Specific Optical Rotation +20°to+25°, in a solution of 50 mg per ml in ethanol (Appendix Ⅶ E).

Refractive Index 1.500-1.510 (Appendix Ⅶ F).

Identification Dissolve 4 mg of curcuma oils in 1 ml of petroleum ether (30-60℃) as the test solution. Dissolve curcuma oils reference extract in petroleum ether (30-60℃) to prepare a solution containing 4 mg per ml as the reference extract solution. Dissolve separately a quantity of curcumenol CRS and germacrone CRS in petroleum ether (30-60℃) to prepare the solutions each containing 1 mg per ml, respectively, as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃) and ethyl acetate (9∶1) as the mobile phase. Apply separately 10 ml of each of the four solutions to the plate. After developing and removal of plate, dry in air. Spray with vanillin-sulfuric acid TS to the plate, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference extract solution and reference solution. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution

correspond in position and colour to the spots in chromatogram obtained with the reference extract solution and reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use cyanogen-decylsilane bonded silica as the stationary phase and a mixture of acetonitrile and water (35 : 65) as the mobile phase. As detector a spectrophotometer set at 210 nm, maintain the column temperature at 35℃. The number of the theoretical plates for the column is not less than 5000, calculated with the reference to the peak of germacrone.

Reference solution Dissolve 20 mg of germacrone CRS in ethanol, accurately weighed, in a 50 ml volumetric flask, add ethanol to volume, and shake well. Measure accurately 2 ml to 50 ml volumetric flask, add the mobile phase to volume and shake well (containing 16 μg of germacrone per ml).

Test solution Weigh accurately 0.1 g of curcuma oils in 50 ml volumetric flask, add ethanol to volume and shake well. Measure accurately 2 ml to 25 ml volumetric flask, add the mobile phase to volume, shake well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 20 ml of each of the reference solution and the test solution into the column, respectively, and calculate the content.
It contains not less than 10.0 per cent of germacrone ($C_{14}H_{22}O$).

Category Antivirus and anticancer

Storage Preserve in tightly closed containers, protected from light, and stored in cool place.

Oleum Eucalypti
(桉油, Anyou)

Eucalyptus Oil

Eucalyptus Oil is the volatile oil obtained by steam distillation from the plants of *Eucalyptus globulus* Labill. (Fam. Myrtaceae), *Cinnamomum camphora* (L.) Sieb. (Fam. Lauraceae) or other plants belong to the same genus of these two families.

Description A colourless or pale yellow clear liquid; odour, characteristic and aromatic, resembling to camphor; taste pungent and cool; darkens slightly on long storage.
Freely soluble in 70% ethanol.

Relative density 0.895-0.920 (Appendix Ⅶ A).

Refractive index 1.458-1.468 (Appendix Ⅶ F).

Identification Dissolve 0.1 ml in dehydrated ethanol to make 1 ml by shaking, use the solution as the test solution. Dissolve cineol CRS in the same manner, use as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and cyclohexane and ethyl acetate (9.5 : 0.5) as the mobile phase. Apply separately to the plate 2 μl of each of the solutions. After developing and removal of the plate, dry in air and spray with 1% solution of vanillin in sulfuric acid. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Phellandrene To 2.5 ml of the oil add 12.5 ml of petroleum ether (60-90℃), shake well. Add 5 ml of sodium nitrite solution (5 → 8) and then 5 ml of glacial acetic acid gradually, stir, no crystals are separated within ten minutes.

Heavy metals Carry out the limit test for heavy metals (Appendix Ⅸ E, method 2), using 1 g, not more than 10 ppm.

Assay Carry out the Determination of cineol (Appendix Ⅹ C).
It contains not less than 70 per cent (g/g) of cineol ($C_{10}H_{18}O$).

Action To dispel *wind* and alleviate pain.

Indications Itch of skin, neuralgia.

Storage Preserve in tightly closed containers, stored in a cool place, and protected from light.

Oleum Linderae
(香果脂, Xiangguozhi)

Spiceleaf Kernel Oil

Spiceleaf Kernal Oil is the solid fat obtained by squeezing from the ripe kernal of *Lindera communis* Hemsl. (Fam. Lauraceae), or by hydrogenation and purification of the fat obtained by squeezing from the ripe seed.

Description A white, crystalline powder, or pale yellowish-white mass. Texture light. Odour, slight; taste, weak.
Freely soluble in chloroform or ether; soluble in dehydrated ethanol; very slightly soluble in ethanol; insoluble in water.

Melting range 30-36℃ (Appendix Ⅶ C).

Acid value Not more than 3 (Appendix Ⅸ N).

Saponification value 255-280 (Appendix Ⅸ N).

Iodine value 1-5 (Appendix Ⅸ N).

Usage Suppository base.

Storage Preserve in tightly closed containers, stored in a cool place, and protected from light.

Oleum Menthae Dementholatum
(薄荷素油, Bohesuyou)

Peppermint Oil

Peppermint Oil is the volatile oil obtained by steam distillation from the fresh stem and leaf of *Mentha haplocalyx* Briq. (Fam. Labiatae). The oil obtained is cooled, removed partly from menthol.

Description A colourless or pale yellow clear liquid, gradually becoming dark in colour with long storage. Odour, characteristic and aromatic; taste, pungent, and then cool.
Freely miscible with ethanol, chloroform or ether.

Relative density 0.888-0.908 (Appendix Ⅶ A).

Optical rotation −24°--17° (Appendix Ⅶ E).

Refractive index 1.456-1.466 (Appendix Ⅶ F).

Identification Dissolve 0.1 g of the volatile oil in 5 ml of n-hexane as the test solution. Prepare a solution of Peppermint oil reference extract in the same manner as the reference

extract solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of toluene and ethyl acetate (19 : 1) as the mobile phase. Apply separately to the plate 5 μl of the above two solutions. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm, the fluoresent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference extract solution. Spray with anisaldehyde TS and heat to the spots clear at 105℃. Examine in daylight, spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference extract solution. Examine under ultraviolet light at 365 nm, the fluoresent pots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference extract solution.

Colour Not more intensely coloured than colour matching solution Y_6.

Insoluble matter in ethanol To 1 ml add 3.5 ml of 70% ethanol, the solution should be clear.

Acid value Not more than 1.5 (Appendix Ⅸ N).

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use capillary column of macrogol (HP-FFAP) (0.20 mm in internal diameter, and 25 meter long). Column temperature gradient: initial temperature at 60℃, maintain 4 minutes; increase at 2℃ per minute to 100℃, then increase at 10℃ per minute to 230℃, maintain 1 minute. Maintain injector temperature at 250℃ and detector temperature at 250℃. The split ratio is 10 : 1. The number of theoretical plates of the column is not less than 20000, calculated with the reference to the peak of cyclohexanone.

Correction factor Dissolve a quantity of cyclohexanone, accurately weighed, in n-hexane to prepare a solution containing 8 mg per ml as the internal standard solution. Dissolve about 50 mg of (-) -Menthone CRS and 80 mg of menthplum CRS, weighe accurately, in a 25 ml volumetric flask, add accurately 2 ml of the internal standard solution, dilute to volumn with n-hexane, and mix well. Inject accurately 1 μl of the solution into the column, calculate the correction factor for cyclohexanone.

Procedure Weigh accurately 0.2 g, transfer to a 25 ml volumetric flask, add accurately 2 ml of the internal standard solution, and dilute to volumn with *n*-hexane, mix well. Inject accurately 1 μl of the solution into the column and measure. It contains not less than 18.0 percent and not more than 26.0 percent of (-) -Menthone ($C_{10}H_{18}O$). And it contains not less than 28.0 percent and not more than 40.0 percent of menthplum ($C_{10}H_{20}O$).

Action and indications Aromatic, flavouring agent, carminative. Apply to the skin or mucous membrane to give cooling feeling and to relieve pain or other uncomfortable symptoms.

Usage and dosage 0.02-0.2 ml; 0.06-0.6 ml, daily.

Storage preserve in tightly closed containers, stored in a cool place and protected from light.

Oleum Ocimi Gratissimi (丁香罗勒油, Dingxiang Luoleyou)

Ocimum Oil

Ocimum Oil is the volatile oil obtained by steam distillation from the herb of *Ocimum gratissimum* L. (Fam. Labiatae).

Description A pale yellow, clear liquid, gradually becoming brown and viscid on exposure to the air or long storage. Odour, aromatic; taste, pungent, with a sensation of numbness and fullness.
Freely soluble in ethanol, ether or glacial acetic acid; practically insoluble in water.

Relative density 1.030-1.050 (Appendix Ⅶ A).

Refractive index 1.530-1.540 (Appendix Ⅶ F).

Identification Dissolve 0.5 ml in 1 ml of ethanol, add 5-10 drops of freshly prepared 5% vanillin in hydrochloric acid, shake well, and a dark green colour is produced.

Water-soluble phenols To 1 ml add 20 ml of hot water, shake well, cool, and filter through moistened filter paper. Add 1 drop of ferric chloride TS to the filtrate, A blue or purple colour should not be produced except a transient greyish green colour.

Heavy metals Carry out the limit test for heavy metals (Appendix Ⅸ E, method 2), using 1.0 g, not more than 10 ppm.

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use capillary column packed with 10% methylsilicone rubber (SE-30) as the stationary phase, column temperature set at 110℃. The number of theoretical plates of the column is not less than 3000, caculated with the reference to the peak of eugenol.

Correction factor Dissolve methyl salicylate CRS, accurately weighed, in dehydrated ethanol to prepare a solution containing 20 mg per ml as internal standard solution. Dissolve 50 mg of eugenol CRS, accurately weighed, in a 10 ml volumetric flask, accurately add 2 ml of the internal standard solution, dilute with dehydrated ethanol to volume, mix well, inject 2 μl of the solution into the column, and calculate the correction factor.

Procedure Dissolve 50 mg, accurately weighed, to a 10 ml volumetric flask, accurately add 2 ml of the internal standard solution, add dehydrated ethanol to volume, mix well, inject 2 μl into the column, and calculate the content.
It contains not less than 65.0 per cent (ml/ml) of eugenol ($C_{10}H_{12}O_2$).

Action To alleviate pain and antisepticize.

Indication Dental caries.

Usage and dosage Local use.

Storage Preserve in tightly colosed containers, stored in a cool place and protected from light.

Oleum Pogostemonis
(广藿香油，Guanghuoxiangyou)

Cablin Patch Oils

Cablin Patch Oils is the volatile oil obtained by steam distillation from Herba *Pogostemonis*.

Description A redish-brown or greenish-brown clear liquid; odour, characteristic and aromatic; taste, pungent, and slightly warm.
Freely miscible in chloroform, ether or petroleum ether.

Relative density 0.950-0.980 (Appendix Ⅶ A).

Specific optical rotation −66°-−43° (25℃), in a solution of 10 g per 100 ml in 90% ethanol (Appendix Ⅶ E).

Refractive index 1.503-1.513 (Appendix Ⅶ F).

Identification Dissolve 0.5 ml in 5 ml of ethyl acetate as the test solution. Dissolve a quantity of patchouli alcohol CRS in ethyl acetate to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃), ethyl acetate and glacial acetic acid (95 : 5 : 0.2) as the mobile phase. Apply separately to the plate 1-2 μl of each of the test solution and the reference resolutions. After developing and removal of the plate, dry in air, and spray with a 5% solution of ferric chloride in ethanol. A yellow spot exhibits in the chromatogram obtained with the test solution. Heat to the spot clear, the purplish-blue spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Insoluble matter in ethanol Dissolve 1 ml of cablin patch oils in 10 ml of 90% ethanol, shake well, the solution is clear (25℃).

Assay Carry out the method for gas chromatography (Appendix Ⅵ E)

Chromatographic system and system suitability Use 5% phenylmethyl polysiloxane (HP-5) as the stationary phase (30 m in length, 0.32 mm in diameter, 0.25 μm in film thickness). Programmed column temperature: maintain the initial column temperature at 150℃ for 23 minutes, and raise temperature to 230℃ at a speed of 8℃ per minute, and then maintain for 2 minutes. Maintain the temperature of detector at 280℃ and the sample gasifing temperature set at 280℃. The split ratio is 20 : 1. The number of the theoretical plates of the column is not less than 50000, calculated with the reference to the peak of patchouli alcohol.

Correction factor Dissolve a quantity of octadecylsilane, accurately weighed, in hexane to produce a solution containing 15 mg per ml as the internal standard solution. Dissolve 30 mg of patchouli alcohol CRS, accurately weighed, in a 10 ml volumetric flask and add accurately 1 ml of the internal standard solution, add hexane to volume, and shake well. Inject accurately 1 μl of the solution into the column, calculate the correction factor for patchouli alcohol.

Procedure Transfer 0.1 g, accurately weighed, in a 10 ml volumetric flask, add accurately 1 ml of the internal standard solution, dissolve and dilute with hexane to volume, and shake well as the test solution. Inject accurately 1 μl of the test solution into the column and calculate the contents.
It contains not less than 26.0 per cent of patchouli alcohol ($C_{15}H_{26}O$).

Action Remove turbidity with aroma, whet appetite, stop vomiting, release the exterior and eliminate *summer-heat*.

Indications Epigestric stuffiness and vomiting due to retention of *dampness* in the *middle-energizer*, lassitude due to *summer-dampess*, constriction in the chest, abdominal pain, vomiting and diarrhea due to *cold-dampness* and *summer-heat*, and headache due to nasosinusitis.

Usage and Dosage According to the dosage in each formula.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Packing Packed with stainless steel tins.

Oleum Rhododendri Daurici
(满山红油，Manshanhongyou)

Daurian Rhododendron Oil

Daurian Rhododendron Oil is the volatile oil obtained by steam distillation from Folium Rhododendri Daurici.

Description A pale yellowish-green to yellowish-brown clear liquid, with crystals separating out when cooled below −10℃. Odour, strongly irritant and aromatic; taste, cool and pungent.
Freely miscible with methanol, ethanol, acetone, chloroform, or ether; slightly soluble in water.

Relative density 0.935-0.950 (Appendix Ⅶ A).

Refractive index 1.500-1.520 (Appendix Ⅶ F).

Identification Dissolve 0.1 g in 5 ml of *n*-hexane, apply to a small column (1 cm in inner diameter) packed with silica gel (120-150 mesh, 3 g) by wet method, add 3 g of sodium sulfate anhydrous on the upper layer of the column, pre-elute with 50 ml of *n*-hexane, and discard the eluates. Elute with 50 ml of a mixture of *n*-hexane and ethyl acetate (50 : 1), and collect the eluates as the test solution. Dissolve a quantity of germacrone CRS in *n*-hexane to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (14 : 1) as the mobile phase. Apply separately 10 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with vanillin sulphuric acid TS, heat at 105℃ to the spot clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference solution.

Action To stop coughing and eliminate phlegm.

Indications Acute and chronic bronchitis.

Usage and dosage 0.05-0.1 g, 2-3 times a day.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Preparation Daurian Rhododendron Oil Soft Capsules.

Oleum Ricini
(蓖麻油，Bimayou)

Castor Oil

Castor Oil is the fatty oil obtained by squeezing and purification from the ripe seed of *Ricinus communis* L. (Fam. Euphorbiaceae).

Description A almost colourless or pale yellow, clear viscid liquid; odour, slight; taste, weak, then slightly pungent. Freely soluble in ethanol; freely miscible with dehydrated ethanol, chloroform, ether or glacial acetic acid.

Relative density 0.956-0.969, at 25℃ (Appendix Ⅶ A).

Refractive index 1.478-1.480 (Appendix Ⅶ F).

Acid value Not more than 2.0 (Appendix Ⅸ N).

Saponification value 176-186 (Appendix Ⅸ N).

Iodine value 82-90 (Appendix Ⅸ N).

Other oils To 1 g of the oil add 4 ml of ethanol, the solution is clear; then add 15 ml of ethanol, the solution should not be turbid.

Action To cause laxation.

Indication Constipation due to lack of intestinal fluid.

Usage and dosage 10-20 ml.

Precaution Incompatible with liposoluble anthelmintics. Contraindicated in pregnancy.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Oleum Sesami
(麻油，Mayou)

Sesame Oil

Sesame Oil is the fatty oil obtained by squeezing from the ripe seed of *Sesamum indicum* L. (Fam. Pedaliaceae).

Description A pale yellow or brownish-yellow, clear liquid. Odour, slight or aromatic of cooked sesame seeds; taste, weak. Freely miscible with chloroform, ether, petroleum ether or carbon disulfide; slightly soluble in ethanol.

Relative density 0.917-0.923 (Appendix Ⅶ A).

Refractive index 1.471-1.475 (Appendix Ⅶ F).

Identification To 1 ml add 10 ml of hydrochloric acid containing 0.1 g of sucrose, shake for 30 seconds, the acid layer appears pink colour, which becomes red gradually on standing.

Acid value Not more than 2.5 (Appendix Ⅸ N).

Saponification value 188-195 (Appendix Ⅸ N).

Iodine value 103-116 (Appendix Ⅸ N).

Heating test Carry out the method for heating test (Appendix Ⅸ N), using 50 ml of the oil, no precipitate is produced.

Foreign matter Not more than 0.2 per cent (Appendix Ⅸ N).

Water and volatile matter Not more than 0.2 per cent (Appendix Ⅸ N).

Action and Indications Lubricant and excipient. For relaxing the bowels and moistening the *lung* when taken orally, also used as ground substance in making ointment and plaster for external application.

Usage and dosage 17-68 ml.

Storage Preserve in tightly closed containers, stored in a cool place, and protected from light.

Oleum Terebinthinae
(松节油，Songjieyou)

Turpentine Oil

Turpentine Oil is the volatile oil obtained by distilling or extracting from the oleoresin of several species of *Pinus* (Fam. Pinaceae).

Description A colourless or pale yellow, clear liquid; odour characteristic; odour strengthened and turning yellow on long storage or exposure to air; inflammable, producing dense smoke on burning.
Freely soluble in ethanol; freely miscible with chloroform, ether or glacial acetic acid; insoluble in water.

Relative density 0.850-0.870 (Appendix Ⅶ A).

Boiling range Not less than 90.0% (ml/ml) is distilled between 154-165℃ (Appendix Ⅶ B).

Refractive index 1.466-1.477 (Appendix Ⅶ F).

Insoluble matter in ethanol Dissolve 1 ml of the oil in 7 ml of 90% ethanol with shaking, the solution is clear.

Heavy metals Carry out the limit test for heavy metals (Appendix Ⅸ E, method 2), using 1 g: Not more than 10 ppm.

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use 20% macrogol (PEG)-20M as the stationary phase; maintain the column temperature at 90℃. The number of theoretical plates of the column is not less than 1500, calculated with the reference to the peak of α-pinene.

Correction factor Dissolve a quantity of *n*-butyl alcohol, weigh accurately, in petroleum ether (30-60℃) to produce a solution containing 20 mg per ml as the internal solution. Weigh accurately about 30 mg of α-pinene CRS in a 10 ml brown volumetric flask, add accurately 2 ml of the internal solution, dilute with petroleum ether (30-60℃) to volume, and mix well. Inject 1 μl into the column, and calculate the correction factor.

Procedure Weigh accurately 35 mg in a 10 ml brown volumetric flask, add accurately 2 ml of the internal solution, dissolve and dilute with petroleum ether (30-60℃) to the volume, mix well, use it as the test solution, Inject 1 μl of the test solution into the column, calculate the content. It contains not less than 70.0 per cent of α-pinene ($C_{10}H_{16}$)

Action Dermerethistica.

Indications Myalgia, arthralgia.

Usage and dosage For external use, appropriate quantity of the oil for topical application.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Oleum Viticis Negundo (牡荆油, Mujingyou)

Negundo Chastetree Oil

Negundo Chastetree Oil is the volatile oil obtained by steam distillation from Folium Viticis Negundo.

Description A pale yellow to orange yellow, clear liquid; Odour, characteristic and aromatic; taste, slightly pungent. Freely miscible with dehydrated ethanol, chloroform or ether; practically insoluble in water.

Relative density 0.890-0.910, at 25℃ (Appendix Ⅶ A).

Refractive index 1.485-1.500 (Appendix Ⅶ F).

Identification (1) Dissolve about 0.1 g of sodium nitrite in 1-2 drops of water, add 0.3 ml of the oil and 0.5 ml of dilute sulfuric acid, mix well, the oil layer shows a jade green colour.
(2) To 1 drop of the oil add 1 ml of chloroform, mix well, add 5% solution of bromine in chloroform in dropwise, then the bromine colour of the solution disappears; continue to add 5% solution of bromine in chloroform in dropwise until the solution becomes pale yellow, a green colour is produced gradually on standing.

Fatty oil To 1 ml of the oil add 10 ml of ethanol, oil globules should not be produced on standing.

Action To eliminate phlegm, stop coughing and relieve dyspuea.

Indication Chronic bronchitis.

Usage and dosage 20-40 mg, 3 times a day.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Preparation Negundo Chastetree Oil Soft Capsules

Pulvis Cornus Bubali Concentratus (水牛角浓缩粉, Shuiniujiao Nongsuofen)

Buffalo Horn Concentrate

Buffalo Horn Concentrate is prepared from Cornu Bubali.

Procedure Take Cornu Bubali, wash clean, saw off, discard the horn plug, and cleave in pieces. Take the solid core part of horn tip (commonly known "Jiaojian"), macerate in 75% ethanol or sterilize with steam, and pulverize to fine powder. Take 810 g of the remained part (commonly known "Jiaozhuang"), pulverized to coarse granules or chiped into slices, decoct with 10 quantities of water 2 times, 7 to 10 hours each, and replenishing the water loss in decoction process momentarily. Combine the decoctions, filter, and concentrate to 80-160 ml. Mix well with 190 g of the fine powder of "Jiaojian", dry under 80℃, pulverize to fine powder and sift.

Description Pale greyish powder; odour, slightly stinking; taste, slightly salty.

Water Not more than 11.0 per cent (Appendix Ⅸ H, method 1).

Assay Weigh accurately 0.18 g, carry out the method for determination of nitrogen (Appendix Ⅸ L, method 1).
It contains not less than 15.0 per cent of nitrogen, calculated with reference to the dried drug.

Action and Indications As described under Corni Bubali.

Usage and dosage Taken after mixed with boiled water, 1.5-3 g, twice a day.

Storage Preserve in tightly closed containers, stored in a dry place, and protected from moisture.

MONOGRAPHS
PART Ⅲ

Traditional Chinese Patent Medicines and Simple Preparations

Aifu Nuangong Wan
(艾附暖宫丸)

Aifu Nuangong Pills

Ingredients Folium Artemisiae Argyi (carbonized) 120 g; Rhizoma Cyperi (processed with vinegar) 240 g; Fructus Evodiae (processed) 80 g; Cortex Cinnamomi 20 g; Radix Angelicae Sinensis 120 g; Rhizoma Chuanxiong 80 g; Radix Paeoniae Alba (stir-baked with wine) 80 g; Radix Rehmanniae 40 g; Radix Astragali Praeparata Cum Melle 80 g; Radix Dipsaci 60 g.

Procedure Pulverize the above ten ingredients to fine powder, sift and mix well. To each 100 g of powder add 110-130 g of refined honey to make small honeyed pills or big honeyed pills.

Description Dark brown to black small honeyed pills or big honeyed pills; odour, slight; taste, sweet, then bitter and pungent.

Identification (1) Microscopical: T-shaped hairs brown or black, curved; stalk 2～4-celled, Non glandular hair 4～6-celled, some containing brownish-red contents. Glandular hairs with a multicellular, ellipsoidal head, containing brownish-yellow to brownish-red contents, and a 2～6-celled stalk. Secretory cells subrounded, containing pale yellowish-brown to reddish-brown secretion, surrounded by radially arranged cells. Parenchymatous cells fusiform, with slightly thickened walls and very fine oblique crisscross striations. Clusters of calcium oxalate 45 μm in diameter, occurring in pale brownish-yellow shrunken parenchymatous cells, often arranged in rows. Fibres 15-35 μm in diameter, with thickened and slightly lignified walls, and large rounded pits. Fibres in bundles or scattered, with thickened walls, and showing longitudinal fissures on the surface, both ends broken to broom-like or relatively truncate. Stone cells subsquare or subrounded, walls thin at one side.

(2) To 9 g of the pills, cut into pieces, add 20 ml of ether, ultrasonicate for 20 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 0.5 ml of *n*-hexane as the test solution. Dissolve α-cyperone CRS in *n*-hexane to produce a solution containing 2 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of benzene and ethyl acetate (19∶1) as the mobile phase. Apply separately 20 μl of the test solution and 10 μl of the reference solution to the plate. After developing and removal of the plate, dry it in air, examine under ultraviolet light at 254 nm. The dark blue spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. Spray with a solution of dinitrophenylhydrazine TS, allow to stand for a while, the spots turn orange-red gradually.

(3) Heat under reflux 4.5 g of the pills, cut into pieces, with 10 ml of ethanol for 1 hour, allow to cool, filter, and use the filtrate as the test solution. Prepare a solution with 0.2 g of Fructus Evodiae reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of *n*-butanol, acetic acid and water (2∶1∶1) as the mobile phase. Apply separately 10 μl each of the above two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Macerate 9 g of the pills, cut into pieces, in 5 ml of water, add 30 ml of *n*-butanol saturated with water, shake well, and ultrasonicate for 10 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of ethanol as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40∶5∶10∶0.2) as the mobile phrase. Apply separately 5-10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry it in air, spray with 5% vanillin in sulfuric acid, and heat to the spots clear. The spot in the chromatogram obtained with the test solution correspond in position and colour to the spot in chromatogram obtained with the reference solution.

(5) Macerate 9 g of the pills, cut into pieces, in 5 ml of water, add 30 ml of *n*-butanol saturated with water, shake well, and ultrasonicate for 10 minutes, filter, wash the filtrate with two 30-ml quantities of ammonia TS, discard the ammonia washings, evaporate the *n*-butanol extract to dryness. Dissolve the residue in 1 ml of ethanol as the test solution. Dissolve astragaloside Ⅳ CRS in ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13∶7∶2) as the mobile phase. Apply separately 10 ml of the test solution and 5 μl of the reference solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulfuric acid, heat at 110℃ for about 10 minutes, and examine under ultraviolet light at 365 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% phosphoric acid (12∶88) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, accurately weighed, in 50% methanol to prepare a solution containing 50 μg per ml as the reference solution.

Test solution Cut the small honeyed pills or the big honeyed pills, obtained under the test of weight variation, into pieces, weigh accurately 2 g, in a stopper conical flask, add accurately 25 ml of 50% methanol, stopper well, and weigh. Ultrasonicate (power 300 W, frequence 50 kHz) for 40 minutes, cool, weigh again, replenish the loss weight with 50% methanol, shake well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, calculate the content.

It contains not less than 0.45 mg per gram of the small honeyed pills, 4.0 mg per big honeyed pill, of paeoniflorin ($C_{23}H_{28}O_{11}$), referred to Radix Paeoniae Alba.

Action To regulate *qi* and nourishing blood, and warm the

uterus and regulate menstruation.

Indications Irregular menstruation and dysmenorrhea due to blood deficiency, *qi* stagnation and *cold* in the *lower-energizer* with manifestations of delayed menstrual cycle, scanty menstrual blood with clots, pain in the lower abdomen, lower abdominal cold pain, alleviated by warmth, aching pain of lower back and knee.

Usage and dosage 9 g of small honeyed pills or 1 big honeyed pill, 2-3 times a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Angong Niuhuang San (安宫牛黄散)

Angong Niuhuang Powder

Ingredients Calculus Bovis 100 g; Pulvis Cornus Bubali Concentratus 200 g; Moschus 25 g; Margarita 50 g; Cinnabaris 100 g; Realgar 100 g; Rhizoma coptidis 100 g; Radix Scutellariae 100 g; Fructus Gardeniae 100 g; Radix Curcumae 100 g; Borneolum Syntheticum 25 g.

Procedure Levigate or pulverize Cinnabaris, levigate Margarita and Realgar respectively to very fine powder. Pulverize Rhizoma Coptidis, Radix Scutellariae, Fructus Gardeniae and Radix Curcumae to fine powder. Triturate Calculus Bovis, Pulvis Cornus Bubali Concentratus, Moschus and Borneolum Syntheticum with the above powder, sift and mix well.

Description A yellow to yellowish-orange powder; odour, strongly aromatic; taste, bitter.

Identification (1) Microscopical: Irregular fragments greyish-white or greyish-yellow, somewhat lustrous, with greyish-brown pigment granules and irregular longitudinal clefts on the surface. Irregular fragments colourless or pale green, translucent, lustrous, some times fine and dense sinuous striations visible. Irregular fine granules dark brownish-red, lustrous, with dark black edge. Irregular fragments yellow or orange-yellow, lustrous. Fibre bundles bright yellow, with slightly thickened and distinctly pitted walls. Stone cells bright yellow. Phloem fibres pale yellow, fusiform, with thickened walls and fine pit-canals. Stone cells of pericarp subrounded or polygonal, 17-31 μm in diameter, thick-walled, containing prisms of calcium oxalate. Mass of aleurone almost colourless.

(2) Heat under reflux 2 g of the powder, with 20 ml of ethanol for 1 hour, cool and filter, use the filtrate as the test solution. Dissolve cholic acid CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), Using silica gel G as the coating substance and a mixture of ether, chloroform and glacial acetic acid (2∶2∶1) as the mobile phase. Apply separately 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% phosphomolybdic acid in ethanol and heat at 105℃ for about 10 minutes to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Dissolve separately berberine hydrochloride CRS and baicalin CRS in ethanol to produce two solutions containing 0.2 mg of berberine hydrochloride CRS and 0.5 mg of baicalin CRS per ml respectively as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with a solution of 4% sodium acetate as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (10∶7∶1∶1) as the mobile phase. Apply in stripe separately 20 μl of the test solution obtained under Identification test (2) and 10 μl of each of the above two reference solutions to the plate. After developing and removal of the plate, dry in air. The stripe in the chromatogram obtained with the test solution corresponds in position and colour to the stripe in the chromatogram obtained with the reference solution of baicalin CRS. Examine under ultraviolet light at 365 nm, the fluorescent stripe in the chromatogram obtained with the test solution corresponds in position and colour to the stripe in the chromatogram obtained with the reference solution of berberine hydrochloride CRS.

(4) To 1 g of the powder, add 5 ml of ethyl acetate, ultrasonicate for 15 minutes, allow to cool, centrifuge, use the supernatant as the test solution. Dissolve a mixture of (±) borneol and (±)-isoborneol CRS in ethyl acetate to produce a mixture containing 1 mg per ml as the reference solution. Carry out the method for the thin layer chromatography (Appendix Ⅵ B), using silica G as the coating substance and a mixture of toluene and acetone (9∶1) as the mobile phase. Apply separately 3 μl of each of the test solution and the reference solution to the plate. Spray 5% vanilin in sulfuric acid and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(5) Carry out the method for the determination of volatile oil (Appendix Ⅹ D). To 3 g of the powder, add 0.5 ml of cyclohexane, heat gently to boil and keep boiling for 2.5 hours. Allow to stand for half an hour, use the cyclohexane solution as the test solution. Dissolve muscone CRS in benzene to produce a solution containing 2.5 mg per ml as the reference solution. Carry out the method for gas chromatography (Appendix Ⅵ E), using a 2 m long column packed with 9% phenylmethyl polysiloxane (OV-17) as the stationary phase, and maintain the column temperature at 210℃. Inject a quantity of each of the test solution and the reference solution respectively into the column. The peak in the chromatogram obtained with the test solution corresponds in retention time to the peak in the chromatogram obtained with the reference solution.

Other requirements Complies with the general requirements for powder (Appendix Ⅰ B).

Action To clear *heat* and *toxins*, and relieve convulsion and resuscitate.

Indications Febrile disease, invasion of the pericardium by pathogenic factors, convulsion due to high fever, coma and delirium; coma in stroke, encephalitis, cerebral meningitis, toxic encephalopathy, cerebral hemorrhage and septicemia with above symptoms.

Usage and dosage 1.6 g (1 bottle), once a day; 0.4 g (1/4 bottle) for children under 3 years of age; 0.8 g (1/2 bottle) for children of 4-6 years of age; or follow doctor's advice.

Precaution Be cautious about pregnant women.

Strength 1.6 g per bottle

Storage Preserve in tightly closed containers.

Angong Niuhuang Wan
(安宫牛黄丸)

Angong Niuhuang Pills

Ingredients Calculus Bovis 100 g; Pulvis Cornus Bubali Concentratus 200 g; Moschus 25 g; Margarita 50 g; Cinnabaris 100 g; Realgar 100 g; Rhizoma Coptidis 100 g; Radix Scutellariae 100 g; Fructus Gardeniae 100 g; Radix Curcumae 100 g; Borneolum Syntheticum 25 g.

Procedure Levigate or pulverize Cinnabaris, levigate Margarita and Realgar to very fine powders respectively. Pulverize Rhizoma Coptidis, Radix Scutellariae, Fructus Gardeniae and Radix Curcumae to fine powder. Triturate Calculus Bovis, Pulvis Cornus Bubali Concentratus, Moschus and Borneolum Syntheticum with the above powders, sift and mix well. Add a quantity of refined honey to make 600 big honeyed pills, or coated with gold.

Description Yellowish-orange to reddish-brown big honeyed pills, or gold coated big honeyed pills; odour, strongly aromatic; taste, slightly bitter.

Identification (1) Microscopical: Irregular fragments greyish-white or greyish-yellow, somewhat lustrous, with greyish-brown pigment granules and irregular longitudinal clefts on the surface. Irregular fragments colourless or pale green, translucent, lustrous, some times fine and dense sinuous striations visible. Irregular fine granules dark brownish-red, lustrous, with dark black edge. Irregular fragments yellow or orange-yellow, lustrous. Fibre bundles bright yellow, with slightly thickened and distinctly pitted walls. Stone cells bright yellow. Phloem fibres pale yellow, fusiform, with thickened walls and fine pit-canals. Stone cells of pericarp subrounded or polygonal, 17-31 μm in diameter, thick-walled, containing prisms of calcium oxalate. Mass of aleurone almost colourless.

(2) Heat under reflux 2 g of the pills, cut into pieces, with 20 ml of ethanol for 1 hour, cool and filter, use the filtrate as the test solution. Dissolve cholic acid CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ether, chloroform and glacial acetic acid (2∶2∶1) as the mobile phase. Apply separately 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% phosphomolybdic acid in ethanol and heat at 105 ℃ for about 10 minutes. to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Dissolve separately berberine hydrochloride CRS and baicalin CRS in ethanol to produce two solutions containing 0.2 mg of berberine hydrochloride and 0.5 mg of baicalin per ml respectively as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with a solution of 4% sodium acetate as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (10∶7∶1∶1) as the mobile phase. Apply in stripe separately 20 μl of the test solution obtained under Identification test (2) and 10 μl of each of the above two reference solutions to the plate. After developing and removal of the plate, dry in air. The stripe in the chromatogram obtained with the test solution corresponds in position and colour to the stripe in the chromatogram obtained with the reference solution of baicalin CRS. Examine under ultraviolet light at 365 nm, the fluorescent stripe in the chromatogram obtained with the test solution corresponds in position and colour to the stripe in the chromatogram obtained with the reference solution of berberine hydrochloride CRS.

(4) Cut 1.5 g of the pills into pieces, add 5 ml of ethyl acetate, ultrasonicate for 15 minutes, allow to cool, centrifuge, use the supernatant as the test solution. Dissolve (－) borneol CRS and (±)-isoborneol CRS in ethyl acetate to produce a mixture containing 1 mg per ml as the reference solution. Carry out the method for the thin layer chromatography (Appendix Ⅵ B), using silica G as the coating substance and a mixture of toluene and acetone (9∶1) as the mobile phase. Apply separately 3 μl of each of the test solution and the reference solution to the plate. Spray 5% vanilin in sulfuric acid and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(5) Carry out the method for the determination of volatile oil (Appendix Ⅹ D). Cut 3 g of the pills into small pieces, add 0.5 ml of cyclohexane, heat gently to boil and keep boiling for 2.5 hours. Allow to stand for half an hour, use the cyclohexane solution as the test solution. Dissolve muscone CRS in cyclohexane to produce a solution containing 2.5 mg per ml as the reference solution. Carry out the method for gas chromatography (Appendix Ⅵ E), using a 2 m long column packed with 9% phenylmethyl polysiloxane (OV-17) as the stationary phase, and maintain the column temperature at 210 ℃. Inject a quantity of each of the test solution and the reference solution respectively into the column. The peak in the chromatogram obtained with the test solution corresponds in retention time to the peak in the chromatogram obtained with the reference solution.

Acid-insoluble ash To 1 g of the pills, recovered the coats, cut into pieces, weigh accurately, carry out the method for the determination of ash (Appendix Ⅸ K), not more than 1.0%.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To clear *heat* and *toxins*, and relieve convulsion and resuscitate.

Indications Febrile disease, invasion of the pericardium by pathogenic factors, convulsion due to high fever, coma and delirium; coma in stroke, encephalitis, cerebral meningitis, toxic encephalopathy, cerebral hemorrhage and septicemia with above symptoms.

Usage and dosage 1 pill, once a day; 1/4 pill for children under 3 years of age; 1/2 pill for children of 4-6 years of age; or follow doctor's advice.

Precaution Be cautious about pregnant women.

Strength 3 g per pill

Storage Preserve in tightly closed containers.

Ankun Zanyu Wan
(安坤赞育丸)

Ankun Zanyu Pills

Ingredients Rhizoma Cyperi (processed with vinegar) 96 g; Cornu Cervi Pantotrichum 24 g; Colla Corii Asini 24 g; Placenta Hominis 20 g; Radix Paeoniae Alba 16 g; Radix Angelicae Sinensis 16 g; Radix Achyranthis Bidentatae 14 g; Radix Cyathulae 14 g; Radix Glehniae 12 g; Myrrha

(processed with vinegar) 12 g; Radix Asparagi 11.5 g; Fructus Psoraleae(processed with salt)11 g; Arillus Longan 10 g; Poria 8 g; Cortex Phellodendri Chinensis 8 g; Carapax et Plastrum Testudinis 8 g; Herba Cynomorii 8 g; Cortex Eucommiae(processed with salt)8 g; Radix Gentianae Macrophyllae 8 g; Carapax Trionycis(processed with vinegar)8 g; Folium Artemisiae Argyi (carbonized) 8 g; Radix Cynanchi Atrati 8 g; Rhizoma Corydalis(processed with vinegar)8 g; Fructus Corni(processed with wine)8 g; Cauda Cervi 7.5 g; Fructus Lycii 6 g; Flos Celosiae Cristatae 6 g; Radix Astragali 6 g; Olibanum (processed with vinegar) 6 g; Halloysitum Rubrum (calcined) 6 g; Colla Cornus Cervi 6 g; Semen Cuscutae 4 g; Herba Cistanches (processed with wine) 6 g; Caulis Spatholobi 4 g; Herba Taxilli 4 g; Succinum 4 g; Radix et Rhizoma Glycyrrhizae Cum Melle 4 g; Radix et Rhizoma Ginseng 2 g; Radix Linderae 3 g; Silk Floss (carbonized) 2 g; Crinis Carbonisatus 2 g; Rhizoma Atractylodis Macrocephalae (stir-baked with bran) 24 g; Stigma Croci 0.8 g; Radix Rehmanniae 16 g; Fructus Amomi 24 g; Lignum Aquilariae Resinatum 13 g; Semen Ziziphi Spinosae (stir-baked) 16 g; Radix Dipsaci 10 g; Pericarpium Citri Reticulatae 14 g; Exocarpium Citri Rubrum 8 g; Rhizoma Chuanxiong 12 g; Rhizoma Alismatis 8 g; Radix Scutellariae 10 g; Herba Artemisiae Annuae 6 g; Radix Polygalae(processed)8 g; Semen Myristicae (roasted in ash) 6 g; Rhizoma Ligustici 6 g; Flos Carthami 4 g; Radix Bupleuri 6 g; Radix Aucklandis 2 g; Folium Perillae 5 g; Radix Rehmanniae Praeparata 16 g; Radix et Rhizoma Salviae Miltiorrhizae 2 g.

Procedure Pulverize Rhizoma Atractylodis Macrocephalae, Fructus Amomi, Radix Rehmanniae, Semen Ziziphi Spinosae, Lignum Aquilariae Resinatum, Pericarpium Citri Reticulatae, Radix Dipsaci, Rhizoma Chuanxiong, Exocarpium Citri Rubrum, Radix Scutellariae, Rhizoma Alismatis, Radix Polygalae, Herba Artemisiae Annuae, Rhizoma Ligustici, Semen Myristicae, Radix Bupleuri, Flos Carthami, Folium Perillae, Radix Aucklandis, Radix Salviae Miltiorrhizae and Radix Rehmanniae Preparata to coarse powder. Fill the other 42 ingredients in a jar, add 400 g of yellow wine, cover closely with a lid, place the jar in a pressure-resistant container, heat or stew over water till the wine completely absorbed. Take out the drugs, mix well with the above coarse powder, dry, pulverize to fine powder, sift and mix well. To each 100 g of the powder add 110-130 g of refined honey to make big honeyed pills.

Description Black big honeyed pills; taste, sweet and slightly bitter.

Identification Microscopical: Irregularly branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Fibre bundles bright yellow, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres; walls of the crystal cells thickened and lignified. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, each containing a brown nucleus-like mass. Rubber threads stripe-shaped or twisted into masses, surface granular. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Bast fibres pale yellow, spindle-shaped, walls thickened, with fine pit-canals. Fibres in bundles or scattered, walls thickened, surface with longitudinal fissures, both ends broken into broom-like or relatively truncate. Sclerenchymatous cells of endopleura yellowish-brown or brownish-red, subpolygonal in surface view; walls thickened; lumen containing silica body. Testa stone cells pale yellow, with thicked and sinuous walls; striations well-defined. Secretory cells subrounded, containing pale yellowish-brown to reddish-brown secretion, the surrounding cells arranged stellately. Pollen grains subrounded or ellipsoidal, up to 60 μm in diameter, extine spinous and with 3 germinal apertures. Needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells. Endopleura cells brownish-yellow, rectangular or subsquare in surface view, anticinal walls beadedly thickened. Stone cells rectangular or long stripe-shaped, 50-110 μm in diameter, with dense and very fine pits.

Other requirements Comply with the general requirements for pills (Appendix I A).

Action To replenish *qi* and nourish blood, reinforce the liver and kidney and regulate the function of them.

Indications Menstrual disorders, metrorrhagia or metrostaxis and leukorrheal disease due to a deficiency of both *qi* and blood, deficiency in the liver and kidney, with manifestations of oligomenorrhea, or dribbling of menstrual blood, delayed menstrual cycle, lassitude, weakness and aching in the lower back and legs and leukorrhagia.

Usage and dosage 1 pill, twice a day.

Precaution Follow doctor's order in pregnancy.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Anshen Bunaoye (安神补脑液)

Anshen Bunao Mixture

Ingredients Cornu Cervi Pantotrichum; Radix Polygoni Multiflori Praeparata Cum Succo Glycines Sotae; Herba Epimedii; Rhizoma Zingiberis; Radix et Rhizoma Glycyrrhizae; Fructus Jujubae; Vitamin B_1.

Procedure Distil volatile oil of Rhizoma Zingiberis, to the residue of distillation, add Radix Polygoni Multiflori Praeparata Cum Succo Glycines Sotae, Herba Epimedii, Fructus Jujubae and Radix et Rhizoma Glycyrrhizae, decoct with water three times. Combine the decoctions, filter, concentrate the filtrate to a quantity, precipitate with a quantity of ethanol, filter, keep the filtrate for latter use. Decoct Cornu Cervi Pantotrichum with water five times, filter separately, combine the filtrate, concentrate and add fengla, allow to stand to fengla solidified completely, discard the solid, filter, precipitate with a quantity of ethanol, filter. Recover ethanol, add a quantity of water and ethanol, adjust to a quantity concentration. Mix well the above solution, decoction of Cornu Cervi Pantotrichum and syrupus simplex, add the volatile oil of Rhizoma Zingiberis, Vitamin B_1, benzoic acid, sodium benzoate and ethyl benzoate, stir well, allow to stand to clear, filter, add water to 1000 ml.

Description A yellow or brownish-yellow liquid; odour, aromatic; taste, sweet and pungent.

Identification (1) Shake 5 ml with 2.5 ml of sodium hydroxide TS, 0.5 ml of potassium ferricyanide TS, and 5 ml of *n*-butanol thoroughly for 2 minutes. Allow to stand, examine under ultraviolet light at 365 nm. A blue fluorescence is produced in the *n*-butanol layer. Add acid to acidic, the fluorescence vanished which returned when alkaline.

(2) Extract 30 ml of the oral liquid with two 20-ml quantities of ether. Combine the water layer, extract with two 30-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol solution, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution.

To 0.25 g of Radix Polygoni Multiflori Praeparata reference drug, add 20 ml of ethanol, heat under reflux for 1 hour, filter, concentrate the filtrate to about 3 ml as the reference drug solution. Dissolve 2,3,5,4'-tetrahydroxystilbene-2-O-β-D-glucoside CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of benzene, acetone and methanol (6∶2∶1) as the mobile phase. Apply separately 3 μl of the three solutions to the plate. After developing and removal of the plate, dry in air. Spray with phosphomolybdic acid in sulfuric acid solution (dissolve 2 g of phosphomolybdic acid in 20 ml of water, add 30 ml of sulfuric acid slowly, shake well) and heat slightly. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

pH value 3.0-5.0 (Appendix Ⅷ G).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and acetonitrile-water (25∶75) as the mobile phase. As detector a spectrophotometer set at 270 nm. The number of theoretical plates for the column is not less than 2500, calculated with the reference to the peak of icariine.

Reference solution Dissolve a quantity of icariine CRS, accurately weighed, in methanol to produce a solution containing 0.1 mg per ml as the reference solution.

Test solution Measure accurately 20 ml of the mixture in a separating funnels, extract with two 15-ml quantities of ether, discard the ether solutions, extract the water solution with five 15-ml quantities of ethyl acetate. Combine the ethyl acetate solutions, evaporate to dryness, and dissolve the residue in methanol and transfer to a 5 ml volumetric flask, add methanol to volume, mix well and filter. Use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 30 μg of icariine ($C_{33}H_{40}O_{15}$) per ml, referred to Herba Epimedii.

Action To generate essence to reinforce marrow, and replenish *qi* and nourish blood.

Indications Dizziness, lassitude, amnesia due to insufficient *kidney-essence* and consumption of *qi* and blood; neurasthenia with above symptoms.

Usage and dosage 10 ml, twice a day.

Strength (1) 10 ml per phial (2) 100 ml per bottle

Storage Preserve in tightly closed containers.

Anshen Buxin Wan
(安神补心丸)

Anshen Buxin Pills

Ingredients Radix et Rhizoma Salviae Miltiorrhizae 300 g; Fructus Schisandrae Chinensis (steamed) 150 g; Rhizoma Acori Tatarinowii 100 g; Decoctum Tranquilizici Concentratum 560 g.

Procedure Pulverize Radix et Rhizoma Salviae Miltiorrhizae, Fructus Schisandrae Chinensis and Rhizoma Acori Tatarinowii to fine powder. Mix Decoctum Tranquilizici Concentratum with the above fine powder according to the quantities specified in the recipe. Make pills, dry, polish, or coat with sugar.

Description Dark brown concentrated watered pills or sugar-coated concentrated watered pills with dark brown core; taste, astringent, slightly sour.

Identification (1) Microscopical: Bordered pitted vessels 29-48 μm in diameter, with fine and dense bordered pits. Stone cells of epidermis of testa pale yellowish-brown, subpolygonal in surface view, walls thickened, with fine and dense pit-canals, containing dark brown contents. Oil cells rounded, up to 50 μm in diameter, containing yellow or yellowish-brown oily substances.

(2) Grind well 4 g of the pills, add 20 ml of petroleum ether (30-60℃), ultrasonicate for 20 minutes, and filter. Evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of petroleum ether (30-60℃) as the test solution. Prepare a solution with 1 g of Radix et Rhizoma Salviae Miltiorrhizae reference drug as the reference drug solution in the same manner. Dissolve tanshinone ⅡA CRS in petroleum ether (30-60℃) to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and ethyl acetate (19∶1) as the mobile phase. Apply separately 5 μl of each of the above three solutions to the plate. After developing and removal of the plate, dry in air. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

(3) Dissolve deoxyschizandrin CRS in petroleum ether (30-60℃) to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and the upper layer of the mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15∶5∶1) as the mobile phase. Apply separately 1 μl of each of the reference solution and the test solution obtained under Identification test (2) to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Grind well 4 g of the pills, in the flask, add 100 ml of water, distill and collect the distillate 50 ml, extract with three 20-ml quantities of petroleum ether (60-90℃), combine the extract and evaporate to dryness. Dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 1 g of Rhizoma Acori Tatarinowii reference drug in the same manner as the reference drug solution. Carry out the method for the thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (4∶1) as the mobile phase. Apply separately 10-20 μl of the test solution and 1 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Expose to iodine vapour until the spots clear. The spots in the chromatogram obtained with the test solution correspond in the position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid

chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of methanol and water (50 : 50) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 6000, calculated with the reference to the peak of schisandrin.

Reference solution Dissolve a quantity of schisandrin CRS, accurately weighed, in methanol to prepare a solution containing 20 μg per ml as the reference solution.

Test solution Weigh accurately 30 pills, pulverized (remove the coating substance for the sugar-coated concentrated watered pills) to fine powder and mix well. To 1 g, weigh accurately, add accurately 50 ml of methanol, weigh, ultrasonicate (power 250 W, frequency 20 kHz) for 30 minutes, allow to stand to room temperature, weigh again and replenish the lost weight with methanol. Mix thoroughly, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contents not less than 70 μg of schisandrin ($C_{24}H_{32}O_7$) per pill, referred to Fructus Schisandrae Chinensis.

Action To nourish the heart to anchor the mind.

Indications Palpitation, dreamfulness, dizziness and tinnitus due to a deficiency of *heart-blood* and *fire* blazing within in a deficiency syndrome.

Usage and dosage 15 pills, 3 times a day.

Strength 2 g per 15 pills

Storage Preserve in tightly closed containers.

Attached:

Decoctum Tranquilizici Concentratum
安神膏

Ingredients Cortex Albiziae 300 g; Semen Cuscutae 300 g; Herba Ecliptae 300 g; Caulis Polygoni Multiflori 500 g; Radix Rehmanniae 200 g; Concha Margaritifera 2000 g; Fructus Ligustri Lucidi (steamed) 400 g.

Procedure Decoct the above seven ingredients with water twice, 3 hours for the first time and 1 hour for the second. Combine the decoctions, filter and concentrate the filtrate to a thin extract with relative density of 1.21 (80-85℃).

Anshen Jiaonang
(安神胶囊)

Anshen Capsules

Ingredients Semen Ziziphi Spinosae (stir-baked) 40 g; Rhizoma Chuanxiong 47 g; Rhizoma Anemarrhenae 112 g; Radix Ophiopogonis 92 g; Radix polygoni Multiflori Praeparata Cum Succo Glycines Sotae 32 g; Fructus Schisandrae Chinensis 97 g; Radix et Rhizoma Salviae Miltiorrhizae 130 g; Poria 97 g.

Procedure Pulverize Semen Ziziphi Spinosae and Fructus Schisandrae Chinensis to fine powder. Decoct Rhizoma Chuanxiong and other five ingredients with water twice, 3 hours for the first time and 2 hours for the second time, filter, combine the filtrate, concentrate to thick extract, dry under low temperature and pulverize to powder. Mix well with the above powder, make granules, make to 1000 of capsules.

Description Hard capsules, containing brownish-yellow to dark brown granules; odour, aromatic; taste, slight.

Identification (1) Place 20 capsules of the contents, pulverize to fine powder, add 30 ml of chloroform, ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 1 g of Fructus Schisandrae Chinensis reference drug in the same manner as the reference drug solution. Dissolve deoxyschisandrin CRS in chloroform to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and the mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15:5:1) as the mobile phase. Apply separately 2 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.
(2) To 1 g of Rhizoma Chuanxiong reference drug in 20 ml of chloroform, ultrasonicate for 10 minutes, and filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of chloroform as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of petroleum ether and ethyl acetate (1 : 1) as the mobile phase. Apply separately 2 μl of the above test solution obtained in Identification (1) and the reference drug solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and the mixture of methanol and water (58:42) as the mobile phase. As detector a spectrophotometer set at 250 nm, the number of theoretical plates for the column is not less than 9000, calculated with the reference to the peak of schisandrin.

Reference solution Dissolve a quantity of schisandrin CRS, accurately weighed, in methanol to produce a solution containing 30 μg per ml as the reference solution.

Test solution Weigh accurately 1 g of the content, obtained under the test of weight variation, pulverized to fine powder, to a stopper conical flask. Add accurately 25 ml of the mixture of chloroform and methanol (2 : 1), stopped tightly, weigh accurately, ultrasonicate (power 250 W, frequency 25 kHz) for 40 minutes, cool, weigh accurately, add the mixed solution of chloroform-methanol (2:1) to the original weight, mix well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 0.20 mg of schisandrin ($C_{24}H_{32}O_7$) per capsule, referred to Fructus Schisandrae Chinensis.

Action To nourish *yin*, reinforce blood and the heart to anchor the mind.

Indication Insomnia, dreamfulness, palpitation, feverish sensation in the palms, soles and chest, night sweats and tinnitus due to insufficient *yin-blood*.

Usage and dosage 4 capsules, 3 times a day.

Strength 0.32 g per capsule

Storage Preserve in tightly closed containers.

Anwei Pian
(安胃片)
Anwei Tablets

Ingredients Rhizoma Corydalis (processed with vinegar) 63 g; Alumen (calcined) 250 g; Endoconcha Sepiae 187 g.

Procedure Pulverize the above three ingredients to fine powder, sift and mix well. Make granules with 125 g of honey and a quantity of water, dry, compress into 1000 tablets.

Description Whitish to yellowish tablets; odour, slight; taste, astringent and slightly bitter.

Identification (1) Pulverize 5 tablets to fine powder, heat under reflux with 20 ml of ethanol on a water bath for 10-15 minutes, allow to cool and filter, apply the filtrate to a piece of filter paper, dry in air and examine under ultraviolet light at 365 nm; a yellowish-green fluorescence is produced.
(2) Pulverize 2 tablets to fine powder, in a test tube, add 10 ml of dilute hydrochloric acid TS, it effervesces and evolves carbon dioxide, which produces a white precipitate on introducing into calcium hydroxide TS. Filter the acidic solution in the test tube. Transfer 3 ml of the filtrate, alkalize slightly with ammonia TS, a white colloid precipitate is produced, which is soluble in hydrochloric acid TS, acetic acid TS or in an excess of sodium hydroxide TS. To the filtrate add 2 drops of ammonium oxalate TS, a white precipitate is produced, which is soluble in hydrochloric acid, but insoluble in acetic acid.
(3) Place 2 tablets, in fine powder, in a small beaker, add 10 ml of water, stir thoroughly and filter. To 2 ml of the filtrate add 2 drops of barium chloride TS, a white precipitate is produced, which is insoluble in hydrochloric acid or nitric acid. To another 2 ml of the filtrate add 2 drops of sodium cobaltinitrite TS; a yellow precipitate is produced.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Action To promote *qi* and blood circulation, and arrest gastric acid and kill pain.

Indications Stabbing pain in the stomach, belching, acid regurgitation and epigastric fullness due to stagnation of qi and blood; gastroduodenal ulcer, chronic gastritis with above symptoms.

Usage and dosage 5-7 tablets, 3-4 times a day.

Storage Preserve in tightly closed containers.

Anyang Jingzhi Gao
(安阳精制膏)
Anyang Jingzhi Plaster

Ingredients Radix Aconiti 24 g; Radix Aconiti Kusnezoffii 24 g; Radix Linderae 24 g; Radix Ampelopsis 24 g; Radix Angelicae Dahuricae 24 g; Rhizoma Bletillae 24 g; Semen Momordicae 24 g; Caulis Akebiae 24 g; Fructus Chaenomelis 24 g; Rhizoma Sparganii 24 g; Rhizoma Curcumae 24 g; Radix Angelicae Sinensis 24 g; Radix Paeoniae Rubra 24 g; Cortex Cinnamomi 24 g; Radix et Rhizoma Rhei 48 g; Fructus Forsythiae 48 g; Sanguis Draconis 10 g; Resina Ferulae 10 g; Olibanum 6 g; Myrrha 6 g; Catechu 6 g; Mentholum 8 g; Methyl Salicylate 8 g; Borneolum Syntheticum 8 g.

Procedure Pulverize Sanguis Draconis, Olibanum, Myrrha, Resina Ferulae and Catechu to coarse powder, use 90% ethanol to make a liquid extract with a relative density of 1.05; after cooling, add Mentholum, Methyl Salicylate and Borneolum Syntheticum and mix well. Decoct the other 16 ingredients with water 3 times, 3 hours for the first and the second, 2 hours for the third; combine the decoctions, filter and concentrate the filtrate to a thin extract with a relative density of 1.25-1.30 (80℃), combine with the above liquid extract and mix well. Additionally add in 8.5-9.0 times quantity of plaster base made from rubber and rosin etc. to form adhesive matter. Spread the adhesive matter on the tape, cover with liner, and cut into small pieces.

Description Slightly red pieces of rubber plaster; odour, aromatic.

Identification Place 10 pieces to a 250 ml flask, add 150 ml of water, connect to an apparatus for the determination of volatile oil. Add water through the top of the apparatus until the graduated tube is filled and overflows to the flask, then add 5 ml of ethyl acetate and connect to the reflux condenser. Heat under reflux for 40 minutes. Transfer the liquid from the apparatus to a separator, filter the ethyl acetate solution through a funnel laid with anhydrous sodium sulfate, and use the filtrate as the test solution. Dissolve 8 mg of menthol CRS, 8 mg of a mixture of (±)-borneol and (±)-isoborneol CRS and 8 mg of methyl salicylate CRS in 10 ml of ethanol as the reference solution. Carry out the method for gas chromatography (Appendix Ⅵ E), using a 2 m long column packed with 10% polyethylene glycol (PEG)-20 M as the stationary phase, maintain the column temperature at 130℃. Inject a quantity of each of the reference solution and the test solution respectively into the column, the retention times of the peaks obtained with the test solution and the reference solution are concordant with each other.

Plaster content Carry out the determination method of plaster content for cataplasms (Appendix Ⅰ I, method 1), use ether as the solvent, not less than 1.7 g per 100cm^2.

Other requirements Complies with the general requirements for cataplasms (Appendix Ⅰ D).

Action To disintegrate masses, expel stagnated blood to kill pain, relax muscles and tendons and promote blood circulation, and expel and disperse cold.

Indications Abdominal masses, rheumatalgia due to *wind*, *cold* or *dampness*, cold and pain in the stomach and numbness of hands and feet.

Usage and dosage Apply to the lesion.

Precaution Avoid foods that are not easily digested when it is prescribed for abdominal masses.

Strength 8 cm×9.5 cm

Storage Preserve in well closed containers, store in a cool place.

Anzhong Pian
(安中片)

Anzhong tablets

Ingredients Ramulus Cinnamomi 180 g; Rhizoma Corydalis (processed with vinegar) 180 g; Concha Ostreae (calcined) 180 g; Fructus Foeniculi 120 g; Fructus Amomi 120 g; Rhizoma Alpiniae Officinarum 60 g; Radix et Rhizoma Glycyrrhizae 120 g.

Procedure Pulverize 36 g of Ramulus Cinnamomi and 72 g of Concha Ostreae to fine powder, take 80 g and the remained portion for latter use. Carry out the method for percolation described under liquid extract and extract (Appendix Ⅰ O), percolate Rhizoma Corydalis with 70% ethanol, collect the percolates, recover ethanol to produce a liquid extract for later use. Distill Fructus Foeniculi, Fructus Amomi, Rhizoma Alpiniae Officinarum and the remained un-powdered Ramulus Cinnamomi with water to get the volatile oil. Combine the residue, the remained powder of Ramulus Cinnamomi and Concha Ostreae, Radix et Rhizoma Glycyrrhizae and the aqueous solution after distillation, and decoct three times. Combine the decoctions, filter, concentrate it to 1000 ml, allow to stand, filter, combine the filtrates and the liquid extract of Rhizoma Corydalis, and concentrate to a thick extract. Add the previously prepared fine powder of Ramulus Cinnamomi and Concha Ostreae to the thick extract, mix well, dry, triturate, add a quantity of sucrose powder and starch, mix well, make into granules, dry, add the volatile oil, mix well, and make to 2500 tablets; or add a quantity of adjuvant, mix well, make into granules, dry, add the volatile oil, mix well, make to 1000 tablets, and coat with film.

Description Pale brown tablets or film coated tablets with pale brown core; odour, aromatic; taste, slightly sweet, bitter, and astringent.

Identification (1) Microscopical: Stone cells scattered or in group. Colourless to brown, subsquare or long-rectangular, 30-64 μm in diameter, thin walled at one side. Irregular pieces colourless or pale yellowish-brown, with fine striations on surface.

(2) Grind 40 tablets or 16 film coated tablets to fine powder, ultrasonicate with 30 ml of ether for 20 minutes. Filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve cinnamaldehyde CRS in ethyl acetate to prepare a solution containing 1 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (17∶3) as the mobile phase. Apply separately 10-15 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, spray with alcoholic dinitrophenyl hydrazine TS. The spot in chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Grind 15 tablets or 6 film coated tablets to fine powder, ultrasonicate with 30 ml of methanol for 30 minutes and filter. To the filtrate add 5 g of neutral alumina, shake for several minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in water, alkalify with concentrated ammonia TS, partition with three 10-ml quantities of ether, combine the ether extracts, and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve tetrahydropalmatine CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of hexane, chloroform, methanol and diethyl amine (10∶6∶1∶0.1) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, expose to iodine vapour to the spots clear, evaporate the adsorbed iodine and examine under ultraviolet light at 365 nm. The fluorescent spot in chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Volatile ether extractives Take 20 tablets, or film-coated tablets with coating removed, weigh accurately, grind well, weigh accurately 2 g, carry out the method for determination of volatile ether extractives (Appendix Ⅹ A), using ether as the solvent, and calculate the content.

It contains not less than 0.35 mg per tablet, 0.80 mg per film-coated tablet, of the volatile ether extractives.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, 0.2 mol/L ammonium acetate solution and glacial acetic acid (68∶32∶1) as the mobile phase. As detector a spectrophotometer set at 252 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of glycyrrhizic acid.

Reference solution Dissolve a quantity of ammonium glycyrrhizinate CRS, accurately weighed, in mobile phase to prepare a solution containing 100 μg per ml as the reference solution (correspond to 97.95 μg of glycyrrhizinic acid per ml).

Test solution Weigh accurately 20 tablets, or film-coated tablets with coating removed, grind well, weigh accurately 1 g in a stoppered conical flask, add accurately 10 ml of the mobile phase, stopper tightly and weigh. Ultrasonicate (power 300 W, frequency 33 kHz) for 30 minutes, cool, weigh again, replenish the loss of weight with the mobile phase, and shake well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 0.80 mg per tablet, 2.0 mg per film-coated tablet, of glycyrrhizinic acid ($C_{42}H_{62}O_{16}$), referred to Radix et Rhizoma Glycyrrhizae.

Action To warm the *middle-energizer* to expel cold, regulate *qi* flow to kill pain, and regulate the stomach to arrest vomiting.

Indications A deficiency of *yang* and *cold* in the stomach with manifestations of prolonged stomachache, aversion to cold and preference for warmth, vomiting of watery fluid, lassitude and cold limbs; chronic gastritis and gastroduodenitis with above symptoms.

Usage and dosage 4-6 tablets or 2-3 film-coated tablets, 2-3 tablets or 1-1.5 film-coated tablets for children, 3 times a

day, or follow doctor's advice.

Precaution Contraindicated for patients with acute gastritis and hemorrhagic ulcer.

Strength 1 g per tablet, 0.2 g per film-coated tablet

Storage Preserve in tightly closed containers.

Awei Huapi Gao
(阿魏化痞膏)

Awei Huapi Plaster

Ingredients Rhizoma Cyperi 20 g; Cortex Magnoliae Officinalis 20 g; Rhizoma Sparganii 20 g; Rhizoma Curcumae 20 g; Radix Angelicae Sinensis 20 g; Radix Aconiti Kusnezoffii (not prepared) 20 g; Radix Aconiti (not prepared) 20 g; Bulbus Allii 20 g; Fructus Quisqualis 20 g; Radix Angelicae Dahuricae 20 g; Squama Manis 20 g; Semen Momordicae 20 g; Catharsius 20 g; Rhizoma Picrorhizae 20 g; Radix et Rhizoma Rhei 20 g; Semen Ricini 20 g; Olibanum 3 g; Myrrha 3 g; Aloe 3 g; Sanguis Draconis 3 g; Realgar 15 g; Cortex Cinnamomi 15 g; Camphora 15 g; Resina Ferulae 20 g.

Procedure Levigate Realgar to very fine powder. Pulverize Olibanum, Myrrha, Aloe, Sanguis Draconis and Cortex Cinnamomi to fine powder. Triturate all the powders, sift and mix well. Crush all the other ingredients except Resina Ferulae and Camphora into small pieces, deep-fry with 2400 g of edible vegetable oil, discard the residue, filter, concentrate the oily filtrate until it condenses to pills on dripping. Add 750-1050 g of Plumbi Oxydum Rubrum to the above oil, stir and make plaster, and soak the plasters in water. Melt the plaster by gentle heating, add the above powders, Resina Ferulae and Camphora, stir well and spread on the cloth.

Description A black plaster spread on the cloth.

Other requirements Complies with the requirements for plasters (Appendix Ⅰ P).

Action Relieve stuffiness and disintegrate masses.

Indications Abdominal masses, epigastric and abdominal pain, fullness in the chest and hypochondria due to stagnation of *qi* and blood.

Usage and dosage Apply it to the umbilicus or lesion after being softened with heat.

Precaution Contraindicated in pregnancy.

Strength 6 g or 12 g per piece of plaster

Storage Preserve in well closed containers, store in a cool and dry place.

Babao Kunshun Wan
(八宝坤顺丸)

Babao Kunshun Pills

Ingredients Radix Rehmanniae Praeparata 80 g; Radix et Rhizoma Rehmanniae 80 g; Radix Paeoniae Alba 80 g; Radix Angelicae Sinensis 80 g; Rhizoma Chuanxiong 80 g; Radix et Rhizoma Ginseng 40 g; Rhizoma Atractylodis Macrocephalae 80 g; Poria 80 g; Radix et Rhizoma Glycyrrhizae 40 g; Herba Leonuri 40 g; Radix Scutellariae 80 g; Radix Achyranthis Bidentatae 40 g; Exocarpium Citri Rubrum 80 g; Lignum Aquilariae Resinatum 40 g; Radix Aucklandiae 16 g; Fructus Amomi 40 g; Succinum 40 g.

Procedure Pulverize the above seventeen ingredients to fine powder, sift, and mix well. To each 100 g of the powder add 110-130 g of refined honey to make big honeyed pills.

Description Blackish-brown big honeyed pills; taste, slightly bitter.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS, hyphae colourless or pale brown, 4-6 μm in diameter. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, each containing a brown nucleus-like mass. Parenchymatous cells fusiform, with slightly thickened walls and very fine oblique crisscross striations. Prisms of calcium oxalate abundant in parenchyma. Clusters of calcium oxalate 18-32 μm in diameter, scattered in parenchymatous cells, often in rows or several clusters in one cell. Needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Bast fibres yellowish, fusiform, with thickened walls and minute pit-canals. Spiral vessels 8-23 μm in diameter, with thickened walls connected each other, like reticulated spiral vessels. Sclerenchymatous cells of endotesta yellowish-brown or brownish-red, subpolygonal in surface view, walls thickened, lumen containing silica body. Non-glandular hairs 1～3-celled, slightly curved, with warty walls.

(2) To 18 g of the pills, cut into pieces, add 100 ml of dehydrated ethanol, heat under reflux for 2 hours, cool, and filter. Evaporate the filtrate to dryness and dissolve the residue in 30 ml of water, add sodium chloride to form a saturated solution, stir thoroughly, and filter. Extract the filtrate with two 15-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts and evaporate to dryness. Dissolve the residue in 1 ml of dehydrated ethanol, add a quantity of neutral alumina, stir well on a water bath, dry, and apply to a small column previously packed with neutral alumina (200-mesh, 1 g, 10-15 mm in internal diameter). Pre-elute with 30 ml of a mixture of ethyl acetate and methanol (3∶1) and discard the eluate. Elute with 30 ml of a mixture of ethyl acetate and methanol (1∶1), collect the eluate and evaporate to dryness, dissolve the residue in 0.5 ml of ethanol as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40∶5∶10∶1) as the mobile phase. Apply separately 4 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Grind well 6 g of the pills with 4 g of kieselguhr, add 30 ml of ether, ultrasonicate for 10 minutes and filter. Evaporate the filtrate to dryness and dissolve the residue in 15 ml of water, add hydrochloric acid to adjust to pH 1-2, extract with two 20-ml quantities of ethyl acetate. Evaporate the ethyl acetate extracts to dryness and dissolve the residue in 2 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for the thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5∶3∶1∶1) as the mobile phase. Apply separately 4 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in

air, spray with 5% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(4) To 3 g of the pills, cut into pieces, add 40 ml of ether, heat under reflux for 30 minutes and filter. Evaporate the filtrate to dryness and dissolve the residue in 2 ml of the ethyl acetate as the test solution. To 1 g of each of Radix Angelicae Sinensis reference drug and Rhizoma Chuanxiong reference drug, add respectively 25 ml of ether, prepare two solutions in the same manner as the reference drug solution. Carry out the method for the thin layer chromatography (Appendix Ⅵ B), using silica G as the coating substance and the mixture of *n*-hexane and ethyl acetate (9∶1) as the mobile phase. Apply separately 4 μl of each of the above three solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the rest solution correspond in position and colour to the spots in chromatogram obtained with the reference drug solutions.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of methanol and 0.05 mol/L disodium hydrogen phosphate solution [add 0.05 mol/L potassium dihydrogen phosphate solution to adjust to pH 7.4] (15∶85) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 2700, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, accurately weighed, in methanol to prepare a solution containing 30 μg per ml as the reference solution.

Test solution Cut the pills obtained under the test of weight variation, into pieces, mix well. To about 2 g, weighed accurately, add accurately 50ml of 70% methanol, weigh, heat under reflux for 30 minutes, allow to stand to room temperature, weigh again and replenish the lost weight with 70% methanol, filter. Apply accurately 25 ml of the successive filtrate to a neutral alumina column (100-200 mesh, 1 cm in internal diameter, packed with 2 g of neutral alumina by 50% methanol). Wash with 50% methanol, collect the eluate to a 50 ml volumetric flask until almost to volume, add 50% methanol to volume, mix well, as the reference solution.

Procedure Inject accurately 10 μl of the reference solution and 10-15 μl of the test solution into the column, and calculate the content.
It contents not less than 2.6 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per pill, referred to Radix Paeoniae Alba.

Action To replenish *qi* and nourish blood to regulate menstruation.

Indications Menstrual disorders and dysmenorrhea due to a deficiency of *qi* and blood with manifestations of delayed menstrual cycle with scanty menstrual blood and pain during periods.

Usage and dosage 1 pill, twice a day.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Baidai Wan
(白带丸)

Baidai Pills

Ingredients Cortex Phellodendri Chinensis (stir-baked with wine) 150 g; Cortex Ailanthi 300 g; Radix Paeoniae Alba 100 g; Radix Angelicae Sinensis 100 g; Rhizoma Cyperi (processed with vinegar) 50 g.

Procedure Pulverize Cortex Phellodendri Chinensis, Radix Paeoniae Alba, Radix Angelicae Sinensis and Rhizoma Cyperi to fine powder, sift and mix well. Decoct Cortex Ailanthi twice with water, combine the decoctions, filter and concentrate the filtrate to a quantity (keep a part of it for coating). Make pills with the above powder, the concentrated decoction and a quantity of water, coat the pills with the reserved concentrated decoction, dry and polish.

Description Brownish-black watered pills; taste, bitter.

Identification (1) Microscopical: Fibre bundles bright yellow, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres; crystal cells with lignified and thickened walls. Clusters of calcium oxalate 18-32 μm in diameter, occurring in parenchymatous cells, often arranged in rows or several in one cell. Parenchymatous cells fusiform, with a slightly thickened walls and very fine oblique crisscross striations. Secretory cells subrounded, containing pale yellowish-brown to reddish-brown secretion, surrounded by radially arranged cells.
(2) To 5 g of the pills, finely powdered, add 5 ml of ethanol, macerate for 1 hour with constantly shaking, filter, evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of ethanol as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40∶5∶10∶0.2) as the mobile phase. Apply separately 3-5 μl of the test solution and 5 μl of the reference solution to the plate. After developing in a chamber pre-equilibrated with the mobile phase for 15 minutes and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) To 2 g of the powdered pills, add 5 ml of methanol, ultrasonicate for 10 minutes, and filter. Dilute the filtrate with methanol to 5 ml as the test solution. Prepare a solution with 0.1 g of Cortex Phellodendri Chinensis reference drug in the same manner as the reference drug solution. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, isopropanol, methanol and concentrated ammonia TS (12∶6∶3∶3∶1) as the mobile phase. Apply separately 1-2 μl of each of the above three solutions to the plate. After developing in a chamber pre-equilibrated with ammonia vapour for 15 minutes and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for pills (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of acetonitrile and 0.05 mol/L potassium dihydrogen phosphate solution [add sodium hydroxide TS to adjust to pH 5.0] (25 : 75) as the mobile phase. As detector a spectrophotometer set at 346 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of berberine hydrochloride.

Reference solution Dissolve a quantity of berberine hydrochloride CRS, accurately weighed, in methanol to prepare a solution containing 25 μg per ml as the reference solution.

Test solution Triturate a quantity of the pills to fine powder and mix well. To about 0.2 g of the powder, weighed accurately, add accurately 25 ml of a mixture of methanol and hydrochloric acid (1 : 100), weigh, heat under reflux for 30 minutes, allow to stand to room temperature, weigh again and replenish the lost weight with a mixture of methanol and hydrochloric acid (1 : 100). Mix well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl each of the reference solution and the test solution in to the column, and calculate the content.

It contents not less than 1.5 mg of berberine hydrochloride ($C_{20}H_{18}ClNO_4$) per gram, referred to Cortex Phellodendri Chinensis.

Action To clear *heat*, eliminate *dampness*, and arrest leukorrhagia.

Indications Leukorrheal disease due to pouring of *damp-heat* with manifestation of leukorrhagia with bad smell, yellow in colour.

Usage and dosage 6 g, twice a day.

Storage Preserve in well closed containers, protected from moisture.

Baihe Gujin Wan
(百合固金丸)

Baihe Gujin Pills

Ingredients Bulbus Lilii 100 g; Radix Rehmanniae 200 g; Radix Rehmanniae Praeparata 300 g; Radix Ophiopogonis 150 g; Radix Scrophulariae 80 g; Bulbus Fritillariae Cirrhosae 100 g; Radix Angelicae Sinensis 100 g; Radix Paeoniae Alba 100 g; Radix Platycodonis 80 g; Radix et Rhizoma Glycyrrhizae 100 g.

Procedure Pulverize the above ten ingredients to fine powder, sift and mix well. To each 100 g of the powder add 20-30 g of refined honey and a quantity of water to make water-honeyed pills and dry. Alternatively, add 70-90 g of refined honey to make big honeyed pills.

Description Blackish-brown water-honeyed pills or big honeyed pills; taste, slightly sweet.

Identification (1) Microscopical: Anastomosing laticiferous tubes 14-25 μm in diameter, containing yellowish granular contents. Stone cells yellowish-brown or colourless, subrectangular, subrounded or irregular, striation well-defined up to about 94 μm in diameter. Clusters of calcium oxalate 18-32 μm in diameter, occurring in parenchymatous cells, often arranged in rows or several in one cell. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibre. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, each containing a brown nucleus-like mass.

(2) Take 9 g of the big honeyed pills, cut into pieces and soften with a small quantity of warm water, grind well with 9 g of kieselguhr, and dry overnight in a desiccator; or pulverize 6 g of the water-honeyed pills. Add 40 ml of *n*-hexane, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness and dissolve the residue in 0.5 ml of *n*-hexane as the test solution. Prepare a solution with 1 g of Radix Angelicae Sinensis reference drug and 20 ml of *n*-hexane in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 1 μl of the test solution and 2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The major fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Pulverize 13 g of the water honeyed pills to powder; or cut 18 g of the big honeyed pills into pieces. Add 80 ml of water to, stand to disintegrate, heat on a water bath for 2 hours, allow to cool, centrifuge for 10 minutes, separate the supernatant, add 2 ml of hydrochloric, and heat on a water bath for 1 hour, allow to cool. Extract with two 30-ml quantities of chloroform, combine the extracts and concentrate to 1 ml as the test solution. Prepare a solution with 1 g of Radix Ophiopogonis reference drug and 50 ml of water as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of chloroform and acetone (4 : 1) as the mobile phase. Apply separately 2 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to visualize clearly. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Expel the solvent from the drug residue obtained under Identification test (2), add 40 ml of ethanol, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 15 ml of water. Extract under shaking with three 15-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol solutions, wash with three 15-ml quantities of water saturated with *n*-butanol. Evaporate the *n*-butanol solution to dryness, dissolve the residue in 0.5 ml of methanol, add a small quantity of neutral alumina, stir well on a water bath, dry and apply to a previously prepared column packed with neutral alumina (200-300 mesh, 1 g, 1-1.5 cm in internal diameter), elute with 50 ml of methanol. Collect the eluate and evaporate to dryness, dissolve the residue in 0.5 ml of methanol as the test solution. Prepare a solution with 1 g of Radix et Rhizoma Glycyrrhizae reference drug and 40 ml of ethanol as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G prepared with 1% sodium hydroxide solution as the coating substance and a mixture of toluene, ethyl acetate and methanol (7 : 3 : 1) as the mobile phase. Apply separately 1 μl of the test solution and 0.5 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The major fluorescent spots in the

chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of acetonitrile and water (11∶89) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, accurately weighed, in dilute ethanol to prepare a solution containing 50 μg per ml as the reference solution.

Test solution Pulverize the water honeyed pills to powder. To about 0.8 g, accurately weighed; or cut the big honeyed pills obtained under the test of weigh variation, into pieces and mixed well. To about 1 g, weigh accurately, in the stopper. conical flask add accurately 25 ml of dilute ethanol TS, stopper well, weigh and stand for a night. Ultrasonicate (power 300W, frequency 50 kHz) for 40 minutes. allow to stand to room temperature, weigh again and replenish the lost weight with dilute ethanol. Mix thoroughly, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 10-20 μl of the test solution into the column, and calculate the content.

It contents not less than 0.54 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per gram for water honeyed pills, and 3.5 mg for each big honeyed pills, referred to Radix Paeoniae Alba.

Action To nourish *yin* and moisten the lung, and resolve phlegm and stop coughing.

Indications Dry cough with expectoration of scanty phlegm or blood-flecked phlegm, and painful dry throat due to *yin* deficiency in the lung and kidney.

Usage and dosage 6 g of water-honeyed pills or 1 big honeyed pill, twice day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Baihe Gujin Wan (Nongsuowan) (百合固金丸，浓缩丸)

Baihe Gujin concentrated pills

Ingredients Bulbus Lilii 100 g; Radix Rehmanniae 200 g; Radix Rehmanniae Praeparata 300 g; Radix Ophiopogonis 150 g; Radix Scrophulariae 80 g; Bulbus Fritillariae Cirrhosae 100 g; Radix Angelicae Sinensis 100 g; Radix Paeoniae Alba 100 g; Radix Platycodonis 80 g; Radix et Rhizoma Glycyrrhizae 100 g.

Procedure Pulverize Radix Angelicae Sinensis, Bulbus Fritillariae Cirrhosae, Radix Platycodonis and 50 g of Radix et Rhizoma Glycyrrhizae to fine powder. Decoct Radix Rehmanniae and Radix Rehmanniae Praeparata with water three times, 2 hours for first time, 2 hours for second time, 1 hour for third time. Combine the decoctions, filter and concentrate to a thick extract with relative density of 1.30-1.35 (20℃). Decoct the remains of Radix et Rhizoma Glycyrrhizae, Radix Ophiopogonis, Bulbus Lilii, Radix Scrophulariae, Radix Paeoniae Alba with water two times, 3 hours for first time, 2 hours for second time. Combine the decoctions, filter and concentrate to a thick extract with relative density of 1.30-1.35 (20℃). Mix the above thick extract and powder well, make pills, dry and polish.

Description Brown to dark brown concentrated watered pills; taste, sweet, slightly bitter.

Identification (1) Microscopical: Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibre. The simple granules of starch granules broad ovoid of or conchoids, 40-60 μm in diameter, hila short slit-shaped of U-shaped, and striated.

(2) Take 5 g of the pills, pulverize to powder. Add 40 ml of *n*-hexane, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness and dissolve the residue in 0.5 ml of *n*-hexane as the test solution. Prepare a solution with Radix Angelicae Sinensis reference drug and 20 ml of *n*-hexane as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9∶1) as the mobile phase. Apply separately 1 μl of the test solution and 2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Expel the solvent from the drug residue obtained under Identification test (2), add 40 ml of ethanol, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 15 ml of water. Extract with three 15-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol solutions, wash with three 15-ml quantities of water saturated with *n*-butanol. Evaporate the *n*-butanol solution to dryness, dissolve the residue in 0.5ml of methanol, add a small quantity of neutral alumina, stir well on a water bath, dry and apply to a previously prepared small column packed with neutral alumina (200-300 mesh, 1 g, 1-1.5 cm in internal diameter), elute with 50 ml of methanol. Collect the eluate and evaporate to dryness, dissolve the residue in 0.5 ml of methanol as the test solution. Prepare a solution with Radix et Rhizoma Glycyrrhizae reference drug and 40 ml of ethanol as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance prepared with 1% sodium hydroxide solution and a mixture of toluene, ethyl acetate and methanol (7∶3∶1) as the mobile phase. Apply separately 1 μl of the test solution and 0.5 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Take 9 g of the pills, pulverize to powder. Add 80 ml of water, stand to dissolve, heat on the water bath for 2 hours, allow to cool, centrifuge for 10 minutes, separate the supernatant, add 2 ml of hydrochloric, and heat on the water bath for 1 hour, allow to cool. Extract with two 30-ml quantities of chloroform, combine the extract and concentrate to 1 ml as the test solution. Prepare a solution with 1 g of Radix Ophiopogonis reference drug and 50 ml of water as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and acetone (4∶1) as the mobile phase. Apply separately 2 μl of each of the above two

solutions to the plate. After developing and removal of the plate, dry it in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to visualize clearly. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of acetonitrile and water (11∶89) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, accurately weighed, in dilute ethanol TS to prepare a solution containing 50 μg per ml as the reference solution.

Test solution Pulverize the pills to powder. To 0.5 g, weigh accurately, in the stopper conical flask. Add accurately 25 ml of dilute ethanol TS, stopper well, weigh and stand for a night. Ultrasonicate (power, 300 W; frequency 50, kHz) for 40 minutes, allow to stand to room temperature, weigh again and replenish the lost weight with dilute ethanol TS. Mix thoroughly, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 10-20 μl of the test solution into the column, and calculate the content.

It contents not less than 0.80 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per gram, referred to Radix Paeoniae Alba.

Action To nourish *yin* and moisten the lung, and resolve phlegm and stop coughing.

Indications Dry cough with expectoration of scanty phlegm or blood-flecked phlegm, and painful dry throat due to *yin* deficiency in the lung and kidney.

Usage and dosage 8 pills, 3 times a day.

Strength 8 pills equivalent to 3 g of crude drugs

Storage Preserve in tightly closed containers.

Bailing Jiaonang (百令胶囊)

Bailing Capsules

Bailing capsules is prepared from Fermented Cordyceps Powder (C_s-C-Q80).

Procedure To 200 g or 500 g of Fermented Cordyceps Powder, make to 1000 of capsules.

Description Hard capsules, containing gray to dark grayish-yellow powder; odour, slightly fishy; taste, slightly salty.

Identification (1) Place 1 g of the contents, add 15 ml of ethanol, ultrasonicate for 30 minutes, and filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 1 g of Fermented Cordyceps Powder reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and the mixture of petroleum ether (60-90℃), ethyl formate and formic acid (15∶5∶1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) The retention time of the peaks obtained with the test solution obtained under the Assay of Total amino acids and the 2-amino-3-p-hydroxyphenylpropionic acid, lysine, histidine and dl-arginine CRS is concordant with each other.

(3) To 0.5 g of the Fermented Cordyceps Powder (C_S-C-Q80) reference drug, produce a reference drug solution in the same mammer discribed under the preparation of test solution on the Assay of adenosin. Dissolve a quantity of uridine CRS, in 10% methanol to produce a solution containing 5 μg per ml as the reference solution. Carry out the method for high performance liquid chromatography (Appendix VI D), use octadecylsilane bonded silica gel as the stationary phase, acetonitril as the mobile phase A, 0.04 mol solution of potassium dihydrogen phosphate as the mobile phase B, elute in gradient as the following:

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0-15	0	100
15-45	0→15	100→85

As detector a spectrophotometer set at 260 nm. The number of theoretical plates for the column is not less than 3000, calculated with the reference to the peak of adenosin. Inject accurately 20 μl of each of the test solution obtained under the Assay, adenosine and uridine CRS reference solution, and the above reference drug solution, respectively, into the column and record the chromatograms. Except the solvent peak, the retention times of the six peaks obtained with the test solution and the reference drug solution are concordant with each other, the retention times of the peaks obtained with the test solution and the adenosine and uridine reference solution are concordant with each other.

Other requirements Comply with the general requirements for capsules (Appendix I L).

Assay ***Total amino acids*** To 20 mg of the contents, obtained under the test of weight variation, weighed accurately, with 6 ml of 6 mol/L of hydrochloric acid solution in a test tube (180 mm × 18 mm), stopped in vacum, to a bake oven at 110℃ for 24 hours. Transfer the content of the test tube to a 2-amino-3-p-hydroxyphenylpropionic acid, wash the test tube with 25 ml of water for several times, combine the washings to the same evaporating basin, evaporate to dryness, wash the residue with 0.02 mol/L hydrochloric acid solution for several times, combine the washings, and filter. Transfer the filtrate to a 50 ml volumetric flask, add the 0.02 mol/L hydrochloric acid solution to volume, mix well, calculate with amino acids determination meter.

It contains not less than 60 mg of total amino acid per capsule for strength (1); 150 mg of total amino acid per capsule for strength (2).

Mannitol Weigh accurately 1 g of the content, weighed accurately, to a 150 ml round bottom flask, add accurately 100 ml of ethanol, weighed accurately, heat under reflux for 2 hours, cool, add ethanol to the original weight, mix well and filter. Measure accurately 5 ml of the successive filtrate, to a iodine flask, add accurately 50 ml of the iodine flask (Kal) solution prepared with 90 ml of sulfuric acid solution

(1→20) mixed with 110 ml of iodine flask (Kal) solution (2.3→1000), heat on a water bath for 15 ml, cool, add 10 ml of potassium iodide TS, stopped tightly, allow to stand for 5 minutes. Titrate with sodium thiosulfate (0.05 mol/L) VS, towards the end of fitration, add starch IS, continue to titrate until the blue colour disappears. 1 ml of sodium thiosulfate (0.05 mol/L) corresponds to to 0.9109 mg of mannitol ($C_6H_{14}O_6$).
It contains not less than 14 mg of total mannitol ($C_6H_{14}O_6$) per capsule for specification (1); 35 mg of total mannitol ($C_6H_{14}O_6$) per capsule for specification (2).

Adenosine Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and the mixture of acetonitrile and 0.04 mol/L potassium dihydrogen phosphate (5∶95) as the mobile phase. As detector a spectrophotometer set at 260 nm. The number of theoretical plates for the column is not less than 3000, calculated with the reference to the peak of Adenosine.

Reference solution Dissolve a quantity of Adenosine CRS, accurately weighed, in 0.5% phosphoric acid to produce a solution containing 12 μg per ml as the reference solution.

Test solution Weigh accurately 0.5 g of the content of the capsule obtained under the test of weight variation, and mix well to a stopper conical flask. Add accurately 20 ml of ether, stopped tightly, macerate for 30 minutes, filter and discard ether. Evaporate the residue to dryness, to a stopper conical flask companied with filter paper. Add accurately 50 ml of 0.5% phosphoric acid, stopped tightly, weigh accurately, ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, cool, weigh accurately again, replenish the lost weight with 0.5% phosphoric acid, mix well and allow to stand. Filter the supernatant liquid, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and the test solution into the column and calculate the content.
It contains not less than 0.16 mg of adenosine ($C_{10}H_{13}N_5O_4$) per capsule for strength (1); 0.40 mg of adenosine ($C_{10}H_{13}N_5O_4$) per capsule for strength (2).

Action To reinforce the lung and kidney, and replenish essence and *qi*.

Indications Coughing, shortness of breath, hemoptysis, aching pain in the back and lower back due to deficiency in the lung and kidney.

Usage and dosage 5-15 capsules of Strength (1) or 2-6 capsules of strength (2), 3 times a day.

Strength (1) 0.2 g per capsule (2) 0.5 g per capsule

Storage Tightly closed.

Baizi Yangxin Wan
(柏子养心丸)

Baizi Yangxin Pills

Ingredients Semen Platycladi 25 g; Radix Codonopsis 25 g; Radix Astragali Praeparata Cum Melle 100 g; Rhizoma Chuanxiong 100 g; Radix Angelicae Sinensis 100 g; Poria 200 g; Radix Polygalae (processed) 25 g; Semen Ziziphi Spinosae 25 g; Cortex Cinnamomi 25 g; Fructus Schisandrae Chinensis (steamed) 25 g; Massa Pinelliae Fermentata 100 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 10 g; Cinnabaris 30 g.

Procedure Levigate Cinnabaris to very fine powder. Pulverize the other twelve ingredients to fine powder, grind well with the above powder, sift and mix well. To each 100 g of the powder add 25-40 g of refined honey and a quantity of water to make water-honeyed pills. Alternatively, add 100-130 g of refined honey to make small honeyed pills or big honeyed pills.

Description Brown water-honeyed pills, brown to dark brown small honeyed pills or big honeyed pills; taste, sweet and then bitter, slightly numb.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diamater. Parenchymatous cells fusiform, walls slightly thickened, with very fine and oblique crisscross striations. Fibres in bundles or scattered, walls thickened, with longitudinal fissures on the surface, both ends broken to broom-like or truncate. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Stone cells subrounded or subrectangular, 32-88 μm in diameter, with thin walls at one side. Epidermal cells of testa pale yellowish-brown, subpolygonal in surface view, walls relatively thickened, with fine and dense pit-cannals, containing dark brown contents. Endopleura cells yellow, rectangular or long polygonal in surface view, with slightly sinuous walls. Endopleura cells brownish-yellow, rectangular or subsquare in surface view, anticlinal walls beaded. Anastomosing laticiferous tubes 12-15 μm in diameter, containing fine granules. Crystals of calcium oxalate subrounded or clustered crystal-like, occurring in parenchymatous cells. Needle crystals of calcium oxalate in bundles, 32-144 μm long, occurring in mucilage cells or scattered. Irregular fine granules brownish-red, lustrous, with dark black edges.
(2) Pulverize 12 g of water-honeyed pills; or cut 18 g of small honeyed pills or big honeyed pills into pieces, grind well with 10 g of kieselguhr. Put into a Soxhlet's extractor, heat under reflux with ether on a water bath until the extract becomes almost colourless. Expel the ether of the residue, heat under reflux with a quantity of methanol on a water bath until the extract becomes almost colourless, and evaporate the extract to dryness. Dissolve the residue in 40 ml of water, extract with four 30-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol solutions, extract with three 40-ml quantities of ammonia TS, discard the ammonia solutions, and evaporate the *n*-butanol extracts to dryness. Dissolve the residue in 10 ml of 40% methanol, apply to a column packed with neutral alumina (80 mesh, 5 g, 1.5 cm in internal diameter). Elute with 150 ml of 40% methanol, collect the eluate and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve astragaloside Ⅳ CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of chloroform, methanol and water (13∶7∶2) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ for about 5 minutes, and examine separately in daylight and under ultraviolet light at 365 nm. The spot in daylight and the fluorescent spot under ultraviolet light in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Pulverize 12 g of water-honeyed pills; alternatively cut 18 g of small honeyed pills or big honeyed pills into pieces, grind well with 10 g of kieselguhr. Add 50 ml of ether and

10 ml of ammonia TS, mix well, allow to stand for 24 hours, and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of dehydrated ethanol as the test solution. To 1 g of the Rhizoma Chuanxiong reference drug, add 10 ml of ether and 2 ml of ammonia TS to produce a reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G prepared with 1% sodium hydroxide solution as the coating substance and a mixture of petroleum ether (30-60℃) and chloroform (1 : 1) as the mobile phase. Apply separately 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry it in air. Spray with dilute potassium iodobismuthate TS. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To reinforce *qi*, nourish blood and anchor the mind.

Indications Insufficient *heart-qi* in a cold syndrome, palpitation, proneness to fright, insomnia, dreamfulness and amnesia.

Usage and dosage 6 g of water-honeyed pills, 9 g of small honeyed pills or 1 big honeyed pill, twice day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Banlangen Cha (板蓝根茶)

Banlangen Tea

Banlangen Tea is the medicinal tea prepared from Radix Isatidis.

Procedure Decoct 1400 g of Radix Isatidis with water twice, 2 hours for the first time and 1 hour for the second time. Combine the decoctions and filter. Concentrate the filtrate to a solution with a relative density of 1.20 (50℃), add ethanol and adjust the concentration of ethanol to 60%, and stand to precipitate completely. Recover ethanol of the supernatant and concentrate to an appropriate quantity, add a quantity of sucrose and dextrin, compress to 100 pieces, and dry.

Description Brown or dark brown pieces; taste, sweet and slightly bitter.

Identification (1) Dissolve 0.5 g of the tea in 5 ml of water, stand. Apply the supernatant to a filter paper, dry in air. Examine under ultraviolet light at 365 nm, the spot appears bluish-purple colour.
(2) Dissolve 0.5 g of the tea in 10 ml of water, and filter. To 1 ml of the filtrate, add 0.5 ml of ninhydrin TS, heat on water bath for several minutes, a bluish-violet colour is produced.

Other requirements Complies with the general requirements for the teas (Appendix Ⅰ T).

Action To clear heat and toxicity, and cool blood to ease the throat.

Indications Swollen painful throat, dry mouth and pharynx and swollen cheeks due to extremely abundant heat in the lung and stomach; acute tonsillitis and mumps with above symptoms.

Usage and dosage To be taken with the boiled water. 1 piece, 3 times a day.

Strength (1) 10 g per piece (2) 15 g per piece

Storage Preserve in tightly closed containers.

Banlangen Keli (板蓝根颗粒)

Banlangen Granules

Banlangen Granules are the granules prepared from Radix Isatidis.

Procedure Decoct 1400 g of Radix Isatidis with water twice, 2 hours for the first time and 1 hour for the second time. Combine the decoctions and filter. Concentrate the filtrate to an extract with a relative density of 1.20 (50℃), adjust the concentration of ethanol to 60%, stir well, and stand to precipitate completely. Recover ethanol of the supernatant and concentrate to an appropriate quantity. Add a quantity of sucrose and dextrin to make granules, dry, make to 1000 g; or add a quantity of dextrin and sweetening agent to make granules, dry, make to 600 g.

Description Brown or dark brown granules; taste, sweet, slightly bitter; or taste, slightly bitter (without sucrose).

Identification (1) Dissolve 0.5 g of the granules (with sucrose) or 0.3 g of the granules (without sucrose) in 5 ml of water, stand. Apply the supernatant to a piece of filter paper, dry in air, and examine under ultraviolet light at 365 nm; a bluish-purple colour is shown.
(2) Dissolve 0.5 g of the granules (with sucrose) or 0.3 g of the granules (without sucrose) in 10 ml of water, and filter. To 1 ml of the filtrate, add 0.5 ml of ninhydrin TS, heat on a water bath for several minutes; a bluish-purple colour is produced.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Action To clear *heat* and *toxicity*, and cool blood to ease the throat.

Indications Swollen painful throat, dry mouth and pharynx and swollen cheeks due to extremely abundant heat in the lung and stomach; acute tonsillitis and mumps with above symptoms.

Usage and dosage 5-10 g (with sucrose) or 3-6 g (without sucrose), 3-4 times a day, taken after dissolved in boiling water.

Strength (1) 5 g per pack (2) 10 g per pack
(3) 3 g per pack (without sucrose)

Storage Preserve in tightly closed containers.

Baochi San (保赤散)

Baochi Powder

Ingredients Massa Medicata Fermentata (stir-baked) 250 g; Semen Crotonis Pulveratum 150 g; Rhizoma Arisaematis (processed) 400 g; Cinnabaris 250 g.

Procedure Levigate Cinnabaris to very fine powder, pulverize Massa Medicata Fermentata and Rhizoma Arisaematis to fine powder. Pulverize Semen Crotonis

Pulveratum to fine powder and triturate with the above powders, sift and mix well.

Description A pink to orange-red powder; taste, weak and slightly pungent.

Identification (1) Microscopical: Needle crystals of calcium oxalate in bundles or scattered, up to about 90 μm long. Clusters of calcium oxalate 8-24 μm in diameter, occurring in subrounded parenchymatous cells. Irregular fine granules brownish-red, lustrous, with dark black edge.
(2) To 0.5 g of the powder, add 5 ml of 20% hydrochloric acid solution and several small clean copper plates, heat directly on a flame for several minutes, remove the copper plates, wash with water, a silver colour is produced on the surface of copper plates, which disappears on gentle heating.

Other requirements Complies with the general requirements for powders (Appendix Ⅰ B).

Assay To about 0.5 g of the powder, accurately weighed, in a 250 ml conical flask, add 10 ml of sulfuric acid and 1.5 g of potassium nitrate, and heat to dissolve Cinnabaris. Allow to cool, add 50 ml of 1% nitric acid carefully, shake well, cool again, add dropwise 1% solution of potassium permanganate until a pink colour develops (persisting for 2 minutes), then add dropwise 2% ferrous sulfate solution until the pink colour disappears. Add 2 ml of ammonium ferric sulfate IS, and titrate with ammonium thiocyanate (0.1 mol/L) VS. Each ml of ammonium thiocyanate (0.1 mol/L) VS corresponds to 11.63 mg of HgS.
It contains not less than 0.21 g and not more than 0.25 g of Cinnabaris per gram, calculated as HgS.

