in a dry place, protected from moth.

Rhizoma Paridis (重楼, Chonglou)

Paris Root

Paris Root is the dried rhizome of *Paris polyphylla* Smith var. *yunnanensis* (Franch.) Hand.-Mazz. or *Paris polyphylla* Smith var. *chinensis* (Franch.) Hara (Fam. Liliaceae). The drug is collected in autumn, removed from fibrous root, washed clean, and dried in the sun.

Description Nodular and flattened cylindrical, somewhat curved, 5-12 cm long, 1.0-4.5 cm in diameter. Externally yellowish-brown or greyish-brown and white where the outer bark fallen off; having densely lamellar and prominent annular striations. On one side showing distinct nodes with elliptic sunken scars of stems; on the other side showing sparsely rare fibrous roots or warty scars of fibrous roots. Scale leaves and remains of stems occurring at the apex. Texture hard, fracture smooth, white to pale brown, starchy or horny. Odour, slight; taste, slightly bitter and numb.

Identification (1) Powder: White. Starch granules numerous, subrounded, long elliptic or reniform, 3-18 μm in diameter. Needle crystals of calcium oxalate bundled or scattered, 80-250 μm long. Scalariform and reticulated vessels 10-25 μm in diameter.

(2) To 0.5 g of the powder add 10 ml of ethanol, heat under reflux for 30 minutes, filter and use the filtrate as the test solution. Prepare a solution of 0.5 g of Rhizoma Paridis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (15 : 5 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions and 10 μl of the reference solution obtained under Assay. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots clear. Examine in daylight and under ultraviolet light at 365 nm. The spots and the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots and the fluorescent spots obtained with the reference drug solution and the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 12.0 per cent.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (42 : 58) as the mobile phase. As detector a spectrophotometer set at 210 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of chonglou saponin Ⅰ.

Reference solution Weigh accurately a quantity of chonglou saponin Ⅰ CRS and chonglou saponin Ⅱ CRS, dissolve in methanol to produce a mixture containing 0.4 mg of each per ml.

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve) to a stopper conical flask, add accurately 25 ml of ethanol and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, cool and weigh again, replenish the loss of solvent with ethanol and mix well. Filter the supernatant with millipore film (0.45 μm), use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 0.80 per cent of the total amount of chonglou saponin Ⅰ ($C_{44}H_{70}O_{16}$), and chonglou saponin Ⅱ ($C_{51}H_{82}O_{20}$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thin slices, and dry in the sun.

Action To remove *heat*, counteract *toxicity*, cause the subsidence of swelling and alleviate pain, and relieve convulsion.

Indications Boils, carbuncles, sore throat, venomous snake bite, traumatic pain; convulsion.

Usage and dosage 3-9 g; for external use, appropriate quantity is ground into powder and applied after mixed with liquid.

Storage Preserve in a cool and dry place, protected from moth.

Rhizoma Phragmitis (芦根, Lugen)

Reed Rhizome

Reed Rhizome is the fresh or dried rhizome of *Phragmites communis* Trin. (Fam. Gramineae). The drug is collected all the year round, removed from bud, fibrous root and membranaceous leaf. It is used in fresh or dried in the sun.

Description *Rhizoma Phragmitis (fresh)* Long-cylindrical, some slightly compressed, varying in length, 1-2 cm in diameter. Externally yellowish-white, lustrous, the peel loose and exfoliated. Nodes annular, bearing remains of roots and bud scars. Texture light and tough, flexible, fracture yellowish-white, hollowed, walls 1-2 mm thick, showing small pores arranged in a ring. Odour, slight; taste, sweetish.

Rhizoma Phragmitis (dried) Compressed-cylindrical. Nodes relatively hard, internodes longitudinally wrinkled.

Identification To 1 g of the powder, add 10 ml of chloroform, ultrasonicate for 20 minutes and filter, use the filtrate as the test solution. Prepare a solution of 1 g of Rhizoma Phragmitis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), formic acetate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Processing Eliminate foreign matter, wash clean, cut into sections, or dry in the sun after cutting.

Action To remove *heat*, promote the production of body fluid, relieve emesis, and alleviate dysuria.

Indications Dire thirst in febrile diseases; vomiting or retching due to *heat* in the stomach; cough due to *heat* in the lung; lung abscess; urinary infection with difficult painful urination.

Usage and dosage 15-30 g; or 30-60 g of the fresh rhizome to be decocted or pounded for juice.

Storage Preserve in a dry place for the dried drug, or in wet sand for the fresh ones.

Rhizoma Picrorhizae (胡黄连, Huhuanglian)

Figwortflower Picrorhiza Rhizome

Figwortflower Picrorhiza Rhizome is the dried rhizome of *Picrorhiza scrophulariiflora* Pennell (Fam. Scrophulariaceae). The drug is collected in autumn, removed from fibrous root and soil, and dried in the sun.

Description Cylindrical, slightly tortuous, occasionally branched, 3-12 cm long, 0.3-1 cm in diameter. Externally greyish-brown to dark brown, rough, with dense ringed node, exhibiting slightly raised scars of buds and roots, closely covered with dark brown scaly remains of petioles at the upper part. Texture light, hard and fragile, easily broken, fracuture somewhat even, pale brown to dark brown, wood exhibiting 4-10 whitish dotted vascular bundles arranged in a ring. Odour, slight; taste, extremely bitter.

Identification (1) Sublime 0.5 g of the powder at 60-80℃ for 4 hours, examine under a microscope, needle crystals, needle-clusters, plates or cylindrical crystals and yellow spheroids are observed.

(2) Heat 5 g of the powder with 50 ml of water on a water bath at 60℃ for 20 minutes and filter. To 1 ml of the filtrate, add 2 drops of ferric chloride solution in ethanol, a dark green precipitate is produced. To another 1 ml of the filtrate, add 2 drops of 5% solution of α-naphthol in ethanol, mix well, a yellowish-white turbidness is produced. Along the tube wall add 0.5 ml of sulfuric acid slowly, a violet ring is shown at the junction of the two liquids, the colour darkens on shaking and a deep violet precipitate is produced on diluting with water.

(3) Dissolve the sublimate obtained under Identification test (1) with several drops of chloroform as the test solution. Dissolve cinnamic acid CRS and vanillic acid CRS in chloroform to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of *n*-hexane, ether and glacial acetic acid (5 : 5 : 0.1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Water Carry out the determination of water (Appendix Ⅸ H, method 1). Not more than 13.0 per cent.

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using ethanol as the solvent, not less than 30.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (35 : 65 : 0.1) as the mobile phase. As detector a spectrophotometer set at 275 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of picroside Ⅱ.

Reference solution Weigh accurately 10 mg of picroside Ⅰ CRS and picroside Ⅱ CRS, respectively, dissolve in methanol in a 50 ml volumetric flask, dilute with methanol to volume. Measure accurately 1 ml in a 5 ml volumetric flask, dilute with methanol to volume to produce a mixture containing 40 μg of each per ml, and mix well.

Test solution Weigh accurately 0.1 g of the powder (through No. 3 sieve) to a stopper conical flask, accurately add 50 ml of methanol, stopper tightly and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, cool and weigh again, replenish the loss of the weight with methanol, mix well and filter. Measure accurately 1 ml of the successive filtrate in a 5 ml volumetric flask, dilute with

methanol to volume, and mix well.

Procedure Accurately inject 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 9.0 per cent of the total amount of picroside Ⅰ ($C_{24}H_{28}O_{11}$) and picroside Ⅱ ($C_{23}H_{28}O_{13}$), calculated with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughly and cut into thin slices, or break to pieces before use.
In irregular rounded thin slices, cut surface greyish-black or brownish-black, with white dotted vascular bundles, blackish-brown at the edge. Texture fragile.

Action To remove *damp-heat*, and relieve consumptive fever.

Indications Dysentery or jaundice caused by *damp-heat*; hemorrhoids; consumptive fever and fever in infantile malnutrition due to digestive disturbance.

Usage and dosage 1.5-9 g.

Storage Preserve in a dry place.

Rhizoma Pinelliae (半夏, Banxia)

Pinellia Tuber

Pinellia Tuber is the dried tuber of *Pinellia ternata* (Thunb.) Breit. (Fam. Araceae). The drug is collected in summer and autumn, washed clean, removed from the outer bark and fibrous root, and dried in the sun.

Description Subspheroidal, some slightly oblique, 1-1.5 cm in diameter. Externally white or yellowish, apex with a dented stem scar, densely surrounded by pocked and dotted root scars, base obtuse and rounded, relatively smooth. Texture hard, fracture white and starchy. Odour, slight; taste, pungent, with numbing and irritating sensation.

Identification (1) Powder: Whitish. Starch granules fairly abundant, simple granules subrounded, semi-circular or rounded-polygonal, 2-20 μm in diameter, hilum slit-shaped, Y-shaped or stellate; compound granules of 2-6 components. Raphides of calcium oxalate embedded in elliptical mucilage cells or scattered throughout, needle crystals 20-144 μm long. Spiral vessels 10-24 μm in diameter.
(2) To 1 g of the powder add 10 ml of methanol, heat under reflux for 30 minutes, filter, evaporate the filtrate to about 0.5 ml as the test solution. Dissolve arginine CRS, alanine CRS, valine CRS and leucine CRS in 70% methanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of *n*-butanol, glacial acetic acid and water (8 : 3 : 1) as the mobile phase. Apply separately 5 μl of the test solution and 1 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with ninhydrin TS, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Processing *Rhizoma Pinelliae (unprocessed)* Eliminate foreign matter. Break to pieces before use.

Rhizoma Pinelliae (processed with alum) Grade clean Rhizoma Pinelliae according to size, soak in 8% Alumen solution until the centre of the cut surface is devoid of a dry core and the drug has a slight numbing taste. Take out, wash well, cut into thick slices and dry, using 20 kg of Alumen per 100 kg of Rhizoma Pinelliae.
Elliptical, subrounded, or irregular pieces. Cut surface grey to greyish-white, vascular bundle traces greyish-white, pointed or short line-shaped, sometimes showing purplish-red dapples under the remaining cork. Texture fragile, easily broken, fracture slightly horny. Odour, slight; taste, slightly astringent and numb.

Rhizoma Pinelliae (processed with ginger) Grade clean Rhizoma Pinelliae according to size, soak in water until the centre of the cut surface is devoid of a dry core. Add Alumen and the decoction of the slices of Rhizoma Zingiberis Recens to Rhizoma Pinelliae, boil thoroughly, take out, dry in air to half dryness, then cut into thin slices and dry. Using 25 kg of Rhizoma Zingiberis Recens and 12.5 kg of Alumen per 100 kg of Rhizoma Pinelliae.
Sliced, irregular granular or subspheroidal. Externally brown to dark brown. Texture hard and fragile, fracture pale yellowish-brown, frequently horny and lustrous. Odour, slight aromatic; taste weak, slight with numbing and viscous on chewing.

Action To remove *damp* and *phlegm*, relieve nausea and vomiting, and eliminate stuffiness in the chest and the epigastrium.

Indications Cough and asthma with much phlegm; dizziness and palpitation due to retention of phlegm and fluid; vertigo caused by *wind-phlegm*; headache with cold extremities due to attack of phlegm; stuffiness in the chest and the epigastrium; globus hystericus. *Rhizoma Pinelliae (processed with ginger)* is often used for relieving nausea and vomiting, while *Rhizoma Pinelliae (unprocessed)* is used externally for boils, sores and lymphadenitis.

Usage and dosage 3-9 g; for external use, appropriate quantity is rubbed into juice or ground into powder and applied topically after mixing with liquor.

Precaution Incompatible with Radix Aconiti and allied drugs.

Storage Preserve in a ventilated and dry place, protected from moth.

Rhizoma Pinelliae Praeparatum (法半夏, Fabanxia)

Prepared Pinellia Tuber

Prepared Pinellia Tuber is prepared from the Rhizoma Pinelliae.

Procedure Grade Rhizoma Pinelliae according to size, soak in water until the centre of the drug is devoid of a dry core, and take out. Decoct Liquorice with a quantity of water twice, combine the decoctions and pour into the lime solution prepared with suitable amount water, stir evenly, add the soaked Rhizoma Pinelliae, soak, and stir 1-2 times every day, maintain the solution over pH 12 until the cut surface becomes yellow evenly, and tastes a slight numbing sensation, take out, wash clean and dry in the shade or by baking.
To each 100 kg of Rhizoma Pinelliae add 15 kg of Liquorice and 10 kg of quick lime.

Description Subspherical or broken into irregular granules. Externally yellowish-white, yellow or brownish yellow. Texture fragile, loose or hard, granules hard and fragile slightly, fracture yellow or greyish yellow. Odour slight;

taste, slight sweetish and slight numbing.

Identification (1) Powder: Pale yellow to yellow. Comply with the examination as described under the Identification (1) of Rhizoma Pineliae, showing the same results.
(2) To 2 g of the powder add 2 ml of hydrochloric acid and 20 ml of chloroform, heat under reflux for 1 hour, cool, filter, evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of absolute ethanol as the test solution. Dissolve glycyrrhetinic acid CRS in absolute ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (30-60℃), benzene, ethyl acetate and glacial acetic acid (10 : 20 : 7 : 0.5) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 254 nm. The dark red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Action To remove *dampness* and resolve phlegm.

Indications Cough and asthma with copious phlegm, dizziness and palpitation caused by *wind-phlegm* and phlegm retention, headache due to adverse rising of phlegm.

Usage and dosage 3-9 g.

Precaution, Storage As described under Rhizoma Pinelliae.

Rhizoma Polygonati (黄精, Huangjing)

Solomonseal Rhizome

Solomonseal Rhizome is the dried rhizome of *Polygonatum kingianum* Coll. et Hemsl., *Polygonatum sibiricum* Red., or *Polygonatum cyrtonema* Hua (Fam. Liliaceace). According to the shape, they are commonly known as "Dahuangjing", "Jitouhuangjing", and "Jiangxinghuangjing". The drug is collected in spring or autumn, removed from fibrous root, washed clean, scalded briefly or steamed to be softened, and dried.

Description *Dahuangjing* Fleshy tuberculated, up to more than 10 cm long, 3-6 cm wide, 2-3 cm thick. Externally pale yellow to yellowish-brown, with ring-shaped nodes, striations and fibrous root scars, the upper part of nodes showing discoidal lateral stem scars with a sunken circumference and prominent centre. Texture hard and tenacious, uneasily broken, fracture horny, pale yellow to yellowish-brown. Odour, slight; taste, sweet, and viscous on chewing.

Jitouhuangjing Tuberculated cylindrical, curved, 3-10 cm long, 0.5-1.5 cm in diameter. Node 2-4 cm long, somewhat conical, often branched. Externally yellowish-white or greyish-yellow, translucent with longitudinal wrinkles, rounded stem scars 5-8 mm in diameter.

Jiangxinghuangjing Elongated tuberculated, varying in length, often connected in groups of several tubercles. Externally greyish-yellow or yellowish-brown, rough, bearing prominent and discoidal stem scars on the upper part of nodes, 0.8-1.5 cm in diameter.

Identification Transverse section of rhizome:

Dahuangjing External walls of epidermal cells relatively thick. Numerous large mucilaginous cells containing raphides of calcium oxalate, scattered in parenchyma. Vascular bundles scattered throughout, usually in amphivasal-type.

Jitouhuangjing, *Jiangxinghuangjing* Vascular bundles usually in collateral-type.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 2), not more than 18 per cent.

Total ash Crush the crude drug, previously dried for 6 hours at 80℃. Not more than 4.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method as described under the determination of ethanol-soluble extractives (Appendix Ⅹ A), using dilute ethanol TS as the solvent, not less than 45.0 per cent.

Assay *Reference solution* Weigh accurately 33 mg of anhydrous glucose CRS, dried previously to constant weight at 105℃, to a 100 ml volumetric flask, dissolve with water and dilute to volume, mix well (containing 0.33 mg of anhydrous glucose per ml).

Calibration standard Measure accurately 0.1, 0.2, 0.3, 0.4, 0.5 and 0.6 ml of the reference solution, respectively, into 10 ml stopper graduated test tube, add water to 2.0 ml, mix well, slowly dropwise a 0.2% solution of anthranone in sulfuric acid to volume on an ice-water bath, mix well and cool. After thermal insulating for 10 minutes on a water bath, immediately cool on an ice-water bath for 10 minutes and take out. Use the corresponding mixed reagents as the blank. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 582 nm and plot the standard curve, using absorbance as ordinate and concentration as abscissa.

Procedure Weigh accurately 0.25 g of the fine powder, previously dried to constant weight at 60℃, to a round-bottom flask, add 150 ml of 80% ethanol and heat under reflux on a water bath for 1 hour and filter. Wash the residue with three 10-ml quantities of 80% hot ethanol. Transfer the residue and the filter paper to a flask, add 150 ml of water and heat under reflux for 1 hour, filter while hot, wash the residue and the flask with four 10-ml quantities of hot water. Combine the filtrate and the washings, cool and transfer to a 250 ml volumetric flask, dilute with water to volume and mix well. Measure accurately 1 ml to a 10 ml dried stopper test tube. Carry out the procedure as described under the calibration standard, beginning at the words "add water to 2.0 ml", measure the absorbance and read out the weight of glucose (mg) in the test solution from the standard curve, and calculate the content.
It contains not less than 7.0 per cent of solomonseal polysaccharides, calculated as anhydrous glucose ($C_6H_{12}O_6$) with reference to the dried drug.

Processing *Rhizoma Polygonati* Eliminate foreign matter, wash clean, slightly soften, cut into thick slices and dry.

Rhizoma Polygonati (*processed with wine*) Stew or steam the clean Rhizoma Polygonati thoroughly as described under the method for stewing with wine or steaming with wine (Appendix Ⅱ D), dry briefly in the air, cut into thick slices and dry.
To each 100 kg of Rhizoma Polygonati add 20 kg of yellow rice wine.

Action To reinforce *qi* and nourish *yin*, invigorate the

function of the spleen, moisten the lung, and benefit the kidney.

Indications Weakness of the spleen and the stomach marked by lassitude, dryness in the mouth and anorexia; dry cough due to deficiency of *yin* of the lung; deficiency of vital essence and blood; wasting-thirst caused by internal *heat*.

Usage and dosage 9-15 g.

Storage Preserve in a ventilated and dry place, protected from mould and moth.

Rhizoma Polygonati Odorati (玉竹, Yuzhu)

Fragrant Solomonseal Rhizome

Fragrant Solomonseal Rhizome is the dried rhizome of *Polygonatum odoratum* (Mill.) Druce (Fam. Liliaceae). The drug is collected in autumn, removed from the fibrous root, washed clean, dried in the sun to soften, rubbed repeatly and dried in the air until the drug is devoid of hard core, and then dried in the sun thoroughly. Or rubbed to be translucent after steaming thoroughly, and dried in the sun.

Description Long cylindrical, slightly compressed, few branched, 4-18 cm long, 0.3-1.6 cm in diameter. Externally yellowish-white or yellowish-brown, translucent, with longitudinal wrinkles and slightly raised annulations, exhibiting white rounded-dotted fibrous root scars and a disk-like stem scar. Texture hard and fragile or slightly soft, easily broken, fracture horny or granular. Odour slight; taste, sweetish and viscous on chewing.

Identification Transvese section: Epidermal cells oblate or compressed-rectangular, outer walls slightly thickened, cutinized. Numerous mucilage cells scattered throughout parenchyma, 80-140 μm in diameter, containing raphides of calcium oxalate. Collateral bundles, a few amphivasal bundles, scattered.

Assay *Reference solution* Weigh accurately 60 mg of anhydrous glucose CRS, dried previously to constant weight at 105℃, to a 100 ml volumetric flask, dissolve in water and dilute to volume, mix well (containing 0.6 mg of anhydrous glucose per ml).

Calibration standard Measure accurately, 1.0, 1.5, 2.0, 2.5, 3.0 ml of the reference solution in 50 ml volumetric flasks, respectively, dilute with water to volume and mix well. Transfer 2 ml, accurately measured, of each of the resulting solutions to stopper tubes respectively, add 1 ml of 4% phenol solution, mix well, add 7.0 ml of sulfuric acid quickly, shake, keep in a 40℃ water bath for 30 minutes, then move to ice bath for 5 minutes. Carry out the method for ultraviolet spectrophotometry colourimetry (Appendix V A), measure the absorbance at 490 nm, taking the mixture of corresponding solvents as a blank, and plot the standard curve, using absorbance as ordinate and concentration as abscissa.

Procedure Weigh accurately 1 g of the coarse powder to a round bottom flask, add 100 ml of water, heat under reflux for 1 hour, filter with defatted cotton. Repeat the extraction as above once, combine the filtrates, concentrate and transfer to a 100 ml volumetric flask, dilute with water to volume, mix well. Measure accurately 2 ml of the solution, add 10 ml of ethanol, stir and centrifuge, dissolve the precipitate in water, transfer to a 50 ml volumetric flask, and dilute to volume. Measure 2 ml of the resulting solution, carry out the procedure as described under Calibration standard, begining at the words "add 1 ml of 4% phenol", measure the absorbance, read out the weight (mg) of the anhydrous glucose of Rhizoma Polygonati Odorati in the test solution from the standard curve and calculate.

It contains not less than 6.0 per cent of polysaccharide, calculated as glucose ($C_6H_{12}O_6$) with reference to the dried drug.

Processing Eliminate foreign matter, wash clean, soften thoroughly, cut into thick slices or sections and dry.

Action To nourish *yin*, promote the production of body fluid, and relieve dryness syndrome.

Indications Impairment of *yin* of the lung and the stomach with dry cough, dryness of the throat and thirst; wasting-thirst caused by internal *heat*.

Usage and dosage 6-12 g.

Storage Preserve in a ventilated and dry place, protected from mould and moth.

Rhizoma Smilacis Chinae (菝葜, Baqia)

Chinaroot Greenbrier Rhizome

Chinaroot Greenbrier Rhizome is the dried rhizome of *Smilax china* L. (Fam. Liliaceae). The drug is collected in the end of autumn to next spring, removed from fibrous root, washed clean, dried in the sun, or sliced while fresh and dried.

Description Irregular pieces or curved flattened cylindrical, with knob-like outgrowths, 10-20 cm long, 2-4 cm in diameter. Externally yellowish-brown or purplish-brown, with conical protuberant stem scars and stiff spinous remains of fibrous roots or radicels. Texture hard, uneasily broken, fracture fibrous, brownish-yellow or reddish-brown, dotted vascular bundles and numerous small light spots visible. Odourless; taste, slightly bitter and astringent.

Identification (1) Powder: Reddish-brown. Starch granules mostly simple, subrounded or semispherical, 5-30 μm in diameter, hilum pointed, cleft or flyer-shaped. Stone cells singly scattered or several in groups, pale yellow or reddish-brown, subrounded, long elliptical, subsquare or irregular, with distinct branched pit canals, lumen small with oblong pits, some lumen containing reddish-brown content. Fibres frequent, in groups or scattered, pale yellow or deep brown. Needles of calcium oxalate mostly scattered, occasionally in bundles occurring in mucilage cells, 75-140 μm long.

(2) To 5 g of the powder add 50 ml of ethanol, ultrasonicate for 30 minutes, filter, add 5 ml of hydrochloric acid to the filtrate, heat under reflux on a water bath for 2 hours, cool, adjust to neutral with 40% solution of sodium hydroxide, evaporate to no smell of ethanol. Dissolve the residue in 40 ml of hot water, extract with dichloromethane by shaking, 40 ml for the first time and 30 ml for the second time, combine the extracts, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve diosgenin CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (4 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the

above two solutions. After developing and removal of the plate, dry in air, spray with 10% solution of sulfuric acid in ethanol, and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H, Method 1), not more than 12.0 per cent.

Total ash Not more than 3.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method as described under the determination of ethanol-soluble extractives (Appendix Ⅹ A), using 60% ethanol as the solvent, not less than 15.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (90 : 10) as the mobile phase. As detector a spectrophotometer set at 203 nm. The number of theoretical plates of the column is not less than 8000, calculated with reference to the peak of diosgenin.

Reference solution Dissolve a quantity of diosgenin CRS, accurately weighed, in acetonitrile to produce a solution containing 0.2 mg per ml as reference solution.

Test solution Weighed accurately 8 g of the powder (through No. 2 sieve) into a Soxhlet's extractor, add a quantity of ethanol, soak overnight, heat under reflux until the extract colourless. Recover the solvent to about 100 ml, add 16 ml of hydrochloric acid, heat under reflux on a water bath for 2 hours, cool, extract with four 40-ml quantities of petroleum ether (60-90℃) by shaking. Combine the extracts, recover the solvent to dryness. Dissolve the residue in acetonitrile and transfer it to a 10 ml volumetric flask, dilute with acetonitrile to volume, mix well, filter, and use the successive filtrate as the test solution.

Procedures Inject accurately 20 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.040 per cent of diosgenin ($C_{27}H_{42}O_3$), calculated with reference to the dried drug.

Processing Eliminate foreign matter and remove the remains of fibrous roots, wash clean, soften thoroughly, cut into slices, and dry.

Action To expel *wind* and *dampness*, relieve *toxicity* and disperse blood stasis.

Indications Aching pain of muscles and joints, dribbing of urine, morbid leukorrhea, furuncles and sores.

Usage and dosage 10-15 g.

Storage Preserve in a ventilated and dry place.

Rhizoma Smilacis Glabrae (土茯苓, Tufuling)

Glabrous Greenbrier Rhizome

Glabrous Greenbrier Rhizome is the dried rhizome of *Smilax glabra* Roxb. (Fam. Liliaceae). The drug is collected in summer or autumn, removed from fibrous root, washed clean, and dried, or sliced while fresh, and dried.

Description Subcylindrical, slightly flattened or irregularly slat-shaped and lump-shaped, with knob-like outgrowths and short branches, 5-22 cm long, 2-5 cm in diameter. Externally yellowish-brown or greyish-brown, uneven, with stiff remains of fibrous roots and the tops of branches possessing rounded bud scars. Some outer bark irregularly fissured and exhibiting remains of scales. Texture hard. Slices oblong or irregular-shaped, 1-5 mm thick, edge irregular; transversely cut surface whitish to pale red-brown, starchy, dotted vascular bundles and numerous small light spots visible. Texture slightly tough, dusting on breaking, viscous and slippery when moistened. Odourless; taste slightly sweet and astringent.

Identification Powder: Pale brown. Starch granules abundant, simple granules subspherical, polygonal or subsquare, 8-48 μm in diameter, hilum cleft, stellate, Y-shaped or pointed, striations visible in large granules; compound granules consisting of 2-4 components. Raphides of calcium oxalate occurring in mucilage cells or scattered throughout, needle crystals 40-144 μm long, about 5 μm in diameter. Stone cells subelliptical, subsquare or triangular, 25-128 μm in diameter, with fine and dense pit canals; deep brown stone cells elongated, about 50 μm in diameter, walls heavily thickened on the three sides and thin on one side. Fibres in bundles or scattered, 22-67 μm in diameter. Bordered pitted vessels and tracheids more frequent, most bordered pits transversely elongated.

Water Carry out the method for the determination of water (Appendix Ⅸ H, Method 1), not more than 15.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol TS as the solvent, not less than 15.0 per cent.

Processing Eliminate foreign matter; for the unsliced drug soak, wash clean, soften thoroughly, cut into thin slices, and dry.

Action To remove *damp*, counteract *toxicity*, and improve the mobility of joints.

Indications Dysuria with turbid discharge, morbid leukorrhea, carbuncle, lymphadentitis, chronic eczema; contracture of limbs and muscle pain in syphilis with mercury poisoning.

Usage and dosage 15-60 g.

Storage Preserve in a ventilated and dry place.

Rhizoma Sparganii (三棱, Sanleng)

Common Burreed Tuber

Common Burreed Tuber is the dried rhizome of *Sparganium stoloniferum* Buch.-Ham. (Fam. Sparganiaceae). The drug is collected from winter to the next spring, washed clean, peeled, and dried in the sun.

Description Conical, slightly flattened, 2-6 cm long, 2-4 cm in diameter. Externally yellowish-white or greyish-yellow, with marks pared with a knife, fibrous root scars

spotted, slightly ringed-arranged transversely. Texture heavy, compact. Odour, slight; taste, weak, slightly numb on chewing.

Identification (1) Transverse section: Aerenchyma of cortex, consisting of branched parenchymatous cells, tops of branches connected each other forming large intercellular spaces; endodermal cells densely arranged. Parenchymatous cells of stele subrounded, slightly thick-walled, containing starch granules; collateral and amphivasal bundles scattered, vessels non-lignified. Secretory cells scattered in cortex and stele filled with brownish-red secretion.

(2) To 2 g of the powder add 30 ml of ethanol, heat under reflux for 1 hour and filter. Evaporate the filtrate to dryness, and dissolve the residue in 2 ml of ethanol as the test solution. Prepare a solution 2 g of Rhizoma Sparganii reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (4 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 1), not more than 15.0 per cent.

Total ash Not more than 3.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol TS as the solvent, not less than 7.5 per cent.

Processing *Rhizoma Sparganii* Eliminate foreign matter, soak, soften thoroughly, cut into thin slices, and dry.

Rhizoma Sparganii (*processed with vinegar*) Stir-bake the slices of Rhizoma Sparganii as described under the method for stir-baking with vinegar (Appendix Ⅱ D) until a deep colour is produced, using 15 kg of vinegar per 100 kg of slices of Rhizoma Sparganii.

Action To eliminate blood stasis with strong effect, promote the flow of *qi*, remove the retention of undigested food, and relieve pain.

Indications Mass in the abdomen; amenorrhea due to blood stasis; abdominal distension and pain caused by retention of undigested food.

Usage and dosage 4.5-9 g.

Precaution Contraindicated in pregnancy.

Storage Preserve in a ventilated and dry place, protected from moth.

Rhizoma Typhonii (白附子, Baifuzi)

Giant Typhonium Rhizome

Giant Typhonium Rhizome is the dried tuber of *Typhonium giganteum* Engl. (Fam. Araceae). The drug is collected in autumn, removed from the fibrous root and the outer bark, and dried in the sun.

Description Ellipsoidal or ovoid, 2-5 cm long, 1-3 cm in diameter. Externally white to yellowish-white, slightly rough, exhibiting annulations and fibrous root scars, top marked with stem scars and bud scars. Texture hard, fracture white, starchy. Odour, slight; taste, weak, with numb and pungent sensation.

Identification Trasverse section: Sometimes cork cells adhering. Endodermis indistinct. Parenchyma scattered with large mucilage cavities, relatively large in the outer part, usually ringed, gradually becoming small and rare to centre, mucilage cells found everywhere, containing raphides of calcium oxalate. Vascular bundles scattered, collateral and amphivasal. Parenchymatous cells containing abundant starch granules.

Powder: Yellowish-white. Starch granules abundant, simple granules spherical or subspherical, 2-29 μm in diameter, hilum pointed, slit-shaped or V-shaped; compound granules of 2-12 components, among which 2-4 components visible frequently. Needle crystals of calcium oxalate scattered or in bundles embedded in mucilage cells, needle crystal up to 97 (136) μm long. Spiral and annular vessels 9-45 μm in diameter.

Processing *Rhizoma Typhonii* (*unprocessed*) Eliminate foreign matter.

Rhizoma Typhonii (*processed*) Grade Rhizoma Typhonii according to size, soak in water and exchange water 2-3 times every day. After several days some foams emerge, change water again, add a quantity of Alumen equivalent to 2 kg of Alumen per 100 kg of Rhizoma Typhonii. Soak again in water for a day and change water until the drug has slight numbing feeling to the tongue, and take it out. Put the slices of Rhizoma Zingiberis Recens and powder of Alumen in a pan and boil with a quantity of water, then add Rhizoma Typhonii, mix well and boil until the cut surface of the drug is devoid of a dry core. Take out, remove the slices of Rhizoma Zingiberis Recens, dry partially in the shade, cut into thick slices, and dry.

To each 100 kg of Rhizoma Typhonii add 12.5 kg of each of Rhizoma Zingiberis Recens and Alumen.

Occurring in subrounded or elliptic thick slices, pale brown at the edge, yellow at the cut surface, horny. Odour, slight; taste, weak with slight numb and pungent sensation.

Action To dispel *wind-phlegm*, to check convulsion, and counteract *toxicity*, promote subsidence of nodulation and relieve pain.

Indications Stroke with gurgling in the throat, deviation of the eye and the mouth, and impairment of speech; upward invasion of *phlegm* causing headache accompanied with dizziness, heavy body, restlessness, fidgets nausea and cold extremities, or migraine; sore throat; tetanus; external use for scrofula, venomous snake-bite.

Usage and dosage Usually used after processing, 3-6 g; for external use, appropriate quantity of the unprocessed tuber is pounded into paste, stewed into soft extract or ground into powder (mixed with wine), and applied topically.

Precaution Be cautions when the unprocessed tuber is taken orally. Used with caution in pregnancy.

Storage Preserve in a ventilated and dry place, protected from moth.

Rhizoma Wenyujin Concisum (片姜黄, Pianjianghuang)

Wenyujin Concise Rhizome

Wenyujin Concise Rhizome is the dried rhizome of

Curcuma wenyujin Y. H. Chen et C. Ling (Fam. Zingiberaceae). The drug is collected in autumn when stem and leaf withered, washed clean, removed from fibrous root, cut into thick slice while fresh, and dried in the sun.

Description Long-rounded or irregularly sliced, varying in size, 3-6 cm long, 1-3 cm wide, 1-4 mm thick. The outer bark greyish-yellow, rough and uneven with numerous annular nodes and fibrous root scars, transversely cut surface yellowish-white to brownish-yellow, with an annular ring and numerous dotted vascular bundles. Texture hard and fragile, fracture greyish-white to brownish-yellow, somewhat starchy. Odour, characteristic and aromatic; taste, slightly bitter, pungent and cool.

Identification (1) Transverse section: Epidermal cells remained, outer walls slightly thickened. Cork consisting of several layers of cells. Cortex scattered with leaf-trace vascular bundles, endodermis distinct. Stele large, vascular bundles collateral, relatively small outside and arranged densely, some xylem with 1 or 2 vessels only. Parenchyma scattered with oil cells in cortex and stele, parenchymatous cells containing starch granules.
(2) To 1 g of the powder add 5 ml of petroleum ether (30-60℃), shake constantly about 30 minutes, filter, dilute the filtrate to 5 ml as the test solution. Prepare a solution of 1 g of Rhizoma Wenyujin Concisum reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chro-matograghy (Appendix Ⅵ B), using silica gel G as the coat-ing substance and a mixture of petroleum ether (30-60℃) and ethyl acetate (17 : 3) as the mobile phase. Apply separately 2 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with 1% solution of vanilin in sulfuric acid, heat at 100℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Assay Carry out the method for determination of volatile oil (Appendix Ⅹ, method 1).
It contains not less than 1.0 per cent (ml/g) of volatile oil.

Action To eliminate blood stasis, promote the flow of *qi*, stimulate the menstrual discharge and relieve pain.

Indications Amenorrhea and dysmenorrhea due to blood stasis; pricking pain in the chest and hypochondriac regions, arthralgia, traumatic injuries.

Usage and dosage 3-9 g.

Precaution Used with caution in pregnancy.

Storage Preserve in a cool and dry place, protected from moth.

Rhizoma Zingiberis (干姜, Ganjiang)

Zingiber (Dried Ginger)

Zingiber is the dried rhizome of *Zingiber officinale* (Willd.) Rosc. (Fam. Zingiberaceae). The drug is collected in winter, removed from fibrous root and soil, and dried in the sun or at a lower temperature. The drug which is sliced while fleshy and dried in the sun or at a lower temperature is known as "Slice of Rhizoma Zingiberis".

Description *Rhizoma Zingiberis* In flattened pieces with fingered branches, 3-7 cm long, 1-2 cm thick. Externally greyish-yellow or pale greyish-brown, rough, with longitudinal wrinkles and distinct annulated-nodes. Branched parts usually with remains of scale leaves, apex with stem-scars or buds. Texture compact, fracture yellowish-white or greyish-white, starchy and granular, exhibiting a distinct ring of endodermis, scattered with vascular bundles and yellow oil drops. Odour, aromatic and characteristic; taste, pungent.

Slice of Rhizoma Zingiberis Occurring in irregular slices cut longitudinally or obliquely, with fingered branches, 1-6 cm long, 1-2 cm wide, 0.2-0.4 cm thick. Externally greyish-yellow or pale yellowish-brown, rough, with longitudinal wrinkles and distinct annulated-nodes. Cut surface greyish-yellow or greyish-white, slightly starchy, showing more longitudinal fibres, some of which appearing hair-like. Texture compact, fracture fibrous. Odour, aromatic and characteristic; taste, pungent.

Identification (1) Powder: Pale yellowish-brown. Starch granules fairly abundant, long ovate, triangular-ovoid, elliptical, subrounded or irregular, 5-40 μm in diameter, hilum pointed, at the small end, sometimes cleft, striations obvious. Oil cells and resin cells scattered in parenchyma, containing pale yellow oil drops or dark reddish-brown substance. Fibres in bundles or scattered, apex obtusely acute, few branched, some undulate or serrate on one side, 15-40 μm in diameter, walls slightly thickened, unlignified, with fine oblique pits, frequently with thin septa. Vessels mostly scalariform, spiral and reticulate, few annular, 15-70 μm in diameter. Tubular cells containing dark reddish-brown substance, 12-20 μm in diameter, occasionally found beside vessels and fibres.
(2) To 2 g of the powder add 20ml of ethanol, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 2 g of Rhizoma Zingiberis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of cyclohexane and ether (1 : 1) as the mobile phase. Apply separately to the plate 4 μl of each of the above two solutions. After developing and removal of the plate, dry in air, spray with vanillin TS in sulfuric acid, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Assay To a quantity of the coarse powder, add 700 ml of water, and carry out the method for determination of volatile oil (Appendix Ⅹ D).
It contains not less than 0.8 per cent (ml/g) of volatile oil.

Processing *Rhizoma Zingiberis* Eliminate foreign matter, soak briefly, wash clean, soften thoroughly, cut into thick slices or pieces, and dry.
Irregular pieces, 0.2-0.4 cm thick. Total ash not more than 5.5 per cent.

Rhizoma Zingiberis (carbonized) Stir-bake the pieces of Rhizoma Zingiberis as described under the method for carbonized by stir-baking (Appendix Ⅱ D) until the surface becomes black and the inner part brown.

Action To dispel *cold* from the spleen and the stomach, promote recovery from collapse, and eliminate *damp* and *phlegm*.

Rhizoma Zingiberis (processed) To dispel *cold* from the spleen and the stomach, and arrest bleeding.

Indications Epigastric pain with cold feeling, vomiting and diarrhea accompanied with cold extremities and faint pulse; dyspnea and cough with copious frothy expectoration.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place, protected from moth.

Preparation Extractum Zingiberis Liquidum

Rhizoma Zingiberis Praeparatum (炮姜, Paojiang)

Prepared Dried Ginger

Prepared Dried Ginger is prepared from the Rhizoma Zingiberis.

Procedure Scald the dried Ginger with sand (Appendix Ⅱ D) until it becomes inflated and brown externally.

Description Irregular inflated pieces with fingered branches. Externally brownish black or brown. Texture light and loose, fracture brownish-black at the margin, brownish-yellow in the inner part, fine granular, vascular bundles scattered. Odour, aromatic and characteristic; taste, slight pungent.

Identification Powder: Brown. Starch granules abundant, long-ovoid, deltoid-ovoid, ellipsoid, subrounded or irregular, 5-40 μm in diameter, hilum pointed in the smaller end and cleft-like as well, sometimes striations visible, gelatinized masses visible occasionally. Oil cells and resin cells scattered in parenchyma, containing pale yellow oil drops or dark reddish brown contents. Fibres in bundles or scattered, blunt-acute at the end, few branched, sometimes sinuated on one side, 15-40 μm in diameter, walls thickened slightly, nonlignified, with fine oblique pits, and thin transverse septa usually visible. Vessels mostly scalariform, reticulate or spiral, occasionally annular, 15-70 μm in diameter; beside the vessels or fibres, tubular cells containing dark reddish brown contents visible, 12-20 μm in diameter.

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Action To warm the *middle-energizer*, arrest bleed-ing by warming the meridians.

Indications *Deficiency-cold* of spleen and stomach, abdomen ache, vomiting and diarrhea, haematemesis, epistaxis, uterine bleeding, bleeding due to *yang-deficiency*.

Usage and dosage, Storage As described under Rhizoma Zingiberis.

Rhizoma Zingiberis Recens (生姜, Shengjiang)

Fresh Ginger

Fresh Ginger is the fresh rhizome of *Zingiber officinale* (Willd.) Rosc. (Fam. Zingiberaceae). The drug is collected in autumn and winter, removed from fibrous root and soil.

Description In irregular pieces, slightly compressed, with finger-like branches, 4-18 cm long, 1-3 cm thick. Externally yellowish-brown or greyish-brown, ringed, the top of each branch exhibiting a stem scar or buds. Texture fragile, easily broken, fracture pale yellow, with a well-marked endodermis ring and scattered vascular bundles. Odour, aromatic and characteristic; taste, pungent.

Processing *Rhizoma Zingiberis Recens* Eliminate foreign matter, wash clean and cut into thick slices before use.

Peel of Rhizoma Zingiberis Recens Scrape the outer peel of clean Rhizoma Zingiberis Recens.

Action To induce perspiration and dispel *cold*, warm the stomach and arret vomiting, and resolve phlegm and relieve cough.

Indications Common cold; vomiting caused by cold in the stomach; cough with expectoration of whitish thin sputum.

Usage and dosage 3-9 g.

Storage Preserve in a cool and moist place, or embed in wet sand, protected from freezing.

Sanguis Draconis (血竭, Xuejie)

Dragon's Blood

Sanguis Draxonis is the prepared resin of the fruit of *Daemonorops draco* Bl. (Fam. Palmae).

Description Slightly sub-rounded square or square, externally dark red, lustrous, attached with friction-caused red colour. Texture hard and fragile, broken surface red, ground powder brick red. Odour, slight; taste, weak. Insoluble in water, softened in hot water.

Identification (1) Add the powder to a piece of white paper, melt heating at a distance from the fire, but show no spreading oil stains, present bright red. It turns irritating smell being burnt.

(2) To about 0.1 g of the powder add 10 ml of ether, stoppered tightly, shake for 10 minutes, filter, collect the filtrate as the test solution. Prepare a solution of 0.1 g of Sanguis Draxonis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform-methanol (19 : 1) as the mobile phase. Apply separately to the plate 10-20 μl of each of the test solution, reference drug solution and dracorhodin perchlorate CRS solution (as the reference solution, see Assay). After developing and removal of the plate, dry in air. The orange spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution and reference solution.

(3) To about 0.5 g of the coarse powder add 10 ml of ether, stoppered tightly, shake for 10 minutes, filter, add 5 ml of dilute hydrochloric acid to the filtrate, mix well, a brownish-yellow precipitate is separated out, allow to stand for a while, then turn into brownish-black resin-like substance gradually. Wash the resin-like substance with 10 ml of hydrochloride acid for several times, discard the washings, add 10 ml of 20% potassium hydroxide, grind, add 5 ml of chloroform and then transfer to a separating funnel, shake, chloroform layer turns red, take the chloroform layer as the test solution. Prepare a solution of Sanguis Draxonis reference drug in the same manner, and use it as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform-methanol (19 : 1) as the mobile phase. Apply separately to the plate 10-20 μl of each of the two solutions. After developing and removal of the plate, dry in air. The orange spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Rosin To 0.1 g of the powder in a stoppered tube add 10 ml of petroleum ether (60-90℃), shake for several minutes, filter. Transfer 5 ml of the filtrate to another tube, add 5 ml of newly-prepared 0.5% copper acetate solution, stand for a while, separate into two layers, the petroleum ether layer should not show green colour.

Ethanol-insoluble matter Weigh accurately about 2 g of the powder in a weighed filter paper tube, put into Soxhlets extractor, add 200-400 ml of ethanol, reflux untill the extract is colourless. Take out the filter paper tube, evaporate the ethanol, dry at 105℃ for 4 hours, weigh accurately and calculate, not more than 25.0%.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and acetonitrile-0.05 mol/L sodium dihydrogen phosphate solution (50 : 50) as the mobile phase. As detector a spectrophotometer set at 440 nm; column temperature is 40℃. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of dracorhodin.

Reference solution Weigh accurately 9 mg of dracorhodin perchlorate CRS in a 50 ml brown volumetric flask, add 10 ml of 3% phosphoric acid in methanol to dissolve and dilute to the volume, mix well, and use as the reference solution (containing 26 μg of dracorhodin per ml, the weight of dracorhodin is equivalent to 1/1.377 of the weight of dracorhodin perchlorate).

Test solution Weigh accurately 0.05-0.15 g of the powder in a stopper flask, add accurately 10 ml of the 3% phosphoric acid in methanol, stopper tightly, shake for 3 minutes, filter, discard the initial filtrate, transfer accurately 1 ml of the successive filtrate to a 5 ml brown volumetric flask, add methanol and dilute to the volume and use as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, determine and calculate the content.

It contains not less than 1.0% of dracorhodin ($C_{17}H_{14}O_3$).

Processing Eliminate the dust, break into small pieces or grind into fine powder.

Action To eliminate blood stasis and assuage pain, arrest bleeding and promote the growth of muscles.

Indications Traumatic injuries and fracture due to tumble, internal injury with blood stasis and pain; unremitting bleeding due to traumatism.

Usage and dosage 1-2 g; ground into powder, or used in pills. For external use, appropriate quantity is ground into powder or prepared into plaster for topical application.

Storage Preserve in a cool and dry place.

Sargassum (海藻, Haizao)

Seaweed

Seaweed is the dried alga of *Sargassum pallidum* (Turn.) C. Ag. or *Sargassum fusiforme* (Harv.) Setch. (Fam. Sargassaceae). The former is commonly known as "Dayehaizao" and the latter is known as "Xiaoyehaizao". The drug is collected in summer and autumn, removed from foreign matter, washed clean, and dried in the sun.

Description *Dayehaizao* Crumpled and rolled, blackish-brown, some showing white frost-like powder, 30-60 cm long, the stem-like stipe cylindrical, with conical protrudings. Main branchings dichotomous, lateral branchings giving off from the axils of blades bearing on main branchings, with short spiny protrudings. The blades of primary segments lanceolate or obovate, 5-7 cm long, about 1 cm wide, margin entire or dentate. The blades of secondary segments slat-shaped or lanceolate, with small branchings bearing slat-

shaped segments in the axils of blades. Air bladders blackish-brown, spheroidal or ovoid, some with stalks, apex obtuse-rounded, sometimes mucronate. Texture fragile, soft when moistened, swollen, fleshy and lubricant on soaking in water. Odour, seafood-like; taste, slightly salty.

Xiaoyehaizao Slightly small, 15-40 cm long, lateral branchings alternate, without spiny protrudings, blades slat-shaped or spatulate, apex slightly swollen, hollowed, air bladders axillary, fusiform or spheroidal, with relatively long stalks. Texture relatively hard.

Identification Macerate 1 g of the small pieces in 20 ml of water for several hours and filter. Evaporate the filtrate to about 3-5 ml, add 3 drops of ferric chloride TS; a brown precipitate is produced.

Processing Eliminate foreign matter, wash clean, dry in the air briefly, cut into sections, and dry in the sun.

Action To soften indurated mass, eliminte *phlegm* and dissipate nodulation, and induce urination.

Indications Goiter, scrofula, swelling and pain of the testes; edema.

Usage and dosage 6-12 g.

Storage Preserve in a dry place.

Scolopendra
(蜈蚣, Wugong)

Centipede

Centipede is the dried body of *Scolopendra subspinipes mutilans* L. Koch (Fam. Scolopendridae). The animal is captured in spring or summer, stretched by a bamboo piece inserted through the head to tail, and dried.

Description Flattened slat-shaped, 9-15 cm long, 0.5-1 cm wide. Consisting of head and trunk, the whole body containing 22 segments. The head dark red or reddish-brown, somewhat lustrous, covered with a head plate; the head plate subspherical, anterior end slightly projecting, bearing a pair of maxillipeds and a pair of antennae on both sides. The first dorsal plate of the trunk as same as the head plate in colour, the other 20 notums brownish-green or blackish-green, lustrous, usually with 2 longitudinal furrowed lines from the 4th to the 20th; venter light yellow or brownish yellow, wrinkled; each segment bearing a pair of walking legs from the 2nd segment; the walking legs yellow or reddish-brown, occasionally yellowish white, hook-like, the last pair of the walking legs tail-like, also known as uropod, easily fallen off. Texture fragile, fracture with crevices. Odour, slightly stinking, with characteristic smell irritating the nose; taste, pungent, slightly salty.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol as the solvent, not less than 20.0 per cent.

Processing Remove bamboo slip, wash clean, gently roast by small fire until yellow, cut into sections.

Action To relieve convulsion, counteract poisons and cause subsidence of nodulation, and remove obstruction of collaterals and alleviate pain.

Indications Infantile convulsion, tetanus, apoplectic hemiplegia; chronic rheumatic or rheumatoid arthritis; sores, lymphadenitis, venomous snake-bite.

Usage and dosage 3-5 g.

Precaution Contraindicated in pregnancy.

Storage Preserve in a dry place, protected from mould and moth.

Scorpio
(全蝎, Quanxie)

Scorpion

Scorpion is the dried body of *Buthus martensii* Karsch (Fam. Buthidae). The drug is collected from the end of spring to the beginning of autumn, removed from soil, boiled in water or salt water until the body stiffened, scooped out, placed in a ventilated place, and dried in shade.

Description The cephalothorax and preabdomen flattened long ellipsoidal, the postabdomen tail-like, shrunken and curved. The body of intact specimen about 6 cm long, the cephalothorax greenish-brown, the anterior part arising 1 pair of short and small chelicerae and 1 pair of long and large pincerlike pedipalps in the shape of crab pincers, dorsal part covered with ladder-shaped carapace, ventral part bearing 4 pairs of walking legs, each of 7 segments, with 2 claws on distal end. The preabdomen consists of 7 segments, the seventh dark in colour, with 5 ridged spinal lines on the dorsal plate. Dorsal side greenish-brown, the postabdomen brownish-yellow, 6 segments, with longitudinal furrows on each segment, the telson bearing sharp claw like stinger and no spur below the stinger. Odour, slightly stinking; taste, salty.

Extractives Carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, the hot extraction method), using dilute ethanol solvent, not less than 20.0 per cent.

Processing Eliminate foreign matter, wash clean and dry.

Action To relieve convulsion, counteract poisons and reduce nodulation, remove obstructions from the collaterals, and relieve pain.

Indications Infantile convulsion; twitching, spasm; apoplectic hemiplegia; tetanus; chronic arthritis; headache or migraine; sores; scrofula.

Usage and dosage 3-6 g.

Storage Preserve in a dry place, protected from moth.

Semen Abutili
(苘麻子, Qingmazi)

Chingma Abutilon Seed

Chingma Abutilon Seed is the dried ripe seed of *Abutilon theophrastii* Medic. (Fam. Malvaceae). The fruit is collected in autumn when ripe, dried in the sun, and the seed is gathered, removed from foreign matter.

Description Triangular reniform, 3.5-6 mm long, 2.5-4.5

mm wide, 1-2 mm thick. Externally greyish-black or dark brown, bearing sparse white tomenta, a subelliptical hilum dented, pale brown, radially striated. Testa hard, cotyledons 2, folded, oily. Odour, slight; taste, weak.

Identification Transverse section: Epidermal cells 1 layer, flattened-rectangular, sometimes differentiated to unicellular non-glandular hairs; hypodermal cells 1 layer, slightly radially prolated. Palisade cells 1 row, cylindrical, up to about 88 μm long, very thick-walled, linear lumina visible at the upper part, the terminal end expended, containing small globular crystals. Pigment cells 4-5 layers, containing yellowish-brown or reddish-brown contents. Cells of endosperm and cotyledons containing fatty oil droplets and aleurone grains, cells of cotyledons also containing a few of fine clusters of calcium oxalate.

Action To remove *heat* and *damp*, counteract toxicity, and cure nebula.

Indications Dysentery with bloody purulent stools; urinary infection with painful difficult urination; carbuncles and boils; nebula.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place.

Semen Aesculi (娑罗子, Suoluozi)

Buckeye Seed

Buckeye Seed is the dried ripe seed of *Aesculus chinensis* Bge., *Aesculus chinensis* Bge. var. *chekiangensis* (Hu et Fang) Fang or *Aesculus wilsonii* Rehd. (Fam. Hippocastanaceae). The drug is collected in autumn when ripe, removed from pericarp, dried in the sun or at a lower temperature.

Description Oblate or subspherical, resembling chestnut, 1.5-4 cm in diameter. Externally brown or dark brown, frequently shrunken, somewhat lustrous; hilum light in colour, subrounded, occupying about ¼-½ in area of the seed, with a stripe of projecting raphe on one side, sometimes indistinct. Testa hard and fragile, cotyledons 2, thick and hard, resembling the kernel of chestnut, yellowish-white or pale brown, starchy. Odour, slight; taste, bitter then sweet.

Identification The four major peaks in the chromatogram of reference solution obtained in monograph 'Assay' are aescine A, aescine B, aescine C and aescine D in turn. The reserving time of the major peaks obtained with the test solution correspond with the four major peaks of sodium aescine CRS.

Water Carry out the method as described under the determination of water (Appendix Ⅸ H, method 1), not more than 13.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% phosphoric acid (36 : 64) as the mobile phase. As detector a spectrophotometer set at 220 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of aescine A.

Reference solution Weigh accurately a quantity of sodium aescine CRS (the content of aescine A marked) in methanol to produce a solution containing 1 mg per ml as the reference solution.

Test solution Weigh accurately 1 g of the powder (through No. 3 sieve) to a Soxhlet's extractor, heat under reflux in ether for 1 hour, then discard ether, and evaporate the ether to dryness. Transfer the residue to a stopper conical flask, add 50 ml of methanol accurately, weigh, and ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, cool and weigh again, replenish the loss of the solvent with methanol and mix well, filter. Measure accurately 10 ml of the filtrate into a evaprating dish. heat on a water bath at 40℃ and concentrate to suitable volume, transfer into a 10 ml of volumetric flask, add methanol to volume, and mix well.

Procedure Inject accurately 10 μl of the reference solution and 10 μl of the test solution into the column, respectively, and calculate the content corresponded in position with the reference solution of aescine A.
It contains not less than 0.70 per cent of aescine A ($C_{55}H_{86}O_{24}$), calculated with reference to the dried drug.

Processing Remove the outer coat and foreign matter. Break into pieces before use.

Action To regulate the flow of *qi*, normalize the stomach function and relieve pain.

Indications Distress in the chest, distension in the abdomen, epigastric pain.

Usage and dosage 3-9 g.

Storage Preserve in a dry place, protected from mould and moth.

Semen Allii Tuberosi (韭菜子, Jiucaizi)

Tuber Onion Seed

Tuber Onion Seed is the dried ripe seed of *Allium tuberosum* Rottl. (Fam. Liliaceae). The infructescence is collected in autumn when the fruit is ripe, dried in the sun, and the seed is gathered, removed from foreign matter.

Description Semi-spheroidal or semi-ovoid, slightly flattened, 2-4 mm long, 1.5-3 mm wide. Externally black, one side protruding, rough, with fine reticulated wrinkles, the other side slightly dented, wrinkles relatively indistinct. Apex obtuse, base slightly acute with a prominent, dotted hilum. Texture hard. Odour, characteristic; taste, slightly pungent.

Processing *Semen Allii Tuberosi* Eliminate foreign matter.

Semen Allii Tuberosi (*processed with salt*) Stir-bake the clean Semen Allii Tuberosi as described under the method for processing with salt water (Appendix Ⅱ D) to dry.

Action To tonify the liver and the kidney, promote virility, and arrest spontaneous emission.

Indications Impotence, seminal emission, aching of the loins and knee; enuresis, frequent urination; morbid leukorrhea.

Usage and dosage 3-9 g.

Storage Preserve in a dry place.

Semen Alpiniae Katsumadai (草豆蔻, Caodoukou)

Katsumada Galangal Seed

Katsumada Galangal Seed is the dried almost ripe seed of *Alpinia katsumadai* Hayata (Fam. Zingiberaceae). The fruit is collected in summer and autumn, dried in the sun to near dryness, or treated briefly in boiling water and half dried in the sun, removed from pericarp. The seed masses are gathered, and dried in the sun.

Description Seed masses subspheroidal, 1.5-2.7 cm in diameter. Externally greyish-brown, somewhat smooth, with yellowish-white septa in central part dividing the masses into 3 groups, each having numerous seeds, agglutinated closely. Seeds ovoid-polyhedral, 3-5 mm long, about 3 mm in diameter, covered with brownish membranous aril, raphe occurring as a longitudinal furrow, hilum present at one end; texture hard, on cutting in half longitudinally along the raphe, the seed showing oblique-cordate in shape in longitudinal view, testa extending inward along the raphe and occupying about 1/2 of the surface area; endosperm greyish white. Odour, aromatic; taste, pungent and slightly bitter.

Identification (1) Transverse section: Sometimes remains of aril present, consisting of polygonal thin-walled cells. Epidermal cells of testa subrounded, walls relatively thickened; hypodermis consisting of 1-3 layers of parenchymatous cells, slightly elongated tangentially; pigment layer consisting of several layers of brown cells, scattered with 1-2 layers of subrounded oil cells, about 50 μm in diameter; endotesta consisting of 1 layer of palisade sclerenchymatous cells, brownish-red, with heavily thickened inner and lateral walls and a small lumen containing sillica bodies. Cells of perisperm containing starch granules, prisms and a few small clusters of calcium oxalate. Cells of endosperm containing aleurone grains.

Powder: Yellowish-brown. Epidermal cells of testa stripe-shaped in surface view, up to 30 μm in diameter, slightly thick-walled, usually vertical to hypodermal cells; hypodermal cells prolatepolygonal or subrectangular in surface view. Pigment cells shrivelled with indistinct layer border, containing reddish-brown contents, and mostly broken into irregular masses of pigment. Oil cells scattered among the layers of pigment cells, subrounded or oblong and containing yellowish-green oily contents. Sclerenchymatous cells of endotesta yellowish-brown or reddish-brown, polygonal in surface view, with thickened and unlignified walls, and lumina containing silica bodies; 1 layer and palisade-like in section view, with heavily thickened inner and lateral walls and lumina outward eccentric, containing silica bodies. Cells of perisperm filled with masses of starch granules, some containing fine prisms of calcium oxalate. Cells of endosperm containing aleurone grains and fixed oil droplets.

(2) To 1 g of the powder add 5 ml of methanol, heat on a water bath with shaking for 5 minutes, filter, and the filtrate used as the test solution. Dissolve alpinetin CRS and cardamonin CRS in methanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate and methanol (15 : 4 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of two solutions. After developing and removal of the plate, dry in air, heat at 100℃ until the spots appear, and examine under ultraviolet light at 365 nm. The pale blue fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot due to alpinetin in the chromatogram obtained with the reference solution. Then spray with 5% ferric chloride in ethanol, the brown spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot due to cardamonin in the chromatogram obtained with the reference solution.

Assay Carry out the method for determination of volatile oil (Appendix Ⅹ D).

It contains not less than 1.0 per cent (ml/g) of volatile oil.

Processing Eliminate foreign matter. Break into pieces before use.

Action To remove *damp*, invigorate the spleen function, warm the stomach and arrest vomiting.

Indications Accumulation of *damp-cold* in the spleen and the stomach manifested by epigastric distension, pain and cold feeling accompanied with belching, nausea, vomiting and anorexia.

Usage and dosage 3-6 g.

Storage Preserve in a cool and dry place.

Semen Arecae (槟榔, Binglang)

Areca Seed

Areca Seed is the dried ripe seed of *Areca catechu* L. (Fam. Palmae). The ripe fruit is collected from late spring to early autumn, boiled in water, dried, removed from pericarp, and the seed is collected, then dried.

Description Oblate or conical, 1.5-3.5 cm high, base 1.5-3 cm in diameter. Externally pale yellowish-brown or pale reddish-brown, with slightly dented reticulate furrow, and a rounded concave micropyle in the centre of the base, by side with an obvious scar-shaped hilum. Texture hard, uneasily broken; fracture showing marble-like striations alternated with brown testa and white endosperm. Odour, slight; taste, astringent and slightly bitter.

Identification (1) Transverse section: Outer layers of testa consisting of several rows of flattened stone cells, elongated tangentially, containing reddish-brown contents, stone cells varying in shape and size, often having intercellular space; inner layers of testa consisting of several layers of parenchymatous cells, containing reddish-brown contents, and a few vascular bundles scattered. Perisperm relatively narrow; inner layers of testa with perisperm often inserting into endosperm, forming crisscross tissue. Endosperm cells white, polygonal, walls thickened, pits large, containing oil droplets and aleurone grains.

(2) To 8 g of the powder, add 4 ml of concentrated ammonia TS and 50 ml of chloroform, ultrasonicate for 10 minutes, and filter. Wash the residue with 10 ml of chloroform, combine the chloroform solutions, then transfer to a separator, add 5 ml of dilute hydrochloric acid TS and 20 ml of water, and shake. Separate the water layer. Wash with 10 ml of chloroform, discard the washings, add concentrated ammonia TS to pH 9, and extract with 2 quantities, each of 10 ml, of chloroform. Combine the chloroform solutions, and evaporate to dryness. Dissolve the residue in 1 ml of methanol, used as the test solution. Prepare a solution of

Semen Arecae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and cyclohexane, ethyl acetate and concentrated ammonia TS (7.5 : 7.5 : 0.2) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing in a chamber pre-equilibrated with ammonia vapor and removal of the plate, dry in hot air, and spray with dilute potassium iodobismuthate TS. The orange-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Water Not more than 10.0 per cent (Appendix Ⅸ H, method 1).

Assay Place about 8 g, weighed accurately, of the coarse powder in a conical flask with a stopper, add 80 ml of ether and shake. Add 4 ml of ammonia TS, shake for 10 minutes, add 10 g of anhydrous sodium sulfate, shake again for 5 minutes, allow to stand. Transfer the ether solution to a separator, wash the residue with 3 quantities, each of 10 ml, of ether. Combine the ether solutions, add 0.5 g of talc powder, shake for 3 minutes, add 2.5 ml of water, shake for 3 minutes. Allow to stand until the supernatant ether solution is clear. Separate the ether solution, wash the water layer with a small quantity of ether, combine the ether solutions and evaporate to about 20 ml at a lower temperature. Transfer the ether solution to a separator, add accurately 20 ml of sulfuric acid (0.01 mol/L) VS, shake and allow to stand. Separate the ether layer, wash with 3 quantities of 5 ml of water. Combine the washings and the acid solution, filter, wash the filter with water. Combine the washings and the acid solution, add several drops of methyl red IS, titrate with sodium hydroxide (0.02 mol/L) VS. Each ml of sulfuric acid (0.01 mol/L) VS is equivalent to 3.104 mg of $C_8H_{13}NO_2$.
It contains not less than 0.30% of ether-soluble alkaloids, calculated as arecoline ($C_8H_{13}NO_2$), with reference to the dried drug.

Processing *Semen Arecae* Eliminate foreign matter, soak, soften thoroughly, cut into thin slices, and dry in the shade.

Semen Arecae (*stir-baked*) Stri-bake the slices of Semen Arecae as described under the method for simple stir-baking (Appendix Ⅱ D) until a slightly yellow colour is produced.

Action To kill worms, remove undigested food, subdue the upward *qi*, promote the flow of fluid, and stop malarial attacks.

Indications Taeniasis, ascariasis, fasciolopsiasis; abdominal pain due to intestinal parasitosis; diarrhea and tenesmus due to accumulation of undigested food; edema and weakness of the legs; malaria.

Usage and dosage 3-9 g; for the treatment of taeniasis and fasciolopsiasis, 30-60 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Semen Arecae Praepareta (焦槟榔, Jiaobinglang)

Charred Areca Seed

Charred Areca Seed is the processed product of Areca Seed.

Processing Stir-bake the slices of Semen Arecae as described under the method for simple stir-baking (Appendix Ⅱ D) until a charred yellow colour is produced.

Description Sub-rounded slices, 1.5-3 cm in diameter, 1-2 mm thick. Externally charred yellow, marmoration visible. Texture fragile, easily broken. Odour, light; taste, astringent and slightly bitter.