Action To promote digestion to remove retained food, and resolve phlegm to relieve convulsion.

Indications Child retention of food due to interior *cold*, no desire for food or milk, constipation, fullness in the abdomen and expectoration of much phlegm.

Usage and dosage 0.09 g, for children of 0.5-1 year old, 0.18 g, for children of 2-4 years old.

Precaution Contraindicated for diarrhea patients.

Strength 0.09 g per bottle

Storage Preserve in well closed containers, protected from moisture.

Baofukang Shuan
(保妇康栓)

Baofukang Suppositories

Ingredients Oleum Curcumae 82 g; Borneolum Syntheticum 75 g.

Procedure To Oleum Curcumae add 75 g of Tween-80, mix well, dissolve Borneolum Syntheticum with a quantity of ethanol, add it to the above oil solution, mix well. Melt 1551 g of polyoxyethylene stearate on a water bath, add the above solution, stir well, pour into a suppository mould, cool, make 1000 suppositories.

Description Milky white, milky yellow or brownish-yellow, bullet-shaped suppositories.

Identification To 1 suppository add a quantity of water, heat to melt on a water bath, and allow to cool. Add 15 ml of petroleum ether (30-60℃), ultrasonicate for 20 minutes, separate the petroleum ether layer and concentrate to about 1 ml as the test solution. Prepare a solution with 1 g of Rhizoma Curcumae reference drug and 15 ml of petroleum ether (30-60℃) in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and petroleum ether (60-90℃) as the mobile phase. Apply separately 5-10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid. The two pink spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for suppositories (Appendix Ⅰ W).

Assay ***Oleum Curcumae*** Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use capillary column packed with polyethylene glycol (PEG)-20M (10 cm in length, 0.53 mm in inner diameter, 0.1 μm film thickness). Column temperature: initial temperature 150℃, maintain 10 minutes; increase at 2℃ per minute to 180℃, maintain 10 minutes, increase at 10℃ per minute to 200℃, maintain 5 minutes. The number of theoretical plates of the column is not less than 10000, calculated with the reference to the peak of curcumenol.

Reference solution Dissolve a quantity of curcumenol CRS, accurately weighed, in ethyl acetate to prepare a solution containing 2.4 mg per ml as the reference solution.

Test solution To 5 suppositories, obtained under the test of weight variation, add 300 ml of water and several glass beads. Carry out the method for determination of volatile oil (Appendix Ⅹ D). Add water through the top of the apparatus until fills the collector and overflows to the flask, then add 3 ml of ethyl acetate, heat to boil and keep boiling for 5 hours, allow to stand to room temperature, separate the ethyl acetate layer. Wash the apparatus with three 5-ml quantities of ethyl acetate, combine the ethyl acetate solutions, pass through a funnel packed with anhydrous sodium sulfate, transfer to a 25 ml volumetric flask, wash the filter with a small quantity of ethyl acetate, add the washings to the same volumetric flask. dilute with ethyl acetate to volume and mix well.

Procedure Inject accurately 1 μl of each of the reference solution and test solution into the column, calculate the content.
It contains not less than 10.0 mg of curcumenol ($C_{15}H_{24}O_2$) for each suppository, referred to Oleum Curcumae.

Borneolum Syntheticum

Chromatographic system and system suitability Use 10% polyethylene glycol (PEG)-20M as the stationary phase, maintain the column temperature at 130℃. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of naphthalene.

Correction factor Dissolve a quantity of naphthalene in ethyl acetate to prepare a solution containing 20 mg per ml as internal standard solution. Weigh accurately 75 mg of a mixture of (±)-borneol and (±) isoborneol CRS in a 10 ml volumetric flask, add accurately 2 ml of the internal standard solution, dilute to volume with ethyl acetate and mix well. Inject accurately 1 μl of this solution into the column; calculate the correction factor according to the average value of peak areas.

Procedures Measure accurately 5 ml of the test solution obtained under the Assay of Oleum Curcumae, to a 10 ml volumetric flask, add accurately 2 ml of the internal standard solution, dilute to volume with ethyl acetate and mix

thoroughly. Inject accurately 1 μl of the solution into the column, and calculate the content according to the total value of peak areas of (±)-borneol and (±)-isoborneol. It contains not less than 60.0 mg and not more than 90.0 mg of a mixture of (±)-borneol ($C_{10}H_{18}O$) and (±)-isoborneol ($C_{10}H_{18}O$) for each suppository, referred to Borneolum Syntheticum.

Action To move *qi* and remove blood stasis, and regenerate flesh and kill pain.

Indications Leukorrheal disease due to accumulation of *damp-heat* with manifestations of leukorrhagia, yellow in colour, or pruritus valvae sometimes; colpomycosis, senile vaginitis and erosion of cervix with above symptoms.

Usage and dosage 1 suppository per night. Wash clear the vulva, insert the suppository deeply into the vagina; or used under doctor's direction.

Strength 1.74 g per suppository

Storage Preserve in well closed containers, protected from light, store below 30℃.

Baohe Wan
(保和丸)

Baohe Pills

Ingredients Fructus Crataegi (charred) 300 g; Massa Medicata Fermentata (stir-baked) 100 g; Rhizoma Pinelliae (processed) 100 g; Poria 100 g; Pericarpium Citri Reticulatae 50 g; Fructus Forsythiae 50 g; Semen Raphani (stir-baked) 50 g; Fructus Hordei Germinatus (stir-baked) 50 g.

Procedure Pulverize the above eight ingredients to fine powder, sift, mix well. Each 100 g of the powder add 125-155 g of refined honey to make big honeyed pills.

Description Brown big honeyed pills; odour, slightly aromatic; taste, slightly sour, astringent and sweet.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Stone cells of pericarp pale purplish-red, red or yellowish-brown, subrounded or polygonal, up to about 125 μm in diameter. Needle crystals of calcium oxalate in bundles, 32-144 μm long, occurring in mucilage cells or scattered. Prisms of calcium oxalate abundant in parenchyma. The upper and lower layers of fibres of endocarp crisscrossed, fibres pale yellowish-green, short fusiform, pit canals visible. Epidermal cells in longitudinal rows, frequently one long cell alternately joined to two short cells, the longer cells with thickened, sinuous, and lignified walls. Fragments of testa yellow or brownish-red, cells small, polygonal, with thickened walls.

(2) Take 30 g of the pills, cut into pieces, add 80 ml of water, heat under reflux for 1 hour, filter through gauze while hot, evaporate the filtrate to dryness. Heat under reflux the residue with 20 ml of ethanol for 1 hour, filter, evaporate the filtrate to dryness, dissolve the residue in 2 ml of ethanol and filter, use the filtrate as the test solution. Heat under reflux 1 g of Fructus Forsythiae reference drug with 20 ml of water for 1 hour, filter, evaporate the filtrate to dryness, dissolve the residue in 20 ml of ethanol, prepare the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅳ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (20∶3) as the mobile phase. Apply separately 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a mixture of acetic anhydride and sulfuric acid (20∶1), heat at 105 ℃ for about 10 minutes, cool, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Take 10 g of the pills, cut into pieces, grind well with 10 g of kieselguhr. Put into a Soxhlet's extractor, heat under reflux with 50 ml of petroleum ether (30-60℃) on a water bath for 1 hour, discard the petroleum ether solution. Heat under reflux with 40 ml of methanol on a water bath for 30 minutes, evaporate the extract to dryness, dissolve the residue in 10 ml of methanol, filter, use the filtrate as the test solution. Dissolve hesperidin CRS in methanol to produce a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 0.5% sodium hydroxide solution as the coating substance and a mixture of ethyl acetate, methanol and water (100∶17∶13) as the mobile phase. Apply separately 2 μl of each of the above two solutions to the plate. Develop to a distance of 3 cm, dry in air, then, using the upper layer of toluene, ethyl acetate, formic acid and water (20∶10∶1∶1) as the mobile phase, develop again to 8 cm, dry in air. Spray with 1% aluminium chloride in methanol, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of methanol, acetic acid and water (42∶4∶54) as the mobile phase. As detector a spectrophotometer set at 283 nm. Maintain the column temperature at 40℃. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of hesperidin.

Reference solution Weigh accurately 10 mg of hesperidin CRS, dissolve with methanol (ultrasonicate if necessary) in a 50 ml volumetric flask, dilute to volume with methanol and mix well. Transfer accurately 2 ml of it to 10 ml volumetric flask, dilute to volume with mobile phase, mix well. (The solution containing 40 μg of hesperidin CRS per ml)

Test solution To about 5 g of the big honeyed pills, obtained in the test of weight variation, cut into pieces, weigh accurately, add a quantity of kieselguhr, triturate well, transfer to a Soxhlet's extractor, add 80 ml of petroleum ether (60-90℃), heat under reflux for 2-3 hours. Discard the petroleum ether extract and evaporate the residue to dryness, add 80 ml of methanol, heat under reflux until the extract solution is colourless, cool and filter. Transfer the filtrate to a 100 ml volumetric flask, wash the container with a small quantity of methanol for several times, filter the washings to the same flask, dilute with methanol to volume, and mix well. Transfer accurately 5 ml of it to 10 ml volumetric flask, dilute with mobile phase to volume. Mix well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution separately into the column, calculate the content.

It containts not less than 7.0 mg of hesperidin ($C_{28}H_{34}O_{15}$)

per pill, referred to Pericarpium Citri Reticulatae.

Action To promote digestion to remove retained food, and harmonize the stomach.

Indications Fullness in the stomach and abdomen, fetid eructation and casting up of gastric acid, and poor appetite due to retained food in the stomach.

Usage and dosage 1-2 pills, twice a day; appropriate reduction of the dosage for children.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Baohe Wan (Shui wan)
(保和丸，水丸)

Baohe Watered Pills

Ingredients Fructus Crataegi (charred) 300 g; Massa Medicata Fermentata (stir-baked) 100 g; Rhizoma Pinelliae (processed) 100 g; Poria 100 g; Pericarpium Citri Reticulatae 50 g; Fructus Forsythiae 50 g; Semen Raphani (stir-baked) 50 g; Fructus Hordei Germinatus (stir-baked) 50 g.

Procedure Pulverize the above eight ingredients to fine powder, sift, mix well, make pills with water and dry.

Description Greyish-brown to browm watered pills; odour, slightly aromatic; taste, slightly sour and astringent.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Stone cells of pericarp pale purplish-red, red or yellowish-brown, subrounded or polygonal, up to about 125 μm in diameter. Needle crystals of calcium oxalate in bundles, 32-144 μm long, occurring in mucilage cells or scattered. Prisms of calcium oxalate abundant in parenchyma. The upper and lower layers of fibres of endocarp crisscrossed, fibres short fusiform. Epidermal cells in longitudinal rows, frequently one long cell alternately joined to two short cells, the longer cells with thickened, sinuous, and lignified walls. Fragments of testa yellow or brownish-red, cells small, polygonal, with thickened walls.

(2) Pulverize 16 g of the pills to powder, add 80 ml of water, heat under reflux for 1 hour, filter through gauze while hot, evaporate the filtrate to dryness. Heat under reflux the residue with 20 ml of ethanol for 1 hour, filter, evaporate the filtrate to dryness, dissolve the residue in 2 ml of ethanol and filter, use the filtrate as the test solution. Heat under reflux 1 g of Fructus Forsythiae reference drug with 20 ml of water for 1 hour, filter, evaporate the filtrate to dryness, dissolve the residue in 20 ml of ethanol, prepare the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅳ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (20∶3) as the mobile phase. Apply separately 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a mixture of acetic anhydride and sulfuric acid (20∶1), heat at 105℃ for about 10 minutes, cool, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Pulverize 5 g of the pills. Put into a Soxhlet's extractor, heat under reflux with 50 ml of petroleum ether (30-60℃) on a water bath for 1 hour, discard the petroleum ether solution. Heat under reflux with 40 ml of methanol on a water bath for 30 minutes, evaporate the extract to dryness, dissolve the residue in 10 ml of methanol, filter, use the filtrate as the test solution. Dissolve hesperidin CRS in methanol to produce a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 0.5% sodium hydroxide solution as the coating substance and a mixture of ethyl acetate, methanol and water (100∶17∶13) as the mobile phase. Apply separately 2 μl of each of the above two solutions to the plate. Develop to a distance of 3 cm, dry in air, then, using the upper layer of toluene, ethyl acetate, formic acid and water (20∶10∶1∶1) as the mobile phase, develop again to 8 cm, dry in air. Spray with 1% aluminium chloride in methanol, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of methanol, acetic acid and water (42∶4∶54) as the mobile phase. As detector a spectrophotometer set at 283 nm. Maintain the column temperature at 40℃. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of hesperidin.

Reference solution Weigh accurately 10 mg of hesperidin CRS, dissolve with methanol (ultrasonicate if necessary) in a 50 ml volumetric flask, dilute to volume with methanol and mix well. Transfer accurately 2 ml of it to 10 ml volumetric flask, dilute to volume with the mobile phase, mix well. (The solution containing 40 μg of hesperidin CRS per ml)

Test solution Triturate a quantity of the pills to fine powder and mix well. To about 2 g of the powder, weighed accurately, in a Soxhlet's extractor, add 80 ml of petroleum ether (60-90℃), heat under reflux for 2-3 hours. Discard the petroleum ether extract and evaporate the residue to dryness, add 80 ml of methanol, heat under reflux until the extract solution is colourless, cool and filter. Transfer the filtrate to a 100 ml of a volumetric flask, wash the container with a small quantity of methanol for several times, filter the washings to the same flask, dilute with methanol to volume, and mix well. Transfer accurately 5 ml of it to 10 ml volumetric flask, dilute with mobile phase to volume. Mix well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution separately into the column, calculate the content.

It contains not less than 1.8 mg of hesperidin ($C_{28}H_{34}O_{15}$) per gram, referred to Pericarpium Citri Reticulatae.

Action To promote digestion to remove retained food, and harmonize the stomach.

Indications Fullness in the stomach and abdomen, fetid eructation and casting up of gastric acid, and poor appetite due to retained food in the stomach.

Usage and dosage 6-9 g of pills, appropriate reduction of the dosage for children.

Storage Preserve in well closed containers, protected from moisture.

Baoji Wan
(保济丸)

Baoji Pills

Ingredients Ramulus Uncariae Cum Uncis; Flos Chrysanthemi; Fructus Tribuli; Cortex Magnoliae; Radix Aucklandiae; Rhizoma Atractylodis; Radix Trichosanthis; Herba Pogostemonis; Radix Puerariae; Exocarpium Citri Grandis; Radix Angelicae Dahuricae; Semen Coicis; Oryzae Germinatus; Herba Menthae; Poria; Massa Medicata Fermentata (Guangdong produced)

Procedure Pulverize the above sixteen ingredients to fine powder, sift, mix well, make pills with water, and dry. Coat with a mixture of carmine, talc powder and ferric oxide as the pigment, and dextrin as the adhesive, and dry.

Description Vermilion water pills; odour, aromatic; taste, slight bitter and pungent.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter, Needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells. Pollen grains subrounded, 24-34 μm in diameter, exine with spines of 3-5 μm long, with three apertures.

(2) Grind 5 g to fine powder, ultrasonicate with 40 ml of ethanol for 15 minutes, allow to cool, filter, evaporate the filtrate to dryness. Wash the residue with a small quantity of ether three times, discard the ether solutions, dissolve the residue in 1 ml of methanol and use it as the test solution. Dissolve puerarin CRS and naringin CRS separately in methanol to prepare solutions each containing 0.5 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 0.5% solution of sodium hydroxide as the coating substance and a mixture of chloroform, methanol and water (70∶25∶4) as the mobile phase. Apply separately to the plate 5 μl of each of the three solutions. After developing and removal of the plate, examine under ultraviolet light at 365 nm. A fluorescent spot in chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot in the chromatogram obtained with the puerarin reference solution. Spray with 5% aluminium chloride in ethanol and examine under ultraviolet light at 365 nm. A fluorescent spot in chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot in the chromatogram obtained with the naringin reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecasilane bonded silica gel as the stationary phase and a mixture of acetonitrile, water and acetic acid (60∶40∶4) as the mobile phase. As detector a spectrophotometer set at 294 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of magnolol.

Reference solution Dissolve a quantity of magnolol CRS and honokiol CRS, accurately weighed, in methanol to produce a mixture containing 90 μg of magnolol and 120 μg of honokiol per ml as the reference solution.

Test solution Weigh accurately 1.0 g, in fine powder, in a stopper conical flask, add 100 ml of petroleum ether (30-60℃) and ultrasonicate (power 500 W, frequency 33 kHz) for 30 minutes, and filter. Ultrasonicate the residue again with 50 ml of petroleum ether (30-60℃) for 30 minutes and filter. Combine the filtrates, evaporate to dryness, dissolve the residue in methanol, transfer to a 10 ml volumetric flask, dilute to volume with methanol, shake well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 0.40 mg of the total amount of magnolol ($C_{18}H_{18}O_2$) and honokiol ($C_{18}H_{18}O_2$) per gram of water-honeyed pills, referred to Cortex Magnoliae Officinalis.

Action To release the exterior, expel *dampness* and harmonize the *middle-energizer*.

Indications Common cold due to summer *dampness* with manifestations of fever, headache, abdominal pain, diarrhea, nausea, vomiting, discomfort in the stomach and intestines; motion sickness.

Usage and dosage 1.85-3.70 g of watered pills, 3 times a day.

Precaution Contraindicated for patients with affliction from exogenous pathogenic factors and *dry-heat*.

Strength (1) 1.85 g (2) 3.70 g per bottle

Storage Preserve in tightly closed containers, protected from moisture.

Baokening Keli
(宝咳宁颗粒)

Baokening Granules

Ingredients Folium Perillae 30 g; Folium Mori 30 g; Radix Peucedani 60 g; Bulbus Fritillariae Thunbergii 30 g; Herba Ephedrae 30 g; Radix Platycodonis 30 g; Rhizoma Arisaematis (processed) 60 g; Pericarpium Citri Reticulatae 30 g; Semen Armeniacae Amarum (stir-baked) 60 g; Radix Scutellariae 60 g; Indigo Naturalis 21 g; Radix Trichosanthis 60 g; Fructus Aurantii (stir-baked with bran) 60 g; Fructus Crataegi (stir-baked) 45 g; Radix et Rhizoma Glycyrrhizae 15 g; Calculus Bovis Artifactus 3 g.

Procedure Pulverize Calculus Bovis Artifactus to powder. Isolate the volatile oil from Folium Perillae and Pericarpium Citri Reticulatae by distillation and collect the aqueous solution in another container. Decoct other thirteen ingredients with water twice, 2.5 hours for the first time and 1.5 hours for the second time. Combine the decoctions, filter, and combine the filtrate with the above aqueous solution, concentrate to a thin extract with a relative density of 1.32-1.35 (50℃). To the thin extract, add a quantity of sucrose, dextrin, and the powder of Calculus Bovis Artifactus, mix well, make granules and dry, add the above volatile oil, mix well, make to 900 g.

Description Greyish-green granules; taste, sweet, slightly bitter.

Identification (1) Pulverize 10 g of the granules, add 30 ml of ether and 1 ml of concentrated ammonia TS, in a 50 ml conical flask, stopper well and stand for 2 hours, shake constantly. Filter, add 1 ml of acidic ethanol (mix well 20 ml of ethanol and 1 ml of hydrochloric acid) to the filtrate,

and evaporate to dryness. Dissolve the residue in 0.5 ml of methanol as the test solution. Dissolve ephedrine hydrochloride CRS in methanol to produce a solution containing 5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and concentrated ammonia TS (40∶7∶1) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with ninhydrin TS, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) To 4 g of the granules, pulverize to powder, add 30 ml of methanol, ultrasonicate for 20 minutes and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for the thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of ethyl acetate, butanone, formic acid and water (5∶3∶1∶1) as the mobile phase. Apply separately 3 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 1% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Dissolve hesperidin CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for the thin layer chromatography (Appendix Ⅵ B), using silica gel G prepared with a solution of 0.5% sodium hydroxide as the coating substance and the mixture of ethyl acetate, methanol and water (100∶17∶13) as the mobile phase. Apply separately 4 μl of each of the reference solution and the test solution obtained under the test of Identification (2). Develop about 3 cm, remove the plate, and allow to dry in air. Develop using the upper layer of the mixture of methyl benzene, ethyl acetate, formic acid and water (20∶10∶1∶1) as the mobile phase, after developing about 6 cm, remove the plate and dry in air. Spray with aluminium chloride TS. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) To 30 g of the granules, ground to powder, add 40 ml of chloroform, ultrasonicate for 15 minutes and filter. Evaporate the filtrate to about 1 ml as the test solution. Dissolve indigotin CRS in chloroform to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for the thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of methyl benzene, chloroform and acetone (5∶4∶1) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(5) To 15 g of the granules, ground to fine powder, add 30 ml of chloroform, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ethanol as the test solution. Dissolve cholic acid CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for the thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane, ethyl acetate, methanol, and acetic acid (20∶25∶3∶2) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. Spray 10% sulfuric acid in ethanol, heat to the spots clear. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of methanol, water and phosphoric (43∶57∶0.2) as the mobile phase. As detector a spectrophotometer set at 278 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of baicalin.

Reference solution Dissolve a quantity of baicalin CRS, accurately weighed, in dilute ethanol TS to prepare a solution containing 8 μg per ml as the reference solution.

Test solution Weigh accurately 0.5 g of the granules, grounded to powder, to a stopper conical flask, add accurately 50 ml of dilute ethanol TS, weigh, heat under reflux for 1 hour, allow to stand to room temperature, weigh again and replenish the lost weight with dilute ethanol TS. Mix thoroughly, allow to stand filter the supernatant, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contents not less than 4.5 mg of baicalin ($C_{21}H_{18}O_{11}$) per pack, referred to Radix Scutellariae.

Action To clear *heat* and release the exterior, and relieve coughing and resolve phlegm.

Indications Headache, fever, coughing with expectoration of profuse phlegm, shortness of breath, swollen painful throat and restlessness in children due to affliction from external *wind-cold*, interior *heat* and poor appetite.

Usage and dosage 2.5 g, twice a day, taken after dissolved in boiling water; appropriate reduction of the dosage for children under 1 year old.

Strength 5 g per pack

Storage Preserve in tightly closed containers.

Baolong Wan
(抱龙丸)

Baolong Pills

Ingredients Poria 50 g; Halloysitum Rubrum 25 g; Herba Pogostemonis 38 g; Rhizoma Pinelliae Preparatum 31 g; Pericarpium Citri Reticulatae 25 g; Cortex Magnoliae Officinalis 25 g; Herba Menthae 31 g; Folium Perillae 31 g; Bombyx Batryticatus (processed with ginger) 31 g; Rhizoma Dioscorea 25 g; Concretio Silicea Bambusae 38 g; Lignum Santali Album 25 g; Radix Angelicae Dahuricae 25 g; Fructus Amomi 25 g; Radix Saposhnikoviae 31 g; Herba Schizonepetae 38 g; Rhizoma Typhonii 31 g; Radix Angelicae Pubescentis 31 g; Radix Paeoniae Alba 25 g; Fructus Chebulae (removed from seeds) 25 g; Fructus Piperis Longi 25 g; Rhizoma Atractylodis Macrocephalae

(stir-baked) 38 g; Rhizoma Chuanxiong (steamed with wine) 31 g; Radix Aucklandiae 25 g; Cinnabaris 47 g; Rhizoma Gastrodiae 25 g; Rhizoma Cyperi (processed) 25 g.

Procedure Levigate Cinnabaris to very fine powder and pulverize the other twenty-six ingredients to fine powder, sift and mix well. To each 100 g of the powder add 120-130 g of refined honey to make big honeyed pills.

Description Brown big honeyed pills; odour, aromatic; taste, sweet and pungent.

Identification (1) Microscopical: Starch granules triangular-ovoid or rectangular-rounded, 24-40 μm in diameter, hilum shortly cleft or V-shaped. Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filled in parenchymatous cells. Stone cells branched, with thickened walls and distinct striations. Secretory cells subrounded, containing pale brownish-yellow to reddish-brown secretion, the surrounding cells arranged radially. Fine needle crystals of calcium oxalate, scattered in mesophyll tissue. Prisms of calcium oxalate abundant in parenchyma. Sclerenchymatous cells of endocarp yellowish-brown or brownish-red, subpolygonal in surface view, walls thickened, containing silica bodies. Fragments of body-wall colourless, with very fine hyphae in surface. Irregular fine granules dark brownish-red, lustrous, with dark black edge.

(2) Grind well 4 g of the pills, cut into pieces, with 4 g of kieselguhr, add 30 ml of ether, ultrasonicate for 20 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 0.5 ml of ethyl acetate as the test solution. Prepare a solution with 0.2 g of Rhizoma Chuanxiong reference drug and 20 ml of ether as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9:1) as the mobile phase. Apply separately 4 μl of the test solution and 2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To expel *wind* and resolve phlegm, and invigorate the spleen and harmonize the stomach.

Indications Diarrhea due to disharmony between the spleen and stomach, and retention of excessive internal *wind-heat* and phlegm, with manifestations of indigestion of food or milk, nausea, vomiting, loose stools with undigested food.

Usage and dosage 1 pill for children under 1 year old; 2 pills for children of 1-2 years old, 2-3 times a day.

Strength 1.56 g per pill

Storage Preserve in tightly closed containers.

Bawei Chenxiang San
(八味沉香散)

Bawei Chenxiang Powder

Bawei Chenxiang Powder is a prescription used by Tibetan Nationality.

Ingredients Lignum Aquilariae Resinatum 200 g; Semen Myristicae 100 g; Fructus Choerospondiatis 100 g; Calx Pulveratum 100 g; Olibanum 100 g; Radix Aucklandiae 100 g; Fructus Chebulae (stewed) 100 g; Flos Gossampini 100 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix well.

Description A yellowish-brown powder; odour, aromatic; taste, salty, astringent and slightly bitter.

Identification (1) Microscopical: Walls of fibre-tracheids slightly thickened, with bordered pits, pit apertures V-shaped or crossed. Irregular masses colourless or pale yellow, diffused with many minute granules from surface and edge, dissolved on long standing. Stone cells in groups, subrounded, long-ovate, rectangular or long slat-shaped, with distinct fine and dense pit-canals. Endocarp stone cells subrounded or elliptical, walls thickened, with distinct pit-canals, lumina filled with brownish-red granules. Pollen grains triangular, 50-60 μm in diameter, with 3 germinal apertures, and reticulatively sculptured on the surface.

(2) To 4 g of the powder, add 20 ml of ether, shake well, stopper closely, allow to stand for 24 hours and filter. Evaporate the filtrate to about 2 ml as the test solution. To 0.5 g of the Radix Aucklandiae reference drug, prepare a solution in the same manner as the reference drug solution. Carry out the method for the thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of cyclohexane and ethyl acetate (9:1) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid, heat at 105℃ to visualize clearly. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Complies with the general requirements for powders (Appendix Ⅰ B).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of acetonitrile, methanol and water (43:10:45) as the mobile phase. As detector a spectrophotometer set at 225 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of costunolide.

Reference solution Dissolve a quantity of costunolide CRS, accurately weighed, in methanol to prepare a solution containing 0.1 mg per ml as the reference solution.

Test solution To about 2 g of the powder, weigh accurately, in a conical flask. Add accurately 50 ml of ethyl acetate, weigh accurately, mix well. Heat under reflux for 3 hours, allow to cool, weigh again and replenish the lost weight with ethyl acetate. Measure accurately 5 ml of the successive filtrate and evaporate to dryness. Dissolve the residue in a small quantity of methylene chloride, filter,

wash the container and the filter with a small quantity of methylene chloride. Combine the washings and filtrate, evaporate to dryness. Dissolve the residue in methanol, and transfer to a 10 ml volumetric flask, dilute to volume with methanol, mix well, as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution in to the column, and calculate the content.
It contents not less than 0.80 mg of costunolide ($C_{15}H_{20}O_2$) per bag, referred to Radix Scutellariae.

Action To remove *heat* from the heart, to calm the mind, and to induce resuscitation.

Indications Impairment of consciousness and delirium in febrile diseases; angina pectoris in coronary heart disease.

Usage and dosage 0.9-1.5 g, 2-3 times a day.

Storage Preserved in well closed containers, protected from moisture.

Bawei Qingxin Chenxiang San
(八味清心沉香散)

Bawei Qingxin Chenxiang Powder

Bawei Qingxin Chenxiang Powder is a prescription used by Mongolian Nationality.

Ingredients Lignum Aquilariae Resinatum 180 g; Fructus Choerospondiatis 180 g; Lignum Santali Albi 90 g; Lignum Pterocarpi Santalini 90 g; Flos Carthami 90 g; Semen Myristicae 60 g; Concretio Silicea Bambusae 60 g; Radix Glehniae 60 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix well.

Description A pale brownish-red powder; odour, aromatic; taste, slightly sour and bitter.

Identification (1) To 10 g of the powder, carry out the method for determination of volatile oil (Appendix Ⅹ D), separate the layer of volatile oil. Dissolve the volatile oil in 2 ml of ether as the test solution. Dissolve the sandal wood oil reference extract in ether to prepare a solution containing 10 μl per ml as the reference extract solution. Carry out the method for the thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ether (60-90℃) and ethyl acetate (17∶3) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and remoral of the plate, dry in air. Spray with the *p*-dimethylaminobenzaldehyde solution (dissolve 0.25 g of *p*-dimethylaminobenzaldehyde in 50 g of glacial acetic acid, add 5 g of phosphoric acid and 20 ml of water, mix well), heat at 80-90℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference extract solution.
(2) To 3 g of the powder, add two 15-ml quantities of acetone, stopper tightly, shake constantly for 15 minutes and filter, discard the filtrate. Extract the residue with 15 ml of 80% acetone by shaking constantly for 15 minutes, allow to stand. Imbibition the supernatant liquid is used as the test solution. Prepare the reference drug solution in the same manner using 0.5 g of Flos Carthami reference drug. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H containing carboxymethylcellulose sodium as the coating substance and a mixture of ethyl acetate, methanol, formic acid and water (7∶0.4∶2∶3) as the mobile phase. Apply separately to the plate 5 μl of each of the solutions. After developing and removal of the plate, dry in air. The strips in the chromatogram obtained with the test solution correspond in position and colour to the strips obtained with the reference drug solution.

Other requirements Complies with the general requirements for powders (Appendix Ⅰ B).

Action To remove *heat* from the heart and the lung, to regulate the flow of *qi*, and to induce sedation.

Indications Exuberant *fire* in the heart and the lung with distress in the chest, costal and hypochondriac stuffiness and pain, palpitation and shortness of breath.

Usage and dosage 3 g, 1-2 times a day.

Strength 15 g per pack

Storage Preserve in well closed containers, protected from moisture.

Bawei Tanxiang San
(八味檀香散)

Bawei Tanxiang Powder

Bawei Tanxiang Powder is a prescription used by Mongolian Nationality.

Ingredients Lignum Santali Albi 200 g; Gypsum Fibrosum 100 g; Flos Carthami 100 g; Radix et Rhizoma Glycyrrhizae 100 g; Flos Caryophylli 100 g; Radix Glehniae 100 g; Rhizoma Polygoni Bistortae 100 g; Fructus Vitis Viniferae 100 g.

Procedure Pulverize Gypsum Fibrosum, Flos Carthami, Radix et Rhizoma Glycyrrhizae, Radix Glehniae and Rhizoma Bistortae to coarse powder. Pulverize Fructus Vitis Viniferae with the coarse powder and dry. Pulverize Lignum Santali Albi and Flos Caryophylli with the above powder to fine powder, sift and mix well.

Description A brownish-yellow powder; odour, aromatic; taste, sweet, slightly astringent and cool.

Identification (1) Microscopical: Clusters of calcium oxalate about 40 μm in diameter. Crystal cells containing prisms of calcium oxalate, square or rectangular, with thickened, lignified walls and distinct striations. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Pollen grains spheroidal or ellipsoidal, about 60 μm in diameter, extine sping with 3 germinal apertures. Pollen grains triangular, about 16 μm in diameter. Vittae containing brownish-yellow secretion.
(2) To 50 g of the powder, carry out the method for determination of volatile oil (Appendix Ⅹ D), separate the layer of volatile oil. Dissolve the volatile oil in 2 ml of ether as the test solution. Dissolve the Sandal Wood Oil reference extract in ether to prepare a solution containing 10 μl per ml as the reference extract solution. Carry out the method for the thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ether (60-90℃) and ethyl acetate (17∶3) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference extract solution to the plate. After developing and removal of the plate, dry in air, spray with the *p*-dimethylaminobenzaldehyde solution (dissolve 0.25 g of *p*-dimethylaminobenzaldehyde in 50 g of glacial acetic acid, add 5 g of phosphoric acid and 20 ml of water, mix well.), heat

at 80-90℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference extract solution.

(3) To 4 g of the powder, add 10 ml of 80% acetone, stopper tightly, shake constantly for 15 minuters and allow to stand; use the supernatant liquid as the test solution. Prepare a solution with 0.5 g of Flos Carthami reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with carboxymethylcellulose sodium as the coating substance and a mixture of ethyl acetate, methanol, formic acid and water (7∶0.4∶2∶3) as the mobile phase. Apply separately to the plate 15 μl of the test solution and 5 μl of the reference drug solution. After developing and removal of the plate, dry in air. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution.

(4) To 2.5 g of the powder, add 10 ml of ether, stopper tightly, shake constantly for minutes, filter, used the filtrate as the test solution. Dissolve the eugenol CRS in ether to prepare a solution containing 16 μl per ml as the reference solution. Carry out the method for the thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (9∶1) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray 5% vanilin in sulfuric acid and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Complies with the general requirements for powders (Appendix Ⅰ B).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of methanol, 0.2 mol/L ammonium acetate and glacial acetic acid (67∶33∶1) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of glycyrrhizic acid.

Reference solution Dissolve a quantity of ammonium glycyrrhizate CRS, accurately weighed, in methanol to prepare a solution containing 0.15 mg per ml as the reference solution (0.15 mg per ml, 0.1469 mg calculated for glycyrrhizic acid).

Test solution Weigh accurately 1.5 g of the powder in a stopper conical flask, add accurately 50 ml of methanol, stopper, weigh, and ultrasonicate (power, 250 W; frequency, 20 kHz) for 45 minutes, cool. Weigh again, replenish the lost weight with methanol, mix thoroughly, filter. Measure accurately 25 ml of the successive filtrate and evaporate to dryness. Dissolve the residue in methanol and transfer to a 10 ml volumetric flask, dilute to volume with methanol, mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution in to the column, and calculate the content.

It contains not less than 1.8 mg of glycyrrhizic acid ($C_{42}H_{62}O_{16}$) per gram, referred to Radix et Rhizoma Glycyrrhizae.

Action To remove *heat* from the lung, relieve cough and promote expectoration of phlegm.

Indications *Heat* in the lung with cough and expectoration of purulent phlegm.

Usage and dosage 2-3 g, 1-2 times a day.

Strength 15 g per pack

Storage Preserve in well closed containers, protected from moisture.

Bazheng Heji
(八正合剂)

Bazheng Mixture

Ingredients Herba Dianthi 118 g; Semen Plantaginis (stir-baked) 118 g; Herba Polygoni Avicularis 118 g; Radix et Rhizoma Rhei 118 g; Talcum 118 g; Caulis Clematidis Armandii 118 g; Fructus Gardeniae 118 g; Radix et Rhizoma Glycyrrhizae Cum Melle 118 g; Medulla Junci 59 g.

Procedure Macerate Semen Plantaginis with 25% ethanol solution, collect the maceration solution. Percolate Radix et Rhizoma Rhei with 50% ethanol solution after macerating for 24 hours, carried out the percolation method described under liquid extractives and extractives (Appendix Ⅰ O), collect the percolation extract, and recover ethanol in vacuum. Decoct the other ingredients with water for 3 times, filter, combine the filtrate, and concentrate to about 1300 ml. Combine with the maceration solution of Semen Plantaginis and the percolation extract of Radix et Rhizoma Rhei, allow to stand, filter, concentrate to about 1000 ml. Add 3 g of sodium benzoate, dilute with water to 1000 ml, mix well and pack.

Description A dark brown liquid; taste, bitter and slightly sweet.

Identification (1) To 10 ml of the mixture, add 1 ml of hydrochloric acid, heat on a water bath for 30 minutes, and cool immediately. Extract with two 15-ml quantities of ether, combine the ether extract, and evaporate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. To 1 g of Radix et Rhizoma Rhei reference drug, add water and decoct for 30 minutes, filter and concentrate the filtrate to 10 ml. Prepare a solution as the reference drug solution in the same manner. Dissolve emodin CRS in chloroform to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of petroleum ether (30-60℃), ethyl formate and formic acid (15∶5∶1) as the mobile phase. Apply separately to the plate 5 μl of each of the test solution, the reference drug solution and the reference solution. After developing and removal of the plate, dry in air, expose to ammonia vapour to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution.

(2) Measure 20 ml of the mixture, add 60 ml of ethanol, mix well, allow to stand for 24 hours and filter. Collect the filtrate and remove ethanol. Extract with two 15-ml quantities of ether, and expel the ether extract. Extract the water layer with ethyl acetate for 3 times (20 ml for the first time, 15 ml for the second time and 10 ml for the third time), combine the extracts, and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve geniposide CRS in methanol to produce a solution

containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of acetone, ethyl acetate, formic acid and water (4∶6∶0.5∶0.5) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Relative density Not less than 1.02 (Appendix Ⅶ A).

pH value 4.0-6.0 (Appendix Ⅶ G).

Other requirements Complies with the general requirements for mixtures (Appendix Ⅰ J).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of acetonitrile and water (12∶88) as the mobile phase. As detector a spectrophotometer set at 238 nm. The number of theoretical plates of the column is not less than 1500, calculated with the reference to the peak of geniposide.

Reference solution Dissolve a quantity of geniposide CRS, accurately weighed, in methanol to prepare a solution containing 0.1 mg per ml as the reference solution.

Test solution Measure accurately 5 ml of the mixture in a 50 ml volumetric flask, dilute to the volume with dilute ethanol and mix well, centrifuge and transfer the supernatant as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 5-10 μl of the test solution into the column, and calculate the content.

It contents not less than 0.60 mg of geniposide ($C_{17}H_{24}O_{10}$) per ml, referred to Fructus Gardeniae.

Action To clear *heat*, induce urination and relieve stranguria.

Indications Concentrated urine, difficulty and pain in micturition, dribble of urine, dry mouth and throat due to pouring of *damp-heat*.

Usage and dosage 15-20 ml, 3 times a day, taken after shaking thoroughly.

Strength (1) 100 ml (2) 120 ml (3) 200 ml per bottle

Storage Preserve in well closed containers, stored in a cool place.

Bazhen Wan
(八珍丸)

Bazhen Pills

Ingredients Radix Codonopsis 100 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 100 g; Poria 100 g; Radix et Rhizoma Glycyrrhizae 50 g; Radix Angelicae Sinensis 150 g; Radix Paeoniae Alba 100 g; Rhizoma Chuanxiong 75 g; Radix Rehmanniae Praeparata 150 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix well. To each 100 g of the powder add 40-50 g of refined honey and a quantity of water to make water-honeyed pills and dry; Alternatively, to each 100 g of the powder add 110-140 g of refined honey to make big honeyed pills.

Description Brownish-black water-honeyed pills or blackish-brown to black big honeyed pills; taste, sweet and slightly bitter.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Anastomosing laticiferous tubes 12-15 μm in diameter, containing minute granular substances. Needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells. Clusters of calcium oxalate 18-32 μm in diameter, occured in parenchymatous cells, often arranged in rows or several in a cell. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Parenchymatous cells fusiform, with slightly thickened walls, showing very minute oblique crisscross striations. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, containing brown nucleus-like mass.

(2) Triturate 9 g of the big honeyed pills well with 4.5 g of kieselguhr, or pulverize 6 g of the water-honeyed pills, add 50 ml of water, grind well and add another 50 ml of water, stir for 20 minutes and filter in vacuum. Wash the residue with 50 ml of water, dry at 60 ℃ for 2 hours. Heat under reflux in a Soxhlet's extractor with 70 ml of ethanol on a water bath until the extract becomes colourless, cool, filter, and concentrate the filtrate to near dryness. Dissolve the residue in 1 ml of ethanol as the test solution. To 0.5 g of Radix et Rhizoma Glycyrrhizae reference drug add 30 ml of ethanol, heat under reflux on a water bath for 1 hour, filter, concentrate the filtrate to about 1 ml as the reference drug solution. Dissolve ammonium glycyrrhizinate CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 0.8% sodium hydroxide solution as the coating substance and a mixture of ethyl acetate, formic acid, glacial acetic acid and water (15∶1∶1∶2) as the mobile phase. Apply separately to the plate 1 μl of each of the above three solutions. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ for 5-10 minutes and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution; and an orange-yellow fluorescent spot corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Triturate well 9 g of the big honeyed pills with 5 g of kieselguhr, or pulverize 6 g of the water-honeyed pills, add 40 ml of ethanol, macerate for 1 hour by shaking constantly, filter and evaporate the filtrate to dryness. Dissolve the residue in 20 ml of water and extract with three 20-ml quantities of *n*-butanol saturated with water. Combine the extracts, wash with three 10-ml quantities of water, discard the washings and evaporate the *n*-butanol solution to dryness. Dissolve the residue in 0.5 ml of ethanol as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40∶5∶10∶0.2) as the mobile phase. Apply separately 3 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulfuric acid and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix VI D)

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of acetonitrile and water (17 : 83) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, accurately weighed, in dilute ethanol to prepare a solution containing 40 μg per ml as the reference solution.

Test solution Pulverize 0.3 g of water-honeyed pills to fine powder, accurately weighed, or cut 0.5 g of big honeyed pills obtained under the weight variation test into pieces, accurately weighed, in a stopper conical flask, add accurately 20 ml of dilute ethanol, stopper tightly, and weigh. Ultrasonicate for 1 hour and stand to cool, weigh again and replenish the loss of the weight with dilute ethanol, mix well, centrifuge, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.64 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per gram of water-honeyed pills or 3.6 mg per big honeyed pill, referred to Radix Paeoniae Alba.

Action To reinforce *qi* and nourish blood.

Indications Sallow complexion, anorexia, lassitude and menorrhagia due to a deficiency of *qi* and blood.

Usage and dosage 6 g of water-honeyed pills or 1 big honeyed pill, twice a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Bazhen Yimu Wan
(八珍益母丸)

Bazhen Yimu Pills

Ingredients Herba Leonuri 200 g; Radix Codonopsis 50 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 50 g; Poria 50 g; Radix et Rhizoma Glycyrrhizae 25 g; Radix Angelicae Sinensis 100 g; Radix Paeoniae Alba (stir-baked with wine) 50 g; Rhizoma Chuanxiong 50 g; Radix Rehmanniae Praeparata 100 g.

Procedure Pulverize the above nine ingredients to fine powder, sift and mix well. To each 100 g of powder add 40-50 g of refined honey and a quantity of water to make water-honeyed pills and dry. Alternatively, add 120-140 g of refined honey to make small honeyed pills or big honeyed pills.

Description Brownish-black water-honeyed pills, small honeyed pills or big honeyed pills; odour, slightly aromatic; taste, sweet and slightly bitter.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate solution TS; hyphae colourless or plae brown, 4-6 μm in diameter. Anastomosing laticiferous tubes 12-15 μm in diameter, containing minute granular substances. Non-glandular hairs 1-3 celled, slightly curved, with warty walls. Needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells. Clusters of calcium oxalate 18-32 μm in diameter, scattered in parenchymatous cells, often arranged in rows or several clusters in a cell. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken and each containing a brown nucleus-like mass. Parenchymatous cells spindle-shaped, with slightly thickened walls, showing very fine oblique crisscross striations.

(2) Triturate well 9 g of the small honeyed pills or the big honeyed pills with 5 g of kieselguhr, grind and mix well, or pulverize 6 g of the water-honeyed pills, add 40 ml of ethanol, macerate for 1 hour with frequently shaking, and filter. Evaporate the filtrate to dryness and dissolve the residue in 20 ml of water, extract with three 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, wash with water for three times. Discard the washings and evaporate the *n*-butanol solution to dryness. Dissolve the residue in 0.5 ml of ethanol as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40:5:10:0.2) as the mobile phase. Apply separately to the plate 3 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of acetonitrile and 0.1% phosphoric acid (13 : 87) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, accurately weighed, in dilute ethanol to prepare a solution containing 15 μg per ml as the reference solution.

Test solution Triturate about 0.5 g of the water-honeyed pills, or cut about 1 g of the small honeyed pills into pieces, accurately weighed; or weigh accurately about 1 g of the big honeyed pills, obtained under the test of weight variation, cut into pieces and mixed well, in a stopper conical flask. Add accurately 25 ml of dilute ethanol, stopper well, weigh and ultrasonicate for 40 minutes. Allow to stand to room temperature, weigh again and replenish the lost weight with dilute ethanol. Mix thoroughly, centrifuge and use the supernatant as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contents not less than 0.40 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per gram of water-honeyed pills, 0.27 mg per gram of small honeyed pills or 2.5 mg per big honeyed pill, referred to Radix Paeoniae Alba.

Action To replenish *qi* and nourish blood, and promote blood circulation to regulate menstruation.

Indications Menstrual disorders due to a deficiency of *qi* and blood accompanied with blood stagnation, with manifestations of delayed menstrual cycle, scanty menstrual blood, persistent dribbling of menstrual blood, listlessness and lassitude.

Usage and dosage 6 g of water-honeyed pills, 9 g of small honeyed pills or 1 big honeyed pill, twice a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Beiling Jiaonang
(贝羚胶囊)

Beiling Capsules

Ingredients Bulbus Fritillariae Cirrhosae; Cornu Saigae Tataricae; Hyodeoxycholic Acid; Moschus; Lignum Aquilariae Resinatum; Concretio Silicea Bambusae (prepared, levigated); Lapis Chloriti (calcined, levigated); Borax (stir-baked).

Procedure Pulverize Cornu Saigae Tataricae to fine powder, and pulverize the other seven ingredients to fine powders and sift respectively. Except powder of Lapis Chloriti, mix well with 68 g of starch, triturate well with powder of Lapis Chloriti in portions, sift, add 6 g of magnesium stearate, mix well and make capsules.

Description Capsules containing soil-yellow powder; odour, characteristic; taste, slightly bitter.

Identification (1) Microscopical: Irregular masses slightly lustrous, evenly distributed with slit-like or oblong fissures. Walls of fibre tracheids slightly thickened, with bordered pits, pit apertures V-shaped or crossed.
(2) To about 15 mg of the contents add 2 ml of 60% acetic acid, stir thoroughly, and filter. To the filtrate add 2 ml of fresh prepared 1% furfural solution, and mix well. Divide the solution into tube A and B respectively. Add 10 ml of sulfuric acid solution (7→10) to tube A and 10 ml of sulfuric acid solution (4→10) to tube B, heat at 70℃ on a water bath for several minutes. The solution in tube A exhibits a red to purplish-red colour, and the solution in tube B should be colourless.
(3) Place 0.3 g of the contents in a stopper test tube, extract with two 2-ml quantities of ether, and filter. Evaporate the filtrate to dryness, dissolve the residue in 0.5 ml of ether as the test solution. Dissolve muscone CRS in ether to produce a solution containing 0.1 mg per ml as the reference solution. Carry out the method for gas chromatography (Appendix Ⅵ E), using a 2 m long column packed with a mixture of 1.64% polyethylene glycol (PEG)-20M and 1.32% methyl polysiloxane (SE-30) as the stationary phase, maintain the column temperature at 180℃. Inject respectively a quantity of the reference solution and the test solution into the column. The retention time of the peak obtained with the test solution and that of the reference solution is concordant with each other.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Action To clear *heat* and resolve phlegm, and relieve coughing and asthma.

Indications Coughing and asthma due to *phlegm-heat* accumulated in the lung; pneumonia and asthmatic bronchitis in children and chronic bronchitis in adults with above symptoms.

Usage and dosage 0.6 g, 3 times a day; 0.15-0.6 g for children; appropriate reduction of the dosage for children under 1 year old twice a day.

Precaution Contraindicated patients with loose stool.

Strength 0.3 g per capsule

Storage Preserve in tightly closed containers.

Bidouyan Koufuye
(鼻窦炎口服液)

Bidouyan Mixture

Ingredients Flos Magnoliae; Herba Schizonepetae; Herba Menthae; Radix Platycodonis; Radix Bupleuri; Fructus Xanthii; Radix Angelicae Dahuricae; Rhizoma Chuanxiong; Radix Scutellariae; Fructus Gardeniae; Poria; Caulis Clematidis Armandii; Radix Astragali; Herba Gentianae.

Procedure Steam distill Flos Magnoliae, Herba Schizonepetae, Herba Menthae and Radix Bupleuri and collect the aromatic aqueous liquid; decoct the drug residue and the other ingredients with water for 3 times, 1 hour for each time, combine the decoction, filter and concentrate the filtrate to a quantity, stand, filter the supernatant, add the above aromatic aqueous liquid and a quantity of preservative, stir well. Add water to an appropriate volumn; stir well, filter, pack and sterilize.

Description A clear, dark brownish-yellow to dark brown liquid; odour, aromatic; taste, bitter.

Identification (1) Adjust 20 ml of the mixture with 20% solution of sodium hydrochloride to pH 12, extract with two 20-ml quantities of chloroform, combine the extracts, evaporate to dryness, dissolve the residue with 1 ml of chloroform to produce a solution as the test solution. Decoct 1 g of Radix Angenlicae Dahuricae reference drug with water for 30 minutes, allow to cool, filter, prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and a mixture of chloroform and methanol (9:1) as the mobile phase. Apply separately 10 μl of each of the above two solutions to the plate. After developing in a chamber pre-equilibrated with ammonia vapour and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(2) Extract 10 ml of the mixture, adjusted to pH 2 with dilute hydrochloric acid TS, with two 20-ml quantities of ethyl acetate, combine the extracts and evaporate to dryness, dissolve the residue with 2 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and the upper layer of a mixture of butyl acetate, formic acid and water (7:4:3) as the mobile phase. Apply separately 2 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 2% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Relative density Not less than 1.03 (Appendix Ⅶ A).

pH value 4.6-6.0 (Appendix Ⅶ G).

Other requirements Complies with the general requirements

for mixtures (Appendix Ⅰ J).

n-Butanol extractives Extract 20 ml of the mixture, measured accurately, with four 20-ml quantities of *n*-butanol saturated with water in a separator, combine the extracts in a evaporating dish, dried to constant weight, evaporate to dryness on a water bath and then dry at 105℃ for 3 hours, move to a desiccator, allow to cool for 30 minutes, weigh rapidly accurately and calculate.

It contains not less than 1.2 per cent *n*-butanol-soluble extractives.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bounded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (47∶53∶0.2) as the mobile phase. As detector a spectrophotometer set at 278 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin CRS, dissolve in methanol to prepare a solution containing 60 μg per ml as the reference solution.

Test solution Measure accurately 1 ml of the mixture, in a 50 ml volumetric flask, dilute to volume with water, mix well, centrifuge and use the supernatant as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column and calculate the contant.

It contains not less than 1.0 mg of baicalin ($C_{21}H_{18}O_{11}$) per ml, referred to Radix Scutellariae.

Action To disperse *wind-heat*, clear *heat* and drain *dampness*, and free nasal orifices.

Indications Stuffy nose and thick yellow nasal discharge due to invasion of the lung by *wind-heat* and retention of *damp-heat*; acute or chronic rhinitis and nasosinusitis with above symptoms.

Usage and dosage 10 ml, 3 times a day; 20 days for one course of treatment.

Strength 10 ml per vial

Storage Preserve in tightly closed containers, protected from light and store in a cool place.

Binglang Sixiao Wan (Damiwan)
(槟榔四消丸，大蜜丸)

Binglang Sixiao Big Honeyed Pills

Ingredients Semen Arecae 200 g; Radix et Rhizoma Rhei (stir-baked with wine) 400 g; Semen Pharbitidis (stir-baked) 400 g; Fructus Gleditsiae Abnormalis (stir-baked) 200 g; Rhizoma Cyperi; (processed with vinegar) 200 g; Faeces Trogopterori (stir-baked with vinegar) 200 g.

Procedure Pulverize the above six ingredients to fine powder, sift and mix well. To each 100 g of the powder add 110-130 g of refined honey to make big honeyed pills.

Description Yellowish-brown big honeyed pills; odour, slightly aromatic; taste, sweet, bitter and slightly pungent.

Identification (1) Microscopical: Clusters of calcium oxalate big 60-140 μm in diameter. Secretory cells subrounded, containing yellowish-brown to reddish-brown secretion, surrounded by radially arranged cells. Fibre bundles reddish-brown or yellowish-brown, slender, walls extremely thick-ened. Fibre bundles pale yellow, surrounded by cells containing prisms of calcium oxalate and a few of clusters, forming crystal fibres, which frequently accompanied by subsquare sclerenchymatous cells. Palisade cells of testa pale brown or brown, 48-80 μm long. Fragments of endosperm cells colourless, walls relatively thickened, with numerous large subrounded pits.

(2) To 2 g of pills, cut into pieces, add 20 ml of hydrochloric acid (1→10), ultrasonicate for 5 minutes. Add 10 ml of chloroform, heat under reflux on the water bath for 1 hour, cool immediately. Separate chloroform extracts, extract the acidified solution with two 15-ml quantities of chloroform, combine the chloroform solution and evaporate to dryness. Dissolve the residue in 2 ml of chloroform as the test solution. Prepare a solution with 0.2 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15∶5∶1) as the mobile phase. Apply separately 4 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The five orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The spots turn to red on exposure to ammonia vapour.

(3) Triturate 18 g of the pills, in pieces with 10 g of kieselguhr, add 5 ml of concentrated ammonia TS and 80 ml of chloroform, ultrasonicate for 30 minutes, filter, extract the filtrate with 10 ml of dilute hydrochloric acid TS and 20 ml of water. Separate the acidic layer, adjust to pH 8-9 with concentrated ammonia TS, extract with two 10-ml quantities of chloroform, combine the chloroform solutions and evaporate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. To 1 g of Semen Arecae reference drug, add 30 ml of chloroform and 1 ml of concentrated ammonia TS, and prepare the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the mixture of cyclohexane, ethyl acetate and concentrated ammonia TS (7.5∶7.5∶0.2) as the mobile phase. Apply separately 20 μl of the test solution and 10 μl of the reference drug solution to the plate. After developing in a chamber equilibrated with ammonia vapour and removal of the plate, dry in air, spray with potassium dilute iodobismuthate TS solution. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) To 20 g of pills, cut into pieces. Carry out the method for determination of volatile oil (Appendix Ⅹ D). Add water through the top of reflux condenser until the graduated tube is filled and overflows to flask about 100 ml. Add 2 ml of ethyl acetate through the top of the apparatus, heat to boil and keep boiling gently for 2 hours, allow to stand to room temperature, separate the ethyl acetate layer as the test solution. Dissolve α-cyperone CRS in ethyl acetate to produce a solution containing 1 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of cyclohexane and ethyl acetate (9∶1) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing in a chamber pre-equilibrated with ammonia evapour and remoral of the plate,

dry it in air. Spray with dinitrophenylhydrazine TS, allow to stand for a while. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of methanol and 0.1% phosphoric acid (85∶15) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 1500, calculated with the reference to the peak of emodin.

Reference solution Dissolve a quantity of emodin CRS and chrysophanol CRS, weighed accurately, in a mixture of ethyl acetate and dehydrated ethanol (1∶2) to prepare a solution containing 10 μg of emodin CRS and 25 μg of chrysophanol CRS per ml as the reference solution.

Test solution Cut the big honeyed pills, obtained under the test of weight variation, into pieces and mixed well. To about 2 g, weigh accurately, in the flask with stopper. add accurately 50 ml of methanol, stopper well, weigh and ultrasonicate to disintegration, then heat under reflux on the water bath for 1 hour, allow to stand to room temperature, weigh again and replenish the lost weight with methanol. Mix thoroughly, filter and measure accurately 5 ml of the successive filtrate, evaporate the successive filtrate to dryness and dissolve the residue in 10 ml of the hydrochloric solution(1→10). Ultrasonicate (power, 300 W; frequency, 50 kHz) for 5 minutes, add 10 ml of chloroform, heat under reflux on the water bath for 1 hour, cool immediately. Transfer to separator, separate water layer, extract the acidified solution with two 15-ml quantities of chloroform, combine the chloroform extracts and evaporate to dryness. Dissolve the residue in a mixture of ethyl acetate and dehydrated ethanol (1→3), transfer to 10 ml volumetric flask, and dilute to volume, mix thoroughly as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contents not less than 8.0 mg of the total of emodin ($C_{15}H_{10}O_5$) and chrysophanol ($C_{15}H_{10}O_4$) per pill, referred to Radix et Rhizoma Rhei.

Action To promote digestion to remove retained food, and promote *qi* flow to clear retained water.

Indications Indigestion due to retention of food, phlegm and morbid fluid, with manifestations of indigestion, fullness in the stomach and abdomen, belching and casting up gastric acid and constipation.

Usage and dosage 1 pill, twice a day.

Precaution Contraindicated for pregnant women.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Binglang Sixiao Wan (Shuiwan) (槟榔四消丸，水丸)

Binglang Sixiao Watered Pills

Ingredients Semen Arecae 200 g; Radix et Rhizoma Rhei (stir-baked with wine) 400 g; Semen Pharbitidis (stir-baked) 400 g; Fructus Gleditsiae Abnormalis (stir-baked) 50 g; Rhizoma Cyperi (processed with vinegar) 200 g; Faeces Trogopterori (stir-baked with vinegar) 200 g.

Procedure Pulverize the above six ingredients to fine powder, sift and mix well. Make pills with water, and dry.

Description Pale brown to brown watered pills, odour, slightly aromatic; taste, bitter and pungent.

Identification (1) Microscopical: Clusters of calcium oxalate big, 60-140 μm in diameter. Secretory cells subrounded, containing yellowish-brown to reddish-brown secretion, surrounded by radially arranged cells. Fibre bundles reddish-brown or yellowish-brown, slender, walls extremely thickened. Fibre bundles pale yellow, surrounded by cells containing prisms of calcium oxalate and a few of clusters, forming crystal fibres, which frequently accompanied with subsquare sclerenchymatous cells. Palisade cells of testa pale brown or brown, 48-80 μm long. Fragments of endosperm cells colourless, walls relatively thickened, with numerous large subrounded pits.

(2) Macerate 0.5 g of pills, pulverized to fine powder, in 20 ml of methanol for 1 hour, filter. Evaporate 5 ml of the filtrate to dryness, dissolve the residue in 10 ml of water, add 1 ml of hydrochloric acid, heat under reflux on a water bath for 30 minutes, cool immediately. Extract with two 10-ml quantities of ether, combine the ether solutions and evaporate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution with 0.1 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixtare of petroleum ether (30-60℃), ethyl formate and formic acid (15∶5∶1) as the mobile phase. Apply separately 4 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The five orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The spots turn to red on exposure to ammonia vapour.

(3) Triturate 10 g of the pills to fine powder, add 5 ml of concentrated ammonia TS and 80 ml of chloroform, ultrasonicate for 30 minutes, filter. extract the filtrate with 10 ml of dilute hydrochloric acid TS and 20 ml of water. Separate the acidic layer, adjust to pH 8-9 with concentrated ammonia TS, extract with two 10-ml quantities of chloroform, combine the chloroform solutions and evaporate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. To 1 g of Semen Arecae reference drug, add 30 ml of chloroform and 1 ml of concentrated ammonia TS, and prepare the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the mixture of cyclohexane, ethyl acetate and concentrated ammonia TS (15∶15∶0.4) as the mobile phase. Apply separately 20 μl of the test solution and 10 μl of the reference drug solution to the plate. After developing in a chamber

pre-equilibrated with ammonia vapour and removal of the plate, dry in air, spray with potassium dilute iodobismuthate TS solution. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Triturate 10 g of the pills to fine powder, carry out the method for determination of volatile oil (Appendix Ⅹ D). Add water through the top of reflux condenser until the graduated take is filled and overflows to flask about 100 ml. Add 2 ml of ethyl acetate through the top of the apparatus, heat to boil and keep boiling gently for 2 hours, allow to stand to room temperature, separate the ethyl acetate layer as the test solution. Dissolve α-cyperone CRS in ethyl acetate to produce a solution containing 1 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of cyclohexane and ethyl acetate (9∶1) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with dinitrophenylhydrazine TS, allow to stand for a while. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of methanol and 0.1% phosphoric acid (85∶15) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 1500, calculated with the reference to the peak of emodin.

Reference solution Dissolve a quantity of emodin CRS and chrysophanol CRS, accurately weighed, in a mixture of ethyl acetate and dehydrated ethanol (1∶2) to prepare a solution containing 10 μg of emodin and 25 μg of chrysophanol per ml as the reference solution.

Test solution Triturate 6 g of the Pills to fine Powder, mix well. To about 1 g, weighed accurately, in a stopper flask add accurately 50 ml of methanol, weigh, then heat under reflux for 1 hour, allow to stand to room temperature, weigh again and replenish the lost weight with methanol. Mix thoroughly, filter and measure accurately 5 ml of the successive filtrate, evaporate the successive filtrate to dryness and dissolve the residue in 10 ml of the hydrochloric solution (1→10). Ultrasonicate (power 300 W; frequency 50 kHz) for 5 minutes, add 10 ml of chloroform, heat under reflux on the water bath for 1 hour, cool immediately. Transfer to separator, separate water layer, extract the acidified solution with two 15-ml quantities of chloroform, combine the chloroform solutions and evaporate to dryness. Dissolve the residue in a mixture of ethyl acetate and dehydrated ethanol (1∶2), transfer to 10 ml volumetric flask, and dilute to volume, mix thoroughly as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contents not less than 1.8 mg of the total amount of emodin ($C_{15}H_{10}O_5$) and chrysophanol ($C_{15}H_{10}O_4$) per gram, referred to Radix et Rhizoma Rhei.

Action To promote digestion to remove retained food, and promote *qi* flow to clear retained water.

Indications Indigestion due to retention of food phlegm or morbid fluid, with manifestations of indigestion, fullness in the stomach and abdomen, belching and casting up gastric acid and constipation.

Usage and dosage 6 g, twice a day.

Precaution Contraindicated for pregnant women.

Storage Preserve in tightly closed containers.

Bingpeng San
(冰硼散)

Bingpeng Powder

Ingredients Borneolum Syntheticum 50 g; Borax (calcined) 500 g; Cinnabaris 60 g; Natrii Sulfas Exsiccatus 500 g.

Procedure Levigate Cinnabaris to very fine powder, pulverize Borax to fine powder and triturate Borneolum Syntheticum with the above powders and Natrii Sulfas Exsiccatus, sift and mix well.

Description A pink powder; odour, aromatic; taste, pungent and cool.

Identification (1) To 1 g add 6 ml of water, shake, acidify with hydrochloric acid and filter. Moisten a strip of *tumeric* paper with 3 ml of the filtrate, an orange-red colour is produced, the colour darkens on dryness and turns greenish-black on exposure to ammonia vapour.

(2) To the remained filtrate obtained under Identification test (1), add 1-2 drops of barium chloride TS, a white precipitate is produced, which, after separating, is insoluble in hydrochloric acid.

(3) Place 1 g in a test tube, add 10 ml of water and shake vigorously, a vermilion precipitate is rapidly produced at the bottom of the test tube. Separate a small quantity of the precipitate, moisten with hydrochloric acid, rub on a smooth copper plate, a silver lustre is produced, and disappears on heating.

(4) Carry out the method under the Assay, the retention time of the peaks in the chromatogram obtained with the test solution correspond to that of the peaks in the chromatogram obtained with the reference solutions.

Other requirements Complies with the general requirements for powders (Appendix Ⅰ B).

Assay ***Cinnabaris*** Dissolve about 3 g of the powder, weighed accurately, with 10 ml of sulfuric acid and 1.5 g of potassium nitrate in a conical flask by heating. Allow to cool, and 50 ml of water and 1% potassium permanganate solution until a pink colour is produced, then add dropwise 2% ferrous sulfate solution until the pink colour disappears. Add 2 ml of ammonium ferric sulfate IS and titrate with ammonium thiocyanate (0.1 mol/L) VS. 1 ml of ammonium thiocyanate (0.1 mol/L) VS is corresponds to 11.63 mg of mercuric sulfide (HgS).

It contains 40-60 mg of mercuric sulfide (HgS) per gram, referred to cinnabaris.

Borneolum Syntheticum Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use an elasticity quartz capillary column (0.25 mm in internal diameter, 0.25 μm in film thicked, and 30 meter long) packed with polyethylene glycol (PEG)-20M as the stationary phase; Column temperature: initial temperature at 100℃; increase at 10℃ per minute to 200℃; split

injection, split ratio, 30:1. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of (±)-borneol.

Correction factor Dissolve a quantity of tetradecane in dehydrated ethanol to prepare a solution containing 8 mg per ml as internal standard solution. Weigh accurately 10 mg of each of (±)-borneol CRS and (±)-isoborneol CRS in a stopper conical flask, add accurately 2 ml of the internal standard solution and 25 ml of dehydrated ethanol, mix well. Inject accurately 2 μl of the solution into the column; calculate the correction factor according to the average value of peak areas.

Procedure Weigh accurately 0.5 g of the powder in a conical flask with stopper, add accurately 2 ml of the internal standard solution and 25 ml of dehydrated ethanol, weigh. Ultrasonicate for 20 minutes, allow to stand to room temperature, weigh again and replenish the lost weight with dehydrated ethanol, mix well. Filter and use the successive filtrate as the test solution. Inject accurately 2 μl of the solution into the column, and calculate the content.
It contains not less than 30 mg of the total amount of (±)-borneol and (±)-isoborneol per gram, referred to Borneolum Syntheticum.

Action To clear *heat-toxicity*, reduce swelling and kill pain.

Indications Swollen painful throat or swollen painful gums, or sores on the mouth and tongue due to accumulation of *heat*.

Usage and dosage A small quantity is insufflated to the lesion, several times a day.

Storage Preserve in tightly closed containers.

Biwen San
(避瘟散)

Biwen Powder

Ingredients Lignum Santali Albi 156 g; Herba Lysimachiae Foenum-graeci 18 g; Radix Angelicae Dahuricae 42 g; Herba Eragrostis 180 g; Rhizoma Curcumae Longae 18 g; Flos Rosae Rugosae 42 g; Radix seu Rhizoma Nardostachyos 18 g; Flos Caryophylli 42 g; Radix Aucklandiae 36 g; Moschus 1.4 g; Borneolum Syntheticum 138 g; Cinnabaris 662 g; Mentholum 138 g.

Procedure Levigate Cinnabaris to very fine powder. Pulverize other ingredients, except Moschus, Borneolum Syntheticum and Mentholum, to fine powders, sift and mix well. Grind Borneolum Syntheticum and Mentholum to liquified, add 276 g of glycerine and mix well. Grind Moschus to powder, mix it well with the above powders, sift and finally mix well with the above liquid.

Description A vermilion powder; odour, aromatic; taste, cool.

Identification Shake 0.5 g of the powder in 10 ml of petroleum ether (30-60℃) for several minutes and filter. Concentrate the filtrate to about 2 ml at a low temperature as the test solution. Dissolve menthol CRS and a mixture of (±)-borneol and (±)-isoborneol CRS in petroleum ether (30-60℃) to prepare a mixture containing 0.5 g of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (17:3) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid, heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Action To expel *summer-heat* and pathological factors, and induce resuscitation and kill pain.

Indications Dizziness, headache, stuffy nose, nausea, vomiting due to affliction from *summer-heat*; motion sickness.

Usage and dosage 0.6 g; appropriate quantity to be inhaled into the nostrils.

Strength 0.84 g per box

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Biyan Pian
(鼻炎片)

Biyan Tablets

Ingredients Fructus Xanthii; Flos Magnoliae; Radix Saposhnikoviae; Fructus Forsythiae; Flos Chrysanthemi Indici; Schisandrae Chinensis; Radix Platycodi; Radix Angelicae Dahuricae; Rhizoma Anemarrhenae; Herba Schizonepetae; Radix et Rhizoma Glycyrrhizae; Cortex Phellodendri Chinensis; Herba Ephedrae; Herba Asari.

Procedure Pulverize Radix Angelicae Dahuricae, Radix Platycodi and a part of Cortex Phellodendri Chinensis to fine powder. Isolate volatile oil from Flos Magnoliae, Flos Chrysanthemi Indici, Herba Asari and Herba Schizonepetae by distillation, collect the aqueous solution in another container. Pulverize Herba Ephedrae, Rhizoma Anemarrhenae and Schisandrae Chinensis to coarse powder, carry out the method for percolation as described under liquid extracts and extracts (Appendix Ⅰ O), using 60% ethanol as the solvent and collect the percolate, recover ethanol. Decoct the other ingredients and the remained Cortex Phellodendri Chinensis with water twice, 1 hour for each, combine the decoctions with the above aqueous solution and percolate, concentrate to form an extract with a relative density of 1.25, spray drying to fine powder, add the above fine powder of Radix Angelicae Dahuricae and other two ingredients, mix well, make granules and dry, spray the above volatile oil to granules, compress into tablets, coat with sugar or film.

Description Sugar-coated or film-coated tablets with brown core; odour, aromatic; taste, bitter.

Identification (1) Microscopical: Compound starch granules consisting of 8-12 components. Anastomosing laticiferous tubes 14-25 μm in diameter, containing pale yellow granules.
(2) Pulverize 20 sugar-coated tablets or 12 film-coated tablets, removed from the coats, to fine powder, add 60 ml of ether, ultrasonicate for 20 minutes, and filter. Expel ether of the filtrate, dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution with 0.5 g of Radix Angelicae Dahuricae reference drug and 20 ml of ether in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ether (3:2) as the mobile

phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The main fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Pulverize 20 sugar-coated tablets or 12 film-coated tablets, removed from the coats, to fine powder. Add 60 ml of ether, heat under reflux for 1 hour and filter. Transfer the filtrate to a separator, wash with three 15-ml quantities of 5% sodium carbonate solution, discard the washings. Extract with three 20-ml quantities of 1% sodium hydroxide solution, acidify the combined extracts with dilute hydrochloric acid TS and extract with three 20-ml quantities of ether. Evaporate the combined ether solution to dryness, dissolve the residue in 1 ml of ethanol as the test solution. Prepare a solution with 1 g of Fructus Forsythiae reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 2% sodium hydroxide solution as the coating substance and a mixture of chloroform, ethyl acetate and methanol (10∶5∶1) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Pulverize 10 sugar-coated tablets or 6 film-coated tablets, removed from the coats, to fine powder. Add 30 ml of ethyl acetate, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness. Dissolve the residue in a quantity of methanol. Apply to a neutral alumina column (100-200 mesh, 1 cm in internal diameter, packed with 3 g of neutral alumina by methanol, washed previously with methanol) and elute with 20 ml of methanol. Collect the eluate, evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve magnolin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for the thin layer chromatography (Appendix Ⅵ B), using silica gel H as the coating substance and the mixture of chloroform and ether (5∶1) as the mobile phase. Apply seperately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 90℃ to the spots distinct. The purplish-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of acetonitrile and water (38∶62) as the mobile phase. As detector a spectrophotometer set at 278 nm. The number of theoretical plates of the column is not less than 7000, calculated with the reference to the peak of magnolin.

Reference solution Dissolve a quantity of magnolin CRS, accurately weighed, in methanol to prepare a solution containing 6 μg per ml as the reference solution.

Test solution Weigh accurately 10 tablets, removed the coating, pulverize to fine powder. Place 1 g, weighed accurately, in a stopper conical flask, add exactly 25 ml of methanol, stopper closely and weigh. Ultrasonicate (power 150 W, frequency 25 kHz) for 30 minutes, allow it to cool, weigh again and replenish the lost weight with methanol, mix well and filter. Measure accurately 5 ml of the successive filtrate and apply to a neutral alumina column (100-200 mesh, 1 cm in internal diameter, packed with 2 g of neutral alumina by methanol, washed previously with methanol) and elute with a quantity of methanol, collect eluate into a 10 ml volumetric flask until almost to the volume, dilute with methanol to volume and mix well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contents not less than 60 μg (sugar coated tablet) or 0.10 mg (film coated tablet) of magnolin ($C_{23}H_{28}O_7$) per tablet, referred to Flos Magnoliae.

Action To expel *wind* and disperse *lung-qi*, and clear *heat—toxicity*.

Indications Acute or chronic rhinitis due to accumulation of *heat* in the lung with manifestations of stuffy and running nose, fever and headache.

Usage and dosage 3-4 tablets (sugar-coated tablets) or 2 tablets (film-coated tablets), 3 times a day.

Strength 0.5 g per tablet (film-coated tablets)

Storage Preserve in tightly closed containers.

Biyuanshu Koufuye (鼻渊舒口服液)

Biyuanshu Mixture

Ingredients Fructus Xanthii; Flos Magnoliae; Herba Menthae; Radix Angelicae Dahuricae; Radix Scutellariae; Fructus Gardeniae; Radix Bupleuri; Radix et Rhizoma Asari; Rhizoma Chuanxiong; Radix Astragali; Caulis Clematidis Armandii; Radix Platycodonis; Poria.

Procedure Distill the above ingredients, except Radix Scutellariae, with a quantity of water, collect a quantity of the distillate; redistill, collect a quantity of the redistillate, store at low temperature for the latter use. Extract dynamically the residue with hot water for 0.5 hour, centrifuge and filter, concentrate the filtrate to a quantity, cool. Add ethanol to a concent of 79% ethanol, stir well, stand for over 20 hours. Recover ethanol from the supernatant, concentrate to a quantity, refrigerate for the latter use. Extract dynamically Radix Scutellariae with water for 2 hours, centrifuge and filter, concentrate the filtrate to a quantity and precipitate with a quantity of acid. To the precipitate, add the above two solutions refrigerated, stir well, add 9 ml of polysorbate 80 and a quantity of simple syrup (or sodium cyclamate), add water to a volume of 1000 ml. Adjust to pH 7.0-8.0 with sodium hydroxide solution, stir well, refrigerate, filter.

Description A brownish-yellow to brown liquid; odour, specifically aromatic; taste sweet and slightly bitter.

Identification (1) To 20 ml of the mixture, add 30 ml of ethanol, shake thoroughly, allow to stand for 30 minutes, filter, evaporate the filtrate to dryness. Dissolve the residue in 20 ml of water, extract by shaking with two 20-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extracts, evaporate to dryness. Dissolve the residue in 5 ml of ethanol, filter, evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the test solution.

Dissolve geniposide CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13∶7∶2), stood below 10℃ overnight, as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots distinct. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

(2) Extract by shaking 50 ml of the mixture with two 30-ml quantities of chloroform, combine the chloroform extracts, evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Macerate 0.5 g of Rhizoma Chuanxiong reference drug with 20 ml of chloroform for 30 minutes, shake constantly, filter, use the filtrate to prepare a solution as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (9∶1) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the fluorescent spots in chromatogram obtained with the reference drug solution.

(3) Extract by shaking 5 ml of the mixture with two 10-ml quantities of ether, discard the ether extracts, adjust the aqueous solution to pH 2-3 with hydrochloric acid. Extract the aqueous solution with two 10-ml quantities of ethyl acetate by shaking, combine the ethyl acetate extracts, evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 4% solution of sodium acetate as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5∶3∶1∶1) as the mobile phase. Apply separately 1-2 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with 2% acidic ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spotin chromatogram obtained with the reference solution.

(4) Apply 30 ml of the mixture to a column packed with macroporous resin D 101 (1.5 cm in internal diameter, 12 cm long), elute with 100 ml of 1% sodium hydroxide, discard the eluates; elute with water to neutral, discard the aqueous solution; elute with 30 ml of 30% ethanol, discard the eluates; elute with 60 ml of 70% ethanol, collect the eluates. Evaporate the eluates to about 1 ml on a water bath, add 2 g of neutral aluminium oxide (100-200 mesh), stir well, dry. Stir and wash with 30 ml of 40% methanol in portions, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve astragaloside Ⅳ CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatog-raphy (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13∶7∶2), stood below 10℃ overnight, as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots distinct. Examine in daylight, the spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution. Examine under ultraviolet light at 365 nm, the fluorescent spot with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

Relative density Not less than 1.08 or not less than 1.04 (without sucrose) (Appendix Ⅶ A).

pH value 5.0-7.5 (Appendix Ⅶ G).

Other requirements Complies with the general requirements for mixtures (Appendix Ⅰ J)

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.2% solution of phosphoric acid (30∶70) as the mobile phase. As detector a spectrophotometer set at 238 nm. The number of theoretical plates of the column is not less than 3500, calculate with the reference to the peak of geniposide.

Reference solution Dissolve a quantity of geniposide CRS, accurately weighed, in methanol to prepare a solution containing 30 μg per ml as the reference solution.

Test solution Measure accurately 1 ml of the mixture to a 100 ml volumetric flask, dilute with 50% methanol to volume and shake thoroughly, filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content. It contains not less than 2.0 mg of geniposide ($C_{17}H_{24}O_{10}$) per ml, referred to Fructus Gardeniae.

Action To disperse *wind* and clear *heat*, eliminate *dampness* and free the orifices.

Indications Rhinitis and nasosinusitis due to *wind-heat* in the Lung Meridian and *heat* retention in the gallbladder.

Usage and dosage 10 ml, 2-3 times a day. 7 days for one course of treatment.

Strengh 10 ml per vial

Storage Preserve in tightly closed containers.

Boyun Tuiyi Wan (拨云退翳丸)

Boyun Tuiyi Pills

Ingredients Flos Buddlejae 80 g; Fructus Tribuli (stir-baked with salt) 60 g; Flos Chrysanthemi 20 g; Herba Equiseti Hiemalis 80 g; Periostracum Serpentis 12 g; Periostracum Cicadae 20 g; Spica Schizonepetae 40 g; Fructus Viticis 80 g; Herba Menthae 20 g; Radix Angelicae Sinensis 60 g; Rhizoma Chuanxiong 60 g; Rhizoma Coptidis 20 g; Cortex Lycii 40 g; Pericarpium Zanthoxyli 28 g; Fructus Broussonetiae 20 g; Radix Trichosanthis 24 g; Radix et Rhizoma Glycyrrhizae 12 g.

Procedure Pulverize the above seventeen ingredients to fine powder, sift and mix well. To each 100 g of the powder add 140-160 g of refined honey to make big honeyed pills.

Description Blackish-brown to black big honeyed pills; odour, aromatic; taste, bitter.

Identification Microscopical: Pollen grains subrounded,

24-30 μm in diameter, extine spiny, 3-5 μm long, with 3 germinal apertures. Non-glandular hairs of epidermis of persistent calyx 2-3 celled, the base of terminal cells slightly thickened, walls with warty cuticle. Non glandular hairs 4-celled, with two cells uniseriated at the base and two cells biserrated at the apex, each cell 2-forked, forks 250-500 μm long, walls extremely thickened, lumen linear. Stone cells of pericarp pale yellowish-brown, or pale yellow, abundent, with indistinct boundary, anticlinal walls slightly thickened and deeply sinuous with sparse pits. Pericarp fibres lignified with the upper and lower layer crisscross arranged. Crystal thick-walled cells brownish-yellow, subpolygonal in surface view containing clusters of calcium oxalate. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Fibre bundles bright yellow, walls slightly thickened, with distinct pits. Epidermal cells rectangular, walls thickened and densely sinuous, containing sandy crystals of silicates; stomata characteristic, walls of the guard cells radiately thickened. Bordered pitted vessels large, mostly broken, some bordered pits hexagonal or rhombic, arranged closely. Fragments of chitin shell yellowish-brown, translucent, densely covered with papillary or short spiny protrudings.

Other requirements Comply with the general requirements for pills (Appendix I A).

Action To disperse *wind* and clear *heat*, and remove nebula to improve eyesight.

Indications Nebula, blurred vision, dull pain of eyes and tears running due to upward disturbance by *wind-heat*.

Usage and dosage 1 pill, twice a day.

Precaution Avoid pungent and spicy food.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Bushen Guchi Wan
(补肾固齿丸)

Bushen Guchi Pills

Ingredients Radix Rehmanniae Praeparata; Radix Rehmanniae; Caulis Spatholobi; Placenta Hominis; Rhizoma Drynariae (stir-baked with salt water); Radix Rhapontici; Radix et Rhizoma Salviae Miltiorrhizae (stir-baked with wine); Fructus Schisandrae Chinensis (stir-baked with wine); Rhizoma Dioscoreae; Radix Curcumae (stir-baked with vinegar); Radix Astragali praeparata Cum Melle; Radix Achyranthis Bidentatae; Flos Chrysanthemi Indici; Poria; Fructus Lycii; Cortex Moutan; Rhizoma Alismatis (stir-baked with salt water); Cortex Cinnamomi.

Procedure Pulverize the above eighteen ingredients to fine powder, sift and mix well. Dissolve 30 g of salt in a quantity of water and filter. To the powder add salt water, make pills and dry, coat with film.

Description Film-coated watered pills with brown core; taste, salty, slightly bitter and pungent.

Identification (1) Microscopical: Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Stone cells of epidermis of testa pale yellowish-brown, subpolygonal in surface view, walls relatively thickened, with fine and dense pit-canals, containing dark brown contents. Fibres in bundles or scattered, walls thickened, with longitudinal fissures in surface, both ends broken to broom-like or relatively truncate. Pollen grains subrounded, 24-34 μm in diameter, extine spiny, 3-5 μm long, with 3 germinal apertures. Stone cells of testa irregular subpolygonal in surface view, walls thickened and sinuous, striations well-defined.

(2) Pulverize 10 g of the pills, add 40 ml of dehydrated ethanol, heat under reflux for 30 minutes, centrifuge, evaporate the supernatant to dryness. Dissolve the residue in 20 ml of ether, wash the ether solution by shaking, with a quantity of 0.1% sodium hydroxide solution, and wash again with two 5-ml quantities of water, discard the washings, dehydrate the ether solution with a quantity of sodium sulfate anhydrous and evaporate to dryness naturally. Dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve tanshinone II_A CRS in ethyl acetate to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of benzene and ethyl acetate (19:1) as the mobile phase. Apply separately 6-8 μl of the test solution and 4 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix I A).

Action To nourish the kidney to strengthen teeth, promote blood circulation and relieve *toxicity*.

Indications Aching and weakness of teeth, masticatory atonia, odontoseisis, swollen and bleeding gums; chronic peridontitis with above symptoms.

Usage and dosage 4 g, twice a day.

Strength 1 g per 30 pills

Storage Preserve in well closed containers.

Bushen Yinao Pian
(补肾益脑片)

Bushen Yinao Tablets

Ingredients Cornu Cervi Pantotrichum (removed from hairs) 6 g; Radix et Rhizoma Ginseng Rubra 39 g; Poria 38 g; Rhizoma Dioscoreae (stir-baked) 38 g; Radix Rehmanniae Praeparata 81 g; Radix Angelicae Sinensis 38 g; Rhizoma Chuanxiong 29 g; Fructus Psoraleae (stir-baked with salt) 29 g; Radix Achyranthis Bidentatae 29 g; Fructus Lycii 30 g; Radix Scrophulariae 29 g; Radix Ophiopogonis 38 g; Fructus Schisandrae Chinensis 29 g; Semen Ziziphi Spinosae (stir-baked) 38 g; Radix Polygalae (stir-baked with honey) 38 g; Cinnabaris 10 g.

Procedure Levigate Cinnabaris to very fine powder, pulverize Cornu Cervi Pantotrichum, Radix et Rhizoma Ginseng Rubra, Poria, Rhizoma Dioscoreae, Rhizoma Chuanxiong, Fructus Psoraleae, Fructus Lycii and Radix Rehmanniae Preparata to fine powder, sift and mix well, then triturate with the Cinnabaris powder and mix well. Decoct the other seven ingredients with water three times, 3 hours for the first time and 2 hours for the second and third time respectively. Combine the decoctions, filter, concentrate the filtrate to a quantity, mix well with the above powder, dry, pulverize and sift. Add a quantity of excipients, mix well, make granules and compress into 1000 tablets, coat with sugar.

Description Sugar coated tablets with brown core; taste, sweet, slightly sour.

Identification (1) Microscopical: Clusters of calcium oxalate 20-68 μm in diameter, angle acute. Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, each containing a brown nucleus-like mass. Palisade cells of testa pale brown or reddish-brown, subpolygonal in surface view, walls slightly thickened, containing reddish-brown masses. Stone cells of testa irregular in surface view, polygonal, walls thickened and sinuous, striations well-marked. Starch granules triangular-ovate or long subrounded, 24-40 μm in diameter, hilum short cleft or V-shaped.

(2) Pulverize 10 tablets, removed from the sugar coats, add 20 ml of ethyl acetate, ultrasonicate for 15 minutes, filter, keep the residue for latter use, evaporate the filtrate to dryness. Dissolve the residue in 2 ml of ethyl acetate as the test solution. Dissolve psoralen CRS and isopsoralen CRS in ethyl acetate to produce a mixture containing 2 mg of each per ml as the reference solution. Carry out the thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of n-hexane and ethyl acetate (4∶1) as the mobile phase. Apply separately 2-4 μl of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% potassium hydroxide in methanol. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(3) Take the drug residue, obtained under Identification test (2), expel ethyl acetate, add 20 ml of 70% ethanol, ultrasonicate for 30 minutes, filter, evaporate the filtrate to almost dryness, dilute with 20 ml of water. Transfer the water solution to a separator, extract with two 10-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extracts, wash with two 10-ml quantities of ammonia TS, separate the *n*-butanol solution and evaporate to dryness. Dissolve the residue in 2 ml of methanol as the test solution. To 0.5 g of Radix et Rhizoma Ginseng reference drug, add 10 ml of ether, ultrasonicate for 10 minutes, filter, expel ether of the drug residue, then prepare the reference drug solution in the same manner. Dissolve ginsenoside Rb_1 CRS, ginsenoside Re CRS, and ginsenoside Rg_1 CRS in methanol to produce a mixture containing 2 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13∶7∶2, standing under 10℃) as the mobile phase. Apply separately 6 μl of the test solution, 4 μl of the reference drug solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. Examine under daylight, the spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

(4) Grind well 10 tablets, removed from the sugar coats, add 10 ml of ether, ultrasonicate for 20 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution with 1 g of Rhizoma Chuanxiong reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of n-hexane and ethyl acetate (9∶1) as the mobile phase. Apply separately 5 μl of the above two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (45∶55) as the mobile phase. As detector a spectrophotometer set at 245 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of psoralen.

Reference solution Dissolve respectively a quantity of psoralen CRS and isopsoralen CRS, accurately weighed, in methanol to produce a mixture containing 25 μg of each per ml as the reference solution.

Test solution Weigh accurately 20 tablets, with coating removed, grind well. Weigh accurately 3 g in a stopper conical flask, add accurately 50 ml of methanol, stopper well, and weigh. Ultrasonicate (power 280 W, frequency 40 kHz) for 30 minutes, cool, weigh again, replenish the loss of weight with methanol, shake well and filter. Use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, repectively, calculate the content.

It contains not less than 0.23 mg of the total amount of psoralen ($C_{11}H_6O_3$) and isopsoralen ($C_{11}H_6O_3$) per tablet, referred to Fructus Psoraleae.

Action To nourish the kidney to generate essence, and replenish *qi* to nourish blood.

Indications Palpitation, shortness of breath, insomnia, amnesia, seminal emission, night sweat, weakness and aching in the lower back and legs, tinnitus, poor hearing or deafness due to a deficiency of kidney-essence, *qi* and blood as well.

Usage and dosage 4-6 tablets, twice a day.

Precaution Contraindicated for patients with common cold and fever.

Storage Preserve in tightly closed containers.

Buzhong Yiqi Wan
(补中益气丸)

Buzhong Yiqi Pills

Ingredients Radix Astragali Praeparata Cum Melle 200 g; Radix Codonopsis 60 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 100 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 60 g; Radix Angelicae Sinensis 60 g; Rhizoma Cimicifugae 60 g; Radix Bupleuri 60 g; Pericarpium Citri Reticulatae 60 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix well. Decoct 20 g of Rhizoma

Zingiberis Recens and 40 g of Fructus Jujubae with water for two times and filter. Concentrate the filtrate, to each 100 g of the powder add 100-120 g of refined honey and concentrated decoction, make small honeyed pills, or to each 100 g of the powder add 100-120 g of refined honey, make big honeyed pills.

Description Brown to blackish-brown small or big honeyed pills; taste, slightly sweet, slightly bitter and pungent.

Identification (1) Microscopical: Fibres in bundles or scattered, walls thickened, with longitudinal fissures on the surface, both ends broken to broom-like or slightly truncate. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Needles of calcium oxalate minute, 10-32 μm long, irregularly filled in parenchymatous cells. Prisms of calcium oxalate abundant in parenchyma. Anastomosing laticiferous tubes 12-15 μm in diameter, containing fine granules. Parenchymatous cells fusiform, walls slightly thickened, with very minute oblique crisscross striations. Wood fibres in bundles, pale yellowish-green, with narrowly acute or obtuse-rounded ends, some branched, 14-41 μm in diameter, walls slightly thickened, with cross-shaped pit-pairs, sometimes containing yellowish-brown contents. Vittae containing pale yellow or yellowish-brown stripped secretion, 8-25 μm in diameter.

(2) Triturate 9 g of the small honeyed pills or the big honeyed pills, mix well with 5 g of kieselguhr, add 20 ml of *n*-hexane, ultrasonicate for 15 minutes, and filter. Evaporate the filtrate to dryness at a low temperature. Dissolve the residue in 1 ml of *n*-hexane as the test solution. Prepare a solution with 0.2 g of Rhizoma Atractylodis Macrocephalae reference drug and 5 ml of *n*-hexane as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (20∶0.1) as the mobile phase. Apply separately 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Triturate 9 g of the small honeyed pills or the big honeyed pills into pieces, add 30 ml of water, decoct for 30 minutes and filter. To the filtrate add 5 ml of dilute hydrochloric acid, ultrasonicate for 5 minutes, allow to stand and centrifuge. Separate the precipitate and dissolve in 1 ml of dilute ethanol, neutralize with 10% sodium bicarbonate solution and heat for a while as the test solution. Dissolve ammonium glycyrrhizinate CRS in dilute ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of *n*-butanol, glacial acetic acid and water (6∶1∶3) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 254 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To reinforce the *middle-energizer* to replenish *qi* and elevate *yang* to prevent drooping.

Indications Diarrhea, prolapse of the rectum or uterus due to deficiency in the spleen and stomach and sinking of *spleen-qi*, with manifestations of lassitude, anorexia and abdominal distension, loose stools or chronic diarrhea, drooping of the anus or prolapse of the rectum or uterus.

Usage and dosage 9 g of small honeyed pills or 1 big honeyed pill, 2-3 times a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containerc.

Buzhong Yiqi Wan (Shui Wan)
(补中益气丸，水丸)

Buzhong Yiqi watered Pills

Ingredients Radix Astragali Praeparata Cum Melle 200 g; Radix Codonopsis 60 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 100 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 60 g; Radix Angelicae Sinensis 60 g; Rhizoma Cimicifugae 60 g; Radix Bupleuri 60 g; Pericarpium Citri Reticulatae 60 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix well. Decoct 20 g of Rhizoma Zingiberis Recens and 40 g of Fructus Jujubae with water for two times and filter. Make watered pills with the decoction and dry.

Description Brown watered pills; taste, slightly sweet, slightly bitter and pungent.

Identification (1) Microscopical: Fibres in bundles or scattered, walls thickened, with longitudinal fissures on the surface, both ends broken to broom-like or slightly truncate. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Needles of calcium oxalate minute, 10-32 μm long, irregularly filled in parenchymatous cells. Prisms of calcium oxalate abundant in parenchyma. Anastomosing laticiferous tubes 12-15 μm in diameter, containing fine granules. Parenchymatous cells fusiform, walls slightly thickened, with very minute oblique crisscross striations. Wood fibres in bundles, pale yellowish-green, with narrowly acute or obtuse-rounded ends, some branched, 14-41 μm in diameter, walls slightly thickened, with cross-shaped pit-pairs, sometimes containing yellowish-brown contents. Vittae containing pale yellow or yellowish-brown stripped secretion, 8-25 μm in diameter.

(2) Triturate well 5 g of the watered pills and add 10 ml of *n*-hexane, ultrasonicate for 15 minutes, and filter. Evaporate the filtrate to dryness at a low temperature. Dissolve the residue in 1 ml of *n*-hexane as the test solution. Prepare a solution with 0.2 g of Rhizoma Atractylodis Macrocephalae reference drug and 5 ml of *n*-hexane in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (20∶0.1) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Triturate well 5 g of the watered pills, add 20 ml of water, decoct for 30 minutes and filter. To the filtrate add 5 ml of dilute hydrochloric acid, ultrasonicate for 5 minutes, allow to stand and centrifuge. Separate the precipitate and dissolve in 1 ml of dilute ethanol, neutralize with 10%

sodium bicarbonate solution and heat for a while as the test solution. Dissolve ammonium glycyrrhizinate CRS in dilute ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of *n*-butanol, glacial acetic acid and water (6∶1∶3) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at (254 nm). The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Triturate well 2 g of the watered pills, add 25 ml of ethyl acetate, ultrasonicate for 20 minutes, and filter, evaporate the filtrate to about 1 ml as the test solution. Prepare a solution with 0.3 g of Radix Angelicae Sinensis reference drug as the reference drug solution in the same manner. Carry out the method for the thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of cyclohexane and ethyl acetate (9∶2) as the mobile phase. Apply separately 2 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(5) Triturate well 2 g of the watered pills, and 25 ml of ethyl acetate, heat under reflux for 20 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Dissolve hesperidin CRS in methanol to produce a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of ethyl acetate, methanol and water (100∶17∶13) as the mobile phase. Apply separately 1 μl of the test solution and 10 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with aluminium trichloride TS, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of acetonitrile and water (35∶65) as the mobile phase. Use an evaporative light scattering detector. The number of theoretical plates of the column is not less than 4500, calculated with the reference to the peak of astragaloside Ⅳ.

Reference solution Dissolve 10 mg of astragaloside Ⅳ CRS, accurately weighed, in dilute methanol to prepare a solution containing 0.5 mg per ml as the reference solution.

Test solution Triturate a quantity of the pills to fine powder and mix well. To about 4 g of the powder, weighed accurately, in a Soxhlet's extractor, add a quantity of methanol, heat under reflux for 7 hours. Evaporate the extracts to dryness, and dissolve residue in 25 ml of water in warm, wash with two-20 ml quantities of ether, extract the water layer with six-20 ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extract, wash with three 40-ml quantities of ammonia TS. Evaporate the *n*-butanol extracts to dryness, and dissolve residue in methanol, and transfer to 10 ml volumetric flask, dilute with methanol to the volume. Mix well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl, 10 μl, 15 μl, 20 μl of the reference solution separately and 20 μl of the test solution into the column, calculate the content, using a calibration equation of logarithm alteration. It contents not less than 0.28 mg of astragaloside Ⅳ ($C_{41}H_{68}O_{14}$) per gram, referred to Radix Astragali Praeparata Cum Melle.

Action To reinforce the *middle-energizer* to replenish *qi* and elevate *yang* to prevent drooping.

Indications Diarrhea, prolapse of the rectum or uterus due to deficiency in the spleen and stomach and sinking of *spleen-qi*, with manifestations of lassitude, anorexia and abdominal distention, loose stools or chronic diarrhea, drooping of the anus or prolapse of the rectum or uterus.

Usage and dosage 6 g, 2-3 times a day.

Strength 9 g per big honeyed pill

Storage Preserve in well closed containers, protected from moisture.

Can'e gong Bu Pian
(蚕蛾公补片)

Can'egong Bu Tablets

Ingredients Bombyx Masculus (processed) 156.25 g; Radix et Rhizoma Ginseng 15.625 g; Radix Rehmanniae Praeparata 75 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 75 g; Radix Angelicae Sinensis 56.25 g; Fructus Lycii 56.25 g; Fructus Psoraleae (processed with salt) 56.25 g; Semen Cuscutae (processed with salt) 37.5 g; Fructus Cnidii 37.5 g; Rhizoma Curculiginis 37.5 g; Herba Cistanches 37.5 g; Herba Epimedii 37.5 g.

Procedure Pulverize Radix et Rhizoma Ginseng and Rhizoma Atractylodis Macrocephalae to fine powder. Reflux the other ten ingredients with 50% ethanol for three times, filter and combine the filtrates, recover ethanol and concentrate to a thick extract. Add the above fine powder and a quantity of starch, mix well, make granules, make to 1000 tablets and coat with sugar.

Description Sugar coated tablets with brown core; odour, aromatic; taste, bitter.

Identification (1) Microscopical: Clusters of calcium oxalate 20-68 μm in diameter, with acute angles. Needles of calcium oxalate slender, 10-32 μm long, irregularly filling in the parenchyma cells.

(2) Grind 20 tablets, with coating removed, to fine powder, add 50 ml of methanol, heat under reflux for 1 hour, filter, and evaporate the filtrate to dryness. Dissolve the residue in 15 ml of water, extract by shaking with two 15-ml quantities of chloroform and discard the chloroform extracts. Extract the aqueous solution by shaking with three 15-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol solutions, wash with three 20-ml quantities of ammonia TS, wash with 30 ml of water saturated with *n*-butanol, evaporate the *n*-butanol solution to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve ginsenoside Rb1 CRS and ginsenoside Rg1 CRS in ethanol to produce a mixture containing 0.5 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13 : 7 : 2) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and spray with 10% sulfuric acid in ethanol. Heat at 105℃ to the spots clear, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(3) Grind 20 tablets, with coating removed, to fine powder, add 50 ml of ethanol, ultrasonicate for 30 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in 30 ml of water, extract by shaking with two 20-ml quantities of ether, combine the ether extracts, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve osthol CRS in methanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (17 : 3) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Grind 20 tablets, with coating removed, to fine powder, add 50 ml of methanol, heat under reflux for 1 hour, filter and evaporate the filtrate to dryness. Dissolve the residue in 20 ml of water, Extract by shaking with three 15-ml quantities of ether, combine the ether extracts, evaporate to dryness, and dissolve the residue in 0.5 ml of methanol as the test solution. Dissolve ferulaic acid CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petrol ether (60-90℃), chloroform and glacial acetic acid (12 : 4 : 1) as the mobile phase. Apply separately 15 μl of the test solution and 5 μl of the reference solution to the plate. After developing at a temperature below 10℃ and removal of the plate, dry in air and spray with a newly prepared mixture of 1% ferric chloride in ethanol and 1% solution of potassium ferricyanide (1 : 1). The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablet (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (25 : 75) as the mobile phase. As detector a spectrophotometer set at 245 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peaks of psoralen.