Identification (1) Powder: charred yellow. Endosperm cells extremely numerous, mostly broken, colourless, when whole, irregular polygonal or subsquare, intercellular layer somewhat indistinct, 56-112 μm in diameter, walls 6-11 μm thick, pits relatively numerous, extremely great, subrounded or rectangle-rounded, 8-19 μm in diameter. Perisperm cells subsquare, subpolygonal or strip-shaped, 40-72 μm in diameter, walls about 8 μm thick, pit-canals visible, most lumina filled with reddish-brown to dark brown substance. Stone cells of testa spindle-shaped, polygonal, 24-64 μm in diameter, walls 5-12 μm thick, pale yellowish-brown, pits few, slit-like, some lumina filled with reddish-brown substance. Spiral or reticulate vessels occasionally visible, 8-16 μm in diameter.
(2) Complies with the Identification test (2) described under Semen Arecae.

Action To promote digestion and relax bowels.

Indications Retention of undigested food, dysentery with tenesmus.

Usage and dosage 3-9 g.

Storage As described under Semen Arecae.

Semen Armeniacae Amarum (苦杏仁, Kuxingren)

Bitter Apricot Seed

Bitter Apricot Seed is the dried ripe seed of *Prunus armeniaca* L. var. *ansu* Maxim., *Prunus sibirica* L., *Prunus mandshurica* (Maxim.) Koehne or *Prunus armeniaca* L. (Fam. Rosaceae). The fruit is collected in summer and the seed is removed from the pulp and the shell, and dried in the sun.

Description Flattened-cordate, 1-1.9 cm long, 0.8-1.5 cm wide, 5-8 mm thick. Externally yellowish-brown to deep brown, acute at one end, plump and unsymmetrical and rounded at the other end. A short-linear hilum situated at the acute end and a chalaza at the rounded end with numerous upwards deep-brown veins. Testa thin; cotyledons 2, milky-white, oily. Odour, slight; taste, bitter.

Identification (1) Grind several grains of the drug with water, a characteristic odour of benzaldehyde is perceptible.
(2) Break several grains of the drug to pieces and immediately place about 0.1 g into a test tube, moisten with several drops of water, hang a strip of trinitrophenol TP and stopper tightly. Heat on a warm water bath for 10 minutes, the test paper turns to a brick red colour.
(3) To 1 g, add 50 ml of ether, heat under reflux for 1 hour, and discard the ether solution. Wash the residue with 25 ml of ether, then evaporate to dryness, add 30 ml of methanol, and heat under reflux for 30 minutes. Cool to room temperature, filter, and use the filtrate as the test solution. Dissolve a quantity of amygdalin CRS in methanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of chloroform, ethyl acetate, methanol and water (15 : 40 : 22 : 10), on standing at 5-10℃ for 12

hours, as the mobile phase. After developing and removal of the plate, spray immediately with a solution of phosphomolybdic acid in sulfuric acid (to 2 g of phosphomolybdic acid, add 20 ml of water to dissolve, then add slowly 30 ml of sulfuric acid, and mix well), and heat at 105℃ for about 10 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Peroxide value Carry out the method for the limit test of rancidity (Appendix Ⅸ P), not more than 0.11.

Assay Place about 15 g of the coarse powder, accurately weighed, in a kjeldahl flask, add 150 ml of water, stopper tightly and immediately, warm on a water bath at 37℃ for 2 hours. Connect the condenser, distill and collect the distillate in a receiver containing 10 ml of water and 2 ml of ammonia TS and cool on an ice bath. Stop the distillation when the distillate is up to 60 ml, add 2 ml of potassium iodide TS to the distillate, and titrate with silver nitrate (0.1 mol/L) VS slowly until a yellowish-white opalescence is produced. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 91.48 mg of $C_{20}H_{27}NO_{11}$.
It contains not less than 3.0 per cent of amygdalin ($C_{20}H_{27}NO_{11}$).

Processing *Semen Armeniacae Amarum* Eliminate foreign matter. Break to pieces before use.

Semen Armeniacae Amarum (*rinsed in boiling water*) Peel the clean Semen Armeniacae Amarum as described under the method for rinsing in boiling water (Appendix Ⅱ D). Break to pieces before use.

Semen Armeniacae Amarum (*stir-baked*) Stir-bake the Semen Armeniacae Amarum (rinsed in boiling water) as described under the method for simple stir-baking (Appendix Ⅱ D) until it becomes yellow. Break to pieces before use.

Assay Weigh accurately about 15 g of the coarse powder in a kjeldahl flask, add accurately 4 g of coarse powder of the crude Semen Armeniacae Amarum, and then add 150 ml of water, stopper tightly immediately, warm on a water bath at 37℃ for 2 hours. Connect the condenser, distill and collect the distillate in a receiver containing 10 ml of water and 2 ml of ammonia TS and cool on an ice bath untill the distillate up to 60 ml, stop distilling, add 2 ml of potassium iodide TS to the distillate, and titrate with silver nitrate (0.1 mol/L) VS slowly untill a yellowish-white opalescence is produced. In addition, weigh accurately about 15 g of the coarse powder of the crude Semen Armeniacae Amarum, add 150 ml of water, titrate as the same manner, use as correction. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 91.48 mg of amygdalin ($C_{20}H_{27}NO_{11}$).
It contains not less than 3.0 per cent of amygdalin ($C_{20}H_{27}NO_{11}$).

Action To relieve cough and asthma, and relax bowels.

Indications Cough and asthma accompanied with stuffiness in the chest and profuse expectoration; constipation due to deficiency of blood and fluid.

Usage and dosage 4.5-9 g, decocted later.

Precaution Overdosage may cause intoxication.

Storage Preserve in a cool and dry place, protected from moth.

Semen Astragali Complanati (沙苑子, Shayuanzi)

Flatstem Milkvetch Seed

Flatstem Milkvetch Seed is the dried ripe seed of *Astragalus complanatus* R. Br. (Fam. Leguminosae). The plant is collected in late autumn and early winter when the fruit is ripe but not dehiscent, dried in the sun, and the seed tapped out, removed from foreign matter, and dried in the sun.

Description Somewhat reniform, slightly flattened, 2-2.5 cm long, 1.5-2 mm wide, about 1 mm thick. Externally smooth, brownish-green or greyish-brown, with a rounded hilum located on one slightly dented edge. Texture hard, uneasily broken. Cotyledons 2, pale yellow, radicle curved, about 1 mm long. Odour, slight; taste, weak and bean-like on chewing.

Identification Break 1 g of the drug to pieces, add 10 ml of ether, heat under reflux on a warm water bath for 10 minutes, filter and discard the ether solution. Heat the residue to expel ether, add 5 ml of methanol, heat under reflux for 10 minutes and filter. Spot 1 drop of the filtrate on a piece of filter paper, examine under ultra-violet light at 365 nm; a purplish-red fluorescence is shown. Add 2 drops of methanol and allow the spot to disperse, a brilliant yellow ring is shown inside the purplish-red fluorescent ring.

Processing *Semen Astragali Complanati* Eliminate foreign matter, wash and dry.

Semen Astragali Complanati (*processed with salt*) Stir-bake the clean Semen Astragali Complanati as described under the method for stir-baking with salt-water (Appendix Ⅱ D) to dryness.

Action To benefit the liver and the kidney, arrest seminal discharge, restrain urination and improve eyesight.

Indications Back pain, nocturnal emission and premature ejaculation in deficiency syndromes of the kidney; turbid discharge with urination, excessive leukorrhea; dribbling of urine after urination; dizziness and blurred vision.

Usage and dosage 9-15 g.

Storage Preserve in a ventilated and dry place.

Semen Canavaliae (刀豆, Daodou)

Jack Bean

Jack Bean is the dried ripe seed of *Canavalia gladiata* (Jacq.) DC. (Fam. Leguminosae). The fruit is collected in autumn when ripe, and the seed is gathered, and dried in the sun.

Description Flattened-ovoid or flattened-reniform, 2-3.5 cm long, 1-2 cm wide, 0.5-1.2 cm thick. The outer surface pale red to reddish-purple, slightly shrunken, somewhat lustrous. A black eyebrow-shaped hilum occurred at the edge, about 2 cm long, exhibiting 3 white fine striations. Texture hard, uneasily broken. Testa coriaceous, the inner surface brownish-green, lustrous; cotyledons 2, yellowish-white, oily. Odour, slight; taste, weak, bean-like on chewing.

Identification Transverse section: Epidermis of 1 layer of palisad cells, 2 layers at hilum, with cuticle, light bend distinct. Supporting cells of 2-6 layers, dumbell-shaped. Nutritive layer consisting of more than 10 layers of parenchymatous cells, tangentially elongated, the inner ones obiterate. Vascular bundles visible, several layers of cells of cotyledons located under testa, polygonal containing numerous starch granules. Tracheid islet elliptical, walls reticularly thickened, bordered pits few, surrounded by 4-5 layers of

parenchymatous cells, with stellate tissue at two sides, cells stellate, with large inter cellular space.

Processing Eliminate foreign matter. Break into pieces before use.

Action To warm the stomach and check its upward adverse movement.

Indications Hiccup and vomiting of *deficiency-cold* type.

Usage and dosage 6-9 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Semen Cassiae (决明子, Juemingzi)

Cassia Seed

Cassia Seed is the dried ripe seed of *Cassia obtusifolia* L. or *Cassia tora* L. (Fam. Leguminosae). The ripe legume is collected in autumn and dired in the sun, then the seed is tapped out and removed from foreign matter.

Description *Semen Cassiae Obtusifoliae* Slightly rhomboidal-cuboid or shortly cylindrical, both ends pararell and oblique, 3-7 mm long, 2-4 mm wide. Externally greenish-brown or dark brown, smooth and lustrous. One end relatively even, the other end oblique and acuminate, dorsal and ventral surfaces exhibiting a raised rib respectively, with an obliquely symmetrical and paler-coloured dented line on each side of a rib. Texture hard and uneasily broken. Testa thin, cotyledons 2, yellow, S-shaped. Odour, slight; taste, slightly bitter.

Semen Cassiae Torae Shortly cylindrical, relatively small, 3-5 mm long, 2-3 mm wide, with broad yellowish-brown bands on both sides of the rib.

Identification (1) Powder: Yellowish-brown. Palisade cells of testa colourless or pale yellow, one row of cells in section, rectangular, arranged slightly disorderly, 42-53 μm long, walls relatively thickened, with two streaks of light bands; subpolygonal in surface view, walls somewhat shrunken. Supporting cells of testa subrounded in surface view, 10-35 (55) μm in diameter, two central circles visible. The fragments of cuticle 11-19 μm thick. Clusters of calcium oxalate numerous, mostly existing in parenchymatous cells, 8-21 μm in diameter.

(2) To 0.5 g of the powder add 20 ml of dilute sulfuric acid and 10 ml of chloroform, heat gently under reflux for 15 minutes. Allow to cool, transfer to a separator. Separate the chloroform layer and shake with 10 ml of sodium hydroxide TS, allow to stand; a red colour is produced in aqueous layer. If a brown colour is produced, add 1-2 drops of hydrogen peroxide TS to the separated aqueous layer and heat for 4 minutes in a water bath, a red colour is produced.

(3) Macerate 1 g of the powder with 10 ml of methanol for 1 hour, fliter, evaporate the filtrate to dryness, dissolve the residue with 10 ml of water, add 1 ml of hydrochloric acid, heat on a water bath for 30 minutes, cool immediately, extracted with two quantities, each of 20 ml, of ether, combined the test solution, evaporate to dryness, dissolve the residue with 1 ml of chloroform as the test solution. Dissolve emodin and chrysophanol CRS with ethanol to produce a solution containing each of 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H containing sodium carboxymethylcellulose as the coating substance and petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The orange fluroscent spots in the chromatogram obtained with the test solution correspond in positon and colour to the spots in the chromatogram obtained with the reference solution. The spots turn to red on exposure to ammonia vapour.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.1% phosphoric acid (85 : 15) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of chrysophanol.

Reference solution To a quantity of chrysophanol CRS, accurately weigh, add a mixture of dehydrated ethanol and ethyl acetate (2 : 1). Produce a solution containing 20 μg per ml as the reference solution.

Test solution Weigh accurately 0.5 g of the powder (through No. 3 sieve) in a stopper conical flask, add 50 ml of methanol accurately and weigh. Heat under reflux for 20 minutes on a water bath, cool and weigh accurately again, replenish the loss of the solvent with methanol, mix well, and filter. Measure accurately 25 ml of the filtrate and evaporate the filtrate to dryness. Add 10% hydrochloric acid to the filtrate. Heat for 1 hour on a water bath and cool immediately. Extract the filtrate with four 30-ml quantities of chloroform. Combine chloroform extract, reclaim the solvent on a water bath, and evaporate to dryness. Dissolve the residue with a mixture of dehydrated ethanol and ethyl acetate (2 : 1) to a 10 ml volumetric flask. Dilute with the same solvent to volume, mix well, and filter.

Procedure Inject accurately 10 μl of the reference solution and 10 μl of the test solution into the column, respectively, and calculate the content.

It contains not less than 0.080 per cent of chrysophanol ($C_{15}H_{10}O_4$), calculated with reference to the dried drug.

Processing *Semen Cassiae* Eliminate foreign matter, wash clean and dry. Break into pieces before use.

Semen Cassiae (*stir-baked*) Stir-bake the clean Semen Cassiae as described under the method for simple stir-baking (Appendix Ⅱ D) until slightly scented. Break into pieces before use.

Action To remove *heat*, improve eyesight, and relax bowels.

Indications Inflammation of the eyes with pain, photophobia and lacrimination; headache, dizziness, blurred vision and constipation.

Usage and dosage 9-15 g.

Storage Preserve in a dry place.

Semen Celosiae (青葙子, Qingxiangzi)

Feather Cockscomb Seed

Feather Cockscomb Seed is the dried ripe seed of *Celosia argentea* L. (Fam. Amaranthaceae). The

plant is cut up or the infructescence is picked up in autumn when the fruit is ripe, dried in the sun, and the seed is gathered and removed from foreign matter.

Description Oblate, a few rounded-reniform, 1-1.5 mm in diameter. Externally black or reddish-black, lustrous, somewhat raised in center, with a hilum on the slightly dented lateral side. Testa thin and brittle. Odour, slight; tasteless.

Foreign matter Not more than 2 per cent (Appendix Ⅸ A).

Action To remove *heat* from the liver, and to clear the eyes of corneal opacity.

Indications Redness of the eyes and dizziness due to excessive *heat* or *fire* in the liver; nebula with blurred vision.

Usage and dosage 9-15 g.

Storage Preserve in a dry place.

Semen Citri Reticulatae
(橘核, Juhe)

Tangerine Seed

Tangerine Seed is the dried ripe seed of *Citrus reticulata* Blanco and its other cultivates (Fam. Rutaceae). The drug is collected after the fruit ripened, washed clean, and dried in the sun.

Description Slightly ovoid, 8-12 mm long, 4-6 mm in diameter. Externally pale yellowish-white or pale greyish-white, smoothy, with raphe line on one side, one end obtuse-rounded and the other end acuminate and small stalk-shaped. Testa thin, tenacious; endotesta thin, pale brown, cotyledons 2, yellowish-green, oily. Odour, slight; taste, bitter.

Identification Transverse section: Epidermal cells of testa consisting of rows of mucilage cells, with 1 row of palisade-arranged sclerenchymatous cells underneath, outer walls even or with a tail-like convex at the upper end, cell walls lignified, with cross-shaped or diagonal pits and uneven in thickness; cells of pigment layer containing orange-yellow or yellowish-brown contents and prisms of calcium oxalate, 7-16 μm in diameter. Endosperm cells 3-4 rows, some cell walls beaded, containing oil droplets. Cotyledon cells containing fine clusters or prisms of calcium oxalate, oil droplets and rosette crystals of hesperidin.

Processing *Semen Citri Reticulatae* Eliminate foreign matter, wash clean and dry. Break into pieces before use.

Semen Citri Reticulatae (*processed with salt*) Stir-bake the clean Semen Citri Reticulatae as described under the method for stir-baking with salt (Appendix Ⅱ D) to dryness and break into pieces before use.

Action To regulate the flow of *qi*, cause subsidence of nodulation, and relieve pain.

Indications Hernia; painful swelling of the testes; mastitis with formation of painful nodules.

Usage and dosage 3-9 g.

Storage Preserve in a dry place, protected from mould and moth.

Note The main cultivaries are *Citrus reticulate* 'Dahongpao' and *Citrus reticulate* '*tangerina*'.

Semen Coicis
(薏苡仁, Yiyiren)

Coix Seed

Coix Seed is the dried ripe kernel of *Coix lacryma-jobi* L. var. *mayuen* (Roman.) Stapf (Fam. Gramineae). The plant is collected in autumn when the fruit is ripe and dried in the sun. The fruit is picked up, dried in the sun, and the kernel is separated from the shell, yellowish-brown coat, and foreign matter.

Description Broad ovoid or elongated-elliptical, 4-8 mm long, 3-6 mm wide. Externally milky white, smooth, occasionally with yellowish-brown testa; One end obtusely rounded, the other end relatively broad and slightly dented with 1 pale brown dotted hilum; Dorsal surface rounded and protruding; ventral surface having 1 relatively broad and deep longitudinal furrow. Texture hard, fracture white and starchy. Odour, slight; taste, slightly sweet.

Identification (1) Powder: Pale whitish. Starch granules numerous, simple granule subrounded or polyhedral, 2-20 μm in diameter, hilum stellate; compound granules seldom visible, usually consisting of 2-3 components.

(2) To 1 g of the powder add 10 ml of petroleum ether (60-90℃), ultrasonicate for 30 minutes, cool and filter, evaporate the filtrate to dryness. Dissolve the residue in 1 ml of petroleum ether (60-90℃) as the test solution. Prepare a solution of 1 g of Semen Coicis reference drug in the same manner as the reference drug solution. Carry out the method for thin-layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃), ethyl acetate and acetic acid (10 : 3 : 0.1) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air and examine under ultra-violet light at 365 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution and the reference solution.

(3) Dissolve a quantity of semen coicis oil extractives CRS and linolein CRS, accurately weighed, in the mobile phase obtained under the Assay to produce the reference solutions of 1 mg and 0.14 mg per ml, respectively. Carry out the method as described under the Assay, inject accurately 10 μl of the test solution and the reference solution obtained under the Assay, and each of the above solutions into the column. The retention time of the peaks obtained with the test solution and the reference solution is concordant with each other. The retention time of seven main peaks obtained with the test solution and the reference solution of semen coicis oil extractives is concordant with each other.

Foreigh matter Not more than 2.0 per cent (Appendix Ⅸ A).

Water Not more than 15.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 3.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using anhydrous ethanol as the solvent, not less than 5.5 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and dichloromethane (65 : 35) as the mobile phase. As detector an evaporative light scattering detector is used. The number of theoretical plates of the column is not less than 5000, calculated with reference to the peak of linolein CRS.

Reference solution Dissolve a quantity of linolein CRS accurately weighed, in the mobile phase to produce a solution of 0.14 mg per ml.

Test solution Weigh accurately 0.6 g of the powder (through No. 3 sieve), add 50 ml of the mobile phase, accurately measured, weigh accurately and macerate for 2 h, ultrasonicate (power, 300 W; frequency, 50 kHz) for 30 minutes, allow to cool and weigh again, make up the loss in weight with the mobile phase to the initial weight and mix well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl and 10 μl of the reference solution, and 5-10 μl of the test solution into the column respectively, measure the peak area and calculate the content with external standard method.
It contains not less than 0.50 per cent of linolein ($C_{57}H_{104}O_6$), calculated with reference to the dried drug.

Processing *Semen Coicis* Eliminate foreign matter.

Semen Coicis (stir-baked) Stir-bake the clean Semen Coicis as described under the method for stir-baking with bran (Appendix Ⅱ D) until a pale yellow is produced.

Action To invigorate the spleen function and promote diuresis, alleviate arthritis, arrest diarrhea, remove *heat* and facilitate the drainage of pus.

Indications Edema, oliguria; arthritis with contracture of joints; diarrhea due to diminished function of the spleen; lung abscess, appendicitis; verruca plana.

Usage and dosage 9-30 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Semen Crotonis Pulveratum (巴豆霜, Badoushuang)

Defatted Croton Seed Powder

Defatted Croton Seed Powder is a processed product of Croton Seed.

Processing Treat the clean Croton Seed as described under the method for frost-like powder (Appendix Ⅱ D), or pulverize the seed and carry out the Assay to determine its content of fatty oil, add sufficient starch to make the fatty oil content in compliance with the requirement and mix well.

Description A pale yellow, lax powder, homogeneous in size, oily in appearance.

Identification Complies with the tests for Identification described under Fructus Crotonis.

Assay Heat under reflux about 5 g of the powder, accurately weighed, in a Soxhlet's extractor with 100 ml of ether for 6-8 hours to exhaust fatty oil. Transfer the extract to the evaporating dish dried previously to constant weight, remove the ether at a low temperature on a water bath. Dry the residue at 100℃ for 1 hour, cool, and weigh accurately.
It contains not less than 18.0 per cent and not more than 20.0 per cent of fatty oil.

Action To cause drastic purgation, relieve edema, and soothe the throat.

Indications Constipation and indigestion due to accumulation of cold; ascites and edema with oliguria and constipation; inflammation of the throat.

Usage and dosage 0.1-0.3 g; usually used for making pills or powder.

Precaution Contraindicated in pregnancy. Incompatible with Semen Pharbitidis.

Storage Preserve in a cool and dry place.

Semen Cuscutae (菟丝子, Tusizi)

Dodder Seed

Dodder Seed is the dried ripe seed of *Cuscuta chinensis* Lam. (Fam. Convolvulaceae). The plant is collected in autumn when the fruit is ripe, dried in the sun, the seed is collected and removed from foreign matter.

Description Subspherical, 1-1.5 mm in diameter. Externally greyish-brown or yellowish-brown, with numerous fine projecting dots, a slightly sunken linear raphe at one end. Texture hard, difficult to break with finger. Odour, slight; taste, weak.

Identification (1) Macerate a small quantity in boiling water, a mucilage is produced on the surface; boil until the testa is broken, yellowish-white silky rotary embryo is revealed.
(2) Powder: Yellowish brown or dark brown. The epidermal cell of testa subsquare or subrectangular in section, with lateral walls thickened; rounded polygonal, with walls at the corner markedly thickened in the surface view. Palisade cells of testa arranged in pieces, two raws of cells visible in section, with lustrous strip; polygonal shrunken in the surface view. Perisperm cell polygonal or subrounded, containing aleurone grains in the lumen. Cotyledon cell filled with aleurone grains and fatty oil droplets.

Total ash Not more than 10.0% (Appendix Ⅵ K).

Processing *Semen Cuscutae* Eliminate foreign matter, wash clean, dry in the sun.

Semen Cuscutae (stir-baked with salt-water) Stir-bake the clean Semen Cuscutae as described under the method for stir-baking with salt-water (Appendix Ⅱ D) until the seeds become slightly convex.
Externally brownish-yellow, broken and slightly aromatic. A mucilage is produced on the surface after macerating the processed Semen Cuscutae in an appropriate quantity of boiling water. A yellow to dark brown curved and rotary embryo is revealed after boiling.

Action To arrest seminal discharge and abnormal urination, prevent abortion, improve eyesight and relieve diarrhea by replenishing and tonifying the liver and the kidney.

Indications Impotence, seminal emission, dripping of urine after urination, enuresis, frequent urination, aching and weakness of the loins and knees, blurred vision and tinnitus; threatened abortion due to deficiency of the kidney; diarrhea due to hypofunction of the spleen and the kidney; external use for vitiligo.

Usage and dosage 6-12 g; appropriate quantity for external use.

Storage Preserve in a ventilated and dry place.

Semen Euphorbiae (千金子, Qianjinzi)

Caper Euphorbia Seed

Caper Euphorbia Seed is the dried ripe seed of *Euphorbia lathyris* L. (Fam. Euphorbiaceae). The drug is collected in summer and autumn when the fruit is ripe, removed from foreign matter, and dried.

Description Ellipsoidal or ovoid, about 5 mm long, 4 mm in diameter. Externally greyish-brown, with irregular reticulated wrinkles, greyish-black in the dents of reticulated pits, forming fine spots. A longitudinally furrowed raphe occurring on one side, a protrudent chalaza at the apex, a linear raphe at the lower end, and an almost white raised caruncle or its scar at the base. Testa thin and fragile, kernel white or yellowish-white, oily. Odour slight, taste, pungent.

Identification (1) Transverse section: Epidermal cells of testa undulated, outer wall relatively thickened containing brown contents; hypodermis consisting of 1-3 layers of parenchymatous cells; the inner epidermis consisting of 1 layer of subsquare palisade cells, the inner part of lateral walls and inner walls thickened distinctly. Palisade cells of endotesta 1 row, brown, slender cylindrical, with thickened and lignified walls, sometimes pits visible. Perisperm consisting of several layers of subsquare parenchymatous cells; cells of endosperm subrounded, cells of cotyledons square or rectangular. All containing aleurone grains.

(2) To 2 g of the powder in a Soxhlet's extractor add 80 ml of petroleum ether (30-60℃), heat under reflux for 30 minutes, filter and discard the petroleum ether solution. To the residue add 80 ml of ethanol, heat under reflux for 1 hour, cool, and filter, evaporate the filtrate to dryness. Dissolve the residue in 10 ml of ethanol and use it as the test solution. Dissolve esculetin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethyl cellulose as the coating substance and a mixture of toluene-ethyl acetate-formic acid (5 : 4 : 1) as the mobile phase. Apply separately 5 μl of the test solution and 1 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The bright bluish fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Processing *Semen Euphorbiae* Eliminate foreign matter, sift and wash clean, dry in the sun. Break into pieces before use.

Action To cause drastic purgation for treating edema, and eliminate blood stasis for treating masses.

Indications Edema or retained fluid with abdominal distension, oliguria and constipation; amenorrhea due to blood stasis; external use for ringworm and verrucous vegetations.

Usage and dosage 1-2 g without shell and oil, used in pills or powder; for external use, appropriate quantity is pounded into paste and applied topically.

Precaution Contraindicated in pregnancy or debility with loose bowels.

Storage Preserve in a cool and dry place, protected from moth.

Semen Euphorbiae Pulveratum (千金子霜, Qianjinzi Shuang)

Caper Euphorbia Seed Powder

Caper Euphorbia Seed Powder is the processed product of Semen Euphorbiae.

Processing Rub off the testa of clean Semen Euphorbiae, carry out the method for frost-like powder making (Appendix Ⅱ D) to make the frost-like powder.

Description Homogeneous and loose, light yellow powder, slightly oleaginous. Taste, pungent.

Identification Complies with Identification test (2) described under Semen Euphorbiae.

Assay Transfer 5 g, accurately weighed, to a Soxhlet's extractor, add 100 ml of ethanol, and heat under reflux for 6-8 hours to exhaust fatty oil. Collect the extracts to a evaporating dish dried previously to constant weight, and evaporate to dryness at a low temperature on a water bath. Dry at 100℃ for 1 hour, allow to cool and weigh accurately. It contains not less than 18.0 per cent and not more than 20.0 per cent of fatty oils.

Action and indications As described under Semen Euphorbiae.

Usage and dosage 0.5-1 g, usually used in pills or powder. For external use, appropriate quantity is applied topically.

Precaution and storage As described under Semen Euphorbiae.

Semen Euryales (芡实, Qianshi)

Gordon Euryale Seed

Gordon Euryale Seed is the dried kernel of ripe seed of *Euryale ferox* Salisb. (Fam. Nymphaeaceae). The ripe fruit is collected in late autumn and early winter, peeled, and the seed is taken out, washed clean, removed from hard shell (testa), and dried.

Description Subspherical, mostly broken, the whole one, 5-8 mm in diameter; surface showing brownish-red tegmen, one end yellowish-white, about 1/3 in size of the whole kernel, with a depressed dotted scar of hilum, white on removal of tegmen. Texture relatively hard, fracture white, starchy. Odour, slight; taste, weak.

Identification Powder: White, mainly consisting of starch granules. Simple granules subrounded, 1-4 μm in diameter, hilum of large granules indistinctly visible; compound granules mostly consisting of more than one hundred components, subspherical, 13-35 μm in diameter, a few consisting of 2-3 components.

Processing *Semen Euryales* Eliminate foreign matter.

Semen Euryales (stir-baked with bran) Stir-bake the clean Semen Euryales as described under the mehtod for stir-baking with bran (Appendix Ⅱ D) to pale yellow.

Action To benefit the kidney and arrest seminal discharge,

to invigorate the function of the spleen and relieve diarrhea, and to remove *damp* and check excessive leukorrhea.

Indications Nocturnal emission, spermatorrhea, enuresis, frequent urination; chronic diarrhea due to hypofunction of the *spleen*; turbid discharge mixed with urine, excessive leukorrhea.

Usage and dosage 9-15 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Semen Ginkgo (白果, Baiguo)

Ginkgo Seed

Ginkgo Seed is the dried ripe seed of *Ginkgo biloba* L. (Fam. Ginkgoaceae). The drug is collected in autumn when the seed is ripe, removed from the fleshy testa, washed clean, steamed or boiled briefly, and dried by baking gently.

Description Somewhat ellipsoidal, one end relatively acute and the other end obtuse, 1.5-2.5 cm long, 1-2 cm wide, about 1 cm thick. Externally yellowish-white or pale brownish-yellow, smooth, with 2-3 ribs. Mesotesta (shell) bony and hard. Endotesta membranous. Kernel broadly ovoid or ellipsoidal, one end pale brown and the other end golden-yellow; transverse section yellow, gelatinized in the outer part, and pale yellow or pale green in the inner part, starchy, with a fissure in the centre. Odour; slight; taste, sweet, slightly bitter.

Identification To 10 g of the powder add 40 ml of methanol, heat and reflux for 1 hour, filter, evaporate the filtrate to dryness, add 15 ml of water to dissolve the residue, filter with a few cotton, the filtrates pass through a pre-prepared polyamide small column (80-100 mesh, 3 g, 10-15 mm in inner diameter), elude with 70 ml of water, shake and extract the eludes with ethyl acetate for 2 times, each of 40 ml, combine the ethyl acetate solutions, evaporate to dryness, dissolve the residue with 1 ml of methanol and use as the test solution. Prepare a solution of bilobalide A CRS, bilobalide C CRS containing 0.5 mg respectively per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G previously prepared with 4% solution of sodium acetate, containing sodium carboxymethylcellulose, as the coating substance and a mixture of toluene, ethyl acetate, acetone and methanol (10 : 5 : 5 : 0.6) as the mobile phase. Apply separately to the plate 10 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with acetic anhydride, heat at 110℃ for 30 minutes to the spots distinct, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Processing *Nux Ginkgo* Remove foreign matter and shell from Semen Ginkgo. Break into pieces before use.

Nux Ginkgo (*stir-baked*) Stir-bake the clean Nux Ginkgo as described under the method for simple stir-baking (Appendix Ⅱ D) to scented. Break into pieces before use.

Action To arrest persistent cough and asthma, and reduce leukorrhea and urination.

Indications Persistent cough and asthma with profuse expectoration; morbid leukorrhea with whitish discharge; enuresis, frequent urination.

Usage and dosage 4.5-9 g.

Precaution Raw Semen Ginkgo is toxic.

Storage Preserve in a ventilated and dry place.

Semen Hyoscyami (天仙子, Tianxianzi)

Henbane Seed

Henbane Seed is the dried ripe seed of *Hyoscyamus niger* L. (Fam. Solanaceae). The fruit is collected in summer and autumn when the pericarp turns yellow, exposed to the sun, and the seeds are tapped out, removed from pericarp and branch, dried in the sun.

Description Flattened subreniform or flattened ovoid, about 1 mm in diameter. Externally brownish-yellow or greyish-yellow, with fine reticulated striations, and a pointed hilum at the somewhat acute end. Section greyish-white, oily, having endosperm, embryo curved. Odour, slight; taste, slightly pungent.

Identification (1) To 0.5 g of the powder add 0.5 ml of concentrated ammonia TS, mix well, add 5 ml of chlorofrom, stopper tightly, shake constantly for 0.5 hour, filter. Evaporate the filtrate to dryness, dissolve the residue in 0.5 ml of chloroform. Evaporate 5 drops of the solution on a water bath to dryness, add 4 drops of fuming nitric acid, evaporate to dryness. To the residue add 1 ml of dehydrated ethanol and a small piece of potassium hydroxide, a purple colour is produced.
(2) To 1 g of the powder add 10 ml of petroleum ether (30-60℃), ultrasonicate for 15 minutes, discard the petroleum ether solution, treat the residue in the same manner once again. Evaporate the residue to dryness, moisten with 2 ml of a mixed solution of equal amount of concentrated ammonia TS and ethanol, add 20 ml chloroform, ultra sonicate for 15 minutes, filter. Evaporate the filtrate to dryness, dissolve the residue in 0.5 ml of dehydrated ethanol as the test solution. Dissolve atropine sulfate CRS and scopolamine hydrobromide CRS in dehydrated ethanol to produce a solution containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate methanol and concentrated ammonia TS (17 : 2 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of two solutions. After developing and removal of the plate, dry in air, spray with potassium iodobismuthate TS and ethanolic sodium nitrite TS successively. The two brown spots in the chromatogram obtained with the test solution correspond in position and colour to the two spots in the chromatogram obtained with the reference solution.

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 3.0 per cent (Appendix Ⅸ K).

Action To relieve spasm and pain, cause tranquilization and alleviate asthma.

Indications Gastric spasm and pain; asthma and cough; mania.

Usage and dosage 0.06-0.6 g.

Precaution Contraindicated in heart diseases, tachycardia,

glaucoma and pregnancy.

Storage Preserve in a ventilated and dry place.

Semen Impatientis (急性子, Jixingzi)

Garden Balsam Seed

Garden Balsam Seed is the dried ripe seed of *Impatiens balsamina* L. (Fam. Balsaminaceae). The drug is collected in summer and autumn when the fruit is nearly ripe, dried in the sun, removed from pericarp and foreign matter.

Description Elliptic, oblate, or ovoid, 2-3 mm long, 1.5-2.5 mm wide. Externally brown or greyish-brown, rough, with sparse white or pale yellowish-brown spots. Raphe occurring at the narrow end, slightly prominent. Texture hard, testa thin, cotyledons greyish-white, translucent, oily. Odour, slight; taste, weak, slightly bitter.

Action To eliminate blood stasis, soften hard masses, and remove undigestion food.

Indications Masses; amenorrhea; dysphagia.

Usage and dosage 3-4.5 g.

Precaution Used with caution in pregnancy.

Storage Preserve in a dry place.

Semen Juglandis (核桃仁, Hetaoren)

English Walnut Seed

English Walnut Seed is the dried ripe seed of *Juglans regia* L. (Fam. Juglandaceae). The drug is collected in autumn when the fruit is ripe, removed from the fleshy pericarp, dried in the sun, then removed from the nut-shell and lignified septate.

Description Mostly broken to irregular pieces, with shrunken and curved furrows, varying in size. The whole seeds subspheroidal, 2-3 cm in diameter. Testa pale yellow or yellowish-brown, membranous, veins of vascular bundles dark brown. Cotyledons almost white. Texture fragile, oily. Odour, slight; taste, sweet, testa taste, astringent and slightly bitter.

Water Carry out the method for the determination of water (Appendix Ⅸ H, method 1), not more than 7.0%.

Action To tonify the kidney, warm the lung, and relax the bowels.

Indications Aching and weakness of the loins and knees; impotence, seminal emission, asthma and cough of deficiency-cold type, constipation.

Usage and dosage 6-9 g.

Storage Preserve in a cool and dry place, protected from moth.

Semen Lablab Album (白扁豆, Baibiandou)

White Hyacinth Bean

White Hyacinth Bean is the dried ripe seed of *Dolichos lablab* L. (Fam. Leguminosae). The fruit is collected in autumn and winter when ripe, dried in the sun, and the seed is gathered, and dried again in the sun.

Description Flattened-ellipsoidal or flattened-ovoid, 8-13 mm long, 6-9 mm wide, about 7 mm thick. Externally pale yellowish-white or pale yellow, smooth, somewhat lustrous, with a white, prominent, eyebrow-shaped caruncle at the edge of one side. Texture hard. Testa thin and brittle, cotyledones 2, plump, yellowish-white. Odour, slight; taste, weak, bean-like on chewing.

Identification Transverse section: Epidermis of 1 layer of palisade cells, 2 layers at hilum, light bend distinct. Supporting cells of 1 layer, dumbell-shaped, 3-5 layers at hilum. Parenchyma of 10 layers of cells, located under supporting cells, the inner ones obiterate. Cells of cotyledons containing numerous starch granules. The outer part of palisade cells at hilum with caruncle, the inner part with tracheid islet, elliptical walls reticularly thickened, with stellate tissue at two sides, cells stellate, with large intercellular space, some lumen containing brown contents.

Processing *Semen Lablab Album* Eliminate foreign matter. Break to pieces before use.

Semen Lablab Album (*stir-baked*) Stir-bake the clean Semen Lablab Album as described under the method for simple stir-baking (Appendix Ⅱ D) until it becomes yellowish, with charred spots. Break to pieces before use.

Action To invigorate the spleen and remove *damp*, particularly the *summer-damp*.

Semen Lablab Album (*stir-baked*) To invigorate the spleen and remove *damp*.

Indications Weakness of the spleen and stomach with loss of appetite and loose bowels; excessive leukorrhea; vomiting, diarrhea, distress in the chest and distension in the abdomen caused by *summer-damp*.

Semen Lablab Album (*stir-baked*) Diarrhea and excessive leukorrhea in deficiency syndrome of the spleen.

Usage and dosage 9-15 g.

Storage Preserve in a dry place, protected from moth.

Semen Lepidii Semen Descurainiae (葶苈子, Tinglizi)

Pepperweed Seed

Tansymustard Seed

Pepperweed Seed or Tansymustard Seed is the dried ripe seed of *Lepidium apetalum* Willd. or *Descurainia sophia* (L.) Webb ex Prantl. (Fam. Cruciferae). The former is commonly known as "Bei Tinglizi", and the latter is known as "Nan

Tinglizi". The plant is collected in summer when the fruit is ripe, dried in the sun, and the seed is gathered, removed from foreign matter.

Description *Seed of Lepidium apetalum* Flattened-ovoid, 1-1.5 mm long, 0.5-1 mm wide. Externally brown or reddish-brown, somewhat lustrous, with 2 longitudinal furrows, one of them relatively distinct. One end obtuse, the other acute and slightly concave, almost white, hilum situated at the concave end. Odour, slight; taste, slightly pungent, relatively viscous.

Seed of Descurainia sophia Oblong, somewhat flattened, about 1 mm long, 0.5 mm wide. One end obtuse, the other end slightly concave or relatively truncate. Taste, slightly pungent and bitter, somewhat viscous.

Identification (1) Macerate a small quantity of the drug in water, observe under a magnifier, the transparent mucilage layer of *Seed of Lepidium apetalum* is relatively thick occurred in more than 1/2 of the width of seed. The transparent mucilage layer of *Seed of Descurainia sophia* is thin and occurs in less than about 1/5 of the width of seed.
(2) *Seed of Lepidium apetalum* Powder: yellowish-brown. Epidermal cells of testa consisting of mucilage cells, rectangular in section view, thickened inner-walls, extending outwards to cellulose column, 24-34 μm long, obtuse-rounded, oblique or truncate at apex, mucilage striations visible in periphery. Inner epidermal cells of testa yellow, polygonal, subsquare, some times longpolygonal in surface view, 15-42 μm in diameter, walls 5-8 μm thick.

Seed of Descurainia sophia Outer epidermal cells of testa subsquare in section view, cellulose column short, 8-18 μm long, inner epidermal cells of testa rectangular polygonal in surface view.

Swelling capacity Weigh about 0.6 g of the drug, carry out the method for the determination of swelling capacity (Appendix Ⅸ O), not less than 12 for Semen Lepidii, and not less than 3 for Semen Descurainiae.

Processing *Semen Lepidii or Semen Descurainiae* Eliminate foreign matter.

Semen Lepidii or Semen Descurainiae (*stir-baked*) Stir-bake the clean Semen Lepidii or Semen Descurainiae as described under the method for simple stir-baking (Appendix Ⅱ D) until it cracks.

Action To quench *fire* in the lung, relieve dyspnea, and cause urination.

Indications Dyspnea, cough with profuse expectoration and fullness sensation in the chest, accompanied with hydrothorax, ascites and oliguria; edema in pulmonary heart disease.

Usage and dosage 3-9 g, decocted with wrapping.

Storage Preserve in a dry place.

Semen Lini
(亚麻子, Yamazi)

Linseed

Linseed is the dried ripe seed of *Linum usitatissimum* L. (Fam. Linaceae). The plant is collected in autumn when the fruit is ripe, dried in the sun. The seed is tapped off, removed from foreign matter, and dried again in the sun.

Description Flattened-ovate, obtuse at one end, acute and slightly oblique at the other end, 4-6 mm long. 2-3 mm wide. Externally reddish-brown or greyish-brown, smooth, lustrous. Hilum occurring at the sunken part of the acute end; raphe pale brown, occurring at the edge of one side. Testa thin, endosperm brown, membranous; cotyledons 2, yellowish-white, oily. Odour, slight; taste, bean-like on chewing.

Identification (1) Soak a few of the drug with warm water, the epidermal mucilage layer swells to a transparent mucilage membrane surrounding the seed.
(2) Transverse section: Epidermal cells relatively large, subrectangular, walls containing mucilage, swelling and showing striations when contacted with water, externally covered with cuticle. Hypodermis consisting of 1-5 layers of parenchymatous cells, with slightly thickened walls. Fibre layer consisting of 1 layer of fiber cells, arranging closely, slightly prolonged radially, 3-5 μm in diameter, walls thickened and lignified, lumen relatively narrow, striations indistinctly visible. Cells of decadent layer indistinct. Pigment layer consisting of 1 layer of flattened parenchymatous cells, containing brownish-red contents. Cells of endospermum and cotyledons polygonal, containing fatty oil and aleurone grains. Aleurone grain 7-14 μm in diameter, containing 1-2 crystalloids and globoids.
(3) To 0.5 g of the powder add a small amount of water in a test tube, hanging a stripe of trinitrophenol TP, impregnated with 10% solution of sodium carbonate (the stripe should not touch the powder and the tube wall), stopper tightly, heat on a hot water bath for 3-5 minutes, the test paper turns to a brick-red colour.

Processing Eliminate foreign matter, break to pieces or grind after stir-frying.

Action To cause lubrication and dispel *wind*.

Indications Constipation, dryness and itching of the skin, withering and loss of hair.

Usage and dosage 9-15 g.

Precaution Contraindicated in patients with loose bowels.

Storage Preserve in a cool and dry place, protected from moth.

Semen Litchi
(荔枝核, Lizhihe)

Lychee Seed

Lychee Seed is the dried ripe seed of *Litchi chinensis* Sonn. (Fam. Sapindaceae). The fruit is collected in summer when ripe, and the seed is removed from pericarp and fleshy aril, washed clean, and dried in the sun.

Description Prolate-rounded or ovoid, slightly flattened, 1.5-2.2 cm long, 1-1.5 cm in diameter. Externally brownish-red or purplish-brown, smooth, lustrous, with slightly dents and fine wrinkles, bearing a subrounded, yellowish-brown raphe at one end, about 7 mm in diameter. Texture hard, cotyledons 2, brownish-yellow. Odour, slight; taste, slightly sweet, bitter and astringent.

Identification Powder: brownish-yellow. Parquetry layer cells yellowish-brown, stripe-shaped, with several cells forming a group, in irregular parquet. Stellate cells brownish, presenting irregular stellate branches, truncate or relatively obtuse rounded at the apex of branch, intercellular space wide, walls thin. Stone cells occuring in

groups or scattering in singles, subrounded, subsquare, subpolyangular, rectangle or oval, most protruding or branched. Cotyledon cells subrounded or subpolyangular, filled with starch granules, brown oil cells visible.

Processing *Semen Litchi* Eliminate foreign matter, wash clean and dry. Break to pieces before use.

Semen Litchi (*processed with salt*) Stir-bake the clean Semen Litchi as described under the method for processing with salt water (Appendix Ⅱ D) to dry.

Action To promote the flow of *qi* and the subsidence of induration, and dispel *cold* and relieve pain.

Indications Hernial pain of cold type, swelling and pain of the testes.

Usage and dosage 4.5-9 g.

Storage Preserve in a dry place, protected from moth.

Semen Momordicae (木鳖子, Mubiezi)

Cochinchina Momordica Seed

Cochinchina Momordica Seed is the dried ripe seed of *Momordica cochinchinensis* (Lour.) Spreng. (Fam. Cucurbitaceae). The ripe fruit is collected in winter, cut and half-dried in the sun. The seed is removed from the pulp and dried.

Description Flattened-orbicular plate-like, slightly raised or dented in the centre, 2-4 cm in diameter, about 5 mm thick. Externally greyish-brown to blackish-brown, with reticulated patterns and a yellowish hilum at the relatively larger dentate protruding in the margin. Testa hard and brittle, endotesta greyish-green, tomentose-like. Cotyledons 2, yellowish-white, oily. Odour, characteristically greasy; taste, bitter.

Identification (1) Powder: Yellowish-grey. Sclerenchymatous cells elliptical or subrounded, sinuous-margined, 51-117 μm in diameter. with thickened and lignified walls, and lumina distinct and some narrowed. Parenchymatous cells of cotyledons polygonal, containing fixed oil masses and aleurone grains; fixed oil masses subrounded, 27-73 μm in diameter, reticulated striations visible on the surface.
(2) To 2 g of the coarse powder add 20 ml of ether, macerate warmly for 30 minutes and filter. Place 2 ml of the ether extract into a glass dish, evaporate to dryness. To the residue add a small quantity of anhydrous sodium sulfate, heat, bubbles and thick white irritating gas are produced.
(3) To 2 g of the coarse powder add 20 ml of water, heat on a water bath for 30 minutes and filter. Place 2 ml of the filtrate into a stoppered test tube, shake vigorously for 1 minute, a large amount of foam is produced, which persists for 10 minutes.

Processing *Semen Momordicae* Remove the shell and break the kernel to pieces.

Semen Momordicae (*frost-like powder*) Stir-bake clean kernels, triturate, wrap in paper and press to remove the oil.

White or greyish-white lax powder.

Action To promote the subsidence of nodulation and swelling, counteract poisons and cure sores.

Indications Sores and inflammatory swelling, mastitis, scrofula, hemorrhoids, anal fistula, chronic eczema, neurodermatitis, scald.

Usage and dosage 0.9-1.2 g for oral administration; appropriate quantity is ground into powder and mixed with oil or vinegar for topical application.

Precaution Used with caution in pregnancy.

Storage Preserve in a dry place.

Semen Myristicae (肉豆蔻, Roudoukou)

Nutmeg

Nutmeg is the dried kernel of *Myristica fragrans* Houtt (Fam. Myristicaceae).

Description Ovoid or ellipsoidal, 2-3 cm long, 1.5-2.5 cm in diameter. Externally greyish-brown or greyish-yellow, sometimes covered with white powder (lime powder). Pale longitudinal furrows and irregular reticulated wrinkles occurred all over the seed. A hilum occurring at the broad end, showing a pale coloured, rounded convex. Chalaza dark and dented. Raphe longitudinally furrowed, connecting with two ends. Texture hard, fracture showing marble-like striations, brownish-yellow, interweaved. A dried and shrunken embryo visible at the broad end, oily. Odour, strongly aromatic; taste, pungent.

Identification (1) Transverse section: Outer layers of perisperm consisting of more than 10 rows of flattened and wrinkled cells, containing brown contents, small prisms visible occasionally, crisscross tissure with small vascular bundles, dark brown perisperm inserting to the pale yellow endosperm, forming marble-like striations, with numerous oil cells. Cells of endosperm thin-walled, subrounded, filled with starch granules, fatty oil droplets and aleurone grains, scattered with pale yellow cells. Starch granules mostly simple, 10-20 μm in diameter, occasionally compound, composed of 2-6 components, 25-30 μm in diameter, hilum distinct. After treating with iodine solution and mounting in glycerin, examine immediately under a microscopy, the relatively large aleurone grains visible among numerous bluish-black starch granules. If mount in chloral hydrate, the fatty oil often showing piece-shaped or scale-shaped, and turning to oil droplets while heating.
(2) To the volatile oil, obtained from the Assay, add chloroform to prepare a solution containing 0.2 ml of volatile oil per ml as the test solution. Prepare a solution of 20 g of Semen Myristicae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and benzene (1 : 1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with anisaldehyde TS, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Water Carry out the method for determination of water (Appendix Ⅸ H, method 2), not more than 10.0 per cent.

Assay Weigh accurately 20 g of the coarse powder, carry out the method for determination of volatile oil (Appendix Ⅹ D).
It contains not less than 6.0 per cent (ml/g) of volatile oil.

Processing *Semen Myristicae* Eliminate foreign matter, wash clean, and dry.

Semen Myristicae (*stir-baked with gentle heat*) To each

clean Semen Myristicae, wrap in a mixture of wheat flour and a quantity of water, or carry out the method of making water pills, moisten the surface of Semen Myristicae with water, wrap in 3-4 layers of wheat flour. Stir-bake the wrapped drug with heated talc powder or sand until the wheat flour cover showing charred yellow, sift, strip off the cover and cool, using 50 kg of talc powder per 100 kg of Semen Myristicae.

Action To warm the spleen and stomach and promote the flow of *qi*, and arrest diarrhea as an astringent.

Indications *Deficiency-cold* of the spleen and stomach with persistent diarrhea, epigastric and abdominal distension and pain, anorexia, and vomiting.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place, protected from moth.

Semen Nelumbinis (莲子, Lianzi)

Lotus Seed

Lotus Seed is the dried ripe seed of *Nelumbo nucifera* Gaertn. (Fam. Nymphacaceae). The drug is collected in autumn when ripe, removed from the pericarp, and dried.

Description Somewhat ellipsoidal or subspheroidal, 1.2-1.8 cm long, 0.8-1.4 cm in diameter. Externally pale yellowish-brown to reddish-brown, with fine longitudinal striations and relatively wide veins. The centre of one end papillate, dark brown, mostly with cracks, somewhat dented around the edge. Texture hard, testa thin, uneasily peeled off. Cotyledons 2, yellowish-white, plump, with green lotus plumale at the space between two cotyledons. Odour, slight; taste, sweet, slightly astringent.

Identification (1) Powder: almost white. Mainly starch granules. Simple granule long rounded, sub-rounded, subtriangular, some with small protruding, 4-25 μm in diameter, a few hilum visible, cleft or dotted; compound granule rare, consisting of 2-3 components. Cells of pigmented layer yellowish-brown or reddish-brown, on surface view subrectangular, sublongpolygonal or sub-rounded, sometimes calcium oxalate clusters visible. Cotyledon cells oval, walls slightly thickened, some beaded, pitted areas faint. Annular and spiral vessels visible.
(2) Shake thoroughly a small quantity of the powder and a quantity of water, add several drops of iodide TS; a bluish-purple colour is produced. The colour abate gradually after heating, allow to cool, the bluish-purple produced again.
(3) Macerate 0.5 g of the powder in 5 ml of water, filter to a test tube, add several drops of α-naphthol TS, mix well, add dropwise 1 ml of sulfuric acid along the tube wall; a purple colour ring is produced at the junction of the two layers.
(4) To 5 g of the coarse powder add 30 ml of chloroform, shake, allow to stand over night, filter, evaporate the filtrate to dryness. Dissolve the residue in 2 ml of ethyl acetate as the test solution. Prepare a solution of 5 g of Semen Nelumbinis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and acetone (7 : 2) as the mobile phase. Apply separately 2 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in 10% sulfuric acid ethanol solution and heat at 105℃ to the spot distinct. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H, method 1), not more than 14.0 per cent.

Processing Soak with water for a moment, soften thoroughly, cut, remove the lotus *plumule*, and dry.

Action To tonify the spleen, relieve diarrhea, replenish the kidney, arrest seminal emission, nourish the heart, and induce tranquillization.

Indications Protracted diarrhea due to hypofunction of the spleen, seminal emission, leukorrhagia; palpitation, insomnia.

Usage and dosage 6-15 g.

Storage preserve in a dry place, protected from moth.

Semen Nigellae (黑种草子, Heizhongcaozi)

Fennelflower Seed

Fennelflower Seed is the dried seed of *Nigella glandulifera* Freyn (Fam. Ranunculaceae), used commonly by the Uygur nationality. The drug is collected in autumn, removed from soil and pericarp, and dried in the sun.

Description Triangular-ovoid, 2.5-3 mm long, about 1.5 mm wide. Externally black and rough, apex somewhat narrow and sharp; base relatively obtuse, with irregular protrudings. Texture hard; fracture greyish-white, oily. Odour, slightly aromatic; taste, pungent.

Identification Transverse section: Epidermis cells of testa 1 row, varying in size, subrectangular or irregularly oblong, frequently elongated tangentially, outer walls mostly with papilla-like or nonglandular hair-like excrescences, walls slightly thickened, dark brown; cuticle somewhat thin, finely and densely granulate striations indistinctly visible. Parenchyma of testa consisting of 3-4 rows of cells, rectangular or irregular, somewhat elongated tangentially; inner epidermis cells 1 row, flattened, brown. Perisperm consisting of 1 row of rectangular cells, elongated radially, sometimes dilapidated; endosperm cells polygonal, filled with oil droplets and aleurone grains. Cotyledon cells polygonal or subrounded, the outer row of cells slightly elongated radially, filled with aleurone grains and fatty oil droplets.
Powder: Greyish-black. Epidermal cells of testa dark brown, polygonal on surface view, varying in size. the outer walls gibbose or mammillate, the inner epidermis of testa, brown, rectangular, or subpolygonal on surface view, anticlinal walls beaded, periclinal walls finely and densely reticulate-striated. Endosperm cells polygonal, containing oil droplets and aleurone grains.

Foreign matter Not more than 5.0 per cent (Appendix Ⅸ A).

Water Carry out the method for determination of water (Appendix Ⅸ H, method 2), not more than 10.0 per cent.

Total ash Not more than 8.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), not less than 25.0 per cent.

Action To replenish the kidney and benefit the brain, stimulate menstruation, promote lactation, and induce urination.

Indications Tinnitus and forgetfulness; amenorrhea; oligogalaetia; urinary infection, urolithiasis.

Usage and dosage 2-6 g.

Precaution Contraindicated in pregnancy and the patients with febrile diseases.

Storage Preserve in a cool and dry place.

Semen Oroxyli
(木蝴蝶, Muhudie)

Indian Trumpetflower Seed

Indian Trumpetflower Seed is the dried ripe seed of *Oroxylum indicum* (L.) Vent. (Fam. Bignoniaceae). The fruit is collected in autumn and winter, exposed to strong sun light until the fruit dehiscent, the seed is gathered, and dried in the sun.

Description Butterfly-shaped thin slices, testa extended to wide and thin wing at three sides except the base, 5-8 cm long, 3.5-4.5 cm wide. Externally pale yellowish-white, the wing translucent, silky lustrous, with radial striations, most of the edge broken. Texture light, when removed from testa showing cotyledons surrounded by a membranous endosperm. Cotyledons 2, butterfly-shaped, yellowish-green or yellow, 1-1.5 cm in long diameter. Odour, slight; taste, slightly bitter.

Identification (1) Powder: yellow or yellowish-green. Cells of seed wing long fibre-shaped, with sinuously thickened walls, 20-40 μm in diameter. Cells of endosperm polygonal, with beaded walls.

(2) To 2 g of the powder add 30 ml of ethanol, heat under reflux for 15 minutes, filter. Dissolve 0.5 g boric acid in the filtrate, filter, use filtrate as the test solution. Dissolve baicalin CRS in the ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of *n*-butanol, acetic acid and water (6 : 1.5 : 2.5) as the mobile phase. Apply separately 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Action To remove *heat* from the lung and relieve sore throat, and regulate the flow of *qi* of the liver and the stomach.

Indications Cough, sore throat and hoarseness due to *heat* in the lung; epigastic pain due to stagnation of *qi* of the liver and the stomach.

Usage and dosage 1.5-3 g.

Storage Preserve in a ventilated and dry place.

Semen Persicae
(桃仁, Taoren)

Peach Seed

Peach Seed is the dried ripe seed of *Prunus persica* (L.) Batsch or *Prunus davidiana* (Carr.) Franch. (Fam. Rosaceae). The fruit is collected when ripe. The seed is removed from sarcocarp and shell (endocarp), and dried in the sun.

Description *Seed of Prunus persica* Prolate-ovate, 1.2-1.8 cm long, 0.8-1.2 cm wide, 0.2-0.4 cm thick. Externally yellowish-brown to reddish-brown, with numerous granular protrudings. One end acute, expanded in the middle, the other end obtuse-rounded and slightly oblique, with relatively thin edge. A short linear hilum occurring by the acute end and a relatively distinct and slightly dark chalaza at the round end, with many longitudinal vascular bundles radiated from the chalaza. Testa thin, cotyledons 2, almost white and oily. Odour, slight; taste, slightly bitter.

Seed of Prunus davidiana Subovoid, smaller but thicker, about 0.9 cm long, 0.7 cm wide and 0.5 cm thick.

Identification *Powdered or isolated tissue of testa of Seed of Prunus persica* Stone cells yellow or yellowish-brown, conchoidal, helmet-shaped, bow-shaped or elliptic in lateral view, 54-153 μm high, up to 180 μm wide at the base, with one side wall thicker and more densely striated than the other side; subrounded, rounded, polygonal or sub-square in surface view, with large and dense pits in the cell bottom walls.

Powdered or isolated tissue of testa of Seed of Prunus davidiana Stone cells pale yellow, orange-yellow or orange-red, conchoidal, oblong, elliptic or stripe-shaped in lateral view, 81-198 (279) μm high, about 128 (198) μm wide; subrounded, subhexagonal, prolately polygonal or subsquare in surface view, with smaller pits in the unevenly thickened bottom walls.

Acid value Not more than 10.0 (Appendix IX P).

Carbonyl value Not more than 11.0 (Appendix IX P).

Processing *Semen Persicae* Eliminate foreign matter. Break to pieces before use.

Semen Persicae (blanched in boiling water) Peel the clean Semen Persicae as described under the method for rinsing in boiling water (Appendix II D). Break to pieces before use.

Semen Persicae (stir-baked) Stiry-bake the water rinsed Semen Persicae as described under the method for simple stir-baking (Appendix II D) to yellow colour. Break to pieces before use.

Action To promote blood circulation, eliminate blood stasis, and relax the bowels.

Indications Amenorrhea, dysmenorrhea, mass formation in the abdomen, traumatic injuries; constipation.

Usage and dosage 4.5-9 g.

Precaution Used with caution in pregnancy.

Storage Preserve in a cool and dry place, protected from moth.

Semen Pharbitidis
(牵牛子, Qianniuzi)

Pharbitis Seed

Pharbitis Seed is the dried ripe seed of *Pharbitis nil* (L.) Choisy or *Pharbitis purpurea* (L.) Voigt (Fam. Convolvulaceae). The plant is cut up in

the late autumn when the fruit is ripe but not dehiscent, dried in the sun. The seed is tapped out, and removed from foreign matter.

Description Orange segment-shaped, 4-8 mm long, 3-5 mm wide. Externally greyish-black (Heichou) or yellowish-white (Baichou). Dorsal side with 1 shallow longitudinal furrow and ventral side with a pointed and slightly dented hilum at the lower end of rib. Texture hard, in transverse section, lowish or yellowish-green crumpled and folded cotyledons visible, slightly oily. Odour, slight; taste pungent, bitter and numb.

Identification (1) Testa rimose when soak the drug in water giving a clear viscous and lubricate feeling when twisted with the fingers.
(2) Powder: Pale yellowish-brown. Epidermal cells of testa dark brown, irregular in shape, with lightly sinuous walls. Nonglandular hairs unicellular, yellowish-brown, slightly curved, 50-240 μm long. Secretory cavities visible in cotyledon fragments, rounded or elliptical, 35-106 μm in diameter. Clusters of calcium oxalate 10-25 μm in diameter. Fragments of palisade cells of testa and light band visible occasionally.
(3) To 2 g of the powder, prepare the solution in the same manner described under Assay as the reference drug solution. Dissolve the caffeic acid CRS and caffeoyl acetate CRS in methanol to produce a solution containing each 1 mg of per ml as the reference solution. Carry out the method for the thin layer chromatography (Appendix Ⅵ B), using silica G as the coating substance and the mixture of chloroform, methanol and formic acid (10 : 9 : 4) as the mobile phase. Apply separately 10-20 μl of each of the test solution under Assay and the reference drug solution, 10 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with a 5% solution of phosphomolybdic acid TS, heat at 110℃ to the spot clear. The black-blue spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 10.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the cold maceration method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using ethanol as the solvent, not less than 15.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and acetonitrile as mobile phase A, 0.04% phosphoric acid solution (containing 2% isopropanol) as mobile B, elute in gradient as the following:

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0-12	13	87
12-13	13→54	87→46
13-19	54	46

As detector a spectrophotometer set at 325 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of caffeic acid.

Reference solution Dissolve a quantity of caffeic acid CRS and caffeic acid acetate CRS, accurately weighed, in methanol to prepare a solution containing 10 μg per ml, respectively.

Test solution Weigh accurately 2 g of the powder (through No. 4 sieve) into a Soxhlet's extractor, extract with a quantity of petroleum ether (60-90℃) under reflux for 2 hours, discard petroleum ether, evaporate the residue to dryness. Extract the residue with a mixture of chloroform and methanol (3 : 1) for 6 hours, evaporate the extract to a small quantity, transfer into a 10 ml volumetric flask, wash the container with the same solvent, combine the washings into the same volumetric flask. Dilute to volume, and mix well.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 0.20 per cent of the total amount of caffeic acid ($C_9H_8O_4$) and caffeic acid acetate ($C_{11}H_{12}O_4$), calculated with reference to the dried drug.

Processing *Semen Pharbitidis* Eliminate foreign matter. Break to pieces before use.

Semen Pharbitidis (stir-baked) Stir-bake the clean Semen Pharbitidis as described under the method for simple stir-baking (Appendix Ⅱ D) to slightly inflated. Break to pieces before use.

Action To cause drastic purgation for clearing away retained fluid, and kill worms.

Indications Anasarca with constipation and oliguria; dyspnea and cough caused by retained fluid; abdominal pain due to intestinal parasitosis; ascariasis, taeniasis.

Usage and dosage 3-6 g.

Precaution Contraindicated in pregnancy. Incompatible with Fructus Crotonis or Semen Crotonis Pulveratum.

Storage Preserve in a dry place.

Semen Phaseoli (赤小豆, Chixiaodou)

Rice Bean

Rice Bean is the dried ripe seed of *Phaseolus calcaratus* Roxb. or *Phaseolus angularis* Wight (Fam. Leguminosae). The plant is uprooted in autumn when the fruit is ripe but not dehiscent, and dried in the sun. The seed is collected, removed from foreign matter, and dried in the sun again.

Description *Seed of Phaseolus calcaratus* Oblong and slightly flattened. 5-8 mm long, 3-5 mm in diameter. Externally purplish-red. Lustrousless or somewhat lustrous, hilum linear-raised at one side and inclined to one end, white, about 2/3 in length of the seed, dented and forming a longitudinal furrow in the middle; and with an indistinct ridge at the other side. Texture hard, uneasily broken, cotyledons 2, milky-white. Odour, slight; taste, slightly sweet.

Seed of Phaseolus angularis Short cylindrical, both ends slightly truncate or obtusely rounded, 4-6 mm in diameter. Externally dark brownish-red, lustrous, hilum not raised.

Identification *Seed of Phaseolus calcaratus* Transverse section: Epidermal cells of testa consisting of 1 row palisade cells, 2 row in hilum, containing reddish-brown substances, light band distinct. Pillar cells 1 row, dumbbell-shaped, underneath ranged 10 rows of parenchymatous cells with the

inner cells dilapidated. Cotyledon cells containing numerous starch granules and fine prisms and clusters of calcium oxalate. a caruncle occurring at outside the palisade cells in hilum, a tracheid island occurring inside, elliptical, cell walls reticulate thickened, with actinenchyma in both sides, cells stellar, with large intercellular space.

Seed of Phaseolus angularis Fine calcium oxalate prisms occasionally visible in cotyledon cells, containing no clusters.

Action To cause urination, counteract *toxicity*, and promote the drainage of pus.

Indications Edema; jaundice with dark urine; acute rheumatic arthritis; carbuncles, boils, appendicitis.

Usage and dosage 9-30 g; for external use, appropriate quantity is ground into powder and applied topically after mixing with liquid.

Storage Preserve in a dry place, protected from moth.

Semen Plantaginis (车前子, Cheqianzi)

Plantain Seed

Plantain Seed is the dried ripe seed of *Plantago asiatica* L. or *Plantago depressa* Willd. (Fam. Plantaginaceae). The fruit-spike is collected in summer and autumn when the seed is ripe, and dried in the sun. The seed is rubbed out and removed from foreign matter.