Reference solution Dissolve respectively a quantity of psoralen CRS and isopsoralen CRS, dried to constant weight at 105℃, accurately weighed, in 85% ethanol to prepare a mixture containing 20 μg of each per ml as the reference solution.

Test solution Weigh accurately 10 tablets, with coating removed, ground to fine powder, weigh accurately 1 g in a stopper conical flask, add accurately 25 ml of 85% ethanol, stopper tightly, and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, cool, weigh again, replenish the loss of weight with 85% ethanol, shake well, centrifuge and use the supernatant as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 80 μg of the total amount of psoralen ($C_{11}H_6O_3$) and isopsoralen ($C_{11}H_6O_3$) per tablet, referred to Fructus Psoraleae.

Action To reinforce the kidney to strengthen *yang*, nourish blood and replenish essence.

Indications Impotence, premature ejaculation, sterility due to *cold* in the uterus, hypogonadia caused by a deficiency of *kidney-yang*.

Usage and dosage 3-6 tablets, 3 times a day.

Storage Preserve in tightly closed containers.

Capsulae Cornu Saigae Tataricae (羚羊角胶囊，Lingyangjiao Jiaonang)

Antelope horn Capsules

Antelope horn capsules are prepared from Cornu Saigae Tataricae.

Procedure File 150 g of the horn to very fine powder, mix thoroughly, pack into 1000 capsules or 500 capsules.

Description Capsules, content white or white-like powder; odour, stinking; taste, slight.

Identification Heat under reflux 0.9 g of the powder in 20 ml of petroleum ether (60-90℃) for 1.5 hours, filter, discard the filtrate, expel the solvent of the drug residue. Heat under reflux the drug residue in 20 ml of 70% ethanol for 2.5 hours, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of 70% ethanol as the test solution. Prepare a solution with Cornu Saigae Tataricae reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and a mixture of *n*-butanol, glacial acetic acid and water (3 ∶ 1 ∶ 1) as the mobile phase. Apply separately 10 μl each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with ninhydrine TS, heat to the spots clearly. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Weigh accurately 0.2 g of the content powder, obtained under the test of packing variation, carry out the method of determination of nitrogen (Appendix Ⅸ L, method 1) and determine.
It contains not less than 14.0 mg (strength (1)) or 28.0 mg (strength (2)) of nitrogen per capsule.

Action To pacify the liver to extinguish *wind*, clear the liver to improve eyesight, and dissipate *blood-heat* and reduce *toxicity*.

Indications High fever, proneness to fright, coma, convulsion, eclampsia, epilepsy, mania, headache, dizziness, bloodshot eyes, nebula and skin eruptions caused by *warm toxins* due to stirring of *liver-wind*, hyperactivity of *liver-fire* and abundant *blood-heat*.

Usage and dosage 0.3-0.6 g, once a day.

Strength (1) 0.15 g per capsule (2) 0.3 g per capsule

Storage Preserve in well closed containers.

Capsulae Extractum Dioscoreae Arthaicae seu Nipponicae (地奥心血康胶囊，Di'ao Xinxuekang Jiaonang)

Di'ao Xinxuekang Capsules

Di'ao Xinxuekang Capsules are prepared from Extractum Dioscorea Arthaica seu Nipponica.

Description Hard capsules containing pale yellow or pale brownish-yellow powder; taste slightly bitter.

Identification (1) Dissolve the content of 2 capsules with 10 ml of water in a stopper test tube, shake vigorously for 1 minute, the lasting foam is produced.
(2) Place a small amount of precipitate obtained under Assay in a dropping plate, add 3-4 drops of acetic anhydride to dissolve, add 1-2 drops of sulfuric acid; a purple red colour is produced, then gradually turn to a brown-red and then dirty green colour.

Loss on drying When dried a quantity of the content to constant weight at 105℃, loses not more than 11.0% (Appendix Ⅸ G).

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Weigh accurately a quantity of the content equivalent to 0.12 g of total steroid sapogenin, obtained in the test of packing variation, in a 150 ml round flask, add 50 ml of a solution of sulfuric acid in 40% ethanol (add 60 ml of sulfuric acid to a quantity of 40% ethanol, allow to cool, dilute to 1000 ml. with 40% ethanol, and shake well), heat under reflux on a boiling water bath for 5 hours, allow to cool, add 100 ml of water, filter through a No. 4 sintered glass filter, previously dried to constant weight at 105℃, wash the precipitate until the filtrate is neutral, dry to constant weight at 105℃, and calculate.
It contains not less than 35 mg of total steroid saponins per capsule, calculated as total steroid sapogenins.

Action To promote blood circulation to resolve stagnated blood, move *qi* to relieve pain, dilate coronary arteries and relieve myocardial ischemia.

Indications To prevent and treatment of coronary heart disease, angina pectoris and retention of stagnant blood leading to impeded flow of *yang-qi* in the chest, dizziness, shortness of breath, palpitation, and oppressive or painful feeling in the chest.

Usage and dosage 1-2 capsules, 3 times a day.

Strength 100 mg of total steroid saponins per capsule (correspond to 35 mg of total steroid sapogenin)

Storage Preserve in well closed containers.

Attached:

Extractum Dioscoreae Anthaicae Seu Nipponicae (地奥心血康)

Yellow Yam Extract

Yellow Yam Extract is prepared from Rhizome of *Dioscorea Anthaica* or *Dioscorea Nipponica* (Fam. Dioscoreaceae).

Description Pale yellow or pale brownish yellow powder; odourless, taste slightly bitter, hygroscopic.
Soluble in methanol or hot ethanol, sparingly soluble in water. Insoluble in ether.

Identification (1) Dissolve 5 mg with 10 ml of water in a stopper test tube, shake vigorously for 1 minute, the lasting foam is produced.
(2) Place a small amount of precipitate obtained in Assay on a dropping plate, add 3-4 drops of acetic anhydride to dissolve, add 1-2 drops of sulfuric acid, a purple red colour is produced, and gradually turns brownish red and then dirty green.
(3) Dissolve a quantity of the extract with methanol to produce a

solution containing 50 mg per ml as the test solution. Dissolve a quantity of yellow yam saponin reference extract with methanol to produce a solution containing 50 mg per ml as the reference extract solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, methanol and water (75 : 35 : 4) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate, after developing and removal of the plate, dry in air, spray with 1% *p*-dimethylaminobenzaldehyde in a mixture of methanol and hydrochloric acid (dissolve 1 g of *p*-dimethylamin-obenzaldehyde in 75 ml of methanol, shake well, gently add 25 ml of hydrochloric acid and mix well), heat at 105℃ for 3-5 minutes. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference extract solution.

Loss on drying When dried to constant weight at 105℃, loses not more than 5.0 per cent (Appendix Ⅸ G).

Residue on ignition Not more than 0.3 per cent (Appendix Ⅸ J), using 1.0 g.

Iron Dissolve the residue obtained in the test of Residue on ignition with 4 ml of dilute hydrochloric acid, heat slightly, filter. Using the filtrate, carry out the limit test for iron (Appendix Ⅸ D). Any colour produced is not more intense than that of a reference solution using 2.5 ml of iron standard solution (25 ppm).

Heavy metals Carry out the limit test for heavy metals (Appendix Ⅸ E, method 2), using the residue obtained in the test of Residue on ignition: not more than 20 ppm.

Assay Weigh accurately 0.3g in a 150 ml round flask, add 50 ml of a solution of sulfuric acid in 40% ethanol (add slowly 60 ml of sulfuric acid to a quantity of 40% ethanol, allow to cool, dilute to 1000 ml. with 40% ethanol, and shake well), heat under reflux on a boiling water bath for 5 hours, allow to cool, add 100 ml of water, shake well, filter through a No. 4 sintered glass filter, previously dried to constant weight at 105℃, wash the precipitate with water until the washing is neutral, dry to constant weight at 105℃, and calculate.

It contains not less than 35.0 per cent of total steroid saponins on dried basis, calculated as total steroid sapogenin.

Storage Preserve in well closed containers.

Capsulae Gastrodiae (全天麻胶囊, Quantianma Jiaonang)

Tall gastrodia capsules

Tall gastrodia capsules are prepared from the fine powder of Rhizoma Gastrodiae.

Description Hard capsules with yellowish-white to yellowish-brown fine powder; odourless; taste, sweet.

Identification (1) Microscopical: needle crystals of calcium oxalate in bundles or scattered, 25-75 μm long; Fragments of tissue containing gelatinized polysaccharide showing a brown or pale brown-purple colour on adding a iodine TS.

(2) Heat under reflux 0.5 g of Rhizoma Gastrodiae reference drug with 15 ml of ethanol for 30 minutes, allow to stand, filter, concentrate the filtrate to 3 ml as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, methanol and water (9:1:0.2) as the mobile phase. Apply separately 5 μl of each of the test solution obtained under Assay and the above reference drug solution to the plate, after developing and removal of the plate, dry in air, spray with 10% phosphomolybdic acid in ethanol, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Not more than 12.0 per cent (Appendix Ⅸ H).

Starch granules Examining under microscope, no starch granules are inspected.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, phosphate buffer (a mixture of 0.1 mol/L potassium dihydrogen phosphate solution and equal quantity of 0.1 mol/L disodium hydrogen phosphate solution) and water (10 : 3 : 87) as the mobile phase. As detector a spectrophotometer set at 270 nm. The number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of gastrodin.

Reference solution Weigh accurately 25 mg of gastrodin CRS, dried at 80℃ for 1 hour, in a 50 ml volumetric flask, dissolve with methanol and dilute to the volume and mix well (containing 0.5 mg of gastrodin per ml).

Test solution Weigh accurately 0.5 g of the contents, obtained under the test of weight variation, in a 10 ml conical flask, add 5 ml of methanol, measured accurately, weigh, ultrasonicate for 30 minutes, allow to stand for 24 hours, and shake. Ultrasonicate for 2 hours again, replenish the lost weight with methanol, mix thoroughly, centrifuge, use the supernatant liquid as the test solution.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column and measure.

It contains not less than 1.0 mg of gastrodin ($C_{13}H_{18}O_7$) per capsule, referred to Rhizoma Gastrodiae.

Action To soothe the liver, subside interior *wind* and to stop convulsion.

Indications Dizziness, headache, numbness in limbs, epilepsy or convulsion due to *liver-wind* stirring internally.

Usage and dosage 2-6 capsules, 3 times a day.

Strength 0.5 g per capsule

Storage Preserve in well closed containers.

Capsulae Olei Viticis Negundo (牡荆油胶丸, Mujingyou Jiaowan)

Negundo Chastetree Oil Capsules

Negundo Chastetree Oil Capsules are the capsules prepared from Negundo Chastetree Oil with a quantity of diluent.

Description Yellow-brown and transparent capsules containing pale yollow to orange oily liquid; odour, characteristically aromatic.

Refractive index 1.485-1.500 (Appendix Ⅶ F), using the volatile oil obtained under Assay.

Identification The volatile oil obtained under Assay complies with the identification tests described under Negundo Chastetree Oil.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay To 100 capsules add 500 ml of acetic acid solution (1→10), carry out the method for determination of volatile oil (Appendix Ⅹ D), calculate the content of volatile oil

with 0. 897 as the relative density.
It contains not less than 85. 0 per cent and not more than 110. 0 per cent of the labelled amount of negundo chastetree oil.

Action To expel phlegm, relieve coughing and dyspnea.

Indications Chronic bronchitis.

Usage and dosage 1-2 capsules, 3 times a day.

Strength 20 mg

Storage Preserve in tightly closed containers, protected from light, and stored in a cool place.

Capsulae Radix Lamiophlomidis Ratatae (独一味胶囊)

Duyiwei Capsules

Duyiwei Capsules are the capsules prepared from Radix Lamiophlomis Ratatae.

Procedure Pulverize 1000 g of Radix Lamiophlomis Ratatae, decoct with water twice, each 1 hours. Combine the decoctions and filter. Concentrate the filtrate to a liquid extract with a relative density of 1. 30, and dry below 80℃. Add a quantity of starch to make granules. Dry and pack to 1000 capsules.

Description Hard capsules containing deep-brown granules or powder. taste, slightly bitter.

Identification To 0. 3 g of the content, add 5 ml of ethanol, heat under reflux for 10 minutes, and filter. Concentrate 2 ml of the filtrate to about 1 ml as the test solution. Prepare a solution in the same manner with 1 g of Herba Lamiophlomis ratatae reference drug as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (4 ∶ 1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate (non-actived). After developing and removal of the plate, dry in air, spray with phosphomolybdic acid, heat at 105℃ for about 15 minutes, the spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

***n*-Butanol extractives** Weigh accurately 1. 5 g of the contents, place in a beaker, add 10 ml of water to dissolve. Transfer the solution to a seperator, wash the beaker with 5 ml of water, combine the washings to the same seperator. Extract with four 30-ml quantities of *n*-butanol saturated with water, combine the extracts and wash with three 10-ml quantities of water saturated with *n*-butanol. Evaporate the *n*-butanol extracts in an evaporating dish, previously dried to constant weight, to dryness on a water bath. Dry at 105℃ for 3 hours and allow to cool in a desiccator for 30 minutes, weigh accurately and rapidly. It contains not less than 8. 0% per cent of *n*-butanol extractives.

Assay ***Total Flavone*** *Reference solution* Weigh accurately 200 mg of rutin, previously dried in vaccum to constant weight at 120℃, in a 100 ml volumetric flask, add 70 ml of 70% ethanol and heat gently to dissolve on a water bath, cool and dilute with 70% ethanol to volumn, and mix well. Transfer accurately 10 ml to a 100 ml volumetric flask, dilute to volume with water and mix well, used as the reference solution, containing 0. 2 mg of anhydrous rutin per ml.

Preparation of calibration curve Measure accurately 1, 2, 3, 4, 5 ml and 6 ml of the standard solution in 25 ml volumetric flask separately, add water for each to 6 ml, and add 1 ml of 5% sodium nitrite solution, mix well, allow to stand for 6 minutes, then add 1 ml of 10% aluminium nitrate solution, mix well and allow to stand for 6 minutes, add 10 ml of sodium hydroxide TS and dilute to volume with water. Mix well and allow to stand for 15 minutes. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 500 nm, taking the reagent solution as a blank, plot calibration curve, using absorbance as ordinate and concentration as abscissa.

Procedure Grind the content obtained under the test of packing variation, to fine powder, weigh accurately 0. 6 g of the powder in a 100 ml volumetric flask, add 70 ml of 70% ethanol, warm on a water bath for 30 minutes and shake constantly, cool, dilute to volume with 70% ethanol, mix well, and allow to stand for 4 hours. Transfer accurately 1 ml of the supernatant to a 25 ml volumetric flask, carry out the procedure as described under the preparation of standard curve, beginning at the words "add water for each to 6 ml...", measure the absorbance, read out the weight of anhydrous rutin in the test solution from the calibration curve, and calculate.
It contains not less than 26 mg of anhydrous rutin ($C_{27}H_{30}O_{16}$) per capsule.

Luteolin Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0. 4% phosphoric acid solution (50 ∶ 50) as the mobile phase. As detector a spectrophotometer set at 350 nm. The number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of luteolin.

Reference solution Dissolve a quantity of luteolin CRS, accurately weighed, in methanol to prepare a solution containing 10 μg per ml as the reference solution.

Test solution Weigh accurately 0. 15 g of the content powder, obtained under the test of weight variation, to a 25 ml volumetric flask, add 20 ml of 2. 5 mol/L solution of hydrochloric acid in methanol, ultrasonicate for 30 minutes (power 250 W, frequency 50 kHz), cool. Dilute with 2. 5 mol/L solution of hydrochloric acid in methanol to volume, and mix well, and filter. Transfer accurately 10 ml of the successive filtrate to a 50 ml round-bottomed flask, heat on a water bath at 90℃ for 30 minutes, and cool. Transfer to a 25 ml volumetric flask, dilute with methanol to volume, mix well, filter, use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column and measure.
It contains not less than 0. 80 mg of luteolin ($C_{15}H_{10}O_6$) per capsule.

Action To promote blood circulation to kill pain, and resolve stagnated blood to arrest bleeding.

Indications Painful incisions with bleeding after surgery, traumatic injury and fractures, sprain of tendons and bones, rheumatalgia due to *wind-dampness*, metrorrhagia and metrostaxis, dysmenorrhea, and swollen and painful gums with bleeding.

Usage and dosage 3 capsules, 3 times a day, 7 days making a course treatment, or taken when necessary.

Precaution Be cautions about pregnant women.

Strength 0. 3 g per capsule

Storage Preserve in tightly closed containers.

Capsulae Xylaria
(乌灵胶囊，Wuling jiaonang)

Xylaria Powder Capsules

Wuling Capsules are prepared from fermented Xylaria powder.

Procedure To 330 g of Xylaria powder, pack 1000 capsules.

Description Capsules with pale brown to brown powder content; odour, characteristic; taste, slightly sweet.

Identification (1) To 2 g of capsule content, add 5 ml of ethanol solution of potassium hydroxide TS, heat boiling for 5 minutes, cool, add 4 ml water and 10 ml ether, shake thoroughly, separate 2 ml of ether layer, add 0.5 ml of 0.5% 2,2'-dipyridyl in ethanol and 0.5% ferric chloride in ethanol separately, shake thoroughly. A red colour is produced.

(2) Heat under reflux 2 g of the capsule content with 20 ml of dilute ethanol on a water bath for 2 hour, cool and filter, use the filtrate as the test solution. Prepare a solution in the same manner of 2 g of Xylaria powder reference drug as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G prepared with 0.4% solution of sodium carbonmethylcellulose and 3.85% solution of disodium hydrogen phosphate as the coating substance, and a mixture of chloroform, ethyl acetate, isopropanol, water and concentrated ammonia TS (4 : 1 : 2 : 0.1 : 0.1) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air, and examine instantly under ultraviolet light at 365 nm. The three fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Dissolve separately adenosine CRS and adenine CRS in dilute ethanol to produce two solutions containing 1 mg of adenosine and 0.5 mg of adenine per ml respectively as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} mixed with a 4% solution of sodium acetate as the coating substance and a mixture of chloroform, ethyl acetate, isopropanol, water and concentrated ammonia TS (8 : 2 : 6 : 0.3 : 0.3) as the mobile phase. Apply separately to the plate 10 μl of the test solution obtained under Identification test (2) and 1 μl of each of the reference solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay ***Adenosine*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol and 0.05 mol/L solution of disodium hydrogen phosphate (17 : 83) as the mobile phase. As detector a spectrophotometer set at 260 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of adenosine.

Reference solution Weigh accurately 10 mg of adenosine CRS, in a 100 ml volumetric flask, dissolve and dilute to volume with water, and mix well. Transfer accurately 10 ml to a 100 ml volumetric flask, dilute to volume with water, and mix well (containing 10 μg of adenosine per ml).

Test solution Weigh accurately 0.5 g of the content obtained under the test of packing variation, pulverized to fine powder, in a 50 ml volumetric flask, add a quantity of water, ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, cool, add water to volume, mix well, add filter. Use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column respectively and measure.

It contains not less than 0.25 mg of adenosine ($C_{10}H_{13}N_5O_4$) per capsule.

Polysaccharides *Reference solution* Weigh accurately anhydrous glucose CRS, add water to prepare a solution containing 0.1 mg per ml as the reference solution.

Calibration standard Measure accurately 0.2 ml, 0.4 ml, 0.6 ml, 0.8 ml, and 1.0 ml of the reference solution in 10 ml volumetric flask separately, add accurately 1.8, 1.6, 1.4, 1.2, 1.0 ml of water separately, and add accurately 1 ml of 6% solution of phenol to each flask separately, mix well, add accurately 5 ml of sulfuric acid to each flask instantly, mix well again and place in a boiling water bath for 15 minutes, cool quickly, Carry out the method for ultraviolet and spectrophotometry (Appendix Ⅴ A), using the corresponding solvent as blank, measure the absorbance at 490 nm, plot the calibration curve, using absorbance as ordinate and concentration as abscissa.

Procedure Weigh accurately 1 g of capsule content obtained under the test of packing variation, pulverized to fine powder, in a round-bottom flask, add 30 ml of 0.1% solution of sodium dodecylsulphate accurately, weigh, heat for 2 hours under reflux, cool quickly, weigh and replenish the lost weight with water, mix well. Centrifuge (3500 rpm) instantly. Transfer accurately 10 ml of the supernatant to a flask, add 30 ml of methanol and keep in cold place for 24 hours. Centrifuge (3500 rpm), and discard the supernatant. Wash the residue with a small quantity of methanol, and then dissolved by water. Transfer the water solution to a 100 ml volumetric flask, dilute to volume and mix well. Transfer accurately 5 ml of the solution to a 50 ml volumetric flask, dilute to volume and shake well. Transfer accurately 2 ml of the solution to a test tube, carry out the method described under the preparation of standard calibration, beginning at the words "and add accurately 1 ml of 6% solution of phenol", measure the absorbance, read out the weight of anhydrous glucose from standard curve, and calculate the content of $C_6H_{12}O_6$.

It contains not less than 25 mg polysaccharides per capsule, calculated as anhydrous glucose ($C_6H_{12}O_6$).

Action To reinforce the kidney and replenish essence, and nourish the heart to anchor the mind.

Indications Insomnia, dreamfulness, amnesia, lassitude, aching and weakness of the lower back and knees due to disharmony between the heart and kidney; neurasthenia with above symptoms.

Usage and dosage 3 capsules, 3 times a day.

Strength 0.33 g per capsule

Storage Preserve in tightly closed containers.

Attached:

Xylaria Powder
(乌灵菌粉, Wuling junfen)

Xylaria Powder are the mycetes of Xylaria, which are dry powder of hypal body and prepared by deep-layer fermened.

Procedure Take some mycetes which are separated from Xylaria and prepared by deep-layer fermened.

Description Pale brown to brown powder; odour, characteristic; taste, slightly sweet.

Identification Show the same results when test with the same manners under Identification (1), (2), and (3) of Wuling Capsules.

Water Not more than 6.0 per cent (Appendix Ⅸ H).

Residue on ignition Not more than 6.5 per cent (Appendix Ⅸ J).

Assay ***Adenosine*** Accurately weigh 0.5 g of the powder, comply with the method as described under Assay (adenosine) of Wuling Capsules.
It contains not less then 0.078 per cent of adenosine ($C_{10}H_{13}N_5O_4$).

Polysaccharides Accurately weigh 1 g of the powder, comply with the method as described under Assay (polysaccharides) of Wuling Capsules.
It contains not less than 7.5 per cent of anhydrous glucose ($C_6H_{12}O_6$), refered to polysaccharides.

Usage and dosage 1 g, 3 times a day.

Storage Preserve in tightly closed containers.

Preparation Wuling Capsules

Chaihu Koufuye
(柴胡口服液)
Chaihu Mixture

Chaihu Mixture is prepared from Radix Bupleuri.

Procedure To Radix Bupleuri, pulverized to coarse powder, add 4 portions of water, macerate at 80℃ for half an hour, heat under reflux for 1 hour and then perform water steam distillation (add 4 times of water during distillation), collect a quantity of initial distillate, add sodium chloride to a content of 12%, salt out for 12 hours, redistill, collect a quantity of redistillate, add propylene glycol, shake and allow to stand. Continue to collect a quantity of redistillate. Filter and concentrate the above decoction to a quantity, refrigerate for 24 hours, filter, to the filtrate add sucrose, warmly heat to dissolve, cool, combine with redistillate, filter, add flavoring essence and successive distillate to a fixed volume, filter with G3 sintered glass filter, pack, seal and sterilize at 100℃ for 30 minutes.

Description A brownish-red liquid; taste, slightly sweet and bitter.

Identification (1) Distill 10 ml of the oral liquid with 50 ml of water in a 250 ml flask, collect 10 ml of the distillate. To 2 ml of the distillate, add 2 drops of fuchsin-sulfurous acid TS, mix well and stand for 5 minutes; a rose colour is produced.
(2) Evaporate 5 ml of the oval liquid to dryness on a water bath, dissolve the residue in 10 ml of methanol. To 0.5 ml of the supernatant, add 0.5 ml of *p*-dimethylamino-benzaldehyde solution in methanol (1→30), mix well, and then add 2 ml of phosphoric acid, mix well and allow to stand in a hot water bath; a pale reddish-purple colour is produced.
(3) Measure 30 ml of the oral liquid in a separator, extract with three 15-ml quantities of ether, discard ether solutions, extract with three 15-ml quantities of *n*-butanol saturated with water again. Combine *n*-butanol extracts and add a same quantity of ammonia TS, mix well, allow to stand. Separate the supernatant, recover *n*-butanol to dryness in vacuum, dissolve the residue in 1 ml of methanol as the test solution. Heat under reflux 3 g of Radix Bupleuri reference drug, in 30 ml of ether for 30 minutes, discard ether solution. To the residue, expel ether, add 30 ml of methanol and heat under reflux for 30 minutes, filter and recover methanol to dryness in vacuum. Dissolve the residue in 15 ml of water, carry out the same manner as described under the preparation of the test solution, begining at the words "extract with three 15-ml quantities of *n*-butanol saturated with water...", to prepare the reference drug solution. Dissolve saikosaponin a CRS and saikosaponin d CRS in methanol to produce a mixture solution containing 0.5 ml of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13∶7∶2, stand bellow 10℃) as the mobile phase. Apply separately 5 μl each of the above three solutions to the plate. After developing and removal of the plate, dry in air. Spray with 1% *p*-dimethylaminobenzaldehyde in sulfuric acid-ethanol (1→10), heat at 70℃ to the spots clear. Three main spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution. Examine under ultraviolet light at 365 nm, showing same yellow fluorescent spots.

Relative density Not less than 1.01 (Appendix Ⅶ A).

pH value 3.0-5.0 (Appendix Ⅷ G).

Specific absorbance Measure accurately 25 ml of the oral liquid in a 250 ml flask, add 50 ml of water, heat to distill (the speed of distillation is adjusted by distillating the fixed volume in 20-30 minutes). Collect the distillate in a 50 ml volumetric flask, stop distillating while the distillate is almost to 50 ml, dilute with water to volume and mix well. Transfer accurately 3 ml in a 10 ml volumetric flask, add water to volume, mix well. Transfer accurately another 3 ml in a evaporating dish, evaporate to dryness on a water bath, dissolve the residue in water and transfer to a 10 ml volumetric flask, dilute with water to volume, mix well as a blank. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 277 nm, the value of absorbance is not less than 0.50.

Other requirements Complies with the general requirements for mixtures (Appendix Ⅰ J).

Action To release the exterior and relieve fever.

Indications Common cold with fever due to external *wind-heat*, with manifestations of fever, flushed face, headache, general pain, dry mouth and thirst.

Usage and dosage 10-20 ml, 3 times a day; appropriate reduction of the dosage for children.

Strength 10 ml per ampule (equivalent to 10 g of the crude drug)

Storage Preserve in tightly closed containers, stored in a cool place.

Chaihu Shugan Wan
(柴胡舒肝丸)

Chaihu Shugan Pills

Ingredients Poria 100 g; Fructus Aurantii (stir-baked) 50 g; Fructus Amomi Rotundus 40 g; Radix Paeoniae Alba (stir-baked with wine) 50 g; Radix et Rhizoma Glycyrrhizae 50 g; Rhizoma Cyperi (processed with vinegar) 75 g; Pericarpium Citri Reticulatae 50 g; Radix Platycodi 50 g; Cortex Magnoliae Officinalis (processed with ginger) 50 g; Fructus Crataegi (stir-baked) 50 g; Radix Saposhnikoviae 50 g; Massa Medicata Fermentata (stir-baked) 50 g; Radix Bupleuri 75 g; Radix Scutellariae 50 g; Herba Menthae 50 g; Caulis Perillae 75 g; Radix Aucklandiae 25 g; Semen Arecae (stir-baked) 75 g; Rhizoma Sparganii (processed with vinegar) 50 g; Radix et Rhizoma Rhei (stir-baked with wine) 50 g; Pericarpium Ciri Reticulatae Viride (stir-baked) 50 g; Radix Angelicae Sinensis 50 g; Rhizoma Pinelliae (processed with ginger) 75 g; Radix Linderae 50 g; Rhizoma Curcumae (processed) 50 g.

Procedure Pulverize the above twenty-five ingredients to fine powder, sift and mix well. To each 100 g of the powder add 180-190 g of refined honey to make big honeyed pills.

Description Blackish-brown big honeyed pills; taste, sweet and bitter.

Identification (1) Microscopical: Clusters of calcium oxalate large, 60-140 μm in diameter. Irregular branched masses colourless, dissolved in choral hydrate solution; hyphae colourless or pale brown, 4-6 μm in diameter. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Bast fibres pale yellow, fusiform, with thickened walls and fine pit-canals. Fragments of endosperm cells colourless, with relatively thickened walls and many large subrounded pits.

(2) Heat under reflux 2 pills, ground well with 8 g of kieselguhr, in 50 ml of ether on a water bath at a lower temperature for 1 hour. Filter and evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. To 0.5 g of Radix Aucklandiae reference drug, add 10 ml of ether to produce a solution as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and acetone (10 : 3) as the mobile phase. Apply separately 5-10 μl of the test solution and 1 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with a 5% solution of vanillin in sulfuric acid, heat to the spots clear. The blue spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Grind well 3 pills with 10 g of kieselguhr to fine powder, add 90 ml of chloroform and heat under reflux for 1 hour. Filter and extract the filtrate with three 20-ml quantities of 2% sodium hydroxide solution. Combine the extracts, adjust the pH value to 1-2 with dilute hydrochloric acid. Extract with three 20-ml quantities of chloroform. Combine the chloroform extracts and wash with water, and evaporate to dryness after dehydrating with anhydrous sodium sulfate. Dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Dissolve magnolol CRS and honokiol CRS in dehydrated ethanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} prepared with 1% sodium hydroxide solution as the coating substance and a mixture of benzene and ethyl acetate (6 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions, allow to stand in a condition of relative humidity >80% for 15 minutes and then develop immediately. After developing and removal of the plate, dry in air, examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution. Spray with a 5% solution of vanillin in sulfuric acid, heat at 105 ℃ to the spots clear. The spots show reddish-brown or purplish-brown under sunlight.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To soothe the liver and regulate *qi* flow, and relieve distension to kill pain.

Indications Fullness and constriction in the chest and hypochondria, indigestion and casting up of gastric acid due to stagnation of *liver-qi*.

Usage and dosage 1 pill, twice a day.

Strength 10 g per pill

Storage Preserve in tightly closed containers.

Chanfukang Keli
(产复康颗粒)

Chanfukang Granules

Ingredients Herba Leonuri; Radix Angelicae Sinensis; Radix et Rhizoma Ginseng; Radix Astragali; Radix Polygoni Multiflori; Semen Persicae; Pollen Typhae; Radix Rehmanniae Preparata; Rhizoma Cyperi (processed with vinegar); Thallus Eckloniae; Rhizoma Atractylodis Macrocephalae; Auricularia.

Procedure Decoct the above twelve ingredients with water twice, 2 hours for each time, combine the decoctions, filter and concentrate to a thin extract with a relative density of 1.25-1.28 (50-60℃). To the thin extract, add a quantity of brown sugar and dextrin, make granules and dry, then make up to 600 g.

Description Brown granules; taste, sweet and slightly bitter.

Identification (1) Dissolve 2 g of the granules in 10 ml of 1% hydrochloric acid solution and filter, to 1 ml of the filtrate add 1 drop of silicotungstic acid TS, a greyish-white precipitate is produced.

(2) Heat under reflux 6 g of the granules in 25 ml of methanol for 1 hour, evaporate methanol of the extract, dissolve the residue in 50 ml of water by heating, cool. Extract with three 15-ml quantities of ether, combine the ether solutions, extract with three 15-ml quantities of 2% sodium carbonate solution. Separate the alkaline solution, adjust pH value to 2-3 with hydrochloric acid. Extract with 15 ml of benzene, discard the benzene solution and extract again with three 15-ml quantities of ether. Combine the ether extracts and evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve ferulic acid CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of benzene, glacial acetic acid and methanol (30:1:3) as the mobile phase. Apply separately 5 μl each of the above two solutions to the plate. After

developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) To 10 g of the granules, add 25 ml of water, shake and filter. Concentrate the filtrate to 10 ml as the test solution. Macerate 3 g of Radix Astragali reference drug with 15 ml of water overnight, filter and concentrate the filtrate to 5 ml as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethanol, concentrated ammonia TS and water (7 : 1 : 2) as the mobile phase. Apply separately 5 μl each of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with 3% ninhydrin solution in ethanol, heat at 105℃ for about 10 minutes. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay *Reference solution* Dissolve a quantity of stachydrine hydrochloride CRS, accurately weighed, in hydrochloric acid solution (0.1 mol/L) to prepare a solution containing 1 mg per ml as the reference solution.

Test solution Weigh accurately 12 g of the powder, obtained under the weight variation test and triturated, in a stoppered conical flask, add 50 ml of ethanol, accurately measured, ultrasonicate for 30 minutes, filter. Discard the initial filtrate, transfer 25 ml, accurately measured, of the successive filtrate to a 50 ml beaker, evaporate to dryness on a water bath, dissolve the residue in 10 ml, accurately measured, of hydrochloric acid solution (0.1 mol/L).

Procedure To the reference solution and the test solution, separately add 0.5 g of activated charcoal, heat on a water bath for 1 minute, stir and filter to 25 ml volumetric flasks separately. Wash the beaker and filter funnel with 10 ml of hydrochloric acid solution (0.1 mol/L) in portions, combine the washings to same flask. Transfer accurately 20 ml of hydrochloric acid solution (0.1 mol/L, as a blank) to another 25 ml volumetric flask. To each volumetric flask add 3 ml of freshly prepared 2% ammonium reineckate solution, accurately measured, mix well and dilute to volume with hydrochloric acid solution (0.1 mol/L). Mix well, allow to stand in an ice bath for 1 hour, filter through a dry filter paper, discard the initial filtrate. Carry out the method for ultraviolet spectrophtometry and colourimetry (Appendix Ⅴ B), measure the absorbance of the successive filtrate at 525 nm, subtract the absorbance of blank from the absorbance of the reference preparation (or the test preparation), calculate the content of alkaloids. It contains not less than 3.0 mg of alkaloids for each bag, calculated as stachydrine hydrochloride ($C_7H_{13}NO_2 \cdot HCl$).

Action To reinforce *qi* and nourish blood, and expel stagnated blood to promote the reproduction of blood.

Indications Lochiorrhea due to a deficiency *of qi* and stagnation of blood, with manifestations of excessive bleeding after childbirth, lassitude, weakness and aching in the lower back and legs.

Usage and dosage 20 g, 3 times a day; taken after dissolved in boiling water; 5-7 days making one course of treatment. Could be administrated for a long time during the puerperal period.

Strength 10 g per pack

Storage Preserve in tightly closed containers.

Changweining Pian
(肠胃宁片)

Changweining Tablets

Ingredients Radix Codonopsis 96 g; Rhizoma Atractylodis Macrocephalae 64 g; Radix Astragali 96 g; Halloysitum Rubrum 190 g; Rhizoma Zingiberis (carbonized) 38 g; Radix Aucklandiae 38 g; Fructus Amomi 38 g; Fructus Psoraleae 96 g; Radix Puerariae Lobatae 96 g; Radix Saposhnikoviae 38 g; Radix Paeoniae Alba 64 g; Rhizoma Corydalis 64 g; Radix Angelicae Sinensis 64 g; Catechu 32 g; Pericarpium Papaveris 38 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 64 g.

Procedure Pulverize Rhizoma Zingiberis and Radix Aucklandiae to fine powder, pulverize Halloysitum Rubrum to very fine powder. Distil volatile oil of Fructus Amomi, to the volatile oil and residue of distillation for latter use. Pulverize Radix Puerariae Lobatae, Rhizoma Atractylodis Macrocephalae, Radix Paeoniae Alba, Fructus Psoraleae, Pericarpium Papaveris, Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle and Catechu to coarse powder. Percolate with 70% ethanol, Carry out the percolation method in Liquid Extracts and Extracts (Appendix Ⅰ O) collect the percolation, and recover ethanol. Decoct the Fructus Amomi residue and other five ingredients with water twice, 3 hours for the first time and 2 hours for the second time, filter. Combine the filtrate and the ethanol percolation, concentrate to a quantity and mix with the above fine powder of Rhizoma Zingiberis and Radix Aucklandiae, stir well, dry, pulverize to fine powder, mix with the very fine powder of Halloysitum Rubrum, mix well to make granules, spry with the volatile oil, make to 1000 tablets and coat with sugar.

Description Sugar coated tablets with blackish-brown core; odour, aromatic; taste, slightly bitter.

Identification (1) To 10 tablets with coating removed, pulverized to powder, add 50 ml of ether, ultrasonicate for 5 minutes, discard the ether, dry the residue, add 30 ml of methanol, ultrasonicate for 15 minutes, filter. Evaporate the filtrate to dryness, dissolve the residue in 20 ml of water, filter by cotton, and extract by shaking the filtrate with two 25-ml quantities of ethyl acetate, discard the ethyl acetate layer, and extract by shaking the filtrate with two 25-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extracts, extract with 30 ml of water saturated by *n*-butanol, evaporate the *n*-butanol layer to dryness, dissolve the residue in 5 ml of methanol, apply the methanol to a column (1.5 cm in internal diameter) previously packed with neutral aluminium oxide (100-200 mesh, 2 g), elute with 40 ml of methanol, and collect the elute, evaporate the elute to dryness, and dissolve the residue in 0.5 ml of methanol as the test solution. Dissolve paeoniflorin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 10 μl of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin solution in sulfuric acid, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) To 20 tablets with coating removed, pulverized to powder, add 50 ml of methanol, heat on a water bath to

dissolved, filter. Apply the filtrate to a column (1-1.5 cm in internal diameter) previously packed with neutral aluminium oxide (100-200 mesh, 5 g), elute with 100 ml of 40% methanol, and collect the eluate, evaporate the eluate to dryness on a water bath, dissolve the residue in 30 ml of water, extract by shaking with *n*-butanol saturated with water twice, 20 ml for each time. Combine the *n*-butanol extracts, extract with ammonia TS twice, 20 ml for each time, evaporate the *n*-butanol layer to dryness on a water bath, and dissolve the residue in 0.5 ml of methanol as the test solution. Dissolve astragaloside Ⅳ CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of the mixture of chloroform, methanol and water (13∶7∶2) as the mobile phase. Apply separately 5 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% solution of sulfuric acid in ethanol, heat at 105℃ for about 5 minutes. Examine separately in daylight and ultraviolet light at 365 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution examine in daylight; and the fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot in the chromatogram obtained with the reference solution under ultraviolet light.

(3) To 20 tablets with coating removed, pulverized to fine powder, add 40 ml of ether, shake continuously for 1 hour, and filter, keep the drug residue for further use, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve psoralen CRS in ethyl acetate to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the mixture of *n*-hexane and ethyl acetate (4∶1) as the mobile phase. Apply separately 5 μl of the above two solutions to the plate. After developing and removal of the plate, dry it in air, examine under ultraviolet light at 254 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot in the chromatogram obtained with the reference solution.

(4) To the drug residue obtained from Identification (3), recover the solvents, add 30 ml of methanol, ultrasonicate for 20 minutes, filter. Evaporate the filtrate to dryness, add 20 ml of water, stir to dissolved, filter by cotton, adjust the filtrate to alkaline with concentrated ammonia TS, extract by shaking with three 20-ml quantities of ether. Combine the ether extracts, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve tetrahydropalmatine CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 1% solution of sodium hydroxide as the coating substance and the mixture of *n*-hexane, chloroform and methanol (15∶8∶2) as the mobile phase. Apply separately 10-15 μl of the test solutions and 2 μl of the reference solution to the plate. After developing in a chamber pre-equilibrated with mobile phase and removal of the plate, dry in air, fumigate the plate in iodine vapour, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and the mixture of acetonitrile and 0.1% solution of phosphoric acid (11∶89) as the mobile phase. As detector a spectrophotometer set at 250 nm, the number of theoretical plates for the column is not less than 3000, calculated with the reference to the peak of puerarin.

Reference solution Dissolve a quantity of puerarin CRS, accurately weighed, in ethanol to produce a solution containing 40 μg per ml as the reference solution.

Test solution To 10 tablets with coating removed, weighed accurately, pulverized to fine powder, weighed accurately a proper quantity of the powder (corresponding about 2 tablets) to a stopper conical flask. Add accurately 25 ml of dilute ethanol, stopped tightly, weighed accurately, ultrasonicate (power 250 W, frequency 33 kHz) for 20 minutes, cool, weighed accurately again, replenished the lost weight with dilute ethanol, mix well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of the reference solution and the test solution separately into the column and calculate the content.

It contains not less than 0.40 mg of puerarin ($C_{21}H_{20}O_9$) per tablet, referred to Radix Puerariae Lobatae.

Action To invigorate the spleen and kidney, warm the *middle-energizer* to kill pain, and astringe the intestines to stop diarrhea.

Indications Diarrhea due to a deficiency of *spleen-yang* and *kidney-yang*, with manifestations of abnormal bowels movement, or dawn diarrhea with mucous stools, sometimes accompanied with abdominal distending pain, discomfort in the epigastrium, sag and fullness of the lower abdomen; chronic colitis, ulcerative colitis and intestinal dysfunction with above symptoms.

Usage and dosage 4-5 tablets, 3 times a day.

Precaution Avoid sour, cold and irritant foods. Be cautious about children.

Storage Preserve in tightly closed containers.

Chenxiang Huaqi Wan (沉香化气丸)

Chenxiang Huaqi Pills

Ingredients Lignum Aquilariae Resinatum 25 g; Radix Aucklandiae 50 g; Herba Pogostemonis 100 g; Rhizoma Cyperi (processed with vinegar) 50 g; Fructus Amomi 50 g; Pericarpium Citri Reticulatae 50 g; Rhizoma Curcumae (processed with vinegar) 100 g; Massa Medicata Fermentata (stir-baked) 100 g; Fructus Hordei Germinatus (stir-baked) 100 g; Radix et Rhizoma Glycyrrhizae 50 g.

Procedure Pulverize the above ten ingredients to fine powder, sift, mix well; make pills with water and dry at a low temperature.

Description Greyish-brown to yellowish-brown watered pills; odour, aromatic; taste, slightly sweet and bitter.

Identification (1) Microscopical: Gelatinized starch granule masses pale yellow. Fibre tracheids with slightly thickened

walls and bordered pits, pit-apertures V-shaped or cross-shaped. Wood fibres in bundles, long-fusiform, 16-24 μm in diameter, walls slightly thickened, pit-apertures transversely cleft, cross-shaped or V-shaped. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Non-glandular hairs 1-6 celled, with warty protuberances. Secretory cells subrounded, containing pale yellowish-brown to reddish-brown secretion, surrounded by radially arranged cells; Sclerenchymatous cells of endotesta yellowish-brown or brownish-red, subpolygonal in surface view, walls thickened, lumen containing silica body. Prisms of calcium oxalate abundant in parenchyma. Epidermal cells with longitudinal fissures, arranged with 1 long cell connected to 2 short cells alternately, the walls of long cells thickened, sinuous and lignified.

(2) Macerate overnight 20 g of the pills, triturated, with 200 ml of water in a 500 ml round-bottom flask, and connect the apparatus for determination of volatile oil. Add water through the top of reflux condenser until the graduated tube of B is filled and overflows to flask A, then add 2 ml ethyl acetate to the graduated tube of B, heat under reflux. transfer the collected liquid in the determination tube to a separator. Extract with 2 ml of ethyl acetate, shake and separate the ethyl acetate extract as the test solution. Dissolve patchouli alcohol CRS and α-cyperone CRS in ethyl acetate separately to produce solutions containing 2 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and ethyl acetate (60 : 1) as the mobile phase. Apply separately to the plate 2 μl of the test solution and 1 μl of the reference solution. After developing and removal of the plate, dry in air. Spray with a 5% solution of ferric chloride in ethanol acidified with hydrochloric acid, and heat at 105℃ for about 5 minutes. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

(3) Pulverize 8 g of the pills to powder, add 100 ml of ether, ultrasonicate for 20 minutes, and filter, evaporate the filtrate to dryness, dissolve the residue in 2 ml of ethyl acetate as the test solution. Dissolve dehydrocostus lactone CRS in ethylacetate to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B coating), using silica gel G mixed with sodium carboxyme thylcellulose as the coating substance and a mixture of chloroform-cyclohexane (5 : 1) as the mobile phase. Apply separately 5 μl each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 5% solution of vanillin in sulfuric acid. The spots in the chromatogram obtained with test solution correspond in position and colour to the spots in the chromatogram obtained with reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Volatile ether extractives Weigh accurately about 2 g of the coarse powder triturated, carry out the determination of ether extractives (Appendix Ⅹ A). It contains not less than 0.40 percent of volatile ether extractives.

Assay Carry out the method for high performance liguid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% phosphoric acid solution (20 : 80) as the mobile phase. As detector a spectrophotometer set at 283 nm. The number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of hesperidin.

Reference solution Dissolve a quantity of hesperidin CRS, accurately weighed, in methanol to produce a solution containing 50 μg per ml as the reference solution.

Test solution Weigh accurately 0.5 g of the powder, to a Soxhlet's extractor, add a quantity of methanol, heat under reflux for 3 hours. Transfer the extracts to a 50 ml volumetric flask, wash the container with a quantity of methanol for several times, combine the washings with the extracts to the same flask, dilute with methanol to volume, and mix well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 3.0 mg of hesperidin ($C_{28}H_{34}O_{15}$) per gram, referred to Pericarpium Citri Reticulatae.

Action To regulate *qi* flow and soothe the liver, and remove the retained and harmonize the stomach.

Indications Distending pain in *the* stomach and abdomen, fullness in the chest, anorexia, belching and casting up of gastric acid due to stagnation of *qi* in the liver and stomach.

Usage and dosage 3-6 g, 2 twice a day.

Precaution Be cautious about pregnant women.

Storage Preserve in well closed containers, protected from moisture.

Chitong Xiaoyanling Keli (齿痛消炎灵颗粒)

Chitong Xiaoyanling Granules

Ingredients Gypsum Fibrosum 200 g; Herba Schizonepetae 80 g; Radix Saposhnikoviae 80 g; Pericarpium Citri Reticulatae Viride 100 g; Cortex Moutan 100 g; Radix Rehmanniae 150 g; Indigo Naturalis 100 g; Radix et Rhizoma Asari 60 g; Radix Angelicae Dahuricae 50 g; Radix Glycyrrhizae 60 g.

Procedure Distil volatile oil of Herba Schizonepetae, Radix et Rhizoma Asari and Radix Angelicae Dahuricae, and keep water solution for further use. Carry out the method of percolation as described under liquid and extracts (Appendix Ⅰ O), macerate Indigo Naturalis with 90% ethanol for 48 hours, and percolate. Recover ethanol, and concentrate to a quantity. Decoct the other six ingredients with water for two times, 1.5 hours for each, combine the decoction, and filter. Combine the filtrate with the above water solution and the percolate, and concentrate to a quantity. Add a quantities of sucrose and dextrin, make granules, dry, spray with the above volatile oil, mix thoroughly, and make 1000 g; or add a quantities of dextrin and 10 g of stevioside, make granules, dry, spray with the above volatile oil, mix thoroughly, and make 500 g.

Description Yellowish brown to brown granules; taste, sweet, slightly bitter; or taste slightly bitter (without sucrose).

Identification (1) Grind 10 g or 5 g (without sucrose) to fine powder, add 20 ml of ether, stopper, and shake for 15 minutes. Stand for 1 hour, filter, evaporate the filtrate, and dissolve the residue in 1 ml of chloroform as the test solution. Dissolve a quantity of Indirubin CRS in chloroform to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed

with sodium carboxymethylcellulose as the coating substance and a mixture of benzene, chloroform and acetone (5 : 4 : 1) as the mobile phase. Apply separately 10 μl of the two solutions to the plate. After developing and removal of the plate, dry in air. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Grind 10 g or 5 g (without sucrose) to fine powder, add 20 ml of methanol, and heat under reflux for 20 minutes. Filter and use the filtrate as the test solution. Dissolve a quantity of hesperidin CRS in methanol to produce a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance. Apply separately 10 μl of the two solutions to the plate. After developing 4.5 cm with a mixture of ethyl acetate, methanol and water (100 : 17 : 13) as the mobile phase, removal of the plate, and dry in air. Develop again with the upper layer of toluene, ethyl acetate, formic acid and water (20 : 10 : 1 : 1) to 12 cm, removal of the plate, dry in air, spray with aluminium chloride TS and examine under ultraviolet light at 365 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅵ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (35 : 65) as the mobile phase. As detector a spectrophotometer set at 283 nm. The number of theoretical plates of the column is not less than 1000, calculated with the reference to the peak of hesperidin.

Reference solution Dissolve a quantity of hesperidin CRS, weighed accurately, in methanol to produce a solution containing 80 μg of per ml.

Test solution Pulverize the granules, obtained under the test of packing variation, to fine powder, weigh accurately 2 g or 1 g (without sucrose) in a stopper conical flask, add accurately 25 ml of methanol, stopper, weigh, ultrasonicate (power 250 W, frequency 33 kHz) for 1 hour, allow to cool, weigh again, replenish the lost weight with methanol, and mix thoroughly. Filter, and use the filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 16.0 mg of hesperidin ($C_{28}H_{34}O_{15}$) per bag, referred to Pericarpium Citri Reticulatae Viride.

Action To disperse *wind* and clear *heat*, and cool blood and kill pain.

Indications Headache, fever, dry mouth, foul breath, constipation and swollen painful gums due to retained *heat* in the spleen and stomach and attack of the upper part of the body by *wind-heat*; acute pericoronitis of the wisdom teeth, acute gingivitis, acute periodontitis and acute pulpitis with above symptoms.

Usage and dosage 1 pack, 3 times a day, double dosage for the first time.

Precaution Aavoid wine and pungent food.

Strength (1) 20 g (2) 10 g (without sucrose) per pack

Storage preserve in tightly closed container.

Chuanbei Pipa Tangjiang (川贝枇杷糖浆)

Chuanbei Pipa Syrup

Ingredients Extractum Fritillariae Cirrhosae Liquidum 45 ml; Radix Platycodi 45 g; Folium Eriobotryae 300 g; Mentholum 0.34 g.

Procedure Pulverize 45 g of Bulbus Fritillariae Cirrhosae to coarse powder and carry out the percolation as described under the liquid extracts and extracts (Appendix Ⅰ O). Macerate the coarse powder in 70% ethanol for 5 days and percolate slowly. Collect 38 ml of the initial percolate in a separate container and continue to percolate until the soluble constituents are completely percolated. Concentrate the successive percolate to a quantity, mix with the initial percolate, continue to concentrate to 45 ml and filter. Decoct Radix Platycodi and Folium Eriobotryae with water for two times (2.5 and 2 hours respectively). Combine the decoctions, filter and concentrate to a quantity, add 400 g of sucrose and a quantity of antiseptic agent, boil to dissolve and filter. Mix the filtrate with the Extractum Fritillariae Cirrhosae Liquidum, cool, add Mentholum and a quantity of the solution of almond essence in ethanol with stiring, add water to make a volume of 1000 ml and stir well.

Description A brownish-red thick liquid; odour, aromatic; taste, sweet, slightly bitter, and cool.

Identification Extract 20 ml with three 15-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, and evaporate to dryness. Dissolve the residue in 3-5 ml of water, cool, and apply to a small column (15 mm in diameter, 8 cm in length) packed with macroporous resin D101, pre-elute with 50 ml of water. Elute with dilute ethanol TS, and collect the eluates. Evaporate to dryness and dissolve the residue in 1 ml of methanol as the test solution. Decoct Folium Eriobotryae reference drug with 100 ml water for 1 hour, filter. Prepare a solution of filtrate in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B coating), using silica gel G as the coating substance and a mixture of cyclohexane, ethylacetate, and glacial acetic acid (8 : 4 : 0.1) as the mobile phase. Apply in strips separately 10-20 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 5% solution of vanillin in sulfuric acid. The spots in the chromatogram obtained with test solution correspond in position and colour to the spots in the chromatogram obtained with reference solution.

Relative density Not less than 1.13 (Appendix Ⅶ A).

Other requirements Comply with the general requirements for syrups (Appendix Ⅰ H).

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use capillary column of macrogol (0.25 μm in internal diameter, and 30 meter long); maintain injector temperature at 250℃ and detector temperature at 250℃. The split ratio is 25 : 1. The number of theoretical plates of the column is not less than 5000, calculated with reference to the peak of naphthalene.

Correction factor Dissolve a quantity of naphthalene, accurately weighed, in cyclohexane to prepare a solution containing 15 mg per ml as the internal standard solution. Dissolve about 75 mg of menthplum CRS, weighed

accurately, in a 5 ml volumetric flask, add a quantity of cyclohexane to dissove and dilute to volumn, mix well. Measure accurately 1 ml, in a 20 ml volumetric flask, add accurately 1 ml of the internal standard solution, dilute to volumn with cyclohexane, and mix well. Inject accurately 1 μl of the solution into the column, calculate the correction factor for mentholum.

Procedure Measure accurately 50 ml and add 250 ml of water. Carry out the method for determination of volatile oil (Appendix Ⅵ D). Add water through the top of the apparatus until fills the collector and overflows to flask, then add 3 ml of cyclohexane, connect to the reflux condenser, heat to boil and keep boiling for 4 hours, cool, and transfer the liquid from the apparatus to a separator. Wash the inner wall of the reflux condenser and the apparatus with cyclohexane, transfer the washings to the same separator. Separate the cyclohexane layer, and extract the water layer with two 3-ml of cyclohexane, filter the cyclohexane layer through a funnel laid with anhydrous sodium sulphate, combine the cyclohexane extract, transfer to a 20 ml volumetric flask, add accurately 1 ml of the internal standard solution, and dilute to volumn with cyclohexane, mix well. Inject accurately 1 μl of the solution into the column and measure. It contains not less than 0.20 mg of mentholum ($C_{10}H_{20}O$) per ml.

Action To clear *heat* and disperse the lung, and resolve phlegm and relieve cough.

Indications Coughing with expectoration of yellow phlegm, or difficult expectoration of phlegm, sore throat, constriction and distending pain in the chest due to invasion of the lung by *wind-heat* and internal retention of *phlegm-heat*; common *cold* and bronchitis with above symptoms.

Usage and dosage 10 ml, 3 times a day.

Storage Preserve in tightly closed containers, stored in a cool place.

Chuanbei Xueli Gao (川贝雪梨膏)

Chuanbei Xueli Concentrated Decoction

Ingredients Extractum Pyri Nivalis Liquidum 400 g; Bulbus Fritillariae Cirrhosae 50 g; Radix Ophiopogonis 100 g; Bulbus Lilii 50 g; Flos Farfarae 25 g.

Procedure Take fresh fruits of Pyrus nivalis, wash clean, squeeze to obtain juice, and decoct the residue with water for 2 hours and filter. Combine the filtrate and the above juice, stand for 24 hours, separate the supernatant and concentrate to a relative density of 1.30 (90℃) to obtain Extractum Pyri Nivalis Liquidum. Pulverize Bulbus Fritillariae Cirrhosae to coarse powder, carry out the method for percolation as described under liquid extracts and extracts (Appendix Ⅰ O), using 70% ethanol as the solvent, macerate for 48 hours and then percolate. Collect the percolate, recover ethanol. Decoct the residue and the other 3 ingredients with water twice, 4 hours for the first time and 3 hours for the second, combine the decoctions, filter, and stand for 12 hours. Separate the supernatant and concentrate to a quantity, add the above percolate of Bulbus Fritillariae Cirrhosae and Extractum Pyri Nivalis Liquidum, concentrate to a thin extract with relative density of 1.30 (90℃). To each 100 g of the thin extract, add invert sugar prepared from 400 g of sucrose, mix well and concentrate to the required density.

Description Brownish-yellow thick semifluid; taste, sweet.

Identification (1) To 20 ml add 20 ml of water and 5 ml of sodium carbonate TS, stir well, transfer the solution to a separator, extract by shaking with 20 ml of ether, separate the ether layer and evaporate to dryness, dissolve the residue in 2 ml of 1% hydrochloric acid and filter. Add 1-2 drops of potassium iodobismuthate TS to half of the filtrate in a test tube, a reddish brown precipitate is produced. Add 1-2 drops of mercuric potassium iodide TS to the other half of the filtrate in another test tube, a white turbidity is produced. (2) To 15 g add 15 ml of water, stir well, extract with two 25-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts and evaporate to dryness. Dissolve the residue in 10 ml of water, add 2 ml of hydrochloric acid, heat under reflux on a boiling water bath for 1 hour, cool. Extract with two 20-ml quantities of chloroform, evaporate the combined extracts to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. To 1 g of Radix Ophiopogonis reference drug add 30 ml of water, decoct for 30 minutes, cool and filter, to the filtrate add 2 ml of hydrochloric acid, prepare a solution as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and acetone (4∶1) as the mobile phase. Apply separately 2-5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Relative density Not less than 1.10 for a solution of 10 g in 20 ml of water (Appendix Ⅶ A).

Other requirements Complies with the general requirements for concentrated decoctions. (Appendix Ⅰ F).

Action To nourish *lung-yin* to stop cough, and promote fluid production to relieve sore throat.

Indications Cough, shortness of breath, dryness of the mouth and throat due to *lung-heat* in the *yin* deficiency syndrome.

Usage and dosage 15 g, twice a day.

Precaution Avoid pungent food.

Storage Preserve in tightly closed containers.

Chuanxiong Chatiao San (川芎茶调散)

Chuanxiong Chatiao Powder

Ingredients Rhizoma Chuanxiong 120 g; Radix Angelicae Dahuricae 60 g; Rhizoma seu Radix Notopterygii 60 g; Radix et Rhizoma Asari 30 g; Radix Saposhnikoviae 45 g; Herba Menthae 240 g; Herba Schizonepetae 120 g; Radix et Rhizoma Glycyrrhizae 60 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix well.

Description A dark yellow powder; odour, aromatic; taste, pungent and slightly bitter.

Identification (1) Microscopical: Compound starch granules consisting of 8-12 components. Spiral or reticular-spiral vessels 14-50 μm in diameter, walls thickened. The cells of epicarp polygonal in surface view, with mucous walls, containing brown contents. Vittae containing brownish-

yellow secretion, about 100 μm in diameter. Vittae containing golden yellow secretion, about 30 μm in diameter. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres.
(2) To 3 g of the powder add 20 ml of petroleum ether (60-90℃), stopper tightly, shake frequently, macerate for 4 hours, filter, concentrate the filtrate to about 1 ml as the test solution. Prepare a solution with 0.3 g of Rhizoma Chuanxiong reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 10 μl each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light 365 nm. A major fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.
(3) Prepare a solution with 0.5 g of Rhizoma seu Radix Notopterygii reference drug in the same manner described under Identification test (2) as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane, benzene and ethyl acetate (2 : 1 : 1) as the mobile phase. Apply separately 10 μl of each of the reference drug solution and the test solution obtained under Identification test (2) to the plate. After developing and removal of the plate, dry in air. Spray with a 1% solution of vanillin in sulfuric acid and heat at 105℃ for about 5 minutes. A main spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Other requirements Complies with the general requirements for powders (Appendix Ⅰ B).

Action To disperse *wind* to kill pain.

Indications Headache, or aversion to cold, fever and stuffy nose due to affliction from external wind.

Usage and dosage 3-6 g, twice a day, taken with light tea after meals.

Precaution Be cautious about pregnant women.

Storage Preserve in well closed containers, protected from moisture.

Chuanxiong Chatiao Wan
(川芎茶调丸)

Chuanxiong Chatiao Pills

Ingredients Rhizoma Chuanxiong 120 g; Radix Angelicae Dahuricae 60 g; Rhizoma seu Radix Notopterygii 60 g; Radix et Rhizoma Asari 30 g; Radix Saposhnikoviae 45 g; Herba Schizonepetae 120 g; Herba Menthae 240 g; Radix et Rhizoma Glycyrrhizae 60 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix well. Make pills with water and dry at a lower temperature.

Description Dark brown watered pills; odour, aromatic; taste, pungent, sweet and slightly bitter.

Identification (1) Microscopical: Compound starch granules consisting of 8-12 components. Spiral or reticular-spiral vessels 14-50 μm in diameter, walls thickened. Vittae containing brownish-yellow secretion, about 100 μm in diameter. Vittae containing golden yellow secretion, about 30 μm in diameter. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres.
(2) Pulverize 3 g of the pills to fine powder, add 20 ml of petroleum ether (60-90℃), stopper tightly, shake frequently, macerate for 4 hours, filter, evaporate the filtrate to 1 ml as the test solution. Prepare a solution with 0.3 g of Rhizoma Chuanxiong reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry it in air. Examine under ultraviolet light at 365 nm. The major fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the fluorescent spots in the chromatogram obtained with the reference drug solution.
(3) Pulverize 10 g of the pills to fine powder, add about 150 ml of water, decoct for 30 minutes, allow to cool, centrifuge (1500 rpm) for 10 minutes. Adjust the pH value of the supernatant to 2-3 with hydrochloric acid, extract with two 20-ml quantities of chloroform. Combine the chloroform solutions and evaporate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution with 1 g of Radix Angelicae Dahuricae reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of chloroform and methanol (20 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing in a chamber pre-equilibrated with the mobile phase for 20 minutes and removal of the plate, dry in air. Examine under ultraviolet light at 365nm. The principal fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liguid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 2% acetic acid solution (20:80) as the mobile phase. As detector a spectrophotometer set at 323 nm. The number of theoretical plates of the column is not less than 8000, calculated with reference to the peak of ferulic acid.

Reference solution Dissolve a quantity of ferulic acid CRS, accurately weighed, in a mixture of 45% ethanol and glacial (20 : 1) to prepare a solution containing 10 μg per ml as the reference solution.

Test solution Weigh accurately 0.5 g of the powder, add accurately 20 ml of a mixture of 45% ethanol and glacial (20 : 1), weigh, heat under reflux for 1 hour, cool, and weigh. Replenish the lost weight with the above solution, mix thoroughly, centrifuge, use the supernatant liquid as the test solution.

Procedure Inject accurately 10 μl each of the reference solution and the test solution into the column and calculate the content.
It contains not less than 0.15 mg of a ferulic acid ($C_{10}H_{10}O_4$) per gram, referred to Rhizoma Chuanxiong and Radix et Rhizoma Notopterygii.

Action To disperse *wind* to kill pain.

Indications Headache, or aversion to cold, fever and stuffy nose due to affliction from external wind.

Usage and dosage 3-6 g, twice a day; taken with light tea after meals.

Precaution Be cautious about pregnant women.

Storage Preserve in well closed containers, protected from moisture.

Chunyang Zhengqi Wan
(纯阳正气丸)

Chunyang Zhengqi Pills

Ingredients Herba Pogostemonis 100 g; Rhizoma Pinelliae (processed) 100 g; Radix Inulae 100 g; Pericarpium Citri Reticulatae 100 g; Flos Caryophylli 100 g; Cortex Cinnamomi 100 g; Rhizoma Atractylodis 100 g; Rhizoma Atractylodis Macrocephalae 100 g; Poria 100 g; Cinnabaris 10 g; Saltpetre (refined) 10 g; Borax 6 g; Realgar 6 g; Lapis Micae Aureus (calcined) 4 g; Moschus 3 g; Borneolum Syntheticum 3 g.

Procedure Levigate separately Cinnabaris and Realgar to very fine powders. Pulverize all the other ingredients except Moschus, Borneolum Syntheticum and Saltpetre to fine powder. Triturate Moschus and Borneolum Syntheticum with the above powders, add the fine powder of Saltpetre, sift and mix well. Decoct 50 g of Pericarpium Zanthoxyli with water twice. Make pills with the decoction and the above powders, and dry in air.

Description Brownish-yellow to brownish-red watered pills; odour, aromatic; taste, bitter and pungent.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate solution; hyphae colourless or pale brown, 4-6 μm in diameter. Raphides of calcium oxalate 32-144 μm long, abundant in mucilage cells or scattered. Needles of calcium oxalate minute, 10-32 μm long, irregularly filled in parenchymatous cells. Prisms of calcium oxalate abundant in parenchyma. Non-glandular hairs 1～6-celled, walls warty. Stone cells subrounded or subrectangular, walls thin on one side. Pollen grains triangular, about 16 μm in diameter. Irregular fine granules dark brownish-red, lustrous, edge black. Irregular pieces golden or orange, lustrous.

(2) Triturate 3 g of the pills to fine powder, add 30 ml of ether, macerate for 1 hour, filter and evaporate the ether. Dissolve the residue in 1 ml of ethanol as the test solution. Dissolve eugenol CRS in ethanol to produce a solution containing 10 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and benzene as the mobile phase. Apply separately 1-2 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry it in air. Spray with a 5% solution of vanillin in sulfuric acid and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Dissolve cinnamaldehyde CRS in ethanol to produce a solution containing 1 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (8∶1) as the mobile phase. Apply separately 2-5 μl of the test solution obtained under Identification test (2) and the above reference solution to the plate. After developing and removal of the plate, dry in air. Spray with solution of ethanolic dinitrophenylhydrazine TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To warm the *middle-energizer* to disperse *cold*.

Indications Abdominal pain, vomiting, diarrhea, fullness in the chest, headache, aversion to cold, heaviness sensation of the body and limbs due to affliction from *cold-dampness* in summer.

Usage and dosage 1.5-3 g, 1-2 times a day.

Precaution Contraindicated for pregnant women.

Storage Preserve in tightly closed containers.

Cuitang Wan
(催汤丸)

Cuitang Pills

Cuitang pills are prescription used by Tibetan nationality.

Ingredients Extractum Inulae Racemosae 30 g; Radix Inulae Racemosae 20 g; Caulis Rubi (removed from bark and pith) 90 g; Caulis Tinosporae Sinensis (removed from bark) 50 g; Rhizoma Zingiber 20 g; Fructus Chebulae (removed from kerned) 36 g; Fructus Phyllanthi 40 g; Fructus Terminaliae Billericae (removed from kerned) 20 g; Radix Phlomis younghusbandii 60 g.

Procedure Pulverize the above ingredients, except Extractum Inulae Racemosae, to coarse powder, sift and mix well. Add Extractum Inulae Racemosae and water to make pills, and dry.

Description Greyish-yellow concentrated watered pills; externally rough, fragments of fibres distinct; odour, aromatic; taste, bitter, pungent and slightly salty.

Identification (1) Microscopical: Fibres mostly broken, walls thickened, with fissures, pits and pit-cannals indistinct. Sclerenchymatous cells subsquare or subrounded, walls unevenly thickened, lignified, striations faintly visible, containing prisms of calcium oxalate. Starch granules single, elongated-ovoid, broad-ovoid or irregular shaped, 25-32 μm in diameter, hila pointed, striations at relatively small end visible. Lignified cells subrectangular, pits obliquely fissured, containing clusters of calcium oxalate. Parenchymatous cells subrounded or subpolygonal, containing sand crystals, prisms and rounded-rosette crystals of calcium oxalate. Non-glandular hairs 1～2-celled, 7-20 μm in diameter, some containing yellow or brownish-yellow contents. Cork cells subrectangular or subpolygonal, walls slightly sinuous, containing yellow or yellowish-brown fine granular contents.

(2) To 4 g of the powdered pills, add 20 ml of water and macerate for 10 minutes. Add 20 ml of a mixture of *n*-hexane and ethyl acetate (1∶1), macerate for 3 hours, centrifuge, concentrate the supernatant liquid to about 1 ml and use the solution as the test solution. Prepare a solution with 0.5g of Radix Inulae Racemosae reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose

as the coating substance and a mixture of petroleum ether and ethyl acetate (4 : 1) as the mobile phase. Apply separately 2 μl each of the two solutions to the plate. After developing and removal of the plate, dry it in air, spray with a 5% solution of vanillin in sulfuric acid and heat to the spots clear. The two purple spots in the chromatogram obtained with the test solution correspond in position and colour to that in the chromatogram obtained with the reference drug solution.

(3) Ultrasonicate 6 g of the powdered pills with 20 ml of chloroform for 30 minutes, filter, and concentrate the filtrate to 1 ml as the test solution. Prepare a solution with 2 g of Caulis Rubi reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (8 : 2) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Water Not more than 8.0% (Appendix Ⅸ H).

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A), no disintegration test is required.

Action To induce diaphoresis, reduce fever, relieve cough, and to arrest pain.

Indications Cold at the early stage with cough, headache, and joint aching; also used for prevention and treatment of influenza.

Usage and dosage 1-2 pills, 3 times a day, to be immersed in 400 ml of cold water for 1-2 hours, then decocted to a volume of about 300 ml, and taken while warm.

Precaution Be cautions about patients with renal dysfunction.

Specification 4 g per pill

Storage Preserve in tightly closed containers.

Dabuyin Wan
(大补阴丸)

Dabuyin Pills

Ingredients Radix Rehmanniae Praeparata 120 g; Rhizoma Anemarrhenae (stir-baked with salt) 80 g; Cortex Phellodendri (stir-baked with salt) 80 g; Carapax et Plastrum Testudinis (stir-baked with vinegar) 120 g; Medulla Spinalis Suis 160 g.

Procedure Decoct slightly Medulla Spinalis Suis with boiling water to eliminate the epidermis. Pulverize the other four ingredients to coarse powder, stir with the peeled Medulla Spinalis Suis, dry, pulverize to fine powder, sift and mix well. To each 100 g of the powder add 10-15 g of refined honey and a quantity of water to make water-honeyed pills and dry; or add 80-100 g of refined honey to make big honeyed pills.

Description Dark brownish-black water-honeyed pills; taste, bitter, slightly sweet with astringency.

Identification (1) Microscopical: Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Fibre bundles bright yellow, surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres, walls of crystal cells lignified and thickened. Irregular pieces greyish-yellow, with minute striations or pits on the surface. Needle crystals of calcium oxalate in bundles or scattered, 26-110 μm long.

(2) Triturate well 2 g of the big honeyed pills, add 10 ml of methanol, or pulverize 0.7 g of the water-honeyed pills to powder, add 5 ml of methanol, heat under reflux on a water bath for 15 minutes and filter. Make up for the filtrate or evaporate to 5 ml with methanol, use it as the test solution. Prepare a solution with 0.1 g of Cortex Phellodendri reference drug as the reference drug solution in the same manner. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol, and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately 1 μl of each of the above three solutions to the plate. After developing in a chamber pre-equilibrated with ammonia vapour and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution; and a yellow fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtaind with the reference solution.

Other requirments Comply with the general requirements for pills (Appendix Ⅰ A).

Action To nourish *yin* to reduce *fire*.

Indications Hectic fever, night sweating, coughing, hemoptysis, tinnitus, seminal emission due to *yin* deficiency resulting in hyperactivity of *fire*.

Usage and dosage 6 g, 2-3 times a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Dahuang Qingwei Wan
(大黄清胃丸)

Dahuang Qingwei Pills

Ingredients Radix et Rhizoma Rhei 504 g; Caulis Akebiae 63 g; Semen Arecae 63 g; Radix Scutellariae 96 g; Arisaema cum Bile 42 g; Rhizoma seu Radix Notopterygii 42 g; Pulvis Talci 168 g; Radix Angelicae Dahuricae 42 g; Semen Pharbitidis (stir-baked) 42 g; Natrii Sulfas 63 g.

Procedure Pulverize the above ten ingredients to fine powder, sift and mix well. To each 100 g of the powder add 120-150 g of refined honey to make big honeyed pills.

Description Blackish-brown big honeyed pills; taste, bitter and pungent.

Identification (1) Microscopical: Clusters of calcium oxalate large, 60-140 μm in diameter. Bast fibres pale yellow, fusiform, walls thickened, and with fine pit-canals. Palisade cells of testa pale brown or brown, 48-80 μm long. Fragments of endosperm cells colourless, walls relatively thickened and with numerous large subrounded pits. Vittae containing brownish-yellow secretion, about 100 μm in diameter.

(2) To 3 g add 50 ml of water, mix well and filter. Rinse

the residue with water in portions to obtain a small quantity of white precipitate. The precipitate complies with the test for Identification described under Talc.
(3) The filtrate obtained under Identification test (2) yields the reactions characteristic of sodium and sulphate (Appendix Ⅳ).
(4) Pulverize 2 g of pills to powder, add 50 ml of methanol, ultrasonicate for 20 minutes, and filter, evaporate 5 ml of the filtrate to dryness, dissolve the residue in 10 ml of water, add 1 ml of hydrochloric acid, heat on a water bath for 30 minutes, and cool immediately. Extract with two 10-ml quantities of ether, combine the ether solution and evaporate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution with 0.1 g of Radix et Rhizoma Rhei reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H containing sodium carboxymethylcellulose as the coating substance and the upper layer of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 2 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. Five orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The spots saturated with ammonia vapour turns to red under sunlight.
(5) Triturate well 30 g of pills with 10 g of kieselguhr, mix well, add 50 ml of chloroform and 1 ml of concentrated ammonia TS, ultrasonicate for 30 minutes, filter, extract the filtrate with 20 ml of 2% hydrochloric acid solution with shaking, adjust pH value of the extracts with concentrated ammonia TS to pH 8-9, then extract with two 10-ml quantities of chloroform with shaking. Combine the chloroform solution and evaporate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution with 1 g of Semen Arecae reference drug, 30 ml of chloroform and 0.5 ml of concentrated ammonia TS as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (9 : 1) as the mobile phase. Apply separately 30 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with dilute potassium iodobismuthate TS and dry in air. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To clear *heat* and relax bowels.

Indications Dry mouth and tongue, headache, dizziness and constipation due to hyperactivity of *stomach-fire*.

Usage and dosage 1 pill, twice a day.

Precaution Contraindicated for pregnant women.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Dahuang Zhechong Wan
(大黄䗪虫丸)

Dahuang Zhechong Pills

Ingredients Radix et Rhizoma Rhei (processed) 300 g; Eupolyphaga seu Steleophaga (stir-baked) 30 g; Hirudo (processed) 60 g; Tabanus (removed from wings and feet, stir-baked) 45 g; Holotrichia Diomphalia (stir-baked) 45 g; Resina Toxicodendri (calcined) 30 g; Semen Persicae 120 g; Semen Armeniacae Amarum (stir-baked) 120 g; Radix Scutellariae 60 g; Radix Rehmanniae 300 g; Radix Paeoniae Alba 120 g; Radix et Rhizoma Glycyrrhizae 90 g.

Procedure Pulverize the above twelve ingredients to fine powder, sift and mix well. To each 100 g of the powder add 30-45 g of refined honey and a quantity of water to make water-honeyed pills and dry; or add 80-100 g of refined honey to make small honeyed pills or big honeyed pills.

Description Black water-honeyed pills, small honeyed pills or big honeyed pills; odour, strong; taste, sweet and slightly bitter.

Identification (1) Microscopical: Clusters of calcium oxalate large, 60-140 μm in diameter. Clusters of calcium oxalate 18-32 μm in diameter, occuring in parenchymatous cells, usually arranged in rows, or several clusters in one cell. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Bast fibres yellowish, fusiform, walls thickened, and with fine pit-canals. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Fragments of body walls yellow or brownish-red, with rounded hair pits, 8-24 μm in diameter, with setae varying in length. Fragments of body walls golden-yellow or yellowish brown, hair pits double-ringed, sometimes covered with warts or spinal protuberances. Fragments of body walls yellowish, the edges of alveolar in overlapped rings.
(2) Pulverize 2.5 g of the water-honeyed pills, or triturate well 6 g of the big honeyed pills or small honeyed pills with 3 g of kieselguhr, mix well, add 40 ml of ethanol, ultrasonicate for 30 minutes, and filter. Evaporate half volume of the filtrate to dryness. Dissolve the residue in 10 ml of water, add 1 ml of hydrochloric acid, heat on a water bath for 30 minutes and cool immediately. Extract with two 15-ml quantities of ether in shaking, combine the ether solution and evaporate to dryness. Dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution with 50 mg of Radix et Rhizoma Rhei reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H containing sodium carboxymethylcellulose as the coating substance and the upper layer of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 1-2 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, and then expose to ammonia vapour. The orangish-red spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(3) Evaporate the remainded filtrate obtained under Identification test (2) to dryness. Dissolve the residue in 40 ml of water, extract with three 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol solutions. Wash with three 20-ml quantities of water saturated with *n*-butanol. Evaporate the *n*-butanol solution to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing about 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G prepared with 4% sodium acetate solution containing sodium carboxymethylcellulose as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply in strips separately 6 μl each of the

above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 1% solution of ferric chloride in ethanol. The strip in the chromatogram obtained with the test solution corresponds in position and colour to the strip in the chromatogram obtained with the reference solution.

(4) Triturate well 3 g of small honeyed pills or big honeyed pills with 3 g kieseguhr, mix well, or pulverize 1.2 g of water-honeyed pills to powder, add 80 ml of dilute ethanol, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 30 ml each of water and ether. Transfer the solution to a separater, allow to stand, discard ether solution. extract with three 30-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extracts, recover *n*-butanol to dryness, dissolve the residue in 5 ml of water, and apply to a small column (10 mm in diameter, 12 cm in length) packed with macroporous resin D101, pre-elute with 50 ml of water, discard the eluates. Elute with 40% ethanol, and collect the eluates. Evaporate to dryness and dissolve the residue in 1 ml of acetone, use the supernatant as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and concentrated ammonia TS (8 : 4 : 4 : 1) as the mobile phase. Apply separately 10 μl of the test solutions and 5 μl of the reference solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 5% solution of vanillin in sulfuric acid and heat to the spot clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water, and phosphoric acid (85 : 15 : 0.05) as the mobile phase. As detector a spectrophotometer set at 289 nm. The number of theoretical plates of the column is not less than 4000, calculated with reference to the peak of emodin.

Preparation of reference solution Weigh accurately 10 mg of emodin CRS, in a 50 ml volumetric flask, add a quantity of methanol to dissove and dilute to volumn, mix well. Measure accurately 2 ml, in a 50 ml volumetric flask, dilute to volumn with methanol, mix well, used as the reference solution, containing 8 μg of emodin per ml.

Preparation of test solution Pulverize 1 g of water-honeyed pills to fine powder, accurately weighed, or cut a quantity of small honeyed pills or big honeyed pills obtained under the weight variation test into pieces, triturate well with an equal quantity of kieseguhr, mix well. Weigh accurately 4 g of the powder, to a stopper conical flask, add accurately 25 ml of methanol, weigh, heat under reflux on a water bath for 1 hour, and stand to cool, weigh again and compensate the loss of the weight with methanol, mix well, and filter. Measure accurately 5 ml of the successive filtrate in a conical flask, expel the solvent, add 20 ml of 2.5 mol/L sulfuric acid solution, ultrasonicate for 10 minutes, and heat under reflux for 1 hour, and cool immediately, transfer to a separator. Extract with three 25-ml quantities of ether, combine the ether extracts, wash with 15 ml of water, discard the washings, pass through a funnel packed with anhydrous sodium sulfate. Wash the filter and the container with a little quantity of ether, combine the washings with the filtrate evaporate to dryness at a low temperature. Dissolve the residue with a quantity of methanol in a 25 ml volumetric flask, dilute with methanol to volume, and mix well and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl each of the reference solution and the test solution into the column and calculate the content. It contains not less than 0.40 mg of emodin per 1 g of water-honeyed pills or 0.26 mg of that per 1 g of small honeyed pills or 0.80 mg of that per pill of big honeyed pills, referred to Radix et Rhizoma Rhei.

Action To promote blood circulation to eliminate blood stasis, and stimulate menstrual flow and disintegrate masses.

Indications Abdominal masses and amenorrhea due to retention of blood with manifestations of abdominal masses, scaly dry skin, darkish complexion, tidal fever and emaciation or amenorrhea.

Usage and dosage 3 g of water-honeyed pills, 3-6 pills of small honeyed pills or 1-2 big honeyed pills, 1-2 times a day.

Precaution Contraindicated for pregnant women; withdrawal of it when there is skin allergy.

Strength 3 g per big honeyed pill

Storage Preserve in tightly closed containers.

Daige San
(黛蛤散)

Daige Powder

Ingredients Indigo Naturalis 30 g; Concha Meretricis seu Cyclinae 300 g.

Procedure Pulverize the above two ingredients to fine powder, sift and mix well.

Description A greyish-blue powder; taste, weak.

Identification (1) To the powder, add in drops dilute hydrochloric acid, bubble is produced. Pass the gas into calcium hydroxide TS, a white precipitate is produced.

(2) Stir well the powder with 10 ml of water and 10 ml of dilute hydrochloric acid and filter. To 1 ml of the filtrate, add 2 drops of methyl red IS, neutralize with ammonia TS, then add in drops hydrochloric acid to exact acidity, add 1-2 drops of ammonium oxalate TS, a white precipitate is produced. Separate the precipitate, it does not dissolve in acetic acid, but dissolve in hydrochloric acid.

(3) Shake 2 g of the powder in 5 ml of chloroform for several minutes, filter and use the filtrate as the test solution. Dissolve indigo CRS and indirubin CRS in chloroform to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, chloroform, and acetone (5 : 4 : 1) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Action To clear the liver and lung, and send *qi* downward and release restlessness.

Indications Dizziness, tinnitus, coughing with expectoration of copious, yellow and thick phlegm, epistaxis, hemoptysis, discomfort in the throat, thirst and restlessness due to invasion of the lung by *liver-fire*.

Usage and dosage 6 g, 1 time a day, used in decoction of prescription.

Storage Preserve in well closed containers, protected from moisture.

Daiwenjiu Gao (代温灸膏)

Daiwenjiu Plaster

Ingredients Fructus Capsici; Cortex Cinnamomi; Rhizoma Zingiberis Recens; Oleum Cinnamomi.

Procedure Pulverize Fructus Capsici, Cortex Cinnamomi and Rhizoma Zingiberis Recens to coarse powders. Macerate with ethanol three times, 24 hours for the first time, 72 hours for the second time and 48 hours for the third time, filter. Combine the filtrates and concentrate to a thick extract with relative density of 1.30-1.35 (70℃), add the plaster base made from rubber, zinc oxide, rosin etc, mix well with Oleum Cinnamomi to produce adhesive matter. Spread the adhesive matter on the tape, cut into sections, cover with liner, and cut into small pieces.

Description Orange yellow pieces of rubber plaster; odour, aromatic.

Identification (1) Macerate overnight 6 pieces, removed from the coating and cut into strips with width of 1 cm, in 50 ml of ethanol in a stopper conical flask, and filter. Evaporate the filtrate at 60-70℃ on a water bath to dryness, and dissolve the residue in 2 ml of ethanol as the test solution. Dissolve cinnamic aldehyde CRS in ethanol to prepare a solution containing 1 μl per ml as the reference solution. Carry out the method of thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (17 : 3) as the mobile phase. Apply separately 2 μl each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with dinitrophenylhydrazine TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) To 6 pieces, removed from the coating, add 20 ml of chloroform, dissolve the ointment base by stirring, add 30 ml dehydrated ethanol, solidify the ointment base by stirring, allow to stand for 10 minutes, filter. Repeat the above operation with chloroform and dehydrated ethanol, combine the filtrate and evaporate to dryness. Dissolve the residue in 2 ml of dehydrated ethanol, centrifuge. Apply the supernatant to the column of C18 (300 mg). Elute with 5 ml water and 5 ml 30% methanol in turn, discard the eluates. Then Elute with 5 ml 70% methanol, collect the eluates as the test solution. Dissolve capsaicin CRS in methanol to produce a solution containing 30 μg per ml as the reference solution. Carry out the method for high performance liquid chromatography (Appendix Ⅵ D), Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% phosphoric acid (45 : 55) as the mobile phase. Maintain the temperature of the column at 35℃. As detector a spectrophotometer set at 270 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of capsaicin. Inject accurately 10 μl of each of the two above solutions into the column. The retention time of the peak in the chromatograph obtained with the test solution corresponds to that in the obtained with the reference solution.

Plaster content Not less than 1.7 g per 100 cm^2. (Appendix Ⅰ I, method 1), using ether as the solvent.

Other requirements Comply with the general requirements for adhesive plasters of cataplasms.

Determination of ethanol-soluble extractives Measure the area of two pieces, removed from the cover liner, cut into pieces, to a stopper conical flask, add 50 ml of dehydrated ethanol, stopper tightly, and macerate for 16 hours, filter, wash the container and residue with three 10-ml of dehydrated ethanol, combine the washings with the filtrate in a evaporating dish, dried to constant weight, evaporate to dryness on a water bath at 60-70℃, dry the residue in a desiccator for 3 hours, weigh accurately, and calculate. It contains not less than 0.20 g per 100 square centimeter.

Action To warm meridians, and disperse *cold* to kill pain.

Indications Impeded flow of *yang-qi* due to *wind-dampness* that blocks meridians with manifestations of cold and pain of the back, lower back and joints of limbs; cold and painful stomach and abdomen due to impairment of the spleen and stomach by cold, diarrhea due to cold in a deficiency syndrome; chronic rheumatic arthritis and chronic gastroenteritis with above symptoms.

Usage and dosage Apply it to the acupuncture points according to the condition.

Storage Preserve in tightly closed containers, stored in a cool place.

Danggui Longhui Wan (当归龙荟丸)

Danggui Longhui Pills

Ingredients Radix Angelicae Sinensis (stir-baked with wine) 100 g; Radix Gentianae (stir-baked with wine) 100 g; Aloe 50 g; Indigo Naturalis 50 g; Fructus Gardeniae 100 g; Rhizoma Coptidis (stir-baked with wine) 100 g; Radix Scutellariae (stir-baked with wine) 100 g; Cortex Phellodendri Chinensis (stir-baked with salt) 100 g; Radix et Rhizoma Rhei (stir-baked with wine) 50 g; Radix Aucklandiae 25 g; Moschus 5 g.

Procedure Pulverize the above ingredients, except Moschus, to fine powder. Triturate Moschus with the above fine powder, sift and mix well. Make pills with water and dry under a lower temperature.

Description Yellowish-green to dark brown watered pills; odour, slight; taste, bitter.

Identification (1) Microscopical: Parenchymatous cells fusiform, walls slightly thickened and with very fine oblique crisscross striations. Fibre bundles bright yellow, with slightly thickened walls and distinct pits. Fibre bundles bright yellow, surrounded by cells containing prisms of calcium oxalate, forming crystal fibre, crystal cells with lignified and thickened walls. Bast fibres pale yellow, fusiform, walls thickened and with fine pit-canals. Stone cells of testa yellow or pale brown, mostly broken, when whole, elongated-polygonal, rectangular or irregular, walls thickened and with large rounded pits, lumina brownish-red. Clusters of calcium oxalate large, 60-140 μm in diameter. Irregular pieces or granules blue.

(2) Pulverize 5 g of the pills to powder, add 20 ml of ether, macerate for 4 hours, shaking frequently, and filter. Wash the filtrate with 5 ml of 1% solution of sodium hydroxide, discard the aqueous layer, evaporate the ether layer to about 1 ml as the test solution. Prepare a solution with 1 g of Radix Angelicae Sinensis reference drug and 10 ml of ether as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 5 μl of the test solution and 3 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Heat under reflux 2 g of the pills, ground well, in 20 ml of chloroform for 20 minutes, and filter. Evaporate the filtrate to about 1 ml as the test solution. Dissolve indirubin CRS in chloroform to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of benzene and acetone (4 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. The red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) To 1 g of Radix Aucklandiae reference drug, add 10 ml of ether, macerate for 4 hours, shake frequently, and filter. Evaporate the filtrate to about 1 ml as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 5 μl of the test solution obtained under Identification test (2) and 3 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with a 1% solution of vanillin in sulfuric acid and heat to the spots clear. The violet-blue spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To purge *fire* and relax bowels.

Indications Restlessness, dizziness, tinnitus, poor hearing or deafness, hypochondriac pain, distending pain in the stomach and constipation due to exuberant *fire* in the liver and gallbladder.

Usage and dosage 6 g, twice a day.

Precaution Contraindicated for pregnant women.

Storage Preserve in tightly closed containers.

Danggui Yangxue Wan (当归养血丸)

Danggui Yangxue Pills

Ingredients Radix Angelicae Sinensis 150 g; Radix Paeoniae Alba (stir-baked) 150 g; Radix Rehmanniae 400 g; Radix Astragali Praeparata 150 g; Colla Corii Asini 150 g; Cortex Moutan 100 g; Rhizoma Cyperi (processed) 150 g; Poria 150 g; Cortex Eucommiae (stir-baked) 200 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 200 g.

Procedure Pulverize the above 10 ingredients, except Colla Corii Asini, to fine powder, sift and mix well. Dissolve Colla Corii Asini with a quantity of water and mix well with the refined honey. To each 100 g of the powder add a quantity of the above mixtured liquid containing 35-45g of refined honey to make pills and dry.

Description Dark brown watered pills; taste, sweet and slightly bitter.

Identification (1) Microscopical: Masses of gelatinized starch granules colourless. Irregularly branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells. Parenchymatous cells fusiform, walls slightly thickened, with very fine oblique crisscross striations. Parenchyma greyish-brown to blackish-brown, cells usually shrunken, and each containing a brown nucleus-like mass. Fibres in bundles or scattered, walls thickened, with longitudinal fissures, the two ends broken to broom-like or relatively truncate. Rubber threads strip-shaped or twisted into masses, surface granular. Secretory cells subrounded, containing pale yellowish-brown to redish-brown secretion, the surrounding cells radiately arranged.

(2) To 5 g of the pills, ground well, add 15 ml of petroleum ether (60-90℃), ultrasonicate for 15 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Prepare a solution with 1 g of Radix Angelicae Sinensis reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane-ethyl acetate (9 : 1) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Moist 10 g of the pills, ground well, with 10 ml of ether, add 40 ml of petroleum ether (30-60℃), ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 2 ml of acetone as the test solution. Dissolve paeonol CRS in acetone to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and benzene as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 5% solution of ferric chloride in ethanol acidified with hydrochloric acid. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To replenish *qi* and nourish blood, and regulate menstruation.

Indications Menstrual disorders due to a deficiency of both *qi* and blood, with manifestations of preceded menstrual cycle, menorrhagia or oligomenorrhea, menostaxis and lassitude.

Usage and dosage 9 g, 3 times a day.

Storage Preserve in tightly closed containers.

Danle Jiaonang
(胆乐胶囊)

Danle Capsules

Ingredients Zhudanzhisuan 75 g; Pericarpium Citri Reticulatae 75 g; Fructus Crataegi 600 g; Radix Curcumae 240 g; Herba Glechomae 600 g.

Procedure Decoct Fructus Crataegi, Radix Curcumae and Herba Glechomae with water twice, 2 hours for the first and 2 hours for the second time; filter, combine the filtrate, concentrate the filtrate in vacuum to a thick extract; dry and pulverize it to fine powder. Pulverize Pericarpium Citri Reticulata and Zhudanzhisuan to fine powder, combine this powder with the above powder, and mix thoroughly, pack to make 1000 capsules.

Description Capsules containing brownish-yellow to brown powder; taste, bitter.

Identification (1) Heat under reflux 3 g of the contents, with 25 ml of absolute ethanol for 30 minutes, cool and filter, use the filtrate as the test solution. Dissolve a quantity of hyodeoxycholic acid CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, ethyl acetate, and glacial acetic acid (10 : 10 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spot clear. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) Prepare a solution of 0.75 g of Pericarpium Citri Reticulatae reference drug in the same manner as the reference drug solution as described in the test solution preparation under Identification (1). Dissolve a quantity of hesperidin CRS in methanol to produce a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxyme thylcellulose as the coating substance and a mixture of ethyl acetate, methanol, and water (100 : 17 : 13) as the mobile phase. Apply separately 10 μl of each of the above two kinds of solutions and the test solution obtained under Identification (1) to the plate. After developing and removal of the plate, dry in air. Spray with 10% aluminium trichloride in ethanol, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference solution and reference drug solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilance bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.2% solution of phosphoric acid (19 : 81) as the mobile phase. As detector a spectrophotometer set at 284 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of hesperidin.

Reference solution Dissolve a quantity of hesperidin CRS, accurately weighed, in methanol to produce a solution containing 35 μg per ml.

Test solution Weigh accurately 0.3 g of the contents, obtained under the test of weight variation, place to a Soxhlet's extractor, add a quantity of methanol, heat under reflux on a water bath for 6 hours; transfer the extract to a 100 ml volumetric flask, dilute with methanol to volume and mix well. Filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 2.6 mg of hesperidin ($C_{28}H_{34}O_{15}$) per capsule, referred to pericarpium Citri Reticulatae.

Action To regulate *qi* to kill pain, and promote bile flow and remove gallstones.

Indications Hypochondriac pain and gallbladder distention due to stagnation of *liver-qi* with manifestations of distending pain in the hypochondriac region, loss of appitite and yellow urine; chronic cholecystitis and cholelithiasis with above symptoms.

Usage and dosage 4 capsules, 3 times a day.

Strength 0.3 g per capsule

Storage Preserve in tightly closed containers.

Attached:

Acidum Bilis Susis
(猪胆汁酸)

Pig Gall Acidic Extract

Pig Gall Extract is an extraction made from the bile of *Sus scrofa domestica* Brisson (Fam. Suidae).

Procedure Filter pig bile, adjust the pH value of the filtrate to above 10 with sodium hydroxide; boiling the filtrate for 2-3 hours to react for saponification. Filter, adjust the filtrate to 1 with hydrochloric acid, wash the deposit with water until the pH value to above 3.5; dry the deposit below 80℃ and obtain the extract.

Description Brownish-yellow or brown powder; taste, bitter, easily moistened.

Solubility: Freely soluble in ethanol, practically insoluble in water.

Identification Heat under reflux 0.5 g of the extract, with 25 ml of ethanol for 30 minutes; filter, use the filtrate as the test solution. Dissolve a quantity of hyodeoxycholic acid CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxy methylcellulose as the coating substance and a mixture of cyclohexane, ethyl acetate, methanol and acetic acid (2 : 16 : 1 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% phosphomolybdic acid in ethanol and heat at 105℃ to the spot clear. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

pH value 1% water solution, pH 3.5-5.0 (Appendix Ⅶ G).

Loss on drying Not more than 5.0 per cent (Appendix Ⅸ G).

Total ash Not more than 5.0 per cent (Appendix Ⅸ K).

Assay Heat under reflux 0.5 g of the extract, weighed accurately,

with 20 ml of ethanol for 30 minutes; filter, wash the residue with 10 ml of ethanol, combine the filtrate and the washing, evaporate to dryness. Add 30 ml of 15% solution of sodium hydroxide and 1 ml of ethanol to the residue, heat under reflux for 6 hours, cool; add 30 ml of water, mix thoroughly, and filter, transfer the filtrate to a separating funnel. Wash the vessel and the residue with 20 ml of hot water, and combine the washing to the filtrate. Acidify this solution with dilute sulfuric acid TS, cool; extract with successive quantities of 50, 50, 30 and 30 ml of ether, combine ether extracts, and wash with two 20-ml quantities of water. Filter, and wash the filter vessel with 10 ml of ether, combine the washing and the filtrate; transfer the combining ether to a conical flask, previously dried to constant weight. Recover ether to dryness, dry to constant weight at 105℃, weigh accurately and calculate.
It contains not less 55.0 per cent of zhudanzhisuan.

Danning Pian
(胆宁片)

Danning Tablets

Ingredients Radix et Rhizoma Rhei; Radix et Rhizoma Polygoni Cuspidati; Pericarpium Citri Reticulatae Viride; Rhizoma Imperatae; Pericarpium Citri Reticulatae; Radix Curcumae; Fructus Crataegi.

Procedure Pulverize Radix et Rhizoma Rhei to fine powder. Distil volatile oil from Pericarpium Citri Reticulatae. Heat under reflux the other 5 ingredients with 70% ethanol twice, 1 hour for each time; recover the ethanol and concentrate to an appropriate amount, dry in vacuum, pulverize. Add the fine powder of Radix et Rhizoma Rhei, the volatile oil and a quantity of excipient, mix thoroughly; make granules, compress into tablets, and coat with film.

Description Film coated tablets with brown core; taste, sweet and bitter.

Identification (1) Triturate 3 tablets, removed the coat, to fine powder; add 10 ml of methanol, ultrasonicate for 15 minutes, filter, use the filtrate as the test solution. Prepare a solution of 0.5 g of Radix et Rhizoma Polygoni Cuspidati reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (4 : 1) as the mobile phase. Apply separately 4 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution; the spot turn to red on exposure to ammonia vapour.
(2) Evaporate 2 ml of the test solution, obtained under Identification (1), to dryness; add 4 ml of ethyl acetate and ultrasonicate for 15 minutes, filter, use the filtrate as the test solution. Prepare a solution of 1 g of Fructus Crataegi reference drug in the same manner as the reference drug solution. Dissolve a quantity of ursolic acid in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and formic acid (20 : 4 : 0.5) as the mobile phase. Apply separately 8 μl of the test solution and 2 μl of each of the reference drug solution and reference solution to the plate. After developing and removal of the plate, dry in air. Spray with a solution of sulfuric acid in ethanol (1→10), and heat at 105℃ to spots clear. Examine in daylight, the spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution and the reference solution. Examine under ultraviolet light at 365 nm, the fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution and reference solution.
(3) Dissolve a quantity of hesperidin CRS in methanol to produce a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, methanol and water (100 : 17 : 13) as the mobile phase. Apply separately 4 μl of the test solution, obtained under Identification (1), and 10 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 1% aluminium trichloride in ethanol and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilance bonded silica gel as the stationary phase and a mixture of methanol and 0.1% solution of phosphoric acid (80 : 20) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of emodin.

Reference solution Dissolve a quantity of emodin CRS and chrysophanol CRS, accurately weighed, in methanol to produce a mixture containing 12 μg of emodin and 1.6 μg of chrysophanol per ml.

Test solution Weigh accurately 10 tablets, removed the coat, triturate to fine powder; weigh accurately 0.35 g of the powder, place to a round-bottomed flask; add 10 ml 30% solution of sulphuric acid, and heat under reflux with successive 30 ml, 20 ml, 20 ml of chloroform for 2 hours, 30 minutes and 30 minutes respectively. Combine the chloroform solution and wash with a quantity of water, transfer the chloroform solution to a 100 ml of volumetric flask, dilute with chloroform to the volume, mix thoroughly. Measure accurately 3 ml of the chloroform solution, evaporate to dryness, dissolve the residue in methanol and transfer to a 10 ml of volumetric flask, dilute with methanol to the volume, mix thoroughly and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 3.2 mg of the summation of emodin ($C_{15}H_{10}O_5$) and chrysophanol ($C_{15}H_{10}O_4$) per tablet, referred to Radix et Rhizoma Rhei and Radix et Rhizoma Polygoni Cuspidati.

Action To soothe the liver to promote bile flow, clear *heat* and release constipation.