Description Ellipsoid, irregularly oblong or triangular oblong, slightly flattened, about 2 mm long, 1 mm wide. Externally yellowish-brown to dark brown, with fine wrinkles, and a greyish-white concave pointed hilum on one side. Texture hard. Odour, slight; taste, weak.

Identification (1) *Seed of Plantago asiatica* Powder: Dark yellowish-brown. The outer epidermal cells of testa subsquare or slightly elongated tangentially in sectional view, with mucilaginous walls. The inner epidermal cells of testa subrectangular in surface view, 5-19 μm in diameter, up to about 83 μm long, thin-walled, slightly sinuous, usually parqueted. The endosperm cell walls heavily thickened, filled with small aleurone grains.

Seed of Plantago depressa The inner epidermal cells of testa relatively small, 5-15 μm in diameter, 11-45 μm long. (2) Shake 0.1 g of the drug with 3 ml of water, allow to stand for 30 minutes and filter. To the filtrate add 3 ml of dilute hydrochloric acid, boil for 1 minute, cool, neutralize with sodium hydroxide TS, add 1 ml of alkaline cupric tartarate TS, heat on a water bath; a red precipitate is produced.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Swelling Capacity Weigh accurately 1 g of the drug, carry out the method for determination of swelling capacity (Appendix Ⅸ O). Not less than 4.0.

Processing *Semen Plantaginis* Eliminate foreign matter.

Semen Plantaginis (processed with salt) Stir-bake the clean Semen Plantaginis as described under the method for processing with salt-water (Appendix Ⅱ D) until it cracks, spray with salt-water and stir-bake to dryness.

Externally dark-brown or yellowish-brown, odour, slightly aromatic. Taste, slightly salty. Carry out the method described under Acid-insoluble ash, not more than 3.0 per cent, carry out the method described under Swelling capacity, not less than 5.0.

Action To remove *heat*, cause urination and eliminate *damp*, relieve dysuria, clear the eyes and promote expectoration.

Indications Edema; dysuria with difficult painful urination; diarrhea caused by *summer-damp*; inflammation of the eyes; cough caused by *phlegm-heat*.

Usage and dosage 9-15 g, decocted with wrapping.

Storage Preserve in a ventilated and dry place, protected from moisture.

Semen Platycladi (柏子仁, Baiziren)

Chinese Arborvitae Kernel

Chinese Arborvitae Kernel is the dried ripe kernel of *Platycladus orientalis* (L.) Franco (Fam. Cupressaceae). The ripe seed is collected in autumn and winter, dried in the sun, and removed from the testa.

Description Long ovoid or long elliptical, 4-7 mm long, 1.5-3 mm in diameter. Externally yellowish-white or pale yellowish-brown, covered with membranous tegmen, apex slightly acute, with a small dark brown point, base obtusely rounded. Texture soft, oily. Odour, slightly aromatic; taste, weak.

Acid value Not more than 40.0 (Appendix Ⅸ P).

Carbonyl value Not more than 30.0 (Appendix Ⅸ P).

Peroxide value Not more than 0.26 (Appendix Ⅸ P).

Processing *Semen Platycladi* Eliminate foreign matter and remaining testa.

Semen Platycladi (frost-like powder) Make the clean Semen Platycladi into frost-like powder as described under the method for frost-like powder (Appendix Ⅱ D).

Action To calm the nerves, to check excessive perspiration, and to relax the bowels.

Indications Insomnia with fidgetness and palpitation; night sweating due to *deficiency* of *yin*; constipation.

Usage and dosage 3-9 g.

Storage Preserve in a cool and dry place, protected from heat and moth.

Semen Pruni (郁李仁, Yuliren)

Chinese Dwarf Cherry Seed

Chinese Dwarf Cherry Seed is the dried ripe seed of *Prunus humilis* Bge., *Prunus japonica* Thunb. or *Prunus pedunculata* Maxim. (Fam. Rosaceae). The former two are known as "Xiaoliren" (small Chinese Dwarf Cherry Seed) and the latter is known as "Daliren" (large Chinese Dwarf Cherry

Seed). The ripe fruit is collected in summer and autumn, removed from the sarcocarp and the shells. The seed is collected, and dried.

Description *Xiaoliren* Ovoid, 5-8 mm long, 3-5 mm in diameter. Externally yellowish-white or pale brown, one end acute, and the other end obtuse, with a linear hilum on the edge of the acute end and a dark-coloured chalaza at the centre of the obtuse end from which many vascular bundles extend upwards. Testa thin, cotyledons 2, milky white, oily. Odour, slight; taste, slightly bitter.

Daliren 6-10 mm long, 5-7 mm in diameter, externally yellowish-brown.

Identification To 0.5 g of the powder in a stopper test tube, add 3 ml of 5% solution of sulfuric acid, mix well, hang a strip of trinitrophenol TP in the test tube, keep the TP a distance from the solution, and stopper tightly. Heat on a water bath at 40-50℃ for 10 minutes, the test paper turns to a red colour.

Acid value Not more than 10.0 (Appendix Ⅸ P).

Carbonyl value Not more than 3.0 (Appendix Ⅸ P).

Peroxide value Not more than 0.050 (Appendix Ⅸ P).

Assay Place about 20 g of the coarse power, accurately weighed, in a kjeldahl flask, add 150 ml of water, stopper tightly and immediately, allow to stand for 2 hours. Connect the condenser, distill and collect the distillate in a receiver containing 10 ml of water and 2 ml of ammonia TS. Cool on an ice bath until the distillate up to 200 ml. Stop the distillation, add 2 ml of potassium iodide TS to the distillate, and titrate with silver nitrate (0.1 mol/L) VS slowly until a yellowish-white opalescence is produced. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 91.48 mg of $C_{20}H_{27}NO_{11}$.
It contains not less than 1.5 per cent of amygdalin ($C_{20}H_{27}NO_{11}$).

Processing Eliminate foreign matter. Break to pieces before use.

Action To relax the bowles, subdue the upward *qi*, and cause urination.

Indications Stagnancy of undigested food with abdominal distension and constipation; weakness and edema of the legs with oliguria.

Usage and dosage 6-9 g.

Precaution Used with caution in pregnancy.

Storage Preserve in a cool and dry place, protected from moth.

Semen Raphani (莱菔子, Laifuzi)

Radish Seed

Radish Seed is the dried ripe seed of *Raphanus sativus* L. (Fam. Cruciferae). The plant is cut up in summer when the fruit is ripe, dried in the sun. The seed is rubbed out, removed from foreign matter, and dried again in the sun.

Description Subovoid or ellipsoidal, slightly flattened, 2.5-4 mm long, 2-3 mm wide. Externally yellowish-brown, reddish-brown or greyish-brown, with a dark brown round hilum at one end and several longitudinal furrows on one side. Testa thin and brittle, cotyledons 2, yellowish-white and oily. Odour, slight; taste, weak, slightly bitter and pungent.

Identification (1) To a small quantity of the powder, add a small piece of sodium hydroxide, heat on a flame and cool. Dissolve the mixture in 2 ml of water, and filter. Acidify 1 ml of the filtrate with 5% hydrochloric acid, the gas of hydrogen sulfide is evolved and a briliant brownish-black colour occurred on contacting with the freshly prepared lead acetate TP.
(2) To 1 g of the powder add 30 ml of ether, heat under reflux for 1 hour and discard the ether, and evaporate the drug residue to dryness. To the drug residue add 20 ml of methanol, heat under reflux for 1 hour, filter and evaporate the filtrate to dryness. Dissolve the residue with 2 ml of methanol as the test solution. Prepare a solution of 1 g reference drug of Semen Raphani in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and the upper layer solution of ethyl acetate, formic acid and water (10 : 2 : 3) as the mobile phase. Apply separately 5 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air. The fluorescence spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution under ultraviolet light at 254 nm. Spray with a 1% solution of vanillin in sulfuric acid-ethanol (10 : 90) and heat to the spots distinct. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Water Not more than 8.0 per cent (Appendix Ⅸ H, Method 2).

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using ethanol as the solvent, not less than 10.0 per cent.

Processing *Semen Raphani* Eliminate foreign matter, wash clean and dry. Break to pieces before use.

Semen Raphani (*stir-baked*) Stir-bake the clean Semen Raphani as described under the method for simple stir-baking (Appendix Ⅱ D) to slightly expanded. Break to pieces before use.

Action To promote digestion and relieve abdominal distension, and relieve cough and resolve *phlegm*.

Indications Retention of undigested food with epigastric and abdominal distension and pain, and constipation; diarrhea due to stagnation of undigested food; cough and dyspnea with copious expectoration.

Usage and dosage 4.5-9 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Semen Ricini (蓖麻子, Bimazi)

Castor Seed

Castor Seed is the dried ripe seed of *Ricinus communis* L. (Fam. Euphorbiaceae). The fruit is collected in autumn when ripe, dried in the sun, removed

from the pericarp, and the seed is gathered.

Description Ellipsoidal or ovoid, slightly flattened, 0.9-1.8 cm long, 0.5-1 cm wide. Externally smooth, alternately with greyish-white and blackish-brown or yellowish-brown and reddish-brown piebald striations. One side relatively even, bearing 1 prominent raphe, and the other side slightly raised. A greyish-white or pale brown, prominent caruncle at one end. Testa thin and brittle, endosperm plump, white and oily, cotyledons 2, thin. Odour, slight; taste, slightly bitter and pungent.

Processing Eliminte foreign matter, remove the testa and break to pieces before use.

Action To induce subsidence of swelling, remove toxic substances, and cause purgation.

Indications Carbuncles, boils and other pyogenic infections of the skin, sore throat, scrofula; constipation.

Usage and dosage For external use, appropriate quantity is pounded into paste and applied topically; also used in pills for oral administration.

Storage Preserve in a cool and dry place.

Semen Sesami Nigrum (黑芝麻, Heizhima)

Black Sesame

Black Sesame is the dried ripe seed of *Sesamum indicum* L. (Fam. Pedaliaceae). The plant is collected in autumn when the fruit is ripe, dried in the sun. The seed is gathered, removed from foreign matter, and dried in the sun.

Description Flattened-ovoid, about 3 mm long, and 2 mm wide. Externally black, smooth or reticulately wrinkled. A dotted brown raphe at the apex. Testa thin, cotyledons 2, white, oily. Odour, slight; taste sweet, slightly oily aromatic.

Identification (1) Macerate 1 g of the broken seed with 10 ml of petroleum ether (60-90℃) for 1 hour. Decant the supernatant to a test tube, add 10 ml of hydrochloric acid containing 0.1 g of sucrose, shake for 30 seconds, a pink colour is produced in the acid layer and gradually turns to red on standing.

(2) Triturate 0.5 g into pieces, add 10 ml of chloroform and macerate for 2 hours, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of chloroform as the test solution. Dissolve sesamin CRS and β-sitosterol CRS separately in chloroform to prepare two solutions each containing 2 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of cyclohexane, ether and ethyl acetate (20 : 5 : 2.5) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of each of the two reference solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and heat to the spot clear, the spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Processing *Semen Sesami Nigrum* Eliminate foreign matter, wash clean, dry in the sun. Break to pieces before use.

Semen Sesami Nigrum (stir-baked) Stir-bake the clean Semen Sesami Nigrum as described under the method for simple stir-baking (Appendix II D) until it cracks. Break to pieces before use.

Action To tonify the liver and the kidney, replenish vital essence and blood, and relax the bowels.

Indications Dizziness, blurred vision, tinnitus, impaired hearing, premature greying of the hair and beard; loss of hair after a serious disease; constipation.

Usage and dosage 9-15 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Semen Sinapis (芥子, Jiezi)

Mustard Seed

Mustard Seed is the ripe seed of *Sinapis alba* L. or *Brassica juncea* (L.) Czern. et Coss. (Fam. Cruciferae). The former is known as "Bai Jiezi" (Semen Sinapis Albae). The latter is known as "Huang Jiezi" (Semen Brassicae Junceae). The plant is cut up in late summer and early autumn when the fruit is ripe, and dried in the sun. The seed is tapped out and removed from foreign matter.

Description *Bai Jiezi* Spherical, 1.5-2.5 mm in diameter. Externally greyish-white to pale yellow, finely reticulated, with an obvious point-like hilum. Testa thin and brittle, after cutting, white folded cotyledons visible, oily. Odour, slight; taste, pungent.

Huang Jiezi Relatively small, 1-2 mm in diameter. Externally yellow to brownish-yellow, a few dark reddish-brown. Odour, characterisitic and pungent when triturated and moistened with water.

Identification (1) Transverse section: *Bai Jiezi* Epidermal cells of teata consisting of mucilage cells having mucilage striations; hypodermis consisting of 2 rows of collenchyma cells; palisade cells consisting of 1 row of stone cells with thickened inner and lateral walls and thin outer wall. Endosperm consisting of 1 row subsquare cells, containing aleurone grains. Parenchy matous cells of cotyledons and radicle containing oil droplets and aleurone grains.

Huang Jiezi Epidermal cells of testa elongated tangentially; hypodermis consisting of 1 row of thin cells.

(2) To 1 g of the powder, add 50 ml of methanol, ultrasonicate for 1 hour, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 5 ml of methanol as the test solution. Dissolve sinapine cyanide sulfonate CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and ethyl acetate-acetone-formic acid-water (5 : 3 : 1 : 0.5) as the mobile phase. Apply separately 5-10 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with a solution of diluted potassium iodobismuthate TS. The spots in the chromatography obtained with test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.

Water Carry out the method for determination of water

(Appendix Ⅹ H, method 1), not more than 14.0 per cent.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the cold maceration method for determination of water-soluble extractives (Appendix Ⅹ A), not less than 12.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use phenyl bonded silica gel as the stationary phase and acetonitrile as mobile phase A, 3% acetic acid as mobile B. gradient elution as the following:

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0-3	20→25	80→75
3-5	25→30	75→70
5-10	30	70

As detector a spectrophotometer set at 326 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of sinapine.

Reference solution Dissolve a quantity of sinapine cyanide sulfonate CRS, accurately weighed, in mobile phase to prepare a solution containing 0.2 mg per ml as the reference solution.

Test solution Weigh accurately 1 g of the fine powder in a stopper conical flask, add 50 ml of methanol, ultrasonicate (power, not less than 250 W; frequence, not less than 20 kHz) for 20 minutes, and filter. Extract the residue 3 times in the same manner. Combine the filtrates and concentrate the filtrates to dryness. Dissolve the residue with the mobile phase and transfer to a 50 ml volumetric flask. Dilute with the mobile phase to volume, and mix well.

Procedure Inject accurately 10 μl of the reference solution and 10 μl of the test solution into the column, and calculate the content.

It contains not less than 0.50 per cent of sinapine, calculated as sinapine cyanide sulfonate ($C_{16}H_{24}NO_5 \cdot SCN$) with reference to the dried drug.

Processing *Semen Sinapis* Eliminate foreign matter. Break to pieces before use.

Semen Sinapis (*Stir-baked*) Stir-bake the clean Semen Sinapis as described under the method for simple stir-baking (Appendix Ⅱ D) until it becomes deep yellow and pungent scented. Break to pieces before use.

Action To relieve dyspnea and cough by eliminating *cold-phlegm*, reduce nodulation, and relieve pain by removing the obstruction of collaterals.

Indications Cough, asthma and distending pain of the chest caused by *cold-phlegm*; arthralgia accompanied with numbness due to obstruction of collaterals by *phlegm*; deep abscesses.

Usage and dosage 3-9 g; appropriate quantity for external use.

Storage Preserve in a ventilated and dry place, protected from moisture.

Semen Sojae Praeparatum (淡豆豉, Dandouchi)

Fermented Soybean

Fermented Soybean is the fermented preparation obtained from the ripe seed *Glycine max* (L.) Merr. (Fam. Leguminosae).

Preparation Decoct 70-100 g of each of Folium Mori and Herba Artemisiae Annuae with water, filter. Mix the filtrate with 1000 g of clean Semen Sojae until the liquid is exhausted, steam thoroughly, then take out the seeds, dry in air briefly, cover with decocted Folium Mori and Herba Artemisiae Annuae, and ferment until yellow hyphae appear completely. Remove the residue, wash clean, ferment again for 15-20 days until an aromatic odour is produced. Take out the fermented seeds, steam briefly, and dry.

Description Ellipsoidal, slightly flattened, 0.6-1 cm long, 0.5-0.7 cm in diameter. Externally black, shrunken. Texture soft, fracture brownish-black. Odour, aromatic; taste, slightly sweet.

Identification To 1 g of the broken drug, add 10 ml of water, boil for several minutes, filter. Apply 0.5 ml of the filtrate to a piece of filter pater, allow to dry, spray with 1% solution of indoquinone-acetic acid (10 : 1), dry, heat at 100-110℃ for about 10 minutes, a purplish-red colour is produced.

Other requirements To 1 g of the broken drug add 10 ml of water, macerate warmly on a 50-60℃ water bath for 1 hour, and filter. To 1 ml of the filtrate add 4 drops of each of 1% cupric sulfate solution and 40% potassium hydroxide solution, shake; purplish-red colour is produced.

Action To release the exterior, ease the mind, and relieve fever.

Indications Headache with mild heat or cold in common cold, vexation, oppressed feeling in the chest and insomnia.

Usage and dosage 6-12 g.

Storage Preserve in a ventilated and dry place, protected from moth.

Semen Sterculiae Lychnophorae (胖大海, Pangdahai)

Boat-fruited Sterculia Seed

Boat-fruited Sterculia Seed is the dried ripe seed of *Sterculia lychnophora* Hance (Fam. Sterculiacaeae).

Description Fusiform or ellipsoidal, 2-3 cm long, 1-1.5 cm in diameter. Apex obtuse-rounded, base somewhat acute and oblique, bearing a pale and rounded hilum. Externally brown or dark brown, somewhat lustrous, with irregular wrinkles. Testa extremely thin, fragile and easily fallen. Mesotesta relatively thick, blackish-brown, loose and easily broken, swelling to spongy-like when treated with water. Scattered resinous dots visible in the fracture. Endotesta can be stripped off from mesotesta, slightly coriaceus, with 2 plump endosperm, broad-ovoid; cotyledons 2, thin, adhering closely to the inner side of endosperm, similar to endosperm in size. Odour, slight; taste, weak, viscous on

chewing.

Identification (1) Macerate several seeds in an appropriate quantity of boiling water, allow to stand for several minutes, the seeds swelling to brown, translucent and spongy.
(2) To 0.2 g of the powder add 10 ml of water, heat on a water bath for 30 minutes, and filter. To 4 ml of the filtrate add 3 ml of sodium hydroxide TS and 5 ml of alkaline cupric tartrate TS, heat on a water bath, a red precipitate is produced.

Water Not more than 16.0 per cent (Appendix Ⅸ H, method 1).

Action To remove *heat* from the lung, cure sore throat, counteract toxicity and relax the bowels.

Indications Hoarseness, dry cough, dry and painful throat due to *heat* in the lung; constipation with headache and blood-shot eyes.

Usage and dosage 2-3 pieces, soaked in boiling water or decocted.

Storage Preserve in a dry place, protected from mould and moth.

Semen Strychni (马钱子, Maqianzi)

Nux Vomica

Nux Vomica is the dried ripe seed of *Strychnos nux-vomica* L. (Fam. Loganiaceae). The fruit is collected in winter, and the seed is gathered, and dried in the sun.

Description *Semen Strychni* Button-shaped, 1.5-3 cm in diameter, 0.3-0.6 cm thick, frequently one side prominent and the other slightly dented. Outer surface closely covered with greyish-brown or greyish-green silky hairs, radiating from centre to circumference, silky-lustrous. Edge slightly prominent, relatively thick, with a protrudent micropyle; a prominent dot-like hilum in the centre of the bottom surface. Texture hard, pale yellowish-white, endosperm visible in horizontal section, horny, cotyledons cordate, with 5-7 veins. Odour, slight; taste, extremely bitter.

Identification (1) Powder: Greyish-yellow. Non-glandular hairs unicellular, mostly broken, with very thickened and lignified walls, enlarged at base like a stone cell. Endosperm cells polygonal, thick-walled, containing fatty oil and aleurone grains.
(2) Extract 0.5 g of the powder with 5 ml of a mixture of chloroform-ethanol (10 : 1) and 0.5 ml of concentrated ammonia TS in a stopper conical flask by shaking for 5 minutes, allow to stand for 2 hours, filter and use the filtrate as the test solution. Dissolve a quantity of strychnine CRS and brucine CRS in chloroform to prepare a solution containing 2 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, acetone, ethanol and concentrate ammonia (4 : 5 : 0.6 : 0.4) as the mobile phase. Apply separately 10 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with potassium iodobismuthate TS. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H, method 1), not more than 13.0 per cent.

Total ash Not more than 2.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and a mixture solution of equal quantities of 0.01 mol/L sodium heptane sulfonate solution and 0.02 mol/L potassium dihydrogen phosphate solution (adjust pH to 2.8 with 10% phosphoric acid) (21 : 79) as the mobile phase. As detector a spectrophotometer set at 260 nm. The number of theoretical plates of the column is not less than 5000, calculate with the reference to the peak of strychnine.

Reference solution Dissolve 6 mg of strychnine CRS and 5 mg of brucine CRS, accurately weighed, in a 10 ml volumetric flask respectively and dilute with chloroform to volume, and mix well. Accurately measure each of 2 ml to a 10 ml volumetric flask, dilute with methanol to volume, and mix well. (containing 0.12 mg of strychnine and 0.1 mg of brucine per ml)

Test solution Weigh accurately 0.6 g of the powder (through No. 3 sieve), in a stopper conical flask, add 3 ml of sodium hydroxide TS, mix well, stand for 30 minutes. Add accurately 20 ml of chloroform, weigh, heat under reflux for 2 hours, allow to stand to cool, weigh again, replenish the loss of the weight with chloroform, shake thoroughly. Separate the extract, filter with filter paper spreaded with a small quantity of anhydrous sodium sulfate. Accurately measure 3 ml of the successive filtrate in a 10 ml volumetric flask, dilute with methanol to volume, and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 1.20 per cent and not more than 2.20 per cent of strychnine ($C_{21}H_{22}N_2O_2$), not less than 0.80 per cent of brucine ($C_{23}H_{26}N_2O_4$), calculated with reference to the dried drug.

Processing *Semen Strychni* Eliminate foreign matter.

Semen Strychni (*processed*) Scald the clean Semen Strychni as described under the method for scalding (Appendix Ⅱ D) until inflated and turns into brown or dark brown.

Action To promote the flow of *qi* and blood in the collaterals, relieve pain, and promote the subsidence of swelling.

Indications Protracted arthritis, rheumatoid arthralgia; numbness and paralysis; sequela of poliomyelitis; traumatic injury; boils and sores.

Usage and dosage 0.3-0.6 g, used in pills or powder after being processed.

Precaution Not used unprocessed, in overdosage or in long term administration; contraindicated in pregnancy.

Storage Preserve in a dry place.

Semen Strychni Pulveratum (马钱子粉, Maqianzi Fen)

Nux Vomica Powder

Nux Vomica Powder is the product of processed Semen Strychni.

Processing Pulverize the Processed Semen Strychni to fine powder, carry out the Assay for Semen Strychni to determine the content of strychnine, then add a sufficient quantity of starch to make its content complies with the requirements, and mix well.

Description A yellowish-brown powder. Odour, slightly aromatic; taste, extremely bitter.

Identification Complies with Identification test (2) described under Semen Strychni.

Water Not more than 14.0 per cent (Appendix Ⅸ H, method 1).

Assay Carry out the Assay described under Semen Strychni. It contains not less than 0.78 per cent and not more than 0.82 per cent, of strychnine ($C_{21}H_{22}N_2O_2$) not less than 0.50 per cent of brucine ($C_{23}H_{26}N_2O_4$), calculated with reference to the dried drug.

Action and indications As described under Semen Strychni.

Usage and dosage 0.3-0.6 g, used in pills or powder.

Storage Preserve in tightly closed containers, stored in a dry place.

Semen Torreyae (榧子, Feizi)

Grand Torreya Seed

Grand Torreya Seed is the dried ripe seed of *Torreya grandis* Fort. (Fam. Taxaceae). The drug is collected in autumn when ripe, removed from the fleshy aril, washed clean, and dried in the sun.

Description Ovoid or prolate-ovoid, 2-3.5 cm long, 1.3-2 cm in diameter. Externally greyish-yellow or pale yellowish-brown, longitudinally wrinkled. One end obtuse, with a elliptical raphe; the other end slightly acute. Testa hard, about 1 mm thick. Kernel surface wrinkled; perisperm greyish-brown, membranous; endosperm yellowish-white, plump and oily. Odour, slight; taste, slightly sweet and astringent.

Processing Remove the shell (testa). Break to pieces before use.

Action To kill worms and relax bowels.

Indications Ankylostomiasis, ascariasis, taeniasis; abdominal pain and malnutrition caused by intestinal parasitosis in children; constipation.

Usage and dosage 9-15 g.

Storage Preserve in a cool and dry place, protected from moth.

Semen Trichosanthis (瓜蒌子, Gualouzi)

Snakegourd Seed

Snakegourd Seed is the dried ripe seed of *Trichosanthes kirilowii* Maxim. or *Trichosanthes rosthornii* Harms (Fam. Cucurbitaceae). The ripe fruit is picked in autumn and dissected. The seed is collected, washed clean, and dried in the sun.

Description *Seed of Trichosanthes kirilowii* Flattened-elliptical, 12-15 mm long, 6-10 mm wide, about 3.5 mm thick. Externally pale brown to brown, smooth, with a circle of furrow along the edge. Apex relatively acute, with a hilum, base obtuse or relatively narrow. Testa hard; tegmen membraneous, greyish-green, cotyledons 2, yellowish-white, oily. Odour, slight; taste, weak.

Seed of Trichosanthes rosthornii Relatively large and flattened, 15-19 mm long, 8-10 mm wide, about 2.5 mm thick. Externally brown, the circular furrow distinct and rather near the inner part. Apex even and truncate.

Identification To 1 g of the powder in a stopper conical flask add 10 ml of petroleum ether (60-90℃), stopper tightly and ultrasonicate for 10 minutes, filter and use the filtrate as the test solution. Dissolve 3,29-dibenzoyl karounitriol CRS in chloroform to prepare a solution of 0.12 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of cyclohexane and ethyl acetate (5 : 1) as the mobile phase. Apply separately 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with a 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Water Not more than 10.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 3.0 per cent (Appendix Ⅸ K).

Extractives Carry out the cold extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using petroleum ether (60-90℃) as the solvent, not less than 4.0 per cent.

Processing *Semen Trichosanthis* Eliminate foreign matter and blighted seeds, wash clean, and dry in the sun. Break to pieces before use.

Action To moisten the lung and resolve phlegm and cause laxation.

Indications Dry cough with sticky sputum; constipation.

Usage and dosage 9-15 g.

Precaution Incompatible with aconite and allied drugs.

Storage Preserve in a cool and dry place, protected from mould and moth.

Semen Trichosanthis Tostum (炒瓜蒌子, Chaogualouzi)

Stir-baking Snakegourd seed

Stir-baking Snakegourd seed is the processing product obtained from the seed of *Trichosanthes kirilowii* Maxim. or *Trichosanthes rosthornii* Harms. (Fam. Cucurbitaceae).

Processing Stir-bake the clean Semen Trichosanthis as described under the method for simple stir-baking (Appendix Ⅱ D) until inflated, take out, and cool in air.

Description Flattened-elliptical, 12-15 mm long, 6-10 mm wide, about 3.5 mm thick. Externally pale brown to brown, smooth, sometimes the charred-spots visible, with a circle of furrow along the edge. Apex relatively acute, with a hilum, base obtuse or relatively narrow. Testa hard;

tegmen membranous, grayish-green, cotyledons 2, yellowish-white, oily. Odour, slight; taste, weak.

Identification Weigh 1 g of the powder in a stopper conical flask, add 10 ml of petroleum ether (60-90℃), ultrasonicate for 10 minutes, filter; and use the filtrate as the test solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of cyclohexane and ethyl acetate (5 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference solution prepared in the "Assay" to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol. Heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Water Carry out the determination of water (Appendix Ⅸ H, method 1), not more than 10.0 per cent.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of methanol and water (93 : 7) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of 3,29-dibenzoylkarounitriol CRS.

Reference solution Weigh accurately a quantity of 3,29-dibenzoylkarounitriol CRS, dissolve in chloroform to produce a solution containing 0.12 mg per ml as the reference solution.

Test solution Weigh accurately 1 g of the coarse powder, previously dried at 40℃ for 6 hours, to a 50 ml stopper conical flask, add accurately 10 ml of chloroform, weigh, ultrasonicate for 30 minutes (power, 250 W; frequency, 20 kHz), allow to stand to cool, weigh again, replenish the loss of the weight with chloroform. Mix well, and stand. Use the supernatant as the test solution.

Procedure Inject accurately 5 μl of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 0.060 per cent of 3,29-dibenzoylkarounitriol ($C_{44}H_{58}O_5$), calculated with reference to the dried drug.

Action To moisten the lung and resolve phlegm and help the bowels to empty.

Indications Cough with thick phlegm due to dryness, constipation due to dryness in the intestine.

Usage and dosage 9-15 g.

Precaution It is antagonistic to Radix Aconiti Kusnezoffii.

Storage Preserve in a well closed, cool and dry place, protected from mould and moth.

Semen Trigonellae (胡芦巴, Huluba)

Common Fenugreek Seed

Common Fenugreek Seed is the dried ripe seed of *Trigonella foenum-graecum* L. (Fam. Leguminosae). The plant is collected in summer when the fruit is ripe, dried in the sun. The seed is tapped out and removed from foreign matter.

Description Slightly rhomboid or rectangular, 3-4 mm long, 2-3 mm wide, about 2 mm thick. Externally yellowish-green or yellowish-brown, smooth, with a deep oblique furrow on each of the two sides, and a point-like hilum at the intersection of the two furrows. Texture hard, uneasily broken. Testa thin, endosperm translucent and viscous; cotyledons 2, pale yellow, radicle curved, plump and long. Odour, aromatic; taste, slightly bitter.

Identification (1) Powder: Yellowish-brown. Palisade cells of epidermis 1-layer, with thickened outer and upper lateral walls, and a relatively large lumen at the lower part. Longitudinal pit-cannals fine and close. The light bend situated in outer part at 1/3 length of the cells with cuticle. Supporting cells 1 layer, somewhat dumbell-shaped, narrow at the upper end but broader at the lower end with linear striations on anticlinal walls. Endosperm mostly consisting of mucilage cells with highly thickened walls. Cotyledon cells containing aleurone grains and fatty oil droplets.

(2) To 1 g of the powder add 30 ml of petroleum ether (30-60℃), ultrasonicate for 30 minutes, filter and discard the filtrate, evaporate the residue to dryness. Add 30 ml of ethanol, ultrasonicate for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue with 1 ml methanol as the test solution. Dissolve trigonelline CRS in methanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of n-butanol, hydrochloride and ethyl acetate (8 : 3 : 1) as the mobile phase. Apply separately 6 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a mixture solution of potassium iodobismuthate TS and ferric chloride TS (2 : 1). The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 15.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using dilute ethanol TS as the solvent, not less than 18.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, 0.05% sodium dodecyl sulfonate and glacial acetic acid (20 : 80 : 0.1) as the mobile phase. As detector a spectrophotometer set at 265 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of trigonelline.

Reference solution Dissolve a quantity of trigonelline CRS, accurately weighed, in 50% methanol to prepare a solution containing 60 μg per ml as the reference solution.

Test solution Weigh accurately 0.5 g of the powder in a conical flask, add 50 ml of 50% methanol, and weigh. Allow to stand for 1 hour, ultrasonicate (power, 300 W; frequency, 50 kHz) for 45 minutes, allow standing to cool and weigh again, replenish the loss of weight with 50% methanol and mix well. Filter and use the successive filtrate

as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 0.45 per cent of trigonelline ($C_7H_7NO_2$), calculated with reference to the dried drug.

Processing *Semen Trigonellae* Eliminate foreign matter, wash clean and dry.

Semen Trigonellae (*processed with salt*) Stir-bake the clean Semen Trigonellae as described under the method for stir-baking with salt-water (Appendix Ⅱ D) until it becomes inflated and scenty. Break to pieces before use.

Action To warm the kidney, dispel cold, and relieve pain.

Indications *Cold* syndrome of the kidney due to *yang* deficiency marked by pain and coldness in the lower abdomen; hernia; weakness and edema of the legs caused by *cold-damp*.

Usage and dosage 4.5-9 g.

Storage Preserve in a dry place.

Semen Vaccariae (王不留行, Wangbuliuxing)

Cowherb Seed

Cowherb Seed is the dried ripe seed of *Vaccaria segetalis* (Neck.) Garcke (Fam. Caryophyllaceae). The plant is collected in summer when the fruit is ripe but not dehiscent, and dried in the sun, the seed is gathered, removed from foreign matter, and dried again in the sun.

Description Spheroidal, about 2 mm in diameter. Externally black, a few in reddish-brown, somewhat lustrous, with fine and dense granular protuberances and a concave longitudinal furrow on one side. Texture hard, endosperm white, embryo curved in a ring, cotyledons 2. Odour, slight; taste, slightly astringent and bitter.

Identification (1) Powder: Pale greyish-brown. Epidermal cells of testa reddish-brown or yellowish-brown, polygonal or elongated polygonal in surface view, 50-120 μm in diameter, anticlinal walls thickened, stellate or sinuate. Inner epidermal cells of testa pale yellowish-brown, subsquare, subrectangular or polygonal in surface view, anticlinal walls densely beaded, reticulated striations visible on surface. Endosperm cells polygonal, subsquare or subrectangular, lumina filled with starch granules and aleurone grains. Cotyledon cells containing fatty oil droplets.
(2) To 1.5 g of the powder add 20 ml of methanol, heat under reflux for 30 minutes, cool and filter, evaporate the filtrate to dryness. Dissolve the residue with 2 ml methanol as the test solution. Prepare a solution of 1.5 g reference drug of Semen Vaccariae in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (15 : 7 : 2, lower layer) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a solution of potassium iodobismuthate modified TS. The orange-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Water Not more than 12.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 4.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using ethanol as the solvent, not less than 6.0 per cent.

Processing *Semen Vaccariae* Eliminate foreign matter.

Semen Vaccariae (*stir-baked*) Stir-bake the clean Semen Vaccariae as described under the method for simple stir-baking (Appendix Ⅱ D) until most of the seeds burst.

Action To promote the menstrual flow and the flow of milk, and cause the subsidence of swelling.

Indications Agalactia, amenorrhea, dysmenorrhea, mastitis with swelling and pain of the breast.

Usage and dosage 4.5-9 g.

Precaution Used with caution in pregnancy.

Storage Preserve in a dry place.

Semen Ziziphi Spinosae (酸枣仁, Suanzaoren)

Spine Date Seed

Spine Date Seed is the dried ripe seed of *Ziziphus jujuba* Mill. var. *spinosa* (Bunge) Hu ex H. F. Chou (Fam. Rhamnaceae). The ripe fruit is collected in later autumn and early winter. The seed is collected and removed from the pulp and shell (endocarp), and dried in the sun.

Description Oblate or flattened ellipsoidal, 5-9 mm long, 5-7 mm wide, about 3 mm thick. Externally purplish-red or purplish-brown, smooth, lustrous, some fissured. One surface even, with 1 raised longitudinal line in the centre; the other surface slightly raised. One end dented, showing a linear hilum; the other end having a finely raised chalaza. Testa fragile; endosperm white; cotyledons 2, pale yellow, oily. Odour, slight; taste, weak.

Identification (1) Powder: Brownish-red. Palisade cells of testa brownish-red, polygonal in surface view, about 15 μm in diameter, with thickened and lignified walls, small lumen. Cells of tegmen brownish-yellow, rectangular or subsquare with beaded and lignified anticlinal walls in surface view. Epidermal cells of cotyledon containing fine clusters or prisms of calcium oxalate.
(2) To 1 g of the powder add 30 ml of methanol, heat under reflux for 1 hour and filter. Evaporate the filtrate to dryness, dissolve the residue in 0.5 ml of methanol used as the test solution. Dissolve jujuboside A CRS and jujuboside B CRS in methanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and *n*-butanol saturated with water as the mobile phase. Apply separately to the plate 10 μl of each of the two solutions. After developing and removal of the plate, dry in air, spary with 1% solution of vanillin in sulfuric acid, and examine immediately. The spots in the chromatogram obtained with the test solution

correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Foreign matter Not more than 5 per cent (Appendix Ⅸ A).

Processing *Semen Ziziphi Spinosae* Remove the remained shells. Break to pieces before use.

Semen Ziziphi Spinosae (*stir-baked*) Stir-bake the clean Semen Ziziphi Spinosae as described under the method for simple stir-baking (Appendix Ⅱ D) to inflated and the colour slightly draken. Break to pieces before use.

Action To replenish the liver, cause tranquilizatio, arrest excessive perspiration, and promote the production of body fluid.

Indications Insomnia, dream-disturbed sleep; excessive sweating due to debility; thirst due to consumption of body fluid.

Usage and dosage 9-15 g.

Storage Preserve in a cool and dry place, protected from moth.

Spica Prunellae (夏枯草, Xiakucao)

Common Selfheal Fruit-Spike

Common Selfheal Fruit-Spike is the dried fruit-spike of *Prunella vulgaris* L. (Fam. Labiatae). The drug is collected in summer when the spike becomes brownish-red, removed from foreign matter, and dried in the sun.

Description Cylindrical, somewhat flattened, 1.5-8 cm long, 0.8-1.5 cm in diameter; pale brown to brownish-red. The whole spike composed of up to ten or more whorls of persistent calyx and bracts, each whorl with two opposite bracts, fan-shaped, apex acuminate, striations of vein distinct, the outer surface with white hairs. Each bract with three flowers, the corolla often fallen off, persistent calyx bilabiate, with four small brown ovoid nutlets, with white convex at the acute end. Texture light, Odour, slight; taste, weak.

Identification Heat under reflux 1 g of the powder in 20 ml of ethanol for 1 hour, filter, evaporate the filtrate to dryness, macerate the residue with two 15 ml-quantity of petroleum ether (30-60℃) for about 2 minutes, discard the petroleum ether solution and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve ursolic acid CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform, ethyl acetate and glacial acetic acid (20 : 5 : 8 : 0.5) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% surfuric acid in ethanol, heat at 100℃ to the spots clear, examine under daylight and ultraviolet light at 365 nm, respectively. The spot or fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 14.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 12.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 4.0 per cent (Appendix Ⅸ K).

Extractives Carry out the hot extraction method for determination of water-soluble extractives (Appendix Ⅹ A), not less than 10.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (88 : 12) as the mobile phase. As detector a spectrophotometer set at 210 nm. The number of theoretical plates of the column is not less than 4000, calculated with reference to the peak of ursolic acid.

Reference solution Weigh accurately a quantity of ursolic acid CRS dried previously to constant weight at 105℃, add anhydrous ethanol to produce a solution of 0.12 mg per ml.

Test solution Weigh accurately 2 g of the powder (through No. 2 sieve) in a Soxhlet's extractor, add a quantity of ether and macerate overnight, heat under reflux for 6 hours, recover the solvent. Macerate the residue with two 15 ml-quantity of petroleum ether (60-90℃) for 2 minutes, discard the petroleum ether solution, evaporate to dryness. Dissolve the residue in anhydrous ethanol and transfer into a 10 ml volumetric flask, add anhydrous ethanol to volume. Measure accurately 1 ml to a 10 ml volumetric flask, dilute with anhydrous ethanol to volume and mix well.

Procedure Inject accurately 20 μl of each of the two solutions into the column, and calculate the content.
It contains not less than 0.12 per cent of ursolic acid ($C_{30}H_{48}O_3$), calculated with reference to the dried drug.

Action To quench *fire* of the liver and counteract inflammation of the eyes, and reduce nodulation and induce subsidence of swelling.

Indications Inflammation of the eyes, ophthalmalgia at night, headache and dizziness; scrofula, goitre, mastitis with swelling and pain, hyperplasia of breast; hypertension.

Usage and dosage 9-15 g.

Storage Preserve in a dry place.

Preparation Extractum Prunellae Inspissatum.

Spica Schizonepetae (荆芥穗, Jingjiesui)

Fineleaf Schizonepeta Spike

Fineleaf Schizonepeta Spike is the dried fruit-spike of *Sesamum indicum* L. (Fam. Labiatae). The drug is collected in summer and autumn when the spike becomes green, removed from foreign matter, and dried in the sun.

Description Spike cylindrical-shaped, 3-15 cm long, about 7 mm in diameter. Corolla often fallen off, persistent calyx yellowish-green, campanulate, fragile, easily broken, with small brownish-black nutlets. Odour, aromatic; taste, pungent, and slightly astringent.

Identification (1) Powder: Yellowish-brown. Epidermal cells of persistent calyx with deeply sinuous anticlinal walls. Glandular scales with a 8-celled head, 95-110 μm in diameter, and an unicellular stalk, brownish-yellow. Small glandular hair with a 1-2 celled head and an unicellular stalk. Non-glandular hair 1-6 celled, mostly with warty walls. Cells of exocarp polygonal in surface view, with mucilaginous

walls, and containing brown contents. Stone cells of endocarp pale brown, with deeply sinuous anticlinal walls, and densely pitted. Fibre bundles with straight or slight sinuous walls.

(2) To 0.8 g of the coarse powder, add 20 ml of petroleum ether (60-90℃), stopper tightly, shake frequently, and allow to stand overnight. Filter and evaporate the filtrate to 1 ml as the test solution. Prepare a solution of 0.8 g of Spica Schizonepetae reference drug as the reference drug solution in the same manner. Dissolve l-pulegone CRS in petroleum ether (60-90℃) to produce a solution containing 4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (37 : 3) as the mobile phase. Apply separately 3 μl of the test solution, 10 μl of each of the reference solution and reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 1% vanillin in sulfuric acid, and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution and the reference drug solution.

Water Carry out the method for the determination of water (Appendix Ⅸ H, method 2), not more than 12.0 per cent.

Extractives Carry out the cold maceration method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using ethanol as the solvent, not less than 8.0 per cent.

Assay ***Volatile oil*** Carry out the method for determination of volatile oil (Appendix Ⅹ D).

It contains not less than 0.4 per cent (ml/g) of volatile oil.

l-Pulegone Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of methanol and water (80 : 20) as the mobile phase. As detector a spectrophotometer set at 252 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of l-pulegone.

Reference solution Weigh accurately a quantity of l-pulegone CRS, dissolve in methanol to produce a solution containing 20 μg per ml as the reference solution.

Test solution Weigh accurately 0.5 g of the coarse powder (through No. 2 sieve) to a stopper conical flask, add 10 ml of methanol, ultrasonicate for 20 minutes (power, 250 W; frequency, 50 kHz), filter, add 10 ml of methanol to the residue, extract again for one time as the same manner. Transfer the filtrate to a 25 ml volumetric flask, wash the container with a quantity of methanol for two times, filter the washings to the same flask, dilute with methanol to volume. Mix well.

Procedure Inject accurately 10 μl of the reference solution and the test solution into the column respectively, and calculate the content.

It contains not less than 0.080 per cent of l-pulegone ($C_{10}H_{16}O$), calculated with reference to the dried drug.

Action To disperse wind to release the exterior and induce eruptions.

Indications Common cold, headache, measles, rubella, pyocutaneous diseases at the early stage.

Usage and dosage 5-10 g.

Storage Preserve in a cool and dry place.

Spica Schizonepetae Carbonisata (荆芥穗炭, Jingjiesuitan)

Carbonized Fineleaf Schizonepeta Spike

Carbonized Fineleaf Schizonepeta Spike is the product of processed Fineleaf Schizonepeta Spike.

Processing Stir-bake the section of Spica Schizonepetae as described under the method for carbonizing by stir-baking (Appendix Ⅱ D) until its surface becomes charred-black and inside becomes charred-yellow, take out, dry in the air.

Description The sections irregular in shape, about 5 mm long, surface dark-brown. Corolla often fallen off, persistent calyx campanulate, 5-toothed at apex, dark-brown, small nutlets brownish-black. Odour, charred-aromatic; taste, bitter and pungent.

Identification Cells of exocarp polygonal in surface view, with mucilaginous walls, and containing brown contents. Stone cells of endocarp pale brown, with deeply sinuous anticlinal walls, and densely pitted. Fibre bundles with straight or slight sinuous walls. Stomata diacytic.

Water Carry out the method for the determination of water (Appendix Ⅸ H, method 2), not more than 12.0 per cent.

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using 70% ethanol as the solvent, not less than 13.0 per cent.

Action To astringe and arrest bleeding.

Indications Hemafecia, metrorrhagia and metrostaxis and postpartum anemic fainting.

Usage and dosage 5-10 g.

Storage Preserve in a cool and dry place.

Spina Gleditsiae (皂角刺, Zaojiaoci)

Chinese Honeylocust Spine

Chinese Honeylocust Spine is the dried spine of *Gleditsia sinensis* Lam. (Fam. Leguminosae). The drug is collected all year round, and dried, or cut into slices when fresh, and dried.

Description Consisting of main spines and 1-2 branched spines. Main spines elongated conical, 3-15 cm long or longer, 0.3-1 cm in diameter; branched spines 1-6 cm long, acute at apex. Externally purplish-brown or brown. Texture light, hard, uneasily broken. Slices 0.1-0.3 cm thick, usually tapering-tipped; wood yellowish-white, pith lax, pale reddish-brown; texture fragile, easily broken. Odour, slight; taste, weak.

Identification Transverse section: Epidermis consisting of 1 layer of cells covered with cuticle, sometimes unicellular non-glandular hairs found. Cortex consisting of 2-3 layers of parenchymatous cells, someones containing brownish-red substances. Pericycle fibre bundles in a discontinuous ring, surrounded by parenchymatous cells containing prisms of calcium oxalate occasionally and clusters rarely, usually accompanied with 1 or 2-3-grouped stone cells with thin walls. Phloem narrow. Cambium ring distinct. Xylem in

ring, xylary rays 1-2 cells wide. Pith wide, parenchymatous cells containing a few of starch granules.

Processing Eliminate foreign matter; for the unsliced spines, soak briefly, soften thoroughly, cut into thick slices and dry.

Action To cause subsidence of swelling, drain pus, and kill parasites.

Indications Carbuncles and boils at the early stage or formation of abscess difficult to burst; external use for scabies and leprosy.

Usage and dosage 3-9 g; for external use, appropriate quantity is steamed with vinegar and the juice applied topically.

Storage Preserve in a dry place.

Spora Lygodii
(海金沙, Haijinsha)

Japanese Climbing Fern Spore

Japanese Climbing Fern Spore is the dried ripe spores of *Lygodium japonicum* (Thunb.) Sw. (Fam. Lygodiaceae). The plant is collected in autumn when the spore has not fallen off, and dried in the sun. The spore is tapped out, removed from the stem and leaf.

Description Powder-like, brownish-yellow or pale brownish-yellow. Texture light and smooth, with lubricant feeling when twisted with the finger. Odour, slight; taste, weak.

Identification (1) Scatter a small quantity of spores on fire, a slightly bursting noise and a bright flame are produced.
(2) Powder: brownish-yellow. Spores tetrahedral or triangular conical; triphase conical in top view, Y-shaped fissures visible, subtriangular in lateral view, subrounded in bottom view, 60-85 μm in diameter, with granular sculptures in outer walls.

Acid-insoluble ash Not more than 15.0 per cent (Appendix IX K).

Action To remove *damp-heat* and relieve dysuria.

Indications Pyretic stranguria, urolithiasis, hematuria, chyluria, urethral pain with difficult urination.

Usage and dosage 6-15 g.

Storage Preserve in a dry place.

Squama Manis
(穿山甲, Chuanshanjia)

Pangolin Scales

Pangolin Scales is the scale of *Manis pentadactyla* Linnaeus (Fam. Manidae). The scales is collected, washed clean, and dried in the sun.

Description In fan-shape, triangular, rhombic, shield-shaped flattened plates, or sometimes half-folded, central part relatively thick, marginal part thin, varying in sizes, 0.7-5 cm in length and width. The outer suface blackish-brown or yellowish-brown, lustrous, broad end with dozens of regularly arranged longitudinal lines and several transverse lines, narrow end smooth. Inner surface relatively light coloured, with 1 obviously raised arciform transverse crest line at the central part and several fine parallel lines under-neath. Horny, translucent, texture tenacious and elastic, uneasily broken. Odour, slightly stinking; taste, weak.

Identification To 1 g of the powder add 60 ml of chloroform, heat under reflux on a water bath for 4 hours, cool, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of Squama Manis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of benzene and acetone (20 : 1) as the mobile phase. Apply separately 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with a solution of acetic anhydride and sulfuric acid (9 : 1), heat at 80℃ for several minutes. Examine in daylight, the spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Foreign matter Not more than 4 per cent (Appendix IX A).

Processing *Squama manis* Eliminate foreign matter, wash clean, and dry.

Squama manis (*scalded with sand*) Grade clean Squama manis according to size, scald with sand as described under the method for processing with scalding (Appendix II D) to swell, wash clean, and dry. Break to pieces before use.

Squama manis (*processed with vinegar*) Grade clean Squama manis according to size, scald in the same manner, quench with vinegar, take out, and dry. Break to pieces before use.
Using 30 kg of vinegar per 100 kg of Squama manis.

Action To stimulate menstrual flow and the flow of milk, cause the subsidence of swelling and promote the discharge of pus, and eliminate *wind* from the collaterals.

Indications Amenorrhea with mass formation in the abdomen; agalactia; carbuncles and sores; arthralgia with numbness and muscular contracture.

Usage and dosage 5-9 g, used after being processed.

Precaution Used with caution in pregnancy.

Storage Preserve in a dry place.

Stalactitum
(钟乳石, Zhongrushi)

Stalactite

Stalactite is a mineral of carbonates of calcite group, containing mainly calcium carbonate ($CaCO_3$). The drug is collected, removed from foreign matter, washed clean, and dried in the sun.

Description Aggregates crystalith-shaped, somewhat conical or cylindrical. Externally white, greyish-white or brownish-yellow, rough and uneven. Texture heavy and hard, fracture relatively even, white to pale greyish-white, showing bright twinkle against light, often with a rounded hole near the centre, surrounded by numerous pale orangish-yellow,

concentrical rings. Odour, slight; taste, slightly salty.

Identification To the drug, add dropwise dilute hydrochloric acid TS, effervescence is produced; the solution yields the reactions characterisitic of calcium salts (Appendix Ⅳ).

Assay Dissolve about 0.12 g of the fine powder, accurately weighed, in 5 ml of dilute hydrochloric acid TS in a conical flask by heating. Add 150 ml of water and 1 drop of methyl red IS, add dropwise potassium hydroxide TS until the solution turns to yellow, then add 10 ml in excess. Add a small quantity of calcein indicator mixture, titrate with disodium edetate (0.05 mol/L) VS until the yellowish-green fluorescence disappears and turns to orange. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 5.004 mg of calcium carbonate ($CaCO_3$).
It contains not less than 95.0 per cent of calcium carbonate ($CaCO_3$).

Processing *Stalactitum* Wash clean, break to small pieces and dry.

Stalactitum (calcined) Calcine the clean pieces of Stalactitum as described under the method for calcining openly (Appendix Ⅱ D) to red thoroughly.

Action To warm the lung, relieve asthma, and inhibit acid secretion.

Indications Asthma and cough caused by *cold-phlegm*; feeling of coldness and pain in the loins and kness; gastric pain with acid regurgitation; cessation of the milk secretion.

Usage and dosage 3-9 g.

Storage Preserve in a dry place.

Stamen Nelumbinis (莲须, Lianxu)

Lotus Stamen

Lotus Stamen is the dried stamen of *Nelumbo nucifera* Gaertn. (Fam. Nymphaeaceae). The drug is collected at flowering period on fine days in summer, and dried in the sun under the cover of paper, or in shade.

Description Linear. Anthers twisted, longitudinally split, 1.2-1.5 cm long, about 0.1 cm in diameter, pale yellow or brownish-yellow. Filaments slender, slightly curved, 1.5-1.8 cm long, pale purple. Odour, slightly aromatic; taste, astringent.

Identification Powder: Yellowish-brown. Pollen grains subspherical or oblong, 45-86 μm in diametre, with 3 pit canals and granularly reticulate on the surface. Epidermal cells rectangular, polygonal or irregular, anticlinal walls sinuous; outer walls papillated in lateral view. cells in Inner wall of pollen pocket strip-shaped, thick-walled, and the lumina containing yellowish-brown or reddish-brown contents. Vessels spiral.

Action To strengthen the kindey and arrest seminal emission.

Indications Seminal emission, spermatorrhea, excessive leukorrhea, frequent urination.

Usage and dosage 3-5 g.

Storage Preserve in a dry place, protected from mould.

Stigma Croci (西红花, Xihonghua)

Saffron

Saffron is the dried stigma of *Crocus sativus* L. (Fam. Iridaceae).

Description Linear, 3-branched, about 3 cm long, dark red, the upper part broader and slightly flattened, the margin of apex irregularly dentate, with a short slit at the inner side, sometimes a small piece of yellow style remained at the lower end. Texture light, lax and soft, without oily lustre, brittle and short after drying. Odour, characteristic, slightly irritant; taste, slightly bitter.

Identification (1) Powder: Orange-red. Epidermal cells long stripe-shaped in surface view, thin-walled, slightly sinuous, sometimes the outer walls protruding and showing papillae, with indistinct fine striations. Terminal epidermal cells of stigma papillated, 26-56 μm in diameter, with sparse stirations on surface. Parenchymatous cells crowded with crystals of calcium oxalate, granular, round-fascicled, fusiform or subsquare, 2-14 μm in diameter.
(2) Macerate a small quantity of the drug in water, the orange-yellow colour descends vertically and diffuses slowly, while the solution is yellow without precipitation. Stigma looks like a loudspeaker with short chink which is not broken in a short time when picked with a needle.
(3) Place small quantity of the drug on a white porcelain plate, add 1 drop of sulfuric acid, a blue to purple colour is produced, which turns to reddish-brown or brown gradually.
(4) Measure the absorbance of the solution obtained under the test for Absorbance at 458 nm (Appendix Ⅴ A), the ratio of the absorbance at 458 nm to that at 432 nm is 0.85-0.90.
(5) To 20 mg of the powder add 1 ml of methanol, ultrasonicate for 10 minutes, allow to stand until clear and use the supernatant as the test solution. Prepare a solution of 20 mg of Stigma Croci reference drug in the same manner as the reference drug solution. Carry out the method for thin-layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate-methanol-water (100 : 16.5 : 13.5) as the mobile phase. Apply separately to the plate 3-5 μl of each of the above two solutions. After developing and removal of the plate, dry in air, examine under the daylight and ultra-violet light at 365 nm. The spots or fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution (Protected from light).

Loss on drying Dry 2 g at 105℃ for 6 hours, loses not more than 12.0 per cent (Appendix Ⅸ G).

Total ash Not more than 7.5 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 1.5 per cent (Appendix Ⅸ K).

Absorbance Dry the drug in vacuum desiccator over silica gel for 24 hours and grind into fine powder. Weigh accurately 30 mg into a Soxhlet's extractor, extract with 70 ml of ethanol under reflux and cool. Transfer the extract to a 100 ml volumetric flask, filter, if necessary. Wash the extractor with methanol, transfer the washings into the volumetric flask, dilute with methanol to volume and mix well. Measure accurately 5 ml to a 50 ml volumetric flask, dilute with methanol to volume and mix well. Carry out the

method for ultraviolet spectrophotometry and colourimetry (Appendix V A), measure the absorbance at 432 nm, not less than 0.50.

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix X A), using 30% ethanol as the solvent, not less than 55.0 per cent.

Assay Operate protected from light. Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (45 : 55) as the mobile phase. As detector a spectrophotometer set at 440 nm. The number of theoretical plates of the column is not less than 3500, calculated with reference to the peak of crocin-Ⅰ.

Reference solution Weigh accurately a quantity of crocin-Ⅰ CRS and crocin-Ⅱ CRS, add dilute ethanol to produce the solutions of 30 μg per ml and 12 μg per ml, respectively.

Test solution Weigh accurately 10 mg of the powder (through No. 3 sieve) in a 50 ml amber coloured volumetric flask, add a quantity of dilute ethanol TS, ultrasonicate in the ice bath for 20 minutes; allow to stand to cool, add dilute ethanol TS to volume and mix well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the two solutions into the column and calculate the content.

It contains not less than 10.0 per cent of the total amount of crocin-Ⅰ ($C_{44}H_{64}O_{24}$) and crocin-Ⅱ ($C_{38}H_{54}O_{19}$), calculated with reference to the dried drug.

Action To activate blood circulation and eliminate blood stasis, remove *heat* from blood and counteract *toxicity*, and calm the nerves.

Indications Amenorrhea with abdominal mass formation; blood stasis after childbirth; eruptions in infectious diseases; emotional dejection, mania.

Usage and dosage 3-9 g.

Precaution Used with caution in pregnancy.

Storage Preserve in tightly closed containers, stored in a cool and dry place, protected from light.

Styrax
(苏合香, Suhexiang)

Storax

Storax is the purified balsam obtained from the trunk of *Liquidambar orientalis* Mill. (Fam. Hamamelidaceae).

Description A semifluid viscid liquid, brownish-yellow or dark brown, translucent; odour aromatic.

Soluble in 90% ethanol, carbon disulfide, chloroform or glacial acetic acid; slightly soluble in ether.

Identification (1) Mix 1 g with 3 g of finely powdered sand, add 5 ml of potassium permanganate TS and warm gently, a distinct odour of benzaldehyde is produced.

(2) Dissolve 1 g of the drug in 10 ml of ethyl ether, use the supernatant as the test solution. Dissolve cannamic aldehyde CRS and cinnamic acid CRS in ethyl ether to produce a solution containing 1 mg of each per ml as the reference solution respectively. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel GF_{254} mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (30-60℃), *n*-hexane, ethyl formate and formic acid (10 : 30 : 15 : 1) as the mobile phase. Apply separately to the plate 2 μl of the test solution and 1 μl of the reference solution. After developing at 10-15℃ and removal of the plate, dry in air and examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Acid value 52-76 (Appendix Ⅸ N).

Saponification value 160-190 (Appendix Ⅸ N).

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use a column packed with octadecylsilane bonded silica gel as the stationary phase and the mixture of methanol and 1% of glacial acetic acid solution (50 : 50) as mobile phase. As detector a spectrophotometer set at 285 nm. The number of the theoretical plate of the column is not less than 7000, calculated with reference to the peak of cinnamic acid.

Reference solution Dissolve cinnamic acid CRS, accurately weighed, in methanol to produce a solution containing 8 μg of cinnamic acid per ml, and mix well.

Test solution To 0.5 g of the powder, accurately weighed, add 10 ml of 0.5 mol/L potassium hydroxide in ethanol, heat under reflux on a water bath for 1 hour. Cool, and evaporate ethanol, to the residue add 20 ml of hot water, mix well, cool, add 30 ml of water and 20 ml of magnesium sulfate solution (1.5 → 50), mix well, stand for 10 minutes, filter, wash the residue with 20 ml of water for several times. Combine the filtrate and washing, add hydrochloric acid to acidification by shaking, extract with 4 quantities, each of 40 ml of ether. Combine the filtrate, evaporate the ether at low temperature. Dissolve the residue in methanol and transfer into 100 ml volumetric flask, add with methanol to volume. Accurately measure 1 ml of the solution to a 50 ml volumetric flask, add methanol to volume, mix well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and of the test solution respectively into the column, and calculate the contents.

It contains not less than 5.0 per cent of cinnamic acid ($C_9H_8O_2$), calculated with reference to the dried drug.

Action To induce resuscitation, expel evil factors, and relieve pain.

Indications Stroke, sudden loss of consciousness; epilepsy and convulsion; pain with cold sensation in the chest or abdomen.

Usage and dosage 0.3-1 g, used in pills or powder, but not decoction.

Storage Preserve in well closed containers, stored in a cool and dry place.

Sulfur
(硫黄, Liuhuang)

Sulfur

Sulfur is the natural sulfur of natural elemental mineral group. The drug is collected and melted to remove foreign matter; or obtained by processing

the minerals containing sulfur.

Description In irregular masses, yellow or somewhat greenish-yellow. Surface uneven, showing fatty lustre, often with numerous small holes. Slightly bursting sound being heard on holding the drug tightly near the ear. Texture light and fragile, easily broken, fracture often showing needle crystals. Odour, characteristically stinking; taste, weak.

Identification Melts easily on burning, with a blue flame and an irritant odour of sulfur dioxide.

Assay To about 0.2 g of the fine powder, accurately weighed, in a conical flask, add 50 ml of ethanolic potassium hydroxide (0.5 mol/L) VS, accurately measured, and 10 ml of water, heat on a water bath to dissolve and evaporate the ethanol until no bubble and no odour of ethanol are produced in the solution. Add 40 ml of water, place a small funnel on the mouth of the flask, boil gently for 10 minutes, allow to cool, add dropwise carefully 5 ml of hydrogen peroxide TS, mix well, heat on a boiling water bath for 10 minutes, cool to room temperature, wash the funnel and the inner wall of the flask with water, add 2 drops of methyl orange IS, and titrate with hydrochloric acid (0.5 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of ethanolic potassium hydroxide (0.5 mol/L) VS is equivalent to 8.015 mg of sulfur (S).
It contains not less than 98.5 per cent of sulfur (S).

Processing *Sulfur* Eliminate foreign matter, and break to pieces.

Sulfur (processed) Boil the clean sulfur with bean curd until the bean curd shows blackish-green, take out, wash clean, and dry in the shade.
Using 200 kg of bean curd per 100 kg of sulfur.

Action To counteract poison, kill parasites and cure sores when used externally; to reinforce *yang* and relax the bowels when taken orally.

Indications External use for scabies, favus, abscesses due to cold and phlegm retention and malignant ulcers; oral administration for impotence with cold lower extremities; asthma or constipation of *deficiency-cold* type.

Usage and dosage For external use, appropriate quantity is applied topically after ground into powder and mixed with oil; for oral administration, 1.5-3 g, used in pills or powder after processed.

Precaution Use with caution in pregnancy.

Storage Preserve in a dry place, protected from fire.

Syngnathus
(海龙, Hailong)

Pipefish

Pipefish is the dried body of *Solenognathus hardwickii* (Gray), *Syngnathoides biaculeatus* (Bloch) or *Syngnathus acus* Linnaeus (Fam. Syngnathidae). The drug is collected in summer or autumn. For *Solenognathus hardwickii* and *Syngnathoides biaculeatus*, removed from the skin and viscera, washed clean, and dried in the sun. For *Syngnathus acus*, washed clean, and dried in the sun.

Description *Body of Solenognathus hardwickii* Narrow, long and laterally flattened, 30-50 cm long. Externally yellowish-white or greyish-brown. Head possessing a long tubular snout, mouth small, toothless, eyes rounded and deeply sunken. The axis of the head forming somewhat an obtuse angle with axis of the body. Trunk 3 cm wide, five-ridged, the anterior part of the tail six-ridged, the posterior part tapered off, four-ridged, and coiled at the end. Both sides of the dorsal ridge each bearing a longitudinal stripe consisted of greying-black spots. Whole body covered with striated bony rings and fine transverse streaks, projected granular spines occuring in each bony ring. The pectoral fin short and wide, dorsal fin long, sometimes indistinct, caudal fin lacking. Texture bony, hard. Odour, slightly stinking; taste, slightly salty.

Body of Syngnathoides biaculeatus Long and flattened, 20-22 cm long. The trunk somewhat four-ridged, externally greyish-yellow, the axises of the head and the body usually in the same straight line.

Body of Syngnathus acus Long and narrow, whip-shaped, 10-30 cm long, the skin not removed, externally yellowish-brown. Breeding pouch visible in some samples, caudal fin present. Texture fragile, easily torn.

Processing Eliminate dust and scraps. Break to pieces or cut into sections before use.

Action To warm the kidney and reinforce *kidney esseme*, reduce nodulation, and induce subsidence of swelling.

Indications Impotence and seminal emission; mass in the abdomen; scrofula; traumatic injuries; external use for carbuncles and boils.

Usage and dosage 3-9 g; for external use, appropriate quantity is ground into powder and applied topically.

Storage Preserve in a cool and dry place, protected from moth.

Talcum
(滑石, Huashi)

Talc

Talc is a mineral of silicates of talcum group, containing mainly hydrated magnesium silicate [$Mg_3(Si_4O_{10})(OH)_2$]. The drug is collected, and removed from foreign matter.

Description Aggregates of masses, irregular, white, yellowish-white or pale bluish-grey, with waxy lustre. Texture soft, smooth and unctuous on touching. Nonhygroscopic, non-disintegrated in water. Odour, slight; and tasteless.