Indications Dull pain in the right upper abdomen, distesion of *stomach* and abdomen after meals, poor appetite, belching and constipation due to stagnation of *liver-qi* and failure of *damp-heat* to be cleared; chronic cholecystitis with above symptoms.

Usage and dosage 5 tablets, 3 times a day.

Precaution Reduce the dosage when over three times of bowels movement occur.

Strength 0.36 g per tablet

Storage Preserve in tightly closed containers.

Daochi Wan
(导赤丸)

Daochi Pills

Ingredients Fructus Forsythiae 120 g; Rhizoma Coptidis 60 g; Fructus Gardeniae (stir-baked with ginger) 120 g; Caulis Akebiae 60 g; Radix Scrophulariae 120 g; Radix Trichosanthis 120 g; Radix Paeoniae Rubra 60 g; Radix et Rhizoma Rhei 60 g; Radix Scutellariae 120 g; Talcum 120 g.

Procedure Pulverize the above ten ingredients to fine powder, sift and mix well. To each 100 g of the powder add 120-140 g of refined honey to make big honeyed pills.

Description Blackish-brown big honeyed pills; taste, sweet and bitter.

Identification (1) Microscopical: Compound starch granules composed of 2-14 component, mostly a big helmet-like component combined with several small ones. Stone cells yellowish-brown or colourless, subrectangular, subrounded or irregular, up to about 94 μm in diameter, striation well-defined. Stone cells of testa yellow or pale brown, mostly broken, when whole, elongated-polygonal, rectangular or irregular, with thickened walls and large rounded pits, lumina brownish-red. Fibre bundles bright yellow, with slightly thickened walls and distinct pits. phloem fibres pale yellow, fusiform, with thickened walls and fine pit-canals. Fibres of endocarp short-fusiform, with the lower and upper fibre layers alternated crisscrossly. Clusters of calcium oxalate large, 60-140 μm in diameter.

(2) Triturate well 3 g of the pills, cut into pieces, with 1 g of kieselguhr, macerate in 10 ml of methanol for 1 hour, constantly shake, filter and concentrate the filtrate to 1 ml as the test solution. Prepare a solution with 50 mg of Rhizoma Coptidis reference drug as the reference drug solution in the same manner. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately to the plate 1-2 μl of each of the above three solutions. After developing in a chamber pre-equilibrated with ammonia vapour and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution; A yellow fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Triturate well 3 g of the pills, cut into pieces, with 1 g of kieselguhr, macerate in 10 ml of methanol in a stopper conical flask for 1 hour, with frequently shaking, filter. Evaporate 5 ml of the filtrate to dryness. Dissolve the residue in 5 ml of water, add 0.5 ml of hydrochloric acid, heat on a water bath for 30 minutes, cool immediately, extract with 15 ml of ether in two portions. Combine the ether extracts and evaporate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution with 0.1 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Expose the plate to ammonia vapour and examine in daylight, the spots turn red.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Cut the pills obtained under the weight variation test into pieces, mix well. To 1 g of the powder, weighed accurately, in a 100 ml volumetric flask, add 5 ml of water, stand to dissolve. Add about 80 ml of a mixture of hydrochloric acid and methanol (1 : 100), heat at 60℃ on a water bath for 15 minutes, and ultrasonicate (power 250 W, frequency 33 kHz) for 15 minutes, cool. Dilute with the mixture of hydrochloric acid and methanol (1 : 100) to volume, shake well and filter. Measure accurately 5 ml of the successive filtrate and apply to a neutral aluminium oxide column (100-200 mesh, 3 g, 0.9 cm in diameter), elute with 25 ml of ethanol, collect the eluate and evaporate to dryness. Dissolve the residue in a quantity of methanol and transfer to a 5 ml volumetric flask, dilute with methanol to volume, shake well as the test solution. Dissolve berberine hydrochloric CRS, accurately weighed, in methanol to produce a solution containing 0.025 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and water (20 : 10 : 5 : 5 : 1) as the mobile phase. Apply accurately 4 μl of the test solution, 2 μl and 4 μl of the reference solution to the plate. After developing in a chamber pre-equilibrated with ammonia vapour and removal of the plate, dry in air. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan at the wavelength λ_{ex}=365 nm with fluorescent mode, measure the integrated value and calculate the content.

It contains not less than 3.0 mg of berberine hydrochloride ($C_{20}H_{18}ClNO_4$) per pill, referred to Radix Coptidis.

Action To clear *heat* and purge *fire*, and induce urination and relax bowels.

Indications Sores on the mouth and tongue, sore throat, feverish sensation and restlessness in the chest, concentrated urine and constipation due to abundant *fire* in the interior.

Usage and dosage 1 pill, twice a day; appropriate reduction of the dosage for children under 1 year old.

Strength 3 g per pill

Storage Preserve in tightly closed containers.

Dashanzha Wan
(大山楂丸)

Dashanzha Pills

Ingredients Fructus Crataegi 1000 g; Massa Medicata Fermentata (stir-baked with bran) 150 g; Fructus Hordei Germinatus (stir-baked) 150 g.

Procedure Pulverize the above three ingredients to fine powder, sift and mix well. To 600 g of sucrose add 270 ml of water and 600 g of refined honey, mix well, decoct gently to a relative density of 1.38 (70 ℃), filter, mix well with the above powder to make big honeyed pills.

Description Brownish-red or brown big honeyed pills; taste, sour and sweet.

Identification (1) Microscopical: Stone cells of pericarp pale purplish-red, red or yellowish-brown, subrounded or polygonal, up to 125 μm in diameter. Epidermal cell longitudinally arranged, with one long cell connected to two short cells, the long cells with thickened, sinuous and lignified walls.

(2) To 9 g of pills, cut into pieces, add 40 ml of ethanol, heat under reflux for 10 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 10 ml of water on heating, extract with 15 ml of *n*-butanol with shaking. Separate the *n*-butanol solution and evaporate to dryness, dissolve the residue in 5 ml of methanol and filter. To 1 ml of the filtrate add a small quantity of magnesium powder and 2-3 drops of hydrochloric acid, heat for 4-5 minutes, an orange-red colour is produced.

(3) Use the filtrate obtained under Identification test (2) as the test solution. Dissolve ursolic acid CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and acetone (9 : 1) as the mobile phase. Apply separately to the plate 2 μl each of the above two solutions. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol and heat at 105 ℃ for several minutes. The purplish-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Weigh accurately 3 g of the pills, obtained in test of weight variation and cut into pieces, add 30 ml of water, allow to disintegrate thoroughly on a water bath at 60℃, add 2 g of the kieselguhr, stir well and filter. Wash the residue with 30 ml of water, dry at 100℃. Transfer the residue together with the filter paper to a Soxhelt's extractor and heat under reflux with an appropriate quantity of ether for 4 hours. Recover the ether and macerate the residue with two 5-ml quantities of petroleum ether (30-60℃) for about two minutes each time. Decant the petroleum ether, dissolve the residue in a mixture of dehydrated ethanol and chloroform (3 : 2) by warming. Transfer accurately the solution to a 5 ml volume flask, dilute to volume, mix well, use the solution as the test solution. Dissolve ursolic acid CRS, weighed accurately, in dehydrated ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform, ethyl acetate and formic acid (20 : 5 : 8 : 0.1) as the mobile phase. Apply accurately to the plate 5 μl of the test solution, 4 μl and 8 μl of the reference solutions. After developing and removal of the plate, dry it in air. Spray with a 10% solution of sulfuric acid in ethanol and heat at 110℃ to the spots clear. Cover with a same size glass to the plate and fix with adhesive tape. Carry out the method of thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan at the wavelengh: $\lambda s = 535$ nm, $\lambda R = 650$ nm. Measure the integration value of absorbence of the test solution and the reference solution and calculate the content.

It contains not less than 7.0 mg of ursolic acid ($C_{30}H_{48}O_3$) per pill, referred to Fructus Crataegi.

Action To promote digestion and whet appetite.

Indications Poor appetite, indigestion, and fullness in the stomach and abdomen due to retention of food in the stomach.

Usage and dosage 1-2 pills, 1-3 times a day; appropriate reduction of the dosage for children.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Desheng Wan
(得生丸)

Desheng Pills

Ingredients Herba Leonuri 600 g; Radix Angelicae Sinensis 200 g; Radix Paeoniae Alba 200 g; Radix Bupleuri 100 g; Radix Aucklandiae 50 g; Rhizoma Chuanxiong 50 g.

Procedure Pulverize the above six ingredients to fine powder, sift and mix well. To each 100 g of the powder add 190-210 g of refined honey to make big honeyed pills.

Description Blackish-brown big honeyed pills; odour, slightly aromatic; taste, bitter.

Identification (1) Microscopical: Parenchymatous cells fusiform, walls slightly thickened, with very fine oblique crisscross striations. Clusters of calcium oxalate 18-32 μm in diameter, occurring in parenchymatous cells, usually arranged in rows or several clusters in one cell. Non-glandular hairs 1-3-celled, slightly curved with warty walls. Vittae containing pale yellow or yellowish-brown strips of secretion, 8-25 μm in diameter.

(2) Macerate warmly 9 g of the pills, cut into pieces and ground well with 6 g of kieselguhr, in 60 ml of ethanol for 1 hour, shake constantly. Filter and evaporate the filtrate to dryness. Dissolve the residue in 15 ml of water, extract with two 20-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extract, wash with two 10-ml quantities of water, discard the water solutions and evaporate the *n*-butanol solution to about 1 ml. Add a quantity of neutral aluminium oxide stir well and dry on a water bath. Apply to a neutral aluminium oxide column (200-300 mesh, 1 g, 1-1.5 cm in internal diameter), elute with 30 ml of the mixture of ethyl acetate and methanol (1 : 1). Collect the eluate and evaporate to dryness. Dissolve the residue in 1 ml of ethanol as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with a 5% solution of vanillin in sulfuric acid, heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To nourish blood and resolve stasis, and soothe the liver to regulate menstruation.

Indications Irregular menstruation, dysmenorrhea due to stagnation of *qi* and blood, with manifestations of scanty menstrual blood with clots, delayed or advanced menstrual cycle, abdominal pain during menstruation or abdominal masses.

Usage and dosage 1 pill, twice a day.

Precaution Contraindicated for pregnant women.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Dieda Huoxue San
(跌打活血散)

Dieda Huoxue Powder

Ingredients Flos Carthami 120 g; Radix Angelicae Sinensis 60 g; Sanguis Draxonis 14 g; Radix et Rhizoma Notoginseng 20 g; Rhizoma Drynariae (stir-baked) 60 g; Radix Dipsaci 60 g; Olibanum (processed) 60 g; Myrrha (processed) 60 g; Catechu 40 g; Radix et Rhizoma Rhei 40 g; Borneolum Syntheticum 4 g; Eupolyphaga seu Steleophaga 40 g.

Procedure Grind Borneolum Syntheticum to fine powder. Pulverize Radix Notoginsen to fine powder. Pulverize the other ten ingredients to fine powder. Mix the fine powder of Borneolum Syntheticum with the above powders, sift and mix well.

Description A reddish-brown powder; odour, characteristic aromatic of Borneolum; taste, slightly bitter.

Identification (1) Microscopical: Irregular fragments pale yellow, translucent, with oil droplets diffusing out while melted on heating and exhibiting prisms of calcium oxalate. Irregular masses colourless or pale yellow, surface and surrounding diffusing out numerous fine granules, soluble on long standing. Irregular fragments sanguineous, surrounded by bright yellow liquid, changing to red gradually. Pollen grains globular or elliptical, about 60 μm in diameter, extine spiny with 3 germinal apertures. Clusters of calcium oxalate up to about 45 μm in diameter, occurring in pale brownish-yellow and shrunken parenchymatous cells, often arranged in rows. Clusters of calcium oxalate large, 60-140 μm in diameter. Fragments of body walls yellow or brownish-red, with rounded hair pits, 8-24 μm in diameter, sometimes with setae varying in length.

(2) To 5 g of the powder, add 10 ml of dehydrated ethanol, heat under reflux for 30 minutes, filter, evaporate the filtrate to dryness. Dissolve the residue in a small quantity of glacial acetic acid, add 1-2 drops of sulfuric acid, a red colour is produced initially and turns gradually to purple and brown.

(3) To 3 g of the powder, add 25 ml of methanol, ultrasonicate for 20 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 50 ml of water, then add 5 ml of hydrochloric acid, heat on a water bath for 30 minutes, cool immediately, and transfer to a separator. Extract with two 20-ml quantities of ether, combine the ether solutions and evaporate to dryness. Dissolve the residue in 2 ml of ethyl acetate as the test solution. Prepare a solution with 0.05 g of Radix et Rhizoma Rhei reference drug as the reference drug solution in the same manner. Macerate 2 g of Radix Angelicae Sinensis reference drug in 15 ml of ether for 30 minutes, shake constantly, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of ethyl acetate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately to the plate 2 μl of each of the above three solutions. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The two blue fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with Radix Angelicae Sinensis reference drug solution. The two to three orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with Radix et Rhizoma Rhei reference drug solution. Expose the plate to ammonia vapour and examine in sunlight, the five red spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the Radix et Rhizoma Rhei reference drug solution.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Action To relax muscles and tendons to promote blood circulation, and dissipate blood stasis to kill pain.

Indications Traumatic injury with bruise and pain or lumbar sprain.

Usage and dosage 3 g, twice a day, taken with warm boiled water or yellow rice wine; for external use, appropriate quantity to be mixed with yellow rice wine or vinegar and applied topically.

Precaution It should not be applied to an open wound; it is forbidden to prescribe to pregnant women.

Storage Preserve in tightly closed containers.

Dieda Wan
(跌打丸)

Dieda Pills

Ingredients Radix et Rhizoma Notoginseng 64 g; Radix Angelicae Sinensis 32 g; Radix Paeoniae Alba 48 g; Radix Paeoniae Rubra 64 g; Semen Persicae 32 g; Flos Carthami 48 g; Sanguis Draxonis 48 g; Herba Siphonostegiae 32 g; Rhizoma Drynariae (scalded) 32 g; Radix Dipsaci 320 g; Lignum Sappan 48 g; Cortex Moutan 32 g; Olibanum (processed) 48 g; Myrrha (processed) 48 g; Rhizoma Curcumae Longae 24 g; Rhizoma Sparganii (processed with vinegar) 48 g; Radix Saposhnikoviae 32 g; Semen Cucumis 32 g; Fructus Aurantii Immaturus (stir-baked) 32 g; Radix Platycodi 32 g; Radix et Rhizoma Glycyrrhizae 48 g; Caulis Akebiae 32 g; Pyritum (calcined) 32 g; Eupolyphaga seu Steleophaga 32 g.

Procedure Pulverize the above twenty four ingredients to fine powder, sift, mix well. To each 100 g of the powder add 100-120 g of refined honey to make big honeyed pills.

Description Blackish-brown to black big honeyed pills; odour, slightly stinking; taste, bitter.

Identificaton (1) Microscopical: Pollen grains globular or elliptical, about up to 60 μm in diameter, extine spiny, with three germinal apertures. Fibre bundles orange-yellow, surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Fibre bundles pale yellow, surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Stone cells orange-yellow, shell-like, walls relatively thickened, pits distinct at the broader side. Stone cells of testa golden-

yellow, subrectangular, walls thickened, deeply sinuous, with distinct striations, closely parqueted. Prisms of calcium oxalate aboundant in parenchyma. Vittae containing golden-yellow secretion, 30 μm in diameter. Anastomosing laticiferous tubes 14-25 μm in diameter, containing pale yellow granules. Non-grandular hairs pale yellow to pale brown, 1-2 celled. Fragments of body walls yellow or brownish-red, with rounded hair pits, 8-24 μm in diameter, with setae, varying in length.

(2) Heat under reflux 5 g, cut into pieces, with 50 ml of methanol for 1 hour, cool and filter. Evaporate the filtrate to dryness, and dissolve the residue in 20 ml of water. Extract with three 30-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, wash with two-20 ml quantities of ammonia TS and wash with water saturated with *n*-butanol. Evaporate the *n*-butanol extracts to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve notoginsenoside R1 CRS and ginsenoside Rg1 CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and water (15 : 40 : 22 : 10) (allow to stand below 10℃) as the mobile phase. Apply separately 2 μl of the test solutions and 1 μl of the reference solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol and heat at 105℃ to the spots clear. Examine in daylight, the spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with reference solution. Examine under ultraviolet light at 365 nm, the fluoresent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with reference solution.

(3) Heat under reflux 5 g, cut into pieces, with 20 ml of ethyl acetate for 1 hour, cool and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 1 g of Radix Angelicae Sinensis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately to the plate 2 μl of the test solutions and 1 μl of the reference solutions. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluoresent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.05 mol/L sodium dihydrogen phosphate (49 : 51) as the mobile phase. As detector a spectrophotometer set at 440 nm. The number of theoretical plates of the column is not less than 4000, calculated with reference to the peak of dracorhodin.

Reference solution Dissolve a quantity of dracorhodin perchlorate CRS, accurately weighed, in 3% solution of phosphoric acid in methanol to produce a solution containing 20 μg per ml as the reference solution (per ml is equivalent to 14.52 μg of dracorhodin).

Test solution Weigh accurately 2 g of the pills, obtained in test of weight variation and cut into pieces, add accurately 25 ml of 3% solution of phosphoric acid in methanol, heat under reflux for 30 minutes, cool, weigh again and replenish the loss of the weight with 3% solution of phosphoric acid in methanol, mix well, and centrifuge, use the supernatant as test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column and measure. It contains not less than 0.30 mg of drcorhodin ($C_{17}H_{14}O_3$) per pill, referred to Sanguis Draxonis.

Action To promote blood circulation to dissipate blood stasis and reduce swelling to kill pain.

Indications Traumatic injury, broken tendons and fracture, bruise with swelling and pain or lumbar sprain.

Usage and dosage 1 pill, twice a day.

Precaution Contraindicated for pregnant women.

Strength 3 g per pill

Storage Preserve in tightly closed containers.

Dieda Zhentong Gao (跌打镇痛膏)

Dieda Zhentong Plaster

Ingredients Eupolyphaga seu Steleophaga 48 g; Radix Aconiti Kusnezoffii 48 g; Semen Strychni (stir-baked) 48 g; Radix et Rhizoma Rhei 48 g; Ligni Dalbergiae Odoriferae 48 g; Radix Zanthoxyli 48 g; Radix Scutellariae 48 g; Cortex Phellodendri Chinensis 48 g; Rhizoma Polygoni Cuspidati 15 g; Borneolum Syntheticum 24 g; Oleum Menthae Dementholatum 30 g; Camphor 60 g; Methyl Salicylate 60 g; Mentholum 30 g.

Procedure Grind Borneolium Syntheticum to fine powder. Pulverize Eupolyphaga seu Steleophaga, Semen Strychni, Radix Aconiti Kusnezoffii, Radix et Rhizoma, Rhei, Ligni Dalbergiae Odoriferae, Radix Zanthoxyli, Radix Scutellariae, Cortex Phellodenclri Chinensis and Rhizoma Polygoni Cuspidati to fine powder. Weigh the powders according to the formulated dose, add 0.7-0.9 fold by weight of the plaster base composed of rubber and rosin to make adhesive masses. Spread the masses on the tape, cut into pieces, covered with gauze as liner and cut into small pieces of suitable size.

Description Brownish-black pieces of adhesive tape plaster, the back of the plaster turn yellow slightly after long storage; odor, aromatic.

Identification (1) Using the remains obtained under the test of Plaster content for microscopic observation: Fibre bundles bright yellow, surrounded by parechymatous cells containing prisms of calium oxalate, forming crystal fibres, walls of crystal cells lignified and thickened. Purplish-red fibres and crystal fibres in bundles or scattered, with thickened and lignified walls. Phloem fibres pale yellow, fusiform, wall thickened, with fine pit-canals. Clusters of calcium oxalate large, 60-140 μm in diameter. Unicellular nonglandular hairs fibre-like, mostly broken, swelled at base and stone cell-like, and lignified. Fragments of the body walls yellow or brownish-red, with rounded seta pits, 8-24 μm in diameter, setae varying in length visible.

(2) Transfer the liquid obtained under the test of Volatile oil to a funnel, wash the volatile oil determination with 10 ml of ethyl acetate, and combine the washings to funnel, separate the ethyl acetate solution as the test solution. Dissolve mentholum CRS, borneolum syntheticum CRS, methyl

salicylate CRS and camphor CRS in dehydrate ethanol respectively to produce a mixture containing 8 mg, 7 mg, 17 mg and 17 mg respectively per ml as the reference solution. Carry out the method for gas chromatogram (Appendix Ⅵ E), using a column of 2 meters length packed with 10% polyethylene glycol (PEG-20 M) as the stationary phase; maintain the column temperature at 150℃. Inject 1 μl of each of the test solution and the reference solution separately into the column. The retention times of the peaks obtained with the test solution and the reference solution correspond to each other.

Strychnine Take 5 pieces, remove the cover, and cut into pieces. Macerate in 60 ml of 1 mol/L hydrochloric acid in a stopper conical flask overnight, ultrasonicate for 20 minutes, and filter, transfer the filtrate to a funnel and adjust to pH 9-10 with strong ammonia TS and extract with ether three times (30, 20 and 20 ml). Combine the ether solutions, dehydrate with anhydrous sodium sulfate, filter, and evaporate the filtrate to dryness. Dissolve the residue in chloroform, transfer the solution to a 2 ml volumetric flask, dilute with chloroform to volume, mix well and use as the test solution. Dissolve strychnine CRS, weighed accurately, in chloroform to produce a solution containing 6 mg per ml as the reference solution. Carry out the method for thin layer chromatograph (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, acetone, ethanol and strong ammonia TS (4 : 5 : 0.6 : 0.4) as the mobile phrase. Apply separately 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with a dilute potassium iodobismuthate TS. The spot in the chromatogram obtained with the test solution is not stronger than the spot in the chromatogram obtained with the reference solution.

Aconitine Dissolve aconitine CRS, weighed accurately, in chloroform to produce a solution containing 0.4 mg per ml as the reference solution. Carry out the method for thin layer chromatograph (Appendix Ⅵ B), using silica gel G prepared with 2% sodium hydroxide solution as the coating substance and a mixture of ether and methanol (60 : 1) as the mobile phrase. Apply separately to the plate 10 μl of each of the reference solutions and the test solution obtained under the test of Other requirements for strychnine. After developing and removal of the plate, dry in air, expose to iodine vapour to the spots clear. The spot in the chromatogram obtained with the test solution is not stronger than the spot in the chromatogram obtained with the reference solution or not visible.

Plaster content Carry out the determination method of plaster content for adhesive plasters (Appendix Ⅰ D), using 2 pieces and ether as the solvent, not less than 3.0 g per 100 cm^2.

Others requirements Comply with the general requirements for plaster (Appendix Ⅰ D).

Volatile Oil Take 2 pieces, cut 50 cm^2 from each piece, remove the cover, and cut into pieces. Carry out the the method for determination of volatile oil (Appendix Ⅹ D, first method), it contains 0.3 ml of volatile oil per 100 m^2.

Action To promote blood circulation to kill pain, dissipate blood stasis to reduce swelling, and expel *wind* to drain *dampness*.

Indications Traumatic injury with bruise, acute or chronic sprain, persistent pain of the lower back and legs and rheumatic arthralgia.

Usage and dosage External use, topically.

Precaution Be cautious about pregnant women and patients with skin sensitivity.

Strength (1) 10 cm×7 cm (2) 10 cm×400 cm

Storage Preserve in tightly closed containers.

Dingkun Dan
(定坤丹)

Dingkun Pills

Dingkun Pills are big honeyed pills prepared from Radix et Rhizoma Ginseng Rubra; Cornu Cervi Pantotrichum; Stigma Croci; Caulis Spatholobi; Radix et Rhizoma Notoginseng; Radix Paeoniae Alba; Radix Rehmanniae (steamed); Radix Angelicae Sinensis; Rhizoma Atractylodis Macrocephalae; Fructus Lycii; Radix Scutellariae; Rhizoma Cyperi; Fructus Leonuri; Rhizoma Chuanxiong; Cornu Cervi Degelatinatum; Colla Corii Asini; Rhizoma Corydalis and other ingredients.

Description Blackish-brown big honeyed pills; odour, slight; taste, sweet, then bitter and astringent.

Identification (1) Microscopical: Stone cells of testa irregularly polygonal in surface view, walls thickened, sinuous and distinctly striated. Needle crystals fine, 10-32 μm long, irregularly filling in parenchymatous cells. Bast fibres yellow, fusiform, walls thickened, with fine pit canals. Fibre bundles brownish-yellow, surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres.

(2) Triturate well 5 g of the pills with 5 g kieseguhr, mix well, add 60 ml of ether, ultrasonicate for 10 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 0.5 ml of ethyl acetate as the test solution. Prepare a solution of 0.5 g each of Radix Angelicae Sinensis reference drug and Rhizoma Chuanxiong reference drug, add separately 20 ml of ether, in the same manner as the reference drug solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 10 μl of the test solutions and 3 μl of the reference drug solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluoresent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with reference drug solutions.

(3) Prepare a solution of 1 g of Radix Angelicae Sinensis reference drug and Rhizoma Chuanxiong reference drug in the same manner discribed under Assay test as the reference drug solution. Dissolve ginsenoside Rd1 CRS and ginsenoside Re CRS and ginsenoside Rg1 CRS and notoginsenoside R1 CRS in methanol to prepare a mixture solution containing 0.5 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (13 : 7 : 2)(allow to stand below 10℃) as the mobile phase. Apply separately 10 μl of the test solutions obtained under Assay test and 1 μl of the reference solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol and heat at 105℃ to the spots clear. Examine in daylight, the spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution and the reference drug solution. Examine under ultraviolet light at 365 nm, the fluoresent spots in the

chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution and the reference drug solution.

(4) Triturate well 20 g of the pills with 20 g kieseguhr, mix well, add 60 ml of ethanol, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 30 ml of water, and extract with three 20-ml quantity of *n*-butanol saturated with water. Combine the *n*-butanol extracts, concentrate to 1 ml, add a quantity of aluminium oxide, stir well, and apply to a small column (1.0 cm in diameter) packed with neutral aluminium oxide (100 mesh, 4 g). Elute with 50 ml of methanol, and collect the eluates. Evaporate to dryness and dissolve the residue in 1 ml of ethanol as the test solution. To 0.5 g of Radix Paeoniae Alba reference drug, add 20 ml of ethanol, ultrasonicate for 15 minutes, and filter. Evaporate to dryness, and dissolve the residue in 1 ml of ethanol as the reference drug solution. Dissolve paeoniflorin CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (5 : 1) as the mobile phase. Apply separately 10 μl of each of the above three solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 5% solution of vanillin in sulfuric acid and heat at 100℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with reference solution and reference drug solution.

(5) Triturate well 6 g of pills, add 60 ml of water, decoct for 30 minutes, and centrifuge, extract the supernatant with three 30-ml quantity of ethyl acetate, combine the ethyl acetate extracts, recover ethyl acetate to dryness, dissolve the residue in 20 ml of ethanol, and 0.1 g of activated charcoal, stir and filter. Evaporate the filtrate to dryness, and dissolve the residue in 0.5 ml of ethyl acetate as the test solution. To 0.5 g of Fructus Lycii reference drug, add 60 ml of water, decoct for 15 minutes, cool and filter. Extract the filtrate with 15 ml of ethyl acetate, evaporate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate and formic acid (2 : 3 : 1) as the mobile phase. Apply separately 10 μl of the test solutions and 5 μl of the reference solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluoresent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.05% phosphoric acid solution (21 : 80) as the mobile phase. As detector a spectrophotometer set at 203 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of ginsenoside Rg1.

Reference solution Dissolve a quantity of ginsenoside Rg1 CRS, accurately weighed, in methanol to prepare a solution containing 0.25 mg per ml as the reference solution.

Test solution Weigh accurately 3 g of the pills, obtained in test of weight variation and cut into pieces, add 3 g of the kieselguhr, stir well. To a Soxhlet's extractor, add 100 ml of methanol, heat under reflux until the extract becomes almost colourless, and evaporate to dryness. Dissolve the residue in 30 ml of water, extract with three 20-ml quantity of chloroform, discard the chloroform extract, extract with four 30-ml quantity of *n*-butanol saturated with water, combine the *n*-butanol extracts, wash with three 30-ml quantity of 1% sodium hydroxide solution, and wash with water saturated with *n*-butanol to neutral. Recover *n*-butanol to dryness, dissolve the residue with methanol in a 10 ml volumetric flask, dilute with methanol to volume, and mix well.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 3.0 mg of ginsenoside Rg1 ($C_{42}H_{72}O_{14}$) per pill, referred to Radix et Rhizoma Ginseng Rubra and Radix et Rhizoma Notoginseng.

Action To replenish *qi* and blood, and regulate menstruation and alleviate *qi* stagnation.

Indications Menstrual disorders, dysmenorrhea, metrorrhagia or metrostaxis, multicoloured leukorrhea, dizziness and prostration of blood, various deficiency syndromes after childbirth, and bone-steaming with hectic fever due to a deficiency of *qi* and *blood* and stagnation of *qi* and blood.

Usage and dosage 0.5-1 pill, twice a day.

Precaution Avoid raw, cold and greasy foods; cease medication when one catches common cold.

Strength 10.8 g per pill

Storage Preserve in tightly closed containers.

Erchen Wan
(二陈丸)

Erchen Pills

Ingredients Pericarpium Citri Reticulatae 250 g; Rhizoma Pinelliae (processed) 250 g; Poria 150 g; Radix et Rhizoma Glycyrrhizae 75 g.

Procedure Pulverize the above four ingredients to fine powder, sift and mix well. Break 50 g of Rhizoma Zingiberis Recens to pieces, add a quantitiy of water and press to make juice. Mix the Zingiber juice with the above powder to make pills and dry.

Description Greyish-brown to yellowish-brown watered pills; odour, slightly aromatic; taste, sweet and slightly pungent.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or brownish, 4-6 μm in diameter. Needle crystals of calcium oxalate in bundles, 32-144 μm long, occurring in mucilage cells or scattered. Prisms of calcium oxalate abundant in parenchyma. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres.

(2) To 5 g add 30 ml of methanol, heat under reflux in a water bath for 30 minutes, and filter. Concentrate the filtrate to about 5 ml as the test solution. Dissolve hesperidin CRS in methanol to produce a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance prepared with 0.5% sodium hydroxide solution and a mixture of ethyl acetate-methanol-water (100∶17∶13) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. Develop about 3 cm, remove the plate and allow it to dry in air. Develop the plate about 8 cm once more, using the upper layer of toluene, ethyl acetate, formic acid and water (20∶10∶1∶1) as the mobile phase, remove the plate, and allow to dry in air. Spray with aluminium chloride TS, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Heat under reflux 10 g, triturate well, with 40 ml of ether for 1 hour, and filter. Heat under reflux the residue, with 50 ml of methanol for 1 hour, filter, and evaporate to dryness. Dissolve the residue in 40 ml of water, and extract with three 20-ml quantities of n-butanol saturated with water. Combine the *n*-butanol extracts, wash with three 20-ml quantities of water, discard the washings. Evaporate the extract to dryness, and dissolve the residue in 5 ml of methanol as the test solution. Prepare a solution of 1 g of Radix et Rhizoma Glycyrrhizae reference drug in the same manner as the reference drug solution. Dissolve ammonium glycyrrhizate CRS in methanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 1% solution of sodium hydroxide as the coating substance and a mixture of ethyl acetate, formic acid, glacial and water (15∶1∶1∶2) as the mobile phase. Apply separately 5 μl of the above three solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol and heat at 105℃ to the spots clear. Examine under ultraviolet light at 365 nm, the fluoresent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, acetic acid and water (42∶4∶54) as the mobile phase. As detector a spectrophotometer set at 283 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of hesperidin.

Reference solution Weigh accurately 10 mg of hesperidin CRS, in a 50 ml volumetric flask, add a quantity of methanol to dissolve and dilute to volumn, mix well. Measure accurately 2 ml, in a 10 ml volumetric flask, dilute to volumn with the mobile phase, mix well for use, containing 40 μg of hesperidin per ml.

Test solution Pulverize 1 g of pills to powder, weigh accurately. To a Soxhlet's extractor, add a quantity of petroleum ether (60-90℃), heat under reflux for 2-3 hours, discard the petroleum ether, evaporate the residue to dryness, add a quantity of methanol, heat under reflux until the extract becomes almost colourless (6-8 hours), cool. Transfer the methanol extract to a 100 ml volumetric flask, wash the container with small quantity of methanol in portions, combine the washings to the same volumetric flask, dilute to volume and shake well. Measure accurately 3 ml, in a 10 ml volumetric flask, dilute to volumn with the mobile phase, mix well for use.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 10.0 mg of hesperidin ($C_{28}H_{34}O_{15}$) per g, referred to pericarpium Citri Reticulatae.

Action To remove *dampness* and resolve phlegm, and regulate *qi* flow to harmonize the stomach.

Indications Coughing with expectoration of copious phlegm, fullness and oppressive feeling in the chest, nausea and vomiting due to accumulation of *damp-phlegm*.

Usage and dosage 9-15 g, 2 times a day.

Storage Preserve in well closed containers, protected from moisture.

Erding Keli
(二丁颗粒)

Erding Granules

Ingredients Herba Violae 250 g; Herba Lobeliae Chinensis 250 g; Herba Taraxaci 250 g; Radix Isatidis 250 g.

Procedure Decoct the above four ingredients with water twice, 2 hours for the first time, 1.5 hours for the second time. Combine the decoctions, and filter. Concentrate the filtrate to a thick extract with a relative density of 1.36 (70℃), add 900 g of sucrose, mix well, make granules, dry, and make to 1000 g granules; or concentrate the filtrate to a thin extract with a relative density of 1.20 (50℃), dry by spraying, add 100 g dextrin or lactose and 0.3 g stevioside, mix well, make granules, dry, and make to 1000 g granules without sucrose.

Description Dark brown granules; taste, sweet, slightly bitter, or slightly sweet, slightly bitter (without sucrose).

Identification Pulverize 15 g or 3 g (without sucrose) to fine powder, add 40 ml of methanol, ultrasonicate for 30 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in 20 ml of hot water, allow to cool, extract with two 20-ml quantities of ethyl acetate, combine the ethyl acetate extracts, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve aesculetin CRS and caffeic acid CRS in methanol respectively to produce solutions containing 0.5 mg of each per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of toluene, ethyl acetate, and formic acid (5∶3∶1) as the mobile phase. Apply separately 5-8 μl of each of the test solution and the reference solutions to the plate. After developing and removing the plate, dry in the air, and expose the plate to iodine vapour to the spots clear. The spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference solutions.

Other requirements Comply to the general requirements for medicine granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatography system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water, and glacial acetic acid (20∶80∶0.4) as the mobile phase. As detector a spectrophotometer set at 353 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of aesculetin.

Reference solution Weigh accurately a quantity of aesculetin CRS, dissolve in methanol to produce a reference solution containing 20 μg per ml.

Test solution Pulverize the granules obtained under the test of packing variation to fine powder, weigh accurately 0.5 g or 0.3 g (without sucrose) to a stopper conical flask, add accurately 25 ml of methanol and weigh. Ultrasonicate (power 250 W, frequence 50 kHz) for 30 minutes, cool, weigh again, and replenish the lost weight with methanol. Mix well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 1.8 mg of aesculetin ($C_9H_6O_4$) per pack, referred to Herba Violae.

Action To clear *heat* and *toxic materials*.

Indications Furuncles and carbuncles, or sore throat, or acute conjunctivitis due to abundant *wind-heat* and *toxic materials*.

Usage and dosage 1 pack to be dissolved in boiled water for oral administration, 3 times a day.

Precaution Be cautious about diabetes patients (as it contains cane sugar granules)

Strength (1) 20 g per pack
(2) 4 g per pack (without sucrose)

Storage Preserve in tightly closed containers.

Erdong Gao (二冬膏)

Erdong Concentrated Decoction

Ingredients Radix Asparagi 500 g; Radix Ophiopogonis 500 g.

Procedure Decoct the two ingredients with water three times (3, 2 and 2 hours respectively). Combine the decoctions, filter and concentrate the filtrate to a thick extract with relative density of 1.21-1.25 (80℃). To each 100 g of the extract add 50 g of refined honey and mix well.

Description A brownish-yellow viscous semifluid; taste, sweet and slightly bitter.

Other requirements Complies with the general requirements for concentrated decoctions (Appendix Ⅰ F).

Action To replenish *yin* to moisten the lung.

Indications Dry cough with expectoration of scanty phlegm or blood-flecked phlegm, dry nose and sore throat due to a deficiency of *lung-yin*.

Usage and dosage 9-15 g, twice a day.

Storage Preserve in tightly closed containers, stored in a cool place.

Erkangning Tangjiang (儿康宁糖浆)

Erkangning Syrup

Ingredients Radix Codonopsis; Radix Astragali; Rhizoma Atractylodis Macrocephalae; Poria; Rhizoma Dioscoreae; Semen Coicis; Radix Ophiopogonis; Radix Polygoni Multiflori Praeparata; Fructus Jujubae; Fructus Crataegi (charred); Fructus Hordei Germinatus (stir-baked); Ramulus Mori.

Procedure Decoct all the above 12 ingredients with water for 2 times, combine the decoctions and filter. Concentrate the filtrate to a quantity of amount, add sucrose and refined honey, mix well, filter, add a quantity of citric acid and preservative, shake thoroughly, add 0.6 ml of tangerine peel oil and water to the volume of 1000 ml, mix well and pack.

Description A viscous, brownish-yellow to brown liquid; odour, aromatic; taste, sweet.

Identification (1) Extract 10 ml with two 20-ml quantities of *n*-butanol saturated with water, separate the *n*-butanol extract and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. To 1 g of Radix Ophiopogonis reference drug, add 20 ml of *n*-butanol saturated with water, ultrasonicate for 20 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of *n*-butanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of *n*-butanol, acetic acid and water (4∶1∶1) as the mobile phase. Apply separately 5-10 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% solution of sulfuric acid in ethanol, heat at 105℃ for about 5 minutes. The spots in the chromatogram obtained

with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(2) Extract 20 ml with two 20-ml quantities of chloroform, combine the chloroform extracts and evaporate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Dissolve emodin CRS in chloroform to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and formic acid (15∶2∶1) as the mobile phase. Apply separately to the plate 10-20 μl of the test solution and 5 μl of the reference solution. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution; expose the plate to ammonia vapour and examine in sunlight, the colour of the spot turns red.
(3) Extract 20 ml with three 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, wash with three 20-ml quantities of 1% solution of sodium hydroxide, and wash with water saturated with *n*-butanol to neutral. Discard the washings, evaporate the *n*-butanol extract to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve astragaloside Ⅳ CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of chloroform, ethyl acetate, methanol and water (10∶20∶11∶5) (allow to stand below 10℃) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% solution of sulfuric acid in ethanol, and heat at 105℃ to the spots clearly. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Relative density Not less than 1.24 (Appendix Ⅶ A).

pH value 4.0-5.0 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for syrup (Appendix Ⅰ H).

***n*-Butanol extractives** Accurately measured 20 ml of the syrup, in a separator, extract with successive quantities of 30, 20, 20, 20 and 20 ml of *n*-butanol saturated with water, combine the *n*-butanol extracts in a tared evaporating dish, previously dried to constant weight, and evaporate to dryness. Dry at 105℃ for 3 hours and allow to cool for 30 minutes in a desiccator. Weigh accurately and calculate.
It contains not less than 3.0 percent of the *n*-butanol extractives.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (25∶75) as the mobile phase. As detector a spectrophotometer set at 320 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of 2,3,5,4'-Tetrahydroxystilbene-2-*O*-β-D-glucoside.

Reference solution Dissolve a quantity of 2,3,5,4'-Tetrahydroxystilbene-2-*O*-β-D-glucoside CRS, accurately weighed, in dilute ethanol to produce a solution containing 20 μg per ml as the reference solution.

Test solution Measure accurately 5 ml, in a 25 ml amber volumetric flask, dilute to volumn with dilute ethanol, mix well, centrifuge, use the supertatant as the test solution.

Procedure Inject accurately 10 μl each of the reference solution and the test solution into the column and measure.
It contains not less than 30 μg of 2,3,5,4'-Tetrahydroxystilbene-2-*O*-β-D-glucoside ($C_{20}H_{22}O_9$) per ml.

Action To replenish *spleen-qi*, promote digestion and whet appetite.

Indications Anorexia with manifestations of poor appetite, indigestion, sallow complexion, emaciation and loose stools due to a deficiency of *spleen-qi* and *stomach-qi*

Usage and dosage 10 ml, 3 times a day; 20-30 days making a course of treatment.

Strength (1) 10 ml per phial (2) 150 ml per bottle

Storage Preserve in well closed containers, and store in dark and cool place.

Erlong Zuoci Wan
(耳聋左慈丸)

Erlong Zuoci Pills

Ingredients Magnetitum (calcined) 20 g; Radix Rehmanniae (Praeparata) 160 g; Fructus Corni (processed) 80 g; Cortex Moutan 60 g; Rhizoma Discoreae 80 g; Poria 60 g; Rhizoma Alismatis 60 g; Radix Bupleuri Marginati 20 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix well. To each 100 g of powder add 35-50 g of refined honey and a quantity of water to make pills and dry; Alternatively add 90-110 g of refined honey to make small honeyed pills or big honeyed pills.

Description Brownish-black water-honeyed pills, blackish-brown small honeyed pills or big honeyed pills; taste, sweet, slightly sour.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. clusters of calcium oxalate occurring in colourless parachymatous cells, sometimes several clusters in one cell. Parenchymatous cells subrounded, with elliptical pits, gathered into pit groups. The anticlinal walls of endodermis cells sinuous, relatively thickened, lignified, with sparse and fine pit-canals. Raphides of calcium oxalate occurring in mucilage cells, 80-240 μm long, needles 2-8 μm in diameter. Vittae containing yellow or brownish-yellow secretion. Irregular fragments black varying in size.
(2) To about 0.1 g add 5 ml of dilute hydrochloric acid, stir thoroughly, heat to boil for 2-3 minutes and filter. The filtrate produces the characteristic reactions of ferric salts (Appendix Ⅳ).
(3) Grind well 9 g of the small or the big honeyed pills, cut into pieces, with 5 g of kieselguhr, or pulverize 6 g of the water-honeyed pills, add 70 ml of ether, heat under reflux at a lower temperature for 1 hour, and filter. Expel the ether from the filtrate and dissolve the residue in 1 ml of acetone as the test solution. Dissolve paeonol CRS in acetone to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (3∶1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and

removal of the plate, dry in air. Spray with a 5% solution of ferric chloride in ethanol acidated with hydrochloric acid and heat to the spots clear The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Dissolve ursolic acid CRS in dehydrated ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform, ethyl acetate and glacial acetic acid (20∶5∶8∶0.5) as the mobile phase. Apply separately 4 μl of each of the test solution obtained in the Identification test (3) and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol and heat at 105℃ to the spots distinct. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Grind water-honeyed pills, or chip small honeyed pills and big honeyed pills, obtained under the test of weight variation, into pieces, weigh accurately 5 g, add 30 ml of water, and warm for full dispersion on a water bath at 60℃. Add 1 g of kieselguhr, stir well, filter, wash the residue with 30 ml of water and heat at 100℃ to dryness. Transfer the residue along with the filter paper to a Soxhlet's extractor, and extract under reflux with a quantity of ether for 4 hours. Recover the ether thoroughly, macerate the residue with two 15-ml quantities of petroleum ether (30-60℃) for about 2 minutes each, and discard the petroleum ether solution. Dissolve the residue in a mixture of chloroform and dehydrated ethanol (2∶3) by slight warming, transfer to a 5 ml volumetric flask, dilute with the same mixture solvent to volume, shake well, and use it as the test solution. Dissolve a quantity of ursolic acid CRS, weighed accurately, in dehydrated ethanol to produce a solution cotaining 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform, ethyl acetate and formic acid (20∶5∶8∶0.1) as the mobile phase. Apply accurately 10 μl of the test solution of the small honeyed pills or the big honeyed pills, or 5 μl of the test solution of water-honeyed pills, and 1 μl, and 3 μl of the reference solution to the plate alternatively. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots clear. Cover the plate with a same sized glass and fix with tape. Carry out the method for thin layer chromatography (Appendix Ⅵ B, A thin layer chromatographic scanning method), scan at a wavelength of $\lambda=540$ nm. Measure the integrated values of absorbance of the test solutions and the reference solutions respectively, and calculate the content.

It contains not less than 0.15 mg per gram of water-honeyed pills, 0.10 mg per gram of small honeyed pills, and 0.90 mg per big honeyed pill, of ursolic acid ($C_{30}H_{48}O_3$), referred to Fructus Corni.

Action To nourish the kidney and soothe the liver.

Indications Tinnitus, poor hearing or deafness, dizziness and blurred vision due to preponderance of *yang* from *yin* deficiency.

Usage and dosage 6 g of water-honeyed pills, 9 g of small honeyed pills or 1 big honeyed pill, twice a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Ermiao Wan
(二妙丸)

Ermiao Pills

Ingredients Rhizoma Atractylodis (stir-baked) 500 g; Cortex Phellodendri Chinensis (stir-baked) 500 g.

Procedure Pulverize the two ingredients to fine powder, sift and mix well. Make pills with water and dry.

Description Yellowish-brown watered pills; odour, slightly aromatic; taste, bitter and astringent.

Identification (1) Microscopical: Needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells. Fibre bundles bright yellow, surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres, the crystal cells with lignified and thickened walls.

(2) Pulverize 2 g of the pills to powder, add 15 ml of ether, ultrasonicate for 15 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethylacetate as the test solution. Prepare a solution of 1 g of Rhizoma Atractylodis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (10∶1) as the mobile phase. Apply separately 5 μl of the each solutions to the plate. Develop about 4 cm, remove the plate and dry in air. Develop the plate about 7 cm once more, using cyclohexane as the mobile phase, remove the plate and dry in air. Spray with a 5% solution of p-dimethylaminobenzaldehyde in 10% solution of sulfuric acid in ethanol and heat at 80℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) To 0.1 g of the pulverized sample, add 5 ml of methanol, heat under reflux on a water bath for 15 minutes and filter, to the filtrate add methanol to 5 ml and use it as the test solution. Prepare a solution with 0.1 g of Cortex Phellodendri reference drug as the reference drug solution in the same manner. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia TS (12∶6∶3∶3∶1) as the mobile phase. Apply separately 1 μl each of the three solutions to the plate. After developing in a chamber pre-equilibrated with ammonia vapour for 15 minutes, and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Apply 1 g of the pulverized sample, weighed accurately, to a Soxhlet's extractor, add an appropriate quantity of ether, heat under reflux on a water bath for 1-2 hours, discard the ether extract, remove the ether of the residue, add an appropriate quantity of methanol, heat under reflux until the extract colourless. Transfer (concentrate properly if necessary) the methanolic solution to a 50 ml

volumetric flask and dilute with methanol to volume, mix well, used as the test solution. Dissolve Berberine hydrochloride CRS in methanol to produce a solution containing 0.06 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and strong ammonia TS (12∶6∶3∶3∶1) as the mobile phase. Apply separately 1 μl of the test solution and 1 μl, 3 μl of the reference solution alternately to the plate. After developing in a twin-trough chamber pre-equilibrated with ammonia vapour and mobile phase vapour for 15 minutes and removal of the plate, dry in air. Carry out the method for thin layer chromatography (Appendix Ⅵ B thin layer chromatographic scanning method), scan at the wavelength λ_{ex} = 365 nm with fluorescence mode, measure the integrated value and calculate the content.
It contains not less than 3.0 mg of berberine hydrochloride ($C_{20}H_{18}ClNO_4$) per gram, referred to Cortex phellodendri.

Action To eliminate *dampness* and clear *heat*.

Indications Red, swollen and painful legs and knees with a hot sensation, erysipelas of the lower limbs, morbid leukorrhea, or wetness and itching of the scrotum due to pouring of *damp-heat*.

Usage and dosage 6-9 g, twice a day.

Storage Preserve in well closed containers, protected from moisture.

Ershiwuwei Shanhu Wan
(二十五味珊瑚丸)

Ershiwuwei Shanhu Pills

Ershiwuwei shanhu Pills are prescription used by Tibetan Nationality.

Ingredients Os Corallii 75 g; Margarita 15 g; Qingjinshi 20 g; Concha Margaritifera 50 g; Fructus Chebulae 100 g; Radix Aucklandiae 60 g; Flos Carthami 80 g; Cloves Flos Caryophylli 35 g; Lignum Aquilariae Resinatum 70 g; Cinnabaris 30 g; Os Draconis 40 g; Calamina 25 g; Naoshi 25 g; Magnetitum 25 g; Limonitum 25 g; Semen Sesami 40 g; Fructus Lagenariae 30 g; Flos Asteris 45 g; Herba Swertiae Bimaculatae 80 g; Rhizoma Acori Calami 50 g; Radix Aconiti Kusnezoffii 45 g; Herba Chrysanthemi Tatsiiensis 75 g; Radix et Rhizoma Glycyrrhizae 75 g; Stigma Croci 25 g; Moschus 2 g.

Procedure Pulverize the above ingredients, except Os Corallii, Margarita, Stigma Croci and Moschus, to fine powder and sift. Pulverize Os Corallii, Margarita, Stigma Croci and Moschus to fine powder, triturate with the above powder, sift, and mix well. Make pills with water, dry in the shade.

Description Redish-brown watered pills; odour, slightly aromatic; taste, sweet, bitter and astringent.

Identification (1) To 0.2 g of the powder add 3 ml of hydrochloric acid and 1 ml of nitric acid, heat on a water bath for 10 minutes, add 4 ml of water, and filter. To 1 drop of the filtrate add a quantity of copper iodide (mix equal volumes of copper sulfate TS and potassium iodide TS, eliminate the excess iodine by adding a small quantity of sodium thiosulfate, and use the precipitate), allow to stand, the white precipitate turns to red. To another 1 ml of the filtrate add 0.5 ml of barium chloride TS, a white precipitate is produced.

(2) To 0.5 g of the powder add 4 ml of methanol, ultrasonicate for 10 minutes, allow to stand, and use the supernatant as the test solution. Prepare a solution with 20 mg of Stigma Croci reference drug in the same manner and use it as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, formic acid and water (5∶1∶0.8) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, allow to dry in air. The three yellow spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(3) Pulverize 3 g of the pills to powder, add 10 ml of 80% acetone, ultrasonicate for 30 minutes, filter, use the filtrate as the test solution. Prepare a solution of 0.5 g of Flos Carthami reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, formic acid, water, and methanol (7∶2∶3∶0.4) as the mobile phase. Apply separately 10 μl of the above two solutions to the plate. After developing and removal of the plate, dry in air. A major spot in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for the pills (Appendix Ⅰ A), except the disintegration time.

Action To promote the restoration of consciousness, blood circulation and relieve pain.

Indications "*bai mai*" disease, unconsciousness, numbness of body, dizziness, headache, abnormal blood pressure, epilepsy and cranial neuralgia.

Usage and dosage 1 g, once a day, taken after infusing in boiling water.

Strength (1) 1 g per 4 pills (2) 1 g per pill

Storage Preserve in tightly closed containers.

Ershiwuwei Songshi Wan
(二十五味松石丸)

Ershiwuwei Songshi Pills

Ershiwuwei Songshi Pills are prescription used by Tibetan Nationality.

Ingredients Songshi 50 g; Margarita 10 g; Os Corallii 40 g; Cinnabaris 20 g; Fructus Chebulae (cored) 50 g; Pulvis Ferri (processed with Fructus Chebulae) 100 g; Fructus Phyllanthi 50 g; Extractum Faeces Trogopterori 40 g; Lignum Santali Albi 40 g; Lignum Dalbergiae Odoriferae 40 g; Fructus Aristolochiae 50 g; Herba Adhadotae vasicae 50 g; Calculus Bovis 5 g; Radix Aucklandiae 60 g; Herba Meconopsis 50 g; Radix Aconiti Naviculare 40 g; Semen Myristicae 20 g; Cloves Flos Caryophylli 25 g; Herba Saxifragae Umbellulatae 50 g; Fructus Terminaliae Billericae (cored) 5 g; Concretio Silicea Bambusae 35 g; Stigma Croci 5 g; Flos Gossampini 35 g; Moschus 0.25 g; Calx Pulveratum 35 g.

Procedure Pulverize the above ingredients, except Calculus Bovis, Stigma Croci, Moschus and Extractum Faeces Trogopterori, to fine powder and sift. Pulverize Calculus Bovis, Stigma Croci, and Moschus to fine powder, triturate

with the above powder, sift and mix well, make pills with Extractum Faeces Trogopterori and a quantity of water, dry in the shade.

Description Black watered pills; odour, aromatic; taste, bitter and astringent.

Identification (1) To 1 g, finely powdered, add 20 ml of acetone, ultrasonicate for 30 minutes, and filter and keep the residue for latter use. Concentrate the filtrate to 1 ml as the test solution. Dissolve cholic acid CRS in acetone to produce a solution containing 0.2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ether, chloroform and glacial acetic acid (2∶2∶1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol and heat at 105℃ for several minutes, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Take the drug residue, obtained under Identification (1) and dry in air, moisten with concentrated ammonia TS, add 5 ml of dehydrated ethanol, shake for 1 minute, allow to stand, use the supernatant as the test solution. Prepare a solution with 20 mg of Stigma Croci reference drug in the same manner and use it as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, formic acid and water (4∶1∶1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. The three yellow spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Pulverize 4 g of the pills to powder, add 20 ml of petroleum ether (60-90℃), ultrasonicate for 30 minutes, filter, and evaporate the filtrate to 1 ml as the test solution. Prepare a solution of 2 g of Radix Aucklandiae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxy methylcellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (9∶1) as the mobile phase. Apply separately 10 μl of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 5% solution of vanillin in sulfuric. Spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Pulverize 4 g of pills to powder, add 20 ml of chloroform, ultrasonicate for 30 minutes, filter, and evaporate the filtrate to 1 ml as the test solution. Prepare a solution of 2 g of Semen Myristicae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxy methylcellulose as the coating substance and a mixture of petroleum ether (60-90℃) and acetone (10∶0.3) as the mobile phase. Apply separately 10 μl of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 10% solution of phosphomolybdic. Spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A), except the disintegration time.

Action To remove *heat* and counteract *toxicity*, to regulate the flow of *qi* in the liver and gall-bladder, to eliminate blood stasis.

Indications Stagnation of *qi* in the liver, blood stasis, liver tenderness, cirrhosis, acute and chronic hepatitis, cholecys-titis.

Usage and dosage 1 g, once a day, taken after infusing in boiling water.

Strength (1) 1 g per 4 pills (2) 1 g per pill

Storage Preserve in tightly closed containers.

Ershiwuwei Zhenzhu Wan
(二十五味珍珠丸)

Ershiwuwei Zhenzhu Pills

Ershiwuwei Zhenzhu Pills are prescription used by Tibetan Nationality, and prepared from Margarita, Semen Myristicae, Calx Pulveratum, Fructus Tsaoko, Flos Caryophylli, Stigma Croci, Calculus Bovis, Moschus, etc.

Description Yellowish-brown and slightly red watered pills; odour, aromatic; taste, bitter and pungent.

Identification (1) To 3 g, finely powdered, add 20 ml of acetone, ultrasonicate for 20 minutes, filter and keep the residue for latter use. Concentrate the filtrate to 2 ml as the test solution. Dissolve cholic acid CRS in acetone to produce a solution containing 0.4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, acetone and formic acid (2∶1∶0.1) as the mobile phase. Apply separately 3 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots distinct, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) To 0.2 g of the residue obtained under Identification test (1) in an ampoule, add 5 ml of dilute hydrochloric acid TS, seal hermetically the ampoule, heat in an oven at 105℃ for 20 hours, use the supernatant as the test solution. Prepare a solution with 0.02 g of Margarita reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of phenol and water (7∶2) as the mobile phase. Apply separately 4 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and heat at 105℃ for 5-10 minutes. Spray immediately with 0.2% solution of ninhydrin in ethanol, heat at 105℃ to the spots clear. The purplish-red spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A), except the disintegration time.

Action To induce sedation, to promote the restoration of consciousness.

Indications Apoplexy, hemiplegia, distortion of the face, coma, confusion, delirium, and mania.

Usage and dosage 1 g, 1-2 times a day, taken after infusing

in boiling water.

Strength (1) 1 g per 4 pills (2) 1 g per pill

Storage Preserve in tightly colsed containers.

Ertong Qingfei Wan
(儿童清肺丸)

Ertong Qingfei Pills

Ingredients Herba Ephedrae 10 g; Semen Armeniacae Amarum (stir-baked) 20 g; Gypsum Fibrosum 40 g; Radix et Rhizoma Glycyrrhizae 10 g; Cortex Mori (stir-baked with honey) 30 g; Pericarpium Trichosanthis 30 g; Radix Scutellariae 40 g; Radix Isatidis 40 g; Exocarpium Citri Rubrum 30 g; Rhizoma Pinelliae Preparata 30 g; Fructus Perillae (stir-baked) 20 g; Semen Lepidii seu Descurainiae 10 g; Bulbus Fritillariae Thunbergii 40 g; Folium Perillae 20 g; Radix et Rhizoma Asari 8 g; Herba Menthae 30 g; Folium Eriobotryae (stir-baked with honey) 40 g; Rhizoma Cynanchi Stauntonii 30 g; Radix Peucedani 20 g; Rhizoma Acori Tatarinowii 30 g; Radix Trichosanthis 30 g; Lapis Chloriti (calcined) 10 g.

Procedure Pulverize the above twenty two ingredients to fine powder, sift and mix well. To each 100 g of the powder add 170-180 g of refined honey to make big honeyed-pills.

Description Black big honeyed pills; taste, bitter and pungent.

Identification (1) Microscopical: Irregular plate crystals colourless, with straight striations. Bast fibres pale yellow, fusiform, walls thickened and with fine pit-canals. Fibres colourless, 13-26 μm in diameter, walls thickened, pits indistinct. Stomata particular, guard cells dumb-bell shaped in lateral view. The inner epidermal cells of testa yellow, polygonal or elongated polygonal, walls slightly thickened. Mesophyll tissues containing fine calcium oxalate clusters, 4-8 μm in diameter. Compound starch granules composed of 2-14 components, usually combined by 1 big helmet-shaped component and several tiny components.

(2) Heat under reflux 10 g, triturate well with 5 g kieseguhr, mix well, with 2 ml of concentrated ammonia TS, 5 ml of ethanol and 50 ml of ether for 1 hour, and filter. Evaporate the filtrate at low temperature to dryness, dissolve the residue in a quantity of methanol, add 1 g of neutral aluminium oxide, stir well, and apply to a small column (10 mm in diameter) packed with neutral aluminium oxide (100-200 mesh, 6 g). Elute with 30 ml of methanol, collect the eluates, and evaporate at low temperature to 0.5 ml as the test solution. Dissolve ephedrine hydrochloride CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and concentrated ammonia TS (20∶5∶0.5) as the mobile phase. Apply separately 10 μl of the test solutions and 2 μl of the reference solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(3) Heat under reflux 3 g, triturate well with 1 g of kieseguhr, mix well, with 30 ml of ether for 1 hour, filter and keep the filtrate for the latter use. To the residue, expel ether, add 30 ml of 70% ethanol, heat under reflux for 1 hour, and filter. Evaporate the filtrate to dryness, dissolve the residue in a quantity of water, and apply to a small column (10 mm in diameter) packed with polyamide (60-80 mesh, 1 g) and water. Pre-elute with 50 ml of water, discard the water solution and elute with 50 ml of 85% methanol. Collect the eluates, evaporate to dryness and dissolve the residue in 1 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide film as the absorbant and a mixture of ethyl acetate, butanone, methanol and water (5∶3∶1∶1) as the mobile phase. Apply separately 4 μl of the test solutions and 1 μl of the reference solutions to the film. After developing and removal of the film, dry in air. Spray with a 10% solution of ferric chloride in ethanol and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(4) Evaporate the ether solution under indentification (3) to dryness, and dissolve in 1 ml of a mixture of dehydrated ethanol and chloroform (3∶2) as the test solution. Heat under reflux 0.5 g of Folium Eriobotryae reference drug, with 20 ml of ether for 1 hour, and filter. Evaporate the filtrate to dryness, and prepare in the same manner as the reference drug solution. Dissolve ursolic acid CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform and ethyl acetate (20∶5∶8) as the mobile phase. Apply separately 5 μl of the test solutions and 2 μl of the reference drug solution and 1 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirement for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (47∶53∶0.2) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 2500, calculated with reference to the peak of baicalin.

Reference solution Dissolve a quantity of baicalin CRS, accurately weighed, in methanol to prepare a solution containing 30 μg per ml as the reference solution.

Test solution Cut a quantity of the pills obtained under the weight variation test into pieces, triturate well with an half quantity of kieseguhr, mix well. Weigh accurately 1.5 g of the powder to a conical flask, add 40 ml of 70% ethanol, heat under reflux on a water bath for 2 hour, cool, filter, transfer the filtrate to a 100 ml volumetric flask, wash the container and residue with small quantity of 70% ethanol in portions, combine the washings to the same volumetric flask, dilute to volume and shake well for use.

Procedure Inject accurately 10 μl each of the reference solution and the test solution into the column and measure. It contains not less than 4.5 mg of baicalin ($C_{21}H_{18}O_{11}$) per pill, referred to Radix Scutellariae.

Action To clear the lung, release the exterior, resolve phlegm and relieve coughing.

Indications Red complexion, fever, coughing with expectoration of profuse thick phlegm, shortness of breath, or painful throat and hoarseness in children due to affliction from external *wind-cold* or *phlegm-heat* in the *Lung Meridian*.

Usage and dosage 1 pill, twice a day, half pill for children under 3 years of age.

Strength 3 g per pills

Storage Preserve in tightly closed containers.

Erzhi Wan
(二至丸)

Erzhi Pills

Ingredients Fructus Ligustri Lucidi (steamed) 500 g; Herba Ecliptae 500 g.

Procedure Pulverize Fructus Ligustri Lucidi to fine powder and sift. Decoct Herba Ecliptae with water twice for 1 hour each. Combine the decoctions, filter and evaporate the filtrate appropriately. Add 60 g of refined honey and a quantity of water. Mix well with the above powder to make pills and dry.

Description Blackish-brown water-honeyed pills; odour, slight; taste, sweet and bitter.

Identification (1) Microscopical: Epidermal cells of pericarp subpolygonal in surface view, with unevenly thickened anticlinal walls and lumina containing pale brownish substances.
(2) To 0.5 g, in powder, add 30 ml of ether and heat under reflux for 40 minutes. Filter and evaporate the filtrate to dryness. Dissolve the residue in 10 ml of dehydrated ethanol as the test solution. Dissolve oleanolic acid CRS in a quantity of dehydrated ethanol to produce a solution containing 1 mg per ml, used as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxy methylcellulose as the coating substance and a mixture of chloroform and methanol (40∶1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% solution of sulfuric acid in ethanol and heat at 105℃ to the spots distinct. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A), except that the disintegration time is within 2 hours.

Assay Grind 0.5 g, weighed accurately, to fine powder, place into a Soxhelt's extractor, add an appropriate quantity of ethyl acetate and heat under reflux for about 6 hours, recover the ethyl acetate to dryness. Dissolve the residue in ethyl acetate, transfer to a 5 ml volumetric flask, dilute with ethyl acetate to volume and mix well, used as the test solution. Dissolve a quantity of oleanolic acid CRS, weighed accurately, in dehydrated ethanol to produce a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, acetone and ethyl acetate (5∶2∶1) as the mobile phase. Apply accurately to the plate 2 μl of test solution and 1 μl and 4 μl of the reference solution, spotted alternatively. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 110℃ to the spots clear. Cover the plate with a piece of glass of the same size, and fix with tape. Carry out the method for thin layer chromatography (Appendix Ⅵ B thin layer chromatographic scanning method), scan at the wavelength of $\lambda_s = 530$ nm and $\lambda_R = 680$ nm. Determine the integrated values of the test solution and reference solution respectively, and calculated the content.
It contains not less than 8.0 mg of oleanolic acid ($C_{30}H_{48}O_3$) per gram, referred to Fructus Ligustri Lucidi.

Action To nourish the liver and kidney, and replenish *yin* and arrest bleeding.

Indications Dizziness and tinnitus, dryness of the throat and nose, aching pain in the lower back and knees or menorrhagia due to *yin* deficiency in the *liver* and kidney.

Usage and dosage 9 g, twice a day.

Storage Preserve in tightly closed containers.

Extractum Folii Eriobotryae Inspissatum
(枇杷叶膏, Pipaye Gao)

Loquat Leaf Concentrated Decoction

Loquat Leaf Concentrated Decoction is the concentrated decoction prepared from Folium Eriobotryae.

Procedure Decoct Folium Eriobotryae with three quantities of water. Combine the decoctions, filter and concentrate the filtrate to a liquid extract with relative density 1.21-1.25 (80℃). To 100 g of the liquid extract, add 200 g of refined honey or 200 g of sucrose, heat to dissolve, mix well, concentrate to relative density as required.

Description A blackish-brown thick semi-fluid; taste, sweet, slightly astringent.

Relative density 1.42-1.46 (Appendix Ⅰ F).

Other requirements Complies with the general requirments for concentrated decoctions (Appendix Ⅰ F).

Action To clear the lung and relieve *dryness* by moistening, and stop coughing and resolve phlegm.

Indications Dry cough due to *heat* in the lung, expectoration of scanty phlegm and dry throat.

Usage and dosage 9-15 g, twice a day.

Storage Preserve in tightly closed containers, stored in a cool place.

Extractum Leonuri Inspissatum
(益母草膏, Yimucao Gao)

Concentrated Decoction of Motherwort Herb

Concentrated Decoction of Motherwort Herb is the concentrated decoction prepared from Herba Leonuri.

Procedure Cut Herba Leonuri into pieces, decoct with water for two times, 2 hours each, combine the decoctions, filter. Concentrate the filtrate to a thin extract of relative density 1.21-1.25 (80℃). To each 100 g of the thin extract add 200 g of brown sugar, heat to dissolve, mix well and concentrate to the specified relative density.

Description A brownish-black and thick semifluid; odour,

slight; taste, bitter and sweet.

Identification To 10 g, add 20 ml of water, stir well, add dilute hydrochloric acid to adjust to pH 1-2 and centrifuge. Apply the supernatant to a strong acidic cation exchange resin column (0.9 cm in internal diameter and 12 cm in length) packed with sodium type of resin [Na type, 001×7 (732)]. Elute with water to the eluate nearly colourless, discard the water eluate and then elute with 40 ml of 2 mol/L ammonia solution. Combine the ammonia eluate, evaporate to dryness on a water bath. Dissolve the residue in 2 ml of methanol as the test solution. Dissolve stachydrine hydrochloride in methanol to produce a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance, and a mixture of *n*-butanol, hydrochloric acid and ethyl acetate (8∶3∶1) as the mobile phase. Apply separately to the plate 4 μl of each of the two solutions. After developing and removal of the plate, dry in air. Spray with a dilute Potassium iodobismuthate TS. A spot in the chromatogram obtained with test solution corresponds in position and colour to the spot in the chromatogram obtained with reference solution.

Relative density 1.10-1.12, diluting 10 g in 20 ml of water (Appendix Ⅶ A).

Other requirements Complies with the general requirements for concentrated decoctions (Appendix Ⅰ F).

Assay Weigh accurately 3 g in beaker, add 10 ml of water, allow to dissolve, adjust the pH value to 1-2 with dilute hydrochloric acid, apply to a strong acidic cation exchange resin column (0.9 cm in internal diameter and 12 cm long) packed with sodium type of resin (732). Elute with water to the eluate nearly colourless, discard the water eluate and then elute with 150 ml of 2 mol/L ammonia solution. Combine the ammonia eluate, evaporate to dryness, dissolve the residue in methanol, transfer to a 10 ml volumetric flask, dilute to volume, mix well, stand, use the supernatant as the test solution. Dissolve stachydrine hydrochloride CRS, dried at 105℃ for 3 hours, weighed accurately, in methanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of n-butanol, ethyl acetate and hydrochloric acid (8∶1∶3) as the mobile phase. Apply separately 8 μl of the test solution, 3 μl and 8 μl of the reference solutions to the plate. After developing and removal of the plate, dry in air. Heat at 105℃ for 15minutes, cool. Spray with a mixture of 1% solution of ferric chloride in ethanol and dilute Potassium iodobismuthate Ts (1∶10) to the spots clear, dry in air. Cover with a same size glass to the plate and fix with adhesive tape. Carry out the method of thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan at the wavelength $\lambda_s = 510$ nm. Measure the integration value of absorbency of the test solution and the reference solution and calculate.

It contains not less than 3.6 mg of stachydrine hydrochloride ($C_7H_{13}NO_2 \cdot HCl$) per gram.

Action To promote blood circulation to regulate menstruation.

Indications Menstrual disorders due to stagnated blood and prolonged lochiorrhea with manifestations of hypomenorrhea, continuous dripping of menstrual blood and long-term bleeding after childbirth; postpartum subinvoution of the uterus with above symptoms.

Usage and dosage 10 g, 1-2 times a day.

Precaution Contraindicated for pregnant women.

Strength (1) 125 g per bottle (2) 250 g per bottle

Storage Preserve in tightly closed containers, stored in a cool place.

Extractum Prunellae Inspissatum (夏枯草膏, Xiakucao Gao)

Common Selfheal Concentrated Decoction

Common Selfheal Concentrated Decoction is the concentrated decoction prepared from Spica Prunellae.

Procedure Decoct 2500 g of Spica Prunellae with water for 3 times, 2 hours each, combine the decoctions, filter, concentrate the filtrate to a liquid extract with a relative density of 1.21-1.25 (80-85℃). To each 100 g of the liquid extract add 200 g of refined honey or 200 g of sucrose, heat to dissolve, mix well, concentrate to the specified relative density, and make 1000 g.

Description A blackish-brown and thick semifluid; taste, sweet, slightly astringent.

Identification Place 2 g of the extract, add 25 ml of water to dissolve, adjust the pH value to 2-3 with dilute hydrochloric acid TS, and filter. Extract the filter with three 25-ml quantities of ether, combine the ether extract and evaporate to dryness. Dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Decoct 0.5 g of Spica Prunellae reference drug with 25 ml of water for 30 minutes; cool, filter. Use the filter to prepare the reference drug solution in the same manner as described in the test solution preparation, beginning at the words "adjust the pH value to 2-3 with dilute hydrochloric acid TS". Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol, glacial acetic acid, and water (7∶2∶0.5∶0.3) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 2% ferric chloride in ethanol and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution.

Relative density 1.40-1.46 (Appendix Ⅰ F).

Other requirements Comply with the general requirements for concentrated decoctions (Appendix Ⅰ F).

Action To clear *fire*, dissipate nodulation and reduce swelling.

Indications Headache, dizziness, scrofula, or mastitis due to *internal fire* accumulation; goiter, tuberculous lymphadenitis and hyperplasia of mammary glands with above symptoms.

Usage and dosage 9 g; twice a day.

Storage Preserve in tightly closed containers, stored in a cool place.

Fangfeng Tongsheng Wan
(防风通圣丸)

Fangfeng Tongsheng Pills

Ingredients Radix Saposhnikoviae 50 g; Spica Schizonepetae 25 g; Herba Menthae 50 g; Herba Ephedrae 50 g; Radix et Rhizoma Rhei 50 g; Natrii Sulfas 50 g; Fructus Gardeniae 25 g; Talcum 300 g; Radix Platycodonis 100 g; Gypsum Fibrosum 100 g; Rhizoma Chuanxiong 50 g; Radix Angelicae Sinensis 50 g; Radix Paeoniae Alba 50 g; Radix Scutellariae 100 g; Fructus Forsythiae 50 g; Radix et Rhizoma Glycyrrhizae 200 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 25 g.

Procedure Pulverize the above ingredients, except Natrii Sulfas and Talcum, to fine powder, sift and mix well. Dissolve Natrii Sulfas in an appropriate quantity of water, filter and make pills with the filtrate. Pulverize Talcum to very fine powder, coat the pills, polish and dry.

Description White to greyish-white bright watered pills; taste, sweet, salty and slightly bitter.

Identification (1) Microscopical: Vittae containing golden-yellow secretion, about 30 μm in diameter. Epidermal cells of calyx pale yellow, with sinuous anticlinal walls. Stomata characteristic, guard cells dumbbell-shaped in lateral view. Clusters of calcium oxalate large, 60-140 μm in diameter. Irregular plate crystals colourless, with straight striations. Clusters of calcium oxalate 18-32 μm in diameter, occurring in parenchymatous cells, often arranged in rows, or several in one cell. Phloem fibres pale yellow, fusiform, with thickened walls and fine pit-canals. Fibre bundles surrounded with parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Needle crystals of calcium oxalate fine, 10-32 μm in long, irregularly filling in parenchymatous cells. Stone cells containing crystals of pericarp subrounded or polygonal, 17-31μm in diameter, with thickened walls and containing prisms of calcium oxalate. Endocarp fibres, the upper and lower layers crossed alternately, fibres short fusiform.

(2) Place 4 g, in fine powder, in a crucible and ignite to complete carbonization, cool, add 5 ml of water to the residue, stir and filter. To 2 ml of the filtrate, add ammoina TS until the solution becomes neutral and add 1 ml of zinc-uranyl acetate TS; a yellow precipitate is produced. To another 2 ml of the filtrate, add 1 drop of barium chloride TS; a white precipitate is produced, which is insoluble in hydrochloric acid or nitric acid.

(3) Place 15 g, in powder, in a Soxhlet's extractor, moisten with 10 ml of dilute sulfuric acid, add 40 ml of chloroform and heat under reflux for 8 hours. separate the chloroform layer and evaporate to dryness. Dissolve the residue with sodium hydroxide solution (0.1 mol/L), stir and filter. Acidify the filtrate with dilute hydrochloric acid to pH 2-3 and extract again with an appropriate quantity of chloroform. Concentrate the extract to about 2 ml, used as the test solution. Prepare a solution with 0.5 g of Radix et Rhizoma Rhei reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of benzene, ethyl formate, methanol, formic acid, and water (6:2:0.4:0.1:1) as mobile phase. Apply separately 20 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Develop again, using the upper layer of a mixture of hexane, petroleum ether (60-90℃), ethyl formate, formic acid, and water (6:2:3:0.2:1) as the mobile phase. After developing and removal of the plate, dry in air. The yellow spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtined with the reference drug solution. The colour of the spots turns to red on exposure to ammonia vapour.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To release the exterior and promote bowels movement, and clear *heat* and relieve *toxicity*.

Indications Aversion to cold, high fever, headache, dry throat, concentrated urine, constipation, scrofula at the initial stage, rubella and exudative sores in the condition of exterior *cold* and interior *heat* and the exterior and interior excess syndrome.

Usage and dosage 6 g, twice a day.

Precaution Be cautious about pregnant women.

Strength 1 g per 20 pills

Storage Preserve in well closed containers, protected from moisture.

Fei'er Wan
(肥儿丸)

Fei'er Pills

Ingredients Semen Myristica (simmered) 50 g; Radix Aucklandiae 20 g; Massa Medicata Fermentata (stir-baked) 100 g; Fructus Hordei Germinatus (stir-baked) 50 g; Rhizoma Picrorhizae 100 g; Semen Arecae 50 g; Semen Quisqualis 100 g.

Procedure Pulverize the above seven ingredients to fine powder, sift and mix well. To each 100 g of powder add 100-130 g of refined honey to make big honeyed pills.

Description Blackish-brown big honeyed pills; taste, slightly sweet and bitter.

Identification (1) Microscopical: Epidermal cells in longitudinal rows, frequently one long cell alternately joined to two short cells, the longer cells with thickened, sinuous, and lignified walls. Fatty oil drops numerous, add chloral hydrate TS, after heating gradually forming sphaeraphides crystalized. Epidermal cells of testa yellow or brown, polygonal, walls thin and folded with reticulate cells underneath. Bi-spiral vessels 14-17 μm in diameter with walls about 5 μm thick. Fragments of endosperm cells colourless, walls relatively thick, with many large subrounded pits.

(2) Heat under reflux 15 g of the pills, cut into pieces and triturated with 10 g of kieselguhr, in 3 ml of ammonia TS, 50 ml of chloroform on a water bath for 1 hour and filter. To the filtrate, add 5 ml of dilute hydrochloric acid, 20 ml of water, shake, separate the acidic aqueous layer, adjust to pH 8-9 with strong ammonia TS. Extract with two 10-ml, quantities of chloroform. Combine the chloroform extracts, evaporate to dryness. Dissolve the residue in 0.5 ml of methanol as the test solution. Prepare a solution with 1 g of Semen Arecae reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance prepared with 1% solution of sodium hydroxide and the lower layer of a mixture of chloroform, ethyl acetate, methanol, and water (2:4:2:1) as the mobile phase. Apply separately 10 μl of each of the two

solutions to the plate. After developing and removal of the plate, dry in air, spray with potassium iodobis-muthate TS. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(3) Cut 24 g of the pills into pieces, grind with 12 g of kieselguhr. Add 80 ml of ether, ultrasonicate for 5 minutes, filter, evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol, centrifuge and use the supernatant as the test solution. Prepare a solution of 0.5 g of Radix Aucklandiae reference drug and 20 ml of ether in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (10∶3) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 5% solution of vanillin in sulfuric acid. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference drug solution.
(4) Dissolve Vanillic acid CRS and cinnamic acid CRS in methanol separately to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of *n*-hexane, ether and glacial acetic acid (5∶5∶0.1) as the mobile phase. Apply separately 5 μl of each of the test solution obtained under the test of Identification (3) and the above two reference solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the fluorescent spots in chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To invigorate the spleen to expel retained food and intestinal parasites.

Indications Child indigestion, or abdominal pain due to parasitic malnutrition, emaciation and sallow complexion, loss of appetite, abdominal bloating and diarrhea.

Usage and dosage 1-2 pills, 1-2 times a day; appropriate reduction of the dosage for children under 3 years of age.

Strength 3 g per pill

Storage Preserve in tightly closed containers.

Fenghan Kesou Keli
(风寒咳嗽颗粒)

Fenghan Kesou Granules

Ingredients Pericarpium Citri Reticulatae 100 g; Rhizoma Zingiberis Recens 150 g; Rhizoma Pinelliae Preparatum 150 g; Pericarpium Citri Reticulatae Viride 100 g; Semen Armeniacae Amarum 100 g; Herba Ephedrae 100 g; Folium Perillae 100 g; Fructus Schisandrae Chinensis 100 g; Cortex Mori 100 g; Radix Glycyrrhize preparata 100 g.

Procedure Distill volatile oil of Pericarpium Citri Reticulatae, Pericarpium Citri Reticulatae Viride. Collect the aqueous extract solution in another container, Decoct the drug residue and the other 8 ingredients three times, 1.5 hours for each time. Combine the decoctions and filter. Combine the filtrate and the above water solution and concentrate to a thick extract with a relative density of 1.38-1.40 (60℃). Mix 1 thick extract, 3 sucrose, and 1 dextrin together thoroughly. Make granules and dry. Add volatile oil of Pericarpium Citri Reticulatae and Pericarpium Citri Reticulatae Viride. Mix thoroughly, make up to 1000 g.

Description Pale brown granules; odour, aromatic; taste, sweet, slightly bitter.

Identification (1) To 5 g of the granules, dissolve in 20 ml of water, extract with two 20-ml quantities of ether, discard the ether layer, and extract the water layer with two 30-ml quantities of ethyl acetate, and combine the ethyl acetate extracts. Evaporate the ethyl acetate extracts to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve hesperidine CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium hydroxide as the coating substance and a mixture of ethyl acetate, ethanol and water (20∶10∶1) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing about 3 cm, remove the plate, dry it in air, and use a mixture of toluene, ethyl acetate, formic acid and water (20∶10∶1∶1) as the mobile phase, develop again about 8 cm, remove the plate, and dry in air. Spray with aluminium chloride TS, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) To 10 g of the granules, add 10 ml of water, 0.5 ml of concentrated ammonia TS, and 20 ml of chloroform. Ultrasonicate for 20 minutes, allow to stand, and separate the chloroform layer. Evaporate to dryness on a water bath, and dissolve the residue in 2 ml of methanol as the test solution. Dissolve ephedrine hydrochloride CRS in methanol to produce a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of chloroform, methanol and concentrated ammonia TS (4∶1∶0.1) as the mobile phase. Apply separately 6 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with ninhydrin TS, heat at 105℃ to the spots distinct. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for medicinal granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol and water (1∶1) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of ephedrine hydrochloride.

Reference solution Weigh accurately 15 mg of ephedrine hydrochloride CRS, place in a 50 ml volumetric flask, dissolve in water and dilute to volume, and mix well. Measure accurately 5 ml of the solution, transfer to a 100 ml volumetric flask, add water to volume, and mix well. Measure accurately 10 ml of the solution, transfer to a 25 ml volumetric flask. Add 1 ml of periodic acid solution (0.25 g→10 ml) and 2.5 ml of 0.25 mol/L sodium hydroxide, and

mix well. Allow to stand for 30 min, add 0.5 mol/L solution of hydrochloric acid to adjust to pH 7, then add methanol to volume, and mix well to produce a solution containing 6 μg per ml.

Test solution Weigh accurately 3 g of the content obtained under the test of packing variation, pulverized to fine powder, place in a round-ground flask, add 120 ml of 5 mol/L solution of sodium hydroxide, stir well, add 7.5 g of sodium chloride, ultrasonicate for 30 minutes (power 250 W, frequency 50 kHz), add 50 ml of water, and distill, collect about 95 ml of the distillate in a 100 ml of volumetric flask previously added 5 ml of 0.5 mol/L hydrochloric acid, add water to volume, shake well, measure accurately 10 ml of the solution to a 25 ml of volumetric flask, process with the same manner as described under *Reference solution*, beginning at the words "add 1 ml of periodic acid" to "add methanol to volume", stir well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column respectively and calculate the content.

It contains not less than 2.0 mg of ephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) per bag referred to Herba Ephedrae.

Action To disperse *lung-qi* and *cold*, expel phlegm and relieve coughing.

Indications Coughing and shortness of breath due to affliction from external *wind-cold* and failure of *lung-qi* to disperse with manifestations of headache, stuffy nose, coughing with expectoration of much phlegm, and constriction in the chest and shortness of breath.

Usage and dosage 5 g, twice a day, taken with boiled water.

Precaution Be cautious about patients with dry cough caused by *yin* deficiency.

Strength 5 g per bag

Storage Preserve in tightly closed containers.

Fengliaoxing Fengshi Dieda Yaojiu (冯了性风湿跌打药酒)

Fengliaoxing Fengshi Dieda Wine

Ingredients Caulis Erycibes 2500 g; Ramulus Cinnamomi 75 g; Herba Ephedrae 93.8 g; Rhizoma et Radix Notopterygii 7.5 g; Radix Angelicae Sinensis 7.5 g; Rhizoma Chuanxiong 7.5 g; Radix Angelicae Dahuricae 7.5 g; Fructus Psoraleae 7.5 g; Olibanum 7.5 g; Fructus Gleditsiae Abnormalis 7.5 g; Pericarpium Citri Reticulatae 33.1 g; Rhizoma Atractylodis 7.5 g; Cortex Magnoliae Officinalis 7.5 g; Rhizoma Cyperi 7.5 g; Radix Aucklandiae 7.5 g; Fructus Aurantii 50 g; Rhizoma Atractylodis Macrocephalae 7.5 g; Rhizoma Dioscoreae 7.5 g; Rhizoma Polygonati 20 g; Semen Cuscutae 7.5 g; Fructus Foeniculi 7.5 g; Semen Armeniacae Amarum 7.5 g; Rhizoma Alismatis 7.5 g; Faeces Trogopterori 7.5 g; Feculae Bombycis 16.2 g; Cortex Moutan 7.5 g; Myrrha 7.5 g.

Procedure Mix well the above ingredients, except Olibanum, Faeces Trogopterori, Radix Aucklandiae, Myrrha, Herba Ephedrae, Ramulus Cinnamomi, Radix Angelicae Dahuricae, Fructus Foeniculi, Rhizoma et Radix Notopterygii and Fructus Gleditsiae Abnormalis, steam for 2 hours. Take out and allow to cool, combine with the other ten ingredients in a container, add 10000 g of white rice wine, well stopper, macerate for 30-40 days and filter.

Description A brownish-yellow to reddish-brown liquid; odour, aromatic; taste, slightly bitter and sweet.

Identification (1) Evaporate 10 ml to dryness, dissolve the residue in 10 ml of dehydrated ethanol and filter. Evaporate 1 ml of the filtrate to dryness, to the residue add 1 ml of water, a turbid solution is produced, which clarifies on shaking with 1 drop of sodium hydroxide TS, and then becomes turbid again on adding 1 drop of hydrochloric acid.

(2) Use the wine as the test solution. Heat under reflux 1 g of Caulis Erycibes reference drug with 10 ml of dehydrated ethanol for 30 minutes, filter, use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, acetone and formic acid (16 : 4 : 0.3) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Spray with sodium hydroxide TS, the fluorescent intensity of the spots becomes stronger.

(3) Concentrate 30 ml to 2 ml, add 10 ml of ether and 1 ml of strong ammonia TS, stopper closely and allow to stand for 2 hours with constant shaking. Separate the ether layer, add 1 drop of hydrochloric acid, evaporate ether, add 2 ml of methanol, filter, and use the filtrate as the test solution. Dissolve ephedrine hydrochloride CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and strong ammonia TS (20:3:0.5) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with nihydrin TS and heat at 105℃ for about 10 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Ethanol content 35 per cent-45 per cent (Appendix Ⅸ M).

Total solid Measure accurately 25 ml, in a tared evaporating dish, heated at 105℃ to a constant weight, evaporate to dryness on a water bath and heat at 105℃ to a constant weight. The residue remained should not be less than 1.2 per cent.

Other requirements Complies with the general requirements for medicinal wine (Appendix Ⅰ M).

Action To expel *wind* and *dampness*, and promote blood circulation to kill pain.

Indications Wind, cold, damp athralgia, numbness of hands and feet, aching pain of the lower back and legs; traumatic injuries, and pain due to stagnation of *qi* and blood.

Usage and dosage 10-15 ml, 2-3 times a day; appropriate quantity for topical application; for swollen, painful black bruise, some fresh ginger is crushed and stir-baked and mixed with some wine and applied topically.

Precaution It is forbidden to prescribe to pregnant women or rubbed with it into the abdomen of pregnant women.

Storage Preserve in tightly closed containers, stored in a cool place.

Fengshi Gutong Jiaonang
(风湿骨痛胶囊)

Fengshi Gutong Capsules

Ingredients Radix Aconiti Praeparata; Radix Aconiti Kusnezoffii Praeparata; Flos Carthami; Radix et Rhizoma Glycyrrhizae; Fructus Chaenomelis; Fructus Mume; Herba Ephedrae.

Procedure Pulverize Radix Aconiti Praeparata, Radix Aconiti Kusnezoffii Praeparata and Radix Glycyrrhizae to fine powder respectively, sift and mix thoroughly. Decoct the other four ingredients with water twice, 2 hours each time, combine the decoctions and filter. Concentrate the filtrate to a thick extract, add the above fine powder, mix thoroughly, dry, pulverize to fine powder, pack 1000 capsules.

Description Hard capsules with yellowish-brown powder; taste, slightly bitter and sour.

Identification (1) Microscopical: Stone cells rectangular or subsquare with slightly thickened walls; Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibre.
(2) Heat under reflux 5 g of the content, moistened with 0.5 ml of concentrated ammonia TS, with 50 ml of chloroform for 2 times, 2 hours each time, filter, and combine the filtrates. Recover solvent to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve ephedrine hydrochloride CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and concentrated ammonia TS (4∶1∶0.1) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with ninhydrin TS and heat at 105℃ for several minutes. The red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay *Reference solution* Dissolve 10 mg of aconitine CRS, dried to the constant weight at 105℃ and accurately weighed, in chloroform in a 100 ml volumetric flask, dilute to volume, and mix well (containing 0.1 mg of aconitine per ml).

Preparation of standard calibration Transfer separately 1,2,3,4 and 5 ml of the reference solution, accurately measured, in separatoring funnels, add accurately chloroform to 20 ml in order. Add accurately 10 ml of pH 3.0 buffer solution (dissolve 0.15 g of dehydrated sodium acetate in water, add 5.6 ml of glacial acetic acid, dilute with water to 500 ml, mix well and make any necessary correction with pH meter) and 2 ml of 0.1% solution of bromcresol green (dissolve 0.2 g of bromcresol green in 3.2 ml of 0.05 mol/L solution of sodium hydroxide, dilute with water to 200 ml and mix well), shake strongly for 5 minutes, and allow to stand for 20 minutes. Separate the chloroform layer and filter through a dry filter paper. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), using the corresponding solution as the blank, measure the absorbance at 412 nm respectively. Use the absorbance as the ordinate and the concentration as the abscissa, plot the standard calibration.

Procedure Weigh accurately 1 g of the finely powdered content, obtained under the test of packing variation, in a conical flask with stopper, add accurately 25 ml of a mixture of ether, chloroform, dehydrated ethanol (16∶8∶1) and 1.5 ml of ammonia TS, shake thoroughly, weigh, extract on a high speed oscillator for 3 times, 2 minutes each time, allow to stand overnight, weigh again and replenish the loss of weight with the above mixture, mix well on a high speed oscillator for 2 minutes, allow to stand. Transfer accurately 5 ml of the supernatant to a separating funnel, add 5 ml of ether, and extract with four 10-ml quantities of 0.05 mol/L sulfuric acid solution, collect the sulfuric acid extract, filter and combine the filtrates in another separating funnel. Add 4 ml of concentrated ammonia TS, mix well, and extract with four 10-ml quantities of chloroform, collect the chloroform extract and filter. Combine the filtrates, recover the solvent to dryness, and heat the residue at 105℃ for 1 hour, take out and allow to cool. Dissolve the residue with chloroform in portions to a 25 ml volumetric flask, dilute to volume and mix well. Transfer accurately 20 ml of the solution in a separating funnel, carry out the method described under the preparation of standard calibration, beginning at the words "add accurately 10 ml of buffer solution of pH 3.0", measure the absorbance, read out the content of aconitine (μg) from standard curve and calculate.
It contains not less than 0.25 mg and not more than 0.80 mg of total alkaloids per capsule, calculated as aconitine ($C_{34}H_{47}NO_{11}$).

Action To warm the meridians to disperse *cold*, and dredge meridians to kill pain.

Indications Impediment disease due to *wind-dampness* that blocks the meridians, with manifestations of pain in the lower back, cold pain in the limbs and joints; rheumatic arthritis with above symptoms.

Usage and dosage 2-4 capsules, twice a day.

Precaution Overdosage is forbidden as it contains poisonous ingredients; it is contraindicated for pregnant women.

Strength 0.3 g per capsule

Storage Preserve in well closed containers.

Fengshi Maqian Pian
(风湿马钱片)

Fengshi Maqian Tablets

Ingredients Semen Strychni Pulveratum 125 g; Bimbyx Batryticatus (stir-baking) 19 g; Olibanum (stir-baking) 19 g; Myrrha (stir-baking) 19 g; Sacorpio 19 g; Radix Achyranthis Bidentatae 19 g; Rhizoma Atractylodis 19 g; Herba Ephedrae 19 g; Radix et Rhizoma Glycyrrhize 19 g.

Procedure Pulverize Sacorpio, Olibanum, Myrrha and Bimbyx Batryticatus (baking) into fine powder, carry out the method for percolation described under liquid extracts and extracts (Appendix Ⅰ O), percolate Herba Ephedrae, Rhizoma Atractylodis use 75% ethanol as solvent, collect percolation, recover ethanol and concentrate to a thick extract. Decoct Radix Achyranthis Bidentatae and Radix et Rhizoma Glycyrrhize with water three times, 1-2 hours for each time and filter. Combine the filtrates and concentrate to a thick extract. Combine the above thick extracts and add the fine Semen Strychni Pulveratum and the above powder, and mix thoroughly. Make granules and dry. Make to 1000 tablets.

Description Sugar coated tablets with yellowish-brown core; taste, bitter.

Identification (1) Triturate 3 tablets, removed sugar coat, to fine powder, add 0.5 ml of concentrated ammonia TS and 5 ml of dichloromethane, stopper closely the container. Ultrasonicate for 20 minutes, cool, filter and use the filtrate as the test solution. Dissolve separately strychnine CRS and brucine CRS in dichloromethane to produce a mixture solution containing 2 mg each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with soldium hydroxide solution (0.2 mol/L) as the coating substance and a mixture of chloroform, cyclohexane and ethanol (3∶1∶1) as the mobile phase. Apply separately 10 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with potassium iodobismuthate TS. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(2) Triturate 10 tablets, removed sugar coat, to fine powder, add 0.5 ml of concentrated ammonia TS and 10 ml of dichloromethane, stopper closely. Ultrasonicate for 20 min, cool, filter, and use the filtrate as the test solution. Dissolve ephedrine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of butanol, glacial acetic acid and water (8∶2∶1) as the mobile phase. Apply separately 10 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with ninhydrin TS and heat at 105℃ to spot clearly. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Triturate 20 tablets, removed sugar coat, to fine powder; weigh accurately a quality of the powder (about 3 tablets in weight) in a stopper conical flask, add accurately 25 ml of chloroform and 1 ml of concentrated ammonia TS, stopper closely, shake gently and weigh. Allow it to stand at room temperature for 24 hours, weigh again, replenish the loss weight with chloroform, shake thoroughly and filter. Discard the initial filtrate, and use the successive filtrate as the test solution. Dissolve strychnine CRS, weighed accurately, in chloroform to produce a solution containing 0.15 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of toluene, acetone, ethanol, and concentrated ammonia TS (4∶5∶0.6∶0.4) as the mobile phase. Apply separately 10 μl of the test solution, 5 μl and 10 μl of each of the reference solution to the plate, pre-equilibrated in development chamber for 15 min. After developing and removal of the plate, dry in air for 2 hours. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan at wavelength λ_S=254 nm; λ_R=300 nm. Measure the integration values of absorbance both for the test solution and the reference solution respectively. Calculate the content of strychnine in the powder.

It contains not less than 0.65 mg and not more than 1.20 mg of strychnine ($C_{21}H_{22}N_2O_2$) per tablet, referred to the Semen Strychni Pulveratum.

Action To expel *wind* and *dampness*, promote blood circulation to remove stasis, and dredge meridians to kill pain.

Indications Impediment disease due to *wind-dampness* and blood stasis, that block the meridians, with manifestations of pricking or severe pain in joints; rheumatic and rheumatoid arthritis, and sciatica with above symptoms.

Usage and dosage 3-4 tablets, maximum dose: 5 tablets, once a day, taken with warm boiled water before sleeping, 7 days making a course of treatment, in an interval of 2-3 days between two courses.

Precaution Contraindicated for pregnant women; be cautious about aged and debilitated patients or follow doctor's advice.

Storage Preserve in tightly closed containers.

Fenqing Wulin Wan (分清五淋丸)

Fenqing Wulin Pills

Ingredients Caulis Akebiae 80 g; Semen Plantaginis (stir-baked with salt) 40 g; Radix Scutellaris 80 g; Poria 40 g; Polyporus 40 g; Cortex Phellodendri Chinensis 40 g; Radix et Rhizoma Rhei 120 g; Herba Polygoni Avicularis 40 g; Herba Dianthi 40 g; Rhizoma Anemarrhenae 40 g; Rhizoma Alismatis 40 g; Fructus Gardeniae 40 g; Radix et Rhizoma Glycyrrhizae 20 g; Talcum 80 g.

Procedure Pulverize the above ingredients, except Talcum to fine powder, sift and mix well. Make pills with water and dry. Pulverize Talcum to very fine powder, coat the pills with Talcum powder, then polish and dry.

Description White to greyish-white polished watered pills; taste, sweet and bitter.

Identification Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate; hyphae colourless or pale brown, 4-6 μm in diameter. Hyphae sticking into masses, mostly colourless. Prisms of calcium oxalate octahedral, 32-60 μm in diameter. The inner epidermal cells of testa subrectangular in surface view, with slightly sinuous walls, somewhat parqueted in groups of several cells. Bast fibres pale yellow, fusiform, with thickened walls and minute pit-canals. Fibre bundles bright yellow, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres, crystal cells with lignified and thickened walls. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Clusters of calcium oxalate large, 60-140 μm in diameter. Needle crystals of calcium oxalate in bundles or scattered, 26-110 μm long. Fibre bundles surrounded by parenchymatous cells containing clusters of calcium oxalate, forming crystal fibres, crystal cells arranged in rows. Epidermis cells of leaves showing cuticle striations on periclinal walls; stomata anisocytic, with 3 subsidiary cells. Palisade tissue occurring in the upper and lower epidermis. Parenchymatous cells subrounded, with elliptical pits gathered into pit-groups. Anticlinal walls of endodermal cells sinuous, somewhat relatively thick, lignified, with sparse and minute pit-canals. Stone cells of testa yellow or pale brown, mostly broken, when whole, elongated polygonal, rectangular or irregular, with thickened walls and large rounded pits, lumina brownish-red.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To clear *heat* and purge *fire*, and induce urination to relieve stranguria.

Indications Stranguria due to pouring of *damp-heat* with manifestations of dark urine, frequency and urgency of urination and burning pain in the urethra.

Usage and dosage 6 g, 2-3 times a day.

Precaution Be cautious about pregnant women.

Storage Preserve in well closed containers, protected from moisture.

Fubao Keli
(妇宝颗粒)

Fubao Granules

Ingredients Radix Rehmanniae; Caulis Lonicerae Japonicae; Radix Dipsaci (stir-baked with salt); Folium Eucommiae (stir-baked with salt); Radix Ophiopogonis; Fructus Toosendan (stir-baked); Radix Paeoniae Alba (stir-baked with wine); Rhizoma Corydails (processed with vinegar); Radix et Rhizoma Glycyrrhizae; Cacumen Platycladi (stir-baked); Receptaculum Nelumbinis (carbonized); Caulis Sargentodoxae

Procedure Decoct the above twelve ingredients except Rhizoma Corydalis with water twice, 2 hours for each time. Decoct Rhizoma Corydalis individual in the same manner. Combine the decoctions, filter, concentrate the filtrate until its relative density is 1.08-1.18 (60℃). Add ethanol to produce a solution containing 65% of ethanol, stir well, allow to stand for 48 hours. Recover ethanol, concentrate the supernatant liquid to a thick extract with a relative density of 1.33-1.45 (60℃). Add a proper quantity of water, stir well, allow to stand for 24 hours, concentrate the supernatant liquid to a thick extract with a relative density of 1.36-1.41 (60℃), add 485 g of sucrose and a proper quantity of dextrin, make 1000 g of granules. Alternatively, concentrate the supernatant liquid to a thin extract with a relative density of 1.10 (60℃), add 5 g of steviosin and a quantity of dextrin, spray-granulated, make 500 g of granules (without sucrose).