Identification (1) To 0.2 g of the powder in a platinum crucible, add an equal quantity of calcium fluoride or sodium fluoride powder, stir, add 5 ml of sulfuric acid, heat gently, cover immediately the platinum crucible with a cover hanging with a drop of water, after a moment, take the cover off, the white turbidity is produced in the water drop. (2) To 0.5 g of the powder in a beaker, add 10 ml of hydrochloric acid (4→10), cover with a watch glass, boil gently with occasional shaking for 40 minutes, filter through rapid filter paper, wash the residue with water for four or five times. To about 0.1 g of the residue in a platinum crucible, add 10 drops of sulfuric acid (1→2) and 5 ml of hydrofluoric acid, heat until a white fume of sulfur trioxide is produced. Allow to cool, and dissolve in 10 ml of water. To 2 drops of the solution add 1 drop of magnesium reagent [dissolve 0.01 g of (*p*-nitro-azo)-resorcinol in 1000 ml of 4% sodium hydroxide solution], and add dropwise sodium hydroxide solution (4→10) to make alkaline; a blue precipitate is produced.

Processing Eliminate foreign matter, wash clean, break to pieces, pulverize to fine powder, or carry out the method for levigating (Appendix Ⅱ D), levigate the drug to fine powder, and dry in the shade.

Action To relieve dysuria, eliminate *summer-heat* and *damp*, and arrest discharges and promote healing of sores.

Indications Urinary infection, urolithiasis with difficult urination accompanied with burning pain; fidget and thirst caused by *summer-damp*, diarrhea caused by *damp-heat*; external use for eczema, sores with exudation, miliaria.

Usage and dosage 10-20 g; appropriate quantity for external use.

Storage Preserve in a dry place.

Thallus Laminariae Thallus Eckloniae
(昆布, Kunbu)

Kelp or Tangle

Kelp or Tangle is the dried thalline of *Laminaria japonica* Aresch. (Fam. Laminariaceae) or Ecklonia kurome Okam. (Fam. Alariaceae). The drug is collected in summer and autumn, and dried in the sun.

Description *Thallus Laminariae* Rolled and folded into a mass, or winded up into a bundle. Blackish-brown or greenish-brown throughout, externally showing white frost-like powder. After soaking in water, swollen into a flattened long strap, 50-150 cm long, 10-40 cm wide, relatively thick in central part, thinner and undulate on edges. Slightly coriaceous, remains of stipe compressed-cylindrical. Odour, seaweed-like; taste, salty.

Thallus Eckloniae Rolled and crumpled into an irregular ball. Black throughout, relatively thin. After soaking in water, swollen into a flattened phylloid, 16-26 cm long and wide, about 1.6 mm thick; two sides pinnatipartite, lobes long-ligulate, margins serrulate or entire. Texture soft and smooth.

Identification (1) Thick, swollen on soaking in water, surface smooth and viscous with transparent mucilage. When twisted by fingers, Thallus Laminariae can not be laminated, and Thallus Eckloniae laminated.
(2) Macerate about 10 g of the small pieces in 200 ml of water for several hours, filter and concentrate the filtrate to about 100 ml. To 2-3 ml of the concentrated solution add 1 drop of nitric acid and several drops of silver nitrate TS, a yellow colloidal precipitate is produced, which is slightly soluble in ammonia TS, but insoluble in nitric acid.

Assay Weigh accurately 10 g of the small pieces to a crucible, ignite gently and keep for 10 minutes whenever the temperature is raised for 100℃ and keep for 40 minutes at 400-500℃. Allow to cool and place the residue in a beaker. Add 100 ml of water, boil for about 5 minutes and filter. Treat the residue with further 2 quantitie of 100 ml of water, filter, combine the filtrates, wash the residue with 3 quantities of hot water, combine the washings and the filtrate, and concentrate to about 80 ml. Allow to cool, transfer to a 100 ml volumetric flask and dilute with water to volume. Transfer accurately 5 ml to a glass stoppered flask, add 50 ml of water and 2 drops of methyl red IS, add dropwise dilute sulfuric acid solution until a red colour is produced. Add 5 ml of freshly prepared bromine TS, heat to boil, add 5 ml of 20% sodium formate solution along the flask wall, and heat for 10-15 minutes again. Wash the flask wall with hot water, cool, add 5 ml of dilute sulfuric acid solution and 5 ml of 15% solution of potassium iodide, titrate immediately with sodium thiosulfate (0.01 mol/L) VS to pale yellow, add 1 ml of starch IS, and continue to titrate until the blue colour disappears. Each ml of sodium thiosulfate (0.01 mol/L) VS is equivalent to 0.2115 mg of I.
Thallus Laminariae contains not less than 0.35 per cent of I; Thallus Eckloniae contains not less than 0.20 per cent of I, calculated with reference to the dried drug.

Processing Eliminate foreign matter, rinse, briefly dry in the air, cut into wide slivers, and dry in the sun.

Action To eliminate phlegm, soften hard masses and dissolve lumps, and cause diuresis.

Indications Goiter, scrofula, swelling and pain of the testes; edema.

Usage and dosage 6-12 g.

Storage Preserve in a dry place.

Venenum Bufonis
(蟾酥, Chansu)

Toad Venom

Toad Venom is the dried secretion of *Bufo bufo gargarizans* Cantor or *Bufo melanostictus* Schneider (Fam. Bufonidae). Usually the toad is collected in summer or autumn, washed clean. The white serous fliud of the parotid glands and skin glands is squeezed out, processed, and dried.

Description In flattened and rounded masses or slices, brown or reddish-brown. Texture of the mass hard, uneasily broken, fracture brown, cuticuloid, slightly lustrous. Texture of the slice fragile, easily broken, fracture reddish-brown, translucent. Odour, slightly stinking; taste sweet at first, persistently tingling and pungent latter. Sneeze on smelling the powder.

Identification (1) A creamy white bump is produced on the fracture on touching with water.
(2) Macerate 0.1 g of the powder in 5 ml of methanol for 1 hour, filter. To the filtrate add a small quantity of *p*-dimethylaminobenzaldehyde and several drops of sulfuric acid, a bluish-violet colour is produced.
(3) Macerate 0.1 g of the powder in 5 ml of chloroform for 1 hour, filter, evaporate the filtrate to dryness. Dissolve the residue in a small quantity of acetic anhydride, add sulfuric acid dropwise, a bluish-violet colour is produced, which turns gradually to bluish-green.
(4) Heat under reflux 0.2 g of the powder with 10 ml of ethanol for 30 minutes, filter, transfer the filtrate to a 10 ml volumetric flask and add ethanol to volume as the test solution. Prepare a solution of 0.2 g of Venenum Bufonis reference drug in the same manner as the reference drug solution. Dissolve resibufogenin CRS and cinobufagin CRS in ethanol separately to produce solutions each containing 1 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform and acetone (4 : 3 : 3) as the mobile phase. Apply separately to the plate 10 μl of each of the above four solutions. After developing and removal of the plate, dry in air, spray with 10% solution of sulfuric acid in enthanol, heat to spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution, one green and one red spots are shown in the chromatogram of the test solution, corresponding in position with the reference solutions.

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ B).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of 0.5% potassium dihydrogen phosphate and acetonitrile (50 : 50) (adjust to pH 3.2 with phosphoric acid) as the mobile phase. As detector a spectrophotometer set at 296 nm. The temperature of the column is 40℃. The numbers of theoretical plates of the column are not less than 4000, calculated with references to the peaks of cinobufagin and resibufogenin, respectively.

Reference solution Weigh accurately 10 mg of each of cinobufagin CRS and resibufogenin CRS respectively, previously dried over phosphorous pentoxide in vacuum for 24 hours, to 100 ml volumetric flasks, dissolve separately in methanol and dilute to volumes and mix well. Measure accurately 5 ml of each of the two solutions to 10 ml volumetric flasks and dilute to volumes, respectively, and mix well (each containing 50 μg per ml).

Test solution Weigh accurately 25 mg of the fine powder into a stopper conical flask, add accurately 20 ml of methanol and weigh. Heat under reflux for 1 hour, allow to stand to cool, weigh again, replenish the loss of the solvent with methanol and mix well. Filter and use the successive filtrate as the test solution.

Procedures Accurately inject 20 μl of each of the above two reference solutions and the test solution into the column, and calculate the content.
It contains not less than 6.0 per cent of the sum of cinobufagin ($C_{26}H_{34}O_6$) and resibufogenin ($C_{24}H_{32}O_4$), calculated with reference to the dried drug.

Processing *Venenum Bufonis* (*powdered*) Break Venenum Bufonis to pieces, macerate with white rice wine, frequently stir untile become concentrated extract, dry and pulverize. To each 10 kg of Venenum Bufonis add 20 kg of white rice wine.

Action To counteract *toxicity*, relieve pain, and restore consciousness.

Indications Carbuncles, boils, sore throat; vomiting, diarrhea, abdominal pain and impaired consciousness in heat-stroke.

Usage and dosage 0.015-0.03 g, mostly used in pills or powder; appropriate quantity for external use.

Precaution Used with caution in pregnancy.

Storage Preserve in a dry place, protected from moisture.

Zaocys
(乌梢蛇, Wushaoshe)

Black-tail Snake

Black-tail Snake is the dried body of *Zaocys dhumnades* (Cantor) (Fam. Colubridae). The drug is collected in summer or autumn, opened in the abdomen or opened after the skin is stripped except the head and tail, removed from the viscera, coiled up in disc-shape and dried.

Description Disc-shaped, about 16 cm in diameter. The surface blackish-brown or greenish-black, densely covered with rhombic scales. The rows of dorsal scale in even number, the central 2-4 rows scales strongly keeled, forming two black strips throughout the whole body longitudinally. Head in the centre of the disc, flattened rounded. Eyes large, mostly lustrous and not sunk, 8 upper labials, the 4 th and 5 th entering orbit, 1 loreal, 1 small preocular and 2 postoculars. The median dorsal portion towering like a roof ridge. The edges of the cut abdomen rolled inward; dorsal musculature thick, yellowish-white or pale brown, ribs neatly arranged. The tail long and gradually tapering, with 2 rows of subcaudals. The stripped black snake, only with skin and scales of the head and tail, the middle portion relatively smooth. Odour stinking; taste weak.

Extractives Carry out the hot extraction method for determination of ethanol-soluble extractives (Appendix Ⅹ A), using dilute ethanol TS as the solvent, not less than 12.0 per cent.

Processing *Zaocys* Eliminate the head and scales and cut into sections of about 3 cm long.

Zaocys Flesh After eliminating the head and scales, soften thoroughly with yellow rice wine, eliminate skin and bones, and dry.

Zaocys (*processed with wine*) Stir-bake the clean sections of Zaocys with yellow rice wine as described under the method for stir-baking with wine (Appendix Ⅱ D) to dryness, using 20 kg of yellow rice wine per 100 kg of Zaocys.

Action To dispel *wind*, remove obstruction from the collaterals, and relieve spasm and convulsion.

Indications Chronic rheumatiod arthritis with numbness and ankylosis; hemiplegia in stroke; convulsion, tetanus, leprosy, scabies, scrofula with suppuration.

Usage and dosage 9-12 g.

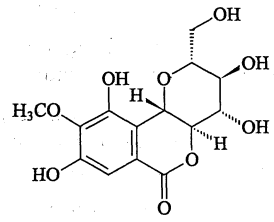
Storage Preserve in a dry place, protected from mould and moth.

MONOGRAPHS
PART II

Oil, Fats and Extractives

Bergeninum
(岩白菜素，Yanbaicaisu)

Bergenin



$C_{14}H_{16}O_9$ 328. 27

Description White, loosen needle crystals or crystalline powder. Odourless; taste, bitter; gradually discolours on exposure to light and heat.
Soluble in methanol; slightly soluble in water or ethanol.

Melting range 232-240℃, dried previously at 130℃ (Appendix Ⅵ C).

Specific optical rotation −38° to −45°, in a solution of 20 mg per ml in methanol, calculated on the dried basis (Appendix Ⅶ E).

Identification (1) Heat to dissolve about 50 mg in 10 ml of water and cool. To 1 ml of the solution add 2 drops of potassium ferricyanide TS containing 1 drop of ferric chloride TS per ml; an emerald green colour is produced and changes to blue colour.
(2) Dissolve 5 mg in 1 ml of methanol, add several drops of 7% hydroxyamine hydrochloride solution in methanol, adjust alkaline with 10% solution of potassium hydroxide in methanol, heat to boil gently. Allow to cool, acidify with dilute hydrochloric acid, add 1-2 drops of 1% ferric chloride solution in ethanol, a purplish-red colour is produced.
(3) The light absorption of the solution obtained in Assay, exhibits maxima at 275 nm and 220 nm (Appendix Ⅴ A).

Loss on drying When dried to constant weight at 130℃, loses not more than 6.0 per cent (Appendix Ⅸ G).

Residue on ignition Not more than 0.1 per cent (Appendix Ⅸ J).

Assay Place about 20 mg, accurately weighed, in a 50 ml volumetric flask, add methanol to volume, mix well. Measure accurately 1 ml of the solution to a 25 ml volumetric flask, add methanol to volume, mix well. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 275 nm, calculate the content of $C_{14}H_{16}O_9$, taking 248 as the value of $A^{1\%}_{1\,cm}$.
It contains not less than 97.0 per cent and not more than 103.0 per cent of bergenin ($C_{14}H_{16}O_9$), calculated with reference to the dried drug.

Action To relieve cough and eliminate phlegm.

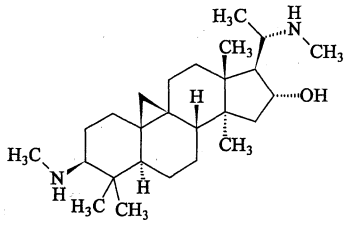
Indications Chronic bronchitis.

Usage and dosage 0.125 g, 3 times a day.

Storage Preserve in tightly closed containers, protected from light.

Cyclovirobuxinum D
(环维黄杨星 D，Huanweihuangyangxing D)

Cyclovirobuxine D



$C_{26}H_{46}N_2O$ 402. 36

Cyclovirobuxine D is the substance extracted from *Buxus microphylla* Sieb. et Zucc. *var sinica* Rehd. et Wils. or other plants of the same genus.

Description A colourless and needle crystals; odourless; taste, bitter.
Freely soluble in chloroform; soluble in methanol or ethanol; sparingly soluble in acetone; slightly soluble in water.
Melting point, 219-222℃, with decomposition (Appendix Ⅵ C).

Identification (1) Dissolve 5 mg in 1 ml of glacial acetic acid solution (1 → 20), add 1-2 drops of potassium iodobismuthate TS, and reddish-brown precipitate is produced.
(2) To 5 mg of the powder add 1 ml of ethanol and 2 ml of sulphuric acid, orange red colour is produced.

Other alkaloids Dissolve the powder with chloroform to prepare 1 mg of Cyclovirobuxinum D per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, acetone and diethylamine (5 : 4 : 0.4) as the mobile phase. Apply separately 10 μl of the above solutions to the plate. After developing and removal of the plate, dry in air. Spray with a solution of dilute potassium iodobismuthate TS, no other spot except for the main spot.

Loss on drying Constant at 105℃, lose not more than 0.5 per cent (Appendix Ⅸ G).

Assay Dissolve 0.15 g, accurately weighted, in 30 ml of glacial acetic acid, add 1 ml of acetic anhydride and 1-2 drops of crystal violet IS, titrate with perchloric acid VS (0.1 mol/L) until the colour changes to blue. Perform a black determination. Each ml of perchloric acid TS (0.1 mol/L) is equivalent to 20.12 mg of Cyclovirobuxinum D ($C_{26}H_{46}N_2O$).
It contains not less than 99.0 per cent of Cyclovirobuxinum D ($C_{26}H_{46}N_2O$) with reference to the dried drug.

Action To promote the flow of *qi* and active blood circulation, remove obstruction from the collaterals and alleviate pain.

Indications Chest impediment with heartache, knotted and inter mittent pulse. due to stagnation of *qi* and blood stasis; coronary heart disease and cardiac arrhythmia marked by above symptoms.

Usage and dosage 1-2 mg, 2-3 times a day.

Storage Preserve in tightly closed containers, protect from light.

Preparation Cyclovirobuxine D Tablets

Extractum Acanthopanacis Senticosi (刺五加浸膏, Ciwujia Jingao)

Manyprickle Acanthopanax Extract

Manyprickle Acanthopanax Extract is prepared from Radix Acanthopanacis Senticosi. The water extract is obtained by extracting with water and the ethanol extract is obtained by extracting with ethanol.

Procedure Pulverize 1000 g of Radix Acanthopanacis Senticosi to coarse powder, decoct with water 2 times, 3 hours each. Combine the decoctions, filter, and concentrate the filtrate to 50 g of extract; or heat under reflux with 75% ethanol for 12 hours, filter, recover ethanol from the filtrate, and concentrate to 40 g of extract.

Description A blackish-brown thick extract; odour, aromatic; taste, slightly bitter and astringent.

Identification Dissolve 1 g in 20 ml of methanol, filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. To 5 g of *Radix Acanthopanacis Senticosi* reference drug, add 20 ml of methanol, ultrasonicate for 30 minutes, filter, evaporate the filtrate do dryness, and dissolve the residue in 1 ml of methanol as the reference drug solution. Dissolve a quantity of isofraxidin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (8 : 1 : 0.1) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference drug solution, 1 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Water Carry out the method for loss on drying (Appendix Ⅸ H, method 1).
Water extract: Not more than 30.0 per cent. Ethanol extract: Not more than 20.0 per cent.

Total ash Not more than 6.0 per cent (Appendix Ⅸ K).

Other requirements Complies with the general requirements for liquid extracts and extracts (Appendix Ⅰ O).

Extractives Carry out the hot extraction method for determination of water soluble extractives (Appendix Ⅹ A). Water extract: Not less than 45.0 per cent. Carry out the hot extraction method for determination of ethanol soluble extractives (Appendix Ⅹ A). Use methanol as solvent, ethanol extract: Not less than 60.0 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (20 : 80) as the mobile phase. As detector a spectrophotometer set at 265 nm. The number of theoretical plates for the column is not less than 2000, calculated with the reference to the peak of syringoside.

Reference solution Dissolve a quantity of syringoside CRS in methanol to prepare a solution containing 80 μg per ml.

Test solution Weigh accurately 0.2 g in a 25 ml volumetric flask, dissolve in methanol and add to volume, shake well and filter. Use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into column, respectively, calculate the content.
It contains not less than 0.50 per cent of syringoside ($C_{17}H_{24}O_9$), calculated with reference to the dried drug.

Action To replenish qi and invigorate the spleen, and nourish the kidney and anchor the mind.

Indications Lassitude, anorexia, aching pain in the lower back and knees, insomnia and dreamfulness due to *yang-deficiency* in the spleen and kidney.

Usage and dosage 0.3-0.45 g, 3 times a day.

Storage Preserve in tightly closed containers.

Preparation Manyprickle Acanthopanax Tablets

Extractum Angelicae Liquidum (当归流浸膏, Danggui Liujingao)

Chinese Angelical Liquid Extract

Chinese Angelica Liquid Extract is prepared from Radix Angelicae Sinensis.

Procedure Carry out the method for percolation described under liquid extracts and extracts (Appendix Ⅰ O). Macerate 1000 g of the coarse powder of Radix Angelicae in 70% ethanol for 48 hours, percolate slowly. Collect 850 ml of the initial percolate in a separate container, and continue the percolation until the percolate becomes colourless or slightly yellow. Concentrate the successive percolate below 60℃ to a thick extract, mix well with the initial percolate, dilute with 70% ethanol to produce 1000 ml. Allow to stand for several days and filter.

Description A dark brown liquid; odour, characteristic; taste, slightly sweet, then bitter and numb.

Ethanol content Not less than 45 per cent and not more than 50 per cent (Appendix Ⅸ M).

Total solid Place 10 ml, measured accurately, in a tared evaporating dish, dried previously to constant weight, evaporate to dryness on a water bath. Dry the residue at 100℃ for 3 hours, transfer to a desiccator and cool for 30 minutes, weigh accurately, the residue is not less than 3.6 g.

Other requirements Complies with the general requirements for liquid extracts and extracts (Appendix Ⅰ O).

Action To nourish blood to regulate menstrual flow.

Indications Irregular menstruation and dysmenorrhea due to a deficiency and stagnation of blood.

Usage and dosage 3-5 ml; 9-15 ml a day.

Storage Preserve in tightly closed containers, stored in a cool place.

Extractum Belladonnae (颠茄浸膏, Dianqie Jingao)

Belladonna Extract

Belladonna Extract is an extract prepared from

Herba Belladonnae.

Procedure Carry out the method of percolation as described under Liquid Extracts and Extracts (Appendix I O), macerate 1000 g of Belladonna Herb (coarse powder) with 85% ethanol for 48 hours, then percolate slowly at a speed of 1-3 ml per minute. Collect about 3000 ml of the initial percolate in a container. Continue the percolation, until alkaloids is percolated thoroughly, and the successive percolate is used as the solvent for the next percolation. Recover ethanol from the initial percolate at 60℃ in vacuum, allow to cool to room temperature, and separate chlorophyll, filter and evaporate the filtrate to a concentrated extract at 60-70℃. Add 10 volumes of ethanol of the extract, stir well and allow to stand to precipitate thoroughly. Separate the supernatant solution, recover ethanol at 60℃ in vacuum, then concentrate to a concentrated extract. Carry out the Assay described under the determination of the content of alkaloids, using 3 g of the concentrated extract. Add a quantity of diluent to adjust the content of alkaloids complying with the requirement, dry at a low temperature, pulverize to fine powder, and sift through a No. 4 sieve.

Description A greyish green powder.

Identification Take a quantity of the solution after being titrated under Assay, add ammonia TS to make the solution alkaline, extract with a quantity of chloroform and evaporate chloroform extract to dryness, the residue produce the characteristic reactions of tropane alkaloids (Appendix Ⅳ).

Other requirements Comply with the general requirements for liquid extracts and extracts (Appendix I O).

Assay Transfer about 3 g, accurately weighed, to a separating funnel with 12 ml of dilute ethanol, shake frequently for 30 minutes, add 2 ml of ammonia TS, extract rapidly with at least six 25-ml quantities of chloroform, until completely extracting of the alkaloids. Combine the chloroform extracts, extract with sulfuric acid (0.1 mol/L) and ethanol (3 : 1), until completely extracting of the alkaloids. Combine the acid solutions and conduct the Assay as described under Belladonna Herb, beginning at the words "extract the solution with portions of 10-ml quantities of chloroform". Each ml of sulfuric acid (0.01 mol/L) VS is equivalent to 5.788 mg of hyoscyamine ($C_{17}H_{23}NO_3$).
It contains not less than 0.95 per cent and not more than 1.05 per cent of alkaloids, calculated as hyoscyamine ($C_{17}H_{23}NO_3$).

Action Anticholinergic, to relieve spasm of smooth muscles, and inhibit secretion of glands.

Indications Gastric and duodenal ulcer, colicky pain in the gastrointestinal tract, kidney, gallbladder and so on.

Usage and dosage Usual dose: 10-30 mg; 30-90 mg a day. Maximum dose: 50 mg; 150 mg a day.

Precaution Contraindicated in patients with glaucoma.

Storage Preserve in tightly closed containers, stored in a cool place.

Preparation Belladonna Tablets

Extractum Belladonnae Liquidum (颠茄流浸膏, Dianqie Liujingao)

Belladonna Liquid Extract

Belladonna Liquid Extract is an extract prepared from Herba Belladonnae.

Procedure Take 1000 g coarse powder of Herba Belladonnae. Carry out the procedure described under Belladonna Extracts to prepare concentrated extract. Determine the content of alkaloids, then add a quantity of 85% ethanol and dilute with water to adjust the content of alkaloids and alchohol complying with the requirements, allow to stand for clarification and filter.

Description A brown liquid; odour, slightly stinking.

Identification (1) Take a quantity of the solution after being titrated under Assay, add ammonia TS to make the solution alkaline, extract with a quantity of chloroform, evaporate the chloroform extract to dryness, the residue produce the characteristic reactions of tropane alkaloids (Appendix Ⅳ).
(2) To 1 ml, add 5 ml each of water and strong ammonia TS, extract with three 10-ml quantities of ether, combine the ether solutions, and evaporate to dryness. Dissolve the residue in 1 ml of chloroform, and use it as the test solution. Dissolve atropine sulfate CRS in methanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, methanol and concentrated ammonia TS (17 : 2 : 1) as the mobile phase. Apply separately 1 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, and spray with dilute potassium iodobismuthate TS. The spot in the chromatogram obtained with the test solution corresponds in colour and position to the spot in the chromatogram obtained with the reference solution.

Ethanol content Not less than 52 per cent and not more than 66 per cent (Appendix Ⅸ M).

Other requirements Complies with the general requirements for liquid extracts and extracts (Appendix I O).

Assay Place 10 ml, measured accurately, in a separating funnle, add 10 ml each of water and sulfuric acid solution (0.1 mol/L), extract with portions of 10-ml quantities of chloroform, until chloroform layer is colourless. Combine the chloroform solutions, wash with 10 ml of sulfuric acid solution (0.1 mol/L), combine the washings with acid solution and conduct the Assay as described under Belladonna Herb, beginning at the words "make the solution alkaline by adding excess of strong ammonia TS". Each ml of sulfuric acid (0.01 mol/L) VS is equivalent to 5.788 mg of hyoscyamine ($C_{17}H_{23}NO_3$).
It contains not less than 0.70 per cent and not more than 0.80 per cent of alkaloids (g/ml), calculated as hyoscyamine ($C_{17}H_{23}NO_3$).

Action Anticholinergic, to relieve spasm of smooth muscles, and inhibit secretion of glands.

Indications Gastric and duodenal ulcer, colicky pain in the gastrointestinal tract, kidney, gallbladder and so on.

Usage and dosage Usual dose: 0.01-0.03 ml; 0.03-0.1 ml a day. Maximum dose: 0.06 ml; 0.2 ml a day.

Precaution Contraindicated in patients with glaucoma.

Storage Preserve in tightly closed containers, stored in a cool place.

Extractum Folium Ginkgo Siccus (银杏叶提取物，Yinxingye Tiquwu)

Ginkgo Biloba leaf Extract

Ginkgo biloba extract is the extract prepared from Ginkgo leaf.

Procedure Pulverize Ginkgo leaf to powder, extract with diluted ethanol under reflux, combine the extracts, recover ethanol and concentrate to a quantity. Apply it to a previously prepared column of macroporous resin, elute stepwise with water and ethanol of different concentrations. Collect the ethanolic eluates, recover ethanol, spray to dryness; or concentrate to a thick extract, dry in vacuum and pulverize.

Description Pale brownish-yellow or blackish-brown powder; taste, slightly bitter.

Identification (1) Macerate 0.2 g in 15 ml of n-butanol on a warm water bath for 15 minutes, shake frequently, cool, filter, and evaporate the filtrate to dryness. Dissolve the residue in 20 ml of ethanol as the test solution. Prepare a solution with 0.2 g of ginkgo leaf reference extract in the same manner as the reference extract solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose prepared with 4% sodium acetate as the coating substance and a mixture of ethyl acetate, butanone, methanol and water (5∶3∶1∶1) as the mobile phase. Apply separately 3 μl of each of the test solution and the reference extract solution to the plate. After developing and removal of the plate, dry in air, and spray with a 3% solution of aluminum chloride in ethanol. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference extract solution.

(2) Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose prepared with 4% sodium acetate as the coating substance and a mixture of toluene, ethyl acetate, acetone and methanol (10∶5∶5∶0.6) as the mobile phase. Apply separately 15 μl of each of the test solution and the reference solution of terpene lactones, obtained under Assay, to the plate. After developing and removal of the plate, dry in air, expose to acetic anhydride vapour for 15 minutes, heat at 140-160℃ for about 30 minutes, cool, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference solution.

Water Not more than 5.0 per cent. (Appendix Ⅸ H, method 1)

Residue on ignition Not more than 0.8 per cent (Appendix Ⅸ J).

Heavy metal Carry out the limit test for heavy metals (Appendix Ⅸ E), not more than 20 ppm, using the residue obtained under the test of residue on ignition.

Peak area ratio of flavone aglycone Calculate the peak areas from the flavonol aglycone chromatogram, obtained under Assay, the peak area ratio of quercetin to kaempferide is 0.8 to 1.5.

Total Ginkgolic acids Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 1% glacial acetic acid solution (90∶10) as the mobile phase. As detector a spectrophotometer set at 310 nm. The number of theoretical plates for the column is not less than 4000, calculated with the reference to the peak of ginkgoneolic acid.

Reference solution Dissolve a quantity of ginkgoneolic acid CRS, accurately weighed, in methanol to produce a solution containing 5 μg per ml as the reference solution. Dissolve a quantity of total gingko acids in methanol to produce a solution containing 100 μg per ml as the reference solution for peaks identification.

Test solution Weigh accurately 10 g in a stopper conical flask, add accurately 50 ml of petroleum ether (60-90℃) and weigh. Heat under reflux for 2 hours, cool, weigh again, replenish the loss of weight with petroleum ether (60-90℃), shake well, and filter. Measure accurately 25 ml of the successive filtrate, recover the solvent to dryness under vacuum, add accurately 2 ml of methanol, stopper well and shake well.

Procedure Inject accurately 10 μl of each of the three solutions into the column, respectively, and determine the total peak area of ginkgolic acids in the test solution, identifying the peaks with reference to the corresponding peaks of the total ginkgolic acids reference solution, and calculate the total ginkgolic acids content with reference to ginkgoneolic acid, using the reference external standard method. It contains not more than 0.001 per cent of total ginkgolic acids.

Assay ***Total flavonol glycosides*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.4% phosphoric acid solution (50∶50) as the mobile phase. As detector a spectrophotometer set at 360 nm. The number of theoretical plates for the column is not less than 2500, calculated with the reference to the peak of quercetin.

Reference solution Dissolve respectively a quantity of quercetin CRS, kaempferol CRS, and isorhamnetin CRS, accurately weighed, in methanol to prepare a mixture containing 30 μg, 30 μg, and 20 μg each per ml respectively as the reference solution. Or weigh accurately 35 mg of the ginkgo biloba extract, with the contents of quercetin, kaempferol and isorhamnetin labelled, carry out the method described under the test solution in the same manner to prepare the reference extract solution.

Test solution Extract 35 mg, weighed accurately, with 25 ml of a mixture of methanol and 25% hydrochloride acid solution (4∶1), under reflux on a water bath for 30 minutes. Cool immediately to room temperature, transfer to a 50 ml volumetric flask, dilute with methanol to volume, shake well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the test solution and the reference solution (or the reference extract solution) into the column, respectively, calculate the content of quercetin, kaempferol and isorhamnetin, respectively, and convert to the content of total amount of flavonol glycosides using the following equation:

The content of total amount of flavonol glycosides = (the content of quercetin + the content of kaempferol + the content of isorhamnetin) × 2.51

It contains not less than 24.0 per cent of total amount of flavonol glycosides, calculated with reference to the dried drug.

Terpene lactones Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of n-propanol, tetrahydrofuran and water (1 : 15 : 84) as the mobile phase. Use an evaporative light scattering detector. The number of theoretical plates for the column is not less than 2500, calculated with the reference to the peak of bilobalide.

Reference solution Dissolve respectively a quantity of bilobalide CRS, ginkgolide A CRS, ginkgolide B CRS, and ginkgolide C CRS, accurately weighed, in methanol to prepare a mixture containing 2 mg, 1 mg, 1 mg, and 1 mg each per ml as the reference solution. Or weigh accurately 0.15 g of the ginkgo biloba reference extract, with the contents of bilobalide, ginkgolide A, ginkgolide B, and ginkgolide C labelled, carry out the method described under the test solution in the same manner to prepare the reference extract solution.

Test solution Disintegrate 0.15 g, weighed accurately, in 10 ml of water, on a water bath, add 2 drops of 2% hydrochloride acid solution, extract by shaking with one 15-ml and three 10-ml quantities of ethyl acetate, combine the ethyl acetate extracts and wash with 20 ml of 5% sodium acetate solution. Separate the sodium acetate layer, wash again with 10 ml of ethyl acetate. Combine the ethyl acetate extracts and ethyl acetate washings, wash with two 20-ml quantities of water, separate the water layer, and wash with 10 ml ethyl acetate. Combine all the ethyl acetate liquids, and recover the solvent to dryness. Dissolve the residue in methanol, transfer to a 5 ml volumetric flask, add methanol to volume, and shake well.

Procedure Inject accurately 5 μl, 10 μl of the reference solution (or the reference extract solution) and 5-10 μl of the test solution into the column, respectively, calculate the content, using a calibration equation of logarithmic alteration of two external standards.

It contains not less than 6.0 per cent of the total amount of bilobalide ($C_{15}H_{18}O_8$), ginkgolide A ($C_{20}H_{24}O_9$), ginkgolide B ($C_{20}H_{24}O_{10}$), and ginkgolide C ($C_{20}H_{24}O_{11}$), referred to total terpene lactones, calculated with reference to the dried drug.

Action To promote blood circulation to resolve stagnated blood and dredge meridians.

Indications Chest impediment, heart pain, stroke, hemiplegia and dysphasia due to blockage of meridians by stagnated blood; angina pectoris of the stable type in coronary heart disease and cerebral infarction with above symptoms.

Usage and dosage 80 mg, 240 mg a day, or follow doctor's advice.

Storage Preserve in tightly closed containers and protected from light

Preparation Ginkgo Biloba Tablets

Extractum Forsythiae Siccus (连翘提取物, Lianqiao Tiquwu)

Weeping Forsythia Extract

Weeping Forsythia Extract is prepared from Fructus Forsythiae.

Procedure Pulverize Fructus Forsythiae to coarse powder, decoct 3 times, 1.5 hours each. Combine the decoctions, filter, concentrate under 60℃ in vacuum to a thin extract with a relative density of 1.10-1.20 (at room temperature), allow to cool, add 4 volumes of ethanol, stir well, allow to stand for 2 hours and filter. Recover the ethanol, concentrate the filtrate in vacuum, and spray to dryness.

Description blackish-brown powder; odour, aromatic; taste, bitter.

Identification Ultrasonicate 0.1 g with 10 ml of methanol for 20 minutes, filter and use the filtrate as the test solution. Prepare a solution with 1 g of Fructus Forsythiae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform and methanol (5 : 1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate, after developing and removal of the plate, dry in air. Spray with a solution of 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Not more than 5.0 per cent (Appendix Ⅸ H, method 1).

Heavy metal Carry out the limit test for heavy metals (Appendix Ⅸ E, method 2), not more than 20 ppm. Using 1 g.

Arsenic Place 5 g in crucible, cover with 1 g of magnesium oxide, add 10 ml of magnesium nitrate solution (dissolve 15 g of magnesium nitrate in 100 ml of water), macerate for 4 hours, and evaporate to dryness on a water bath. Heat gently until it is thoroughly charred, increase the temperature gradually to 500-600℃ until the incineration is complete. Cool and moisten with 5 ml of water, add 10 ml of hydrochloric acid (6 mol/L), transfer to a 50 ml volumetric flask. Rinse the crucible with three 5-ml quantities of hydrochloric acid (6 mol/L), rinse again with three 5 ml quantities of water, combine the rinsings to the same flask, add water to volume, and shake well. Measure 10 ml of the solution, add 3.5 ml rinsings to the same flask, add water to volume, and shake well. Measure 10 ml of the solution, add 3.5 ml of hydrochloric acid and 12.5 ml of water. Carry out the limit test for arsenic (Appendix Ⅸ F, method 1), not more than 2 ppm.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (25 : 75) as the mobile phase. As detector a spectrophotometer set at 277 nm. The number of theoretic plates for the column is not less than 3000, calculated with the reference to the peak of forsythin.

Reference solution Dissolve a quantity of forsythin CRS, accurately weighed, in methanol to prepare a solution containing 0.2 mg per ml.

Test solution Weigh accurately 1 g to a stopper conical flask, add accurately 15 ml of methanol, and weigh. Allow to stand overnight, ultrasonicate (power, 100 W; frequency, 40 kHz) for 25 minutes, cool, weigh again, replenish the loss of weight with methanol, shake well and filter. Measure accurately 5 ml of the successive filtrate, evaporate to nearly dryness, mix well with 1.5 g of neutral aluminium oxide and then transfer to a neutral aluminium oxide column (3 g, 100-120 mesh, 1-1.5 cm in diameter). Elute with 240 ml of 70% ethanol, collect the eluates, and concentrate

to dryness. Dissolve the residue in 50% methanol in a 10 ml volumetric flask, add 50% methanol to volume, shake well and filter.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.
It contains not less than 0.50 per cent of forsythin ($C_{29}H_{36}O_{15}$), calculated with reference to the dried drug.

Action Clear heat and couteract *toxicity*, and reduce swelling and disperse nodes.

Indications Carbuncles, abscesses, scrofula, acute mastitis, erysipelas, common cold due to *wind-heat*, high fever, polydopsia, impaired consciousness, eruptions, stranguria due to heat, and anuresis in warm disease at its early stage or invasion of the *ying* system by heat.

Usage and Dosage According to the dosage of each formula.

Storage Preserve in tightly closed containers, stored in a ventilated and dry place.

Extractum Glycyrrhizae (甘草浸膏, Gancao Jingao)

Liquorice Extract

Liquorice Extract is prepared from Radix Glycyrrhizae.

Procedure Decoct Radix Glycyrrhizae, softened and sliced, for three times, 2 hours for each time. Combine the decoctions, allow to stand over night to deposit any precipitate and concentrate the supernatant to a thick extract. Take a quantity, carry out the determination of glycyrrhetic acid as described under Assay and adjust its content to comply with the requirement.

Description A dark brown solid; odour, slightly characteristic offensive; taste, persistent and characteristic sweet.

Identification (1) Place 1-2 mg, in fine powder, on a white porcelain plate, add several drops of sulfuric acid solution (4→5); a yellow colour is produced, which turns to orange or orange-red gradually.
(2) Dissolve 1 g in 40 ml of water, extract by shaking with three 20-ml quantities of *n*-butanol, centrifuged if necessary. Combine the *n*-butanol solutions, wash with three 20-ml quantities of water and evaporate the *n*-butanol solution to dryness. Dissolve the residue in 5 ml of methanol, used as the test solution. Dissolve ammonium glycyrrhizinate CRS in methanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance prepared with 1% solution of sodium hydroxide and a mixture of ethyl acetate, formic acid, glacial acetic acid and water (15 : 1 : 1 : 2) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots clear and examine under ultraviolet light at 365 nm. An orange-yellow fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 10.0 per cent (Appendix Ⅸ H, method 1).

Total ash Not more than 12.0 per cent (Appendix Ⅸ K).

Water-insoluble matter Dissolve 1 g, weighed accurately, in 25 ml of water on stirring and centrifuge at a speed of 1000 rpm for 1 hour (or 2000 rpm for 30 minutes). Discard the supernatant, add 25 ml of water to the precipitate, stir thoroughly, centrifuge and wash again until the washing becomes clear and colourless. Transfer the precipitate with a small quantity of water to a tared evaporating dish, evaporate to dryness on a water bath and heat to a constant weight at 105℃. The residue is not more than 5.0 per cent.

Other requirements Complies with the general requirements for liquid extracts and extracts (Appendix Ⅰ O).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, 0.2 mol/L ammonium acetate and glacial acetic acid (67 : 33 : 1) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates for the column is not less than 2000, calculated with the reference to the peak of glycyrrhizinic acid.

Reference solution Weigh accurately 10 mg of ammonium glycyrrhizinate CRS in 50 ml volumetric flask, add 45 ml of the mobile phase, ultrasonicate for 30 minutes, cool, add the mobile phase to volume and shake well. (containing 0.2 mg of ammonium glycyrrhizinate, equal to 0.1959 mg of glycyrrhizinic acid per ml).

Test solution Weigh accurately 0.25 g in a 50 ml volumetric flask, add 45 ml of the mobile phase, ultrasonicate for 30 minutes (power, 200 W; frequency, 50 kHz), cool, add the mobile phase to volume, shake well and filter. Measure accurately 10 ml of the successive filtrate to a 25 ml volumetric flask, add the mobile phase to volume and shake well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into column, respectively, calculate the content.
It contains not less than 8.0 per cent of glycyrrhizinic acid ($C_{42}H_{62}O_{16}$), calculate with reference to the dried drugs.

Action It is a demulcent, often prescribed together with antitussives to resolve phlegm, which effects to relieve irritation to the mucosa of the throat and spasm of the gastrointestinal smooth muscles, and it has the similar action as desoxycorticosterone.

Indications Bronchitis, pharyngolaryngitis, bronchial asthma and chronic adrenocortical insufficiency.

Precaution Long term administration in large doses may cause side effects such as edema and hypertension. The symptoms will gradually disappear after stopping of administration.

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Preparation Liquorice Liquid Extract.

Extractum Glycyrrhizae Liquidum (甘草流浸膏, Gancao Liujingao)

Liquorice Liquid Extract

Liquorice Liquid Extract is prepared from Extractum Glycyrrhizae.

Procedure To 300-400 g of the Extractum Glycyrrhizae, add a quantity of water to dissolve on heating with constant stirring, filter and add 85% ethanol slowly to the filtrate

with stirring until the ethanol content of the solution reaches about 65%. Allow to stand over night and decant carefully the supernatant. Add 65% ethanol to the residue, stir thoroughly and allow to stand over night, remove the supernatant and extract the residue again with 65% ethanol. Combine the three extracts, filter, recover the ethanol and determine the content of glycyrrhetic acid. Add a quantity of water and ethanol to make the contents of glycyrrhetic acid and ethanol to comply with the requirements. Add a quantity of strong ammonia TS to adjust the pH value, allow to stand until it becomes clear, decant the supernatant and filter.

Description A brown or reddish-brown liquid; taste, sweet, a little bitter and astringent.

Identification Dissolve 1 ml in 40 ml of water, extract with three 20-ml quantities of *n*-butanol, centrifuged if necessary. Combine the *n*-butanol solutions, wash with three 20-ml quantities of water and evaporate the *n*-butanol solution to dryness. Dissolve the residue in 5 ml of methanol, used as the test solution. Dissolve ammonium glycyrrhizinate CRS in methanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance prepared with a 1% solution of sodium hydroxide, and a mixture of ethyl acetate, formic acid, glacial acetic acid and water (15 : 1 : 1 : 2) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots clear and examine under ultraviolet light at 365nm. An orange-yellow fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

pH value 7.5-8.5 (Appendix Ⅶ G).

Ethanol content Not less than 20 per cent and not more than 25 per cent (Appendix Ⅸ M).

Other requirements Comply with the general requirements for liquid extracts and extracts (Appendix Ⅰ O).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, 0.2 mol/L ammonium acetate and glacial acetic acid (67 : 33 : 1) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates for the column is not less than 2000, calculated with the reference to the peak of glycyrrhizinic acid.

Reference solution Weigh accurately 10 mg of ammonium glycyrrhizinate CRS in 50 ml volumetric flask, add 45 ml of the mobile phase, ultrasonicate to dissolve, cool, add the mobile phase to volume and shake well. (containing 0.2 mg of ammonium glycyrrhizinate, equal to 0.1959 mg of glycyrrhizinic acid per ml).

Test solution Measure accurately 1 ml in a 50 ml volumetric flask, add 20 ml of the mobile phase, ultrasonicate for 30 minutes (power, 200 W; frequency, 50 kHz), cool, add mobile phase to volume, shake well and filter. Measure accurately 10 ml of the successive filtrate to a 25 ml volumetric flask, add the mobile phase to volume and shake well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into column, respectively, calculate the content.

It contains not less that 1.8 per cent (g/ml) of glycyrrhizinic acid ($C_{42}H_{62}O_{16}$).

Action It is a demulcent, often prescribed together with antitussives to resolve phlegm, which effects to relieve irritation to the mucosa of the throat and spasm of the gastrointestinal smooth muscles, and it has the similar action as desoxycorticosterone.

Indications Bronchitis, pharyngolaryngitis, bronchial asthma and chronic adrenocortical insufficiency.

Usage and dosage 2-5 ml, 6-15 ml a day.

Precaution As described under Extractum Glycyrrhizae.

Storage Preserve in tightly closed containers.

Extractum Leonuri Liquidum (益母草流浸膏, Yimucao Liujingao)

Liquid Extract of Motherwort Herb

Liquid Extract of Motherwort Herb is the liquid extract prepared from Herba Leonuri.

Procedure Cut 1000 g of Herba Leonuri into pieces, decoct 3 times, combine the decoctions, filter and concentrate to about 500 ml. Allow to cool, add an equal quantity of ethanol, stir well and allow to stand for precipitation. Filter, wash the precipitate with 45% ethanol, combine the washing and the filtrate, and recover ethanol in vacuum. Allow to cool, filter, adjust the content of ethanol to meet the requirement, make up to a volume of 1000 ml, allow to stand for clarification and filter.

Description A dark brown liquid; taste, slightly bitter.

Identification Dissolve a quantity of stachydrine hydrochloride CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅳ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of ethyl acetate, *n*-butanol and hydrochloric acid (1 : 8 : 3) as the mobile phase. Apply separately to the plate 4 μl of each of the above reference solution and the test solution obtained under Assay. After developing and removal of the plate, dry in air. Spray with a dilute potassium iodobismuthate TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

Ethanol content Not less than 16 per cent and not more than 20 per cent (Appendix Ⅸ M).

Other requirements Complies with the general requirements for liquid extracts and extracts (Appendix Ⅰ O).

Assay Weigh accurately 5 g, add dilute hydrochloric acid to adjust to pH 1-2, and transfer to a strongly acidic cation exchange resin column (2 cm in diameter, 15 cm long), packed with sodium type of resin (732). Elute with water at the speed of 8 ml per minute to the eluate nearly colourless, discard the water eluate and then elute with 150 ml of 2 mol/L ammonia solution at the speed of 2 ml per minute. Collect the ammonia eluates and evaporate to dryness. Dissolve the reside in a quantity of methanol, transfer to a 10 ml volumetric flask, dilute with methanol to volume, shake well, allow to stand and use the supernatant as the test solution. Dissolve a quantity of stachydrine hydrochloride CRS, dried previously for 3 hours at 105℃, accurately weighed, in methanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, *n*-butanol and hydrochloric acid (1 : 8 : 3) as the mobile

phase. Apply accurately 8 μl of the test solution, 3μl and 8 μl of the reference solution to the plate, spotted alternately. After developing and removal of the plate, dry in air. Heat at 105℃ for 15 minutes, allow to cool and spray with a mixture of dilute potassium iodobismuthate TS and a 1% solution of ferric chloride in ethanol (10 : 1) to the spots clear, dry in air. Cover the plate with a same sized glass and fix with tape. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan at the wavelength of $\lambda_S = 510$ nm, $\lambda_R = 700$ nm. Measure the integration values of the absorbance from the test solution and the reference solution respectively, and calculate the content.
It contains not less than 0.20 per cent of stachydrine hydrochloride ($C_7H_{13}NO_2 \cdot HCl$).

Action To promote blood circulation and regulate menstruation.

Indications Menstrual disorders and postpartum lochiorrhagia with manifestations of hypomenorrhea, continuous dripping of menstrual blood and long-term bleeding after childbirth; postpartum subinvolution of the uterus with above symptoms.

Usage and dosage 5-10 ml; 15-30 ml a day.

Precaution Contraindicated in pregnancy.

Storage Preserve in tightly closed containers.

Extractum Polygalae Liquidum (远志流浸膏, Yuanzhi Liujingao)

Thinleaf Milkwort Liquid Extract

Thinleaf Milkwort Liquid Extract is the liquid extract prepared from Radix Polygalae.

Procedure Carry out the method of percolation as described under liquid extracts and extracts (Appendix Ⅰ O), macerate the medium powder of Radix Polygalae with 60% ethanol for 24 hours and percolate slowly at a speed of 1-3 ml per minute. Collect 850 ml of the initial percolate in a seperate container, and continue the percolation until the active components completly extracted. Evaporate the successive percolate below 60℃ to a thick extract and mix well with the initial percolate. Add dropwise a quantity of strong ammonia TS to adjust the extract slightly alkaline and with ammonia odor smelled. Dilute with 60% ethanol to 1000 ml, allow to stand until it becomes clear and filter.

Description A brown liquid.

Ethanol content Not less than 38 per cent and not more than 48 per cent (Appendix Ⅸ M).

Other requirements Complies with the general requirements for liquid extracts and extracts (Appendix Ⅰ O).

Action To expel phlegm.

Indications Coughing with difficult expectoration of phlegm.

Usage and dosage 0.5-2 ml, 1.5-6 ml a day.

Storage Preserve in tightly closed containers.

Preparation Thinleaf Milkwort Tincture.

Extractum Rhei Liquidum (大黄流浸膏, Dahuang Liujingao)

Rhubarb Liquid Extract

Rhubarb Liquid Extract is the liquid extract prepared from Radix et Rhizoma Rhei.

Procedure Carry out the percolation as described under the liquid extracts and extracts (Appendix Ⅰ O). Macerate 1000 g of the coarse powder of Radix et Rhizoma Rhei in 60% ethanol for 24 hours and percolate slowly at a speed of 1-3 ml per minute. Reserve 850 ml of the initial percolate and continue to percolate until the percolate becomes pale in colour. Concentrate the successive percolate to a thick extract, mix well with the initial percolate and dilute with 60% ethanol to produce a volume of 1000 ml. Allow to stand until the fluid becomes clear and filter.

Description A brown liquid; taste, bitter and astringent.

Identification (1) To 1 ml add 10 ml of 1% sodium hydroxide solution, boil, cool and filter. To 2 ml of the filtrate add several drops of dilute hydrochloric acid to adjust to acidic and shake with 10 ml of ether. The ether layer becomes yellow. Separate the ether layer and shake with 5 ml of ammoina TS. The ether layer still shows yellow and the ammonia layer shows persisting cherry-red colour.
(2) Evaporate 1 ml in a porcelain crucible to dryness on a water bath. Cover the crucible with a glass slide, heat slowly on an asbestos gauze with direct flame until sublimates appear on the slide, and cool. Observe under a microscope, rhombic needles, feathery and irregular crystals are shown. The crystals are dissolved and a violet-red colour is produced on adding dropwise sodium hydroxide TS.
(3) Evaporate 0.1 ml to dryness, dissolve the residue in 20 ml of water and filter. To the filtrate add 2 ml of hydrochloric acid, heat under reflux for 30 minutes, cool immediately and extract with two 20-ml quantities of ether. Combine the ether extracts, evaporate to dryness, dissolve the residue in 1 ml of chloroform as the test solution. Macerate 0.1 g of Radix et Rhizoma Rhei reference drug in 20 ml of ethanol for 1 hour and filter. Evaporate 5 ml of the filtrate to dryness, dissolve the residue in 10 ml of water and 1 ml of hydrochloric acid to prepare the reference drug solution in the same manner as described in the test solution preparation, beginning at the words "heat under reflux for 30 minutes". Dissolve rhein CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H containing sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately to the plate 2 μl of the test solution and 4 μl of each of the reference drug solution and reference solution. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The five orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution; and an orange fluorescent spot corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. The colour of spots turns red on exposure to ammonia vapour.

Rhaponticin To 0.2 ml add 2 ml of methanol, macerate warmly for 10 minutes and cool. Apply 10 μl of the supernatant to a stripe of filter paper, using 45% ethanol as the mobile phase. After developing and removal of the paper, dry in air, stand for 10 minutes, and examine under ultraviolet light at 365 nm. No persistent bright purple fluorescence spot exhibits.

Ethanol content Not less than 40 per cent and not more than 50 per cent (Appendix Ⅸ M).

Total solid Place about 1 g in a tared evaporating dish, weighed accurately, and evaporate to dryness on a water

bath. Dry the residue at 105 ℃ for 3 hours, cool in a desiccator for 30 minutes and weigh rapidly. The total solid is not less than 30.0 per cent (g/g).

Other requirements Complies with the general requirements for liquid extracts and extracts (Appendix I O).

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.1% phosphoric acid (80 : 20) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates for the column is not less than 1500, calculated with the reference to the peak of emodin.

Reference solution Dissolve respectively a quantity of emodin CRS and chrysophanol CRS, accurately weighed, in methanol to produce a mixture containing 5 μg each per ml as the reference solution.

Test solution Weigh accurately 0.2 g in a conical flask, evaporate to dryness, add 25 ml of methanol and weigh. Heat under reflux for 30 minutes, cool, weigh again, replenish the loss of weight with methanol, shake well and filter. Measure accurately 5 ml of the successive filtrate to a round bottom flask, expel methanol, add 10 ml of 2.5 mol/L sulfuric acid solution, and ultrasonicate (power, 120 W; frequency, 45 kHz) for 5 minutes. Add 10 ml of chloroform, heat under reflux for 1 hour, cool, transfer to a separating funnel, wash the container with a quantity of chloroform, and combine to the separating funnel. Separate the chloroform layer, extract the acid liquid by shaking with two 10-ml quantities of chloroform. Filter the chloroform layer through a funnel packed with 2 g of anhydrous sodium sulfate, recover the solvent to dryness, add accurately 25 ml of methanol to the residue, and weigh. Dissolve the residue on a water bath, cool, weigh again, replenish the loss of weight with methanol, and shake well. Filter the supernatant through a filter membrane of 0.45 μm, and use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 0.45 per cent of the total amount of emodin ($C_{15}H_{10}O_5$) and chrysophanol ($C_{15}H_{10}O_4$).

Action Irritative purgative and stomachic with bitter in flavor.

Indications Constipation and poor appetite.

Usage and dosage 0.5-1 ml; 1-3 ml a day.

Storage Preserve in tightly closed containers.

Extractum Scutellariae Siccus (黄芩提取物, Huangqin Tiquwu)

Baical Skullcap Extract

Baical Skullcap Extract is prepared from Radix Scutellariae.

Procedure Decoct Radix Scutellariae with water, combine the decoctions, concentrate to a quantity, adjust to pH 1.0-2.0 with hydrochloric acid, keep the temperature at 80℃, allow to stand and filter. Add a quantity of water to the precipitate, stir well, adjust to pH 7.0 with 40% sodium hydroxide solution, add an equal quantity of ethanol, stir to dissolve and filter. Adjust the filtrate to pH 1.0-2.0 with hydrochloric acid, keep the temperature at 60℃, allow to stand and filter. Rinse the precipitate stepwise with a quantities of water and ethanol of different concentrations to pH 7.0, expel ethanol and dry in vacuum.

Description Bright yellow or brownish-yellow powder; taste, weak and slightly bitter.

Identification Dissolve 1 mg in 1 ml of methanol as the test solution. Take 1 g of Radix Scutellariae reference drug, ultrasonicate with 20 ml of methanol for 20 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the reference drug solution. Dissolve a quantity of baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using polyamide as the coating substance and acetic acid as the mobile phase. Apply separately 2 μl of each of the three solutions to the plate, after developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescence spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and with the reference solution.

Water Not more than 5.0 per cent (Appendix IX H, method 1).

Residue on ignition Not more than 0.8 per cent (Appendix IX J).

Heavy metal Carry out the limit test for heavy metals (Appendix IX E, method 2), not more than 20 ppm, using the residue obtained from the Determination of Residue on Ignition.

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (47 : 53 : 0.2) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretic plates for the column is not less than 2500, calculated with the reference to the peak of baicalin.

Reference solution Dissolve a quantity of baicalin CRS, accurately weighed, in methanol to produce a solution containing 60 μg per ml.

Test solution Weigh accurately 10 mg in a 25 ml volumetric flask, add methanol to volume, and shake well. Measure accurately 5 ml in a 25 ml volumetric flask, add methanol to volume, shake well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 85.0 per cent of baicalin ($C_{21}H_{18}O_{11}$), calculated with reference to the dried drug.

Usage and Dosage According to the dosage of each formula.

Action Clear *heat* and remove *dampness*, purge *fire* and counteract *toxicity*, and check bleeding and prevent miscarriage.

Indications Constriction in the chest, nausea and vomiting due to *damp-warm* and *summer-heat-warm*, stuffiness in the chest due to *damp-heat*, dysentery, jaundice, cough due to excessive *lung-heat*, higher fever and polydipsia, hematemesis due to heat in blood, carbuncles and abscesses, and threatened abortion.

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Extractum Zingiberis Liquidum
(姜流浸膏，Jiang Liujingao)

Ginger Liquid Extract

Ginger Liquid Extract is the liquid extract prepared from Rhizoma Zingiberis.

Procedure Carry out the method for percolation as described under the liquid extracts and extracts (Appendix Ⅰ O). Macerate 1000 g of powder of Rhizoma Zingiberis in 90% ethanol for 24 hours and percolate slowly at a speed of 1-3 ml per minute. Collect 850 ml of the initial percolate and continue the percolation, until the percolate becomes nearly colourless and the odour and taste of ginger becomes very slight. Evaporate the successive percolate below 60℃ to a thick extract, mix well with the initial percolate, and filter. Take 20 ml of the extract for the Assay and dilute the rest with 90% ethanol to make the contents of ether-soluble extractive and ethanol to comply with the requirements. Allow to stand until the fluid becomes clear, then filter.

Description A brown liquid; odour, aromatic resembling Rhizoma Zingiberis; taste, pungent.

Ethanol Content Not less than 72 per cent and not more than 80 per cent (Appendix Ⅸ M).

Other requirements Complies with the general requirements for liquid extracts and extracts (Appendix Ⅰ O).

Assay Expel ethanol of 20 ml of the liquid extract, accurately measured, and cool. Add 50 ml of ether, stir with a glass rod to dissolve ether-soluble substances and filter. Extract the residue with two to three 50-ml quantities of ether, and filter. Combine the ether solutions, recover ether at a low temperature, dry the residue for 24 hours in a desiccator over sulfuric acid and weigh accurately. Calculate the content of ether-soluble extractives.
It contains not less than 4.5 per cent of ether-soluble extractive.

Action To invigorate the stomach and expel wind.

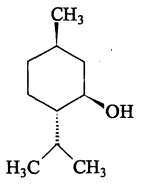
Usage and dosage 0.5-2 ml; 1.5-6 ml daily.

Storage Preserve in tightly closed containers.

Preparation Ginger Tincture

Mentholum
(薄荷脑，Bohenao)

Menthol



$C_{10}H_{20}O$ 156.27

Menthol is a saturated, cyclic alcohol obtained from peppermint oil.

Description Colourless needle or prismatic crystals or a white, crystalline powder. Odour, aromatic, resembling that of peppermint; taste, warm, and then cool. A solution in ethanol is neutral.
Very soluble in ethanol, chloroform, ether, liquid paraffin or volatile oils; very slightly soluble in water.

Melting point 42-44℃ (Appendix Ⅵ C).

Specific optical rotation −49° to −50°, in a solution of 0.1 g per ml in ethanol (Appendix Ⅶ E).

Identification (1) Dissolve 1 g in 20 ml of sulfuric acid, an orange-red colour is produced; after 24 hours, a colourless oil layer without aromatic odour of menthol is separated (distinction from thymol).
(2) Dissolve 50 mg in 1 ml of glacial acetic acid, add a cool mixture of 6 drops of sulfuric acid and 1 drop of nitric acid; only a pale yellow colour is produced (distinction from thymol).

Non-volatile matter Heat 2 g of the drug in a tared evaporating dish, on a water bath, evaporate slowly and dry to constant weight at 105℃. The residue is not more than 1 mg.

Action and indications As described under Peppermint Oil.

Usage and dosage 0.02-0.1 g, often in buccal tablet; or for topical application in spirit, or ointment.

Storage Preserve in tightly closed containers, stored in a cool place.

Oleum Anisi Stellati
(八角茴香油，Bajiao Huixiangyou)

Anise Oil

Anise Oil is the volatile oil obtained by steam distillation from the fresh branch and leaf or the ripe fruit of *Illicium verum* Hook. f. (Fam. Magnoliaceae).

Description A colourless or pale yellow clear liquid; odour and taste, similar to those of Fructus Anisi Stellati. Turbiding or crystallizing on cooling, clear again after heating.
Freely soluble in 90% ethanol.

Relative density 0.975-0.988, at 25℃ (Appendix Ⅶ A).

Congealing point Not lower than 15℃ (Appendix Ⅶ D).

Optical rotation −2° to +1° (Appendix Ⅶ E).

Refractive index 1.553-1.560 (Appendix Ⅶ F).

Insoluble matter in ethanol To 1 ml of the oil add 3 ml of 90% ethanol, the solution is clear.

Heavy metals Carry out the limit test for heavy metals (Appendix Ⅸ E, method 2), using 2 g: Not more than 5 ppm.

Action and indications To season by the aromatic nature, invigorate the spleen function.

Usage and dosage 0.02-0.2 ml; 0.06-0.6 ml, daily.

Precaution If there is turbidity or crystallization, heat it on a water bath for dissolving, and shake well before taking.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Oleum Camelliae (茶油，Chayou)

Tea-seed Oil

Tea-seed Oil is the fatty oil obtained by squeezing from the ripe seed of *Camellia oleifera* Abel or *Camellia meiocarpa* Hu. ms. (Fam. Theaceae).

Description A pale yellow, clear liquid.
Freely soluble in chloroform, ether or carbon bisulfite; slightly soluble in ethanol.

Relative density 0.909-0.915, at 25℃ (Appendix Ⅶ A).

Refractive index 1.466-1.470, at 25℃ (Appendix Ⅶ F).

Identification Add 2 ml of the oil carefully to 10 ml of cool, freshly prepared fuming nitric acid, sulfuric acid and water (1∶1∶1), allow to stand for a moment, a bluish-green colour is produced between two layers.

Tung oil Dissolve 3 ml of the oil in 3 ml of petroleum ether to form a clear liquid. Add a small quantity of sodium nitrite crystal and several drops of dilute sulfuric acid, bubbles are produced immediately; shake strongly, allow it to stand, the oil layer is clear and there is no turbity at the junction of oil layer and acid layer.

Cotton-seed oil Measure 5 ml of the oil to a test tube, add 5 ml of a mixture containing equal volumes of sulfur in carbon disulfide solution (1→100) and amyl alcohol, heat carefully on a saturated natrium chloride bath until the bubbles stop (removed from carbon disulfied); continue to heat on a boiling water bath, a red colour should not be produced within two hours.

Acid value Not more than 3 (Appendix Ⅸ N).

Saponification value 185-196 (Appendix Ⅸ N).

Iodine value 80-88 (Appendix Ⅸ N).

Usage Used as the raw material of injectable Tea-seed Oil and the ointment base.

Storage Preserve in tightly closed containers, stored in a cool place, and protected from light.

Oleum Cinnamomi (肉桂油，Rouguiyou)

Cassia Bark Oil

Cassia Bark Oil is the volatile oil obtained by steam distillation from the dried branch and leaf of *Cinnamomum cassia* Presl (Fam. Lauraceae).

Description Yellow or yellowish-brown clear liquid; odour characteristic and aromatic, resembling Cortex Cinnamomi; taste sweet and pungent. The colour darkens gradually and becomes viscid on exposure to the air or on long storage.
Freely soluble in ethanol or glacial acetic acid.

Relative density 1.055-1.070 (Appendix Ⅶ A).

Refractive index 1.602-1.614 (Appendix Ⅶ F).

Identification Cool to 0℃, shake with an equal volume of nitric acid, a crystalline precipitate is produced.

Heavy metals To 10 ml of the oil add 10 ml of water and 1 drop of hydrochloric acid, shake, then saturate the solution with hydrogen sulfide gas, both the aqueous layer and oil layer show no colour change.

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use 10% macrogol (PEG)-20M as the stationary phase; maintain the column temperature at 190℃. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of cinnamaldehyde.

Reference solution Dissolve a quantity of cinnamaldehyde CRS, weigh accurately, in dehydrated ethanol to prepare a solution containing 4 mg per ml.

Test solution Weigh accurately 50 mg of the oil in a 10 ml volumetric flask, dilute with dehydrated ethanol to volume, and mix well.

Procedure Inject accurately 3 μl of each of the reference solution and the test solution, into the column, and calculate the content.
It contains not less than 75 per cent of cinnamaldehyde (C_9H_8O).

Action To expel pathogenic *wind* and invigorate the stomach function.

Usage and dosage 0.02-0.2 ml; 0.06-0.6 ml, daily.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Oleum Curcumae (莪术油 Ezhuyou)

Curcuma Oils

Curcuma Oils is the volatile oil obtained by steam distillation from Rhizoma Curcumae (Wenezhu).

Description A pale brown or dark brown clear liquid; odour, characteristic; taste, slightly bitter and pungent.
Easily dissolved in methanol, ethanol, acetone, ethyl acetate, chloroform, ether, petroleum ether or benzene. Slightly dissolved in water.

Relative Density 0.970-0.990 (Appendix Ⅶ A).