Description Brownish-yellow to brown granules; taste, sweet, slightly bitter or bitter, slightly sweet (without sucrose).

Identification (1) Dissolve 5 g of the granules or 2.5 g of the granules (without sucrose) in 30 ml of water, add 3 ml of hydrochloric acid, heat under reflux for 1 hour, filter, extract by shaking with 25 ml of ether. Evaporate the ether solution to dryness, and dissolve the residue in 2 ml of chlorofrom as the test solution. Prepare a solution of 1 g of Radix Ophiopogonis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and the mixture of *n*-hexane and ethyl acetate (1∶1) as the mobile phase. Apply separately 2 μl of the two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Spray with 10% sulfuric acid in ethanol, heat at 105℃ for 5 minutes, and examine in daylight. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) To 10 g of the granules or 5 g of the granules (without sucrose), pulverized to fine powder, heat under reflux with 50 ml of 80% of ethanol for 1 hour, filter, evaporate the filtrate to dryness, dissolve the residue in 30 ml of water. Extract with 30 ml of *n*-butanol saturated with water, elute the *n*-butanol solution with 20 ml of ammonia TS, evaporate the *n*-butanol solution to dryness, and dissolve the residue in 2 ml of ethanol as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of chloroform, methanol and water (14∶6∶1) as the mobile phase. Apply separately 5 μl of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Dissolve tetrahydropalmatine CRS in ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of toluene and acetone (9∶2) as the mobile phase. Apply separately 5 μl of the test solution obtained from the test for Identification (2) and the reference solution to the plate. After developing in a chamber pre-equilibrated with ammonia vapour and removal of the plate, dry in air, fumigate the plate in iodine vapour, examine under ultraviolet light at 365 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and the mixture of acetonitrile and 0.01 mol/L solution of phosphoric acid (13∶87) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates for the column is not less than 1500, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, accurately weighed, in methanol to produce a solution containing 0.1 mg per ml as the reference solution.

Test solution Weigh accurately 2 g or 1 g (without sucrose) of the content of the capsules obtained under the test of weight variation, pulverized to fine powder, weighed accurately to a stopper conical flask. Add accurately 20 ml of 50% methanol, shake to dissolve allow to stand overnight, shake well and filter. Discard the initial filtrate, filter the successive filtrate with micropore film (0.45 μm), then discard the initial filtrate, use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of the reference solution and the test solution into the column and calculate the content.

It contains not less than 8.0 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per capsule, referred to Radix Paeoniae Alba.

Action To reinforce the kidney and regulate blood circulation, and promote *qi* flow to kill pain.

Indications Leukorrhagia and pain in the lower abdomen due to deficiency in the kidney accompanied with stagnation of blood, with manifestations of weakness and aching in the lower back and knees, distending pain in the lower abdomen; chronic pelvic inflammation and annexitis with above symptoms.

Usage and dosage 20 g or 10 g (without sucrose), twice a day, taken with boiled water.

Strength (1) 10 g per pack
(2) 5 g per pack (without sucrose)

Storage Preserve in tightly closed containers.

Fufang Caoshanhu Hanpian (复方草珊瑚含片)

Compound Caoshanhu Tablets

Ingredients Extractum Herba Sarcandrae; Mentholum; Oleum Menthae Dementholatum.

Procedure Decoct Herba Sarcandrae with water twice, 2 hours for the first time and 1.5 hours for the second time. Combine the decoctions and filter, concentrate the filtrate to a relative density of 1.15 (80℃). Add ethanol to 65%, allow to stand for 24 hours. Filter, recover the ethanol from the filtrate in vacuum, then concentrate to a thin extract with a relative density of 1.24-1.26. Add a quantity of excipients to the Extractum Herba Sarcandrae, make granules, and dry. Mix Oleum Menthae Dementholatum and Mentholum to dissolve, add the mixture to the granuales and mix well, compress into tablets, or coat with film.

Description Pink to brownish-red tablets or film coated tablets. Odour, fragrant; taste, sweet and cool.

Identification (1) To 5 g, add 50 ml of water in a 250 ml round-bottom flask, connect to a volatile oil determination tube, add water through the top of the gratusted tube until the water overflows to flask, add 1 ml of ethyl acetate, then connect to reflux condenser. Heat the flask until boiling, and continue heating for 30 minutes. Allow to stand to room temperature, use the layer of ethyl acetate as the test solution. Dissolve mentholum CRS in ethyl acetate to produce a solution containing 4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and ethyl acetate (19:1) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with a mixture of vanillin in sulfuric acid-ethanol (1:4), heat at 105℃ until the spots distinct. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) Filter the aqueous solution after extracting volatile oil obtained under Identification (1) through cotton. Extract the filtrate by shaking with ethyl acetate twice, each 25 ml, combine the ethyl acetate extracts and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. To 2 g of Herba Sarcandrae reference drug, add 50 ml of water, ultrasonicate for 30 minutes, filter, extract the filtrate by shaking with ethyl acetate twice, each 25 ml, combine the ethyl acetate extracts, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the reference drug solution. Dissolve isofraxidin CRS in methanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of toluene, ethyl acetate and formic acid (9:4:1) as the mobile phase. Apply separately 4 μl of each of the above three solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution. The spot, which corresponds to the reference solution, turns to yellow-green on exposure to ammonia vapour for 10 minutes.

Other requirements Comply with the general requirements for tablets except for disintegration test (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% phosphoric acid solution (20 : 80) as the mobile phase. The wavelength of the detector is 344 nm. The number of theoretical plates of the column is not less than 1200, calculated with reference to the peak of isofraxidin.

Reference solution Dissolve a quantity of isofraxidin CRS, accurately weighed, in methanol to produce a solution containing 4 μg per ml.

Test solution Pulverize 10 tablets obtained in the test of weight variation, weighed accurately, into fine powder. Weigh accurately about 1 g, add 10 ml of water, ultrasonicate (power 300 W, frequency 25 kHz) for 10 minutes, transfer to a separating funnel, extract by shaking with chloroform five times of each 10 ml, and centrifuge when necessary. Combine the chloroform extracts, recover chloroform to dryness, dissolve the residue in methanol, transfer to a 25 ml volumetric flask, dilute to volume with methanol, and mix well, filter and use the successive filtrate as the test solution.

Procedure Accurately inject 20 μl of each of the reference solution and the test solution, respectively, into the column, and determine the content and calculate.
It contains not less than 40 μg of isofraxidin ($C_{11}H_{10}O_5$) for each small tablet and not less than 0.10 mg for each big tablet, referred to Herba Sarcandrae.

Action To disperse *wind* and clear *heat*, reduce swelling and kill pain and ease the throat.

Indications Inflammation of the throat due to affliction from external *wind-heat* with manifestations of swollen painful throat, hoarseness or aphonia; acute pharyngolaryngitis with above symptoms.

Usage and dosage Suck, 2 small tablets, once per 2 hours, 6 times a day; 1 large tablet, once per hour, 5-6 times a day.

Strength (1) 0.44 g (small tablets)
(2) 1.0 g (large tablets)

Storage Preserve in tightly closed containers.

Fufang Chuanbeijing Pian (复方川贝精片)

Compound Chuanbeijing Tablets

Ingredients A quantity of Extractum Herba Ephedrae (equivalent to 2.1 g of ephedrine hydrochloride); Bulbus Fritillariae Cirrhosae 25 g; Pericarpium Citri Reticulatae 94 g; Radix Platycodonis 94 g; Fructus Schisandrae Chinensis 53 g; Extractum Glycyrrhizae 15 g; Rhizoma Pinelliae Praeparatum 75 g; Radix Polygalae 53 g.

Procedure Decoct a quantity of Herba Ephedrae with water twice, each 2 hours, filter the decoctions, combine the filtrate and concentrate the filtrate in vacuum to a thin extract

with a relative density of 1.40 (50℃), dry and determine quantitatively ephedrine hydrochloride. Pulverize Bulbus Fritillariae Cirrhosae and Rhizoma Pinelliae Preparatum to fine powder, and sift. Distill Pericarpium Citri Reticulatae to get the essential oil, decoct the drug residue with water one time, and filter. Extract Fructus Schisandrae Chinensis, Radix Polygalae and Radix Platycodonis with 65% ethanol under reflux twice, filter, combine the filtrates, recover ethanol, combine with the decoction of Pericarpium Citri Reticulatae, concentrate to a thick extract, mix with Extractum Glycyrrhizae, the above fine powder of Bulbus Fritillariae Cirrhosae and Rhizoma Pinelliae Preparatum and a quantity of excipients, dry and pulverize, mix with Extractum Herba Ephedrae, dry, spray with the essential oil of Pericarpium Citri Reticulatae, mix well and make granules. Compress into 1000 tablets and coat with sugar.

Description Sugar coated tablets with brown core; taste, bitter, slightly pungent.

Identification (1) Microscopical: Raphides of calcium oxalate 32-144 mm long, occurring in mucilage cells or scattered; starch granules broad-ovate or conchoidal, 40-64 μm in diameter, hilum slit-shaped, V-shaped or U-shaped, striations visible.

(2) Pulverize 20 tablets, add 30 ml dehydrated ethanol, ultrasonicate for 30 minutes, filter, recover the ethanol to about 1 ml, add a quantity of neutral alumina, stir well and dry. Apply to the column, previously packed with 10 g of neutral aluminum oxide (200-300 mesh, 15mm in internal diameter), elute with 70 ml of ethanol, collect the eluate and recover the ethanol to dryness. Dissolve the residue in 0.5 ml ethanol as the test solution. Dissolve ephedrine hydrochloride CRS in ethanol to prepare a solution containing 0.4 mg per ml as the reference solution. Carry out the method for thin layer chromatogrophy (Appendix Ⅵ B), using silica gel G, prepared with 2% sodium hydroxide solution, as the coating substance and a mixture of chloroform, methanol and concentrated ammonia TS (40∶7∶1) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with ninhydrin TS, heat at 105℃ until spots distinct. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (1∶1) as the mobile phase. The wavelength of the detector is 254 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of ephedrine hydrochloride.

Reference solution Weigh accurately about 12.5 mg of ephedrine hydrochloride CRS to a 100 ml volumetric flask, dissolve and dilute to volume with water, mix well. Transfer accurately 5 ml to a 100 ml volumetric flask, dilute to volume with water, and mix well. Transfer accurately 10 ml to a 25 ml volumetric flask, add 1 ml of 2.5% (g/ml) periodic acid solution and 2.5 ml of 0.25 mol/L sodium hydroxide, mix well, allow to stand for 30 minutes, adjust the pH to neutral with 0.5 mol/L hydrochloride acid, dilute to volume with methanol, mix well, producing a solution containing 2.5 μg of ephedrine hydrochloride per ml as the reference solution.

Test solution Pulverize 20 tablets with coating removed, weighed accurately, into fine powder, weigh accurately about 0.1 g of the fine powder, add 120 ml of a solution of 5 mol/L sodium hydroxide, shake, add 7.5 g of sodium chloride, ultrasonicate for 10 minutes, and distil. Collect the distillate to about 95 ml in a 100 ml volumetric flask containing 5 ml of 0.5 mol/L hydrochloric acid, dilute with water to volume and mix well. Transfer accurately 10 ml to a 25 ml volumetric flask, carry out the method described under the preparation of reference solution, beginning at the words "add 1 ml of periodic acid solution".

Procedure Accurately inject 20 μl of each of the reference solution and the test solution, respectively, into the column and calculate.

It contains not less than 1.4 mg of ephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) for each tablet, referred to Extractum Herba Ephedrinae.

Action To disseminate *lung-qi* and resolve phlegm, and stop coughing and relieve asthma/dyspnea.

Indications Coughing with shortness of breath and constriction in the chest with expectoration of much phlegm due to affliction from external *wind-cold*, and acute or chronic bronchitis with above symptoms.

Usage and dosage 3-6 tablets, 3 times a day; reduce the dosage for children.

Precaution Be cautious about patients with hypertension and heart diseases and pregnant women.

Storage Preserve in tightly closed containers.

Fufang Danshen Diwan (复方丹参滴丸)

Compound Danshen Dripping Pills

Ingredients Radix et Rhizoma Salviae Miltiorrhizae; Radix et Rhizoma Notoginseng; Borneolum Syntheticum.

Procedure Decoct Radix et Rhizoma Salviae Miltiorrhizae and Radix et Rhizoma Notoginseng with water, combine the decoctions, and filter. Concentrate the filtrate, add a quantity of ethanol to precipitate, recover ethanol from the supernatant and concentrate to the thick extract; pulverize Borneolum Syntheticum to the fine powder. Melt an appropriate quantity of polyethylene glycols on heating, add the above thick extract and the fine powder of Borneolum Syntheticum, mix well, drip into cool (refrigerated) liquid paraffin, make dripping pills, or coat with film.

Description Brown dripping pills or film coated dripping pills; odour, fragrant; taste, slightly bitter.

Identification (1) Pulverize 40 pills, add 10 ml of dehydrated ethanol. Ultrasonicate for 10 minutes, filter, and use the filtrate as the test solution. Dissolve a mixture of (±)-borneol and (±)-isoborneol CRS in dehydrated ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (17∶3) as the mobile phase. Apply separately 5-10 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 1% solution of vanillin in sulfuric acid, heat at 105℃ to the spot distinct. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the

reference solution.
(2) Dissolve 20 pills in a centrifuge tube in 9 ml of dilute ammonia solution about 40℃ (to 8 ml of concentrated ammonia solution, add water to a volume of 100 ml, mix well) by shaking, centrifuge. Apply the supernatant to a column packed with macroporous resin D101 (0.7 cm in internal diameter, 5 cm long), elute with 15 ml of water, discard the aqueous solution; elute with methanol, discard about 0.4 ml of the eluate, collect about 5 ml of the successive eluate as the test solution. Dissolve notoginsenoside R_1 CRS in methanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of *n*-butanol, ethyl acetate and water (4∶1∶5) as the mobile phase. Apply separately 15 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% solution of sulfuric acid in ethanol, heat at 105℃ for about 10 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Dissolve 15 pills in a centrifuge tube in 1 ml of water and two drops of dilute hydrochloric acid solution by shaking, add 3 ml of ethyl acetate, shake for 1 minute, centrifuge for 2 minutes, use the supernatant as test solution. Dissolve sodium tanshenol CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, butanone, acetone and formic acid (25∶10∶4) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. After exposure to ammonia vapour for 15 minutes, the pale-yellow spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution. Stand for 30 minutes, examine under ultraviolet light at 365 nm, the fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot in chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for dripping pills (Appendix Ⅰ K).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and glacial acetic acid (8∶91∶1) as the mobile phase. As detector a spectrophotometer set at 281 nm. The number of theoretical plates of the column is not less than 2000, calculate with the reference to the peak of tanshinol.

Reference solution Dissolve a quantity of sodium tanshinol CRS, accurately weighed, in methanol to produce a solution containing 0.16 mg (equivalent to 0.144 mg of tanshinol) per ml as the reference solution.

Test solution Weigh accurately 12 pills to a 25 ml volumetric flask (destroy the coats of the coated-film pills by press, wash the mortar with a quantity of methanol, combine the washing to the same volumetric flask), add methanol to a volume of about 15 ml. Ultrasonicate (power 50 W, frequency 50 kHz, on a 25℃ water bath) for 10 minutes, allow to stand to room temperature. Dilute with methanol to volume, mix well, centrifuge (2000 rpm) for 5 minutes and use the supernatant as the test solution.

Procedure Inject accurately 5 μl of the reference solution and 5-10 μl of the test solution, respectively, into the column, and calculate the content.
It contains not less than 0.10 mg of tanshinol ($C_9H_{10}O_5$) per pill, referred to Radix et Rhizoma Salviae Miltiorrhizae.

Action To promote blood circulation to resolve stagnated blood and regulate *qi* flow to kill pain.

Indications Impeded flow of *yang-qi* in the chest due to stagnation of *qi* and blood with manifestations of constriction and stabbing pain in the precardium; angina pectoris in coronary heart disease with above symptoms.

Usage and dosage Taken orally or sublingually, 10 pills, 3 times a day, 4 weeks making one course of treatment; or follow doctor's advice.

Precaution Be cautious about pregnant women.

Strength 25 mg per pill; 27 mg per pill (film-coated pill)

Storage Preserve in tightly closed containers.

Fufang Danshen Pian
(复方丹参片)

Compound Salvia Tablets

Ingredients Radix et Rhizoma Salviae Miltiorrhizae 450 g; Radix et Rhizoma Notoginseng 141 g; Borneolum Syntheticum 8 g.

Procedure Heat under reflux Radix et Rhizoma Salviae Miltiorrhizae with ethanol for 1.5 hours, filter the extracts, recover ethanol and concentrate to an appropriate quantity. Heat under reflux the residue with 50% ethanol for 1.5 hours, filter the extracts. recover ethanol and concentrate to an appropriate quantity. Decoct the residue with water for 2 hours, filter and concentrate to an appropriate quantity. Pulverize Radix et Rhizoma Notoginseng to fine power, mix with the above concentrate and an appropriate quantity of excipient, make granules and dry. Grind Borneolum Syntheticum to fine powder, mix with the above granules to make 1000 tablets, coat with sugar or film.

Description Sugar or film coated tablets with brown to dark brown core; odour, aromatic; taste, slightly bitter.

Identification (1) Microscopical: Fragments of resin canals containing yellow secretions.
(2) Pulverize 5 tablets, removal of the sugar coat, add 10 ml of ether, ultrasonicate for 5 minutes, filter and reserve the drug residue. Evaporate the filtrate to dryness, dissolve the residue in 2 ml of ethyl acetate as the test solution. Disslove tanshinone ⅡA CRS and (±)-borneol and (±)-isoborneol CRS separately in ethyl acetate to produce two solutions, each containing 0.5 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and ethyl acetate (19∶1) as the mobile phase. Apply separately 4 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the tanshinone ⅡA reference solution. Spray with a 1% solution of vanillin in sulfuric acid and heat at 110℃ for several minutes. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the (±)-borneol and (±)-isoborneol reference solution.
(3) To the drug residue obtained in the test for Identification

(2), add 25 ml of methanol, heat under reflux for 15 minutes, cool and filter. Evaporate the filtrate to dryness, dissolve the residue in 25 ml water by gentle heat, add 25 ml of *n*-butanol saturated with water, shake for extract. Wash the extract solution with 25 ml of ammonia TS, discard the ammonia solution and wash with two 25-ml quantities of water saturated with *n*-butanol. Evaporate the *n*-butanol extract to dryness, dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 0.5 g of Radix et Rhizoma Notoginseng reference drug in the same manner as the reference drug solution. Dissolve notoginsenoside R_1 CRS, ginsenoside Rb_1 CRS and ginsenoside Rg_1 CRS separately in methanol to prepare three reference solutions each containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13∶7∶2), kept below 10℃, as the mobile phase. Apply separately 1 μl of each of the above five solutions to the plate. After developing and removal of the plate, dry in air. Spray with sulfuric acid solution in ethanol (1→10) and heat at 110℃ to the spots distinct. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions and the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay ***Tanshinone*** **ⅡA** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (73∶27) as the mobile phase. As detector a spectrophotometer set at 270 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of tanshinone ⅡA.

Reference solution Dissolve a quantity of tanshinone ⅡA CRS, weighed accurately, in methand in an amber volumetric flask to prepare a solution containing 40 μg per ml as the reference solution.

Test solution Take 10 tablets, uncoated if necessary, weigh accurately and grind to fine powder. Place 1 g of the fine powder, weighed accurately, to a stopper conical flask add 25 ml of methanol, tightly stopper and weigh accurately. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 15 minutes, allow to cool, weigh accurately again, make up the loss with methanol, stir well and filter, and use the successive filtrate (preserved in amber coloured glass bottle) as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.20 mg of tanshinone ⅡA ($C_{19}H_{18}O_3$) per tablet, referred to Radix et Rhizoma Salviae Miltiorrhizae.

Salvianolic acid B Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitril, methanol, formic acid and water (10∶30∶1∶59) as the mobile phase. As detector a spectrophotometer set at 286 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of salvianolic acid B.

Reference solution Dissolve a quantity of salvianolic acid B CRS, accurately weighed, in water to prepare a solution containing 60 μg per ml as the reference solution.

Test solution Weigh accurately 10 tablets, removal of the sugar coat and pulverized to fine power. Weigh accurately 0.15 g of the power to a 50 ml volumetric flask, add a quantity of water. Ultrasonicate (power, 300 W; frequency, 50 kHz) for 30 minutes, allow to stand to room temperature. Dilute with water to volume, mix well, centrifuge, and use the supernatant as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 5.0 mg of salvianolic acid B ($C_{36}H_{30}O_{16}$) per tablet, referred to Radix et Rhizoma Salviae Miltiorrhizae.

Action To promote blood circulation to resolve stagnated blood and regulate *qi* flow to kill pain.

Indications Impeded flow of *yang-qi* in the chest due to stagnation of *qi* and blood with manifestations of constriction and stabbing pain in the precardium; angina pectoris in coronary heart disease with above symptoms.

Usage and dosage 3 tablets, 3 times a day.

Precaution Be cautious about pregnant women.

Storage Preserve in tightly closed containers.

Fufang Fufangteng Heji (复方扶芳藤合剂)

Compound Herba Euonymi Mixture

Ingredients Herba Euonymi; Radix Astragali; Radix et Rhizoma Ginseng Rubra.

Procedure Heat Radix et Rhizoma Ginseng Rubra under a reflux condenser with 65% ethanol for three times, 2 hours for each time respectively. Combine the ethanol solutions, filter and keep the filtrate for further use. Decoct the above drug residue for three times, 1.5 hours for each time. Filter the decoctions, combine the filtrate and concentrate the filtrate to a thin extract with a relative density of 1.06 (60℃). Cool to ambient temperature, store at low temperature for more than 48 hours, filter and keep the filtrate for further use. Decoct Herba Euonymi and Radix Astragali twice, 2 hours for each time. Filter the decoctions, Combine the filtrate and concentrate the filtrate to a thin extract with a relative density of 1.14 (60℃), cool to ambient temperature, add two volumes of ethanol, stir well, stand more than 48 hours, filter, combine the filtrate with the ethanol solution of Radix et Rhizoma Ginseng Rubra, recover ethanol, add a quantity of water and mix well. Add a quantity of a 50% solution of albumen, stir well, boil and filter. Combine the filtrate with the decoction of Radix et Rhizoma Ginseng Rubra, add a quantity of sucrose and boil to dissolve. Add a quantity of sodium benzoate, vanillin and water, boil and filter. Add water to the regulated volume, stir well and pack.

Description A clear, reddish-brown liquid; odour, aromatic; taste, sweet and slightly bitter.

Identification (1) Extract 30 ml with 30 ml of chloroform, separate the upper layer and extract with 40 ml of ethyl acetate. Separate the ethyl acetate solution, evaporate to dryness, dissolve the residue in 10 ml of ethyl acetate, filter and evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of ethyl acetate to prepare a solution as the test solution. Decoct 10 g of Herba Euonymi reference drug with water twice, 40 minutes for the first time, 30 minutes for the second time. Combine the decoctions, filter and

concentrate the filtrate to about 20 ml. Add 40 ml of ethanol to the concentrate, stir well, stand for 2 hours and filter. Recover ethanol of the filtrate until no odour of ethanol, extract with 15 ml of chloroform, separate the upper layer, extract with 20 ml of ethyl acetate, separate and evaporate the ethyl acetate solution to dryness. Dissolve the residue in 0.5 ml of ethyl acetate to prepare a solution as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of toluene, ethyl acetate, formic acid and water (20∶10∶1∶1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, expose to iodine vapour for about 10 minutes and examine immediately under ultraviolet light at 254 nm. The principal spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) To 0.8 g of Radix et Rhizoma Ginseng reference drug add 40 ml of chloroform, heat under reflux on a water bath for 1 hour, cool to ambient temperature and filter. Remove chloroform from the drug residue in air, moisten with 0.5 ml of water, add 10 ml of *n*-butanol saturated with water, ultrasonicate for 30 minutes and stand still. Separate the supernatant liquid, add 3 volumes of ammonia TS, mix well, stand to separate and evaporate the upper layer to dryness. Dissolve the residue in 2 ml of methanol to prepare a solution as the test solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of 10 volumes of the upper layer of a mixture of *n*-butanol, ethyl acetate and water (4∶1∶5) and 1 volume of methanol as the mobile phase. Apply separately 4 μl of each of the test solution obtained under the test of Assay and the reference drug solution to the plate. After developing in a chamber saturated with ammonia vapour and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ until the spots appear and examine under ultraviolet light at 365 nm. Three or more than three principal fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Relative density Not less than 1.2 (Appendix Ⅶ A).

pH value 4.6-6.0 (Appendix Ⅷ G).

Other requirements Complies with the general requirements for mixtures (Appendix Ⅰ J).

Assay Extract 20 ml of the mixture, measured accurately, with two 30 ml quantities of chloroform by shaking. Separate and combine the upper layers. Extract with successive quantities of 30, 20, 20, 20 and 20 ml of *n*-butanol saturated with water. Wash the combined *n*-butanol solution with two quantities of 100 and 80 ml of ammonia TS and evaporate the *n*-butanol solution to dryness. Dissolve the residue in 5 ml of 10% ethanol, apply to a column packed with macroporous resin D101 (1.5 cm in internal diameter, 12 cm long), elute successively with 50 ml of water and 30 ml of 40% ethanol and discard the eluates. Then elute with 50 ml of 70% ethanol and evaporate the eluate to dryness. Dissolve the residue in methanol, transfer to a 2 ml volumetric flask, dilute with methanol to volume, mix well and use the solution as the test solution. Dissolve a quantity of astragaloside Ⅳ CRS, weighed accurately, in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of 10 volumes of the upper layer of a mixture of *n*-butanol, ethyl acetate and water (4∶1∶5) and 1 volume of methanol as the mobile phase. Apply accurately 4 μl of the test solution, 2 μl and 6 μl of the reference solution to the plate. After developing in a chamber saturated with ammonia vapour and allowing the solvent front to ascend more than 16 cm above the line of application, remove the plate and dry in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ for about 7 minutes to visualize the spots clearly and cool. Cover the plate with a glass plate of the same size and fix up with adhesive plaster. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan at wavelength of $\lambda_S = 530$ nm and $\lambda_R = 700$ nm, measure the integrated values of absorbance from the test solution and the reference solution, and calculate the content.

It contains not less than 50 μg of astragaloside Ⅳ ($C_{41}H_{68}O_{14}$) per phial, referred to Radix Astragali.

Action To replenish *qi* and enrich blood, and invigorate the spleen and nourish the heart.

Indications Insufficiency of *qi* and blood and deficiency in the heart and spleen, with manifestations of shortness of breath and constriction in the chest, disinclination to talk due to a deficiency of qi, lassitude, spontaneous sweating, palpitation and amnesia, insomnia and dreamfulness, lusterless complexion, poor appetite, distension and fullness in the abdomen, loose stools, pale or puffy tongue with teeth-prints, thready and weak pulse; neurasthenia, leukopenia with above symptoma.

Usage and dosage 15 ml, twice a day.

Precaution Contraindicated for children under one year old and patients with fever due to affliction from exogenous pathogenic factors.

Strength (1) 15 ml per phial (2) 120 ml per bottle

Storage Preserve in tightly closed container.

Fufang Guazijin Keli
(复方瓜子金颗粒)

Fufang Guazijin Granules

Ingredients Herba Polygalae Japonicae 150 g; Folium Isatidis 350 g; Flos Chrysanthemi Indici 200; Spora Lygodii 250 g; Herba Hedyotidis 250 g; Herba Violae 200 g.

Procedure Decoct the six ingredients with water for two times, 1.5 hours for each, filter the decoction, combine the filtrate, concentrate in vacuum to a quantity. Add a quantity of sucrose and dextrin, make granules, dry, and make 1000 g or 700 g. Or add a quantity of dextrin and 0.75 g of stevioside, make granules, dry, and make 250 g.

Description Brown to black brown granules; taste, sweet, slightly bitter; or taste slightly bitter (without sucrose).

Identification (1) Heat under reflux 20 g (10 g or 20 g per pack), 14 g (7 g per pack) or 5 g (5 g per pack) of the granules. ground to fine powder, with 50 ml of chloroform for 1 hour, filter, concentrate the filtrate to about 1 ml as the test solution. Dissolve a quantity of indirubin CRS with chloroform to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of *n*-hexane, chloroform and acetone (5∶4∶1) as the mobile phase. Apply separately 20 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in

air and examine immediately. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Ultrasonicate 20 g (10 g or 20 g per pack), 14 g (7 g per pack) or 5 g (5 g per pack) of the granules, ground to fine powder, with 50 ml of methanol for 30 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue with 20 ml of water, extract with 20 ml of ethyl acetate, separate the ethyl acetate layer, evaporate to dryness, dissolve the residue with 1 ml of methanol as the test solution. Dissolve a quantity of aesculetin CRS with methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of toluene, ethyl acetate and formic acid (5 : 3 : 1) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with 2% solution of ferric chloride in ethanol, and heat to spots distinct. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% solution of phosphoric acid (8 : 92) as the mobile phase. As detector a spectrophotometer set at 350 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of aesculetin.

Reference solution Dissolve a quantity of aesculetin CRS, weighed accurately, with 50% methanol to produce a solution containing 10 μg per ml.

Test solution Pulverize the granules, obtained under the test of weight variation, to fine powder, weigh accurately 4 g (10 g or 20 g per pack), 2.8 g (7 g per pack) or 1 g (5 g per pack) in a stopper conical flask, add accurately 25 ml of methanol, and weigh. Heat under reflux for 1 hour, stand to cool, weigh again, replenish the lost weight with methanol, and mix thoroughly. Filter, measure accurately 5 ml of the successive filtrate in a 10 ml volumetric flask, dilute with water to volume, mix well, filter and use the filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than (1) 1.2 mg (10 g or 7 g per pack), (2) 2.4 mg (20 g or 5 g per pack) of aesculetin ($C_9H_6O_4$) per pack, referred to Herba Violae.

Action To clear *heat* and ease the throat, dissipate nodulation and kill pain and expel phlegm and relieve cough.

Indications Red swollen throat, pharyngalgia, fever and coughing due to invasion of the lung by *wind-heat* or abundant *phlegm-heat* in the lung; acute pharyngitis, acute attack of chronic pharyngitis and upper respiratory tract infection with above symptoms.

Usage and dosage (1) 20 g (10 g, 20 g per pack) (2) 14 g (7 g per pack) (3) 5 g (5 g per pack); 3 times a day; taken with boiled water, reduce the dosage for children.

Strength (1) 10 g (equalling to 14 g of crude drug)
(2) 20 (equalling to 28 g of crude drug)
(3) 7 g (equalling to 14 g of crude drug)
(4) 5 g (equalling to 28 g of crude drug)

Storage Preserve in tightly closed container.

Fufang Huangliansu Pian (复方黄连素片)

Compound Berberine Hydrochloride Tablets

Ingredients Berberine Hydrochloride 30 g; Radix Aucklandiae 116 g; Fructus Evodiae 40 g; Radix Paeoniae Alba 162 g.

Procedure Pulverize 80 g of Radix Aucklandiae and Fructus Evodiae to fine powder and sift. Mix the coarse powder, not passed through No. 5 sieve, with Radix Paeoniae Alba and 36 g of Radix Aucklandiae. Carry out the method for percolation as described under liquid extracts and extracts (Appendix Ⅰ O), percolate the above mixture, using 70% ethanol as the solvent. Recover ethanol from the percolate and concentrate to a thick extract. Mix the extract with the above fine powder, dry and pulverize. Add Berberine Hydrochloride to the powder, make granules, allow to dry, make to 1000 tablets and coat with sugar.

Description Sugar coated tablets with brownish-yellow to brown core; taste, bitter and slightly pungent.

Identification (1) Triturate 4 tablets, removed sugar coats, to fine powder, add 20 ml of water, boil for 5 minutes and filter while hot. Allow the filtrate to cool, adjust to pH 9-10 with ammonia TS, extract with 10 ml of chloroform and evaporate the extract to dryness. Dissolve the residue in 1 ml of a mixture of hydrochloric acid and ethanol (1:100) as the test solution. Prepare a solution of 0.5 g of Fructus Evodiae reference drug add 10 ml of ethanol, ultrasonicate for 10 minutes, filter and use the filtrate as the reference drug solution. Dissolve berberine hydrochloride CRS in ethanol to produce a solution containing 0.1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-butanol, glacial acetic acid and water (5 : 1 : 1) as the mobile phase. Apply separately 2 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution.

(2) Triturate 10 tablets, removed the sugar coats, to fine powder, add 20 ml of chloroform, ultrasonicate for 20 minutes, filter and evaporate the filtrate to about 2 ml as the test solution. Prepare a solution of 0.5 g of Radix Aucklandiae reference drug and 10 ml of chloroform in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9:1) as the mobile phase. Apply separately 3 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with a 1% solution of vanillin in sulfuric acid and heat until the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) To the drug residue, obtained in the test for Identification (2) and extracted with chloroform, add 30 ml of methanol, heat under reflux for 1 hour, filter, and

evaporate the filtrate to dryness. Dissolve the residue in 20 ml of water, extract with two 30 ml quantities of *n*-butanol saturated with water by shaking, combine the *n*-butanol extracts. Wash the extract solution with two 30 ml quantities of water saturated with *n*-butanol. Evaporate the *n*-butanol extract to dryness, dissolve the residue in 1 ml of ethanol as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol, and formic acid (40∶5∶10∶0.2) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 5% solution of vanillin in sulfuric acid, heat at 105℃ to the spot distinct. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay ***Berberine hydrochloride*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of 0.033 mol/L potassium dihydrogen phosphate solution and acetonitrile (60∶40) as the mobile phase. As detector a spectrophotometer set at 265 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of berberine hydrochloride.

Reference solution Weigh accurately 25 mg of berberine hydrochloride CRS, dried previously at 100℃ for 5 hours, dissolve in 150 ml of boiling water in a 250 ml beaker and allow to cool. Add 3 ml of dilute hydrochloric acid TS, stir well and cool to ambient temperature. Transfer the solution to a 250 ml volumetric flask, add water to volume and mix well. Transfer 2 ml of the solution, measured accurately, to a 25 ml volumetric flask, dilute to volume with the mobile phase and shake well (containing 8 μg of berberine hydrochloride per ml).

Test solution Weigh accurately 20 tablets, removed the sugar coats, and triturate to fine powder. Weigh accurately a quantity of the powder, equivalent to about 30 mg of berberine hydrochloride, disintegrate in about 150 ml of boiling water and cool slightly. Add 3 ml of dilute hydrochloric acid TS, stir well and cool to ambient temperature. Transfer the solution to a 250 ml volumetric flask, add water to volume, mix well. Centrifuge (4000 rpm). Transfer 2 ml of the supernatant, measured accurately, to a 25 ml volumetric flask, dilute to volume with the mobile phase and shake well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 85.0 per cent and not more than 115.0 per cent of the labelled amount of berberine hydrochloride ($C_{20}H_{17}NO_4 \cdot HCl$) per tablet.

Radix Paeoniae Alba Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitril and 0.05 mol/L potassium dihydrogen phosphate solution (15∶85) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, accurately weighed, in 50% ethanol to produce a solution containing 0.1 mg per ml as the reference solution.

Test solution Weigh accurately 20 tablets, removed from coating and pulverized to fine power and mix well. Place 0.5 g, weighed accurately, to a stopper conical flask, add accurately 25 ml of 50% ethanol, stopper tightly and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, allow to stand to room temperature and weigh again, replenish the loss of the weight with 50% ethanol, shake thoroughly and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.65 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per tablet, referred to Radix Paeoniae Alba.

Action To clear *heat* and *dampness*, move *qi* to kill pain, and arrest diarrhea and dysentery.

Indications Diarrhea, dysentery with purulent mucus and blood, tenesmus or spouting diarrhea and burning anus due to *damp-heat* in the large intestine; enteritis and dysentery with above symptoms.

Usage and dosage 4 tablets, 3 times a day.

Strength 30 mg of berberine hydrochloride per tablet

Storage Preserve in tightly closed containers.

Fufang Jixueteng Gao
(复方鸡血藤膏)

Compound Kadsura Extract

Ingredients Powder of Caulis Kadsurae decoction 218.75 g; Radix Cyathulae 59.5 g; Radix Dipsaci 53 g; Flos Carthami 5 g; Semen Glycinic Macis 12.5 g; Glutinous Rice Powder 437.5 g; Molasses 300 g.

Procedure Powder of Caulis Kadsurae decoction is prepared as follow: Decoct Caulis Kadsurae with water three times, 4 hours, 3 hours and 2 hours respectively and filter. Concentrate the filtrate to a thick extract, bake to dry, and pulverize to pass through No. 6 sieve. Wash clean Glutinous rice, steam well, bake to dry, and pulverize to pass through No. 6 sieve. Decoct Radix Cyathulae, Radix Dipsaci, Flos Carthami and Semen Glycinis Macis three times with water, combine the decoctions, filter, and concentrate the filtrate to an appropriate quantity. Add the powder of Caulis Kadsurae decoction, Glutinous Rice powder and Molasses, stir well, make to the shape of square mass, dry and produce 1000 g.

Description Black masses of dry extract; odour, aromatic and burnt; taste, astringent, slightly bitter, then slightly sweet.

Identification (1) To 1 g of the powder add 10 ml of water, heat for 10 minutes and filter. Examine the filtrate under ultraviolet light at 365 nm; a bluish fluorescence is produced.

(2) To 1 g of the powder, add 10 ml of methanol, heat on a warm water bath for 20 minutes and filter. To 1 ml of the filtrate add 1 ml of 3% sodium carbonate solution, heat on a water bath for 3 minutes, cool in ice water, and add 1-2 drops of freshly prepared diazotized *p*-nitroaniline TS; a red colour is produced.

Loss on drying Not more than 14 per cent, when dried at 105℃ to constant weight (Appendix Ⅸ G).

Action To promote blood circulation and enrich blood, and to reinforce the kidney.

Indications Menstrual disorders due to blood stagnation in meridians and failure of the kidney to be nourished, with manifestations of delayed menstrual period, scanty menstrual blood with clots, aching of the lower back, beering-down feeling in the lower abdomen, numbness of hands and feet, and aching pain in joints.

Usage and dosage 6-10 g, twice a day, after crushed and stewed in a mixture of equal amount of water and wine.

Precaution Be cautious about pregnant women.

Strength 200 g per box

Storage Preserve in tightly closed containers, store in a cool place.

Fufang Qianzheng Gao (复方牵正膏)

Compound Qianzheng Plaster

Ingredients Rhizoma Typhonii; Pheretima; Scorpio; Bombyx Batryticatus; Rhizoma Chuanxiong; Radix Angelicae Dahuricae; Radix Angelicae Sinensis; Radix Paeoniae Rubra; Radix Saposhnikoviae; Rhizoma Zingiberis Recens; Camphor; Borneolum Syntheticum; Menthol; Thymol.

Procedure Pulverize the above ten ingredients, except Camphor, Borneolum Syntheticum, Menthol and Thymol, to coarse powder, carry out the method for percolation described under liquid extracts and extracts (Appendix Ⅰ O), using 85% ethanol as solvent to macerate and take percolating. Collect the percolate, recover ethanol and concentrate until its relative density is about 1.05, mix well with Camphor, Borneolum Syntheticum, Menthol and Thymol. Add about four folds in weight of plaster base, prepared with rubber, rosin, zinc oxide, vaselin and wool fat, make to plaster, spread on cloth and cut into pieces.

Description Pale brown or pale brownish-green adhesive tape plaster; odour, aromatic.

Identification (1) To 140 cm^2 of the plaster, removed the covering substance, add 50 ml of ethanol, heat under reflux for 30 minutes, cool and filter. Evaporate the filtrate to dryness, dissolve the residue in 2 ml of ethanol as the test solution. Dissolve imperatorin CRS in dehydrated ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃) and ethyl acetate (4∶1) as the mobile phase. Apply separately 20 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) To 70 cm^2 of the plaster, removed the covering substance, add 30 ml of ethanol, heat under reflux for 30 minutes, cool and filter. Evaporate the filtrate to dryness, dissolve the residue in 2 ml of methanol as the test solution. Dissolve paeoniflorin CRS in dehydrated ethanol to produce a solution containing 0.5 g per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (5∶1) as the mobile phase. Apply separately 15 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with a solution of vanillin in sulfuric acid and heat at 105℃ for about 5 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Macerate 70 cm^2 of the plaster, removed the covering substance, in 10 ml of ethanol for 30 minutes, filter and use the filtrate as the test solution. Dissolve separately (±)-borneol and (±)-isoborneol CRS and menthol CRS in chloroform to produce two solutions each containing 2 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃), benzene and ethyl acetate (9∶2∶1) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of each of the reference solutions to the plate. After developing and removal of the plate, spray with a solution of vanillin in sulfuric acid and heat at 105℃ for about 5-10 minutes. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Extractive in plaster mass To the plaster, use ether as solvent, not less than 1.6 g per 100 cm^2 (Appendix Ⅰ I).

Other requirements Comply with the general requirements for adhesive plasters of cataplasms (Appendix Ⅰ I).

Action To expel *wind* and promote blood circulation, and relax muscles and tendons and activate meridians.

Indications Deviation of the mouth and eye, numbness of muscles, pain of muscles and joints due to invasion of the meridians by pathogenic factors.

Usage and dosage Applied to the selected acupuncture points (wash clean the affected region with wine or warm water).

Precaution Temporarily cease medication on skin sensitivity; avoid catching *wind* and *cold*; it is not prescribed to open wound.

Strength (1) 4 cm×6.5 cm (2) 6.5 cm×10 cm

Storage Preserve in well closed containers, store in a cool and dry place.

Fufang Xianhecao Changyan Jiaonang (复方仙鹤草肠炎胶囊)

Fufang Xianhecao Changyan Capsule

Ingredients Herba Agrimoniae 1250 g; Rhizoma Coptidis 375 g; Radix Inulae 375 g; Periostracum Cicadae 375 g; Rhizoma Acori Tatarinowii 375 g; Radix Platycodis 250 g.

Procedure Distil volatile oil of Radix Inulae and Rhizoma Acori Tatarinowii, decoct the drug residue and other four ingredients with the water solution after distilling volatile oil and water for three times, 1.5 hours for the first time, 1 hour for the second and third. Combine the decoction, filter, concentrate the filtrate to a thick extract of relative density of 1.30-1.35 (25℃), add ethanol to the content of 76% ethanol. Stir thoroughly, stand for 48 hours, filter, and recover ethanol, and concentrate to a quantity. Add a quantity of excipient, make granules, dry, spray volatile oil, keep in a closed container for 2 hours, and make to 1000 capsules.

Description Capsules with contents of brown yellow to

brown granules and powder; taste, bitter, and astringent.

Identification (1) Heat under reflux 0.1 g of the content with 10 ml of methanol for 15 minutes, filter and use the filtrate as the test solution. Dissolve a quantity of berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of isopentyl acetate, dehydrated ethanol and formic acid (7∶1∶2) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) Heat under reflux 2 g of the content with a mixture of a solution of sulfuric acid in ethanol (7→100) and water (1∶3) for 3 hours, stand to cool, and extract with two 20 ml quantities of chloroform. Combine the extract, wash with 30 ml of water, and discard the water solution. Dehydrate chloroform extract with anhydrous sodium sulfate, filter, evaporate the filtrate, and dissolve the residue with 1 ml of methanol as the test solution. Prepare a solution of 1 g of Radix Platycodis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and ether (1∶1) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 10% solution of sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.033 mol/L solution of potassium dihydrogen phosphate (40∶60) as the mobile phase. As detector a spectrophotometer set at 265 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of berberine hydrochloride.

Reference solution Weigh accurately 10 mg of berberine hydrochloride CRS, dried at 100℃ for 5 hours, in a 50 ml stopper conical flask, dissolve with 60 ml of boiling water, add 1.2 ml of dilute hydrochloric acid, mix well, ultrasonicate for 30 minutes, allow to cool, and transfer to a 100 ml volumetric flask, dilute with water to volume. Measure accurately 2 ml in a 25 ml volumetric flask, dilute with the mobile phase to volume, and mix well (containing 8 μg of berberine hydrochloride per ml).

Test solution Pulverize the contents, obtained under the test of packing variation, to fine powder, weigh accurately 1 g in a stopper conical flask, add 150 ml of boiling water and add 3 ml of dilute hydrochloric acid. Mix thoroughly, ultrasonicate (power, 250 W; frequency, 50 kHz) for 30 minutes, allow to cool, and filter. Transfer the filtrate to a 250 ml volumetric flask, dilute with water to volume, and mix well. Measure accurately 2 ml in a 25 ml volumetric flask, dilute with the mobile phase to volume, and mix well. Filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 8.0 mg of berberine hydrochloride ($C_{20}H_{18}ClNO_4$) per capsule, referred to Rhizoma Coptidis.

Action To clear *heat* and *dampness*, and invigorate the spleen to arrest diarrhea.

Indications Diarrhea due to retention of *damp-heat* in a spleen deficiency syndrome with manifestations of urgent, sticky or loose stools, poor appetite, lassitude and abdominal distension and pain; acute or chronic enteritis with above symptoms.

Usage and dosage 3 capsules, 3 times a day; taken after meals.

Strength 0.4 g per capsule

Storage Preserve in tightly closed container.

Fufang Xianzhuli Ye (复方鲜竹沥液)

Fufang Xianzhuli Mixture

Ingredients Succus Bambusae 400 ml; Herba Houttuyniae 150 g; Rhizoma Pinelliae Recens 25 g; Rhizoma Zingiberis Recens 25 g; Folium Eriobotryae 150 g; Radix Platycodis 75 g; Oleum Menthae Dementholatum 1 ml.

Procedure Squeeze Rhizoma Zingiberis Recens to obtain juice, add ethanol to adjust 65% content of ethanol, stir, and stand for 24 hours. Filter the supernatant, and recover ethanol of the filtrate. Distil Herba Houttuyniae, collect 150 ml of distillation for further use. Decoct the drug residue of Rhizoma Zingiberis Recens and Herba Houttuyniae, Rhizoma Pinelliae Recens, Folium Eriobotryae and Radix Platycodis with water for two times, 1.5 hours for the first time, and 1 hour for the second. Combine the decoction, filter, concentrate the filtrate to about 420 ml, stand for cool, add ethanol to adjust 65% content of ethanol, stir, and stand for 24 hours. Filter, recover ethanol, add Succus Bambusae and 150 g of sucrose, heat to boil for 20 minutes, filter while hot, and stand the filtrate to cool. Add juice of Rhizoma Zingiberis Recens, distillation liquid of Herba Houttuyniae, Oleum Menthae Dementholatum and 3 g of sodium benzoate, stir thoroughly, add water to 1000 ml, and mix well.

Description A yellowish brown to brown colour liquid; odour, fragrant; taste, sweet.

Identification (1) Extract 30 ml of the mixture with two 25 ml quantities of *n*-butanol saturated with water, combine the extract, and evaporate to dryness. Dissolve the residue in 5 ml of water, apply to a column packed with macrosphorous resin D 101 (1 cm in diameter, 12 cm high), wash with 50 ml of water, discard the washing, elute with 50 ml of 30% ethanol, collect the eluate, evaporate to dryness, dissolve the residue with 1 ml of methanol as the test solution. Decoct 1 g of Herba Houttuyniae reference drug with 50 ml of water for 20 minutes, and filter. To the filtrate, prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13∶7∶2), stood below 10℃, as the mobile phase. Apply separately 5 μl of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% solution of sulfuric acid in ethanol,

heat at 105℃ to spots clear, and examine under ultraviolet light at 365 nm. The main fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) Extract 30 ml of the mixture with two 25 ml quantities of *n*-butanol saturated with water, combine the extract, and wash with 30 ml of ammonia TS. Evaporate *n*-butanol extract to dryness, and dissolve the residue with 0.5 ml of methanol as the test solution. Decoct 0.5 g of Folium Eriobotryae reference drug with 60 ml of water for 30 minutes, and filter. To the filtrate, prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, ethyl acetate, formic acid and water (15∶40∶22∶10), stood below 10℃, as the mobile phase. Apply separately 5 μl of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with 1% solution of vanillin in ethanol, heat to spots clear, and examine under ultraviolet light at 365 nm. The main spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Extract 20 ml of the mixture with two 20 ml quantities of *n*-butanol saturated with water, combine the extract evaporate to dryness, and dissolve the residue with 1 ml of methanol as the test solution. Ultrasonicate 0.5 g of Radix Platycodis reference drug with 10 ml of methanol for 15 minutes, filter, evaporate the filtrate to dryness, and dissolve the residue with 2 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and formic acid (16∶10∶1) as the mobile phase. Apply separately 2 μl of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% solution of sulfuric acid in ethanol, and heat at 105℃ to spots clear. The main spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Relative density Not less than 1.05 (Appendix Ⅶ A).

pH value 4.8-6.0 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use a capillary column of modified polyethylene glycol (PEG)-20M (30 m long, 0.32 mm in internal diameter, 0.25 μm film thickness), column temperature gradient: initial temperature 100℃, increase at 5℃ per minute to 150℃, and then increase at 30℃ per minute to 200℃, split injection, split radio 3∶1. The number of theoretical plates of the column is not less than 50000, calculated with reference to the peak of menthol.

Correction factor Dissolve a quantity of *n*-octadecane, accurately weighed, with cyclohexane to produce a solution containing 1 mg per ml as internal standard solution. Dissolve a quantity of menthol CRS, accurately weighed, with cyclohexane to produce a solution containing 0.2 mg per ml as the reference solution. Measure accurately 5 ml of the reference solution and 1 ml of internal standard solution in a 10 ml of volumetric flask, dilute with cyclohexane to volume and mix well. Inject accurately 2 μl of the solution into the column and calculate the correction factor.

Procedure Measure accurately 50 ml of the mixture in a ground-bottom flask, add 50 ml of water, carry out the method for determination of volatile oil (Appendix Ⅹ D), add water through the top of the apparatus until fills the collector and overflows to the flask, and add 2 ml of cyclohexane, keep boiling gently for 2 hours, stand to cool, separate the layer of cyclohexane, and transfer to a 10 ml of volumetric flask. Wash the collector with 3 ml of cyclohexane, combine the washing to the same flask, add accurately 1 ml of internal standard solution, dilute with cyclohexane to volume, and mix well. Inject 2 μl into the column and calculate the content.

It contains not less than 10 μg of menthol ($C_{10}H_{20}O$) per ml, referred to Oleum Menthae Dementholatum.

Action To clear heat and resolve phlegm, and stop coughing.

Indications Coughing with expectoration of thick yellow phlegm due to *phlegm-heat*.

Usage and dosage 20 ml, 2-3 times a day.

Strength (1) 10 ml (2) 20 ml (3) 30 ml
(4) 100 ml (5) 120 ml per bottle

Storage Preserve in tightly closed container.

Fufang Yuxingcao Pian
(复方鱼腥草片)

Compound Yuxingcao Tablets

Ingredients Herba Houttuyniae 583 g; Radix Scutellariae 150 g; Radix Isatidis 150 g; Fructus Forsythiae 58 g; Flos Lonicerae Japonicae 58 g.

Procedure Pulverize 200 g of Herba Houttuyniae with Fructus Forsythiae and Flos Lonicerae Japonicae to fine powder. Decoct the remainder of Herba Houttuyniae with Radix Scutellariae and Radix Isatidis with water twice, each 2 hours. Combine the decoctions and filter, concentrate the filtrate to a thick extract, add the above fine powder, mix well, dry and pulverize to fine powder. Make granules, dry and make to 1000 tablets, coat with sugar.

Description Sugar coated tablets with brown core; taste, slightly astringent.

Identification (1) Pulverize 25 tablets, removed from coating, macerate with 20 ml of ether for 24 hours, and filter. Wash the residue with two 10-ml quantities of ether, filter and keep the residue for later use. Evaporate the filtrate to dryness at a low temperature, dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Prepare a solution of 5 g of Herba Houttuyniae reference drug and 30 ml of ether in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃) and ethyl acetate (17∶3) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The main fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference drug solution.

(2) To the drug residue, extracted with ether under Identification test (1), expel the ether, add 30 ml of ethanol, heat under reflux for 1 hour, cool and filter, and evaporate the filtrate to dryness. Dissolve the residue in a quantity of water, apply to a column previously packed with macroporous resin D101 (1.5 cm in diameter, 12 cm long)

Elute with 100 ml of water, discard the water, elute with 50 ml of 30% ethanol, and collect the eluate to be employed for the test of Identification (3). Then elute with 60 ml of 70% ethanol, collect the eluate, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve forsythin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of chloroform, methanol and formic acid (9∶1∶0.1) as the mobile phase. Apply separately 5-10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a solution of 10% sulfuric acid in ethanol, heat at 105℃ for about 5 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Evaporate the 30% ethanolic eluate obtained under the Identification test (2) to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve chlorogenic acid CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance, and the upper layer of a mixture of butyl acetate, formic acid and water (14∶5∶5) as the mobile phase. Apply separately 2-5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (45∶55∶0.2) as the mobile phase. As detector a spectrophotometer set at 315 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of baicalin.

Reference solution Dissolve a quantity of baicalin CRS, accurately weighed, in methanol to produce a solution containing 40 μg per ml as the reference solution.

Test solution Weigh accurately 20 tablets, removed from coating and pulverized to fine power. Place 0.5 g to a 100 ml volumetric flask, add 60 ml of 70% ethanol. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, allow to stand to room temperature. Dilute with 70% ethanol to volume, mix well, centrifuge and use the supernatant as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 2.7 mg of baicalin ($C_{21}H_{18}O_{11}$) per tablet, referred to Radix Scutellariae.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Action To clear *heat* and *toxicity*.

Indications Acute inflammation of the throat, acute tonsillitis due to affliction from external *wind-heat* with manifestations of red swollen painful throat acute pharyngitis and acute tonsillitis with above symptoms.

Usage and dosage 4-6 tablets, 3 times a day.

Storage Preserve in tightly closed containers.

Fufang Zaofan Wan
(复方皂矾丸)

Compound Zaofan Pills

Ingredients Melanteritum; Radix Panacis Quinquefolii; Hippocampus; Cortex Cinnamomi; Fructus Jujubae (cored); Semen Juglandis.

Procedure Dry Hippocampus and Fructus Jujubae at 75-80℃, pulverize to fine powder. Crush Semen Juglandis into pieces, and pulverize with the other three ingredients to fine powder, and triturate with the above powder, sift and mix well. To each 100 g of the powder add 50-60 g refined honey to make small honeyed-pills, coat with active charcoal.

Description Brownish-black or bluish-black small honeyed-pills; odour, characteristic; taste, sweet, slightly bitter and pungent.

Identification (1) Microscopical: Epidermal cells of pericarp yellowish-brown or brownish-red, polygonal in surface view, the thickness of cuticle up to 10 μm in sectional view. Striated muscle fibres colourless or pale yellow, with fine and dense transverse striations, alternated between brightness and darkness, straight or slightly waved. Epidermal cells of tesa polygonal, sometimes oblate stomata visible, about 66 μm wide, guard cells broad reniform; fatty oil drops numerous. Stone cells subrounded or subrectangular, 32-88 μm in diameter, walls thin on one side.

(2) To 2 g, in pieces, add 20 ml of water, add 1 drop of dilute hydrochloric acid, shake and filter. The filtrate yields the characteristic reactions of sulfate (Appendix Ⅳ) and ferrous salts (Appendix Ⅳ).

(3) To 9 g, in pieces, grind with 3 g of kieselguhr, transfer to a conical flask with stopper, add 30 ml of ether, tightly stopper. Macerate for 20 minutes, frequently shaking, filter, concentrate the filtrate to about 2 ml as the test solution. Dissolve cinnamaldehyde CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (17∶3) as the mobile phase. Apply separately 2-5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with dinitrophenyldrazine TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) To 12 g, in pieces, grind with 4 g of kieselguhr, add 40 ml of 70% ethanol, and heat under reflux for 1 hour. Allow to cool, filter, and evaporate the filtrate on a water bath to dryness. Dissolve the residue in 40 ml of water, transfer to a separating funnel, extract by shaking with three 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, wash with double volumes of ammonia TS one time, then wash with water twice, each 15 ml. Discard the washings, evaporate the *n*-butanol solution in vacuum to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 1 g Radix Panacis Quinquefolii reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, ethyl acetate, methanol and water (15∶40∶22∶10), standing at 5-10℃ over 12 hours, as the mobile phase. Apply separately 1-2 μl of each of the two

solution to the plate. After developing in a chamber, pre-equilibrated with mobile phase, at 10-25℃ and less than 60% of relative humidity, and removal the plate, dry under a current of hot air immediately, spray with 10% sulfuric acid in ethanol and heat at 110-120℃ to spots clear. Examine under sunlight and ultraviolet light at 365 nm separately. The spots, examined in sunlight, and the fluorescent spots, examined under ultraviolet light at 365 nm, in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Water Not more than 17.0% (Appendix Ⅸ H).

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay *Reference solution* Weigh accurately 0.4 g of ferrous sulfate CRS to a 100 ml volumetric flask, add 1 ml of sulfuric acid solution (1→20) and 80 ml of water, dilute to volume with water, mix well. Transfer accurately 2 ml to a 100 ml volumetric flask, dilute to volume with water, and mix well (containing 80 μg of ferrous sulfate per ml, prepared before use).

Preparation of standard curve Measure accurately 1,2,4,6,8 ml of the standard solution in 25 ml volumetric flask separately, add water for each to 10 ml, then add 1 ml of 1% hydroxylamine hydrochloride and 1 ml of 0.2% 2,2-dipyridyl in ethanol, mix well, dilute to volume with water, mix well. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 522 nm, taking the reagent solution as a blank, plot the standard curve, using absorbance as ordinate and concentration as abscissa.

Procedure Cut 30 pills, weighed accurately, into pieces. Weigh accurately 2 g of the pieces to a 500 ml volumetric flask, add 5 ml of sulfuric acid solution (1→20) and 200 ml of water, ultrasonicate to disperse completely, add water to volume, mix well. Filter, discard about 20 ml of the initial filtrate, transfer accurately 10 ml of the successive filtrate to a 100 ml volumetric flask, dilute to volume with water, and mix well. Transfer accurately 5 ml to a 25 ml volumetric flask, carry out the procedure as described under the preparation of standard curve, beginning at the words "add water for each to 10 ml", measure the absorbance, read out the weight of ferrous sulfate in the test solution from the standard curve, and calculate the content.

It contains not less than 30.0 mg of Melanteritum per pill, calculated as ferrous sulfate ($FeSO_4 \cdot 7H_2O$).

Action To warm the kidney and invigorate marrows, replenish *qi* and *yin*, and to promote generation of blood and arrest bleeding.

Indications Aplastic anemia, leucopenia and thrombocytopenia, myelodysplastic syndrome, impairment to marrows, leucopenia caused by radiotherapy or chemotherapy due to a deficiency of *kidney-yang* and insufficient *qi* and blood.

Usage and dosage 7-9 pills, 3 times a day.

Precaution Avoid tea.

Strength 0.2 g per pill

Storage Preserved in well closed containers.

Fuke Fenqing Wan
(妇科分清丸)

Fuke Fenqing Pills

Ingredients Radix Angelicae Sinensis 200 g; Radix Paeoniae Alba 100 g; Radix Chuanxiong 150; Radix Rehmanniae 200 g; Fructus Gardeniae 100 g; Rhizoma Coptidis 50 g; Folium Pyrrosiae 50 g; Spora Lygodii 25 g; Radix et Rhizoma Glycyrrhizae 100 g; Caulis Akebiae 100 g; Talcum 150 g.

Procedure Decoct Folium Pyrrosiae twice with water and filter. Pulverize the other ingredients to fine powder, sift and mix well. Make pills with Folium Pyrrosiae decoction and dry.

Description Yellow watered pills; taste, bitter.

Identification (1) Microscopical: Parenchymatous cells fusiform, walls slightly thickened, and with minute oblique crisscross striations. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Clusters of calcium oxalate 18-32 μm in diameter, occurring in parenchymatous cells, often in rows or several in one cell. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Fibre bundles bright yellow, with slightly thickened and distinctly pitted walls. Stone cells of testa yellow or pale brown, mostly broken, the whole ones elongated polygonal, rectangular or irregular, with thickened and large rounded pitted walls, lumina brownish-red. Spores tetrahedral or triangular conical, 60-80 μm in diameter, with granular sculptures in outer walls.

(2) To 9 g, in fine powder, add 20 ml of 75% ethanol, heat under reflux for 30 minutes, allow to cool, filter and use the filtrate as the test solution. Dissolve geniposide CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, acetone, formic acid and water (5∶5∶1∶1) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat to spots clear. The spot in the chromatogram obtained with test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) To 0.5 g of Rhizoma Coptidis reference drug, add 20 ml of methanol, heat under reflux for 15 minutes, allow to cool, filter, use the filtrate as the reference drug solution. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of benzene, ethyl acetate, methanol, isopropanol and water (20∶10∶5∶5∶1) as the mobile phase. Apply separately 1 μl of each of the test solution obtained under Identification (2), the above reference drug solution and the above reference solution to the plate. After developing in a chamber pre-equilibrated with ammonia vapour and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with test solution correspond in position and colour to the spots in the chromatogram obtained with reference drug solution and the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To clear *heat* and drain *dampness*, and promote blood circulation to kill pian.

Indications Stranguria caused by *heat* in women due to accumulation of *damp-heat* in the *lower-energizer*, with manifestation of frequency and urgency in micturition, oliguria, difficult and painful urination, and concentrated turbid urine.

Usage and dosage 9 g, twice a day.

Precaution Be cautious about pregnancy.

Storage Preserve in well closed containers, protected from moisture.

Fuke Qianjin Pian
(妇科千金片)

Fuke Qianjin Tablets

Ingredients Radix Moghaniae; Radix Rosae Laevigatae; Herba Andrographis; Caulis Mahoniae; Danmianzhen; Radix Angeliae Sinensis; Caulis Spatholobi; Radix Codonopsis.

Procedure Pulverize Herba Andrographis, Radix Codonopsis and Radix Angeliae Sinensis to fine powder, and sift. Decoct Radix Moghaniae and other four ingredients with water twice, 2.5 hours for the first time and 2 hours for the second time. Filter and combine the filtrate to a thin extract with a relative density is 1.08-1.12 (85℃), mix well with the above fine powder and a quantity of adjuvants, make granules, make to 1000 tablets and coat with film or sugar.

Description Sugar or film coated tablets with greyish-brown core; taste, bitter.

Identification (1) To 3 tablets with coating removed, pulverized to powder, add 20 ml of methanol, ultrasonicate for 20 minutes, and filter, evaporate the filtrate to dryness on a water bath, and dissolve the residue in 1 ml of ethanol as the test solution. Prepare a solution of 0.5 g of Radix Angeliae Sinensis reference drug in 20 ml of ethanol, ultrasonicate for 20 minutes, and filter as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of *n*-hexane and ethyl acetate (9∶1) as the mobile phase. Apply separately 3 μl of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the fluorescent spots in the chromatogram obtained with the reference drug solution.

(2) To 0.5 g of Herba Andrographis reference drug in 30 ml of ethanol, ultrasonicate for 30 minutes, filter, evaporate the filtrate to about 4 ml as the reference drug solution. Dissolve dehydroandrogrofpholide and andrographolide CRS in ethanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and the mixture of chloroform, ethyl acetate and methanol (4∶3∶0.4) as the mobile phase. Apply 3 μl of the test solution obtained under Identification (1) and 4 μl of each of the reference drug solution and the reference solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

(3) To 5 tablets with coating removed, pulverized to powder, add 30 ml of ethanol, ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness on a water bath, dissolve the residue in 2 ml of methanol, apply to a column (1-1.5 cm in internal diameter) previously packed with neutral aluminium oxide (100-200 mesh, 10 g), elute with 100 ml of 40% methanol, and collect the eluates. Heat the eluate on a water bath, evaporate to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Prepare a solution of 0.5 g of Radix Codonopsis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of *n*-butanol, methanol and water (15∶3∶2) as the mobile phase. Apply separately 2 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and the mixture of methanol and water (55∶45) as the mobile phase. As detector a spectrophotometer set at 240 nm. The number of theoretical plates for the column is not less than 2000, calculated with the reference to the peak of dehydroandrographolide.

Reference solution Dissolve a quantity of dehydroandrographolide and andrographolide CRS, accurately weighed, in methanol to produce a mixture containing 35 μg of andrographolide and 40 μg of dehydroandrographolide per ml respectively as the reference solution.

Test solution To 10 tablets with coating removed, weighed accurately, pulverized to fine powder, and weighted accurately 0.3 g of the powder to a stopper conical flask. Add accurately 20 ml of methanol, stopped tightly, weighed accurately, cool macerate for 30 minutes, ultrasonicate (power, 200 W; frequency, 40 kHz) for 30 minutes, allow to cool, weighted accurately again, replenished the lost weight with methanol, mix well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 0.80 mg of total dehydroandrographolide ($C_{20}H_{28}O_4$) and andrographolide ($C_{20}H_{30}O_5$) per tablet, referred to Herba Andrographis.

Action To clear *heat* and *dampness*, and replenish *qi* and resolve stasis.

Indications Leukorrheal disease and abdominal pain due to accumulation of *damp-heat*, with manifestations of leukorrhagia, thick in quality and yellow in colour with foul smell, lower abdominal pain, aching pain in the lumbosacral region, lassitude; chronic pelvic or endometrial inflammation and chronic cervicitis with above symptoms.

Usage and dosage 6 tablets, 3 times a day.

Storage Preserve in tightly closed containers.

Fuke Shiwei Pian
(妇科十味片)

Fuke Shiwei Tablets

Ingredients Rhizoma Cyperi (processed with vinegar) 500 g; Rhizoma Chuanxiong 20 g; Radix Angelicae Sinensis 180 g; Rhizoma Corydalis (processed with vinegar) 40 g; Rhizoma Atractylodes Macrocephalae 28.75 g; Radix et Rhizoma Glycyrrhizae 13.75 g; Fructus Jujubae 100 g; Radix Paeoniae Alba 15 g; Radix Rehmanniae Praeparata 15 g; Radix Paeoniae Rubra 60 g; Calcium Carbonate 65 g.

Procedure Pulverize Rhizoma Cyperi, Rhizoma Corydalis, Radix Paeoniae Alba, Radix Rehmanniae Praeparata, Calcium carbonate and 126 g of Radix Angelica Sinensis to fine powders. Decoct Radix et Rhizoma Glycyrrhizae and Fructus Jujubae three times, combine the decoctions, and filter. Extract the remains of the Radix Angelicae Sinensis, Rhizoma Atractylodes Macrocephalae, Fructus Jujubae and Rhizoma Chuanxiong with 70% ethanol under reflux twice, filter and combine the filtrates. Combine the above two filtrates and concentrate in vacuum to a thick extract with a relative density of 1.35-1.40 (50℃). Mix well with the above fine powder, dry, pulverize to fine powder, add syrup and starch to make granules, dry, and make to 3000 tablets.

Description Yellowish-brown tablets; taste bitter and slightly sweet.

Identification (1) Microscopical: Secretary cells subrounded, containing pale yellowish-brown to redish-brown secretion, surrounded by radially arranged cells. Parenchymatous cells fusiform, walls slightly thickened, with very fine oblique crisscross striations.

(2) Grind 10 tablets to fine powder, macerate in 20 ml of ether for 1 hour, with constantly shaking, filter and evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of ethyl acetate as the test solution. Dissolve α-cyperone CRS in ethyl acetate to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B) using silica gel GF_{254} as the coating substance and a mixture of *n*-hexane and ethyl acetate (17:3) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. Spray with dinitrophenylhydrazine TS, stand for a moment, the spots gradually turn orange-red.

(3) Ultrasonicate separately 0.5 g of Rhizoma Chuanxiong reference drug and Radix Angelicae Sinensis reference drug with 15 ml of ether for 5 minutes, filter, and evaporate the filtrates to dryness. Dissolve the residues in 1 ml of ethyl acetate as the reference drug solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9:1) as the mobile phase. Apply separately 5 μl of each of the test solution obtained under Indentification (2) and the above two reference drug solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solutions.

(4) Grind 15 tablets to fine powder, ultrasonicate with 20 ml of ethanol for 15 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in 20 ml of water and extract with three 20-ml quantities of ether, and discard the ether solutions. Extract again with two 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol solutions, wash with three 10-ml quantities of water, and evaporate the *n*-butanol solution to dryness. Dissolve the residue in 1 ml of ethanol, add a quantity of neutral aluminium oxide, stir well and dry on a water bath, apply to a column (1-1.5 cm in diameter) packed with neutral aluminium oxide (200-300 mesh, 1 g), elute with 40 ml of methanol. Collect the eluates, evaporate to dryness, dissolve the residue in 1 ml of ethanol as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using sillica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40:5:10:0.5) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulfuric acid and heat at 105℃ to the spots clear. The spot in the chromatograph obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 1% phosphoric acid (12:88) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of paeoniflorin.

Reference solution Weigh accurately 10 mg of paeoniflorin CRS, in a 50 ml volumetric flask, add with diluted ethanol to volume, and shake well. Accurately measure 2 ml to a 10 ml volumetric flask, add diluted ethanol to volume, and shake well. (containing 40 μg of paeoniflorin per ml).

Test solution Grind 20 tablets, weighed accurately, into fine powder, weigh accurately 1 g in a stopper conical flask, add 25 ml of diluted ethanol, weigh and ultrasonicate (power, 100 W; frequency, 40 kHz) for 30 minutes, allow to cool, weigh again, replenish the loss of weight with the diluted ethanol, and shake well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 0.25 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per tablet, referred to Radix Paeoniae Alba and Radix Paeoniae Rubra.

Action To nourish blood and soothe the liver, and regulate menstruation to kill pain.

Indications Menstrual disorders, dysmenorrhea and illnesses before or after menstruation due to a deficiency of blood and stagnation of *liver-qi*, with manifestation of delayed menstrual cycles, oligomenorrhea with clots, pain in the lower abdomen during periods, decline of the clots to discharge, distending pain in breasts before menstruation, restlessness and poor appetite.

Usage and dosage 4 tablets, 3 times a day.

Strength 0.3 g per tablet

Storage Preserve in tightly closed containers.

Fuke Tiaojing Pian
(妇科调经片)

Fuke Tiaojing Tablets

Ingredients Radix Angelicae Sinensis 144 g; Rhizoma Chuanxiong 16 g; Rhizoma Cyperi (stir-baked with vinegar) 400 g; Rhizoma Atractylodis Macrocephalae (stir-baked with bran) 23 g; Radix Paeoniae Alba 12 g; Radix Paeoniae Rubra 12 g; Rhizoma Corydalis (stir-baked with vinegar) 32 g; Radix Rehmanniae Praeparata 48 g; Fructus Jujubae 80 g; Radix et Rhizoma Glycyrrhizae 11 g.

Procedure Pulverize Rhizoma Atractylodis Macrocephalae, Rhizoma Corydalis, Radix Angelicae Sinensis and Rhizoma Chuanxiong to fine powder, and sift. Decoct Rhizoma Cyperi and other five ingredients with water twice, 3 hours for the first time and 2 hours for the second time, filter, combine the filtrate, concentrate to thick extract. Mix well with the above fine powder and a quantity of adjuvants, make granules, and dry below 60℃, make to 1000 tablets and coat with film or sugar.

Description Sugar or film coated tablets with brown or blackish-brown core; taste, bitter and pungent.

Identification (1) To 25 tablets with coating removed, pulverized to fine powder to a stopper conical flask, add 1 ml of concentrated ammonia TS and 20 ml of chloroform, stopped tightly and shake well, macerate for 1 hour with occasional shaking, filter. Extract with two 10-ml quantities of dilute hydrochloric acid TS. Combine the acid extracts, adjust to alkaline with concentrated ammonia TS, extract with two 15-ml quantities of chloroform. Combine the chloroform extracts, evaporate to dryness, and dissolve the residue in 0.5 ml of ethanol as the test solution. Prepare a solution of 0.8 g of Rhizoma Corydalis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the mixture of *n*-hexane, chloroform, methanol and diethylamine (10∶6∶1∶0.05) as the mobile phase. Apply separately 10 μl of the above two solutions to the plate. After developing and removal of the plate, dry in air, and fumigate the plate in iodine vapour, and examine under ultraviolet light at 365 nm. The main fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the main fluorescent spots in the chromatogram obtained with the reference drug solution.

(2) To 5 tablets with coating removed, pulverized to fine powder to a stopper conical flask, add 20 ml of *n*-hexane, ultrasonicate for 15 minutes, and filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Prepare a solution of 1 g of Radix Angelicae Sinensis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the mixture of *n*-hexane and ethyl acetate (9∶1) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the fluorescent spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D) (Manipulate protected from light).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and the mixture of methanol and 0.1% solution of phosphoric acid (30∶70) as the mobile phase. As detector a spectrophotometer sat at 320 nm. The number of theoretical plates for the column is not less than 8000, calculated with the reference to the peak of ferulic acid.

Reference solution Dissolve a quantity of ferulic acid CRS, accurately weighed, in methanol in an amber volumetric flask to produce a solution containing 5 μg per ml as the reference solution.

Test solution To 10 tablets with coating removed, weighed accurately, pulverized to fine powder, weighed accurately 1 g of the powder to a stopper conical flask. Add accurately 20 ml of methanol, stopped tightly, weighed accurately, ultrasonicate (power, 160 W; frequency, 50 kHz) for 60 minutes, allow to cool, weighed accurately again, replenished the lost weight with methanol, mix well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 25 μg of ferulic acid ($C_{10}H_{10}O_4$) per tablet, referred to Radix Angelicae Sinensis and Rhizoma Chuanxiong.

Action To nourish blood and liver and regulate *qi* flow and menstruation.

Indications Irregular menstruation, advanced or delayed menstrual cycles or dysmenorrhea due to stagnation of *liver-qi* and a deficiency of blood.

Usage and dosage 4 tablets, 4 times a day.

Strength 0.32 g per film-coated tablet

Storage Tightly closed.

Fuke Tongjing Wan
(妇科通经丸)

Fuke Tongjing Pills

Ingredients Fructus Crotonis (processed) 80 g; Resina Toxicodendri (carbonized) 160 g; Rhizoma Cyperi (stir-baked with vinegar) 200 g; Flos Carthami 225 g; Radix et Rhizoma Rhei (stir-baked with vinegar) 160 g; Lignum Aquilariae Resinatum 163 g; Radix Aucklandiae 225 g; Rhizoma Curcumae (boiled with vinegar) 163 g; Rhizoma Sparganii (stir-baked with vinegar) 163 g; Radix Curcumae 163 g; Radix Scutellariae 163 g; Folium Artemisiae Argyi (carbonized) 75 g; Carapax Trionycis (processed with vinegar) 163 g; Sal Ammoniac (processed with vinegar) 100 g; Squama Manis (processed with vinegar) 163 g.

Procedure Pulverize the above ingredients, except Fructus Crotonis, to fine powder, sift, mix well with the fine powder of Fructus Crotonis. To each 100 g of the powder add 100 g of yellow wax and make pills. Coat each 500 g of waxed pills with 7.8 g of Cinnabaris powder and polish.

Description Vermillion waxed pills with yellowish-brown core; odour, slight; taste, slightly salty.

Identification (1) To 4 g of the pills, cut into pieces, add 50 ml of water, boil and maintain boiling for 10 minutes, cool in an ice bath for 30 minutes, remove the wax coat and filter. To a quarter of the filtrate, add 1 ml of hydrochloric acid, heat on a water bath for 30 minutes, cool immediately, extract by shaking with two 5-ml quantities of ether. Evaporate the combined ether solution to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. To 0.1 g of Radix et Rhizoma Rhei reference drug, add 20 ml of methanol, macerate at room temperature for 1 hour, filter, evaporate 5 ml of the filtrate to dryness, dissolve the residue in 10 ml of water, add 1 ml of hydrochloric acid, heat on a water bath for 30 minutes to prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel H mixed with sodium carboxymethylcellose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15∶5∶1) as the mobile phase. Apply separately 4 μl of the test solution and 2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The five orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with reference drug solution. Examine in daylight, the colour of the spots changes to red on exposure to ammonia vapour.
(2) Evaporate the remainder of the filtrate obtained under Identification (1) to dryness, dissolve the residue in 2 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G mixed with sodium carboxymethylcelloluse containing 4% solution of sodium acetate as the coating substance and a mixture of ethyl acetate, butanone, methanol and water (5∶3∶1∶1) as the mobile phase. Apply, in strip, separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 1% ferric chloride in ethanol. The band in the chromatogram obtained with the test solution corresponds in position and colour to the band in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix I A), except time limit test for disintegration, which is not necessary to be taken.

Action To remove stagnated blood to stimulate menstrual flow and disintegrate masses.

Indications Amenorrhea, dysmenorrhea and abdominal masses due to stagnation of *qi* and blood with manifestations of prolonged amenorrhea, pain in the lower abdomen, worse when pressed, abdominal mass, constriction in the chest and proneness to sighing.

Usage and dosage 3 g, once a day. Taken with millet soup or yellow rice wine before breakfast.

Precaution It is forbidden to prescribe to pregnant women and patients with amenorrheal abdominalgia or loose stools due to a deficiency of *qi* and blood; avoid raw, cold and pungent foods, and buckwheat flour.

Strength 1 g per 10 pills

Storage Preserve in well closed containers, proteced from moisture.

Fuyanjing Jiaonang (妇炎净胶囊)

Fuyanjing Capsules

Fuyanjing Capsules are prepared from Herba Picriae, Herba Elephantopi, Radix Angelicae Sinensis, Caulis Spatholobi and Radix Zanthoxyli etc.

Description Hard capsules, containing dark brown powder; odour, slightly aromatic; taste, bitter.

Identification (1) To 1.2 g of the contents, add 10 ml of ethanol, heat under reflux for 5 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Prepare a solution of 1 g of Herba Picriae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of chloroform and methanol (4∶1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid and heat at 105℃ for 5 minutes. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(2) To 2 g of the contents add 20 ml of ethanol, then transfer to a mortar, grind for 2 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of chloroform as the test solution. To 1.9 g of Radix Zanthoxyli reference drug add water, decoct for 20 minutes, and filter. Concentrate the filtrate to dryness, dissolve the residue in a quantity of ethanol and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of chloroform as the reference drug solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of benzene and chloroform (1∶1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Examine under the ultraviolet light at 365 nm. The purplish-blue fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for capsuls (Appendix I L).

Action To clear *heat* and *dampness*, and regulate menstruation and arrest leukorrhagia.

Indications Leukorrheal disease, irregular menstruation and dysmenorrhea due to accumulation of *damp-heat*; chronic pelvic inflammation, annexitis and endometrial inflammation with above symptoms.

Usage and dosage 3 capsules, 3 times a day.

Precaution Be cautious about pregnant women.

Strength 0.4 g per capsule

Storage Preserve in tightly closed containers.

Fuzi Lizhong Wan
(附子理中丸)

Fuzi Lizhong Pills

Ingredients Radix Aconiti Lateralis Praeparata 100 g; Radix Codonopsis 200 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 150 g; Rhizoma Zingiberis 100 g; Radix Glycyrrhizae 100 g.

Procedure Pulverize the above five ingredients to fine powder, sift and mix well. To each 100 g of the powder add 35-50 g of refined honey and a quantity of water, make water-honeyed pills and dry. Alternatively, add 100-120 g of refined honey to make big honeyed pills.

Description Brown to brownish-black water-honeyed pills or big honeyed pills; odour, slight; taste, slightly sweet and pungent.

Identification (1) Microscopical: Starch granules long ovoid, broad-ovoid or irregular rounded, 25-32 μm in diameter, hilum pointed, situated on the relatively small end, striations distinct. Anastomosing laticiferous tubes 12-15 μm in diameter, containing minute granular substance. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres.
(2) Cut 6 g of the big honeyed pills into pieces, or pulverize 4 g of the water-honeyed pills, add 250 ml of water in a 500 ml round-bottom flask, connect to an apparatus for the determination of violate oil, add water through the top of the apparatus until the graduated measuring tube is full and the water overflows into flask. Add again 1 ml of petroleum ether (60-90℃) and then connect to the reflux condenser. Heat under reflux for 2 hours, cool and separate the petroleum ether layer as the test solution. To 0.5 g of Rhizoma Atractylodis Macrocephalae, add 1 ml of ethyl acetate, ultrasonicate for 15 minutes, allow to stand, use the supernatant as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (20∶0.1) as the mobile phase. Apply separately 8 μl of the test solution and 4 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid and visualize under a current of hot air. The main spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Limit test of aconitine To 36 g of the big honeyed pills, cut into pieces, or 25 g of the water-honeyed pills, triturated well; add 4 ml of ammonia TS, stir well, allow to stand for 2 hours, add 60 ml of ether, shake for 1 hour, stand for 24 hours, filter, evaporate the filtrate to dryness. Dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Dissolve aconitine CRS in 1 ml of dehydrated ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate and diethylamine (14∶4∶1) as the mobile phase. Apply separately 12 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air and spray with dilute potassium iodobismuthate TS. The size of the spot in the chromatogram obtained with the test solution is less than the corresponding spot in the chromatogram obtained with the reference solution or no spot reveals in the chromatogram obtained with the test solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To warm the *middle-energizer* and invigorate the spleen.

Indications Diarrhea due to cold from deficiency in the spleen and stomach with manifestations of cold pain in the stomach and abdomen, vomiting of watery fluid, diarrhea or loose stools, and cold hands and feet.

Usage and dosage 6 g of water-honeyed pills or 1 big honeyed pill, 2-3 times a day.

Precaution Be cautious about pregnant women.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Ganji San
(疳积散)

Ganji Powder

Ingredients Fossilia Spiriferis (calcined) 100 g; Concha Haliotidis (calcined) 100 g; Semen Quisqualis 100 g; Endothelium Corneum Gigeriae Galli (stir-baked) 50 g; Flos Eriocauli 50 g; Radix et Rhizoma Clematidis 50 g; Poria 100 g.

Procedure Pulverize the above seven ingredients to fine powder, sift, mix well.

Description A greyish-yellow powder; taste, slightly astringent.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Reticulated cells subrounded or elliptical, with irregularly and reticulately thickened and slightly lignified walls. Glandular hairs with a 1-4-celled head, oblong, surface bearing densely fine reticulate striations, and stalk mostly unicellular.
(2) To 0.5 g of the powder, add 2 ml of dilute hydrochloric acid, carbon dioxide gas is produced, which yields a white precipitate with calcium hydroxide TS. Filter, the filtrate yields the characteristic reactions of calcium salts (Appendix Ⅳ).

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Action To promote digestion to remove retained food.

Indications Child malnutrition due to retained food in the spleen and stomach with manifestations of no desire for food or milk, emaciation and sallow complexion, abdominal bloating and indigestion.

Usage and dosage 9 g, twice a day, taken with warm rice soup and some sugar; appropriate reduction of the dosage for children under 3 years old.

Storage Preserve in well closed containers, protected from moisture.

Ganmao Qingre Keli
(感冒清热颗粒)

Ganmao Qingre Granules

Ingredients Spica Schizonepetae 200 g; Herba Menthae 60 g; Radix Saposhnikoviae 100 g; Radix Bupleuri 100 g; Folium Perillae 60 g; Radix Puerariae Lobatae 100 g; Radix Platycodonis 60 g; Semen Armeniacae Amarum 80 g; Radix Angelicae Dahuricae 60 g; Herba Corydalis Bungeanae 200 g; Rhizoma Phragmitis 160 g.

Procedure Isolate the volatile oil from Spica Schizonepetae, Herba Menthae, Folium Perillae by distillation, and collect the aqueous extract solution in another container. To the residue of distillation, add the other eight ingredients, decoct with water twice. Combine the decoctions, filter, combine the filtrates and the above aqueous solutions, concentrate to a thin extract with a relative density of 1.32-1.35 (50℃). To the extract, add a quantity of sucrose, dextrin and ethanol to make granules, dry, add the volatile oil and mix well, make to 1600 g of granules; or concentrate to a thin extract with a relative density of 1.32-1.35 (50℃), add a quantity of excipient and mix well to make to 800 g granules without sucrose, dry, add the above volatile oil and mix well; or concentrate in vacuum to a solution with relative density of 1.08-1.10 (55℃), dry by spraying, make dried extract powder, mix with a quantity of lactose, add the above volatile oil, mix well and dry, make to 400 g of granules.

Description Brownish-yellow granules; taste, sweet, slightly bitter; or brown granules; taste, slightly bitter (without sucrose or with lactose).

Identification (1) Pulverize 1 pack of the granules, add 25 ml of ethyl acetate, ultrasonicate for about 20 minutes, and filter. Evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of methanol as the test solution. Dissolve puerarin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (28 : 10 : 1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) Pulverize 1 pack of the granules, dissolve the powder in 50 ml of water, adjust pH to 12 with concentrated ammonia TS, extract with two 25-ml quantities of chloroform by shaking, separate the chloroform layer, and evaporate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. To 1 g of Herba Corydalis Bungeanae reference drug, add 50 ml of water, ultrasonicate for 10 minutes, filter. Adjust the filtrate pH to 12 with concentrated ammonia TS, and prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose containing 0.4% solution of sodium hydroxide as the coating substance and a mixture of benzene, ether and dichloromethane (10 : 5 : 14) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with modified potassium iodobismuthate TS. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference drug solution.
(3) Pulverize 0.6 g of the granules, or 3 g of the granules without sucrose, or 1.5 g of the granules with lactose to powder. Dissolve the powder in 30 ml of water, extract by shaking with two 15-ml quatities of ether, and discard the ether solution. Extract the water solution with two 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts. Add 40 ml of ammonia TS, mix well, stand to separate and evaporate the *n*-butanol extract to dryness, and dissolve the residue in 1 ml of methanol as the test solution. To 0.5 g of Radix Bupleuri reference drug, add 20 ml of methanol, heat at 80℃ on a water bath under reflux for 1 hour, cool and filter, and evaporate the filtrate to dryness, dissolve the residue in 10 ml of water in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13 : 7 : 2), standing below 10℃, as the mobile phase. Apply separately 8 μl of the test solution and 4 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with 1% solution of *p*-dimethylaminobenzaldehyde in 10% sulfuric acid in ethanol, heat to the spots clear. The main spots in the chromatogram obtained with the test solution correspond in position and

colour to the main spots in the chromatogram obtained with the reference drug solution. Examine under ultraviolet light at 365 nm, the yellow fluorescent spots in chromatogram obtained with the test solution correspond in position and colour to the spot in chromatogram obtained with the reference drug solution.

(4) To 1 g of Radix Saposhnikoviae reference drug, add 20 ml of acetone, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol as the reference drug solution. Dissolve a quantity of cimicifugoside CRS and 5-*O*-methylvisamminol CRS in methanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of chloroform and methanol (4 : 1) as the mobile phase. Apply separately 2 μl of each of the reference solution and the reference drug solution and 8 μl of the test solution obtained under Identification (3) to the plate. After developing for two times and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitril and water (11 : 89) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 4500, calculated with the reference to the peak of puerarin.

Reference solution Dissolve a quantity of puerarin CRS, accurately weighed, in 30% ethanol to produce a solution containing 16 μg per ml as the reference solution.

Test solution Weigh accurately 0.8 g of the granules, or 0.4 g of the granules without sucrose, or 0.2 g of the granules with lactose, obtained in the test of weight variation, and triturated to fine powder, to a stopper conical flask, accurately add 50 ml of 30% ethanol, stopper tightly and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 20 minutes, allow to stand to room temperature, weigh again, replenish the lost weight with 30% ethanol, shake thoroughly and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 10.0 mg of puerarin ($C_{21}H_{20}O_9$) per pack, referred to Radix Puerariae Lobatae.

Action To disperse *wind* and *cold*, and release the exterior and clear *heat*.

Indications Common cold due to *wind-cold* with manifestations of headache, fever, aversion to cold, general pain, thin nasal discharge, coughing and dry throat.

Usage and dosage 1 pack, twice a day, taken with boiled water.

Strength (1) 12 g per pack
(2) 6 g per pack (without sucrose)
(3) 3 g per pack (with lactose)

Storage Preserve in tightly closed containers.

Ganmaoshu Keli
(感冒舒颗粒)

Ganmaoshu Granules

Ingredients Folium Isatidis; Fructus Forsythiae; Herba Schizonepetae; Radix Saposhnikoviae; Herba Menthae; Fructus Arctii; Radix Platycodonis; Radix Angelicae Dahuricae; Radix et Rhizoma Glycyrrhizae.

Procedure Distill volatile oil from one third amount of Fructus Forsythiae, Herba Schizonepetae and Herba Menthae, collect the water solution after distillation in a separate container, decoct the residue, the remanent parts and the other ingredients with water twice, 1.5 hours for each, combine the decoctions, filter and concentrate the filtrate to a relative density of 1.20-1.25 (90℃), adjust with ethanol to a content of 60% ethanol, stand for 24 hours and separate the supernatant, recover ethanol to no ethanolic smell in vacuum and concentrate the filtrate to a thick extract with a relative density of 1.33 (65℃). Add a quantity of sucrose and dextrin, stir thoroughly, make granules, dry, spray the volatile oil and stir thoroughly, make to 1000 g of granules.

Description Pale brown to brown colour granules; taste, sweet and then sour and bitter.

Identification (1) Dissolve 15 g of the granules, pulverized to fine power, in 50 ml of water by stirring, centrifuge, extract by shaking the supernatant with three 20-ml quantities of *n*-butanol saturated with water. Combine the extracts, wash with two 20-ml quantities of ammonia TS, separate the *n*-butanol extract, evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Heat 1 g of Fructus Forsythiae reference drug in 40 ml of water on a water bath for 1 hour, filter, evaporate the filtrate to dryness, heat under reflux the residue in 20 ml of ethanol for 30 minutes, filter, evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (20 : 1) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a mixture of acetic anhydride and sulfuric acid (20 : 1), heat at 105℃ to spots clear. Examine in daylight, the spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) Heat under reflux 1 g of Fructus Arctii reference drug in 20 ml of ethanol for 1 hour, filter, evaporate the filtrate to dryness, dissolve the residue in 2 ml of ethanol, filter, use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (40 : 10 : 1) as the mobile phase. Apply separately 5 μl of each of the test solution obtained under Identification (1) and the above reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained

with the reference drug solution.
(3) Pulverized 15 g of the granules, dissolve in 60 ml of water (heat if necessary and cool), filter. Extract the filtrate with two 40-ml quantities of ether by shaking, combine the extracts, and evaporate to dryness. Dissolve the residue in 0.5 ml of chloroform as the test solution. Dissolve a quantity of indirubin CRS in chloroform to produce a solution containing 0.1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of petroleum ether (30-60℃) and ethyl acetate (7 : 3) as the mobile phase. Apply separately 6 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitril and water (23 : 77) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of arctiin.

Reference solution Dissolve a quantity of arctiin CRS, accurately weighed, in methanol to prepare a solution containing 0.25 mg per ml as the reference solution.

Test solution Weigh accurately 1.5 g of the granules, obtained in the test of weight variation, and pulverized to fine powder, to a stopper conical flask, accurately add 25 ml of methanol, stopper tightly and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 20 minutes, allow to stand to room temperature, weigh again, replenish the lost weight with methanol, shake thoroughly and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 30.0 mg of arctiin ($C_{27}H_{34}O_{11}$) per pack, referred to Fructus Arctii.

Action To disperse *wind* and clear *heat*, and release the exterior to disperse *lung-qi*.

Indications Common cold due to *wind-heat* with manifestations of headache, lassitude, fever, aversion to cold, stuffy and running nose, coughing and sore throat.

Usage and dosage Taken with boiled water, 15 g, 3 times a day; double dosage for the first time if the condition is serious.

Strength 15 g per pack

Storage Preserve in well closed containers.

Ganmao Tuire Keli
(感冒退热颗粒)

Ganmao Tuire Granules

Ingredients Folium Isatidis 435 g; Radix Isatidis 435 g; Fructus Forsythiae 217 g; Rhizoma Polygoni Bistortae 217 g.

Procedure Decoct the above four ingredients with water twice, 1.5 hours for each time. Combine the decoctions, filter, concentrate the filtrate to a thin extract with a relative density of about 1.08 (90-95℃). Allow to cool to the room temperature, add an equal quantity of ethanol to precipitate and concentrate the supernatant liquid to a thin extract with a relative density 1.20 (60℃). Add an equal quantity of water, stir, allow to stand for 8 hours, concentrate the supernatant liquid to a thick extract with a relative density of 1.38-1.40 (60℃). Add a quantity of sucrose powder, dextrin and ethanol, make granules and dry, make to 1000 g of granules; or concentrate the supernatant to a thin extract with a relative density 1.09-1.11 (60℃), add a quantity of dextrin and flavoring agents, mix well and dry by spraying, make to 250 g of granules without sucrose.

Description Brownish-yellow granules; taste, sweet, slightly bitter, or taste, bitter, slightly sweet (without sucrose).

Identification (1) Dissolve 1 pack of the granules in 50 ml of water, filter, extract the filtrate with successive quantities of 40 ml and 30 ml. Combine the ether solutions, concentrate to about 0.5 ml, used as the test solution. Dissolve a quantity of indirubin CRS in ether to produce a solution containing 0.05 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and acetone (4 : 1) as the mobile phase. Apply separately 15 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) Pulverize 5 g of the granules, or 1.25 g of the granules without sucrose, add 25 ml of methanol, ultrasonicate for 20 minute in an ice bath, filter, evaporate the filtrate to dryness, dissolve the residue in 2 ml of methanol as the test solution. Dissolve a quantity of forsythin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and formic acid (9 : 2 : 0.1) as the mobile phase. Apply separately 5-10 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spot clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitril and water (20 : 80) as the mobile phase. As detector a spectrophotometer set at 277 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of forsythin.

Reference solution Dissolve a quantity of forsythin CRS, accurately weighed, in 50% methanol to produce a solution containing 20 μg per ml as the reference solution.

Test solution Weigh accurately 0.5 g of the granules, or 1.25 g of the granules without sucrose, obtained in the test of weight variation, and triturated to fine power. Heat under reflux with two 25-ml quantities of methanol for 30 minutes, filter. Wash the filter funnel and the residue with 15 ml of methanol in portions, combine the washings and the filtrates, and evaporate to dryness. Dissolve the residue in 10 ml of dilute ethanol TS, apply to a column (1 cm in

diameter) packed with neutral aluminium oxide (100-200 mesh, 3 g), elute with 70 ml of dilute ethanol TS, and collect the eluates. Evaporate to dryness and dissolve the residue in 50% methanol, transfer to a 25 ml volumetric flask and dilute to volume, mix well, filter, use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 1.2 mg of forsythin ($C_{29}H_{36}O_{15}$) per pack, referred to Fructus Forsythiae.

Action To clear *heat* to relieve *toxicity*, and disperse wind to release the exterior.

Indications Upper respiratory tract infection, acute tonsillitis and pharyngolaryngitis due to affliction from external *wind-heat* and excessive *heat* with manifestations of fever and swollen painful throat.

Usage and dosage 1-2 packs, 3 times a day, taken with boiled water.

Strength (1) 18 g per pack
(2) 4.5 g per pack (without sucrose)

Storage Preserve in tightly closed containers.

Gegen Qinlian Pian
(葛根芩连片)

Gegen Qinlian Tablets

Ingredients Radix Puerariae Lobatae 1000 g; Radix Scutellariae 375 g; Rhizoma Coptidis 375 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 250 g.

Procedure Pulverize 225 g of Radix Puerariae Lobatae to fine powder. Decoct remained Radix Puerariae Lobatae and Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle with water for 2 times, 2 hours each, combine the decoctions and filter, concentrate the filtrate properly. Carry out the method for percolation as described under liquid extracts and extracts (Appendix I O), macerate Radix Scutellariae and Rhizoma Coptidis respectively with 50% ethanol and percolate. Collect the percolation, recover ethanol, then combine with the above concentrated solution, further concentrate to a thick extract. Add finely powdered Radix Puerariae Lobatae, mix well and dry. Prepare granules and make to 1000 tablets.

Description Dark yellow tablets; odour, slight; taste, bitter.

Identification (1) To 2 tablets, pulverized to powder, add 10 ml of methanol, ultrasonicate for 15 minutes, filter. Dilute 1 ml of the filtrate with methanol to 5 ml as the test solution. To 0.1 g of Rhizoma Coptidis reference drug, add 10 ml of methanol, ultrasonicate for 15 minutes, filter and use the filtrate as the reference drug solution. Dissolve a quantity of berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate, isopropanol, methanol and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately 1 μl of each of the above three solutions to the plate. After developing in a chamber pre-equilibrated with ammonia vapour for 15 minutes and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.
(2) To 4 tablets, in fine powder, add 25 ml of ethyl acetate, ultrasonicate for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of methanol as the test solution. Dissolve a quantity of puerarin CRS in dehydrated ethanol to produce reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of chloroform, methanol and water (28 : 10 : 1) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air, expose to ammonia vapour for 15 minutes and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot in the chromatogram obtained with the reference solution.
(3) To 4 tablets, in fine powder, add 30 ml of methanol, heat under reflux for 30 minutes, filter and evaporate the residue to dryness. Dissolve the residue in 10 ml of water, add hydrochloric acid to adjust pH to 3-3.5. Extract with two 10-ml quantities of ethyl acetate, combine the extracts, evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of baicalin CRS in methanol to produce a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G mixed with sodium carboxymethyl cellulose containing 4% solution of sodium acetate as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with a 2% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix I D).

Action To release muscles and clear *heat*, and stop diarrhea and dysentery.

Indications Diarrhea and dysentery due to accumulation of *damp-heat* with manifestations of fever, excessive thirst, fetid dysentery and abdominal pain and discomfort.

Usage and dosage 3-4 tablets, 3 times a day.

Storage Preserve in tightly closed containers.

Gegen Qinlian Wan
(葛根芩连丸)

Gegen Qinlian Pills

Ingredients Radix Puerariae Lobatae 1000 g; Radix Scutellariae 375 g; Rhizoma Coptidis 375 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 250 g.

Procedure Carry out the method for percolation described under liquid extracts and extracts (Appendix I O), macerate Radix Scutellariae and Rhizoma Coptidis in 50% ethanol for 24 hours and then percolate. Recover ethanol from the percolation and concentrate properly. Decoct Radix Puerariae Lobatae for 30 minutes, then add the residues of Radix Scutellariae and Rhizoma Coptidis, and Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle, decoct twice, each 1.5 hours. Combine the decoctions, filter, concentrate the filtrate to a quantity, add the above concentrated

percolate and continually concentrate to a thick extract. Dry in vacuum at a low temperature, pulverize to super fine powder, moisten with ethanol and make to 300 g of pills, sift and dry below 60℃.

Description Dark brown to blackish concentrated pills; odour, slight; taste, bitter.

Identification (1) To 0.5 g of fine powder add 40 ml of ethanol, heat under reflux for 30 minutes, filter. Evaporate the filtrate to dryness, dissolve the residue in 15 ml of 0.3% solution of sodium hydroxide, transfer the solution into a separating funnel, adjust pH to 5-6 with dilute hydrochloric acid and extract with 15 ml of ethyl acetate by shaking. Separate and dehydrate the ethyl acetate layer with anhydrous sodium sulfate, evaporate the filtrate to dryness, dissolve the residue in 2 ml ethyl acetate, filter, use the filtrate as the test solution. Dissolve a quantity of puerarin CRS in dehydrated ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography using silica gel G as the coating substance and a mixture of chloroform and methanol (4 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of reference solution to the plate. After developing and removal of the plate, dry in air, expose to ammonia vapour for 15 minutes, examine under ultraviolet light at 365 nm. The blue fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.
(2) Pulverize 1 g of the pills, and grind well with 1.5 g of kieselguhr. Heat under reflux for 30 minutes with 40 ml of methanol, filter, evaporate the filtrate to dryness. Dissolve the residue in 15 ml of water, filter, adjust pH to 3.0-3.5 with dilute hydrochloric acid TS. Extract with two 20-ml quantities of ethyl acetate by shaking, combine the extracts, and evaporate to dryness. Dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Dissolve a quantity of baicalin CRS in dehydrated ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of *n*-butyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately 5-10 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 1% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Pulverize 1 g of the pills, heat under reflux for 30 minutes with 40 ml of methanol, cool and filter, evaporate the filtrate to dryness. Dissolve the residue in 2 ml of dehydrated ethanol as the test solution. Dissolve a quantity of berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed wtih sodium carboxymethyl cellulose as the coating substance and a mixture of toluene, ethyl acetate, methanol, isopropanol and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately 1-2 μl of each of the test solution and the reference solution to the plate. After developing in a chamber pre-equilibrated with ammonia vapour and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, acetonitril and water (6 : 8 : 86) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of puerarin.

Reference solution Dissolve a quantity of puerarin CRS, accurately weighed, in methanol to produce a solution containing 60 μg per ml as the reference solution.

Test solution Weigh accurately 0.3 g of the pills, obtained in the test of weight variation and triturated to fine powder, to a stopper conical flask, accurately add 50 ml of methanol, tightly stopper and weigh. Heat under reflux for 1 hour, cool and weigh again, replenish the lost weight with methanol, shake thoroughly and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 4.5 mg of puerarin ($C_{21}H_{20}O_9$) per gram, referred to Radix Puerariae Lobatae.

Action To expel pathogenic factors from the muscles and skin, clear *heat* to reduce *toxicity* and drain *dampness* to stop diarrhea.

Indications Diarrhea, abdominal pain, yellow and sticky stools, burning sensation in the anus due to accumulation of *damp-heat*; common cold due to *wind-heat* with manifestations of fever, aversion to *wind*, headache and general pain.

Usage and dosage 3 g, 1 g for children, 3 times a day, or follow doctor's advice.

Strength 1 g per pack

Storage Preserve in tightly closed containers.

Gejie Dingchuan Wan
(蛤蚧定喘丸)

Gejie Dingchuan Pills

Ingredients Gecko 11 g; Semen Trichosanthis 50 g; Radix et Rhizoma Asteris 75 g; Herba Ephedrae 45 g; Carapax Trionycis (processed with vinegar) 50 g; Radix Scutellariae 50 g; Radix et Rhizoma Glycyrrhizae 50 g; Radix Ophiopogonis 50 g; Rhizoma Coptidis 30 g; Bulbus Lilli 75 g; Fructus Perillae (stir-baked) 25 g; Gypsum Fibrosum 25 g; Semen Armeniacae Amarum (stir-baked) 50 g; Gypsum Fibrosum (calcined) 25 g.

Procedure Pulverize the above fourteen ingredients to fine powder, sift and mix well. To each 100 g of the powder add 10-25 g of refined honey and a quantity of water, make water-honeyed pills and dry. Alternatively, add 70-100 g of refined honey to make small honeyed pills or big honeyed pills.

Description Brown to brownish-black water-honeyed pills, blackish-brown small honeyed pills or big honeyed pills; odour, slight; taste, bitter and sweet.

Identification (1) Microscopical: Stomata characteristic, guard cells dumbbell-shaped in lateral view. Muscle fibres pale yellow, with fine and dense transverse striations in parallel and sinuous form, and arranged in light and dark alternately. Fibres pale yellow, fusiform, with thickened walls and fine pit-canals. Bast fibres bundles bright yellow,

with slightly thickened walls and distinct pits; stone cells bright yellow.

(2) Grind well 2 g of small or big honeyed pills, cut into pieces, with 1 g of kieselguhr, or pulverize 1.3 g of the water-honeyed pills, apply to a column (20 mm in diameter) packed with aluminium oxide (100-200 mesh, 5 g), elute with 50 ml of dehydrated ethanol. Collect the eluate evaporate to dryness, dissolve the residue in 2 ml of ethanol, filter and use the filtrate as the test solution. To 50 mg of Rhizoma Coptidis reference drug, add 5 ml of methanol, ultrasonicate for 15 minutes, filter and use the filtrate as the reference drug solution. Dissolve a quantity of berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and strong ammonia (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately 1-2 μl of each of the above three solutions to the plate. After developing in a chamber pre-equilibrated with ammonia vapour and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

(3) To 3 g small or big honeyed pills, cut into pieces and grind well with 1.5 g of kieselguhr, or pulverize 2 g of the water-honeyed pills; add 15 ml of 50% methanol, ultrasonicate for 20 minutes. Filter, evaporate the filtrate to dryness, add 5 ml of methanol to dissolve the residue as the test solution. Dissolve a quantity of baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and the upper layer of a mixture of ethyl acetate, butanone, acetate acid and water (10 : 7 : 5 : 3) as the mobile phase. Apply separately 4 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution; spray with 5% ferric chloride in ethanol acidified with hydrochloric acid, the colour of the corresponding spot turns to greyish-brown.

(4) Grind well 9 g of small or big honeyed pills, cut into pieces, with 5 g of kieselguhr, or pulverize 6 g of the water-honeyed pills; move to a stopper conical flask, add 30 ml of ether and 1 ml of concentrated ammonia, stand for 2 hours, and shake constantly. Filter, wash the drug residue with three 20-ml quantities of ether and filter. Combine the filtrates, add 1 ml of the mixture of hydrochloric acid and ethanol (1→20), mix well, evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of ephedrine hydrochloride CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of chloroform, methanol and concentrated ammonia TS (40 : 7 : 1) as the mobile phase. Apply separately 4 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with ninhydrin TS, heat at 80℃ to spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (45 : 55 : 0.2) as the mobile phase. As detector a spectrophotometer set at 276 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of baicalin.

Reference solution Dissolve a quantity of baicalin CRS, accurately weighed, in 70% ethanol to prepare a solution containing 50 μg per ml as the reference solution.

Test solution Pulverize 0.5 g of the water-honeyed pills to fine power, weighed accurately, or cut 0.8 g of the small honeyed pills or 0.8 g of the big honeyed pills obtained in the test of weight variation into pieces, weighed accurately, to a 100 ml stopper conical flask accurately add 50 ml of 70% ethanol, and weigh. After macerate warmly for 1 hour, heat under reflux for 30 minutes, cool and weigh again, replenish the lost weight with 70% ethanol, shake thoroughly and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 3.0 mg of baicalin ($C_{21}H_{18}O_{11}$) per gram for water-honeyed pills, and 3.3 mg per gram for small honeyed pills, and 30.0 mg per big honeyed pill, referred to Radix Scutellariae.

Action To nourish *yin* and clear the lung, and relieve coughing and asthma/dyspnea.

Indications Cough resulting from consumption, shortness of breath, fullness in the chest, spontaneous perspiration or night sweat due to deficiency in the lung and kidney or excessive *lung-heat* caused by *yin* deficiency.

Usage and dosage 5-6 g of water-honeyed pills, 9 g of small honeyed pills or 1 big honeyed pill, twice a day.

Strength 9 g per 60 small honeyed pills, 9 g per big honeyed pill

Storage Perserve in tightly closed containers.

Gengnian'an Pian (更年安片)

Gengnian'an Tablets

Ingredients Radix Rehmanniae; Rhizoma Alismatis; Radix Ophiopogonis; Radix Rehmanniae Praeparata; Radix Scrophulariae; Poria; Rhizoma Curculiginis; Magnetitum; Cortex Moutan; Concha Margaritifera; Fructus Schisandrae Chinensis seu Fructus Schisandrae Sphenantherae; Caulis Polygoni Multiflori; Radix Polygoni Multiflori Praeparata Cum Succo Glycines Sotae; Fructus Tritici Levis; Ramulus Uncariae cum Uncis.

Procedure Pulverize Fructus Tritici Levis, Magnetitum and Concha Margaritifera to fine powder and sift for latter use. Decoct Radix Rehmanniae, Radix Rehmanniae Praeparata, Radix Scrophulariae, Poria, Rhizoma Curculiginis and Radix Ophiopogonis twice with water (3 hours, 2 hours respectively) and filter. Concentrate the filtrate to a thin extract with a relative density of 1.20. To Fructus Schisandrae Chinensis seu Fructus Schisandrae Sphenantherae, Caulis Polygoni Multiflori, Radix Polygoni

Multiflori Praeparata Cum Succo Glycines Sotae, Rhizoma Alismatis, Cortex Moutan and Ramulus Uncariae cum Uncis, carry out the method for percolation described under liquid extracts and extracts (Appendix I O), using 60% ethanol as solvent to take percolating. Recover ethanol from the percolation, concentrate to a thin extract with a relative density of 1.20. Mix well the above two thin extracts and the fine powder, make to coarse granules, dry, pulverize and sift. Make granules and dry at a low temperature, sift, add magnesium stearate, mix well, make to tablets and coat with sugar.

Description Sugar coated tablets with blackish-grey core; taste, sweet.

Identification (1) Remove the sugar coats of 20 tablets, pulverize, and heat under reflux with 30 ml of chloroform on a water bath for 90 minutes. Filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 0.5 g of Fructus Schisandrae reference drug in the same manner as the reference drug solution. Dissolve a quantity of deoxyschizandrin CRS in chloroform to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel GF_{254} as the coating substance and the upper layer of a mixture of petroleum ether (30-60 ℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 4 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution.
(2) Remove the sugar coats of 16 tablets, pulverize, heat under reflux with 100 ml of methanol on a water bath for 1 hour, filter, and evaporate the filtrate to dryness. Dissolve the residue in 10 ml of water, add 2 ml of hydrochloric acid, heat on a water bath for 30 minutes, cool immediately and extract with two 20-ml quantities of ether. Combine the ether extracts, evaporate to dryness, dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 1.5 g of Radix Polygoni Multiflori reference drug in the same manner as the reference drug solution. Dissolve a quantity of emodin and physcion CRS in methanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B) using silica gel G mixed with 0.5% solution of sodium hydroxide as the coating substance and a mixture of toluene, ethyl acetate and formic acid (15 : 2 : 1) as the mobile phase. Apply separately 2 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution. The colour of the spots turns to red on exposure to ammonia vapour.

Other requirements Comply with the general requirements for tablets (Appendix I D).

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, water and glacial acetic acid (60 : 40 : 1) as the mobile phase. As detector a spectrophotometer set at 437 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference of the peak of emodin.

Reference solution Dissolve a quantity of emodin CRS, accurately weighed, in methanol to produce a solution containing 12.5 μg per ml as reference solution.

Test solution Take 20 tablets, removed the coats, weigh accurately and grind to fine powder. Place 5 g of the fine powder, weighed accurately, in a stopper conical flask, add accurately 50 ml of methanol, closely stopper and weigh accurately. Heat under reflux for 30 minutes, allow to cool, weigh accurately again, replenish the lost weight with methanol, stir well and filter. Measure accurately 25 ml of the successive filtrate, concentrate in vacuum to dryness. To the residue add 20 ml of water, 2 ml of hydrochloric acid, and 20 ml of chloroform, heat under reflux for 30 minutes and allow to cool. Separate the chloroform layer and extract again with three 10-ml quantities of chloroform. Combine the chloroform solutions, concentrate in vacuum to dryness. Transfer the residue with methanol to a 25 ml volumetric flask, dilute with methanol to volume and mix well, filter, and use the successive filtrate as the test solution.

Procedures Inject accurately 20 μl of each of the reference solution and test solution into the column, and calculate the content.
It contains not less than 25 μg of emodin ($C_{15}H_{10}O_5$) per tablet.

Action To nourish *yin* and clear *heat*, relieve restlessness and anchor the mind.

Indications Syndromes around menopause due to a deficiency of *kidney-yin* with manifestations of tidal sweating, dizziness, tinnitus, feverish feeling in palms and soles, restlessness; menopausal syndrome with above symptoms.

Usage and dosage 6 tablets, 2-3 times a day.

Storage Preserve in tightly closed containers.

Gentongping Keli (根痛平颗粒)

Gentongping Granules

Ingredients Radix Paeoniae Alba 200 g; Radix Puerariae Lobatae 50 g; Semen Persicae (rinsed in boiling water) 50 g; Flos Carthami 50 g; Olibanum (stir-baked with vinegar) 50 g; Myrrha (stir-baked with vinegar) 50 g; Radix Dipsaci 75 g; Rhizoma Cibotii (scalded) 75 g; Herba Lycopodii 75 g; Radix Achyranthis Bidentatae 50 g; Radix Rehmanniae 50 g; Radix et Rhizoma Glycyrrhizae 25 g.

Procedure Decoct the above twelve ingredients with water 3 times, one and half hours for the first time, 1 hour for the second and third time; filter, combine the filtrate; concentrate the filtrate in vacuum to an appropriate amount. Add a quantity of sucrose and dextrin, mix thoroughly, and dry; pulverize to fine powder, make granules, dry and make to 1000 g. Or add a quantity of dextrin and 3.3 g of stevioside, mix thoroughly, make granules, dry and make to 650 g.

Description Brown or dark brown granules; odour, aromatic; taste, sweet and slightly bitter.

Identification (1) Heat under reflux 2 g of the granules (with sucrose) or 1.4 g of the granules (without sucrose), with 30 ml ethanol for 1 hour; filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of paeoniflorin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of chloroform, ethyl

acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) Dissolve a quantity of puerarin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (14 : 5 : 0.5) as the mobile phase. Apply separately 10 μl of each of the reference solution and the test solution, obtained under Identification (1), to the plate. After developing and removal of the plate, dry in air. Spray with 0.5% solution of sodium hydroxide, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilance bonded silica gel as the stationary phase and a mixture of isopropanol, methanol, acetic acid and water (1 : 23 : 1 : 75) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, accurately weighed, in methanol to produce a solution containing 50 μg per ml.

Test solution Triturate a quantity of granules, obtained under the test of weight variation, to fine powder. Weigh accurately 1 g (with sucrose) or 0.7 g (without sucrose) of the granules, place to a stopper conical flask, add accurately 25 ml methanol, stopper tightly and weigh; heat under reflux for 2 hours, allow to stand to cool, weigh again; replenish the lost weight with the methanol and mix well. Filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 9.6 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per pack, referred to Radix Paeoniae Alba.

Action To promote blood circulation, dredge meridians to kill pain.

Indications Cervical spondylopathy and disorders of lumbar vertebrae due to blockage of meridians by *wind-cold* with manifestations of pain in the immobilized shoulders and neck and numb arms.

Usage and dosage 1 pack, twice a day; taken with boiled water after meals; or follow doctor's advice.

Precaution Take it after meals as it mildly irritates the stomach and intestine tract. It is forbidden to prescribe to pregnant women.

Strength (1) 12 g per pack (with sucrose)
(2) 8 g per pack (without sucrose)

Storage Preserve in tightly closed containers.

Gonglao Quhuo Pian
(功劳去火片)

Gonglao Quhuo Tablets

Ingredients Caulis Mahoniae 604 g; Cortex Phellodendri Chinensis 302 g; Radix Scutellariae 302 g; Fructus Gardeniae 302 g.

Procedure Pulverize 100 g of Cortex Phellodendri Chinensis to fine powder. Decoct the remained portion of Cortex Phellodendri Chinensis and Caulis Mahoniae three times, each 2 hours, combine the decoctions, filter, and concentrate the filtrate to a thick extract. Decoct Radix Scutellariae and Fructus Gardeniae twice, each 2 hours, combine the decoctions, filter, and concentrate the filtrate to a thick extract. Add the fine powder of Cortex Phellodendri Chinensis to the above two thick extracts respectively, mix well, dry and pulverize to fine powder. Mix well the two fine powder to make granules, make to 1000 tablets, coat with sugar; or make to 600 tablets, and coat with film.

Description Sugar coated or film coated tablets with brownish-yellow to brown core; taste, bitter.

Identification (1) Microscopical: Fibre bundles bright yellow, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres, walls of crystal cells lignified and thickened.
(2) Pulverize 5 tablets, removed the coats, ultrasonicate 0.6 g of the powder with 10 ml of ethanol for 15 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in 15 ml of water, adjust pH to 2-3 with hydrochloric acid, and extract by shaking with two 10-ml quantities of ethyl acetate, combine the ethyl acetate extracts, evaporate to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Dissolve a quantity of baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of ethyl acetate, acetone, acetic acid and water (10 : 4 : 5 : 3) as the mobile phase. Apply separately 3-5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and spray with a 2% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Grind 5 tablets, removed the coats, to fine powder, extract 0.6 g with 10 ml of ethanol under reflux for 10 minutes. Allow to cool, filter, and use the filtrate as the test solution. Dissolve a quantity of geniposide CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform and methanol (7 : 2) as the mobile phase. Apply separately 5-10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and spray with a solution of sulfuric acid and ethanol (5→10), heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tables (Appendix Ⅰ D).

Assay Carry out the method of high performance liquid

chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use the octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, water, glacial acetic acid and triethylamine (34 : 64 : 1 : 1) as the mobile phase. As detector a spectrophotometer set at 265 nm. Maintain the column temperature at 30℃. The number of the theoretical plates of the column is not less than 4000, calculated with the reference to the peak of berberine hydrochloride.

Reference solution Dissolve a quantity of berberine hydrochloride CRS, accurately weighed, in methanol to produce a solution containing 30 μg per ml as the reference solution.

Test solution Weigh accurately 10 tablets with coating removed, grind well, weigh accurately 0.1 g in a stopper conical flask, add accurately 50 ml of a mixture of hydrochloric acid and 60% methanol (1 : 100), stopper tightly and weigh. Heat on a water bath at 70℃ for 45 minutes, allow to cool, weigh again, replenish the lost weight with methanol, shake well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 1.5 mg of berberine hydrochloride ($C_{20}H_{18}ClNO_4$) per sugar coated tablets, or 2.5 mg per film coated tablet, referred to Cortex Phellodendri Chinensis and Caulis Mahoniae.

Action To clear *heat* and *toxicity*.

Indications Acute pharyngitis, cholecystitis and enteritis due to excessive *heat* and *fire*.

Usage and dosage 5 sugar-coated tablets or 3 film-coated tablets, 3 times a day.

Precaution It is only for the syndrome of abundant *heat* in the *triple energizer* due to excessive heat and *fire-toxicity*. Be cautious about patients with cold in a deficiency condition, and it is forbidden to prescribe to patients with severe deficiency and cold.

Strength 0.5 g per film-coated tablet

Storage Preserve in tightly closed containers.

Gongxuening Jiaonang (宫血宁胶囊)

Gongxuening Capsules

Gongxuening Capsules are prepared from Rhizoma Paridis.

Procedure Pulverize 2000 g of Rhizoma Paridis to coarse powder, heat under reflux with 4 volume of 70% ethanol for three times, 5 hours for the first time, 4 hours for the second, and 3 hours for the third. Combine the extract, filter, and recover solvent in vacuum to a thick extract. Dissolve the extract, filter separation with ceramic film (0.2 μm), dialysis wash appropriately, and dry the film closure solution by spraying. Sift dry extract through No. 5 sieve, add a quantity of adjuvant, mix thoroughly, and make to 1000 capsules.

Description Capsules with content of pale yellowish brown to grayish brown powder; taste, bitter.

Identification Dissolve 0.13 g of the content with 10 ml of water in a separator, extract with 10 ml of *n*-butanol, wash the extract with 5 ml of water, evaporate to dryness on a water bath, and dissolve the residue with 1 ml of methanol as the test solution. Dissolve a quantity of Chonglou saponin Ⅵ CRS and Chonglou saponin Ⅶ CRS in methanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, ethyl acetate, methanol and water (5 : 4 : 3 : 0.6) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol and heat at 100℃ to spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (45 : 55) as the mobile phase. As detector a spectrophotometer set at 203 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of Chonglou saponin Ⅵ.

Reference solution Dissolve a quantity of Chonglou saponin Ⅵ CRS, weighed accurately, in methanol to produce a solution containing 0.4 mg of per ml.

Test solution Pulverize the content of 20 capsules to fine powder, weigh accurately 1 g in a stoppered conical flask, add accurately 25 ml of methanol, and weigh. Ultrasonicate (power, 250 W; frequency, 25 kHz) for 40 minutes, stand to cool, weigh again, replenish the lost weight with dilute ethanol, and mix thoroughly. Filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.52 mg of Chonglou saponin Ⅵ ($C_{39}H_{62}O_{13}$) per capsule.

Action To cool blood to arrest bleeding, clear *heat* and *dampness*, and resolve stagnated blood to kill pain.

Indications Metrorrhagia and metrostaxis, menorrhagia, hemorrhage due to uterine atony after childbirth or abortion, dysfunctional uterine bleeding due to excessive *heat* in blood, or pain in the lower abdomen, lumbar and sacral regions, and leukorrheal disease due to accumulation of *damp-heat* in chronic pelvic inflammatory disease.

Usage and dosage Hypermenorrhea or dysfunctional uterine: 1-2 pills each time, 3 times a day; cease medication when the bleeding is stopped. Chronic pelvic inflammation: 2 pills each time, 3 times a day. 4 weeks making one course of treatment.

Strength 0.13 g per capsule

Storage Preserve in tightly closed container.

Goupi Gao
(狗皮膏)

Goupi Plaster

Ingredients Radix Aconiti 80 g; Radix Aconiti Kusnezoffii 40 g; Rhizoma et Radix Notopterygii 20 g; Radix Angelicae Pubescentis 20 g; Caulis Sinomenii 30 g; Cortex Periplocae 30 g; Radix Saposhnikoviae 30 g; Radix Smilacis 30 g; Rhizoma Atractylodis 20 g; Fructus Cnidii 20 g; Herba Ephedrae 30 g; Rhizoma Alpiniae Officinarum 9 g; Fructus Foeniculi 20 g; Cortex Ramuli Cinnamomi 10 g; Radix Angelicae Sinensis 20 g; Radix Paeoniae Rubra 30 g; Fructus Chaenomelis 30 g; Lignum Sappan 30 g; Radix et Rhizoma Rhei 30 g; Nodum Pini 30 g; Radix Dipsaci 40 g; Rhizoma Chuanxiong 30 g; Radix Angelicae Dahuricae 30 g; Olibanum 30 g; Myrrha 34 g; Borneolum Syntheticum 17 g; Camphora 34 g; Flos Caryophylli 17 g; Cortex Cinnamomi 11 g.

Procedure Pulverize Olibanum, Myrrha, Flos Caryophylli and Cortex Cinnamomi to fine powder respectively, triturate with the powder of Camphora and Boneolum Syntheticum, sift, mix well. Break all the other ingredients to small pieces, deep-fry with 3495 g of edible vegetable oil, discard the residue, filter, concentrate the oily filtrate until it condenses to pills on dripping. Add 1040-1140 g of Plumbi Oxydum Flavum to the oil, stir well to make plaster and soak it in water. Melt the plaster by gentle heat, add the above powders, stir well and spread on beast-skin or cloth.

Description A black plaster spread on the beast-skin or the cloth.

Other requirements Comply with the general requirements for plasters (Appendix Ⅰ P).

Action To expel *wind* and *cold*, and promote blood circulation to kill pain.

Indications Obstruction of *qi* due to invasion by *wind*, *cold* and *dampness*, and stagnation of *qi* and blood, with manifestations of numbness of the limbs, lower back and leg pain, muscular spasm, or traumatic injury, lumbar sprain, local swelling with pain; cold pain in the stomach and abdomen, dysmenorrhea, morbid leukorrhea or abdominal masses due to retention of *cold* and *dampness*.

Usage and dosage Soften the plaster by heat and apply it to the affected area.

Precaution It is forbidden to apply it to the lower back or abdomen of pregnant women.

Strength Net weight per piece: (1) 12 g (2) 15 g (3) 24 g (4) 30 g

Storage Preserve in well closed containers, stored in a cool and dry place.

Granules Clinopodii
(断血流颗粒 Duanxueliu Keli)

Chinese Clinopodium Granules

Chinese Clinopodium Granules are the granules prepared form Herba Clinopodii.

Procedure Decoct 1200 g of the sections of Herba Clinopodii with water for 2 times, 1.5 hours for the each time. Combine the decoctions, filter, and concentrate the filtrate to form a thin extract with a relative density of 1.15 (80℃), add ethanol to a content of 63% ethanol, stand for 24 hours, mix thoroughly, recover the solvent and concentrate the supernatant to a thin extract with a relative density of 1.25 (80℃). Add a quantity of sucrose, dextrin and stevioside, into the thin extract and mix well, make granules, dry, make to 1000 g of granules.

Description Brownish-yellow to drak brown granules; taste, sweet and slightly bitter.

Identification (1) Pulverize 2 g of the granules, ultrasonicate for 15 minutes with 40 ml of methanol and filter. Evaporate the filtrate to dryness, dissolve the residue in 2 ml of methanol. Apply to a column (1 cm in internal diameter) packed with neutral aluminium oxide (100-200 mesh, 10 g). Elute with 60 ml of 40% methanol, collect the 40% methanol eluate. Evaporate to dryness and dissolve the residue in 30 ml of water, extract with two 20-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extracts and evaporate to dryness, and dissolve the residue in 5 ml of methanol as the test solution. Dissolve a quantity of buddlejasaponin Ⅳb CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol, glacial acetic acid and water (7 : 3 : 1 : 0.5) as the mobile phase. Apply separately 1 μl of the test solutions and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 1% sulfuric acid in ethanol and heat at 110 ℃ to the spots clear. Examine in daylight. The violet-blue spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. Examine under ultraviolet light at 365 nm. The brownish-red fluorescent spot in the chromatogram with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (80 : 20) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of the theoretical plates of the column is not less than 3000, calculated with the reference to the peak of buddlejasaponin Ⅳb.

Reference solution Dissolve a quantity of buddlejasaponin Ⅳb CRS, accurately weighed, in methanol to produce a solution containing 10 μg per ml.

Test solution Pulverize granules, obtained under the test of packing variation, to fine powder. Weigh accurately 0.5 g of the above powder, add 30 ml of methanol, ultrasonicate (power, 220 W; frequency, 50 kHz) for 15 minutes, filter. To the drug residue, add 30 ml of methanol, ultrasonicate for 15 minutes, and filter. Combine the filtrates, evaporate to dryness, dissolve the residue in 30 ml of water, transfer to a separator funnel, extract with four 20-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extract and wash with 30 ml of ammonia TS saturated with *n*-butanol and wash successive with two 30-ml quantities of water saturated with *n*-butanol. Separate the *n*-butanol extract, evaporate to dryness, dissolve the residue in methanol, and transfer to a 50 ml volumetric flask. Dilute with methanol to volume, mix well, and filter. Use the

successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 7.0 mg of buddlejasaponin Ⅳb ($C_{48}H_{78}O_{18}$) per pack, referred to Herba Clinopodii.

Action To cool blood and arrest bleeding.

Indications Hypermenorrhea, metrorrhagia and metrostaxis, hematemesis, epistaxis, hemoptysis, hematuria and hematochezia marked by bright red or purple dysfunctional; uterine bleeding, bleeding due to hysteromyoma and various kinds of bleeding, simple purpura and primary thrombocytopenic purpura with above symptoms.

Usage and dosage 1 pack, once a day.

Strength 10 g per pack

Storage Preserve in tightly closed containers.

Guanxin Danshen Jiaonang (冠心丹参胶囊)

Guanxin Danshen Capsules

Ingredients Radix et Rhizoma Salviae Miltiorrhizae 200 g; Radix et Rhizoma Notoginseng 200 g; Oleum Lignum Dalbergiae Odoriferae 1.75 ml.

Precedure Pulverize Radix et Rhizoma Notoginseng to fine powder. Pulverize Radix et Rhizoma Salviae Miltiorrhizae to medium powder, carry out the method of percolation as described under liquid and extracts (Appendix Ⅰ O), percolate with 90% ethanol, collect 1400 ml of percolation, recover ethanol, and concentrate to a thick extract. Decoct the drug residue with water for two times, one hour for each, combine the decoction, filter, and concentrate to a quantity. Add the fine powder of Radix Notoginseng, the thick extract and a quantity of starch, mix thoroughly, and make granules. Dry, add Oleum Lignum Dalbergiae Odoriferae, mix thoroughly, and make to 1000 capsules.

Description Capsules with content of brown yellow to brown granules and powder; odour, slightly aromatic; taste, sweet, slightly bitter.

Identification (1) Macerate 1.5 g of the content with 5 ml of methanol for 10 minutes, shake constantly, filter, and use the filtrate as the test solution. Prepare a solution of 1 g of Radix et Rhizoma Notoginseng reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 ∶ 3 ∶ 1 ∶ 1) as the mobile phase. Apply separately 5-10 μl of the test solution and 5 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol and heat to spots distinct. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(2) Carry out the method of preparation of test solution as described under Identification (1), prepare separately two solutions with 1 g of Radix et Rhizoma Salviae Miltiorrhizae reference drug and 0.5 g of Lignum Dalbergiae Odoriferae reference drug as the reference drug solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (8 ∶ 3) as the mobile phase. Apply separately 5-10 μl of the test solution obtained under Identification (1) and the above reference drug solutions to the plate. After developing and removal of the plate, and dry in air. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with Radix et Rhizoma Salviae Miltiorrhizae reference drug solution. Spray with 1% vanillin in sulfuric acid, heat to spots distinct. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with Lignum Dalbergiae Odoriferae reference drug solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (75 ∶ 25) as the mobile phase. As detector a spectrophotometer set at 270 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of tanshinone ⅡA.

Reference solution Dissolve a quantities of tanshinone ⅡA CRS, weighed accurately, in an amber volumetric flask, with methanol to produce a solution containing 20 μg of per ml.

Test solution Pulverize the granules, obtained under the test of packing variation, to fine powder, weigh accurately 1 g in a stopper conical flask, add accurately 50 ml of methanol, stopper, weigh, ultrasonicate (power, 250 W; frequency, 33 kHz) for 20 minutes, allow to cool, weigh again, replenish the lost weight with methanol, and mix thoroughly. Filter, and use the filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 0.3 mg of tanshinone ⅡA ($C_{19}H_{18}O_3$) per capsule, referred to Radix et Rhizoma Salviae Miltiorrhizae.

Action To promote blood circulation to resolve stagnated blood and regulate *qi* flow to kill pain.

Indications Impeded flow of *yang-qi* in the chest due to stagnation of *qi* and blood with manifestations of constriction and stabbing pain in the chest, palpitation and shortness of breath; angina pectoris in coronary heart disease with above symptoms.

Usage and dosage 3 capsules, 3 times a day.

Strength 0.3 g per capsule

Storage Preserve in tightly closed container.

Guanxin Danshen Pian (冠心丹参片)

Guanxin Danshen Tablets

Ingredients Radix et Rhizoma Salviae Miltiorrhizae 200 g; Radix et Rhizoma Notoginseng 200 g; Oleum Dalbergiae Odoriferae 1.75 ml.

Procedure Pulverize the Radix et Rhizoma Notoginseng to fine powder. Pulverize the Radix et Rhizoma Salviae Miltiorrhizae to powder, carry out the percolation as described under the liquid extracts and extract (Appendix Ⅰ O), use 90% ethanol as the solvent, concentrate the percolate to a thick extract. Decoct the residue with water

twice, each for 1 hour, combine the decoctions, filter. Concentrate the filtrate to an appropriate quantity, add the above fine powder of the Radix et Rhizoma Notoginseng, thick extract, and an appropriate quantity of excipient, mix, make granules and dry. Add Oleum Dalbergiae Odoriferae, mix well, make to 1000 tablets and coat with sugar.

Description Sugar coated tablets with brown core; odour, slightly aromatic; taste, sweet, slightly bitter.

Identification (1) Macerate 5 tablets, removed sugar coats and pulverized to fine podwer, in 5ml methanol for 10 minutes, shake constantly. Filter and use the filtrate as the test solution. Prepare a solution of 1 g of Radix et Rhizoma Notoginseng reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellous as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately 5-10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 1% vanillin solution in sulfuric acid, heat to spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(2) To 1 g of Radix et Rhizoma Salviae Miltiorrhizae reference drug and 0.5 g of Lignum Dalbergiae Odoriferae reference drug, carry out the method as described under Identification (1) of the test solution preparation, prepare separately two kinds of solutions as the reference drug solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethyl cellous as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (8 : 3) as the mobile phase. Apply separately 5-10 μl of each of the test solution obtained under Identification test (1) and the two reference drug solutions to the plate. After developing and removal of the plate, dry in air. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with Radix Salviae Miltiorrhizae reference drug solution. Spray with 1% solution of vanillin in sulfuric acid, heat to spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with Lignum Dalbergiae Odoriferae reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Action To promote blood circulation to resolve stagnated blood, and regulate *qi* flow to kill pain.

Indications Impeded flow of *yang-qi* in the chest due to stagnation of *qi* and blood with manifestations of constriction and stabbing pain in the chest, palpitation and shortness of breath; angina pectoris in coronary heart disease with above symptoms.

Usage and dosage 3 tablets, 3 times a day.

Storage Preserve in tightly closed containers.

Guanxin Suhe Wan
(冠心苏合丸)

Guanxin Suhe Pills

Ingredients Styrax 50 g; Borneolum Syntheticum 105 g; Olibanum (processed) 105 g; Lignum Santali Albi 210 g; Radix Inulae 210 g.

Procedure Pulverize the above ingredients, except Styrax and Borneolum Syntheticum, to fine powder, sift; pulverize Borneolum Syntheticum to fine powder, mix well with the powder of the above three ingredients and sift. To a quantity of refined honey, heat gently, add Styrax, stir well, mix with the above powder to make to 1000 pills or pulverize Borneolum Syntheticum to fine power, mix well with the fine powder of a mixture of Olibanum (processed), Lignum Santali Albi and Radix Inulae to make pill cores. To the pill cores, add the remnant fine powder, Styrax, and a quantity of refined honey to make to 1000 pills.

Description Dark brown to brown big honeyed pills; odour, aromatic; taste, bitter and cool.

Identification (1) Microscopical: Crystal cells square or rectangular, walls thickened, lignified, lumina containing prisms of calcium oxalate.
(2) Cut two pills into pieces, add 50 ml of ether, ultrasonicate for 20 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ether and apply to a column (1.5 cm in diameter) packed with neutral aluminium oxide (100-200 mesh, 8 g), elute with 80 ml of ether, and collect the eluates. Evaporate to dryness on a water bath and dissolve the residue in petroleum ether (60-90℃) as the test solution. Dissolve Styrax reference drug in petroleum ether (60-90℃) to prepare a solution containing 25 μl per ml as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using high performance silica gel GF_{254} as the coating substance and a mixture of petroleum ether (30-60℃), hexane, ethyl formate and formic acid (10 : 30 : 15 : 1) as the mobile phase. Apply separately 3 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm. The main spots in the chromatogram obtained with the test solution correspond in position and colour to the main spots in chromatogram obtained with the reference drug solution. Macerate the plate in 10% sulfuric acid in ethanol for a moment, removal of the plate, dry in air, heat at 105℃ to the spots distinct. Examine under ultraviolet light at 254 nm. The main fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the main fluorescent spots in chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay ***Borneolum Syntheticum*** Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use 10% polyethylene glycol (PEG)-20M as the stationary phase and maintain the column temperature at 140℃. The number of theoretical plates of the column is not less than 1200, calculated with the reference of the peak of pentadecane.

Determination of correction factor Dissolve a quantity of pentadecane, accurately weighed, in ethyl acetate to prepare the internal standard solution containing 7 mg per ml. Place 10 mg of a mixture of (±)-borneol and (±)-isoborneol CRS, accurately weighed, in a 5 ml volumetric flask, add exactly 1 ml of internal standard solution, dilute with ethyl acetate to volume, mix well. Inject exactly 1 μl into the column and calculate the correction factor.

Procedures Grind well 10 pills, accurately weighed; or weigh accurately 10 pills, take a quarter from each pill, combine, weigh accurately, add accurately an equal portion of kieselguhr and grind well. Place a sufficient powder (equivalent to 12 mg of Borneolum Syntheticum), weighed accurately, in a stopper test tube, add exactly 1 ml of the

internal standard solution and 4 ml of ethyl acetate, stopper well, shake to dissolve Borneolum Syntheticum, and allow to stand. Inject 1 μl of the supernatant into the column and measure the sum peak area of (±)-borneol and (±)-isoborneol, calculate the content.
It contains not less than 80.0 mg and not more than 120.0 mg of the mixture of (±)-borneol and (±)-isoborneol per pill.

Radix Inulae Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use polyethylene glycol (PEG)-20M as the stationary phase, capillary column (0.25 mm in internal diameter, 30 meter long and 0.25 μm film thickness). Column temperature gradient: initial temperature at 220℃, maintain 15 minutes; increase at 80℃ per minute to 240℃, then maintain 20 minutes. The number of theoretical plates of the column is not less than 40000, calculated with the reference to the peak of alantolactone.

Reference solution Dissolve a quantity of alantolactone CRS, accurately weighed, in ethyl acetate to produce a solution containing 0.2 mg per ml as the reference solution.

Test solution To 10 pills, accurately weighed, grind well, weigh 4 g accurately, or weigh accurately 10 pills, take a quarter from each pill, combine, weigh accurately, add accurately an equal portion of kieselguhr and grind well. Place a sufficient power (equivalent to 5 mg of alantolactone), weighed accurately, in a stopper conical flask, add exactly 25 ml of ethyl acetate, stopper tightly, and weigh. Ultrasonicate (power, 300 W; frequency, 50 kHz) for 30 minutes, allow to stand to room temperature, weigh again, replenish the lost weight with ethyl acetate, shake thoroughly and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 1 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 0.90 mg of alantolactone ($C_{15}H_{20}O_2$) per pill, referred to Radix Inulae.

Action To regulate *qi* and soothe the chest, and kill pain.

Indications Impeded flow of *yang-qi* in the chest due to cold retention, *qi* stagnation and block of the *Heart Meridian* with manifestations of constriction in the chest, precordial pain, light purple tongue; angina pectoris in coronary heart disease with above symptoms.

Usage and dosage 1 pill, 1-3 times a day, or follow doctor's advice; taken orally by chewing.

Precaution Contraindicated for pregnant women.

Storage Preserve in tightly closed containers.

Guben Kechuan Pian
(固本咳喘片)

Guben Kechuan Tablets

Ingredients Radix Codonopsis 151 g; Rhizoma Atractylodis Macrocephalae (processed with bran) 151 g; Poria 100 g; Radix Ophiopogonis 151 g; Fructus Psoraleae (processed with salt) 151 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 75 g; Fructus Schisandrae Chinensis (processed with vinegar) 75 g.

Procedure Pulverize 34.5 g of Poria to fine powder, decoct the remained portion of Poria and the other six ingredients three times (3 hours, 2 hours and 1 hour respectively), filter and combine the decoctions, allow to stand for 24 hours, separate the supernatant, filter, concentrate in vacuum to a quantity, and allow to cool. Add the above fine powder and a quantity of dextrin, mix well, dry at a lower temperature and grind into fine powder. Add a quantity of starch and cerealose, make granules, make to 1000 tablets and coat with film.

Description Film coated tablets with brown core; taste, sweet, slightly sour, bitter, and slightly astringent.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS, hyphae colourless or brownish, 4-6 μm in diameter.
(2) Grind 10 tablets to fine powder, ultrasonicate with 10 ml of ethanol for 15 minutes, filter, and use the filtrate as the test solution. Dissolve a quantity of psoralen CRS and isopsoralen CRS separately in ethanol to produce two solutions each containing 0.5 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of hexane and ethyl acetate (4 : 1) as the mobile phase. Apply separately 4 μl of the test solution and 2 μl of each of reference solutions to the plate. After developing and removal of the plate, dry in air and spray with a 10% potassium hydroxide in methanol, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.
(3) Grind 10 tablets to fine powder, ultrasonicate with 30 ml of ethanol for 30 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in 30 ml of water, extract by shaking with two 30-ml quantities of ether, discard the ether extracts, then extract the aqueous solution by shaking with two 30-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extract, wash with two 30-ml quantities of water saturated with *n*-butanol, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Decoct 1 g of Radix et Rhizoma Glycyrrhizae reference drug with 50 ml of water for 30 minutes, cool, filter, and evaporate the filtrate to dryness. Dissolve the residue in 30 ml of ethanol by ultrasonicating, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 1% solution of sodium hydroxide as the coating substance and a mixture of ethyl acetate, formic acid, glacial acetic acid and water (15 : 1 : 1 : 2) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and spray with a 10% sulfuric acid in ethanol. Heat at 105℃ to the spots clear, and examine under daylight. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatography system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.1 mol/L sodium dihydrogen phosphate solution (adjust pH to 7.0 with 30% phosphoric acid) (45 : 55) as the mobile phase. As detector a

spectrophotometer set at 246 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of psoralen.

Reference solution Dissolve respectively a quantity of psoralen CRS and isopsoralen CRS, accurately weighed, in methanol to produce a mixture containing 10 μg of psoralen and 14 μg of isopsoralen per ml as the reference solution.

Test solution Weigh accurately 10 tablets, grind to fine powder, weigh accurately 0.4 g in a stopper conical flask, add 20 ml of methanol, stopper tightly, and weigh. Ultrasonicate (power, 300 W; frequency, 50 kHz) for 40 minutes, cool, weigh again, replenish the lost weight with methanol, shake well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.3 mg of the total amount of psoralen ($C_{11}H_6O_3$) and isopsoralen ($C_{11}H_6O_3$) per tablet, referred to Fructus Psoraleae.

Action To replenish *qi* to strengthen the superficies, and invigorate the spleen and reinforce the kidney.

Indications Coughing with expectoration of much phlegm, panting, shortness of breath, worse when active due to abundance of phlegm resulting from deficiency in the spleen and insecurity of *kidney-qi*; chronic bronchitis, pulmonary emphysema, bronchial asthma with above symptoms.

Usage and dosage 3 tablets, 3 times a day.

Strength 0.4 g per tablet

Storage Preserve in tightly closed containers.

Guci Xiaotong Pian
(骨刺消痛片)

Guci Xiaotong Tablets

Ingredients Radix Aconiti Praeparata 53.25 g; Radix Aconiti Kusnezoffii Praeparata 53.25 g; Radix Gentianae Macrophyllae 53.25 g; Radix Angelicae Dahuricae 53.25 g; Radix et Rhizoma Glycyrrhizae 53.25 g; Rhizoma Discoreae Hypoglaucae 106.5 g; Rhizoma Discoreae Nipponicae 106.5 g; Semen Coicis 106.5 g; Rhizoma Arisaematis (prepared) 53.25 g; Flos Carthami 106.5 g; Radix Angelicae Sinensis 53.25 g; Radix et Rhizoma Cynanchi Paniculati 159.75 g.

Procedure Pulverize Radix Angelicae Dahuricae, Semen Coicis and Radix Angelicae Sinensis to fine powder. To Radix Aconiti Praeparata, Radix Aconiti Kusnezoffii Praeparata and Radix Gentianae Macrophyllae, add 8 volume of water and adjust the pH value to 3-4 with hydrochloric acid, then decoct twice, 2 hours for each time; filter, reserve the filtrate for later use. Distill Radix Cynanchi Paniculati with steam and collect the distillation for later use. Decoct other 5 ingredients and the drug residue, which together with the remained water solution, with water twice, 2 hours for each time; filter, combine the filtrate with the reserved solution; allow to stand for 24 hours, concentrate the supernatant to thick extract; add the above fine powder and mix thoroughly, dry and pulverize to fine powder. Dilute the distillation with a quantity of ethanol, mix thoroughly with the second fine powder and a quantity of excipient, make granules. Make to 1000 tablets, coated with sugar.

Description Sugar coated tablets with yellowish-brown core; taste, slightly pungent, spicy, and bitter.

Identification (1) Triturate 10 tablets, removed sugar coats, to fine powder; heat under reflux with 40 ml of ether for 30 minutes, filter, evaporate the filtrate to dryness; dissolve the residue in 1 ml of acetone as the test solution. Dissolve a quantity of paeonol CRS in acetone to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of cyclohexane and ethyl acetate (3 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% ferric chloride in ethanol acidified with hydrochloric acid. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Prepare a solution of 0.5 g of Radix Angelicae reference drug in the same manner as described in the test solution preparation under Identification (1), as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (9 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution, obtained under Identification (1), and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Triturate 10 tablets, removed sugar coats, to fine powder; add 20 ml of a mixture of sulfuric acid and 45% ethanol (7→100), then heat under reflux for 1 hour, allow to stand to cool and filter; extract the filtrate with two 20-ml quantities of petroleum ether (60-90℃), combine the extracts, if the extract appear muddy, centrifuge and use the supernatant. Evaporate the extract to dryness and dissolve the residue in 0.5 ml of ethanol as the test solution. Dissolve a quantity of glycyrrhetinic acid CRS in 1 ml of dehydrated ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of petroleum ether (30-60℃), toluene, ethyl acetate and glacial acidic acid (10 : 20 : 7 : 0.5) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Limit test for aconitine Triturate 15 tablets, removed sugar coats, to fine powder, transfer to a stopper conical flask, add 2 ml of ammonia TS and 30 ml of ether, extract with constantly shaking for 1 hour, allow to stand for 24 hours; filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Dissolve a quantity of aconitine CRS, weighed accurately, in dehydrated ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of toluene, ethyl acetate and diethylamine (14 : 4 : 1) as the mobile phase. Apply separately 5 μl of the test solution and 10 μl of the reference solution to the

plate. After developing and removal of the plate, dry in air. Spray with dilute potassium iodobismuthate TS. The size of the spot in the chromatogram obtained with the test solution is less than the corresponding spot in the chromatogram obtained with the reference solution, or no spot reveals in the chromatogram obtained with the test solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilance bonded silica gel as the stationary phase and a mixture of methanol and water (50 : 50) as the mobile phase. As detector a spectrophotometer set at 274 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of paeonol.

Reference solution Dissolve a quantity of paeonol CRS, accurately weighed, in ethanol to produce a solution containing 80 μg per ml.

Test solution Place 10 tablets, removed sugar coats, weigh accurately and triturate to fine powder; weigh accurately 1 g of the powder to a stopper conical flask, add accurately 25 ml of ethanol and stopper tightly; weigh, ultrasonicate (power, 160 W; frequency, 50 kHz) for 30 minutes. Allow standing to cool and weigh again, replenish the lost weight with ethanol; mix thoroughly and filter; and use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.50 mg of paeonol ($C_9H_{10}O_3$) per tablet, referred to Cortex Moutan.

Action To expel *wind* and kill pain.

Indications Obstruction of *qi* and blood with pain due to accumulation of *wind-dampness* and blood stasis blocking meridians with manifestations of painful and immobilized joints, pain of the lower back and knees; bony arthritis, rheumatic arthritis, pain due to rheumatalgia with above symptoms.

Usage and dosage 4 tablets, 2-3 times a day.

Precaution Be cautious about patients with renal diseases.

Storage Preserve in tightly closed containers.

Guifu Dihuang Wan (桂附地黄丸)

Guifu Dihuang Pills

Ingredients Cortex Cinnamomi 20 g; Radix Aconiti Lateralis Preparata 20 g; Radix Rehmanniae Praeparata 160 g; Fructus Corni (processed) 80 g; Cortex Moutan 60 g; Rhizoma Dioscoreae 80 g; Poria 60 g; Rhizoma Alismatis 60 g.

Procedure Pulverize the above eight ingredients to fine powder, sift, mix well. To each 100 g of the powder add 35-50 g of refined honey and a quantity of water to make pills and dry. Alternatively, add 80-110 g of refined honey to make small honeyed pills or big honeyed pills.

Description Blackish-brown water honeyed pills, small honeyed pills or big honeyed pills; taste, sweet with slightly sour and pungent.

Identification (1) Microscopical: Starch granules triangular-ovoid or oblong, 24-40 μm in diameter; hilum short-cleft or V-shaped. Gelatinized masses of starch granules whitish. Irregular branched masses colourless, dissolved in chloral hydrate solution; hyphae colourless or pale brown, 4-6 μm in diameter. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Clusters of calcium oxalate occurring in colourless parenchymatous cells, sometimes several in a row. Epidermic cells of pericarp orange-yellow, subpolygonal in surface view, anticlinal walls slightly beaded. Parenchymatous cells subrounded, with elliptic pits gathered in pit groups. Anticlinal walls of endodermis cells sinuous, somewhat relatively thick, lignified, with sparse and minute pit-canals. Stone cells subsquare or subrounded, 32-88 μm in diameter, with thin walls at one side.

(2) Pulverize 9 g of big or small honeyed pills, or 6 g of water-honeyed pills, add 15 ml of ether, and shake for 15 minutes, stand for 1 hour, filter, evaporate the ether and dissolve the residue in 1 ml of acetone as the test solution. Dissolve a quantity of paeonol CRS in acetone to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (3 : 1) as the mobile phase. Apply in strip separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% ferric chloride in ethanol, acidified with hydrochloric acid, visualize under a current of hot air. The bluish-brown strip in the chromatogram obtained with the test solution corresponds in position and colour to the strip in the chromatogram obtained with the reference solution.

(3) Pulverize 9 g of big or small honeyed pills, or 6 g of water-honeyed pills, add 10 ml of ethanol, shake for 15 minutes, stand for 1 hour, filter, use the filtrate as the test solution. Dissolve a quantity of cinnamaldehyde CRS in ethanol to produce a solution containing 1 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃) and ethyl acetate (17 : 3) as the mobile phase. Apply separately 15 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry it in air, and spray with alcoholic dinitrophenyl-hydrazine TS. The orange-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay ***Fructus Corni*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, acetonitrile as the mobile phase A, 0.05% phosphoric acid solution as the mobile phase B, elute in gradient as the following:

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0-20	11	89
20-30	90	10
30-40	11	89

As detector a spectrophotometer set at 236 nm; maintain the column temperature at 30℃. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of loganin.

Reference solution Dissolve a quantity of loganin CRS,

accurately weighed, in methanol to produce a solution containing 20 μg per ml as the reference solution.

Test solution Weigh accurately 1 g of water-honeyed pills, pulverized to the fine powder; or weigh accurately 1 g of small honeyed pills or 1 g of big honeyed pills obtained in the test of weight variation, cut into pieces and mix well, to a stopper conical flask, and accurately 50 ml of methanol, stopper well and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 45 minutes, allow to stand to room temperature and weigh again, replenish the lost weight with methanol, shake thoroughly and filter. Measure accurately 25 ml of the successive filtrate (the remain filtrate for later use), evaporate to dryness, dissolve the residue in methanol, transfer to a 5 ml volumetric flask, dilute with methanol to volume and shake thoroughly, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.53 mg of loganin ($C_{17}H_{26}O_{10}$) per gram of water-honeyed pills, 0.38 mg per gram of small honeyed pills and 3.40 mg per big honeyed pill, referred to Fructus Corni.

Cortex Moutan Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (70 : 30) as the mobile phase. As detector a spectrophotometer set at 274 nm. The number of theoretical plates of the column is not less than 3500, calculate with the reference to the peak of paeonol.

Reference solution Dissolve a quantity of paeonol CRS, accurately weighed, in methanol to produce a solution containing 15 μg per ml as the reference solution.

Test solution To the successive filtrate, obtained under the Assay of Fructus Corni, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.80 mg of paeonol ($C_9H_{10}O_3$) per gram of water-honeyed pills, 0.60 mg per gram of small honeyed pills and 5.40 mg per big honeyed pill, referred to Cortex Moutan.

Action To warm and replenish *kidney-yang*.

Indications Cold pain in the lower back and knees, edema of limbs, dysuria, or polyuria or dyspnea, and coughing due to retention of phlegm or morbid fluid and diabetes due to insufficiency of *kidney-yang*.

Usage and dosage 6 g of water-honeyed pills, 9 g of small honeyed pills or 1 big honeyed pill; twice a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Guifu Lizhong Wan
(桂附理中丸)

Guifu Lizhong Pills

Ingredients Cortex Cinnamomi 30 g; Radix Aconiti Lateralis Praeparata 30 g; Radix Codonopsis 90 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 90 g; Rhizoma Zingiberis Praeparatum 90 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 90 g.

Procedure Pulverize the above six ingredients to fine powders, sift, and mix well. To each 100 g of the powder add 120-140 g of refined honey to make big honeyed pills.

Description Brown big honeyed pills; odour, slight; taste, sweet and pungent.

Identification (1) Microscopical: Fibres usually singly scattered, long fusiform, 24-50 μm in diameter, with thickened and lignified walls. Anastomosing laticiferous tubes 12-15 μm in diameter, containing fine granules. Needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells. Starch granules long ovoid, broad ovoid, or irregular, 25-32 μm in diameter, hilum pointed at the small end, striations distinct. Fibre bundles surrounded by cells containing prisms of calcium oxalate, forming crystal fibres.

(2) Cut 9 g of the pills into pieces, add 4.5 g of kieselguhr and 50 ml of water, triturate well. Add another 50 ml of water, stir for 20 minutes, filter under reduced pressure. Wash the residue with 50 ml of water, dry at 60℃ for 2 hours. Heat under reflux in a Soxhlet's extractor with 70 ml of ethanol on a water bath until the extract becomes colourless. Cool, filter, concentrate the filtrate to almost dryness, dissolve in 4 ml of ethanol, and use the solution as the test solution. Heat under reflux 0.5 g of Radix et Rhizoma Glycyrrhizae reference drug with 30 ml of ethanol on a water bath for 1 hour, filter, concentrate the filtrate to 1 ml, and use it as the reference drug solution. Dissolve a quantity of ammonium glycyrrhizinate CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 0.8% solution of sodium hydroxide as the coating substance and a mixture of ethyl acetate, formic acid, glacial acetic acid and water (15 : 1 : 1 : 2) as the mobile phase. Apply separately 1 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, spray with a solution of sulfuric acid in ethanol (1→10). Heat at 105 ℃ for 5-10 minutes, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

(3) Heat under reflux 9 g of the pills, in pieces, with 20 ml of ethyl acetate on a water bath for 30 minutes, cool, and filter. Concentrate the filtrate at a low temperature to 5 ml as the test solution. Dissolve a quantity of cinnamaldehyde CRS in ethanol to produce a solution containing 2 μg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of petroleum ether (60-90 ℃) and ethyl acetate (17 : 3) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, and spray with a solution of dinitrophenylhydrazine in ethanol. The orange-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Limit test of aconitine Cut 42 g of the pills into pieces, weighed accurately, and grind well with an appropriate quantity of kieselguhr. Add 10 ml of ammonia TS, stir well, allow to stand for 2 hours, and add 100 ml of ether, shake for 1 hour, stand for 48 hours, filter, evaporate the

filtrate to dryness. Disslove the residue in 1 ml of dehydrated ethanol as the test solution. Dissolve aconitine CRS in dehydrated ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, acetone and methanol (6 : 1 : 1) as the mobile phase. Apply in strips separately 24 μl of the test solution and 5 μl of the reference solution to the plate. After developing to 13 cm and removal of the plate, dry in air and spray with dilute potassium iodobismuthate TS. The size of the strip in the chromatogram obtained with the test solution is less than the corresponding strip in the chromatogram obtained with the reference solution or no strip reveals in the chromatogram obtained with the test solution.

Action To reinforce the kidney and support *yang*, and warm the *middle-energizer* to invigorate the spleen.

Indications Cold pain in the stomach and abdomen, vomiting and diarrhea and cold limbs due to decline of *kidney-yang*, and cold and deficiency in the spleen and stomach.

Usage and dosage 1 pill, twice a day, taken with ginger decoction or warm boiled water.

Precaution Be cautious about pregnant women.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Guilingji
(龟龄集)

Guilingji Capsules

Guilingji Capsules are prepared from Radix et Rhizoma Ginseng, Cornu Cervi Pantotrichum, Hippocampus, Fructus Lycii, Flos Caryophylli, Squama Manis, Encephalon Passeris, Radix Achyranthis Bidentatae, Herba Cynomorii, Radix Rehmanniae Praeparata, Fructus Psoraleae, Semen Cuscutae, Cortex Eucommiae, Fossilia Spiriferis, Herba Cistanches, Radix et Rhizoma Glycyrrhizae, Radix Asparagi, Herba Epimedii, Halitum, Fructus Amomi and others by processing, pulverizing, mixing and packing into capsules.

Description Aard capsules containing brown contents; odour, characteristic; taste, salty.

Identification (1) Microscopical: Sclerenchymatous cells of tegmen brownish-yellow or brownish-red, subpolygonal in surface view, walls thickened, lumen containing silica bodies. Unossified bone tissue plae grey or nearly colourless, border and surface uneven, with irregularly convex masses, linear striations visible indistinctly. Pieces of scale colourless, with rounded pits in variable size. Striated muscle nearly colourless or pale yellow, transverse striations thin and dense, arranged in light and dark alternately, straight or slightly sinuous.

(2) To 0.2 g of the content add 5 ml of water, heat on a water bath for 15 minutes, cool and filter. To the filtrate add 0.2 g of active charcoal, heat again on a water bath for 5 minutes, cool and filter. To the filtrate add several drops of ninhydrin TS, mix well and heat on a water bath for about 10 minutes, a bluish-violet colour is produced.

(3) Extract 1 g of the content with two 10-ml quantities of petroleum ether (60-90 ℃), discard the petroleum ether, and evaporate the drug residue to dryness. Macerate the residue in 20 ml of dehydrated ethanol for 1 hour, filter and evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of chloroform as the test solution. Dissolve a quantity of psoralen CRS in chloroform to produce a solution containing 0.1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of petroleum ether (60-90℃), ether and chloroform (5 : 1 : 5) as the mobile phase. Apply separately 20 μl of the test solution and 10 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Dissolve separately a quantity of ginsenoside Rg_1 CRS, ginsenoside Re CRS, ginsenoside Rb_1 CRS in methanol to produce three kinds of solutions each containing 1 mg per ml as the reference solutions. Use the test solution prepared in Assay as the test solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance, and the lower layer of a mixture of chloroform, methanol and water (13 : 7 : 2), kept at 10℃ or below, as the mobile phase. Apply separately 10 μl of the test solution and 2 μl each of the reference solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 100℃ to the spots distinct. Examine in daylight. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Volatile ether-soluble extractives To 2 g of the content, carry out the method for determination of volatile ether-soluble extractives (Appendix Ⅹ A), it contains not less than 0.25 per cent of volatile ether-soluble extractives.

Assay Weigh accurately the content of 20 capsules, triturated to fine powder, and mix well. Place 2.5 g, weighed accurately, into a Soxhelt's extractor, add 60 ml of ether, heat under reflux to the extract nearly colourless and discard the ether extract. To the residue, discard ether, add 70 ml of methanol, heat under reflux to the extract colourless. Concentrate the methanol extract to dryness, dissolve the residue in 15 ml of *n*-butanol saturated with water, and transfer to a separating funnel and extract with three 15-ml quantities of water saturated with *n*-butanol. Combine the extracts, wash with successive quantities of 15 ml, 15 ml, 10 ml 1% solution of sodium hydroxide, then wash to neutrality with *n*-butanol saturated with water. Concentrate the butanol extract to dryness, dissolve the residue in a quantity of 70% ethanol and apply to a column (1 cm in inner diameter) packed with D101 macroporous resin at the lower part (7 cm long) and neutral aluminum oxide (100-120 meshes) at the upper part (3 cm long) of the column. Elute the column with 80 ml of 70% ethanol, evaporate the eluate to dryness. Dissolve the residue in methanol, transfer to a 2 ml volumetric flask, add methanol to volume and mix well. Dissolve a quantity of ginsenoside Rg_1 in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of

chloroform, methanol and water (13 : 7 : 2), kept at 10℃ or below, as the mobile phase. Apply accurately 10 μl of the test solution and 2 μl and 4 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 100℃ to the spots clear, cool. Cover the plate with a piece of glass of the same size, and fix with tape. Carry out the method for thin layer chromatography (Appendix Ⅵ B thin layer chromatographic scanning method) scan at the wavelength of $\lambda_S = 541$ nm, $\lambda_R = 700$ nm. Measure the integral values of the absorbance from the test solution and the reference solution, and calculate the content.
It contains not less than 55 μg of ginsenoside Rg_1 ($C_{42}H_{72}O_{14}$) per capsule, referred to Radix et Rhizoma Ginseng.

Action To strengthen the body and nourish the brain, reinforce the kidney and replenish *qi*, and whet the appetite.

Indications Poor memory, emission, aching and weak lower back and knees, coughing in a deficient condition, daily diarrhea occurring before dawn and loss of appitite due to a deficiency of *kidney-essence* specially *kidney-yang*.

Usage and dosage 0.6 g, 1 time a day, taken with dilute salt water 2 hours before breakfast.

Precaution Avoid raw, cold or irritant foods; it is forbidden to prescribe to pregnant women; cease medication when one contracts common cold.

Strength 0.3 g per capsule

Storage Preserve in tightly closed containers.

Guilin Xiguashuang (桂林西瓜霜)

Guilin Xiguashuang

Ingredients Mirabilitum Praeparatum; Boroborax (calcined); Cortex Phellodendri Chinensis; Rhizoma Coptidis; Radix Sophorae Tonkinensis; Rhizoma Belamcandae; Bulbus Fritillariae Thunbergii; Indigo Naturalis; Borneolum Syntheticum; Fructus Sapindi (charred); Radix et Rhizoma Rhei; Radix Scutellariae; Radix et Rhizoma Glycyrrhizae; Mentholum.

Procedure Pulverize the above fourteen ingredients, except Mirabilitum Praeparatum, Boroborax, Indigo Naturalis, Borneolum Syntheticum and Mentholum, to fine powder. Pulverize separately Mirabilitum Preparatum, Boroborax, Indigo Naturalis, Borneolum Syntheticum, Mentholum, then pulverize with the above fine powder and a quantity of silicon dioxide, stevioside, citric acid and other excipients, sift and mix well.

Description Greyish-green powder; odour, fragrant; taste, salty, sweet, slightly bitter and pungent.

Identification (1) To 0.5 g add 3 ml of water, shake well and filter. Add 1 ml of barium chloride TS to the filtrate, a white precipitate is produced immediately. The precipitate doesn't dissolve in hydrochloric acid.
(2) To 0.5 g add 2 ml of sulfuric acid, mix well, add 8ml of methanol, fire to burn, the flame with green edge is produced.
(3) Sublime a quantity, the sublimate is colourless or white amorphous crystal with aromatic odour. Dissolve the crystals with several drops of ethanol, add 1-2 drops of 1% vanillin in sulfuric acid prepared freshly, a violet to violet-red colour is produced immediately.
(4) Macerate 2 g in 20 ml of ethanol for 1 hour with frequently shaking, filter, and evaporate the filtrate to dryness. Dissolve the residue in 15 ml of water, add 0.5 ml of hydrochloric acid, heat under reflux for 30 minutes, and allow to cool immediately. Extract with ether twice, 10 ml for the first time and 5 ml for the second time, combine the ether extract, and evaporate to dryness. Dissolve the residue in 0.5 ml of chloroform as the test solution. Dissolve a quantity of indirubin CRS in chloroform to produce a solution containing 1 mg per ml as the reference solution, dissolve separately a quantity of emodin CRS, chrysophanol CRS in methanol to produce solutions each containing 1 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance, and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 3-6 μl of each of the four solutions to the plate. After developing and removal of the plate, dry in air, examine in daylight and ultraviolet light at 365 nm separately. In daylight, one spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the indirubin reference solution. Under ultraviolet light, other two spots correspond respectively in position and colour to the spots in the chromatogram obtained with the emodin and chrysophanol reference solutions. Examine in daylight, the colour of spots becomes red on exposure to ammonia vapour.
(5) To the ethanol extracted residue obtained under Identification (4), add 5 drops of sodium hydroxide TS and 15 ml of chloroform, heat under reflux for 30 minutes. Filter, evaporate the filtrate to dryness. Dissolve the residue in 5 ml of chloroform, filter and concentrate the filtrate to about 0.5 ml as the test solution. Dissolve a quantity of matrine CRS in chloroform to produce a solution containing 1 mg per ml as the reference solution. Carry out the method of thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance, and a mixture of benzene, ethyl acetate, acetone and concentrated ammonia (10 : 20 : 15 : 1) as the mobile phase. Apply separately 4-8 μl of the test solution and 3 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with dilute potassium iodobismuthate TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(6) Prepare a solution of 0.05 g of Rhizoma Coptidis reference drug in the same manner as described under the Assay as the reference drug solution. Dissolve a quantity of berberine hydrochloride CRS in methanol to produce a solution containing 0.5mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately 2 μl of each of the test solution obtained under the Assay, the reference drug solution and the reference solution to the plate. After developing in a chamber pre-equilibrated with mobile phase and concentrated ammonia TS for 15 minutes, removal of the plate and dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use

octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.05 mol/L sodium dihydrogen phosphate (adjust the pH value to 3 with phosphoric acid) (30 : 70) as the mobile phase. As detector a spectrophotometer set at 350 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of berberine hydrochloride.

Reference solution Dissolve a quantity of berberine hydrochloride CRS, accurately weighed, in a mixture of hydrochloric acid-methanol (1 : 100) to produce a solution containing 40 μg per ml as the reference solution.

Test solution Weigh accurately 0.5 g of the powder, to a stopper conical flask, accurately add 50 ml of a mixture of hydrochloric acid-methanol (1 : 100), tightly stopper and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 40 minutes, allow to stand to room temperature, weigh again, replenish the lost weight with the above mixture, shake thoroughly and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 2.5 mg of berberine hydrochloride ($C_{20}H_{18}ClNO_4$) per gram, referred to Cortex Phellodendri Chinensis and Rhizoma Coptidis.

Action To clear *heat* and *toxicity*, and reduce swelling pain.

Indications Tonsillitis, inflammation of the throat, aphthous stomatitis due to attack of the upper part of the body by *wind-heat* and extremely abundant *heat* in the lung and stomach, with manifestations of swollen painful throat, swollen tonsil, or sores on the mouth and tongue, or swollen painful gums or gingival bleeding; acute and chronic pharyngitis, tonsillitis, stomatitis, stomatocace, gingivitis with above symptoms, and mild scald (without rupture of the skin).

Usage and dosage For external use, spray or spread some on the lesion, several times a day; some for severe conditions, 1-2 g, 3 times a day.

Strength (1) 1 g (2) 2 g (3) 2.5 g (4) 3 g per bottle

Storage Preserve in tightly closed containers.

Guilong Kechuanning Jiaonang (桂龙咳喘宁胶囊)

Guilong Kechuanning Capsules

Ingredients Ramulus Cinnamomi; Os Draconis; Radix Paeoniae Alba; Rhizoma zingiberis Recens; Fructus Jujubae; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle; Concha Ostreae, Rhizoma Coptidis; Rhizoma Pinelliae Praeparatum, Pericarpium Trichosanthis; Semen Armeniacae Amarum (stir-baked).

Procedure Pulverize Ramulus Cinnamomi and a part of Radix Paeoniae Alba to fine powder, sift and mix well. Decoct the remains of Radix Paeoniae Alba and the other nine ingredients with water 3 times, 2 hours for the first time, 1 hour for the second time and 0.5 hour for the third time. Combine the decoctions, filter, concentrate the filtrate in vacuum until its relative density is 1.25-1.30 (60℃), mix with the above fine powder, dry at a low temperature and pulverize to fine powder, sift, mix well, pack into capsules.

Description Hard capsules containing pale-brown powder; odour, fragrant; taste, slightly bitter and sweet.

Identification (1) Microscopical: stone cells scattered or grouped, colourless to brown, subsquare or rectangular, 30-64 μm in diameter, walls thinner on one side. Clusters of calcium oxalate 18-32 μm in diameter, scattered in parenchymatous cells, often in rows, or several crystals in a cell.

(2) Add 10 ml of ethanol to 1.5 g of the contents, tightly stopper, macerate for 30 minutes with frequently shaking, and filter, using the filtrate as the test solution. Dissolve a quantity of cinnamaldehyde CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (17 : 3) as the mobile phase. Apply separately 15 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with dinitrophenylhydrazine TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Add 10 ml of ethanol to 1.5 g of the contents, tightly stopper, shake for 10 minutes, filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve a quantity of paeoniflorin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and ethyl acetate (8 : 4 : 1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing in a chamber pre-equilibrated with ammonia vapour, removal of the plate, dry in air, spray with a solution of sulfuric acid and ethanol (1→10), heat at 100℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Dissolve a quantity of berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of butanol, glacial acetic acid and water (7 : 1 : 2) as the mobile phase. Apply separately 5 μl of the reference solution and 10 μl of the test solution obtained under Identification (2) to the plate. After developing and removal of the plate, and dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane binding silica gel as the stationary phase and a mixture of acetonitrile and 0.1% phosphoric acid solution (30 : 70) as the mobile phase. As detector a spectrophotometer set at 285 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of cinnamic acid.

Reference solution Dissolve a quantity of cinnamic acid CRS in an amber volumetric flask in 50% methanol to produce a solution containing 7 μg per ml as the reference solution.

Test solution Weigh accurately about 1 g of the mixed contents, obtained under the test of weight variation, to a stopper conical flask, add 50 ml of 50% methanol, stopper tightly. Weigh and ultrasonicate (power, 250 W;

frequency, 33 kHz) for 30 minutes. Cool and weigh again, replenish the lost weight with 50% methanol, and mix well. Filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 70 μg of cinnamic acid ($C_9H_8O_2$) per capsule, referred to Ramulus Cinnamomi.

Action To release the exterior to disperse *cold*, relieve coughing and resolve *phlegm*, and send *qi* down to alleviate asthma.

Indications Coughing and asthma due to affliction from external *wind-cold* and *phlegm-dampness* retained in the *lung*, or abundance of *phlegm*; acute and chronic bronchitis with above symptoms.

Usage and dosage 5 capsules, 3 times daily.

Precaution Avoid smoking, wine, pork, raw and cold foods.

Strength 0.3 g per capsule (equivelent to 1 g of crude drug)

Storage Preserve in tightly closed containers.

Guilu Bushen Wan
(龟鹿补肾丸)

Guilu Bushen Pills

Ingredients Semen Cuscutae (stir-baked) 51 g; Herba Epimedii (steamed) 43 g; Radix Dipsaci (steamed) 43 g; Herba Cynomorii (steamed) 51 g; Rhizoma Cibotii (steamed) 64 g; Semen Ziziphi Spinosae (stir-baked) 43 g; Radix Polygoni Multiflori Praeparata Cum Succo Glycines Sotae 64 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 21 g; Pericarpium Citri Reticulatae (steamed) 21 g; Colla Cornus Cervi (stir-baked) 9 g; Radix Rehmanniae Praeparata 64 g; Colla Carapacis et Plastri Testudinis (stir-baked) 13 g; Fructus Rosae Laevigatae (steamed) 51 g; Radix Astragali Praeparata Cum Melle 43 g; Rhizoma Dioscoreae (stir-baked) 43 g; Fructus Rubi (steamed) 85 g.

Procedure Pulverize the above sixteen ingredients to fine powder, sift, mix well. To each 100 g of the powder add 40 g of refined honey and a quantity of water, make to water-honeyed pills and dry; alternatively, add 100-110 g of refined honey, make to big honeyed pills.

Description Brownish-black to black water-honeyed pills or big honeyed pills; taste, slightly sweet.

Identification (1) Microscopical: Starch granules triangular-ovoid or rectangular-rounded, 24-40 μm in diameter, hilum shortly cleft or V-shaped. Palisade cells of testa 2 rows, the inner row relatively long, with brilliant line. Clusters of calcium oxalate up to about 45 μm in diameter, occurring in pale brownish-yellow and shrunken parenchymatous cells, often several arranged in one row. Scalariform tracheid pale yellow to golden yellow, pits arranged regularly. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, containing brown nucleus-like masses. Non-glandular hairs mostly broken, 16-31 μm in diameter, walls thick, lumen containing yellowish-brown masses. Cells of tegmen brownish-yellow, rectangular or subsquare in surface view, anticlinal walls beaded. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Fibres in bundle or scattered, walls thick, with longitudinal fissures in surface, two ends broken to broom-like or relatively even. Non glandular hairs 1-celled, walls thickened and lignified, remaining a scar like stone cell after falling. Epidermal cells of leaves with deeply sinuous walls.
(2) Triturate well 12 g of big honeyed pills or 9 g of water-honeyed pills with 4 g of kieselguhr to powder, and add 30 ml of methanol, stand for 1 hour, shake thoroughly, filter and evaporate the filtrate to dryness. Dissolve the residue in 10 ml of water, and add 2 ml of hydrochloric acid, heat on a water bath for 10 minutes, cool and extract with 20 ml of ethyl acetate, separate the ethyl acetate extracts, evaporate to dryness on a water bath. Dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 0.5 g of Radix Polygoni Multiflori reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 0.5% solution of sodium hydroxide as the coating substance and a mixture of toluene, ethyl acetate and formic acid (15 : 2 : 1) as the mobile phase. Apply separately 5 μl of the test solution and 1-2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To reinforce *kidney-yang*, replenish *qi* and blood and tone up the tendons and bones.

Indications Decline in health, lassitude, aching and weakness in the lower back and knees, dizziness, blurred vision, cold and thin sperm, hyposexuality, night polyuria, amnesia and insomnia due to a deficiency of *kidney-yang*.

Usage and dosage 4.5-9 g of water-honeyed pills, 6-12 g of big honeyed pills, twice a day.

Strength 6 g or 12 g per big honeyed pill

Storage Preserve in tightly closed containers.

Guipi Wan
(归脾丸)

Guipi Pills

Ingredients Radix Codonopsis 80 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 160 g; Radix Astragali Praeparata Cum Melle 80 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 40 g; Poria 160 g; Radix Polygalae (processed) 160 g; Semen Ziziphi Spinosae (stir-baked) 80 g; Arillus Longan 160 g; Radix Angelicae Sinensis 160 g; Radix Aucklandiae 40 g; Fructus Jujubae (cored) 40 g.

Procedure Pulverize the above eleven ingredients to fine powder, sift and mix well. To each 100 g of powder add 25-40 g of refined honey and a quantity of water to make to pills and dry; alternatively, add 80-90 g of refined honey to make to small honeyed pills or big honeyed pills.

Description Brown water-honeyed pills, small honeyed pills or big honeyed pills; odour, slight; taste, sweet, and then slightly bitter and pungent.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Anastomosing laticiferous tubes 12-15 μm in diameter, containing minute granular substances. Cells of endotesta brownish-yellow, polygonal or subsquare in surface view, with beaded anticlinal walls. Fibres in bundles or scattered, mostly broken, with thickened walls and longitudinal fissures on surface, both

ends broken to broom-like, or truncate. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Reticulate vessels up to 90 μm in diameter. Needles of calcium oxalate fine, irregularly filling in parenchymatous cells. Parenchymatous cells fusiform, with slightly thickened walls and fine oblique crisscross striations.

(2) To 9 g of small or big honeyed pills, in pieces, add 5-8 g of kieselguhr, triturate well and heat to dry. Add 20 ml of hexane, ultrasonicate for 15 minutes and filter. Evaporate the filtrate to about 1 ml as the test solution. Prepare a solution of 1 g Radix Angelicae Sinensis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Grind 9 g of water-honeyed pills; or cut 12 g of small honeyed pills or big honeyed pills into pieces, add an appropriate quantity of kieselguhr, mix well. To the powder add 50 ml of ether, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 1 g of Radix Aucklandiae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and acetone (10 : 3) as the mobile phase. Apply separately 10 μl of the test solution and 4 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% vanillin in sulfuric acid, heat to the spots clear. The spots in the chromatogram obtained with test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To reinforce *qi* and invigorate the spleen, nourish blood to anchor the mind.

Indications Shortness of breath, palpitation, insomnia, dreamfulness, dizziness, lassitude, poor appetite, metrorrhagia or metrostaxis, and hemafecia due to deficiency in the heart and spleen.

Usage and dosage 6 g of water-honeyed pills, 9 g of small honeyed pills or 1 big honeyed pill, 3 times a day, taken with warm boiled water or fresh ginger soup.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Guishao Dihuang Wan (归芍地黄丸)

Guishao Dihuang Pills

Ingredients Radix Angelicae Sinensis 40 g; Radix Paeoniae Alba (stir-baked with wine) 40 g; Radix Rehmanniae Praeparata 160 g; Fructus Corni (processed) 80 g; Cortex Moutan 60 g; Rhizoma Dioscoreae 80 g; Poria 60 g; Rhizoma Alismatis 60 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix well. To each 100 g of powder add 35-50 g of refined honey and a quantity of water to make to pills and dry. Alternatively, add 80-110 g of refined honey to make to small honeyed pills or big honeyed pills.

Description Brownish-black water-honeyed pills, blackish-brown small honeyed pills or big honeyed pills; taste, sweet and slightly sour.

Identification (1) Microscopical: Gelatinized starch masses whitish. Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Parenchymatous cells fusiform, with slightly thickened walls and very fine oblique crisscross striations; Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Epidermal cells of pericarp orange-yellow, subpolygonal in surface view, with slightly beaded anticlinal walls. Raphides of calcium oxalate 80-240 μm long, occurring in mucilage cells, needles 2-8 μm in diameter. Cork cells rectangular, slightly thick-walled, pale red to purplish, with slightly thickened walls. Parenchymatous cells subrounded, with elliptical pits, gathered into pit groups. Anticlinal walls of endodermis cells sinuous, somewhat relatively thick, lignified, with sparse and minute pit-canals.

(2) Grind well 9 g of the small or big honeyed pills, cut into pieces, with 3 g of kieselguhr, or pulverize 6 g of water-honeyed pills, add 40 ml of ether, heat under reflux at a lower temperature for 1 hour, and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of ether as the test solution. Prepare a solution of 1 g of Radix Angelicae Sinensis reference drug and 15 ml of ether in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Examine under the ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Grind well 9 g of the small or big honeyed pills, cut into pieces, with 4 g of kieselguhr, or pulverize 6 g of water-honeyed pills. Add 50 ml of ethanol, ultrasonicate for 10 minutes, filter, evaporate the filtrate to dryness. Dissolve the residue in 20 ml of water, extract with three 20-ml quantities of *n*-butanol saturated with water by shaking. Combine the *n*-butanol extracts, evaporate to dryness, dissolve the residue in 1 ml of ethanol as the test solution. Dissolve a quantity of paeoniflorin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol, and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulfuric acid, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

(4) Dissolve a quantity of paeonol CRS in acetone to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (3 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution, obtained under Identification (2), and the reference solution to the plate in strip. After developing and removal of the plate, dry in air, spray with 5% ferric

chloride in ethanol acidified with hydrochloric acid, heat to the band clear. The strip in the chromatogram obtained with the test solution corresponds in position and colour to the strip in chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay ***Cortex Moutan*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (70 : 30) as the mobile phase. As detector a spectrophotometer set at 274 nm. The number of theoretical plates of the column is not less than 3500, calculated with the reference to the peak of paeonol.

Reference solution Dissolve a quantity of paeonol CRS, accurately weighed, in methanol to produce a solution containing 15 μg per ml as the reference solution.

Test solution Weigh accurately 0.4 g of water-honeyed pills or 0.5 g of small honeyed pills, cut into piece; or weigh accurately 0.5 g of big honeyed pills, obtained under the test of weight variation, cut into pieces, to a stopper conical flask, add accurately 50 ml of 70% methanol, tightly stopper and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 45 minutes, shake strongly, allow to stand to room temperature and weigh again, replenish the lost weight with 70% methanol, shake thoroughly and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 20 μl of the test solution into the column, and calculate the content.

It contains not less than 0.80 mg of paeonol ($C_9H_{10}O_3$) per gram of water-honeyed pills, 0.60 mg per gram of small honeyed pills and 5.4 mg per big honeyed pill, referred to Cortex Montan.

Radix Paeoniae Alba and Cortex Moutan Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% phosphoric acid solution (14 : 86) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 4500, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, accurately weighed, in methanol to produce a solution containing 50 μg per ml as the reference solution.

Test solution Measure accurately 25 ml of the test solution, obtained under the Assay of Cortex Moutan, evaporate to dryness. Dissolve the residue in 25 ml of water by gently heating, allow to stand to room temperature, extract with three 25-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extracts, recover the solvent to dryness, dissolve the residue in an appropriate quantity of methanol, transfer to a 5 ml volumetric flask, dilute with methanol to volume and shake thoroughly as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.70 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per gram of water-honeyed pills, 0.50 mg per gram of small honeyed pills and 4.5 mg per big honeyed pill, referred to Radix Paeoniae Alba and Cortex Moutan.

Action To nourish the liver and kidney, replenish *yin* and blood and clear heat in a deficiency syndrome.

Indications Dizziness, blurred vision, tinnitus, dry throat, afternoon fever, aching and weakness in the lower back and knees, and pain in the heels due to deficiency in the liver and kidney.

Usage and dosage 6 g of water-honeyed pills, 9 g of small honeyed pills or 1 big honeyed pill, 2-3 times a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Guizhi Fuling Jiaonang (桂枝茯苓胶囊)

Guizhi Fuling Capsules

Ingredients Ramulus Cinnamoni 240 g; Poria 240 g; Cortex Moutan 240 g; Semen Persicae 240 g; Radix Paeoniae Alba 240 g.

Procedure Pulverize 192 g of Poria to fine powder. Distill Cortex Moutan with water steam; collect the distillation and separate volatile ingredients for later use. Extract the residue of Cortex Moutan after distillation, the remained portion of Poria, Ramulus Cinnamoni, Radix Paeoniae Alba and Semen Persicae with 90% ethanol twice, combine the extracts, recover ethanol, and concentrate in vacuum to a quantity. Decoct the residue with water twice, filter, combine the filtrates and concentrate in vacuum to a quantity. Mix with the fine powder of Poria, dry, pulverize, add a quantity of dextrin, make granules, dry, add the volatile ingredients of Cortex Moutan, mix well, and make to 1000 capsules.

Description Hard capsules with brownish-yellow to brown granular and powdered content; odour, slightly aromatic; taste, slightly bitter.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS, hyphae colourless or pale brown, 4-6 μm in diameter.

(2) Place 2 g of the content, in a Soxhlet's extractor, add a quantity of ether, heat under reflux for 2 hours, allow to cool, filter, and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 1 g of Cortex Moutan reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of toluene, chloroform, ethyl formate and formic acid (5 : 6 : 6 : 3) as the mobile phase. Apply separately 5 μl of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% ferric chloride in ethanol (acidified with hydrochloric acid), heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Place 2 g of the content, in a Soxhlet's extractor, add a quantity of methanol, heat under reflux for 2 hours, allow to cool, filter, concentrate the filtrate to 2 ml, and use it as the test solution. Prepare a solution of 1 g of Radix Paeoniae Alba reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} mixed with sodium carboxymethyl cellulose as the coating substance and the lower layer of a mixture of chloroform, methanol and water (26 : 14 : 5) as the mobile phase. Apply separately 5 μl of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with

anisaldehyde TS, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(4)Dissolve a quantity of cinnamaldehyde CRS in chloroform to produce a solution containing 5 μg per ml as the reference solution. Carry out the method for gas chromatography (Appendix Ⅵ E), using a 1.6 meters long column packed with 5% SE-30 as the sfationary phase; maintain the column temperature at 130℃. Inject a quantity each of the reference solution and the test solution obtained under Assay, into the column. The retention time of the peaks obtained with the test solution and the reference solution is correspond with each other.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use a column packed with 5% SE-30 as the stationary phase, 1.6 m in long; and maintain the column temperature at 130℃. The number of the theoretical plates of the column is not less than 600, calculated with the reference to the peak of paeonol, and the resolution between the peak of paeonol and internal standard substance is not less than 2.

Correction factor Dissolve a quantity of *n*-pentadecane, accurately weighed, in chloroform to produce a solution containing 0.3 mg per ml as the internal standard solution. Dissolve a quantity of paeonol CRS, accurately weighed, in chloroform to produce a solution containing 0.4 mg per ml as the reference solution. Measure accurately 2 ml each of the reference solution and the internal standard solution into a 25 ml volumetric flask, dilute with chloroform to volume and shake well, inject 1 μl into the column, and calculated the correction factor.

Procedure Weigh accurately 0.5 g of the content, obtained under the test of weight variation, distill with steam, collect about 400 ml of distillate, extract with successive quantities of 60 ml, 40 ml, 40 ml, and 30 ml chloroform, combine the chloroform extracts, dehydrate with 2 g of anhydrous sodium sulfate, filter, wash sodium sulfate and container with 10 ml of chloroform in portions, filter. Combine all of the chloroform filtrates, recover chloroform at 70℃ on a water bath to a quantity, transfer to a 5 ml volumetric flask, dilute with chloroform to volume, and shake well. Measure accurately 2 ml of the solution to a 5 ml volumetric flask, add 2 ml of internal standard solution, dilute with chloroform to volume, and shake well. Inject 1 μl into the column, and calculate the content.
It contains not less than 1.2 mg of paeonol ($C_9H_{10}O_3$) per capsule, referred to Cortex Moutan.

Action To promote blood circulation to resolve stagnated blood and disintegrate abdominal masses.

Indications Abdominal masses, dysmenorrhea and lochiorrhea; hysteromyoma, chronic pelvic inflammatory disease with lumps, dysmenorrhea, endometriosis and cophoritic cyst with above symptoms.

Usage and dosage 3 capsules, 3 times a day after meals, not taken in menstrual periods, 3 months making one course of treatment, or follow doctor's advice.

Precaution It is forbidden to prescribe to pregnant women or follow doctor's advice. Gastric discomfort and dull pain are seen in some patients, and they may disappear after ceasation of medication.

Strength 0.31 g per capsule

Storage Preserve in tightly closed containers.

Guizhi Fuling Wan
(桂枝茯苓丸)

Guizhi Fuling Pills

Ingredients Ramulus Cinnamomi 100 g; Poria 100 g; Cortex Moutan 100 g; Radix Paeoniae Rubra 100 g; Semen Persicae 100 g.

Procedure Pulverize the five ingredients to fine powder, sift, and mix well. To each 100 g of the powder add 90-110 g of refined honey to make to big honeyed pills.

Description Dark brown big honeyed pills; taste, sweet.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate solution; hyphae colourless or pale brown, 4-6 μm in diameter. Radial-longitudinal sections of ray cells subsquare or rectangular, walls beaded, usually adjacent to xylem fibres. Stone cells orange-yellow, conchoidal, walls relatively thickened, pits distinct on the wider side.
(2) Cut 6 g into pieces, add 50 ml of ether and heat under reflux at lower temperature for 1 hour, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve a quantity of cinnamaldehyde CRS in ethanol to produce a solution containing 1 μg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (17 : 3) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with dinitrophenylhydrazine TS in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Dissolve a quantity of paeonol CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of cyclohexane and ethyl acetate (3 : 1) as the mobile phase. Apply separately 10 μl of each of the reference solution and the test solution obtained under Identification (2) to the plate. After developing and removal of the plate, dry in air. Spray with 5% ferric chloride in ethanol acidated with hydrochloric acid and heat to the spots distinct. The spot in the chromatogram obtained with the test solution corresponds in the position and colour to the spot in the chromatogram obtained with the reference solution.
(4) To the residue obtained under Identification (2), add 20 ml of ethanol, ultrasonicate for 15 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 15 ml of water, extract with two 20-ml quantities of *n*-butanol saturated with water. Combine the extracts, wash with water twice, each 10 ml, discard the washings, and evaporate the *n*-butanol extract to dryness. Dissolve the residue in 1 ml of ethanol as the test solution. Dissolve a quantity of paeoniflorin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After

developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid, heat to the spots clear. The blue-violet spot in the chromatogram obtained with the test solution corresponds in position to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic System and System Suitability Use octadecyl-silane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% phosphoric acid (30 : 70) as the mobile phase. As detector a spectrophotometer set at 285 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of cinnamic acid.

Reference solution Dissolve a quantity of cinnamic acid CRS, accurately weighed, in 50% methanol in an amber volumetric flask to produce a solution containing 5 μg per ml as the reference solution.

Test solution Cut the pills into pieces and mix well. Weigh accurately 10 g to a stopper conical, add accurately 50 ml of 50% methanol, tightly stopper and weigh, ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, allow to cool and weigh again. Replenish the lost weight with 50% methanol, and mix well. Filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 72 μg of cinnamic acid ($C_9H_8O_2$) per pill, referred to Ramulus Cinnamomi.

Action To promote blood circulation to resolve stagnated blood and disintegrate masses.

Indications Persistent abdominal masses or dysmenorrhea and lochiorrhea due to stagnated blood.

Usage and dosage 1 pill, 1-2 times a day.

Precaution Be cautious about pregnant women.

Strength 6 g per pill

Storage Preserve in tightly closed containers.

Gujing Wan
(固经丸)

Gujing Pills

Ingredients Cortex Phellodendri Chinensis (stir-baked with salt) 300 g; Radix Scutellariae (stir-baked with wine) 200 g; Cortex Ailanthi (stir-baked) 150 g; Rhizoma Cyperi (processed with vinegar) 150 g; Radix Paeoniae Alba (stir-baked) 300 g; Carapax et Plastrum Testudinis (processed) 400 g.

Procedure Pulverize the above six ingredients to fine powder, sift and mix well. Make pills with water and dry.

Description Yellow to yellowish-brown watered pills; taste, bitter.

Identification (1) Microscopical: Fibre bundles bright yellow, surrounded by cells containing prisms of calcium oxalate, forming crystal fibre, crystal cell walls lignified and thickened. Bast fibres pale yellow, fusiform, walls thickened with fine pit-canals. Clusters of calcium oxalate, 18-32 μm in diameter, occurring in parenchymatous cells, often arranged in rows or several clusters in one cell. Stone cells subrounded or subpolygonal, lumina containing prisms of calcium oxalate. Irregular masses greyish-yellow, with fine striations or pores. Secretory cells subrounded, containing yellowish-brown to reddish-brown secretions, surrounded by cells arranged radially.
(2) Pulverize well 10 g of the pills, add 50 ml of ether, stopper closely, macerate for 1 hour, shaking constantly and filter. Evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of ethyl acetate as the test solution. Dissolve a quantity of α-cyperone CRS in ethyl acetate to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (17 : 3) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. Spray with dinitrophenylhydrazine TS. Examine under sunlight, the spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Grind well 0.5 g of the pills, add 10 ml of methanol, ultrasonicate for 15 minutes and filter, use the filtrate as the test solution. Dissolve a quantity of berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia (12 : 6 : 3 : 3 : 1) as the mobile phase, pre-equilibriated the chamber with ammonia for 15 minutes. Apply separately 2 μl of the test solution and 1 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The yellow fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(4) To the drug residue, obtained under Identification (2) and extracted with ether, add 20 ml of ethanol, ultrasonicate for 15 minutes and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethanol as the test solution. Dissolve a quantity of paeoniflorin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 8 μl of the test solution and 4 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulfuric acid and visualize under a current of hot air. The bluish-purple colour spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To nourish *yin* and clear heat, and to arrest uterine bleeding and leukorrhagia.

Indications Advanced menstrual cycles with profuse menstrual blood, dark purple in colour, or red and white leukorrhea due to heat in the blood from *yin* deficiency.

Usage and dosage 6 g, twice a day.

Storage Preserve in well closed containers, protected from moisture.

Guogong Jiu (国公酒)

Guogong Wine

Ingredients Radix Angelicae Sinensis; Rhizoma et Radix Notopterygii; Radix Achyranthis Bidentatae; Radix Saposhnikoviae; Radix Angelicae Pubescentis; Cortex Moutan; Herba Pogostemonis; Semen Arecae; Radix Ophiopogonis; Pericarpium Citri Reticulatae; Cortex Acanthopanacis; Cortex Magnoliae Officinalis (processed with ginger juice); Flos Carthami; Rhizoma Arisaematis (processed with alum); Fructus Lycii; Radix Angelicae Dahuricae; Radix Paeoniae Alba; Radix Arnebiae seu Lithospermi; Fructus Psoraleae (processed with salt); Pericarpium Citri Reticulatae Viride (stir-baked with vinegar); Rhizoma Atractylodis Macrocephalae (stir-baked with bran); Rhizoma Chuanxiong; Fructus Chaenomelis; Fructus Gardeniae; Rhizoma Atractylodis (stir-baked); Fructus Aurantii (stir-baked with bran); Radix Linderae; Fructus Citri Sarcodactylis; Rhizoma Polygonati Odorati; Semen Oryzae cum Monasci Medicata Fermentata Rubra.

Procedure Extract the above thirty ingredients and a quantity of honey and brown sugar under reflux for three times, 40 minutes for the first time and 30 minutes each for the second time and the third time, filter, combine the filtrate and allow to stand for 3-4 months. Filter the supernatant, fill the filtrate into bottles and seal.

Description A dark red, clear liquid; odour, aromatic; taste, pungent, sweet and slightly bitter.

Identification (1) Evaporate 100 ml on a water bath until no ethanol smell is perceptible, cool, and wash with 15 ml of water, in portions, place to a separating funnel. Extract with successive quantities of 15, 10, 10 ml of ether, combine the ether extracts and recover the ether. Dissolve the residue in 1 ml of ethanol as the test solution. To 1 g of Fructus Citri Sarcodactylis reference drug add 10 ml of ethanol, stopper well, shake constantly, and macerate overnight, filter. Use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and ethyl acetate (9 : 1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) Extract the remained water solution extracted with ether obtained under Identification (1) with successive quantities of 15, 10, 10 ml of ethyl acetate. Combine the extracts and evaporate to dryness. Dissolve the residues in 5 ml of methanol as the test solution. Dissolve a quantity of hesperidin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 0.5% solution sodium hydroxide as the coating substance and a mixture of ethyl acetate, methanol and water (100 : 17 : 13) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing to 3 cm and removal of the plate, dry in air. Develop again to 8 cm using the upper layer of a mixture of toluene, ethyl acetate, formic acid and water (20 : 10 : 1 : 1) as the mobile phase. Remove and dry the plate in air. Spray with 1% aluminium chloride in methanol, dry with a current of hot air, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Extract the remained aqueous solution obtained under Identification (2) with two quantities of *n*-butanol saturated with water (15, 10 ml). Combine the extracts and evaporate to dryness. Dissolve the residue in 10 ml of ethanol, add 1 ml of hydrochloric acid, heat under reflux for 1 hour, then concentrate to 5ml and add 10 ml of water. Extract with 20 ml of petroleum ether (60-90℃), evaporate to dryness. Dissolve the residue in 0.5 ml of ethanol as the test solution. Dissolve a quantity of oleanolic acid CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (40 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with phosphomolybdic acid TS and heat at 105℃ for 5 minutes. The blue spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Evaporate the aqueous solution obtained under Identification (3), remove *n*-butanol on a water bath, add 10 ml of water and mix well. Apply to the column packed with cation exchange resin (model 732), elute with water until the eluate clear, then elute with 100 ml of 3.5% ammonia solution. Evaporate the eluate to dryness under reduced pressure. Dissolve the residue in 2 ml of methanol as the test solution. Dissolve a quantity of synephrine CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, acetone, methanol and 12% ammonia solution (3 : 3 : 3 : 1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 0.5% ninhydrin in ethanol, and heat at 105℃ for 5 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Ethanol content 55%-60% (Appendix Ⅸ M).

Other requirements Comply with the general requirements for medicinal wines (Appendix Ⅰ M).

Action To disperse *wind* and expel *dampness*, and relax muscles and tendons and activate meridians.

Indications Impediment disease due to *wind*, *cold* and *dampness* with manifestations of painful and leaden joints with difficult impeded movement, numbness of limbs, painful lower back and legs; hemiplegia due to disorders of meridians, deviated mouth and eye, and flaccidity and weakness of the lower limbs.

Usage and dosage 10 ml, twice a day.

Precaution Contraindicated for pregnant women.

Storage Preserve in tightly closed containers, protected from exposure to sunlight.

Heche Dazao Wan
(河车大造丸)

Heche Dazao Pills

Ingredients Placenta Hominis 100 g; Radix Rehmanniae praeparata 200 g; Radix Asparagi 100 g; Radix Ophiopogonis 100 g; Cortex Eucommiae (stir-baked with salt-water) 150 g; Radix Achyranthis Bidentatae (stir-baked with salt-water) 100 g; Cortex Phellodendri Chinensis (stir-baked with salt-water) 150 g; Carapax et Plastrum Testudinis (processed with vinegar) 200 g.

Procedure Pulverize the above eight ingredients to fine powder, sift, and mix well. To each 100 g of the powder add 30-40 g of refined honey and a quantity of water to make to water-honeyed pills, dry; or add 80-100 g of refined honey to make to small or big honeyed pills.

Description Blackish-brown water-honeyed pills, small honeyed pills or big honeyed pills; odour, slightly aromatic; taste, bitter, sweet.

Identification (1) Microscopical: Fibre bundles bright yellow, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres, walls of crystal cells lignified and thickened. Stone cells rectangular or slat-shaped, 50-110 μm in diameter, finely and densely pitted. Stone cells subsquare or rectangular, 30-64 μm in diameter, walls relatively thickened; some thin at one side, pits fine and dense. Sand crystals of calcium oxalate occurring in parenchymatous cells. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Rubber thread strip-shaped or twisted into masses but granular on surface. Irregular masses with uneven surface, sometimes with concentric striations. Irregular pieces greyish-yellow with fine striations or pores.
(2) Pound 10 g with a quantity of water into pieces, add 100-200 ml of water, stir, allow to stand to precipitate. To the yellow precipitate add 10 ml of water, boil and filter. To 2-3 ml of the filtrate add an equal volume of 10% solution of sodium hydroxide, shake well, add dropwise 0.5% solution of cupric sulphate with shaking; a purple or purplish-red colour is produced immediately.
(3) Grind 5 g of small or big honeyed pills, cut into pieces, with 5 g of kieselguhr, or pulverize 3 g of the water-honeyed pills, add 15 ml of ether, ultrasonicate for 15 minutes and filter. To the residue, evaporated ether, add 10 ml of methanol, ultrasonicate for 15 minutes, filter and concentrate the filtrate to about 1 ml as the test solution. Prepare a solution of 0.1 g of Cortex Phellodendri Chinensis reference drug in the same manner as the reference drug solution. Dissolve a quantity of berberine hydrochloride CRS and palmatine hydrochloride CRS in methanol to produce a mixture containing 0.5 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately 2 μl of each of the three solutions to the plate. After developing in a chamber pre-equilibrated with ammonia vapour and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The main fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.
(4) Grind 10 g of small or big honeyed pills, cut into pieces, with 5 g of kieselguhr; or pulverize 6 g of the water-honeyed pills. Add 30 ml of ethanol and ultrasonicate for 30 minutes, filter, wash the residue with ethanol to about 30 ml, add 2 ml of hydrochloric acid, heat under reflux for 1 hour, concentrate the filtrate to about 5 ml, add 10 ml of water, extract with 20 ml of petroleum ether (60-90℃), recover petroleum ether from the filtrate and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve a quantity of oleanolic acid CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of chloroform and methanol (40 : 1) as the mobile phase. Apply separately 2 μl of the test solution and 4 μl of the reference solution to the plate. After developing in a chamber pre-equilibrated with the mobile phase and removal of the plate, dry in air. Spray with phosphomolybdic acid TS and heat at 110℃ for about 10 minutes. The blue spot in chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To nourish *yin* and clear *fire*, and reinforce the *kidney* and *lung*.

Indications Coughing in consumptive diseases, bone-steaming with hectic fever, night sweating and seminal emission, and aching and weakness in the lower back and knees due to deficiency in the lung and kidney.

Usage and dosage 6 g of water-honeyed pills; 9 g of small honeyed pills; or 1 pill for big honeyed pills; twice a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Hedan Pian
(荷丹片)

Hedan Tablets

Ingredients Folium Nelumbinis; Radix Salviae Miltiorrhizae; Fructus Crataegi; Folium Sennae; Fructus Psoraleae (stir-baked with salt water).

Procedure Macerate Folium Sennae with 90℃ of hot water 3 times, 30 minutes for each time, combine the macerating solution and filter, reserve the filtrate for later use. Pulverize Radix Salviae Miltiorrhizae to coarse powder, heat the powder under reflux with ethanol for 1.5 hours, filter, recover the ethanol, and reserve for later use. Decoct Folium Nelumbinis, Fructus Crataegi, Fructus Psoraleae and the residue of Radix Salviae Miltiorrhizae with water twice, 2 hours for each time; filter, combine the filtrate and concentrate it to a thin extract with a relative density of 1.20 (60℃); allow to stand until the temperature drop to 40℃, add two volumes of ethanol, stir thoroughly. Allow to stand for 48 hours, filter the supernatant, and recover the ethanol of the filtrate. Combine this solution with the above ethanol extract of Radix Salviae Miltiorrhizae, concentrate to an appropriate amount, dry in spraying; add a quantity of excipient, mix thoroughly and make to granules. Make to 2500 tablets, coated with sugar; or make to 1000 tablets, coated with film.

Description Sugar coated or film coated tablets with brown to dark brown core; taste, slightly bitter.

Identification (1) Place 10 tablets, coated with sugar, or 4 tablets, coated with film, remove the coats, triturate to fine powder; add 10 ml of ammonia TS, and extract with three 30-ml quantities of chloroform, combine the chloroform solution and concentrate to about 10 ml. Extract the chloroform solution with 5 ml of 0.01 mol/L solution of hydrochloric acid, discard the chloroform, and adjust the pH value of the acidic solution to 9-10 with concentrated ammonia TS, extract with three 10-ml quantities of chloroform, combine the chloroform and evaporate to dryness; dissolve the residue in 1 ml of chloroform as the test solution. Dissolve a quantity of nuciferine CRS in chloroform to prepare a solution containing 0.1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of *n*-butanol, acetic acid and water (4 : 1 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, and dry in air. Spray with dilute potassium iodobismuthate TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Place 5 tablets, coated with sugar, or 2 tablets, coated with film, remove the coats, triturate to fine powder; add 30 ml of a mixture of methanol and ethyl acetate (1 : 1), and heat under reflux for 15 minutes, allow to stand to cool, and filter; evaporate the filtrate to dryness, dissolve the residue in 2 ml of methanol as the test solution. Dissolve a quantity of psoralen CRS and isopsoralen CRS in methanol to prepare a mixture containing 0.4 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxyme thylcellulose as the coating substance and a mixture of *n*-hexane and ethyl acetate (4 : 1) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, and dry in air. Spray with 4% sodium hydroxide in ethanol and examine under ultraviolet light at 365nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Heat under reflux of 0.5 g of Folium Sennae with 15 ml of methanol for 15 minutes, allow to stand to cool and filter, evaporate the filtrate to dryness; dissolve the residue in 15 ml of water and filter, extract the filtrate with two 15-ml quantities of chloroform, combine the chloroform and extract with 25 ml of 5% solution of sodium carbonate, discard the chloroform, adjust pH to 2 with hydrochloric acid, then extract with 30 ml of chloroform, wash the chloroform extract with two 30-ml quantities of water; evaporate the chloroform to dryness, dissolve the residue in 1 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of *n*-hexane, ethyl acetate and formic acid (3 : 1 : 0.1) as the mobile phase. Apply separately 10 μl of each of the test solution, obtained under Identification (2), and the reference drug solution to the plate. After developing and removal of the plate, and dry in air. The spots in the chromatogram obtainde with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution; the spot turn into red on exposure to ammonia vapour.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilance bonded silica gel as the stationary phase and a mixture of acetonitrile, triethylamine, glacial acetic acid and water (27 : 1.8 : 0.78 : 70.6) as the mobile phase. As detector a spectrophotometer set at 270nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of nuciferine.

Reference solution Dissolve a quantity of nuciferine CRS, accurately weighed, in ethanol to prepare a solution containing 16 μg per ml.

Test solution place 20 tablets, removed the coats, weigh accurately and triturate to fine powder; weigh accurately 0.4 g of the powder, macerate with 5 ml of ammonia TS, heat under reflux with 60 ml of chloroform for 3 hours; allow to stand to cool and transfer to a separating funnel, separate the chloroform, and extract the water layer with three 25-ml quantities of chloroform, combine the chloroform and evaporate to dryness. Dissolve the residue in ethanol and transfer to a 10 ml of volumetric flask, dilute with the same solvent to the volume; filter, and use the successive filtrate as the test solution.

Procedures Inject accurately 20 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.10 mg of nuciferine ($C_{19}H_{21}NO_3$) per tablet for sugar coating tablets, or not less than 0.25 mg per ml for film coating tablets, referred to Folium Nelumbinis.

Action To resolve *phlegm* and send down turbidity, and promote blood circulation to resolve stasis.

Indications Hyperlipemia due to *phlegm* and stasis.

Usage and dosage 5 tablets of sugar-coated tablets, 2 tablets of film-coated tablets; 3 times a day, taken on an empty stomach, 8 weeks making one course of treatment or follow doctor's advice.

Precaution Diarrhea, nausea and thirsty are seen sometimes. It is forbidden to prescribe to patients with loose stools and pregnant women.

Strength 0.73 g per tablet for film coating tablets

Storage Preserve in tightly closed containers.

Heye Wan
(荷叶丸)

Heye Pills

Ingredients Folium Nelumbinis 320 g; Nodus Nelumbinis Rhizomatis 64 g; Herba seu Radix Cirsii Japonici (carbonized) 48 g; Herba Cirsii (carbonized) 48 g; Rhizoma Anemarrhenae 64 g; Radix Scutellariae (carbonized) 64 g; Radix Rehmanniae (carbonized) 96 g; Petiolus Trachycarpi (carbonized) 96 g; Fructus Gardeniae (charred) 64 g; Rhizoma Imperatae (carbonized) 96 g; Radix Scrophulariae 96 g; Radix Paeoniae Alba 64 g; Radix Angelicae Sinensis 32 g; Chinese Ink 8 g.

Procedure Carbonize 160 g of Folium Nelumbinis. Mix the other 160 g of Folium Nelumbinis with 240 g of yellow rice wine in a well closed container, stew on a water bath until the wine is absorbed, and dry at a lower temperature. Pulverize both the processed Folium Nelumbinis and the other thirteen ingredients to fine powder, sift, and mix

well. To each 100 g of the powder add 140-150 g of refined honey to make big honeyed pills.

Description Black big honeyed pills; odour, slight; taste, sweet, then slightly bitter.

Identification (1) Microscopical: Starch granules nearly oblong, slightly broad at one end, some prominent at one side, up to about 30 μm in diameter, hilum V-shaped or cleft at the broad end, striations distinct. The upper epidermal cells of leaf polygonal, and the outer walls papillated. Clusters of calcium oxalate up to about 40 μm in diameter, occurring in mesophyll. Needle crystals of calcium oxalate in bundles or scattered, 26-110 μm long. Clusters of calcium oxalate 18-32 μm in diameter, occurring in parenchymatous cells, usually in rows or several clusters in one cell. Phloem fibres pale yellow, fusiform, walls thickened, with fine pit canals. Fibre bundles brown, rounded cells on the surface containing silica bodies. Stone cells of testa yellow or pale brown, mostly broken, when whole, long polygonal, rectangular or irregular, walls thickened, with big rounded pits, lumina brownish-red. Stone cells yellowish-brown or colourless, subrectangle, subrounded or irregular, with distinct striations, up to about 94 μm in diameter. Epidermal cells arranged longitudinally, with 1 long cell connected with 2 short cells; walls of long cells sinuous, slightly thickened, and lignified. Irregular masses brownish-black or black.
(2) Grind well 18 g of the pills, cut to pieces, with 15 g of kieselguhr, add 100 ml of ether, allow to stand for 1 hour and shake constantly. Filter and evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethanol as the test solution. To 0.2 g of Radix Angelicae Sinensis reference drug, add 10 ml of ethanol, ultrasonicate for 5 minutes, filter and use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply 2 μl of the test solution and 1 μl of the reference drug solution separately to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(3) Heat under reflux 18 g of the pills, cut to pieces and ground well with 15 g of kieselguhr, in 100 ml of ethanol for 1 hour. Filter and evaporate the filtrate to dryness, macerate the residue in ether for three times, 15 ml for each (about 3 minutes), discard the ether solution. Dissolve the residue in 30 ml of water, add 1 ml of hydrochloric acid and heat under reflux for 1 hour. Allow to cool, transfer to a separating funnel, extract with three 20-ml quantities of *n*-butanol. Combine the *n*-butanol extracts and evaporate to dryness, and dissolve the residue with 5 ml of ether. Apply the ether solution to a column packed with aluminium oxide (200-300 mesh, 5 g, 1 cm in diameter), elute with 15 ml of ether, collect the eluate, evaporate to dryness and add 1 ml of ethanol to dissolve the residue as the test solution. Dissolve a quantity of sarsasapogenin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and acetone (9 : 1) as the mobile phase. Apply 10 μl of the test solution and 2 μl of the reference drug solution separately to the plate. After developing and removal of the plate, dry in air, spray with a freshly prepared mixture solution of 8% vanillin in a mixture of dehydrated ethanol and sulfuric acid (7→10) (5 : 1), visualize with a current hot air to the spots clear. The yellow spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for High performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (15 : 85) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of paeoniflorin.

Reference solution Weight accurately a quantity of paeoniflorin CRS, dissolve in methanol to produce a solution containing 50 μg per ml.

Test solution Weigh accurately 5 g, obtained under the test of weight variation and cut into pieces, to a stopper conical flask, accurately add 50 ml of methanol, stopper and weight, ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, allow to cool, weight again, replenish the loss weight of solvent with methanol, mix well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.
It contains not less than 2.0 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per pill, referred to Radix Paeoniae Alba.

Action To cool blood and arrest bleeding.

Indications Hemoptysis, epistaxis, hematuria, hematochezia, metrorrhagia and metrostaxis.

Usage and dosage 1 pill, 2-3 times a day.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Hongling San
(红灵散)

Hongling Powder

Ingredients Moschus 60 g; Realgar 120 g; Cinnabaris 200 g; Borax 120 g; Lapis Micae Aureus (calcined) 80 g; Saltpetre (refined) 200 g; Borneolum Syntheticum 60 g.

Procedure Levigate Realgar and Cinnabaris to very fine powder. Pulverize Borax, Lapis Micae Aureus and Saltpetre to fine powder. Triturate Moschus and Borneolum Syntheticum with the powders mentioned above, sift and mix well.

Description A brown to reddish-brown powder; odour, strongly aromatic; taste, slightly bitter.

Identification (1) Microscopical: Amorphous masses pale yellowish-brown, embedded with small prisms.
(2) Heat 0.6 g in a crucible. Cover the crucible with a piece of slide while fuming and heat until the combustion finish. Cool for a while, remove the slide into a beaker, add separately 5 ml of water to dissolve the residue in the crucible and the condensate on the slide. Add 0.5 ml of acidic stannous chloride TS and 1.5 ml of hydrochloric acid respectively to both the beaker and the crucible, heat over a small flame to boil gently. Cool for a while, put a piece of polished and clean copper plate (treated with nitric acid, cleaned and abraded with fine abrasive paper) to each container respectively. After the colour of copper plates

changed, take it out, wash and absorb the water on the surface of the copper plates with filter paper. The copper plate in the crucible shows silver-white, while the copper plate in the beaker shows black or blackish-grey colour.
(3) Place 0.5 g in a crucible, cover it with a watch glass and heat with a small flame for sublimation. To the sublimate add 1-2 drops of 1% solution of vanillin in sulfuric acid, a pink colour is produced gradually on the border of the drop.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Action To expel *summer-heat*, resuscitate, and cure epidemics and relieve *toxicity*.

Indications Syncope due to sunstroke, dizziness, constriction in the chest, nausea, vomiting, abdominal pain with diarrhea.

Usage and dosage 0.6 g, once a day.

Precaution Contraindicated for pregnant women.

Storage Preserve in tightly closed containers.

Hongyao Tiegao (红药贴膏)

Hongyao Plaster

Ingredients Radix et Rhizoma Notoginseng; Radix Angelicae Dahuricae; Eupolyphaga seu Steleophaga; Rhizoma Chuanxiong; Radix Angelicae Sinensis; Flos Carthami; Borneolum Syntheticum; Camphorum; Methyl Salicylate; Mentholum; Extractum Belladonnae Liquidum; Chondroitin Sulfate; Benadryl hydrochloride.

Procedure Break Radix et Rhizoma Notoginseng, Radix Angelicae Dahuricae, Eupolyphaga seu Steleophaga, Rhizoma Chuanxiong, Radix Angelicae Sinensis and Flos Carthami into pieces, extract with 90% ethanol under reflux three times, using 4 times volume of ethanol for 2 hours for the first time, and 3 times volume of ethanol for 1 hour for the second and third time respectively. Allow to stand and filter after each extraction. Combine the filtrates, recover ethanol, concentrate in vacuum to a extract with a relative density of 1.30-1.40 (40℃). To the matrix prepared with rubber and zinc oxide, add the above extract and other seven ingredients, and quantities of dimethyl sulfoxide, essence and carmine, stir well to prepare coating material. Spread the paste, cover with lining and cut into pieces.

Description Pale red pieced plasters; odour, aromatic.

Identification (1) To 1 piece of the drug, removed of the covering liner and cut into pieces, in a conical flask with a stopper, add 30 ml of ethanol, ultrasonicate for 15 minutes, filter and evaporate the filtrate to dryness on a water bath at 40℃, dissolve the residue in 5 ml of petroleum ether (30-60℃), use the supernatant as the test solution. To 0.5 g of each of Radix Chuanxiong reference drug and Radix Angelicae Sinensis reference drug, add 10 ml of petroleum ether (30-60℃), respectively, ultrasonicate for 15 minutes, filter, and use the filtrate as the reference drug solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (17 : 3) as the mobile phase. Apply separately 3 μl of the test solution and the reference drug solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solutions.
(2) Dissolve a quantity of a mixture of (±)-borneol and (±)-isoborneol CRS, and menthol CRS in petroleum ether (30-60℃), respectively, to produce two solutions each containing 1 mg per ml as the reference solutions. Carry out the method for gas chromatography (Appendix Ⅵ E). Using 10% polyethylene glycol (PEG)-20M as the stationary phase; maintain the column temperature at 120℃. Inject 1-2 μl of each of the reference solutions and the test solution obtained under Identification (1), separately, into the column. The retention time of the peaks in the chromatogram obtained with the test solution correspond to that in the chromatogram obtained with the reference solutions.

Plaster content Not less than 1.6 g per 100 cm^2 of the plaster (Appendix Ⅰ I).

Other requirements Complies with the general requirements for adhesive plasters of cataplasms (Appendix Ⅰ I).

Action To expel *cold* and generate new blood, and promote blood circulation to kill pain.

Indications Traumatic injury and painful tendons and bones.

Usage and dosage For external use, wash the affected part clean and apply the plaster on, changed the plaster every 1-2 days.

Precaution Be cautious about patients who are sensitive to adhesive plasters or have skin lesion with beleeding.

Storage Preserve in a shady, cool and dry place.

Houtou Jianweiling Jiaonang (猴头健胃灵胶囊)

Houtou Jianweiling Capsules

Ingredients Extractum Hericii Fermentatum; Endoconcha Sepiae; Rhizoma Corydalis (processed); Radix Paeoniae Alba (processed); Rhizoma Cyperi (processed) and Radix et Rhizoma Glycyrrhizae Preparata.

Procedure Decoct Extractum Hericii Fermentatum for 2 times, 2 hours for each time, combine the decoction, filter and concentrate the filtrate to a thin extract with a relative density of 1.04 (70℃). Stand for 24 hours, filter, concentrate the filtrate to a thin extract with a relative density of 1.30 (70℃). To each 100g of the thin extract add 50 g of excipient, mix thoroughly, dry and pulverize to fine powder. Pulverize the other five ingredients to fine powder, sift, mix thoroughly and sterilize. Mix with the above powder and pack.

Description Capsules with content of brown powder; odour, aromatic; taste, sweet, slightly bitter.

Identification (1) To 1 g of the content add 5 ml of water, heat on a 50-60℃ water bath for 1 hour and filter. To the filtrate add 10 ml of alkaline cupric tartrate TS, heat on a water bath for 10 minutes, allow to cool, and filter. To a small quantity of the filtrate add same volume of alkaline cupric tartrate TS, treat as the above method; no precipitate is produced. To a small quantity of the filtrate add 2 ml of hydrochloric acid, boil for 20 minutes, allow to cool, add sodium hydroxide TS to alkalize the solution and add a quantity of alkaline cupric tartrate TS, heat on a water bath for 10 minutes, an orange precipitate is produced.
(2) Heat under reflux about 3.5 g of the content with 60 ml of 70% ethanol for 30 minutes, filter, concentrated the filtrate to about 5ml, filter and use the filtrate as the test solution. Dissolve separately a quantity of glycine CRS, threonine CRS, leucine CRS, valine CRS and histidine CRS

in 70% ethanol to produce the reference solutions respectively each containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substances and a mixture of *n*-butanol, glacial acetic acid and water (8 : 3 : 1) as the mobile phase. Apply separately to the plate 5μl of the test solution and 1 μl of each of the reference solutions. After developing and removal of the plate, dry in air. Spray with 0.2% ninhydrine in ethanol, heat at 105℃ to spots distinct. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

(3) To 5 g of the content add 50 ml of methanol, ultrasonicate for 30 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in a quantity of water, adjust to alkaline with concentrated ammonium TS, and extract with three 10-ml quantities of ether. Combine the ether extracts and evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 1 g of Rhizoma Corydalis reference drug in the same manner as the reference drug solution. Dissolve a quantity of tetrahydropalmatine CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅳ B), using silica gel G mixed with a solution of 1% sodium hydroxide as the coating substances, and a mixture of *n*-hexane, chloroform and methanol (15 : 8 : 2) as the mobile phase. Apply separately 2 μl of each of the above three solutions to the plate. After developing and removal of the plate, dry in air. Expose to iodine vapor to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solulion and the reference solution. Examine under ultraviolet light at 365 nm after expelling the absorbed iodine, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Loss on drying When dried to constant weight at 105℃, loses not more than 8.0 per cent of its weight (Appendix Ⅸ G).

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (25 : 75) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of paeoniflorin.

Reference solution Weigh accurately a quantity of paeoniflorin CRS, dissolve with the mobile phase to produce a solution containing 20 μg per ml as the reference solution.

Test solution Weigh accurately 0.5 g of the content, obtained under the test of Packing variation, in a conical flask, add accurately 50 ml of dilute ethanol TS, weigh, shake thoroughly, ultrasonicate for 30 minutes, allow to cool, weigh again and replenish the lost weight with the same solvent. Stand for 30 minutes, shake, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and caculate the content.

It contains not less than 0.40 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per capsule, referred to Radix Paeoniae Alba.

Action To soothe the liver and harmonize the stomach, and regulate *qi* flow to kill pain.

Indications Distending pain in the stomach and hypochondria, vomiting, casting up of gastric acid due to disharmony between the liver and stomach, chronic gastritis, gastroduodenal ulcer with above symptoms.

Usage and dosage 4 capsules, 3 times a day; or follow doctor's advice.

Strengh 0.34 g per capsule

Storage Preserve in well closed containers.

Huaijiao Wan (槐角丸)

Huaijiao Pills

Ingredients Fructus Sophorae (stir-baked) 200 g; Radix Sanguisorbae (carbonized) 100 g; Radix Scutellariae 100 g; Fructus Aurantii (stir-baked) 100 g; Radix Angelicae Sinensis 100 g; Radix Saposhnikoviae 100 g.

Procedure Pulverize the above six ingredients to fine powder, sift and mix well. To each 100 g of the powder add 45-55 g of refined honey and a quantity of water to make water-honeyed pills and dry; or add 130-150 g of refined honey to make small honeyed pills or big honeyed pills.

Description Blackish-brown to black water-honeyed pills, small honeyed pills or big honeyed pills; taste, bitter and astringent.

Identification (1) Microscopical: Palisade cells of testa 1 row, 100-190 μm long. Fibres slender, slightly curved, with slightly thickened and unlignified walls. Phloem fibres pale yellow, fusiform, walls thickened, with fine pit-canals. Vittae containing golden secretion, about 30 μm in diameter.

(2) Grind 9 g of the big honeyed pills or small honeyed pills, cut into pieces, with a equal quantity of kieselguhr, or pulverize 5 g of the water-honeyed pills, add 30 ml of methanol, ultrasonicate for about 20 minutes, and filter. Evaporate the filtrate to dryness. Dissolve the residue with 10 ml of water, then add 3 drops of concentrated ammonia TS, and filter. Add 3 drops of hydrochloric acid to the filtrate, centrifugalize, discard the supernatant. Add 2 ml of the methanol to the precipitate, filter, use the filtrate as the test solution. Dissolve a quantity of baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, formic acid, methanol and water (6 : 0.3 : 2 : 1) as the mobile phase. Apply separately to the plate 10 μl of the test solution and 5 μl of the reference solution. After developing and removal of the plate, dry in air. Spray with 2% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Grind 4 g of the big honeyed pills or small honeyed pills, cut into pieces, with a equal quantity of kieselguhr, or pulverize 2.5 g of the water-honeyed pills, add 15 ml of ethanol, macerate for about 1 hour with shaking constantly, filter, and use the filtrate as the test solution. Prepare a solution of 0.2 g of Radix Angelicae Sinensis reference drug and 15 ml of ethanol in the same manner as the reference

drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixtrue of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Grind 4 g of the big honeyed pills or small honeyed pills, cut into pieces, with a equal quantity of kieselguhr, or pulverize 2.5 g of the water-honeyed pills, heat under reflux in 20 ml of chloroform and 1 ml of concentrated ammonia TS for 1 hour, and filter. Evaporate the filtrate to dryness. Dissolve the residue in 1ml of methanol as the test solution. Prepare a solution of 0.5 g of Radix Saposhnikoviae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (4 : 1) as the mobile phase. Apply separately to the plate 10 μl of the test solution and 2 μl of the reference drug solution. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The bluish-purple colour fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(5) Grind 1.5 g of water-honeyed pills; or grind 2 g of small honeyed pills or big honeyed pills, cut into pieces, with equal portion of kieselguhr. Macerate the powder in 20 ml of petroleum ether (30-60℃) for 2 hours, with frequently shaking, filter and discard the petroleum ether solution. To the residue, expel the solvent, add 20 ml of methanol, ultrasonicate for 30 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of water, apply to a column (0.8-1 cm in inner diameter), packed with 2 g of polyamide (40 mesh). Elute with 50 ml of water, discard the water eluate, then elute with 50 ml of ethanol. Collect the ethanolic eluate, evaporate to dryness, dissolve the residue in 1 ml of methanol, used as the test solution. Dissolve a quantity of rutin CRS in methanol to produce a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of ethyl acetate, formic acid and water (8 : 1 : 1) as the mobile phase. Apply separately 3 μl of test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% aluminum chloride in ethanol, heat to the spots distinct, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and glacial acetic acid (46 : 54 : 1) as the mobile phase. As detector a spectrophotometer set at 280 nm, The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin CRS, dissolve in 50% methanol to produce a solution containing 30 μg per ml.

Test solution Pulverize a quantity of water-honeyed pills to a fine powder and mix well, sift through a No. 3 sieve. To 1 g of the powder, weighted accurately, in a 100 ml volumetric flask, add 80 ml of 50% methanol; or grind 1 g of small honeyed pills or big honeyed pills obtained under the test of Weight variation, cut into pieces and weight accurately, in a mortar with 80 ml of 50% methanol by several times, transfer to a 100 ml volumetric flask. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 1 hour, allow to cool, dilute with 50% methanol to volume, shake thoroughly and filter. Measure accurately 5 ml of the successive filtrate in a 10 ml volumetric flask, dilute with 50% methanol to volume, shake thoroughly, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, into the column, and calculate the content.

It contains not less than 2.8 mg of baicalin ($C_{21}H_{18}O_{11}$) per gram for water-honeyed pills, and 4.0 mg per gram for small honeyed pills, and 36.0 mg per big honeyed pill, referred to Radix Scutellariae.

Action To clear intestines and disperse *wind*, and cool blood to stop bleeding.

Indications Passing of bloody stools and swollen painful hemorrhoids due to *blood-heat*.

Usage and dosage 6 g of water-honeyed pills; 9 g of small honeyed pills, 1 big honeyed pill; 2 times a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Huaji Koufuye (化积口服液)

Huaji mixture

Ingredients Poria (peeled); Endoconcha Sepiae; Endothelium Corneum Gigeriae Galli (stir-baked); Rhizoma Sparganii (processed with vinegar); Rhizoma Curcumae (processed with vinegar); Flos Carthami; Semen Arecae; Omphalia; Fructus Carpesii; Fructus Quisqualis;

Procedure Pulverize Omphalia and Endothelium Corneum Gigeriae Galli to coarse powder, macerate with warm water for 2 hours, and filter. Distill the residue and the other ingredients with a quantity of water for 2 times, combine the distillate. Decant the water decoction in the residual drug, filter, combine the filtrate, and concentrate. Add ethanol to adjust a content of 65% ethanol, refrigerate overnight, filter, recover ethanol, and dilute with a quantity of water, refrigerate overnight and filter. Make a sugar syrup with 340 g of sucrose, add the above filtrate and 0.5 g of ethyl *p*-hydroxybenzoate, mix well, heat to boil. Allow to cool to 60℃, add the maceration extract, the distillate, and 1ml of orange essence, dilute with water to 1000ml, mix well, and pack.

Description A clear, yellowish-brown liquid; odour, faint aromatic; taste, sweet and slightly bitter.

Identification (1) Extract 140 ml of the mixture with three 90-ml quantities of ether and 2ml of saturated sodium chloride solution, collect the ether extract, evaporate to dryness at a lower temperature. Dissolve the residue in 0.5

ml of *n*-hexane as the test solution. Heat under reflux 4g of Poria reference drug with 50 ml of ether for 1 hour, filter and evaporate to dryness at a lower temperature, dissolve the residue in 0.5 ml of *n*-hexane as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃), acetone and ethyl acetate (84 : 15 : 1) as the mobile phase, pre-equilibrated for 15 minutes. Apply separately 40 μl of the test solution and 30 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution.

(2) Extract 90 ml of the mixture with three 60-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extract, and evaporate to dryness. Dissolve the residue in 1ml of methanol, centrifuge, and use the supernatant as the test solution. Decoct 1.5 g of Flos Carthami reference drug with 250 ml of water for 1 hour, filter through absorbent cotton immediately. Concentrate the filtrate to about 10 ml, add 10 ml of ethanol, mix well, precipitate, filter, and evaporate the filtrate to dryness. Dissolve the residue in 10 ml of water, prepare a solution in the same manner as above, beginning at the words "extract with three 60-ml quantities of *n*-butanol saturated with water", as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and ether (3 : 2) as the mobile phase, pre-equilibrated for 15 minutes. Apply separately 5 μl of the test solution and 10 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Expose the plate to ammonia vapour for 15 minutes, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Extract 60 ml of the mixture with two 40-ml quantities of ethyl acetate, combine the ethyl acetate extract and apply to a column (1.2 cm in diameter) packed with neutral aluminum oxide (100-200 mesh, 10 g), collect the ethyl acetate, evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Decoct 1 g of Fructus Carpesii reference drug with 60 ml of water for 30 minutes, filter, to filtrate add 2 times volume of ethanol, filter and evaporate the filtrate to no ethanolic smell, add water to 40 ml, extract with ethyl acetate and prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of toluene, ethyl acetate and glacial acetic acid (5 : 4 : 0.1) as the mobile phase. Apply separetely 10 μl of the test solution and 5 μl of the reference drug solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solutions.

Relative density Not less than 1.10 (Appendix Ⅶ A).

pH value 5.5-7.5 (Appendix Ⅶ G).

Other requirements Complies with the general requirements for mixtures (Appendix Ⅰ J).

***n*-Butanol extractives** Extract 50 ml of the mixture, measured accurately, with five 20-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extract, evaporate the *n*-butanol extract in an evaporating dish, previously dried to constant weight, to dryness, dry at 105℃ for 3 hours and allow to cool in a desiccator for 30 minutes, weight accurately and rapidly.

It contains not less than 0.60 per cent of *n*-butanol extractives.

Action To invigorate the spleen to clear retained food, and promote digestion to treat child malnutrition.

Indications Child malnutrition due to deficiency in the spleen and stomach, with manifestations of emaciation and shallow complexion, distending pain in the abdomen, anorexia or poor appetite and bowels disorders.

Usage and dosage 5 ml, twice a day for infants within 1 year old; 10 ml, twice a day for children from 2 to 5 years old; 10 ml, 3 times a day for children over 5 years old; or follow doctors' advice.

Strength 10 ml per phial

Storage Preserve in well closed containers, and store in a cool place.

Huanglian Shangqing Wan (黄连上清丸)

Huanglian Shangqing Pills

Ingredients Rhizoma Coptidis 10 g; Fructus Gardeniae (processed with ginger) 80 g; Fructus Forsythiae 80 g; Fructus Viticis (stir-baked) 80 g; Radix Saposhnikoviae 40 g; Spica Schizonepetae 80 g; Radix Angelicae Dahuricae 80 g; Radix Scutellariae 80 g; Flos Chrysanthemi 160 g; Herba Menthae 40 g; Radix et Rhizoma Rhei (stir-baked with wine) 320 g; Cortex Phellodendri (stir-baked with wine) 40 g; Radix Platycodonis 80 g; Rhizoma Chuanxiong 40 g; Gypsum Fibrosum 40 g; Flos Inulae 20 g; Radix et Rhizoma Glycyrrhizae 40 g.

Procedure Pulverize the above seventeen ingredients to fine powder, sift and mix well. Make watered pills with water and dry; To each 100 g of the powder, add 30-40 g of refined honey and a quantity of water to make water-honeyed pills and dry; To each 100 g of the powder, add 150-170 g of refined honey to make big honeyed pills.

Description Dark yellow to yellowish-brown watered pills, yellowish-brown to dark brown water-honeyed pills or blackish-brown big honeyed pills; odour, aromatic; taste, bitter.

Identification (1) To 50 mg of Rhizoma Coptidis reference drug, add 10 ml of methanol, ultrasonicate for 15 minutes, filter, use the filtrate as the reference drug solution. Dissolve a quantity of berberine hydrochloride CRS in methanol to produce a solution containing 0.05 mg per ml as the reference solution. Carry out the method for thin-layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and water (20 : 10 : 5 : 5 : 1) as the mobile phase. Apply separately 2 μl of each of the reference drug solution, reference solution and test solution obtained under the Assay to the plate. After developing in a chamber pre-equilibrated with ammonia vapour and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution and the reference drug solution.

(2) To 3 g of watered pills or water-honeyed pills, grind to

powder, or 4 g of big honeyed pills, cut into pieces, add 25 ml of ethyl acetate, heat under reflux for a hour, filter, dry the filtrate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of geniposide CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of ethyl acetate, acetone, formic acid and water (12 : 8 : 1 : 1) as the mobile phase. Apply separately 5 μl of each of the test solution and reference solution to the plate. After developing and removal of the plate, dry in air, spray with a solution of 10% sulfuric acid in ethanol, heat at 105 ℃ to spots distinct. The spot in the chromatogram obtained with the test solution corresponds in the position and colour to the spot in the chromatogram obtained with the reference solution.

(3) To 5 g of watered pills or water-honeyed pills, ground to powder, or 9 g of big honeyed pills, cut into pieces, add 50 ml of ethyl acetate, heat under reflux for 1 hour, filter and keep the residue for latter use, concentrate the filtrate to about 5 ml, apply to a column (1 cm in diameter) packed with alkaline aluminum oxide (100-200 mesh, 6 g, previously activated at 105℃ for 1 hour). Elute with 50 ml of ethyl acetate, collect the eluates and evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. To 0.5 g of Rhizoma Chuanxiong reference drug, add 10 ml of ethyl acetate, ultrasonicate for 15 minutes, filter and use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 5 μl of each of the test solution and reference drug solution to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in the position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) To the drug residue obtained under Identification (3), add 25 ml of the methanol, heat under reflux for 1 hour, filter and use the filtrate as the test solution. Dissolve a quantity of baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose containing 4% solution of sodium acetate as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately 5 μl of each of the test solution and reference solution to the plate. After developing and removal of the plate, dry it in air, spray with 1% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Heavy metals Pulverize 15 g of watered pills or water-honeyed pills to a powder; or cut 30 g of big honeyed pills into pieces, weight 1 g accurately, carry out the method of determination of residue on ignition (Appendix Ⅸ J), char thoroughly. To the residue carry out the limit test for heavy metals (Appendix Ⅸ E, method 2), no more than 25 ppm.

Arsenic Take 15 g of watered pills or water-honeyed pills, or 5 g of big honeyed pills, ground well or cut into pieces, pass through No. 2 sieve. To 1.0 g, weighed, add 1 g of arsenic-free calcium hydroxide and a small quantity of water, stir well and bake to dry. Heat gently until it is charred, then ignite at 500-600℃ until the incineration is complete (simultaneously preparing a blank for arsenic standard stain). Allow to cool, dissolve the residue in 7 ml of hydrochloric acid, add 21 ml of water and carry out the limit test for arsenic (Appendix Ⅸ F, method 1), no more than 2 ppm of arsenic.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.033 mol/L potassium dihydrogen phosphate (35 : 65) as the mobile phase. As detector a spectrophotometer set at 424 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of berberine hydrochloride.

Reference solution Weight accurately a quantity of berberine hydrochloride CRS, dissolve in methanol to produce a solution containing 10 μg per ml.

Test solution Weight accurately 0.6 g of watered pills or water-honeyed pills, ground to powder, or 1 g of big honeyed pills obtained under the test of Weight variation, cut into pieces, to a stopper conical flask, accurately add 10 ml of a mixture of hydrochloric acid and methanol (1 : 100), stopper and weigh, heat in a water bath at 50℃ for 15 minutes, allow to stand to room temperature, ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, allow to stand to room temperature, weigh again, replenish the loss of weight with methanol, mix well, centrifugate and filter. Measure accurately 2 ml of the successive filtrate, evaporate to dryness at a lower temperature, dissolve the residue in a quantity of methanol and apply to a column (1 cm in diameter) packed with alkaline aluminum oxide (100-200 mesh, 8 g). Elute with 35 ml of methanol, collect the eluates and evaporate to dryness, dissolve the residue in a quantity of methanol and transfer to a 2 ml volumetric flask, dilute with methanol to volume, mix well, filter and use the filtrate as the test solution.

Procedure Inject accurately 5-10 μl of each of the reference solution and the test solution, respectively, into the column, and calculate the content.

It contains not less than 0.26 mg of berberine hydrochloride ($C_{20}H_{18}ClNO_4$) per gram for watered pills; 0.19 mg per gram for water-honeyed pills; and 0.60 mg per big honeyed pill, referred to Rhizoma Coptidis and Cortex Phellodendri.

Action To disperse *wind* and clear *heat*, and purge *fire* to kill pain.

Indications Dizziness, or fulminant conjunctivitis, or toothache, or sores on the mouth and tongue, swollen painful throat, or ear pain, tinnitus, constipation and concentrated urine due to attack of the upper part of the body by *wind-heat* and extremely abundant *heat* in the lung and stomach.

Usage and dosage 1-2 pills, twice a day.

Precaution Avoid pungent and spicy foods; be cautious about pregnant women; it is forbidden to prescribe to those suffering from a deficiency and cold syndrome of the spleen and stomach.

Strength 6 g per bag of watered pill; 3 g per forty water-honeyed pills; 6 g per big honeyed pill

Storage Preserve in tightly closed containers.

Huanglian Yanggan Wan
(黄连羊肝丸)

Huanglian Yanggan Pills

Ingredients Rhizoma Coptidis 20 g; Rhizoma Picrorhizae 40 g; Radix Scutellariae 40 g; Cortex Phellodendri chinensis 20 g; Radix et Rhizoma Gentianae 20 g; Radix Bupleuri 40 g; Pericarpium Citri Reticulatae Viride (stir-baked with vinegar) 40 g; Herba Equiseti Hiemalis 40 g; Flos Buddlejae 40 g; Fructus Leonuri 40 g; Semen Cassiae (stir-baked) 40 g; Concha Haliotidis (calcined) 40 g; Faeces Vespertilionis 40 g; Hepar Caprae seu Ovis Recens 160 g.

Procedure Cut Hepar Caprae seu Ovis Recens into pieces, steam, dry, and pulverize with other thirteen ingredients to fine powder, sift, and mix well. To each 100 g of the powder add 120-150 g of refined honey to make big honeyed pills.

Description Blackish-brown big honeyed pills; taste, bitter.

Identification (1) Microscopical: Fibre bundles bright yellow, walls slightly thickened, pits distinct. Phloem fibres pale yellow, fusiform, walls thickened, with fine pit-canals. Fibre bundles bright yellow, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres, walls of crystal cells thickened and lignified. Prisms of calcium oxalate abundant in parenchyma. Palisade cells of testa 1 row, 40-72 μm long, with several layers of cells underneath containing clusters and prisms of calcium oxalate. Vittae containing yellow or brownish-yellow secretion. Irregular masses dark grey, opaque, bubbling on adding acid.

(2) To 0.02 g Rhizoma Coptidis reference drug, add 10 ml of the mixture of hydrochloric acid and methanol (1 : 100), ultrasonicate for 15 minutes, filter and use the filtrate as the reference drug solution, Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately 2 μl of the reference drug solution and 4 μl of the test solution obtained under Assay to the plate. After developing in a chamber pre-equilibrated with the vapour of concentrated ammonia TS for 15 minutes and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) To 5 g of the pills, cut into pieces, add 30 ml of methanol, ultrasonicate for 30 minutes, filter, evaporate the filtrate to almost dryness, to the residue add 30 ml of water, adjust pH to 1-2 with dilute hydrochloric acid TS, extract with 25 ml of ethyl acetate, evaporate the ethyl acetate solution to dryness, dissolve the residue in 2 ml of methanol as the test solution. To 1.5 g of Rhizoma Picrorhizae reference drug, add 20 ml of methanol, ultrasonicate for 20 minutes, filter and evaporate the filtrate to dryness, dissolve the residue in 3 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (30-60℃), ethyl acetate, and formic acid (5 : 1 : 0.1) as the mobile phase. Apply separately 6 μl of each of the test solution and reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with a mixture of 5% vanillin in sulfuric acid and ethanol (1 : 6), heat at 100 ℃ to spots distinct. The main spots in the chromatogram obtained with the test solution correspond in the position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Dissolve a quantity of baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose containing 1% solution of sodium hydroxide as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately 3-5 μl of each of reference solution and test solution obtained under Identification (3) to the plate. After developing and removal of the plate, dry in air, spray with 5% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(5) To 1 ml of the test solution obtained under the Identification (3), add 1 ml of methanol, mix well as the test solution. Macerate 0.5 g of Flos Buddlejae reference drug, cut into pieces, with 5 ml of methanol for 20 minutes, ultrasonicate for 10 minutes, use the supernatant as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of cyclohexane, ethyl acetate and formic acid (20 : 1 : 0.1) as the mobile phase. Apply separately 5 μl of each of the reference drug solution and test solution to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfur acid in ethanol. The main spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Cut the drug obtained under the test of Weight variation into pieces and mix well. Weight accurately 0.5 g of the drug in a stopper conical flask, add accurately 25 ml of the mixture of hydrochloric acid and methanol (1 : 100), weigh and mix well, macerate overnight, ultrasonicate (power, 250 W; frequency, 50 kHz) for 40 minutes, allow to cool, weigh again and replenish the lost weight with the same solvent, mix well, filter, and use the successive filtrate as the test solution. Dissolve a quantity of berberine hydrochloride CRS, weighed accurately, in mixture of hydrochloric acid and methanol (1 : 100) to produce a reference solution containing 20 μg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply accurately to the plate 2-4 μl of the test solution, 2 μl and 4 μl of the reference solution alternatively. After developing in a chamber pre-equilibrated with the vapour of concentrated ammonia TS for 15 minutes and removal of the plate, dry in air. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan at the wavelength of λex = 338 nm with fluorescence mode, measure the integration values both of the test solution and the reference solution respectively, calculate the content.

It contains not less than 6.3 mg of berberine hydrochloride ($C_{20}H_{18}ClNO_4$) per pill, referred to Rhizoma Coptidis and Cortex Phellodendri.

Action To clear the liver and purge *fire*, and improve vision.

Indications Swollen, bloodshot eyes with pain, blurred vision, photophobia and lacrimation, or pterygium due to exuberant *fire* in the liver.

Usage and dosage 1 pill, 1-2 times a day.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Huangshi Xiangsheng Wan (黄氏响声丸)

Huangshi Xiangsheng Pills

Ingredients Herba Menthae; Bulbus Fritillariae Thun-bergii; Fructus Forsythiae; Periostracum Cicadae; Semen Sterculiae Lychnophorae; Radix et Rhizoma Rhei (stir-baked with wine); Rhizoma chuanxiong; Catechu; Radix Platycodon; Fructus Chebulae (cored); Radix et Rhizoma Glycyrrhizae; Mentholum.

Procedure Pulverize Radix et Rhizoma Rhei, Rhizoma chuanxiong, Fructus Chebulae, Bulbus Fritillariae Thunbergii, Herba Menthae and Catechu to coarse powder. Decoct the other five ingredients, except mentholum, with water for 2 times, 1.5 hours for each. Combine the decoction, stand to precipitate, filter and concentrate the filtrate to a quantity of amount. Stir thoroughly with the coarse powder and dry. Pulverize to fine powder, sift (80 mesh), add mentholum and mix thoroughly, make pills, and coat with sugar; or coat with charcoal to make pills of 0.1 g or 0.133 g per pill.

Description Sugar coated concentrated watered pills or charcoal coated concentrated watered pills with brown or dark brown core; taste, bitter, refreshing.

Identification (1) Grind a quantity of the pills, removed the coating substance, to fine powder. To 2 g of the powder, add 20 ml of ethanol, ultrasonicate for 30 minutes and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution with 1 g of Radix et Rhizoma Rhei reference drug as the reference drug solution in the same manner. Dissolve a quantity of emodin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and the upper layer of a mixture of petroleum ether (30-60℃), formate acetate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately to the plate 3 μl of the test solution, 5μl of the reference drug solution and 1 μl of the reference solution. After developing and removal of the plate, dry in air. Expose to ammonia vapour to visualize the spots clearly. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and reference solution.

(2) Grind a quantity of the pills, removed the coating, to fine powder. To 10 g of the powder, add 60 ml of ether, ultrasonicate for 20 minutes, filter, keep the residue for latter use and evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 0.5 g of Rhizoma Chuanxiong reference drug and 30 ml of ether in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 5-10 μl of each of the test solution and reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) To the drug residue, extracted with ether under Identification (2), evaporate to dryness, add 60 ml of methanol, ultrasonicate for 40 minutes, filter, evaporate the filtrate, and dissolve the residue in 40 ml of water, extract with three 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extract, wash the *n*-butanol extract three 20-ml quatilies of water, evaporate the *n*-butanol extract to dryness, dissolve the residue in 2 ml of methanol as the test solution. To 1 g of Radix et Rhizoma Glycyrrhizae reference drug, add 40 ml of ether, ultrasonicate for 20 minutes, filter and evaporate the filtrate to dryness, produce a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, chloroform and methanol (10 : 10 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution and reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Weigh accurately 4 g of the pills, removed the coating substances and triturated to fine powder, add a quantity of kieselguhr, and stir thoroughly. Moisten with small amount of concentrated ammonium TS, stopper tightly, stand for 30 minutes, add 50 ml of a mixture of ether, chloroform and ethanol (50 : 16 : 5), ultrasonicate for 30 minutes (power, 50 W; frenquency, 40 kHz), stand overnight. Filter, wash the drug residue for 3 times with the above mixture solvent, combine the filtrate and the washings, and evaporate to dryness. Dissolve the residue in chloroform, transfer to a 2 ml volumetric flask, dilute to volume, mix well and use as the test solution. Dissolve a quantity of peimisine CRS, weighed accurately, in chloroform to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and the upper layer of the mixture of petroleum ether (60-90℃), formate acetate, methanol and concentrated ammonium TS (10 : 10 : 2 : 1) as the mobile phase. Apply accurately to the plate 10 μl of the test solution, 4 μl and 8 μl of the reference solutions. After developing and removal of the plate, dry in air. Spray with dilute potassium iodobismuthate TS, dry, cover with a same size glass to the plate and fix with a adhesive tape. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan at the wavelength: λ_S = 515 nm, λ_R = 650 nm. Measure the integration value of absorbency of the test solution, and the reference solution, and calculate.

It contains not less than 0.10 mg of peimisine ($C_{27}H_{43}NO_3$) per gram, referred to Bulbus Fritillariae Thunbergii.

Action To disperse *wind* and clear *heat*, resolve *phlegm* and dissipate nodulation, and ease the throat to restore normal voice.

Indications Acute and chronic aphonia due to external *wind-heat* and excessive internal *phlegm-heat*, with manifestations of hoarseness, swollen painful and dry throat, burning sensation and phlegm in the throat, or headache due to *cold* or *heat*, or constipation and deep-coloured urine; acute or

chronic laryngitis, vocal nodules and polyps of the vocal cord at the initial stage with above symptoms.

Usage and dosage 8 charcoal-coated pills (0.1 g per pill) or 6 charcoal-coated pills (0.133 g per pill), 20 sugar coated pills; 3 times a day; taken after meals; half dosage for children.

Precaution Be cautious about patients with loose stools due to cold in the stomach.

Strength (1) 0.1 g per pill (2) 0.133 g per pill

Storage Preserver in well closed containers.

Huatuo Zaizao Wan (华佗再造丸)

Huatuo Zaizao Pills

Huatuo Zaizao Pills are concentrated water-honeyed pills, prepared from Rhizoma Chuanxiong, Fructus Evodiae, Borneolum Syntheticum and some other ingredients.

Description Black concentrated water-honeyed pills; odour, aromatic; taste, bitter.

Identification (1) Heat under reflux 8 g, in pieces, with 50 ml of ether for 1 hour, and filter. Evaporate the filtrate to dryness, dissolve the residue in 2 ml of ethyl acetate as the test solution. Dissolve a quantity of (±)-borneol and (±)-isoborneol CRS in ethyl acetate to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and benzene as the mobile phase. Apply separately to the plate 2-4 μl of each of the two solutions. After developing and removal of the plate, dry in air. Spray with 10% solution of vanillin in sulfuric acid and visualize under a current of hot air. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.
(2) To 0.8 g of Rhizoma Chuanxiong reference drug and 0.2 g of Fructus Evodiae reference drug, add 20 ml of ether respectively, heat under reflux on a water bath for 1 hour and filter. Dissolve the residues in 1 ml of ethyl acetate as the reference drug solutions respectively. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately to the plate 2-4 μl of the test solution obtained under Identification (1), and 1-2 μl of each of the two reference drug solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with Rhizoma Chuanxiong reference drug solution. Spray with 5% aluminium chloride in ethanol and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with Fructus Evodiae reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A)

Action To promote blood circulation, resolve stagnated blood, resolve *phlegm* to dredge meridians, and move *qi* to kill pain.

Indications Convalescence and sequelae of stroke due to blockage of meridians by *phlegm* with manifestations of hemiplegia, muscular contracture and numbness, deviated mouth and eye and dysphasia.

Usage and dosage 4-8 g, 2-3 times a day, 8-16 g in serious case, or follow doctor's advice.

Precaution Contraindicated for pregnant women.

Storage Preserve in tightly closed containers.

Huazheng Huisheng Pian (化癥回生片)

Huazheng Huisheng Tablets

Ingredients Herba Leonuri 112 g; Flos Carthami 14 g; Pericarpium Zanthoxyli (carbonized) 14 g; Hirudo (processed) 14 g; Radix Angelicae Sinensis 28 g; Lignum Sappan 14 g; Rhizoma Sparganii (stir-baked with vinegar) 14 g; Rhizoma Anemones Raddeanae 14 g; Rhizoma Chuanxiong 14 g; Lignum Dalbergiae Odoriferae 14 g; Rhizoma Cyperi (stir-baked with vinegar) 14 g; Radix et Rhizoma Ginseng 42 g; Rhizoma Alpiniae Officinarum 14 g; Rhizoma Curcumae Longae 8.4 g; Myrrha (stir-baked with salt) 14 g; Semen Armeniacae Amarum (stir-baked) 21 g; Radix et Rhizoma Rhei 56 g; Moschus 14 g; Fructus Foeniculi (stir-baked with salt) 21 g; Semen Persicae 21 g; Faeces Trogopterori (stir-baked with vinegar) 14 g; Tabanus 14 g; Colla Carapacis Trionycis 112 g; Flos Caryophylli 21 g; Rhizoma Corydalis (stir-baked with vinegar) 14 g; Radix Paeoniae Alba 28 g; Pollen Typhae (carbonized) 14 g; Olibanum (stir-baked with vinegar) 14 g; Resina Toxicodendri (calcined) 14 g; Fructus Evodiae (stir-baked with the decoction of Radix et Rhizoma Glycyrrhizae) 14 g; Resina Ferulae 14 g; Cortex Cinnamomi 14 g; Folium Artemisiae Argyi (stir-baked) 14 g; Radix Rehmanniae praeparata 28 g; Fructus Perillae 14 g.

Procedure Mix well the above ingredients, except Moschus, Resina Ferulae, Radix Rehmanniae Preparata, Herba Leonuri and Colla Carapacis Trionycis. Pulverize 430 g of the mixture to fine powder, decoct the remaining portion and Herba Leonuri with water twice and filter. Combine the filtrates, add Colla Carapacis Trionycis to dissolve and concentrate to a thick extract. Dissolve Resina Ferulae in water by heat, decoct Radix Rehmanniae Preparata in water, filter respectively, combine the filtrate and concentrate to a thick extract. Combine the two thick extracts, add the above fine powder, stir well, dry and pulverize to fine powder. Make granules with ethanol, dry, add finely powdered Moschus, mix well and compress into 1000 tablets.

Description Brownish-yellow tablets; odour, characteristic of Moschus; taste, slightly bitter.

Identification (1) Microscopical: Fragments of body walls yellowish-brown, with double-ringed alveoli, sometimes showing spinules. Pollen grains yellowish-brown, subrounded, up to 30 μm in diameter, with fine-dotted extine. Pollen grains triangular, up to 16 μm in diameter. Fibre bundles reddish-brown, fibre slender, 8-10 μm in diameter. Fragments of parenchymatous cells containing gelatinized starch granules, pale yellowish-green. Epidermal cells yellowish-brown, polygonal in surface view, with slightly thickened walls. Non-glandular hairs 2 ~ 7-celled, lumina containing brown contents. Starch granules clavate or vase-shaped, about 50 μm long, with faint striations. Stone cells subsquare, with thickened walls, sometimes very thin at one side. Clusters of calcium oxalate fairly large, 80-140 μm in diameter.

Amorphous masses pale yellowish-brown, embedded with small prisms. Pollen grains rounded or ellipsoidal, 64-80 μm in diameter, extine with spinules, and 3 germinal apertures.

(2) To 2 tablets, finely powdered, add 20 ml of methanol, ultrasonicate for 30 minutes, and filter. Evaporate 5 ml of the filtrate to dryness, dissolve the residue in 10 ml of water, add 1 ml of hydrochloric acid, heat on a water bath for 30 minutes, and allow to cool. Extract with two 20-ml quantities of ether, combine the ether extract, evaporate to dryness. Dissolve the residue in 2 ml of chloroform as the test solution. Prepare a solution of 0.1 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and the upper layer of the mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 4 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365nm. The five orange-yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Exposure to ammonia vapour, the colour of the spots turn red on daylight.

(3) Heat under reflux 20 tablets, in fine powder, with 50 ml of 80% ethanol for 1 hour, filter and evaporate the filtrate to dryness. Dissolve the residue in 5 ml of 1% hydrochloric acid solution and filter. To the filtrate, add dropwise sodium carbonate TS and adjust to pH 8.0, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ethanol, used as the test solution. Prepare a solution of 1 g of Herba Leonuri reference drug in the same manner as the reference drug solution. Carry out the method for paper chromatography (Appendix Ⅵ A), using the upper layer of *n*-butanol, acetic acid and water (4 : 1 : 1) as the mobile phase. Apply separately to the chromalographic grade filter paper 20 μl of each of the two solutions in strip. After developing and removal of the paper, dry in air, spray with dilute potassium iodobismuthate TS and dry in air. The strips in the chromatogram obtained with the test solution correspond in position and colour to the strips in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Action To disintegrate abdominal masses and resolve stagnant blood.

Indications Abdominal masses due to stagnated blood, emaciation from blood disorders in women, postpartum blood stasis, and pain in the lower abdomen, worse when pressed.

Usage and dosage 5-6 tablets, twice a day, to be taken with warm wine before meals.

Precaution Contraindicated for pregnant women.

Storage Preserve in tightly closed containers.

Huazhi Shuan
(化痔栓)

Huazhi Suppositories

Ingredients Bismuthi Subgallate 200 g; Radix Sophorae Flavescentis 370 g; Cortex Phellodendri Chinensi 92.5 g; Flos Daturae 55.5 g; Borneolum Syntheticum 30 g.

Procedure Decoct Radix Sophorae Flavescentis; Cortex Phellodendri Chinensi; Flos Daturae with water twice, 4 hours for the first time and 2 hours for the second time, combine the decoctions and filter. Stand for 12 hours, and separate the supernatant and concentrate to a thick extract with a relative density of 1.12 (60-65℃). Dry and pulverize the extract to fine power. Dissolve 2.6 g ethyl p-hydroxybenzoate with 15.5 g ethanol, heat a quantity of suppositories base to melt, and add Bismuthi Subgallate, the above fine power, Borneolum Syntheticum, 16.8 g of polysorbate 80, the solution of hydroxyl-benzoic acetate in ethanol into base, mix and pour into moulds, make 1000 suppositories.

Description Suppositories with dark brown colour.

Identification (1) Ignite slowly 5 suppositories in a crucible, cut into pieces, to complete carbonized, cool, dissolve by adding nitric acid in drop. The solution should be positive to identification reaction of bismuth salt (Appendix Ⅳ).

(2) To 2 suppositories, cut into pieces, add 25 ml of water, and ultrasonicate for 30 minutes, then leave it in a cool place below 10℃ until the suppository bases solidified, and filter. Transfer 5 ml of the filtrate to a separating funnel, add concentrated ammonia TS to adjust to pH 11, extract with three 20-ml quantities of chloroform, and combine the chloroform extracts. Evaporate the chloroform to dryness, and dissolve the residue in 1 ml of chloroform as the test solution. Dissolve matrine CRS in chloroform to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, acetone, ethyl acetate and concentrated ammonia TS (2 : 3 : 4 : 0.2) as the mobile phase. Apply separately to the plate 4 μl of each of the test solution and the reference solution. After developing and removal of the plate, dry in air, spray with modified potassium iodobismuthate TS. The spot in the chromatogram obtained with test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Complies with the general requirements for suppositories (Appendix Ⅰ W).

Assay ***Bismuthi Subgallate*** Weigh accurately 3 g of the suppositories, obtained under the test of weight variation and cut into pieces, place to a crucible, ignite slowly to make the residue turn into orange red, then ignite at 500-600℃ for 1 hour, and cool. Dissolve the residue in 3-5 ml of nitric acid solution (1→2), transfer the solution to a 500 ml of conical flask, add water to about 300 ml, and mix well. Add 10 drops of catechol violet IS (prepared freshly before use), the solution should show blue colour (add ammonia TS untill the solution show blue in case it shows purple or purplish-red). Titrate with disodium edetate (0.05 mol/L) VS. untill the solution turns pale yellow. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 11.65 mg of Bi_2O_3.

It contains not less than 94 mg and not more than 114 mg of Bismuthi Subgallate, calculated as bismuth oxide (Bi_2O_3).

Borneolum Syntheticum Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use a capillary column of polyethylene glycol (PEG) -20 M (30 m long, 0.53 mm in internal diameter, 1.0 μm film thickness) as the stationary phase, and maintain the column temperature at 150℃, split injection, split ratio 40 : 1. The number of theoretical plates of the column is not less than 1900, calculated with the reference of the peak of borneol.

Correction factor Dissolve a quantity of methyl salicylate,

accurately weighed, in ethyl acetate to produce a solution containing 5 mg per ml as internal standard solution. Dissolve 10 mg of (±)-borneol CRS, accurately weighed, in a 10 ml volumetric flask, add 2 ml of the internal standard solution, dilute with ethyl acetate to volume, and mix well. Inject accurately 0.5 μl of the solution into column, calculate correction factor.

Procedure Weigh accurately 10 suppositories, cut into pieces, and weigh accurately 1 g in a 25 ml volumetric flask. Add 5 ml of the internal standard solution and a quantity of ethyl acetate, and ultrasonicate for 20 minutes (power, 300 W; frequency, 33 kHz), cool, dilute with ethyl acetate to volume, stir well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution. Inject accurately 0.5 μl of the test solution into the column and calculate the contents.

It contains not less than 12.6 mg of (±)-borneol ($C_{10}H_{18}O$) per suppository, referred to Borneolum Syntheticum.

Action To clear *heat* and *dampness*, and astringe to stop bleeding.

Indication Internal or external or mixed hemorrhoids due to *damp-heat* in the large intestine.

Usage and dosage Insert the suppository 2-2.5 cm into the anus, 1 suppository each time, 1-2 times a day.

Strength 1.7 g per suppository

Storage Preserve in well closed containers, stored below 30℃.

Hufeng Jiu
(胡蜂酒)

Hufeng Wine

Hufeng Wine is a prescription used by the Jingpo Nationality, prepared by extracting *Vespa manifica* Smith with liquor.

Procedure Macerate 100 g of fresh insect body of *Vespa manifica* Smith in 1000 ml of white wine for 15 days, and filter.

Description A brown, clear liquid; odour, characteristic and aromatic; taste, bitter, numb, slightly pungent.

pH value 4.0-5.0 (Appendix Ⅷ G).

Ethanol content Not less than 40 per cent and not more than 50 per cent (Appendix Ⅸ M).

Total solid Measure accurately 25 ml in a tared evaporating dish, evaporate to dryness on a water bath, dry at 100 ℃ for 3 hours. The residue is not less than 2.5 per cent.

Other requirements Complies with the general requirements for medicinal wines (Appendix Ⅰ M).

Action To soothe the liver to promote bile flow, and clear *heat* and remove constipation.

Indications Dull pain in the right upper abdomen, fullness in stomach and abdomen after meals, poor appetite, belching and constipation due to stagnation of *liver-qi* and failure of *damp-heat* to be cleared; chronic cholecystitis with above symptoms.

Usage and dosage 15-25 ml, twice a day.

Precaution Skin itching may occur occasionally, but it will disappear spontaneously the next day.

Storage Preserve in tightly closed containers, stored in a shady and cool place.

Hugan Pian
(护肝片)

Hugan Tablets

Ingredients Radix Bupleuri 313 g; Herba Artemisiae Scopariae 313 g; Radix Isatidis 313 g; Fructus Schisandrae Chinensis seu Fructus Schisandrae Sphenantherae 168 g; Pulvis Fellis Suis 20 g; Semen Phaseoli Radiati 128 g.

Procedure Pulverize Semen Phaseoli Radiati to fine powder. Decoct Radix Bupleuri, Herba Artemisiae Scopariae and Radix Isatidis with water twice, each two hours and filter. Combine the filtrates, allow to stand for 24 hours, concentrate the supernatant in vacuum to an appropriate quantity, dry by spraying to a fine powder, mix with a quantity of powder of Semen Phaseoli Radiati; or concentrate the supernatant in vacuum to a appropriate quantity, mix with a quantity of powder of Semen Phaseoli Radiati, dry in vacuum and pulverize to fine powder. Extract Fructus Schisandrae, in coarse powder, under reflux with 75% ethanol three times (3 hours, 2 hours and 1 hour respectively). Combine the ethanol extracts, allow to stand for 24 hours, recover ethanol from the supernatant and concentrate to a appropriate quantity, mix well with the remained powder of Semen Phaseoli Radiati, dry in vacuum and pulverize to fine powder. Mix well Pulvis Fellis Suis with the above two fine powders and a quantity of excipient, make granules, dry, press into 1000 tablets and coat with sugar or film.

Description Sugar or film coated tablets with brown core; taste, bitter.

Identification (1) Place 2.5 g, removed sugar coats and finely powdered, in a flask, add 50 ml of *n*-hexane, macerate overnight, heat under reflux at 80-85℃ for 2 hours, and filter. Keep the residue for latter use and evaporate the filtrate at a lower temperature to dryness, and dissolve the residue in 2 ml of ethyl acetate as the test solution. Dissolve a quantity of γ-schisandrin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of toluene and ethyl acetate (9 : 1) as the mobile phase. Apply separately to the plate 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 254 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) To 0.5 g of the drug residue, extracted with *n*-hexane under Identification (1), expel the solvent, add 5 ml of 10% solution of sodium hydroxide, hydrolyze by heating at 120℃ for about 4 hours, cool, and adjust pH to 2-3 with hydrochloric acid. Transfer the solution to a centrifuge tube, wash the container with water, combine the washings to the same tube and centrifuge. Extract the supernatant with 20 ml of ethyl acetate. Evaporate the ethyl acetate extract on a water bath to dryness. Dissolve the residue in 5 ml of ethanol as the test solution. Dissolve a quantity of hyodeoxycholic acid CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of isooctane, ether, glacial acetic acid, *n*-butanol and water (10 : 5 : 5 : 3 : 1) as the mobile phase.

Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with a 10% sulfuric acid in ethanol and heat at 105℃ to the spots distinct, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (63 : 37) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of schisandrin.

Reference solution Weight accurately a quantity of schisandrin CRS, dissolve in methanol to produce a solution containing 0.1 mg per ml as the reference solution.

Test solution Take 10 pills of the drug, removed the coat, weigh accurately and grind to the fine powder, heat under reflux with 25 ml of ethyl acetate for 30 minutes, allow to cool, filter, wash the residue and the container with 30 ml of ethyl acetate in portions, combine the washings and filtrate, evaporate to dryness, dissolve the residue with methanol and transfer to a 10 ml volumetric flask, dilute with methanol to volume, mix well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, calculate the content.
It contains not less than 2.8 mg of schisandrin ($C_{24}H_{32}O_7$) per table, referred to Fructus Schisandrae.

Action To sooth the liver to regulate *qi* flow, and invigorate the spleen to promote digestion, and lower transaminase.

Indications Chronic hepatitis and cirrhosis at the initial stage.

Usage and dosage 4 tablets, 3 times a day.

Strength 0.36 g per film-coated tablet

Storage Preserve in tightly closed containers.

Huixiang Juhe Wan
(茴香橘核丸)

Huixiang Juhe Pills

Ingredients Fructus Foeniculi (stir-baked with salt) 40 g; Fructus Anisi Stellati 40 g; Semen Citri Reticulatae (stir-baked with salt) 40 g; Semen Litchi 80 g; Fructus Psoraleae (stir-baked with salt) 20 g; Cortex Cinnamomi 16 g; Fructus Toosendan 80 g; Rhizoma Corydalis (processed with vinegar) 40 g; Rhizoma Curcumae (processed with vinegar) 20 g; Radix Aucklandiae 20 g; Rhizoma Cyperi (processed with vinegar) 40 g; Pericarpium Citri Reticulatae Viride (processed with vinegar) 40 g; Thallus Eckloniae seu Laminariae 40 g; Semen Arecae 40 g; Olibanum (processed) 20 g; Semen Persicae 16 g; Squama Manis (processed) 20 g.

Procedure Pulverize the above seventeen ingredients to fine powder, sift, mix well, make pills with water and dry.

Description Yellowish-brown to brown watered pills; odour, aromatic; taste, slightly sour, pungent and bitter.

Identification (1) Microscopical: Prisms of calcium oxalate abundant in parenchyma. Stone cells of testa subpolygonal, with sinuous and heavily thickened walls, and branched lumina, with brownish-black contents. Sclerenchymatous cells of seed coat fibre-like, lignified, with different thickness walls, with crisscross or oblique pits. Fibre bundles redish-brown or yellowish-brown, with very thick walls. Sclerenchyma fragments greenish-yellow, cells subpolygonal or slightly elongated, walls slightly sinuous, some beaded, pits fine. Testa cells yellowish-brown, subpolygonal in surface view, with relatively thickened walls. Fragments of endosperm colourless, walls relatively thickened with many large subrounded pits. Alga fragments olivo-brown. Squama fragments colourless, with rounded pores varying in size.
(2) Pulverize 18 g of the pills, add 25 ml of ethanol, shake thoroughly, stand overnight, filter. Transfer 3 ml of the filtrate to a stoppere test tube, add 1 ml of 5% solution of sulfuric acid, mix well, hang a strip of trinitrophenol TP, stopper tightly. Warm the test tube on a water bath for 10 minutes, the test paper turns brownish-red.
(3) Pulverize 18 g of the pills, add 25 ml of ether, shake thoroughly, allow to stand overnight, filter. Concentrate the filtrate to 5 ml, and use as the test solution. To 0.5 g of Radix Aucklandiae reference drug add 10 ml of ether, shake thoroughly, allow to stand overnight, filter, use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and acetone (10 : 3) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 1% vanillin in sulfuric acid, and heat at 120 ℃ for 5 minutes. The blue spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(4) Grind 10 g of the pills to fine powder, add 40 ml of ether, ultrasonicate for 15 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of 4-methoxybenzaldehyde CRS in dehydrated ethanol to produce a solution containing 10 μg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of petroleum ether (60-90℃) and ethyl acetate (17 : 3) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate, after developing and removal of the plate, dry in air, spray with dinitrophenylhydrazine TS, the spot in the chromatogram obtained with the test solution correspond to the spot obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecysialne bonded silica gel as the stationary phase and a mixture of methanol and 0.02 mol/L solution of potassium dihydrogen phosphate (40 : 60) as the mobile phase. As detector a spectrophotometer set at 247 nm. The number of theoretical plates of the column is not less than 10000, calculated with the reference to the peak of psoralen.

Reference solution Weigh accurately a quantity of psoralen CRS and isopsoralen CRS and dissolve in methanol to produce a mixture containing 5 μg of each per ml as the

reference solution.

Test solution Grind a quantity of the pills to fine powder, weigh accurately 2 g of the powder in a stopper conical flask, add accurately 50 ml of the methanol, stopper tightly and weigh, ultrasonicate (power, 260 W; frequency, 40 kHz) for 50 minutes, allow to cool, weigh again and replenish the loss weight with the same solvents, mix well and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the test solution and reference solution into the column, calculate the content.

It contains not less than 0.29 mg of the total amount of psoralen ($C_{11}H_6O_3$) and isopsoralen ($C_{11}H_6O_3$) per gram, referred to Fructus Psoraleae.

Action To disperse *cold* and move *qi*, and reduce swelling and kill pain.

Indications Hernia caused by *cold* retention and *qi* stagnation, with manifestations of straining of swollen and painful testes.

Usage and dosage 6-9 g, twice a day.

Strength 6 g per 100 pills

Storage Preserve in well closed containers, protected from moisture.

Huodan Wan
(藿胆丸)

Huodan Pills

Ingredients Folium Pogostemonis 4000 g; Pulvis Fellis Suis 315 g.

Procedure Pulverize Folium Pogostemonis to fine powder, sift. Extract Pulvis Fellis Suis with ethanol under reflux, filter, recover ethanol, dry in vacuum and pulverize to fine powder. Mix the above powders well, make pills with water and dry.

Description Black watered pills; odour, characteristic; taste, bitter.

Identification (1) Pulverize 4 g of the pills to coarse powder to a stoppere conical flask, add 20 ml of ether, shake and allow to stand overnight. Filter, expel ether of the filtrate and dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve a quantity of patchouli alcohol CRS in ethyl acetate to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃), ethyl acetate and glacial acetic acid (95 : 5 : 0.2) as the mobile phase. Apply separately 1-2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% ferric chloride in ethanol, heat to the spots distinct, the spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Place 1 g of the pills, pulverized to fine powder, in a conical flask, add 20 ml of 40% solution of sodium hydroxide, shake thoroughly, heat in an autoclave at 120℃ for 5 hours. Allow to cool, filter, wash the residue with two 30-ml quantities of water, combine the washings and the filtrate, adjust to pH 1 with hydrochloric acid. Extract with three 30-ml quantities of chloroform, and combine chloroform extracts. Dehydrate with anhydrous sodium sulfate, evaporate to dryness, add 5 ml of dehydrated ethanol to dissolve the residue and use as the test solution. Dissolve a quantity of hyodeoxycholic acid CRS and chenodeoxycholic acid CRS in dehydrated ethanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of *n*-hexane, ethyl acetate, acetic acid and methanol (20 : 25 : 2 : 3) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat at 105℃ to spots clear, examine in daylight. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution. Examine unde ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Grind a quantity of the pills to fine powder. To 1 g of the powder, weighted accurately, in a conical flask, add 20 ml of 40% solution of sodium hydroxide and mix well. Saponify the solution in an autoclave at 120℃ for 5 hours, allow to cool and filter. Wash the residue with three 20-ml quantities of water, centrifuge to get the supernatant. Combine the three supernatants, adjust with hydrochloric acid to about pH 1, extract with two 40-ml and two 30-ml quantities of chloroform. Combine the chloroform extracts, dehydrate with anhydrous sodium sulfate and filter. Wash the anhydrous sodium sulfate and the filtrate with 30 ml of chloroform in portions, combine the washings and the filtrate and recover chloroform to dryness. Dissolve the residue in dehydrated ethanol, transfer to a 25 ml volumetric flask, wash the container with a quantity of dehydrated ethanol, combine the washings into the volumetric flask, add dehydrated ethanol to volume and mix well, used as the test solution. Dissolve separately a quantity of hyodeoxycholic acid CRS and chenodeoxycholic acid CRS in dehydrated ethanol, respectively, to produce two solutions each containing 0.2 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and the upper layer of the mixture of *n*-hexane, ethyl acetate, acetic acid and methanol (20 : 25 : 2 : 3) as the mobile phase. Apply accurately 2 μl of the test solution, 1 μl and 4 μl of each of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with a 5% sulfuric acid in ethanol, heat at 100℃ to the spots distinct. Cover the plate with a same size glass, and fix with tape. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan at an excitation wavelength of 366 nm. Determine the integral values of fluorescent absorbance of the test solution and reference solutions, and calculated the content.

It contains no less than 10.0 mg of the total amount of hyodeoxycholic acid ($C_{29}H_{40}O_4$) and chenodeoxycholic acid ($C_{24}H_{40}O_4$) per gram, referred to Pulvis Fellis Suis.

Action To resolve *dampness* with aromatics, and clear *heat* and free orifices.

Indications Stuffy nose, thin or turbid nasal discharge and forehead pain due to internal retention of *dampness* and *fire* in the *Gallbladder Meridian*.

Usage and dosage 3-6 g, twice a day.

Storage Preserve in tightly closed containers.

Huoxiang Zhengqi Koufuye (藿香正气口服液)

Huoxiang Zhengqi Oral Liquid

Ingredients Rhizoma Atractylodis 80 g; Pericarpium Citri Reticulatae 80 g; Cortex Magnoliae Officinalis (Processed with ginger) 80 g; Radix Angelicae Dahuricae 120 g; Poria 120 g; Pericarpium Arecae 120 g; Rhizoma Pinelliae 80 g; Extractum Glycyrrhizae 10 g; Oleum Pogostemonis 0.8 ml; Oleum Folii Perillae 0.4 ml.

Procedure Heat Cortex Magnoliae with 60% ethanol under reflux for 1 hour, keep the ethanol extract for latter use. Distill Rhizoma Atractylodis, Pericarpium Citri Reticulatae and Radix Angelicae Dahuricae with water, collect the distillations for latter use; filter the aqueous solution after distillation. Decoct Pericarpium Arecae with water twice and filter. Heat Poria with water to boiling, macerate twice at 80℃ and filter. Macerate Rhizoma Pinelliae in water until thoroughly moisturized, add 6.8 g of Rhizoma Zingiberis, decoct twice and filter. Combine the above filtrates, concentrate to a extract with a relative density of 1.10-1.20 (50℃), add Extractum Glycyrrhizae, stir well, precipitate with a two times volume of ethanol and filter. Combine the filtrate with the ethanol extract of Cortex Magnoliae, recover ethanol, add Oleum Pogostemonis and Oleum Folii Perillae and the distillations, and mix well. Add water to a volume of 1025 ml, adjust the solution with sodium hydroxide to pH 5.8-6.2, allow to stand, filter, pack and sterilize.

Description A brown clear liquid; taste, pungent and slightly sweet.

Identification (1) Measure 20 ml of the liquid, extract with two 25-ml quantities of petroleum ether (30-60℃), combine the extracts, evaporate to dryness at a lower temperature, dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve a quantity of patchouli alcohol CRS in ethyl acetate to produce a solution containing 1 mg per ml as the reference solution. Dissolve separately a quantity of magnolol CRS and honokiol CRS in methanol to produce two solutions each containing 1 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethyl cellulose as the coating substance and a mixture of petroleum ether (60-90℃), ethyl acetate and formic acid (85 : 15 : 2) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of each of the reference solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulfuric acid, heat at 100℃ to the spots distinct. The violet-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the patchouli alcohol reference solution. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the magnolol and honokiol reference solutions.

(2) Extract 20 ml of the liquid with 20 ml of ether by shaking, evaporate the ether extract to about 2 ml and use as the test solution. Dissolve a quantity of imperatorin CRS in ether to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellusose as the coating substance and a mixture of cyclohexane and ethyl acetate (4 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution and reference solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) To 1 g of Rhizoma Atractylodis reference drug, add 10 ml of methanol, ultrasonicate for 30 minutes, filter and evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellusose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (19 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution obtained under Identification (2) and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% solution of *p*-dimethylaminobenzaldehyde in 10% sulfuric acid in ethanol, heat to spots distinct. A dark green spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Relative density Not less than 1.01 (Appendix Ⅶ A).

pH value 4.5-6.5 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay Carry out the method for High performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, isopropanol and water (36 : 21 : 36) as the mobile phase. As detector a spectrophotometer set at 294 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of magnolol.

Reference solution Weight accurately a quantities of magnolol CRS and honokiol CRS, dissolve in methanol, separately, to produce solutions containing 0.1 mg of magnolol per ml and 0.05 mg of honokiol per ml as the reference solutions.

Test solution Measuring accurately 5 ml of the liquid, add 2 drops of hydrochloric acid, extract with three 10-ml quantities of chloroform, combine the chloroform extract and evaporate to dryness, dissolve the residue in a quantity of methanol, transfer the methanol solution to a 10 ml volumetric flask, dilute with methanol to the volume, mix well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solutions and the test solution, respectively, into the column, calculate the content.

It contains not less than 0.30 mg of total amount of magnolol ($C_{18}H_{18}O_2$) and honokiol ($C_{18}H_{18}O_2$) per ml, referred to Cortex Magnoliae Officinalis.

Action To release the exterior and remove *dampness*, and regulate the flow of *qi* to harmonize the *middle-energizer*.

Indications Common cold due to affliction from external wind-cold and internal retention of dampness or *summer-heat* and *dampness*, with manifestations of headache with heavy sensation, constriction in the chest, distending pain in the stomach and abdomen, vomiting and diarrhea; gastrointestinal cold with above symptoms.

Usage and dosage 5-10 ml, twice a day, shaking before use.

Strength 10 ml per vial

Storage Preserve in tightly closed containers.

Huoxiang Zhengqi Ruanjiaonang (藿香正气软胶囊)

Huoxiang Zhengqi Soft Capsules

Ingredients Rhizoma Atractylodis 195 g; Pericarpium Citri Reticulatae 195 g; Cortex Magnoliae Offcinalis (processed with ginger) 195 g; Radix Angelicae Dahuricae 293 g; Poria 293 g; Pericarpium Arecae 293 g; Rhizoma Pinelliae 195 g; Extractum Glycyrrhizae 24.4 g; Oleum Pogostemonis 1.95 ml; Oleum Folii Perillae 0.98 ml.

Procedure Extract Rhizoma Atractylodis, Pericarpium Citri Reticulatae Cortex Magnoliae Officinalis and Radix Angelicae Dahuricae with ethanol twice, combine the extracts, concentrate to a thin extract; decoct Poria and Pericarpium Arecae with water twice, combine the decoctions, filter; macerate Rhizoma Pinelliae with cold water, change water every 8 hours until softened thoroughly, add 16.5 g of Rhizoma zingiberis, decoct with water twice, filter. Combine the above filtrates, concentrate to a quantity, precipitate with a quantity of ethanol, concentrate the supernatant to a thin extract. Pulverize and dissolve Extractum Glycyrrhizae with water on boiling, precipitate with a quantity of ethanol, concentrate the supernatant to a thin extract. Combine the above thin extracts, add Oleum Pogostemonis, Oleum Folii Perillae and a quantity of excipient, mix well, make 1000 soft capsules.

Description Soft capsules containing brown extract; odour, fragrant; taste, pungent and bitter.

Identification (1) Cut 4 capsules, get the content, add 1 g of kieselguhr, and grind well. Add 20 ml of *n*-hexane, ultrasonicate for 15 minutes, filter, evaporate to dryness at a low temperature. Dissolve the residue in 2 ml of *n*-hexane as the test solution. To 0.5 g of Rhizoma Atractylodis reference drug, add 2 ml of *n*-hexane, ultrasonicate for 15 minutes, filter, use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (20 : 1) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with 5% solution of p-dimethylaminobenzaldehyde in 10% sulfuric acid in ethanol, heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference drug solution.

(2) To the content of 7 capsules, add 2 g of kieselguhr, and grind well. Add 20 ml of water, ultrasonicate for 30 minutes, filter. Extract the filtrate with two 20-ml quantities of ethyl acetate by shaking, combine the ethyl acetate extracts, evaporate to dryness. Dissolve the residue in 2 ml of methanol as the test solution. Dissolve a quantity of hesperidin CRS in methanol to prepare a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, methanol and water (100 : 17 : 10) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 5% aluminum chloride in ethanol, heat for a few minutes. Examine under ultraviolet light at 365 nm, the fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot in chromatogram obtained with the reference solution.

(3) Dissolve the content of 2 capsules in 10 ml of chloroform, filter, use the filtrate as the test solution. Dissolve 80 μl of cablin patch oil reference extract in 100 ml of chloroform as the reference extract solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using high performance silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (17 : 3) as the mobile phase. Apply separately 2 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulfuric acid, heat at 105℃ to spots distinct. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference extract solution.

(4) Macerate 2 g of Radix Angelicae Dahuricae reference drug with 10 ml of 60% ethanol overnight, filter, use the filtrate as the test solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using high performance silica gel G as the coating substance and a mixture of chloroform and methanol (9 : 1) as the mobile phase. Apply separately 2 μl of each of the test solution obtained under Identification (3) and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the fluorescent spots in chromatogram obtained with the reference drug solution.

Weight variation To 10 capsules, carry out the method for weight variation of capsules (Appendix Ⅰ L). The weight variation limit should be within ±10%. Not more than two of the individual weights deviate outside the weight variation limit and none deviate outside 1 fold of the limit.

Determination of Disintegration Carry out the method for determination of disintegration (Appendix Ⅺ A), all the capsules should disintegrate completely and pass through the gauze within 1.5 hours except the fragments of the capsule shell.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (75 : 25) as the mobile phase. As detector a spectrophotometer set at 294 nm. The number of theoretical plates of the column is not less than 5600, calculated with the reference to the peak of magnolol.

Reference solution Dissolve a quantity of magnolol CRS and honokiol CRS, accurately weighed, in methanol to prepare a mixture containing 0.1 mg of magnolol per ml and 0.08 mg of honokiol per ml as the reference solution.

Test solution Weigh accurately 0.25 g of the content of the capsules, obtained under the test of Weight variation, mix well, to a stopper conical flask, add accurately 50 ml of 50% ethanol, stopper tightly and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 10 minutes, allow to stand to room temperature and weigh again, replenish the lost weight with dilute ethanol TS, shake thoroughly and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 6 μl of the reference solution and 10-20 μl of the test solution, respectively, into the column, and calculate the content.

It contains not less than 2.25 mg of total amount of magnolol ($C_{18}H_{18}O_2$) and honokiol ($C_{18}H_{18}O_2$) per capsule, referred to Cortex Magnoliae Officinalis.

Action To release the exterior and resolve dampness, and regulate the flow of *qi* to harmonize the *middle-energizer*.

Indications Cold due to affliction from external *Wind-cold* and internal retention of *dampness* or *summer-heat* and *dampness*, with manifestations of headache with heavy sensation, constriction in the chest, distending pain in the *stomach* and abdomen, vomiting and diarrhea; gastrointestinal cold with above symptome.

Usage and dosage 2-4 capsules, twice a day.

Strength 0.45 g per capsule

Storage Preserve in tightly closed containers.

Huoxiang Zhengqi Shui (藿香正气水)

Huoxiang Zhengqi Tincture

Ingredients Rhizoma Atractylodis 160 g; Pericarpium Citri Reticulatae 160 g; Cortex Magnoliae Officinalis (processed with ginger) 160 g; Radix Angelicae Dahuricae 240 g; Poria 240 g; Pericarpium Arecae 240 g; Rhizoma Pinelliae 160 g; Extractum Glycyrrhizae 20 g; Oleum Pogostemonis 1.6 ml; Oleum Folii Perillae 0.8 ml.

Procedure Carry out the method for percolation as described under liquid extracts and extracts (Appendix Ⅰ O), macerate separately Rhizoma Atractylodis, Pericarpium Citri Reticulatae, Cortex Magnoliae Officinalis and Radix Angelicae Dahuricae for 24 hours, using 60% ethanol as solvent. Percolate, collect 400 ml of the initial percolate of the former three drugs and 500 ml of the later for latter use. Collect the successive percolate, concentrate, and combine with the initial percolate respectively. Boil Poria with water, macerate at 80℃ for two times, 3 hours and 2 hours respectively and combine the decoctions; macerate Rhizoma Pinelliae with cold water, change water every 8 hours until softened thoroughly, add 13.5 g of dried ginger, decoct with water for two times, 3 hours and 2 hours respectively; decoct Pericarpium Arecae with water for 3 hours, pulverize and dissolve Extractum Glycyrrhizae with water on boiling; combine the above decoctions, filter, concentrate the filtrate properly. Dissolve Oleum Pogostemonis and Oleum Folii Perillae in a quantity of ethanol. Combine the above solutions, mix well; adjust the ethanol content with ethanol and water, make up the total volume to 2050 ml, allow to stand, filter, and pack.

Description A dark brown transparent liquid (slightly turbid on long storage); taste, pungent and bitter.

Identification (1) Extract 20 ml of the liquid with two 25-ml quantities of cyclohexane by shaking, combine the cyclohexane extract and evaporate to dryness at a low temperature, dissolve the residue in 1 ml of cyclohexane as the test solution. To 0.5 g of Rhizoma Atractylodis reference drug, add 2 ml of cyclohexane, ultrasonicate for 15 minutes, filter and use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (20 : 1) as the mobile phase. Apply separately 15 μl of the test solution and 5 μl of reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% solution of *p*-dimethylaminobenzaldehyde in 10% sulfuric acid in ethanol, heat to spots distinct. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) Extract 20 ml of the liquid with two 25-ml quantities of petroleum ether (30-60℃) by shaking, extract the water solution with three 20-ml of quantities of ethyl acetate and keep the petroleum ether layer for latter use, combine the ethyl acetate extract, evaporate to dryness and dissolve the residue in 2 ml of methanol as the test solution. Dissolve a quantity of hesperidin CRS in methanol to produce a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of the mixture of chloroform, methanol and water (32 : 17 : 5) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% aluminum chloride in ethanol, examine under ultraviolet light at 365 nm, the fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Evaporate the petroleum ether extract obtained under Identification (2) to dryness at a low temperature, dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve a quantity of patchoulialcohol CRS in ethyl acetate to produce a solution containing 1 mg per ml as the reference solution. Dissolve a quantity of magnolol CRS and honokiol CRS in methanol, separately, to produce two solutions each containing 1 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellusose as the coating substance and a mixture of petroleum ether (60-90℃), ethyl acetate and formic acid (85 : 15 : 2) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of each of the reference solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid, heat at 100℃ to spots distinct. The red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution of patchoulialcohol, and the spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference solution of magnolol and honokiol.

(4) Dissolve a quantity of imperatorin CRS in ethyl acetate to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ether (3 : 2) as the mobile phase. Apply separately 4 μl of the test solution obtained under Identification (3) and the above reference solution to the plate. After developing at a temperature below 25℃ and removal of the plate. Examine under the ultraviolet light at 365 nm, the fluorescent spot in the chromatogram obtained with the test soluton corresponds in position and colour to the spot obtained with the reference solution.

Ethanol content 40 per cent-50 per cent (Appendix Ⅸ M).

Packing variation Take 5 vials, pour the content into calibrated dry measuring cylinders separately and examine at room temperature. No more than 1 vial is less than the labeled volume, and no vial is less than 95% of the labeled volume.

Other requirements Complies with the general requirements for tinctures (Appendix Ⅰ N).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use Octadecylsilane bonded silica gel as the stationary phase and a

mixture of methanol, acetonitrile and water (50 : 20 : 40) as the mobile phase. As detector a spectrophotometer set at 294 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference of the peak of magnolol.

Reference solution Weigh accurately a quantity of magnolol CRS and honokiol CRS, dissolve in methanol, respectively, to produce two reference solutions, containing 0.2 mg of magnolol per ml and 0.1 mg of honokiol per ml, respectively.

Test solution To 5 ml of the solution, exactly measured, add 2 drops of hydrochloric acid, extract with three 10-ml quantities of chloroform. Combine the chloroform solutions, evaporate to dryness, dissolve the residue in methanol and dilute to 10 ml. Transfer exactly 5 ml to a 10 ml volumetric flask, add methanol to volume, mix well, filter and use successive filtrate as the test solution.

Procedure Exactly inject 10 μl of each of the three solutions, respectively, into the column, determine and calculate the content.
It contains no less than 0.58 mg of the total amount of magnolol ($C_{18}H_{18}O_2$) and honokiol ($C_{18}H_{18}O_2$) per ml, referred to Cortex Magnoliae.

Action To release the exterior and resolve *dampness*, and regulate the flow of *qi* to harmonize the *middle-energizer*.

Indications Cold due to affliction from external *wind-cold* and internal retention of *dampness* or *summer-heat* and *dampness*, with manifestations of headache with heavy sensation, constriction in the chest, distending pain in the stomach and abdomen, vomiting and diarrhea; gastrointestinal cold with above symptoms.

Usage and dosage 5-10 ml, twice a day, shaking before use.

Strength 10 ml per vial

Storage Preserve in tightly closed containers.

Huoxue Zhitong San
(活血止痛散)

Huoxue Zhitong Powder

Ingredients Radix Angelicae Sinensis 400 g; Radix et Rhizoma Notoginseng 80 g; Olibanum (processed) 80 g; Borneolum Syntheticum 20 g; Eupolyphaga seu Steleophaga 200 g; Pyritum (calcined) 120 g.

Procedure Pulverize the above ingredients, except Borneolum Syntheticum, to fine powder, mix well with the fine powder of Borneolum Syntheticum and sift.

Description A greyish-brown powder; odour, aromatic; taste, pungent, bitter, and cool.

Identification (1) Microscopical: Parenchymatous cells fusiform, walls slightly thickened, with very fine and oblique crisscross striations. Fragments of resin ducts containing yellow secretions. Fragments of body wall yellow or brownish-red, with round hair-cavities, 8-24 μm in diameter, with hard hairs of varying length.
(2) To 0.1 g of the powder add 1 ml of dilute hydrochloric acid TS, boil for several minutes and filter; the filtrate yields the characteristic reactions of iron salts (Appendix Ⅳ).
(3) To 1 g of the powder, add 15 ml of petroleum ether (30-60℃), ultrasonicate for 2-3 minutes, filter and evaporate the filtrate to 1 ml, used as the test solution. Dissolve a quantity of (±)-borneol and (±)-isoborneol CRS in petroleum ether (30-60℃) to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of petroleum ether (30-60℃) and ethyl acetate (19 : 2) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulfuric acid, heat at 105℃ to the spots distinct. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.
(4) To 6 g of the powder, add 40 ml of ether, ultrasonicate for 10 minutes, filter, keep the drug residue for latter use and evaporate the filtrate to dryness, dissolve the residue in 2 ml of ethanol as the test solution. Prepare a solution of 1 g of Radix Angelicae Sinensis reference drug and 20 ml of ether in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The main fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(5) Evaporate ether from the drug residue extracted by ether under Identification (4), add 30 ml of methanol and ultrasonicate for 15 minutes. Filter, evaporate the filtrate to dryness, dissolve the residue in 10 ml of water, extract with two 15-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extracts, wash with two 10-ml quantities of water, evaporate the *n*-butanol solution to dryness, dissolve the residue in 2 ml of methanol as the test solution. Prepare a solution with 1 g of Radix et Rhizoma Notoginseng reference drug and 30 ml of methanol in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of *n*-butanol, ethyl acetate and water (4 : 1 : 5) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots distinct. The main spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution.

Other requirements Complies with the general requirements for powders (Appendix Ⅰ B).

Assay Carry out the method for High performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, water and 1% solution of acetic acid (1 : 1 : 5) as the mobile phase. As detector a spectrophotometer set at 313 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of ferulic acid.

Reference solution Weight accurately a quantity of ferulic acid CRS in a amber volumetric flask, dissolve in methanol to produce a solution containing 20 μg per ml as the reference solution.

Test solution Weight accurately about 2.3 g of the powder

to a stopper conical flask, add 20 ml of 0.5% solution of sodium carbonate, ultrasonicate (Power, 150 W; frequency, 20 kHz) for 30 minutes, transfer the solution to a centrifuge tube, centrifugate at 3000 rpm for 10 minutes, transfer the supernatant to a separating funnel. Wash the precipitation with three 10-ml quantities 0.5% solution of sodium carbonate, combine the washings to the same separating funnel, extract with three 20-ml quantities of ether saturated with 2% solution of sodium chloride, discard the ether layer and adjust the solution pH to 1-2 with hydrochloric acid, then extract the solution with two 25-ml and two 20-ml quatities of ether saturated with 2% solution of sodium chloride and eliminate emulsification by centrifugation if necessary. Combine the ether layer and remove the solvent from the extract to dryness, dissolve the residue in methanol and transfer to a 25 ml amber volumetric flask, dilute with methanol to volume, mix well and use as the test solution. (Protect from light throughout the assay)

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column, calculate the content.

It contains not less than 0.10 mg of ferulic acid ($C_{10}H_{10}O_4$) per gram, referred to Radix Angelicae Sinensis.

Action To promote blood circulation to resolve stagnated blood, and reduce swelling to kill pain.

Indications Traumatic injury, bruise and pain.

Usage and dosage 1.5 g, twice a day, taken with warm boiled water or yellow rice wine.

Precaution Contraindicated for pregnant women.

Storage Preserve in tightly closed containers.

Hupo Baolong Wan
(琥珀抱龙丸)

Hupo Baolong Pills

Ingredients Rhizoma Dioscoreae (stir-baked) 256 g; Cinnabaris 80 g; Radix et Rhizoma Glycyrrhizae 48 g; Succinum 24 g; Concretio Silicea Bambusae 24 g; Lignum Santali Albi 24 g; Fructus Aurantii (stir-baked) 16 g; Poria 24 g; Arisaema Cum Bile 16 g; Fructus Aurantii Immaturus (stir-baked) 16 g; Radix et Rhizoma Ginseng Rubra 24 g.

Procedure Pulverize Succinum to very fine powder, levigate Cinnabaris to very fine powder. Pulverize the remained nine ingredients to very fine powders and mix with the above powders, sift and mix well. To each 100 g of the powders add 90-110 g of refined honey to make big honeyed pills.

Description Brownish-red big honeyed pills; taste, sweet, slightly bitterish-pungent.

Identification (1) Microscopical: Irregularly branched masses colourless, dissolved in chloral hydrate TS; hyphae, colourless or pale brown, 4-6 μm in diameter. Raphids of calcium oxalate occurring in mucilage cells, 80-240 μm long, 2-8 μm in diameter. Crystal cells square or rectangular, walls thickened, specially thickened at corners, lignified, lumina containing prisms of calcium oxalate. Irregular fragments pale yellowish-green or brownish-yellow, transparent or translucent.

(2) Grind 3 pills of the drug, cut into pieces, with 3 g of kieselguhr to fine powder. To the powder add 60 ml of ether, ultrasonicate for 10 minutes, filter and discard the ether solution, to the drug residue, expelled the solvent, add 60 ml of methanol, ultrasonicate for 30 minutes, filter and evaporate the filtrate, dissolve the residue in 30 ml of water, heat under reflux with 2 ml of hydrochloric acid and 20 ml of chloroform, allow to stand to room temperature, separate the chloroform layer and extract the water layer with 30 ml of chloroform, combine the chloroform extract and evaporate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve a quantity of Glycyrrhetinic acid in ethyl acetate to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of *n*-hexane, ethyl acetate and glacial acetic acid (15 : 4 : 1) as the mobile phase. Apply separately 5 μl of test solution and reference solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm, the spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Grind 3 pills, cut into pieces, with 5 g of kieselguhr to fine powder. To the powder add 80 ml of methanol, heat under reflux for 2 hours, filter and evaporate the filtrate to dryness, dissolve the residue in 30 ml of water, extract the water solution with two 30-ml quantities of chloroform, discard the chloroform layer, extract the water solution with three 30-ml quantities of *n*-butanol, combine the *n*-butanol extract, wash with two 80-ml quantities of ammonia TS. Evaporate the *n*-butanol extract to dryness, dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 1 g of Radix et Rhizoma Ginseng reference drug in the same manner as the reference drug solution. Dissolve a quantity of ginsenoside Re CRS and ginsenoside Rg_1 CRS in methanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of the mixture of chloroform, ethyl acetate, methanol and water (15 : 40 : 22 : 10), standing below 10℃, as the mobile phase. Apply separately 5 μl of each of above three solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots distinct. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution and reference drug solution. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution and reference drug solution.

Arsenic To 0.4 g of the drug, add 0.4 g of calcium hydroxide, mix well, add a quantity of water, stir well. After drying, ignite gently to carbonization, then ignite at 500-600℃ until the incineration is complete, allow to stand to cool, to the residue add 5 ml of hydrochloric acid and a quantity of water to make up the volume to 28 ml. Carry out the limit test for arsenic (Appendix Ⅸ F, method 1), not more than 5 ppm.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Take a quantity of the pills, obtained under the test of Weight variation, cut into pieces, mix well. To 1.8 g, accurately weighed, in a 250 ml of conical flask, add 10 ml of sulfuric acid and 1.5 g of potassium nitrate, heat to dissolve. Allow to cool, add 50 ml of water, then add dropwise 1% solution of potassium permanganate until a pink colour appears, then add dropwise 2% solution of ferrous sulfate until the pink colour disappears, add 2 ml of ammonium ferric sulfate IS, and titrate with ammonium thiocyanate (0.1 mol/L) VS. Each ml of ammonium thiocyanate (0.1 mol/L) VS is equivalent to 11.63 mg of HgS.

It contains not less than 107 mg and not more than 144 mg of HgS per pill, referred to cinnabaris.

Action To clear *heat* and resolve *phlegm*, and anchor the *mind*.

Indications Acute convulsion of the *phlegm-food* type due to internal impairment by undigested food with manifestations of fever, convulsion, irritability, difficulty in breathing with phlegm and panting, and proneness to fright.

Usage and dosage 1 pill, twice a day; for infants, 1/3 pill, to be taken after dissolved in water.

Precaution Contraindicated for patients with chronic convulsion, a longstanding case and deficiency of *qi*.

Strength 1.8 g per pill

Storage Preserve in tightly closed containers.

Injection Herba Erigerontis (灯盏细辛注射液, Dengzhan Xixin zhusheye)

Dengzhan Xixin Injection

Sterile aqueous products containing phenolic acids extracted from Herba Erigerontis.

Procedure Pulverize Herba Erigerontis to coarse powder. To 300 g of the powder, percolate with 0.2% sodium bicarbonate solution, collect about 10 times volume of percolation, adjust pH to 2-3 with dilute sulfuric acid TS, filter, keep the residue for latter use. Apply the filtrate to a column previously packed with polyamide powder, elute with water to discard the impurity substance, then elute with 90% ethanol, collect the elute for latter use. Extract the above residue with 90% ethanol triple, filter, combine the filtrate and the above elute, recover ethanol and concentrate in vacuum, dissolve with sodium hydroxide dilute solution, filter and dry by spraying to 4.5 g of yellowish-brown powder. Add a quantity of water for injection and 8 g of sodium chloride, after dissolved, add water for injection to 1000 ml, filter and pack, seal and sterilize.

Description A brown clear liquid.

Identification Measure 10 ml of the injection adjust pH to 2-3 with dilute hydrochloric acid TS, extract with 5 ml of *n*-butanol by shaking, evaporate the *n*-butanol layer to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of scutellarin CRS, 1,5-*O*-dicaffeoylquinic acid CRS and caffeic acid CRS in methanol to produce a mixture containing of 2 mg each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using acetic acid as the mobile phase. Apply separately 0.5 μl of the two solutions to a polyamide membrane. After developing and removal of the membrane, dry in air. Spray with 1% ferric chloride in ethanol. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

pH value 5.5-7.5 (Appendix Ⅶ G).

Particulate matter in injection Comply with the test for particulate matter in injection (Appendix Ⅸ R) except oxalate.

Oxalate Measure 10 ml of the injection, adjust pH to 1-2 with dilute hydrochloric acid TS, filter, dry and apply the filtrate to a column (1 cm in internal diameter) previously packed with polyamide powder (100-200 mesh, 1 g), collect 2 ml of the initial elute, adjust pH to 5-6, add 3% solution of calcium chloride 2-3 drops, allow to stand for 10 minutes. No opalescence or precipitate should be observed.

Pyrogens Comply with the test for pyrogens (Appendix ⅩⅢ A), using 1.6 ml per kg of the rabbit's weight.

Undue toxicity Comply with the test for Undue toxicity (Appendix Ⅺ C, Volume 2).

Haemolysis and agglutination *Preparation of 2% red blood cell, RBC, suspension* Measure a quantity of blood of rabbit, transfer it into a conical flask with glass beads, shake for 10 minutes, discard the fibrinogen, and collect the defibrin blood. Wash the defibrin blood with saline for 3-5

times, 5 ml for each time, shake well and centrifuge to remove supernatant. Wash the pellet with saline until the supernatant becomes transparent, and then prepare the 2% RBC suspension with saline.

No. of tubes	1	2	3	4	5	6	7
2% RBC suspension/ml	2.5	2.5	2.5	2.5	2.5	2.5	2.5
saline/ml	2.4	2.3	2.2	2.1	2.0	2.5	distilled water (2.5 ml)
test solution/ml	0.1	0.2	0.3	0.4	0.5	0	0

Procedure Add the 2% RBC suspension and saline into 7 tubes according to the above proportions. Shake well, and keep them in 37℃, add different volume of the injection, shake well, keep them in 37℃ for 3 hours, examine the result every 30 minutes during the first hour and once per hour for the latter 2 hours.
Haemolysis and agglutination must not appear in the No. 3 tube within 2 hours.

Other requirements Comply with the general requirements for injections (Appendix Ⅰ U).

Assay ***Scutellarin*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, tetrahydrofuran and 0.1% solution of phosphoric acid (14 : 14 : 72) as the mobile phase. As detector a spectrophotometer set at 355 nm. Maintain the column temperature at 40℃. The number of theoretical plates for the column is not less than 2500, calculated with the reference to the peak of scutellarin.

Reference solution Dissolve a quantity of scutellarin CRS, accurately weighed, in 90% methanol to produce a solution containing 0.1 mg per ml as the reference solution.

Test solution Measure accurately 2 ml of the injection in a 10 ml volumetric flask, add water to volume, mix well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and the test solution into the column and calculate the content.
It contains not less than 0.40 mg and not more than 0.60 mg of flavonoids per ml, calculated as scutellarin ($C_{21}H_{18}O_{12}$).

Total caffeoyl ester *Reference solution* Dissolve a quantity of 1, 5-*O*-dicaffeoylquinic acid CRS, accurately weighed, in 0.1% sodium bicarbonate solution to produce a solution containing 10 μg per ml as the reference solution.

Test solution Measure accurately 1 ml of the injection in a 200 ml volumetric flask, add water to volume, and mix well as the test solution.

Procedure Carry out the method for ultraviolet spectrophotometer (Appendix Ⅴ A), measure the absorbance of the reference solution and the test solution at 305 nm, respectively, and calculate the content.
It contains not less than 2.0 mg and not more than 3.0 mg of total caffeoyl ester per ml, calculated as 1,5-*O*-dicaffeoylquinic acid ($C_{25}H_{24}O_{12}$).

Action To promote blood circulation to expel stagnated blood, and dredge meridians to kill pain.

Indications Hemiplegia from stroke, numb hands and feet, deviated mouth and eye, dysphasia, heart pain due to impeded flow of *yang-qi* in the chest; ischemic stroke, and angina pectoris in coronary heart disease with above symptoms.

Usage and dosage Intramuscular injection: 4 ml, 2-3 times a day. Acupuncture point injection: 0.5-1.0 ml per point, and maximum dose for multiple points: 6-8 ml; Intravenous drip: 20-40 ml, 1-2 times a day, dilute with 250-500 ml of 0.9% sodium chloride injection for intravenous and infusing use.
As in acidic conditions, the phenolic acids components may be precipitated, compatibility is not suitable for other strong acidic drugs in intravenous and infusing use. If the injection becomes turbid or precipitated, it is forbidion to use.

Strength (1) 2 ml per phial (2) 10 ml per phial

Storage Tightly closed.

Jianbu Wan
(健步丸)

Jianbu Pills

Ingredients Cortex Phellodendri Chinensis (processed with salt water) 40 g; Rhizoma Anemarrhenae (processed with salt water) 20 g; Radix Rehmanniae Praeparata 20 g; Radix Angelicae Sinensis 10 g; Radix Paeoniae Alba (stir-baked with wine) 15 g; Radix Achyranthis Bidentatae 35 g; Os Pardi (processed) 10 g; Carapax et Plastrum Testudinis (stir-baked with vinegar) 40 g; Pericarpium Citri Reticulatae (processed with salt water) 7.5 g; Rhizoma Zingiberis 5 g; Herba Cynomorii 10 g; Caro Caprinus seu Ovillus 320 g.

Procedure Wash Caro Caprinus seu Ovillus clean, remove the tendons, membranes and fats, add 40 g of yellow rice wine and a quantity of water, boil thoroughly. Mix and pound well with the other eleven ingredients, dry, pulverize to fine powder, sift and mix well. To each 100 g of the powder, add 5-10 g of glutinous rice powder and a quantity of water to make pasted pills, and dry.

Description Brown to deep brown pasted pills; odour, slightly stinking; taste, slightly bitter.

Identification (1) Microscopical: Fibre bundles bright yellow, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres, walls of crystal cells lignified and thickened. Needle crystals of calcium oxalate in bundles or scattered, 26-110 μm long. Prisms of calcium oxalate abundant in parenchyma. Clusters of calcium oxalate 18-32 μm in diameter, occurring in paren-chymatous cells, usually in rows or several clusters in one cell. Parenchymatous cells fusiform, walls slightly thickened with minute oblique crossed striations. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing brown nucleus-like mass. Irregular masses greyish-yellow, with fine striations or pits on surface. Fragments of striated muscles numerous, pale yellow, varying in size. Parenchymatous cells filled full of starch granules and yellowish-brown masses which leaving round traces after treating with chloral hydrate TS. Starch granules ellipsoidal oval or irregular, 25-32 μm in diameter, hilum rounded dot, in the relatively small side, with obvious striations. Fragments of bone tissues pale greyish-yellow, with fine longitudinal striations and fusiform or irregular pits, border uneven.

(2) Triturate 0.5 g of the pills to powder, ultrasonicate with 10 ml of methanol for 15 minutes, filter and use the filtrate as the test solution. Prepare a solution of 0.2 g of Cortex Phellodendri Chinensis reference drug in the same manner as the reference drug solution. Dissolve a quantity of berberine hydrochloride CRS in methanol to prepare a solution containing 0.2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of benzene, ethyl acetate, isopropanol methanol, and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately 5 μl of each of the three solutions to the plate. After developing in a chamber pre-equlibrated with ammonia vapour and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

(3) Triturate 15 g of the pills to powder, ultrasonicate with 50 ml of ethanol for 20 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 20 ml of water, extract with ether by shaking until the ether layer is colourless, discard the ether solution, then extract with three 20-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extracts, wash with three 15-ml quantities of water, discard the water washings and evaporate the *n*-butanol solution to dryness. Dissolve the residue in 1 ml of ethanol, stir well with 1 g of neutral aluminium oxide, heat to dry, triturate to fine powder and apply to a column packed with neutral aluminium oxide (100-200 meshes, 10-15 mm in inner diameter, 1 g), elute with 40 ml of methanol. Collect the eluation, evaporate to dryness and dissolve the residue in 0.5 ml of ethanol as the test solution. Dissolve a quantity of paeoniflorin CRS in ethanol to prepare a solution containing 0.8 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 5 μl of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Triturate 5 g of pills, ultrasonicate with 30 ml of ethyl acetate for 15 minutes, filter; evaporate the filtrate to dryness and dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 0.5 g of Radix Angelicae Sinensis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 2 μl of the above two kinds of solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilance bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.05 mol/L solution of sodium dihydrogen phosphate (adjust pH to 3.0 with phosphoric acid) (25 : 75) as the mobile phase. As detector a spectrophotometer set at 347 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of berberine hydrochloride.

Reference solution Dissolve a quantity of berberine hydrochloride CRS, accurately weighed, in methanol to prepare a solution containing 20 μg per ml.

Test solution Triturate pills to fine powder, weigh accurately 0.25 g of the powder, to a stopper conical flask, add accurately 50 ml of a solution of 1% hydrochloric acid in methanol. Stopper tightly and weigh. Ultrasonicate (power, 300 W; frequency, 50 kHz) for 30 minutes, allow to cool and weigh again. Replenish the loss of the weight with the same solvent. Mix thoroughly and centrifuge. Use the supernatant as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 2.4 mg of berberine hydrochloride

($C_{20}H_{18}ClNO_4$) per gram, referred to Cortex Phellodendri Chinensis.

Action To reinforce the liver and kidney, and tone up the muscles and bones.

Indications Aching and weakness of the lower back and knees, flaccidity of lower limbs and difficulty in walking due to insufficiency in the liver and kidney.

Usage and dosage 9 g, twice a day.

Storage Preserve in tightly closed containers.

Jianmin Yanhou Pian
(健民咽喉片)

Jianmin Yanhou Tablets

Ingredients Radix Scrophulariae, Radix Ophiopogonis, Periostracum Cicadae, Fructus Chebulae, Radix Platycodonis, Radix Isatidis, Semen Sterculiae Lychnophorae, Radix Rehmanniae, Fructus Chebulae Immaturus, Radix et Rhizoma Glycyrrhizae, Oleum Menthae Dementholatum, Mentholum.

Procedure Dissolve Oleum Menthae Dementholatum, Mentholum and citrus oil in a quantity of ethanol. Decoct the other ten ingredients and a quantity of Folium Steviae 3 times, 2 hours each for the first and second times, 1 hour for the third time. Filter, combine the filtrate, and concentrate the filtrate to an appropriate amount. Add a quantity of sugar, starch and cocoa, mix and make granules; or add a quantity of sugar, starch and citric acid, mix and make granules. Dry and cool, spray with the above solution of ethanol, add a quantity of citrus powder, compress into tablets, coat with sugar or film.

Description Sugar coated or film coated tablets with yellowish-brown core; odour, aromatic; taste, sweet and cool.

Identification (1) Pulverize 10 small tablets or 7 big tablets removed the coats, to fine powder, add 20 ml of petroleum ether (30-60℃), stopper tightly, macerate for 4 hours while shaking frequently. Filter, reserve the residue for latter use and evaporate the filtrate to about 1 ml as the test solution. Dissolve menthol CRS in ethanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (5 : 1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a mixture of vanillin sulfate TS and ethanol (1 : 4), heat at 100℃ to the spot clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) Add 40 ml of petroleum ether (60-90℃) to the residue obtained from the Identification (1), ultrasonicate for 20 minutes, filter, and evaporate the petroleum ether from the residue. Add 40 ml of ethanol to the residue, ultrasonicate for 30 minutes, filter, and concentrate the filtrate to about 2 ml as the test solution. To 1 g of Fructus Terminaliae Immaturus reference drug, add 10 ml of acetone in a conical flask, stopper tightly, shake for 3 minutes, and filter, using the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅴ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, ethyl acetate, acetone and glacial acetic acid (5 : 2 : 4 : 1) as the mobile phase. Apply separately 8 μl of the test solution and 6 μl of reference drug solution in strip to the plate. After developing and removal of the plate, dry in air. Spray with ammoniated silver nitrate TS, heat to the strips clear. The strip in the chromatogram obtained with the test solution corresponds in position and colour to the strip in the chromatogram obtained from the reference drug solution.

Other requirements Comply with the general requirements for tablets except for disintegration test (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilance bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% solution of phosphoric acid containing 0.1% triethylamine (1 : 99) as the mobile phase. As detector a spectrophotometer set at 273 nm. The number of theoretical plates of the column is not less than 1000, calculated with the reference to the peak of gallic acid.

Reference solution Dissolve a quantity of gallic acid CRS, accurately weighed, in 50% methanol to prepare a solution containing 20 μg per ml.

Test solution Weigh accurately 20 tablets, removed the coats, triturate to powder and mix thoroughly; weigh accurately 1.5 g of the powder to a stopper conical flask, add accurately 50 ml of 50% methanol, stopper tightly and weigh; ultrasonicate (power, 300 W; frequency, 40 kHz) for 30 minutes, allow to cool, weigh again; replenish the loss of the weight with 50% methanol and mix thoroughly. Filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 0.24 mg of gallic acid ($C_7H_6O_5$) per tablet for small one, not less than 0.36 mg per tablet for big one, all referred to Fructus Chebulae and Fructus Chebulae Immaturus.

Action To relieve sore throat, nourish *yin* and promote fluid production, and purge *fire* and eliminate *toxins*.

Indications Swollen, painful throat, aphonia, or upper respiratory tract infection due to body fluids impaired by abundant *heat*.

Usage and dosage For buccal use, 2-4 tablets (small one) or 2 tablets (big one), once per hour.

Strength Each small tablet equivalent to 0.195 g of crude drug, and each big tablet equivalent to 0.292 g of crude drug

Storage Preserve in tightly closed containers.

Jianpi Wan
(健脾丸)

Jianpi Pills

Ingredients Radix Codonopsis 200 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 300 g; Pericarpium Citri Reticulatae 200 g; Fructus Aurantii Immaturus (stir-baked) 200 g; Fructus Crataegi (stir-baked) 150 g; Fructus Hordei Germinatus (stir-baked) 200 g.

Procedure Pulverize the above six ingredients to fine powder, sift, mix well. To each 100 g of powder add 130-160 g of refined honey to make small honeyed pills or big honeyed pills.

Description Brown to blackish-brown small honeyed pills or

big honeyed pills; taste, slightly sweet and bitter.

Identification (1) Microscopical: Stone cells oblique square, or polygonal, tailing at one end, walls relatively thickened, with sparse pits. Epidermal cells longitudinally arranged, with one long cell connected by two shart cells alternatively, the walls of long cells thickened, sinous, and lignified.
(2) Cut 18 g of the pills into pieces, add 250 ml of water to a 500 ml round-bottom flask, connect the apparatus for determination of violate oil, add water through the top until the graduated measuring tube is full and the water overflows into flask. Add again 1 ml of petroleum ether (60-90℃) and then connect the reflux condenser. Heat under reflux for 2 hours, cool and separate the petroleum ether layer as the test solution. Prepare a solution of 1.8 g of Rhizoma Atractylodis Macrocephalae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and petroleum ether (60-90℃) as the mobile phase. Apply separately 3 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% vanillin in sulfuric acid, and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(3) Heat under reflux 0.2 g of the Fructus Crataegi reference drug with 20 ml of ether for 2 hours, expel the ether at a lower temperature, and dissolve the residue in 1 ml of dehydrated ethanol as the reference drug solution. Dissolve a quantity of ursolic acid CRS in dehydrated ethanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform, ethyl acetate and glacial acetic acid (20 : 5 : 8 : 0.5) as the mobile phase. Apply separately 2 μl each of the above two kinds of solutions and the test solution, obtained under Assay, to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution and the reference drug solution.
(4) Triturate well 9 g of the pills, cut into pieces, with 4 g of kieselguhr, add 40 ml of methanol and ultrasonicate for 30 minutes. Filter, evaporate the filtrate to dryness, and dissolve the residue in 5 ml of methanol as the test solution. Prepare a solution of 0.6 g of Fructus Aurantii Immaturus reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol, acetone and formic acid (10 : 5 : 3 : 1) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 4% ferric chloride in ethanol. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Cut small honeyed pill or big honeyed pills, obtained under the test of variation weight, into pieces, mix thoroughly. Weigh accurately 4 g, add 30 ml of water, and allow disintegrating thoroughly, filter. Wash the residue with 30 ml of water, dry under room temperature to obtain soft powder, or dry at a lower temperature and then pulverize to fine powder. Transfer this powder together with the filter paper to a Soxhlet's extractor; add a quantity of ether, heat under reflux for 4 hours. Recover the ether to dryness, macerate the residue with two 10-ml quantities of petroleum ether (30-60℃), about 2 minutes for each time. Discard the petroleum ether, and dissolve the residue in a mixture of chloroform and dehydrated ethanol (2 : 3), transfer to a 2 ml volumetric flask, and dilute to the volume with the same solvent, mix thoroughly, use as the test solution. Dissolve a quantity of ursolic acid CRS, accurately weighed, in dehydrated ethanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform, ethyl acetate and glacial acetic acid (20 : 5 : 8 : 0.5) as the mobile phase. Apply accurately 4 μl or 6 μl of the test solution, 2 μl and 4 μl of the reference solution to the plate alternatively. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. Cover the plate with a same size of glass plate. Carry out the method for thin layer chromatography (Appendix Ⅵ B thin layer chromatographic scanning method), scan at the wavelength of $\lambda_S = 540$ nm, $\lambda_R = 700$ nm. Measure the integration values of the absorbance from the test solution and the reference solution, respectively, and calculate the content.
It contains not less than 0.10 mg of ursolic acid ($C_{30}H_{48}O_3$) per gram for small honeyed pills, and not less than 0.90 mg per gram for big honeyed pills, referred to Fructus Crataegi.

Action To invigorate the spleen to whet appetite.

Indications Fullness in the stomach and abdomen, poor appetite and loose stools due to deficiency in the spleen.

Usage and dosage 9 g of small honeyed pills or 1 big honeyed pill, twice a day; appropriate reduction of the dosage for children.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Jianwei Xiaoshi Pian
(健胃消食片)

Jianwei Xiaoshi Tablets

Ingredients Radix Pseudostellariae 228.6 g; Pericarpium Citri Reticulatae 22.9 g; Rhizoma Dioscoreae 171.4 g; Fructus Hordei Germinatus (stir-baked) 171.4 g; Fructus Crataegi 114.3 g.

Procedure Pulverize half quantity of Radix Pseudostellariae and Rhizoma Dioscoreae to fine powder. Decoct the remained quantity of Radix Pseudostellariae and other 3 ingredients with water for 2 times, 2 hours each time. Combine the decoctions, filter, concentrate the filtrate to a thick extract at a low temperature, or concentrate the filtrate to form a thin extract with a relative density of 1.08-1.12 (65℃), dry by spraying to fine powder, add the above fine powder and a quantity of sucrose powder and dextrin, mix thoroughly, make granules and dry, compress into 1000 tablets, coat with film; or compress into 1600 tablets.

Description Pale brownish-yellow tablets or film-coated tablets with pale brownish-yellow core, or abnormal shape tablets; slightly aromatic, taste, slightly sweet, and sour.

Identification (1) Grind 30 film-coated tablets or 48 tablets, heat under reflux with 50 ml methanol for 30

minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 20 ml of water. Apply to a column (1.2 cm inner diameter, 15 cm length) packed with D101 coarse bore resin. Elute with 200 ml of water, discard the water layer. Elute with 100 ml of ethanol, collect the ethanol eluate. Evaporate to dryness and dissolve the residue in 1 ml of methanol as the test solution. Decoct 5 g of Radix Pseudostellariae reference drug with water for 2 hours and centrifuge, transfer the supernatant, apply to a column packed with D101 coarse bore resin, prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of toluene and ethyl acetate (4 : 1) as the mobile phase. Apply separately 20 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 1% vanillin in sulfuric acid, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) Grind 30 film-coated tables or 48 tablets, heat under reflux with 50 ml methanol for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 20 ml of water. Extract with two 20-ml quantities of ethyl acetate by shaking, combine the ethyl acetate. Evaporate the ethyl acetate extract to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Decoct 2 g of Fructus Crataegi reference drug with 100 ml of water for 1 hour and filter, concentrate the filtrate to 20 ml, adjust to pH 1-2 with dilute hydrochloride acid TS. Extract with two 20-ml quantities of ethyl acetate by shaking, prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of cyclohexane, ethyl acetate and formic acid (20 : 20 : 1) as the mobile phase. Apply separately 20 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 2% ferric chloride in ethanol, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Complies with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.5% solution of acetic acid (40 : 60) as the mobile phase. As detector a spectrophotometer set at 283 nm. The number of the theoretical plates of the column is not less than 2000, calculated with the reference to the peak of hesperidin.

Reference solution Dissolve 12.5 mg of hesperidin CRS, accurately weighed, in a 100 ml volumetric flask, with a quantity of methanol, dilute with methanol to volume, and mix well. Measure accurately 3 ml of the above solution in a 25 ml volumetric flask, dilute with 50% methanol to volume, mix well. (containing 15 μg of hesperidin per ml.)

Test solution Grind 10 tablets to fine powder. To 2 g, weight accurately, add accurately 20 ml of methanol, weigh, heat under reflux for 1 hour, allow to cool, weigh again, and replenish the lost weight with methanol, mix well and filter. Measure accurately 5 ml of the successive filtrate, in a 10 ml volumetric flask, and dilute with water to volume, mix well and filter, use the successive filtrate as test solution.

Procedure Inject accurately 20 μl of the reference solution and 20 μl of the test solution into the column, and calculate the content.

It contains no less than 0.12 mg of hesperidin ($C_{28}H_{34}O_{15}$) per tablet, or 0.20 mg per film-coated tablet, referred to Pericarpium Citri Reticulatae.

Action To invigorate the stomach to promote digestion.

Indications Indigestion due to hypofunctioning of the spleen and stomach, with manifestations of loss of appetite, fetid eructation and foul breath, fullness in the abdomen; indigestion with above symptoms.

Usage and dosage Taken orally by chewing, 4-6 tablets or 3 tablets (film-coated one), 3 times a day; appropriate reduction of the dosage for children.

Strength (1) 0.5 g per tablet
(2) 0.8 g per film-coated tablet

Storage Preserve in tightly closed containers.

Jiawei Shenghua Keli (加味生化颗粒)

Jiawei Shenghua Granules

Ingredients Radix Angelicae Sinensis 133 g; Semen Persicae 133 g; Herba Leonuri 133 g; Radix Paeoniae Rubra 100 g; Folium Artemisiae Argyi 100 g; Rhizoma chuanxiong 100 g; Radix et Rhizoma Glycyrrhizae praeparata Cum Melle 100 g; Rhizoma Zingiberis Praeparatum 100 g; Herba Schizonepetae 100 g; Colla Corii Asini 17 g.

Procedure Decoct the other nine ingredients, except Colla Corii Asini, with water twice, 2 hours for each time. Combine the decoctions, filter and concentrate the filtrate to a quantity, stand for 24 hours, separate the supernatant for latter use. Heat Colla Corii Asini to melt with a quantity of water, add to the above supernatant, and concentrate to a thin extract with a relative density of 1.20. Add a quantity of sucrose and dextrin, make granules, dry, and make up to 500 g.

Description Yellowish-brown granules; taste, sweet, slightly bitter.

Identification To 10 g of the granules, pulverized to fine powder, add 50 ml of methanol, ultrasonicate for 20 minutes, and filter, evaporate the filtrate to dryness. Dissolve the residue in 20 ml of water, and extract with three 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, and wash with three 20-ml quantities of water saturated with *n*-butanol. Evaporate the *n*-butanol extracts to dryness, and dissolve the residue in 2 ml of ethanol, and mix with 2 g of neutral aluminia oxide, evaporate to dryness, and apply the mixture to a prepared neutral aluminia oxide column (100-120 mesh, 4 g, 8-10 mm in internal diameter) and elute with 50 ml of methanol, collect the eluate. Evaporate the eluate on a water bath to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of paeoniflorin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carbonmethylcellulose as the coating substance, and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air

and spray with 5% vanillin in sulfuric acid, and heat at 105℃ to spot clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅰ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of acetonitrile and water (14 : 86) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of paeoniflorin.

Reference solution Weigh accurately a quantity of paeoniflorin CRS, dissolve in methanol and mix well, to prepare a solution containing 30 μg per ml.

Test solution Weigh accurately 1.5 g of the granules obtained under the test of weight variation, pulverized to fine powder, place in a stopper conical flask, add accurately 50 ml of methanol, closely stopper and weigh. Ultrasonicate for 20 minutes (power, 250 W; frequency, 33 kHz), cool, weigh again, replenish the loss of the weight with methanol, stir well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column respectively and calculate the content.

It contains not less than 0.60 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per pack, referred to Radix Paeoniae Alba.

Action To promote blood circulation to resolve stagnated blood and warm meridians to kill pain.

Indications Prolonged lochiorrhea due to stagnation of blood and insecurity of the Thoroughfare and Conception Vessels, with manifestations of dark purple lochiorrhea with clots, and cold and painful lower abdomen.

Usage and dosage 15 g, 3 times a day. taken with boiled water.

Strength 15 g per pack

Storage Preserve in tightly closed containers.

Jiawei Xiaoyao Wan (加味逍遥丸)

Jiawei Xiaoyao Pills

Ingredients Radix Bupleuri 300 g; Radix Angelicae Sinensis 300 g; Radix Paeoniae Alba 300 g; Rhizoma Atractylodis Macrocephalae (stir-fried with bran) 300 g; Poria 300 g; Radix et Rhizoma Glycyrrhizae 240 g; Cortex Moutan 450 g; Fructus Gardeniae (stir-baked with ginger juice) 450 g; Herba Menthae 60 g.

Procedure Pulverize the above 9 ingredients to fine powder, sift and mix well. Make pills with a decoction of 100 g of Rhizoma Zingiberis Recens and dry.

Description Yellowish-brown watered pills; taste, sweet.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Clusters of calcium oxalate 18-32 μm in diameter, occurring in parenchymatous cells, usually arranged in rows, or several clusters in one cell. The fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Testa stone cells yellow or pale brown, often broken, the intact ones elongated polygonal, rectangle, or irregularly-shaped, with thickened walls and big rounded pits, lumens brownish-red.

(2) Triturate 6 g of pills to fine powder, add 10 ml of ether, stopper closely, ultrasonicate for 15 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of acetone as the test solution. Prepare a solution of 0.2 g of Radix Angelicae Sinensis reference drug in the same manner as the reference drug solution. Dissolve paeonol CRS in acetone to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (10 : 1) as the mobile phase. Apply separately 5 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Spray with 5% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Triturate 6 g of pills to fine powder, ultrasonicate with 20 ml of methanol for 20 minutes, filter; evaporate the filtrate to dryness. Dissolve the residue in 10 ml of 2% solution of sodium hydroxide and heat for 30 minutes. Allow to stand to cool, extract with 10 ml of *n*-butanol by shaking, evaporate the *n*-butanol extract to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Prepare a solution of 0.5 g of Radix Bupleuri reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (30 : 10 : 1) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 2% *p*-dimethylaminobenzaldehyde in 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Triturate 6 g of pills to fine powder, ultrasonicate with 20 ml of petroleum ether (30-60℃) for 20 minutes, filter. Reserve the residue for later use. Evaporate the filtrate to dryness and dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 1 g of Rhizoma Atractylodis Macrocephalae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (19 : 1) as the mobile phase. Apply separately 5 μl of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(5) To the reserved residue in Identification (4), expel the solvent, add 20 ml of ethanol and ultrasonicate for 20 minutes. Filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethanol as the test solution.

Dissolve a quantity of geniposide CRS in ethanol to prepare a solution containing 4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, acetone, formic acid and water (5 : 5 : 1 : 1) as the mobile phase. Apply separately 5 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilance bonded silica gel as the stationary phase and a mixture of methanol and 0.05 mol/L solution of disodium hydrogen phosphate (adjust pH to 7.4 with 0.05 mol/L solution of potassium dihydrogen phosphate) (23 : 77) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, accurately weighed, in methanol to prepare a solution containing 60 μg per ml.

Test solution Triturate pills to fine powder, weigh accurately 1 g of the powder, to a stopper conical flask, add accurately 50 ml of dilute ethanol, stopper tightly and weigh. Ultrasonicate (powder, 260 W; frequency, 40 kHz) for 30 minutes, cool, weigh again and replenish the lost weight with dilute ethanol. Mix thoroughly and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 1.9 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per gram, referred to Radix Paeoniae Alba and Cortex Moutan.

Action To soothe the liver and clear *heat*, and invigorate the spleen and nourish blood.

Indications Distending pain in the hypochondria, dizziness, lethargy, poor appetite, menstrual disorders and distending pain in the navel and abdomen due to stagnation of *liver-qi*, a deficiency of blood and disharmony between the liver and spleen.

Usage and dosage 6 g, twice a day.

Precaution Absolutely avoid getting angry and overwork; and avoid cold, raw and greasy foods.

Strength 6 g per 100 pills

Storage Preserve in well closed containers, protected from moisture.

Jiebai Wan
(洁白丸)

Jiebai Pills

Jiebai Pills are prescription used by the Tibetan nationality.

Ingredients Fructus Chebulae (stewed) 370 g; Calcitum 210 g; Herba Pterocephali 85 g; Faeces Trogopteri Extractum 178 g; Radix Inulae 26 g; Fructus Punicae Granati 26 g; Fructus Chaenomelis 26 g; Lignum Aquilariae Resinatum 19 g; Flos Caryophylli 20 g; Calx Pulveratum 13 g; Flos Carthami 6 g; Semen Myristicae 13 g; Semen Alpiniae Katsumadai 13 g; Fructus Tsaoko (husked) 13 g.

Procedure Pulverize the above ingredients, except Faeces Trogopteri Extractum, to fine powder, sift and mix well, then add Faeces Trogopteri Extractum, 370 g of refined honey, and a quantity of water to make pills, dry and polish; or coat with film.

Description Dark brown water-honeyed pills, or film coated water-honeyed pills with dark brown core; odour, aromatic; taste, astringent, bitter and pungent.

Identification (1) Triturate 10 g of the pills to fine powder, add 50 ml of dehydrated ethanol and ultrasonicate for 40 minutes, filter. Evaporate the filtrate to 25 ml and apply to a small column packed with neutral aluminium oxide (100-120 mesh, 10 g, 1 cm in diameter), collect the elute, evaporate to 5 ml and use as the test solution. Dissolve a quantity of eugenol CRS in dehydrated ethanol to prepare a solution containing 10 μl per ml as the reference solution. Dissolve a quantity of alantolactone CRS in methanol to prepare a solution containing 2 mg per ml as another reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and formic acid (38 : 2 : 0.1) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of each of the reference solutions to the plate. After developing and removal of the plate, dry in air. Spray with 2% vanillin in sulfuric acid and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond separately in position and colour to the spot in the chromatogram obtained with the reference solutions.

(2) Triturate 5 g of the pills to fine powder, add 20 ml of ethanol and ultrasonicate for 20 minutes, filter; evaporate the filtrate to 5 ml and use as the test solution. Prepare a solution of 1 g of Fructus Chebulae reference drug in the same manner as the reference drug solution. Dissolve a quantity of gallic acid CRS in ethanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate and formic acid (6 : 4 : 1) as the mobile phase. Apply separately 5 μl of each the above three kinds of solutions to the plate. After developing and removal of the plate, dry in air. Spray with 2% ferric chloride in ethanol. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and reference solution.

Other requirements Comply with the general requirements for pills except for disintegration test (Appendix Ⅰ A).

Action To invigorate the spleen and regulate the stomach function to relieve pain and vomiting, and to cure dysuria.

Indications Distension and fullness sensation in the chest and abdomen, epigastric pain, dyspepsia, vomiting and diarrhea; dysuria.

Usage and dosage 1 pill, taken after being well chewed, 2-3 times a day. 0.8 g of film coated pills, 2-3 times a day.

Strength (1) 0.8 g per pill
(2) 0.8 g per four-pill for film coated ones

Storage Preserve in tightly closed containers.

Jieji Ningsou Wan
(解肌宁嗽丸)

Jieji Ningsou Pills

Ingredients Folium Perillae 48 g; Radix Peucedani 80 g; Radix Puerariae Lobatae 80 g; Semen Armeniacae Amarum 80 g; Radix Platycodonis 80 g; Rhizoma Pinelliae (processed) 80 g; Pericarpium Citri Reticulatae 80 g; Bulbus Fritillariae Thunbergii 80 g; Radix Trichosanthis 80 g; Fructus Aurantii 80 g; Poria 64 g; Radix Aucklandiae 24 g; Radix Scrophulariae 80 g; Radix et Rhizoma Glycyrrhizae 64 g.

Procedure Pulverize the above fourteen ingredients to fine powder, sift, mix well. To each 100 g of powder add 100-120 g of refined honey to make big honeyed pills.

Description Blackish-green big honeyed pills; taste, slightly bitter and pungent.

Identification (1) Microscopical: Starch granules ovate, 35-48 μm in diameter, hilum pointed, V-shaped or hoof-shaped, situated at the small end, with densely minute striations. Irregularly branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Mesophyll containing minute clusters of calcium oxalate, 4-8 μm in diameter. Needle crystals of calcium oxalate in bundles, 32-144 μm long, containing in mucilage cells or isolated, slender. Prisms of calcium oxalate abundant in parenchyma. Anastomosing laticiferous vessels, 14-25 μm in diameter, containing pale yellow granules. Stone cells orange-yellow, musseled-shaped, walls relatively thickened, pits well-marked and situated at the broader side. Stone cells yellowish-brown or colourless, subrectangular, subrounded, or irregular, with well marked striations, up to 94 μm in diameter. Fibre bundles surrounded by parenchymatous cells which containing prisms of calcium oxalate, forming crystal fibres. Fibres in bundles, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres, walls of crystal cells thickened and lignified. Bordered pitted vessels large, frequently broken, some bordered pits hexangular or rhombic, arranged closely.
(2) Heat under reflux 10 g of the pills, cut into pieces, with 30 ml of methanol for 1 hour, cool, filter and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of methanol as the test solution. Dissolve a quantity of hesperidin CRS in methanol to prepare a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using high performance silica gel G as the coating substance, and a mixture of ethyl acetate, methanol and water (100 : 17 : 13) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing to ascend about 5 cm above the base line, remove the plate, dry in air. Develop again using the upper layer of a mixture of toluene, ethyl acetate, formic acid and water (20 : 10 : 1 : 1) as the mobile phase. After developing to about 8 cm and removal of the plate, dry in air. Spray with aluminum chloride TS and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with test solution corresponds in position and colour to the spot in the chromatogram obtained with reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To release the exterior to disseminate *lung-qi*, and relieve cough and resolve phlegm.

Indications Common cold in children due to affliction from external *wind-cold*, blockage of the *lung* by phlegm with manifestations of fever and coughing with expectoration of profuse phlegm.

Usage and dosage 1/2 pill for children of 1 year old, 1 pill for children of 2-3 years old, twice a day.

Strenght 3 g per pill

Storage Preserve in tightly closed containers.

Jingfukang Keli
(颈复康颗粒)

Jingfukang Granules

Ingredients Rhizoma et Radix Notopterygii; Rhizoma Chuanxiong; Radix Puerariae Lobatae; Radix Gentianae Macrophyllae; Radix et Rhizoma Clematidis; Rhizoma Atractylodis; Radix et Rhizoma Salviae Miltiorrhizae; Radix Paeoniae Alba; Pheretima (stir-baked with wine); Flos Carthami; Olibanum (processed); Radix Astragali; Radix Codonopsis; Radix Rehmanniae; Concha Haliotidis; Ophicalcitum (calcined); Cortex Phellodendri Chinensis; Semen Vaccariae (stir-baked); Semen Persicae (barked); Myrrha (processed); Eupolyphaga seu Steleophaga (stir-baked with wine).

Procedure Isolate the volatile oil from Rhizoma Chuanxiong, Rhizoma Atractylodis, Rhizoma et Radix Notopterygii, Olibanum and Myrrha by distillation, coated with betacyclodextrin, dry for latter use. Decoct the residue of distillation and the other sixteen ingredients with water twice, each for 2 hours. Combine the decoctions, filter, concentrate the filtrate in vaccum, dry by spraying to make powder, mix with the above coated volatile oil, a quantity of lactose and magnesium stearate, mix well, make granules.

Description Yellowish-brown to brown granules; taste, slightly bitter.

Identification (1) Pulverize 2 g of the granules to the fine powder, add 25 ml of methanol, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 10 ml of 0.5 mol/L hydrochloric acid solution. Extract with two 15-ml quantities of ethyl acetate by shaking, discard the ethyl acetate extracts, adjust the aqueous solution to pH 12 with ammonia TS. Extract with two 15-ml quantities of chloroform by shaking, combine the chloroform extracts, evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. To 0.1 g of Cortex Phellodendri Chinensis reference drug, add 10 ml of methanol, ultrasonicate for 20 minutes, filter, use the filtrate as the reference drug solution. Dissolve a quantity of berberine hydrochloride CRS in methanol to prepare a solution containing 0.1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of xylene, ethyl acetate, isopropanol, methanol and concentrated ammonia TS (10 : 6 : 3 : 3 : 1) as the mobile phase, pre-equilibrate with an equal volume of concentrated ammonia TS for a few minutes. Apply separately 2 μl of each of the above three solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference drug solution and the reference solution.
(2) Pulverize 2 g of the granules to the fine powder, add 50 ml of methanol, ultrasonicate for 20 minutes, filter,

evaporate the filtrate to dryness, dissolve the residue in a quantity of water. Apply to a column packed with macroporous resin D101 (1.5 cm in internal diameter, 12 cm long), elute with 30 ml of water, discard the water solution; elute with 2 ml of ammonia TS; elute with 80 ml of water, discard the water solution; elute with 50 ml of 40% ethanol, collect the eluates for the latter use; elute with 70 ml of 70% ethanol, collect the eluates, evaporate to dryness. Dissolve the residue in 20 ml of *n*-butanol saturated with water, wash with 10 ml of ammonia TS, evaporate the *n*-butanol solution to dryness, dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Dissolve astragaloside Ⅳ CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of chloroform, methanol and water (13 : 6.5 : 2), stood below 10℃, as the mobile phase. Apply separately 10 μl of the test solution and 4 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat at 100℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

(3) Evaporate the eluates of 40% ethanol, obtained in the test for Identification (2), to dryness. Dissolve the residue with 10 ml of *n*-butanol saturated with water, evaporate the supernatant to dryness, dissolve the residue in 2 ml of methanol as the test solution. Dissolve paeoniflorin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 3 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulfuric acid, heat to the spot clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

(4) Pulverize 5 g of the granules to the fine powder, add 50 ml of methanol, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 20 ml of water, adjust to pH 12 with ammonia TS. Extract with two 20-ml quantities of ethyl acetate by shaking, discard the ethyl acetate extracts, adjust the water solution to pH 2 with dilute hydrochloric acid TS. Extract with two 20-ml quantities of ethyl acetate by shaking, combine the ethyl acetate extracts, evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve sodium danshensu CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of chloroform, ethyl acetate, acetone and formic acid (20 : 10 : 15 : 4) as the mobile phase. Apply separately 3 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm after exposure to ammonia vapour, the spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

Water Not more than 7.0 per cent (Appendix Ⅸ H).

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (25 : 75 : 0.2) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of puerarin.

Reference solution Dissolve a quantity of puerarin CRS, accurately weighed, in methanol to prepare a solution containing 50 μg per ml as the reference solution.

Test solution Weigh accurately 0.5 g of the granules, obtained in the test of weight variation and triturated to fine powder, to a stopper conical flask, accurately add 25 ml of methanol, tightly stopper and weigh. Ultrasonicate (power, 160 W; frequency, 50 kHz) for 30 minutes, allow to stand to cool, weight again, replenish the loss of the weight with methanol, shake thoroughly. Separate the supernatant, filter, use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 8.0 mg of puerarin ($C_{21}H_{20}O_9$) per pack, referred to Radix Puerariae Lobatae.

Action To promote blood circulation and dredge meridians, and disperse *wind* and kill pain.

Indications Cervical spondylopathy due to retention of *wind-dampness* with manifestations of dizziness, stiff neck, aching pain of the shoulder and back, and numbness of hands and feet.

Usage and dosage Taken with boiled water, 1-2 packs, twice a day after meals.

Precaution It is forbidden to prescribe to pregnant women. Be cautious with patients about digestive tract ulcer and renal hypertension, or follow doctor's order. Temporarily cease medication when one has fever and nasopharyngeal pain due to common cold.

Strength 5 g per pack

Storage Preserve in tightly closed containers.

Jinguo Hanpian
(金果含片)

Jinguo Tablets

Ingredients Radix Rehmanniae; Radix Scrophulariae; Fructus Chebulae Immaturus; Periostracum Cicadae; Semen Sterculiae Lychnophorae; Radix Ophiopogonis; Radix Adenophorae; Radix Pseudostellariae; Pericarpium Citri Reticulatae.

Procedure Decoct Radix Rehmanniae, Radix Scrophulariae, Fructus Chebulae Immaturus, Periostracum Cicadae with water twice, 30 minutes for each time; filter, combine the filtrate and concentrate to a thin extract with a relative density of 1.14 (80℃), add two times quantity of ethanol, stir thoroughly, allow standing for 24 hours. Concentrate the supernatant to an appropriate amount, reserve for later use. Decoct the other 5 ingredients with water twice, 30 minutes for each time; filter, combine the filtrate and concentrate to an appropriate amount. Combine this filtrate with the above reserving, and concentrate to an appropriate amount, add a quantity of sugar and stevioside, mix

thoroughly, make granules, dry; spray an ethanol solution containing Oleum Menthae Dementholatum, seal for 2 hours. Add a quantity of excipient, mix thoroughly, compress into tablets.

Description Pale redish-brown to brown tablets; taste, sweet, followed by a sensation of cool.

Identification (1) Triturate 10 tablets to fine powder, add 100 ml of water and 10 ml of dilute hydrochloric acid TS, heat to dissolve the powder; extract with 40 ml of ethyl acetate by shaking slightly, evaporate the ethyl acetate extract to about 2 ml, as the test solution. Decoct 2 g of Fructus Chebulae Immaturus reference drug with 100 ml of water for 15 to 20 minutes, at mean while add 20-30 ml of dilute hydrochloric acid TS constantly, then filter while hot. Extract the filtrate with 50 ml of ether by shaking slightly; evaporate the extract to about 5 ml, as the reference drug solution. Dissolve a quantity of gallic acid CRS in ethyl acetate to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxyme thylcellulose as the coating substance and a mixture of chloroform, butyl acetate, methanol and formic acid (4 : 1 : 0.6 : 0.7) as the mobile phase. Apply separately 10 μl of the test solution, 5 μl of each of the reference drug solution and the reference solution to the plate. After developing at 10-20℃ and removal of the plate, dry in air. Spray with 2% ferric chloride in ethanol. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution and the reference drug solution.

(2) Triturate 5 tablets to fine powder, add 30 ml of ethyl acetate, and ultrasonicate for 30 minutes, filter; evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Decoct 0.25 g of Pericarpium Citri Reticulatae reference drug with 50 ml of water for 20 minutes, filter, apply the filtrate to a small column packed with dry polyamide (60 mesh, 2 g), and elute with 20 ml of 30% ethanol and 30 ml of ethyl acetate, collect the ethyl acetate elution and evaporate to dryness; dissolve the residue in 1 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxyme thylcellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (1 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Triturate 20 tablets to fine powder, add 50 ml of ethanol, ultrasonicate for 1 hour, allow to stand, filter, evaporate the filtrate to dryness; dissolve the residue in 30 ml of water while heating, extract with two 30-ml quantities of ether by shaking; then extract the water solution with 30 ml of *n*-butanol saturated with water by shaking, wash the butanol extract with 10 ml of water, evaporate to dryness. Dissolve the residue in 0.5 ml of methanol as the test solution. Heat under reflux 2.5 g of Radix Scrophulariae reference drug, with 50 ml of ethanol for 1 hour, filter; use the filtrate to prepare the reference drug solution in the same manner as described in the test solution preparation, beginning at the words "evaporate the filtrate to dryness". Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxyme thylcellulose as the coating substance and a mixture of chloroform and methanol (5 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference drug solution to the plate. Pre-equilibrate the plate in the chamber for 30 minutes. After developing and removal of the plate, dry in air. Spray with 1% vanillin in sulfuric acid until the spots turning into red colour. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution, allow to stand, the colour of the spots becoming dark.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilance bonded silica gel as the stationary phase and a mixture of acetonitrile and 1.5% solution of acetic acid (17 : 83) as the mobile phase. As detector a spectrophotometer set at 284 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of hesperidin.

Reference solution Dissolve a quantity of hesperidin CRS, accurately weighed, in methanol to prepare a solution containing 48 μg per ml.

Test solution Weigh accurately 20 tablets, triturate to fine powder; weigh accurately 2 g of the powder, place to a Soxhlet's extractor, add 80 ml of methanol, heat under reflux until the extract colourless and cool. Transfer the extract to a 100 ml volumetric flask, wash the vessel with a quantity of methanol several times; add the washing to the same volumetric flask, and dilute with methanol to the volume. Mix thoroughly and filter, use the successive filtrate as the test solution.

Procedures Inject accurately 10 μl of each fo the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.40 mg of hesperidin ($C_{28}H_{34}O_{15}$) per tablet, referred to Pericarpium Citri Reticulatae.

Action To nourish *yin* to promote body *fluids* production, and clear *heat* to relieve sore throat.

Indications Red and swollen throat, dry mouth and throat due to impairment of *yin* from *lung-heat*; acute or chronic pharyngitis with above symptoms.

Usage and dosage For buccal use, 2-4 tablets in each hour, 10-20 tablets a day.

Precaution Nausea and discomfort of the epigastrium are seen in a few patients after taking it.

Strength 0.55 g per tablet

Storage Preserve in tightly closed containers.

Jingzhi Guanxin Keli
(精制冠心颗粒)

Jingzhi Guanxin Granules

Ingredients Radix et Rhizoma Salviae Miltiorrhizae 456 g; Radix Paeoniae Rubra 228 g; Rhizoma Chuanxiong 228 g; Flos Carthami 228 g; Lignum Dalbergiae Odoriferae 152 g.

Procedure Decoct Radix et Rhizoma Salviae Miltiorrhizae, Radix Paeoniae Rubra, Rhizoma Chuanxiong and Lignum Dalbergiae Odoriferae with water for 3 times, 2 hours for the first time, 1.5 hours for the second time and 1 hour for the third time, filter, combine the filtrate. Macerate Flos

Carthami with a quantity of water at 80℃ for 2 times, 2 hours for the first time and 1 hour for the second time, filter and combine with the above filtrate, concentrate to a thick extract, dry at 80℃, pulverize to fine powder, add a quantity of sucrose and dextrin, stir well, make granules and dry, make to 1300 g.

Description Brown granules; taste, slightly sweet and slightly bitter.

Identification (1) Dissolve 1.3 g of the granules in 10 ml of water, adjust pH to 2 with dilute hydrochloric acid TS, extract with 20 ml of ethyl acetate by shaking, evaporate the extract to dryness, dissolve the residue in 2 ml of methanol as the test solution. Decoct 0.5 g of Radix et Rhizoma Salviae Miltiorrhizae reference drug with a quantity of water for 30 minutes, filter, add water in the filtrate to 10 ml, prepare a solution in the same manner as the test solution preparation as the reference drug solution. Dissolve a quantity of sodium danshensu CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and a mixture of chloroform, acetone and formic acid (25 : 10 : 4) as the mobile phase. Apply separately 2 μl of each of the above three solutions to the plate. After developing and removal of the plate, dry in air. Expose to ammonia vapour, stand for 10 minutes, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.
(2) Dissolve 2.6 g of the granules in 10 ml of water, add 10 ml of ether, shake, and extract the water layer with 15 ml of *n*-butanol saturated with water by shaking. Evaporate *n*-butanol extract to dryness on a water bath, dissolve the residue in 1 ml of dehydrated ethanol as the test solution. To 0.5 g of Radix Paeoniae Rubra reference drug, add 10 ml of ethanol, ultrasonicate for 5 minutes, filter and evaporate the filtrate to dryness, dissolve the residue in 1 ml of dehydrated ethanol as the reference drug solution. Dissolve a quantity of paeoniflorin CRS in dehydrated ethanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 3 μl of each of the above three solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Action To promote blood circulation to resolve stagnated blood.

Indications Impeded flow of *yang-qi* in the chest due to accumulation of stagnated blood with manifestations of constriction in the chest and stabbing pain in the precardium; angina pectoris in coronary heart disease with above symptoms.

Usage and dosage Taken after dissolved in boiled water. 1 bag, 2-3 times a day.

Strength 13 g per pack

Storage Preserve in tightly closed containers.

Jingzhi Guanxin Pian
(精制冠心片)

Jingzhi Guanxin Tablets

Ingredients Radix et Rhizoma Salviae Miltiorrhizae 375 g; Radix Paeoniae Rubra 187.5 g; Rhizoma Chuanxiong 187.5 g; Flos Carthami 187.5 g; Lignum Dalbergiae Odoriferae 125 g.

Procedure Isolate volatile oil from Lignum Dalbergiae Odoriferae by distillation, collect the water extract solution in another container. Heat under reflux the other four ingredients with 85% ethanol twice, 3 hours for the first time, 2 hours for the second time, filter, combine the filtrates, recover ethanol, combine with the above water solution, concentrate in vaccum to form a thick extract with a relative density of 1.35-1.40 (50℃), add a quantity of excipient to make granules and dry. To the granules add the above essential oil of Lignum Dalbergiae Odoriferae, mix well, compress into 1000 tablets, coat with sugar.

Description Sugar coated tablets with dark brown core; odour, slightly aromatic; taste, slightly bitter and pungent.

Identification (1) Pulverized 5 tablets, removed sugar coats to fine powder, add 20 ml of ether, ultrasonicate for 5 minutes, filter and use the filtrate as the test solution. Prepare a solution of 1 g of Rhizoma Chuanxiong reference drug and 10 ml of ethanol in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The brilliant blue fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(2) Heat under reflux 5 tablets, removed sugar coats and pulverized to powder, with 25 ml of dehydrated ethanol for 1 hour, filter and evaporate the filtrate to dryness. Dissolve the residue in 10 ml of water, extract with two 10-ml quantities of ether by shaking, discard the ether solution, extract the water solution with three 15-ml quantities of *n*-butanol saturated with water by shaking. Combine the extract, evaporate to dryness, dissolve the residue in 2 ml of dehydrated ethanol as the test solution. Dissolve a quantity of paeoniflorin CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilance bonded silica gel as the stationary phase and

a mixture of methanol and water (80 : 20) as the mobile phase. As detector a spectrophotometer set at 270 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of tanshinone ⅡA.

Reference solution Place a quantity of tanshinone ⅡA CRS, accurately weighed, to a amber volumetric flask, add methanol to prepare a solution containing 20 μg per ml.

Test solution Weigh accurately 10 tablets, removed the coats, and triturate to fine powder; weigh accruately 0.5 g of the fine powder, then place to a stopper conical flask. Add accurately 25 ml of methanol, stopper closely and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 15 minutes, allow to stand to cool, weigh again and replenish the loss of the weight with methanol and mix well. Filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 1.0 mg of tanshinone ⅡA ($C_{19}H_{18}O_3$) per tablet, referred to Radix et Rhizoma Salviae Miltiorrhizae.

Action To promote blood circulation to resolve stagnant blood.

Indications Impeded flow of *yang-qi* in the chest due to accumulation of stagnated blood with manifestations of constriction in the chest and stabbing pain in the precardium; angina pectoris in coronary heart disease with above symptoms.

Usage and dosage 6-8 tablets, 3 times a day.

Storage Preserve in tightly closed containers.

Jinpu Jiaonang
(金蒲胶囊)

Jinpu Capsules

Ingredients Calculus Bovis Artifactus; Flos Lonicerae Taponicae; Scolopendra; Squama Manis (scalded); Venenum Bufonis; Herba Taraxaci; Herba Scutellariae Barbatae; Pseudobulbus Cremastrae seu Pleiones; Rhizoma Curcumae; Herba Hedyotidis; Radix Sophorae Flavescentis; Herba Solani Nigri; Margarita; Radix et Rhizoma Rhei; Rhizoma Dioscoreae Bulbiferae; Olibanum (processed); Myrrha (processed); Rhizoma Corydalis (processed); Flos Carthami; Rhizoma Pinelliae (processed with ginger); Radix Codonopsis; Radix Astragali; Radix Acanthopanacis Senticosi; Fructus Amomi.

Procedure Decoct Flos Lonicerae Japonicae, Herba Taraxaci, Herba Scutellariae Barbatae, Herba Hedyotidis, Radix Sophorae Flavescentis, Herba Solani Nigri, Rhizoma Dioscoreae Bulbiferae, Radix Astragali and Radix Acanthopanacis Senticosi 3 times (2 hours, 1.5 hours and 1 hour respectively), filter, combine the filtrates and concentrate in vacuum to form a thin extract, Melt Olibanum and Myrrha by heat respectively and filter with coarse mesh gauze, combine the filtrates, and add to the above thin extract. Grind Calculus Bovis Artifactus and Margarita to very fine powder. Pulverize the other eleven ingredients to fine powder, and mix well with the above very fine powder and add to the thin extract. Stir well, dry, pulverize to fine powder, mix well, and pack into capsules.

Description Hard capsules containing brownish-yellow powder; odour, slight; taste, bitter, pungent, numb.

Identification (1) Microscopical: Pollen grains spheroidal or ellipsoidal, up to about 60 μm in diameter, extine with spinules and 3 germinal apertures. Sclerenchymatous cells of endotesta yellowish-brown or brownish-red, subpolygonal in surface view, walls thickened, containing silica body. Fragments of scales colourless, with rounded pits varying in size. Anastomosing laticiferous tubes 12-15 μm in diameter, containing fine granules.

(2) Add 20 ml of methanol to 4 g of the contents, macerate for 10 minutes and filter. Evaporate 10 ml of the filtrate to dryness, dissolve the residue in 10 ml of water, add 1 ml of hydrochloric acid, heat under reflux on a water bath for 30 minutes, and allow to cool immediately. Extract with 20 ml of ether two times by shaking, combine the ether extracts, evaporate to dryness, and dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 0.1 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix ⅥB), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The five orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Expose to ammonia vapour, the colour of the spots turn red.

(3) Add 1 ml of concentrated ammonia TS and 20 ml of chloroform to 5 g of the contents, macerate for 1 hour while frequently shaking, filter and evaporate the filtrate to dryness. Dissolve the residue in 5 ml of ethanol as the test solution. Dissolve tetrahydropalmatine CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix ⅥB), using silica gel G as the coating substance and a mixture of *n*-hexane, chloroform and methanol (10 : 6 : 1) as the mobile phase. Apply separately 20 μl of the test solution, 1 μl of the reference solution to the plate. After developing and removal of the plate, dry in air and expose the plate to iodine vapour to the spots clear. After expelling the iodine, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Add 25 ml of chloroform to 3 g of the content, heat under reflux for 5 hours and filter. Add 0.3 g of active charcoal to the filtrate, shake, stand for 30 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Dissolve resibufogenin CRS in chloroform to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix ⅥB), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform and acetone (4 : 3 : 3) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air and spray with a 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for capsules (Appendix ⅠL).

Assay Carry out the method of high performance liquid

chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use the octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, methanol, phosphate BS (pH = 6.8) and triethylamine (18 : 18 : 70 : 0.1) as the mobile phase. As detector a spectrophotometer set at 220 nm, the number of theoretical plates of the column is not less than 8000, calculated with the reference to the peak of matrine.

Reference solution Weigh accurately a quantity of matrine CRS, dissolve in methanol to prepare a solution containing 60 μg per ml as the reference solution.

Test solution Grind well the content, obtained under the test of weight variation, weigh accurately 0.5 g in a stopper conical flask, moisten with concentrated ammonia TS and add 25 ml of chloroform, ultrasonicate (power, 250 W; frequency, 33 kHz) for 20 minutes, filter. Wash the residue, vessel, and filter funnel with four 5-ml quantities of chloroform, and filter. Combine the filtrates, evaporate to dryness on a water bath, dissolve the residue in methanol and transfer to a 10 ml volumetric flask. Dilute with methanol to volume, mix well, and filter. Use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 0.16 mg of matrine ($C_{15}H_{24}N_2O$) per capsule, referred to Radix Sophorae Flavescentis.

Action To clear *heat* and *toxicity*, reduce swelling and kill pain, and replenish *qi* and resolve phlegm.

Indications Late gastric cancer, carcinoma of esophagus due to accumulation of *phlegm-dampness* and stagnation of blood and *qi*.

Usage and dosage 3 capsules, 3 times a day, taken with warm boiled water after meals, or follow doctor's advice, 42 days making one course of treatment.

Precaution It is forbidden to prescribe to pregnant women. Nausea and poor appetite may be seen in a few patients at the initial stage, but they will have spontaneous remission. Overdosage may cause nausea and poor appetite in a few patients.

Strength 0.3 g per capsule

Storage Preserve in tightly closed containers.

Jinsang Liyan Wan
(金嗓利咽丸)

Jinsang Liyan Pills

Ingredients Poria 50 g; Rhizoma Pinelliae Praeparata 50 g; Fructus Aurantii Immaturus (stir-baked) 50 g; Pericarpium Citri Reticulatae Viride (stir-baked) 50 g; Arisaema cum Bile 50 g; Exocarpium Citri Rubrum 50 g; Fructus Amomi 50 g; Fructus Amomi Rotundus 25 g; Semen Arecae 50 g; Cortex Albiziae 50 g; Massa Medicata Fermentata stir-baked 50 g; Caulis Perillae 50 g; Rhizoma Zingiberis Recens 7.5 g; Periostracum Cicadae 50 g; Semen Oroxyli 50 g; Cortex Magnoliae Officinalis (processed) 50 g.

Procedure Pulverize the above ingredients to fine powder, sift and mix well. To each 100 g of the powder, add 35-50 g of refined honey and a quantity of water to make water-honeyed pills and dry; or add 150-170 g of refined honey to make big honeyed pills.

Description Brownish-black water-honeyed pills or big honeyed pills; odour, slightly; taste, sweet and slightly bitter.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS, hyphae colourless or pale brown, 4-6 μm in diameter. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Raphides of calcium oxalate, 32-144 μm long, occurring in mucilage cell or scatted. Sclerenchymatous cells of endotesta yellowish-brown or brownish-red, subpolygonal in surface view, walls thickened, lumina containing silica bodies. Fragments of chitin shell yellowish-brown, translucent, densely covered with papillose or short-spiny protrudings.

(2) Grind well 20 g of water-honeyed pills, or triturate well 30 g of big honeyed pills, cut into pieces, with 6 g of kieselguhr. Add 2 ml of concentrated ammonia TS and 50 ml of chloroform, ultrasonicate for 30 minutes, filter, and extract the filtrate with 30 ml of 2% solution of hydrochloric acid by shaking. Adjust the extract to pH 8-9 with concentrated ammonia TS, extract with 40 ml of chloroform two times by shaking, combine the extracts and evaporate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 0.5 g of Semen Arecae reference drug and 30 ml of cholorform and 1 ml of concentrated ammonia TS in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (9 : 1) as the mobile phase. Apply separately 20 μl of the test solution and 5 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with dilute potassium iodobismuthate TS. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Grind well 10 g of water-honeyed pills, or triturate well 15 g of big honeyed pills, cut into pieces, with 7.5 g of kieselguhr, ultrasonicate with 30 ml of methanol for 30 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in 40 ml of dilute hydrochloric acid, extract with three 20-ml quantities of chloroform by shaking. Combine the chloroform extracts, and extract with three 20-ml quantities of 2% sodium hydroxide solution by shaking. Combine the extracts, adjust to pH 1-2 with hydrochloric acid, and extract with three 20-ml quantities of chloroform by shaking. Combine the chloroform extracts, wash with a quantity of water, dehydrate with anhydrous sodium sulfate, evaporate to dryness, and dissolve the residue in 5 ml of methanol as the test solution. Dissolve magnolol CRS and honokiol CRS respectively in methanol to prepare two solutions, one containing 2 mg of magnolol per ml and another containing 1 mg of honokiol per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of petroleum ether (60-90℃), ethyl acetate and formic acid (85 : 15 : 2) as the mobile phase. Apply separately 5 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions. Spray with 5% vanillin in sulfuric acid, and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid

chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (78 : 22) as the mobile phase. As detector a spectrophotometer set at 291 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of magnolol.

Reference solution Dissolve separately a quantity of magnolol CRS and honokiol CRS, accurately weighed, in methanol to prepare solutions, one containing 50 μg of magnolol per ml and another containing 30 μg of honokiol per ml as the reference solutions, respectively.

Test solution Grind 8 g of water-honeyed pills to fine powder, weigh accurately 1.5 g, or cut the big honeyed pills, obtained under the test of weight variation, into pieces, weigh accurately 2.2 g, in a stopper conical flask, add accurately 25 ml of methanol, stopper tightly, and weigh. Ultrasonicate (power, 250 W; frequency, 40 kHz) for 30 minutes, cool, weigh again, replenish the loss of the weight with methanol, and mix well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solutions and the test solution into the column, respectively, and calculate the content.

It contains not less than 0.80 mg of the total amount of magnolol ($C_{18}H_{18}O_2$) and honokiol ($C_{18}H_{18}O_2$) per gram for the water-honeyed pills, and 3.6 mg per big honeyed pill, referred to Cortex Magnoliae officinalis.

Action To soothe the liver to regulate *qi* flow, and resolve phlegm to relieve sore throat.

Indications Feeling a foreign body and discomfort in the throat with hoarseness; hypertrophy of the vocal cord with above symptoms.

Usage and dosage 60-120 water-honeyed pills or 1-2 big honeyed pills, twice a day.

Strength 1 g per 10 water-honeyed pills; 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Jinsang Sanjie Wan (金嗓散结丸)

Jinsang Sanjie Pills

Ingredients Lasiosphaera seu Calvatia 25 g; Rhizoma Curcumae (stir-baked with vinegar) 50 g; Flos Lonicerae Japonicae 125 g; Semen Persicae (rinsed in boiling water) 50 g; Radix Scrophulariae 125 g; Rhizoma Sparganii (baked with vinegar) 50 g; Flos Carthami 50 g; Radix et Rhizoma Salviae Miltiorrhizae 75 g; Radix Isatidis 125 g; Radix Ophiopogonis 100 g; Bulbus Fritillariae Thunbergii 75 g; Rhizoma Alismatis 75 g; Endothelium Corneum Gigeriae Galli (stir-baked) 50 g; Periostracum Cicadae 75 g; Semen Oroxyli 75 g; Herba Taraxaci 125 g.

Procedure Pulverize the above 16 ingredients to fine powder, sift and mix well. To each 100 g of the powder add 35-50 g of refined honey and a quantity of water to make water-honeyed pills and dry; alternatively, add 110-130 g of refined honey to make big honeyed pills.

Description Brownish-black water-honeyed pills or big honeyed pills; odour, slight; taste, sweet and slightly bitter.

Identification (1) Microscopical: Hyphae brown, branched, 2-6 μm in diameter. Spores globular, 3.5-5.5 μm in diameter. Head of glandular hairs obverse conical, multicellular; petiole multicellular. Laticiferous vessels brownish-yellow, reticulated branched. Parenchyma grayish-brown to black-brown, cells mostly shrunken, and each containing a nucleus-like mass. Corolla pieces yellow, with reddish-brown or yellowish-brown long-tubular secretory cells. Needles of calcium oxalate in bundles or scattered, 24-50 μm long, 3 μm in diameter. Pieces of chitinous cutis and shell pale yellowish-brown, translucent, densely covered with corpora or short spiny mastoids. Starch granules ovoid, 35-48 μm in diameter, hilum punctiform, V-shaped or U-shaped, situating at the small end, with fine and dense striations.

(2) Grind 10 g of water-honeyed pills or cut 15 g of big honeyed pills to pieces, triturate well with 8 g of kieselgur. Ultrasonicate with 80 ml of water for 20 minutes, filter. To the filtrate add 2 ml of hydrochloric acid, keep slightly boiling for 5 minutes, and filter. Extract the filtrate with three 20-ml quantities of chloroform, combine the extracts, evaporate to dryness, and dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 0.5 g of Radix Ophiopogonis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and acetone (4 : 1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spots in chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Grind 10 g of water-honeyed pills or cut 15 g of big honeyed pills into pieces, triturate well with 8 g of kieselgur. Ultrasonicate with 40 ml of methanol for 20 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in 20 ml of water, adjust with hydrochloric acid to pH 2, extract with two 20-ml quantities of ethyl acetate, combine the extracts, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately to the plate 10 μl of the two solutions. After developing and removal of the plate, dry in air, spray with 1% ferric chloride in ethanol. The spot in chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecasilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.4% solution of phosphoric acid (13 : 87) as the mobile phase. As detector a spectrophotometer set at 330 nm. The number of theoretical plates of the column is not less than 1000, calculated with the reference to the peak of chlorogenic acid.

Reference solution Weight accurately a quantity of chlorogenic acid CRS in an amber volumetric flask, dissolve in methanol to prepare a solution containing 60 μg per ml as the reference solution.

Test solution Grind water-honeyed pills to fine powder,

weigh accurately 1 g, or cut big honeyed pills, obtained in the test of weight variation, into pieces, weigh accurately 1.7 g, in a stopper conical flask, add accurately 25 ml of 50% methanol, stopper tightly, and weigh. Ultrasonicate (power, 250 W; frequency, 40 kHz) for 30 minutes, cool, weigh again, replenish the loss of weight with 50% methanol, mix well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 0.80 mg of chlorogenic acid ($C_{16}H_{18}O_9$) per gram of water-honeyed pills, 4.5 mg per big honeyed pill, referred to Flos Lonicerae Japonicae.

Action To clear *heat* and *toxicity*, promote blood circulation to resolve blood stasis, and drain *dampness* and resolve *phlegm*.

Indications Hoarseness, hyperemia and tumefaction of the vocal cord due to *heat* accumulation in the interior and stagnation of blood and *qi*; chronic laryngitis, vocal nodules and polyp of the vocal cord with above symptoms.

Usage and dosage 60-120 of water-honeyed pills, 1-2 of big honeyed pills, twice a day.

Strength 1.0 g per 10 water-honeyed pills, 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Jinshuibao Jiaonang (金水宝胶囊)

Jinshuibao Capsules

Jinshuibao Capsules are prepared from the Fermentative powder from Cordyceps sinensin (Cs-4).

Procedure Pulverize 330 g of the fermentative powder to fine powder, pack to make 1000 capsules.

Description Capsules containing yellowish-brown to pale brown powder; odour, aromatic; taste, slightly bitter.

Identification (1) Evaporate 15 ml of the test solution, obtained from Assay, to dryness, dissolve the residue in 5 ml of dilute ethanol as the test solution. Dissolve a quantity of adenine CRS, adenosine CRS and uridine CRS in dilute ethanol TS to prepare a mixture containing 2 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} mixed with sodium carboxymethylcellulose containing 4% solution of disodium hydrogen phosphate as the coating substance and a mixture of chloroform, ethyl acetate, isopropanol, water and concentrated ammonia TS (8 : 2 : 6 : 0.3 : 0.2) as the mobile phase. Apply separately 10 μl of the test solution and 1 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spots in the chromatogram obtained with the reference solution.

(2) Add 10 ml of water to 1 g of the content, heat to boil, filter, and use the filtrate as the test solution. Dissolve a quantity of L-leucine CRS, DL-aminopropionic acid CRS and valine CRS in water to prepare a mixture containing 1 mg of each of L-leucine and DL-aminopropionic acid and 0.5 mg of valine per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of butanol, glacial acetic acid and water (4 : 1 : 1) as the mobile phase. Apply separately 3 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with ninhydrin TS, and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(3) Dissolve mannitol CRS in dilute ethanol to prepare a solution containing 9 mg per ml as the reference solution. Carry out the method of thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of isopropanol, ethyl acetate and water (9 : 6 : 2) as the mobile phase. Apply separately 3 μl of the test solution obtained on Identification (1) and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with anisaldehyde TS, and heat at 130℃ to the spot clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and phosphate BS [a mixture of 0.066 mol/L potassium dihydrogen phosphate solution and 0.06 mol/L disodium hydrogen phosphate solution (2 : 3)] containing 2% tetrahydrofuran as the mobile phase. As detector a spectrophotometer set at 260 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of adenosine

Reference solution To 10 mg of adenosine CRS, weigh accurately, transfer to a 25 ml of volumetric flask and add dilute ethanol TS to the volume; mix thoroughly. Transfer accurately 2 ml of the ethanol solution to a 100 ml of volumetric flask, dilute with the mobile phase to the volume, mix thoroughly, to prepare a solution containing adenosine 8 μg per ml.

Test solution Mix thoroughly the contents obtained under the test of weight variation, weigh accurately 1 g of the mixture, place to a stopper conical flask, add accurately 50 ml of dilute ethanol and stopper tightly. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes; allow to stand to cool and weigh again; replenish the loss of the weight with dilute ethanol, and mix thoroughly. Filter, measure accurately 1 ml of the successive filtrate to a 5 ml volumetric flask, dilute with mobile phase to the volume and mix thoroughly.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.70 mg and not more than 1.20 mg of adenosine ($C_{10}H_{13}N_5O_4$) per capsule.

Action To reinforce the lung and kidney, astringe essence and replenish *qi*.

Indications Chronic cough and dyspnea in a deficiency syndrome, lassitude, insomnia and amnesia, aching and weakness in the lower back and knees, menstrual disorders, impotence and premature ejaculation due to deficiency in the lung and kidney and insufficient essence; chronic bronchitis, chronic kidney insufficiency, hyperlipemia and cirrhosis with above symptoms.

Usage and dosage 3 capsules, 3 times a day; for the

patients with chronic impairment of renal function, 6 capsules, 3 times a day.

Strength 0.33 g per capsule

Storage Preserve in tightly closed containers.

Jinshuibao Pian (金水宝片)

Jinshuibao Tablets

Jinshuibao Tablets are the film coated tablets prepared from Fermentation Cordyceps Powder (Cs-4).

Procedure Mix thoroughly 500 g of fermentation cordyceps powder (Cs-4) with a quantitie of adjuvant, make granules, dry, compress into 1000 tablets, and coat with film.

Description Film coated tablets with pale brown to brown colour core; taste slightly bitter.

Identification (1) Evaporate 9 ml of the successive filtrate obtained under Assay to dryness, dissolve the residue with 5 ml of ethanol as the test solution. Dissolve a quantity of adenine CRS, adenosine CRS and uridine CRS with dilute ethanol TS to prepare a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} plate prepared with 4% solution of disodium hydrogen phosphate and sodium carboxymethylcellulose as binder, and a mixture of chloroform, ethyl acetate, isopropanol, water and concentrated ammonia TS (8 : 2 : 6 : 0.3 : 0.2) as the mobile phase. Apply separately 10 μl of the test solution and 1 μl of the reference solution to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(2) Pulverize 2 tablets, removed coats, to fine powder, heat with water to boiling, filter, and use the filtrate as the test solution. Dissolve a quantity of L-leucine CRS, DL-aminopropionic acid CRS and valine CRS with water to prepare a mixture containing 1 mg of each of leucine and DL-aminopropionic acid, and 0.5 mg of valine per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as coating substances and a mixture of *n*-butanol, glacial acetic acid and water (4 : 1 : 1) as the mobile phase. Apply separately 3 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with ninhydrin TS and heat to spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(3) Dissolve mannitol CRS with dilute ethanol to prepare a mixture containing 9 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as coating substances and a mixture of ethyl acetate, isopropanol and water (6 : 9 : 2) as the mobile phase. Apply separately 3 μl of the test solution obtained under Identification (1) and 2 μl of the above reference solution to the plate. After developing and removal of the plate, dry in air, spray with anisaldehyde TS and heat at 130℃ to spot clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and phosphate BS [0.066 mol/L solution of potassium dihydrogen phosphate and 0.066 mol/L solution of dipotassium hydrogen phosphate (2 : 3)] containing 2% tetrahydrofuran as the mobile phase. As detector a spectrophotometer set at 260 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of adenosine.

Reference solution Weigh accurately 10 mg of adenosine CRS in a 25 ml volumetric flask, dissolve and dilute with dilute ethanol to volume, and mix well. Measure accurately 2 ml in a 100 ml volumetric flask, dilute with the mobile phase to volume, and mix well (containing 8 μg of adenosine per ml).

Test solution Pulverize 20 tablets, removed coats and weighed accurately, to fine powder, weigh accurately 1 g in a stopper conical flask, add accurately 20 ml of dilute ethanol TS, and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, stand to cool, weigh again, replenish the lost weight with dilute ethanol, and mix well. Filter, measure accurately 1 ml of the filtrate (the other successive filtrate for identification use) in a 10 ml volumetric flask, dilute with the mobile phase to volume, and mix well.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 1.0 mg and not more than 1.8 mg of adenosine ($C_{10}H_{13}N_5O_4$) per tablet.

Action To reinforce the lung and kidney, astringe essence and replenish *qi*.

Indications Chronic cough and dyspnea in a deficiency syndrome, lassitude, insomnia and amnesia, aching and weakness in the lower back and knees, menstrual disorders, impotence and premature ejaculation due to deficiency in the lung and kidney and insufficient essence; chronic bronchitis, chronic renal insufficiency, hyperlipemia and cirrhosis with above symptoms.

Usage and dosage 2 tablets, 3 times a day; 4 tablets, 3 times a day for the patients with chronic renal insufficiency; or follow doctor's advice.

Strength 0.75 g per tablet

storage Preserve in tightly closed container.

Jisheng Shenqi Wan (济生肾气丸)

Jisheng Shenqi Pills

Ingredients Radix Rehmanniae Praeparata 160 g; Fructus Corni (processed) 80 g; Cortex Moutan 60 g; Rhizoma Dioscoreae 80 g; Poria 120 g; Rhizoma Alismatis 60 g; Cortex Cinnamomi 20 g; Radix Aconiti Lateralis Praeparata 20 g; Radix Achyranthis Bidentatae 40 g; Semen Plantaginis 40 g.

Procedure Pulverize the above ten ingredients to fine powder, sift, mix well. To each 100 g of powder add 35-50

g of refined honey and a quantity of water to make water-honeyed pills and dry. Alternatively, add 90-110 g of refined honey to make small honeyed pills or big honeyed pills.

Description Brown to blackish-brown water-honeyed pills, small honeyed pills or big honeyed pills; taste, sour, slightly sweet and bitter.

Identification (1) Microscopical: Gelatinized masses of starch granules whitish. Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Parenchymatous cells subrounded, with elliptic pits, gathered into pit groups. Anticlinal walls of endopleura cells sinuous, thicken and lignified, with thin and minute pit-canals. Sand crystals of calcium oxalate occurring in parenchymatous cells. Raphides of calcium oxalate occurring in mucilage cells, 80-240 μm long, needle crystals 2-8 μm in diameter. Epidermal cells of pericarp orange yellow, polygonal in surface view, with anticlinal walls slightly beaded and thickened. Hypodermis of testa narrow and long in surface view, walls slightly sinuous, with several cells in a group arranged slightly mosaic. Stone cells subrounded or subrectangle, with walls thin on one side. Cork cells pink to pale purple, walls slightly thickened.
(2) Triturate 6 g of water-honeyed pills; or cut 9 g of small honeyed pills or big honeyed pills into pieces, heat under reflux with 50 ml of ether for 2 hours, filter and expel ether from the filtrate. Dissolve the residue in 1 ml of ether as the test solution. Dissolve a quantity of paeonol CRS in ether to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of cyclohexane and ethyl acetate (3 : 1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% ferric chloride in ethanol. The spot in the chromatogram obtained with test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Dissolve a quantity of ursolic acid CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance, and a mixture of cyclohexane, chloroform and ethyl acetate (20 : 5 : 8) as the mobile phase. Apply separately 5 μl of the test solution, obtained under the Identification (2), and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 80℃ to the spots clear. The spot in the chromatogram obtained with test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To warm the kidney to move *qi*, and induce urination to eliminate edema.

Indications Edema caused by deficiency in the kidney, aching and heaviness of the lower back and knees, dysuria, coughing and dyspnea caused by *phlegm* and morbid fluid from insufficient *kidney-yang* and accumulation of *dampness*.

Usage and dosage 6 g of water-honeyed pills, 9 g of small honeyed pills or 1 big honeyed pill, 2-3 times a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Jiufen San
(九分散)

Jiufen Powder

Ingredients Semen Strychni Pulveratum (processed) 250 g; Herba Ephedrae 250 g; Olibanum (processed) 250 g; Myrrha (processed) 250 g.

Procedure Pulverize Herba Ephedrae, Olibanum and Myrrha to fine powder, triturate with Semen Strychni Pulveratum, sift and mix well.

Description A yellowish-brown to dark yellowish-brown powder, sticky to masses by warming or pressing; odour, slightly aromatic; taste, slightly bitter.

Identification (1) Microscopical: Unicellular non-glandular hairs mostly broken, fibre-like, with swollen bases like stone cells. Stomata characteristic, guard cells dumbbell-shaped in lateral view, fibres attached with fine crystals. Irregular masses pale yellow or yellowish-brown, aggregated by colourless or pale yellow oil droplets and minute granules, the oil droplets stained red on adding Sudan Ⅲ TS. Irregular pieces pale yellow with holes containing yellowish oil droplets, which stained red on adding Sudan Ⅲ TS.
(2) Dissolve separately a quantity of strychnine CRS and brucine CRS in chloroform to prepare two solutions each containing 0.4 mg per ml as the reference solution (1) and the reference solution (2). Dissolve a quantity of ephedrine hydrochloride CRS in methanol to prepare a solution containing 0.4 mg per ml as the reference solution (3). Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 0.2 mol/L of solution sodium hydroxide as the coating substance and a mixture of chloroform, ethanol and cyclohexane (3 : 1 : 1) as the mobile phase. Apply separately 10 μl of the test solution obtained under Assay and 10 μl of each of the reference solutions (1), (2) and (3) to the plate. After developing and removal of the plate, dry in air. Spray with ninhydrin TS and heat at 105℃ for 10 minutes. The spot due to ephedrine in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution (3). Then spray with dilute potassium iodobismuthate TS, the spots due to strychnine and brucine in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions (1) and (2) respectively.

Weight variation Limit within ±3.0 per cent (Appendix Ⅰ B).

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Assay Weigh accurately 2 g of the powder, obtained under the test of variation weight, in a stopper conical flask, add accurately 20 ml of chloroform and 1 ml of concentrated ammonia TS, shake gently and weigh. Allow it to stand at room temperature for 24 hours, weigh again, replenish the loss of weight with chloroform, shake thoroughly and filter. Measure accurately 10 ml of the successive filtrate, extract with sulfuric acid solution (3→300) in portions until the alkaloids are exhausted. Combine the sulfuric acid solutions and transfer to another separating funnel, adjust to alkaline with concentrated ammonia TS and extract with chloroform in portions. Combine the chloroform extracts, evaporate to dryness and cool. Dissolve the residue accurately in 5 ml of

chloroform as the test solution. Dissolve a quantity of strychnine CRS, weighed accurately, in chloroform to prepare a solution containing 0.4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of toluene, acetone, ethanol and concentrated ammonia TS (16 : 12 : 1 : 4) as the mobile phase. Apply accurately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air. Carry out the method for thin layer chromatography (Appendix Ⅵ B thin layer chromatographic scanning method) at wavelength $\lambda_S = 254$ nm; $\lambda_R = 325$ nm. Measure the integration values of the absorbance from the test solution and the reference solution, respectively, and calculate the content.

It contains not less than 4.5 mg and not more than 5.5 mg of strychnine ($C_{21}H_{22}N_2O_2$) per pack, referred to Semen Strychni Pulveratum, caculate with reference to dried drug.

Action To promote blood circulation to dissipate blood stasis, and reduce swelling to kill pain.

Indications Injuries from fall or stumble and bruise.

Usage and dosage 2.5 g, once a day after meals; appropriate quantity mixed with wine, applied to the lesion.

Precaution Overdosage should be avoided because of its toxicity, Contraindicated for pregnant women; follow doctor's order for children or debilitated persons; contraindicated for tetanus patients with bleeding.

Strength 2.5 g per pack

Storage Preserve in tightly closed containers, protected from heat and moisture.

Jiuqi Niantong Wan
(九气拈痛丸)

Jiuqi Niantong Pills

Ingredients Rhizoma Cyperi (processed with vinegar) 138 g; Radix Aucklandiae 34.5 g; Rhizoma Alpiniae Officinari 34.5 g; Pericarpium Citri Reticulatae 69 g; Radix Curcumae 69 g; Rhizoma Curcumae (processed with vinegar) 276 g; Rhizoma Corydalis (processed with vinegar) 138 g; Semen Arecae 69 g; Radix et Rhizoma Glycyrrhizae 34.5 g; Faeces Trogopterori (stir-baked with vinegar) 138 g.

Procedure Pulverize the above ten ingredients to fine powder, sift and mix well. Make pills with water and dry.

Description Yellowish-brown to brown watered pills; odour, aromatic; taste, bitter and pungent.

Identification (1) Microscopical: Fragments of sclerenchyma greenish-yellow, cells subpolygonal or slightly elongated, walls slightly sinuous, sometimes beaded, with fine and dense pits. Wood fibres bundles long fusiform, 16-24 μm in diameter, walls slightly thickened, with cleft, crossed or V-shaped pits. Fibre bundles surrounded with parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Secretory cells subrounded, containing pale yellowish-brown to reddish-brown secretion, the surrounded cells stellate arranged. Prisms of calcium oxalate abundant in parenchyma. Fragments of endosperm colourless, with relatively thickened walls and large subrounded pits.

(2) Triturate 5 g of pills to fine powder, add 1 ml of concentrated ammonia TS and 20 ml of chloroform, macerate for 1 hour with constant shaking, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ethanol, filter, and use the filtrate as the test solution. Dissolve a quantity of tetrahydropalmatine CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane, chloroform and methanol (10 : 6 : 1) as the mobile phase. Apply separately 4 μl of the test solution and 1 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, expose to iodine vapour for a few seconds. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Triturate 10 g of pills to fine powder, add 20 ml of ether and mix thoroughly. Allow to stand overnight, filter, expel the filtrate to dryness and dissolve the residue in 1 ml of ethanol as the test solution. Prepare a solution of 0.2 g Rhizoma Cyperi reference drug and 20 ml of ether in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of toluene and ethyl acetate (9 : 1) as the mobile phase. Apply separately 10 μl of each of the above two kinds of solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm. The spots in the chromatogram.obtained with the test solution corresponds in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Ultrasonicate 0.5 g of Radix Aucklandiae with 10 ml of ether for 15 minutes, filter; expel the filtrate to dryness and dissolve the residue in 1 ml of ethanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and cyclohexane (5 : 1) as the mobile phase. Apply separately 5 μl of the test solution, obtained under Identification (3), and 2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 1% vanillin in sulfuric acid and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

(5) Triturate 10 g of pills to fine powder, add 20 ml of methanol and ultrasonicate for 30 minutes. Filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of ethanol as the test solution. To 0.5 g of Pericarpium Citri Reticulatae reference drug, add 5 ml of methanol, ultrasonicate for 30 minutes; and filter. Use the filtrate as the reference drug solution. Dissolve a quantity of hesperidin CRS in methanol to prepare a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, methanol and water (100 : 17 : 13) as the mobile phase. Apply separately 5 μl of the above three kinds of solutions to the plate. After developing about 3 cm and removal of the plate, dry in air. Use the upper layer of a mixture of toluene, ethyl acetate, formic acid and water (20 : 10 : 1 : 1) as the second mobile phase. After developing about 8 cm and removal of the plate, dry in air. Spray with aluminium chloride TS and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution and reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilance bonded silica gel as the stationary phase and a mixture of methanol, water and acetic acid (40 : 60 : 0.3) as the mobile phase. As detector a spectrophotometer set at 283 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of hesperidin.

Reference solution Dissolve a quantity of hesperidin CRS, accurately weighed, in methanol to prepare a solution containing 40 μg per ml.

Test solution Triturate pills to fine powder, weigh accurately 0.5 g of the powder, to a stopper conical flask, add accurately 50 ml of methanol and stopper tightly. Weigh and macerate overnight. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, allow to stand to cool. Weigh again and replenish the loss of weight with methanol, mix thoroughly. Filter, use the successive filtrate as the test solution.

Procedures Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 2.2 mg of hesperidin ($C_{28}H_{34}O_{15}$) per gram, referred to Pericarpium Citri Reticulatae.

Action To regulate *qi* and blood circulation to kill pain.

Indications Distending pain in the chest and hypochondria or dysmenorrhea due to stagnation of *qi* and blood.

Usage and dosage 6-9 g, twice a day.

Precaution Contraindicated for pregnant women.

Storage Preserve in tightly closed containers.

Jiusheng San
(九圣散)

Jiusheng Powder

Ingredients Rhizoma Atractylodis 150 g; Cortex Phellodendri Chinensis 200 g; Folium Perillae 200 g; Semen Armeniacae Amarum 400 g; Herba Menthae 200 g; Olibanum 120 g; Myrrha 120 g; Calomelas 50 g; Hydrargyri Oxydum Rubrum 50 g.

Procedure Levigate or pulverize separately Calomelas and Hydrargyri Oxydum Rubrum to very fine powder and pulverize the other seven ingredients to fine powder. Triturate all the powders, sift through the sieve made of thin and tough silk (do not use the sieve made of metallic wire) and mix well.

Description A brownish-yellow to pale brown powder; odour, delicately aromatic.

Identification Microscopical: Irregular masses colourless or pale yellow, with plenty of minute granules scattered on surface and around, dissolved on long standing. Minute clusters of calcium oxalate in mesophyll, 4-8 μm in diameter. Needle crystals of calcium oxalate irregularly filling in parenchymatous cells. Fibre bundles bright yellow, surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres, crystal cells with thickened and lignified walls. Stone cells orange-yellow, conchoidal, with thickened walls and pits distinct on the broader side of the walls.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Action To remove toxic materials to reduce swelling, and to eliminate *dampness* to relieve itching.

Indications Ulcers, chronic shank ulcer or impetigo due to *dampness* retained in the skin with manifestations of ulcers with pyecchysis.

Usage and dosage For external use, it is mixed with pepper oil or edible plant oils and applied topically, or sprinkled directely to the affected area.

Precaution Never for per os.

Storage Preserve in tightly closed containers, protected from moisture.

Jiuwei Qianghuo Keli
(九味羌活颗粒)

Jiuwei Qianghuo Granules

Ingredients Rhizoma seu Radix Notopterygii 150 g; Radix Saposhnikoviae 150 g; Rhizoma Atractylodis 150 g; Radix et Rhizoma Asari 50 g; Rhizoma Chuanxiong 100 g; Radix Angelicae Dahuricae 100 g; Radix Scutellariae 100 g; Radix et Rhizoma Glycyrrhizae 100 g; Radix Rehmanniae 100 g.

Procedure Pulverize Radix Angelicae Dahuricae to coarse powder, carry out the method for percolation described under liquid extracts and extracts (Appendix Ⅰ O), use 70% ethanol as solvent to macerate for 24 hours and then take percolating. Collect the percolations for later use. Distill essential oils from Rhizoma seu Radix Notopterygii, Radix Saposhnikoviae, Rhizoma Atractylodis, Radix et Rhizoma Asari and Rhizoma Chuanxiong, collect the water solution after distillation for late use. Decoct the residue, Radix Scutellariae, Radix et Rhizoma Glycyrrhizae and Radix Rehmanniae with water 3 times, 1 hour for each time, combine the decoctions and filter. Combine the filtrate with the above water solution and concentrate to about 900 ml, add same volume of ethanol, allow to stand. Separate the supernate and combine with the above percolations, recover ethanol and concentrate to form a thin extract with a relative density of 1.38-1.40 (60-65℃). Take 1 portion of the thin extract, 2.5 portions of sucrose and 1.5 portion of dextrin, make granules and dry, then spray the above distilled essential oil and mix well.

Description Brownish-yellow granules; odour, aromatic; taste, sweet and slightly bitter.

Identification (1) Triturate 10 g of granules to fine powder, add 20 ml of water and heat to dissolve, cool, apply to a DA-201 macroporous adsorption resin column (1 cm in diameter, column height 12 cm, packed with water). Elute with 100 ml of water, then 30 ml of 60% ethanol, collect the ethanolic eluation and evaporate to dryness. Dissolve the residue in 2 ml of methanol, and use the supernatant as the test solution. To 0.5 g of Radix et Rhizoma Glycyrrhizae reference drug, add 30 ml of water, boil for 30 minutes and filter. Evaporate the filtrate to about 20 ml, then prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 1% solution of sodium hydroxide as the coating substance and a mixture of ethyl acetate, formic acid, glacial acetic acid and water (15 : 1 : 1 : 2) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the

spots in the chromatogram obtained with the reference drug solution.

(2) Triturate 15 g of granules to fine powder, ultrasonicate with 30 ml of methanol for 30 minutes, filter, evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose containing 4% solution of sodium acetate as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 2% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (40 : 60 : 0.2) as the mobile phase. As detector a spectrophotometer set at 280 nm, The number of theoretical plates of the column is not less than 3000, calculated with the reference of the peak of baicalin.

Reference solution Dissolve a quantity of baicalin, weighed accurately, in methanol to prepare a solution containing 18 μg per ml.

Test solution Triturate a quantity of the granules, obtained under the test of weight variation to fine powder, mix well. Weigh accurately 1 g, add exactly 20 ml of 70% ethanol, stopper closely and ultrasonicate for 10 minutes, centrifuge and use the supernatant.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 1.5 mg of baicalin ($C_{21}H_{18}O_{11}$) per pack, referred to Radix Scutellariae.

Action To disperse *wind* to release the exterior, and remove *cold* and *dampness*.

Indications Common cold due to affliction from external *wind-cold* and *dampness* with manifestions of aversion to *cold*, fever, adiaphoresis, heavy-headedness and headache and aching pain of limbs.

Usage and dosage 15 g, 2-3 times a day, taken with ginger soup or boiled water.

Strength 15 g per pack

Storage Preserve in tightly closed containers.

Jiuwei Qianghuo Koufuye (九味羌活口服液)

Jiuwei Qianghuo Mixture

Ingredients Rhizoma seu Radix Notopterygii 150 g; Radix Saposhnikoviae 150 g; Rhizoma Atractylodis 150 g; Radix et Rhizoma Asari 50 g; Rhizoma Chuanxiong 100 g; Radix Angelicae Dahuricae 100 g; Radix Scutellariae 100 g; Radix et Rhizoma Glycyrrhizae 100 g; Radix Rehmanniae 100 g.

Procedure Pulverize Radix Angelicae Dahuricae to coarse powder, carry out the method for percolation described under liquid extracts and extracts (Appendix Ⅰ O), using 70% ethanol as solvent, macerate for 24 hours, and then percolate. Collect the percolation for latter use. Distill essential oils from Rhizoma seu Radix Notopterygii, Radix Saposhnikoviae, Rhizoma Atractylodis, Radix et Rhizoma Asari, and Rhizoma Chuanxiong, collect the water solution after distillation for later use. Decoct the residue and Radix Scutellariae, Radix et Rhizoma Glycyrrhizae, and Radix Rehmanniae with water 3 times, 1 hour for each time, combine the decoctions and filter. Combine the filtrate with the above water solution and concentrate to about 900 ml, add same volume of ethanol to precipitate. Separate the supernatant and combine with the above percolate, recover ethanol and concentrate to a thin extract with a relative density of 1.10-1.20 (70℃), dilute to 800 ml with water, keep for latter use. Dissolve 100 g of sucrose in water by heating to prepare sugar syrup, keep for latter use. Add the essential oils to 2 ml of polysorbate 80, add a quantity of concentrated decoction again, mix well, add concentrated decoction, sugar syrup, and 2 g of sorbic acid and mix well. Add water to 1000 ml, mix well, pack and sterilize.

Description A dark brown liquid; odour, slightly aromatic; taste, bitter, pungent, slightly sweet.

Identification (1) To 40 ml of the mixture, add 150 ml of water, carry out the method for determination of volatile oil (Appendix Ⅹ D). Add 1 ml of petroleum ether (60-90℃) from the top of the apparatus, heat to slightly boil for 2 hours. Allow to cool, use the petroleum ether layer as the test solution. To 0.5 g of Rhizoma Chuanxiong reference drug add 15 ml of ether, ultrasonicate for 15 minutes, filter, evaporate the filtrate to dryness at a lower temperature, dissolve the residue in 1 ml of ethyl acetate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference drug solution to the plate. After developing and removing the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.

(2) To 30 ml of the mixture, extract by shaking with one 50-ml and two 20-ml quantities of ether, and keep the water layer for latter use. Combine the ether extracts, evaporate to dryness on a water bath at a lower temperature, dissolve the residue in 1 ml of ethyl acetate as the test solution. To 1 g of Radix Angelicae Dahuricae reference drug, add 10 ml of ethanol, ultrasonicate for 20 minutes, filter, and concentrate the filtrate to 1 ml as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (10 : 1) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference drug solution to the plate. After developing in a chamber pre-equilibrated with mobile phase for 20 minutes, remove the plate, dry in air, and examine under ultraviolet light at 365 nm. A yellow fluorescent spot in the chromatography obtained with the test solution correspond in position and colour to the spot in the chromatography obtained with the reference drug solution.

(3) To 20 ml of the mixture, add 20 ml of chloroform and 1 ml of concentrated ammonia TS, and heat under reflux for 1

hour. Separate the chloroform layer, evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 0.5 g of Radix Saposhnikoviae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, acetone, ethyl acetate and concentrated ammonia TS (2 : 3 : 4 : 0.2) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference drug solution to the plate. After developing and removing the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ for about 5 minutes, examine under ultraviolet light at 365 nm. The main fluorescent spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.

(4) To the water solution, obtained under the Identification (2), extract again with two 30-ml quantities of ethyl acetate. Combine the ethyl acetate extracts, evaporate to dryness on a water bath, and dissolve the residue in 1 ml of methanol as the test solution. To 1 g of Radix et Rhizoma Glycyrrhizae reference drug, add 40 ml of ether, heat under reflux for 1 hour, filter. Expel the solvent remained in the residue, add 30 ml of methanol, ultrasonicate for 20 minutes. Filter, evaporate the filtrate to dryness, and dissolve the residue in 40 ml of water. Extract with three 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, and wash with three 30-ml quantities of water. Separate the *n*-butanol layer and evaporate to dryness, dissolve the residue in 1 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 1% sodium hydroxide solution as the coating substance and a mixture of ethyl acetate, formic acid, glacial acetic acid and water (15 : 1 : 1 : 2) as the mobile phase. Apply separately 3 μl of each of the test solution and the reference drug solution to the plate. After developing and removing the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.

Relative density Not less than 1.07 (Appendix Ⅶ A).

pH value 4.0-6.0 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (43 : 57 : 0.2) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin CRS, dissolve in methanol to prepare a reference solution containing 0.12 mg per ml.

Test solution Measure accurately 1 ml of the mixture in a 25 ml volumetric flask, dilute to volume with methanol, mix well, filter, and use the successive filtrate as the test solution.

Procedures Inject accurately 5 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 1.5 mg of baicalin ($C_{21}H_{18}O_{11}$) per ml, referred to Radix Scutellariae.

Action To disperse *wind* to release the exterior, and remove *cold* and *dampness*.

Indications Common cold due to affliction from external *wind-cold* and *dampness* with manifestations of aversion to cold, fever, adiaphoresis, heavy-headedness and headache and aching pain of limbs.

Usage and dosage 20 ml, 2-3 times a day.

Strength 10 ml per phial

Storage Preserve in tightly closed containers.

Jiuwei Qianghuo Wan
(九味羌活丸)

Jiuwei Qianghuo Pills

Ingredients Rhizoma seu Radix Notopterygii 150 g; Radix Saposhnikoviae 150 g; Rhizoma Atractylodis 150 g; Radix et Rhizoma Asari 50 g; Rhizoma Chuanxiong 100 g; Radix Angelicae Dahuricae 100 g; Radix Scutellariae 100 g; Radix et Rhizoma Glycyrrhizae 100 g; Radix Rehmanniae 100 g.

Procedure Pulverize the above nine ingredients to fine powder, sift and mix well. Make pills with water and dry.

Description Brown watered pills; odour, aromatic; taste, pungent, and slightly bitter.

Identification (1) Microscopical: Single starch granules subrounded or ellipsoidal, 21-26 μm in diameter. Vattae containing golden-yellow secretion, 30 μm in diameter. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate. Bast fibres pale yellow, spidle-shaped, with thickened walls and minute pit-canals. Parenchyma greyish-brown to blackish-brown, cells mostly wrinkled, and each containing a brown nucleus-like mass. Parenchymatous cells containing minute sand crystals of calcium oxalate.

(2) Triturate 3 g of pills to fine powder, add 15 ml of ether, ultrasonicate for 15 minutes, filter and expel the ether. Dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 0.5 g of Rhizoma Atractylodis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and petroleum ether (60-90℃) as the mobile phase. Apply separately 5-10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a fresh solution of 5% *p*-dimethylaminobenzaldehyde in 10% sulfuric acid and heat to the spots clear. The dark green spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Prepare a solution of 0.3 g of Rhizoma Chuanxiong reference drug in the same manner as described under the Identification test (2) as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 3 μl of each of the test solution obtained under Identification (2) and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Triturate 10 g of pills to fine powder, heat under reflux

with 100 ml of ether for 30 minutes, filter; reserve residue for later use. Wash the filtrate with two 20-ml quantities of 1% solution of sodium hydroxide and two 20-ml quantities of water, discard the washing. Expel the ether, and dissolve the residue in 2 ml of ethyl acetate as the test solution. Ultrasonicate 0.5 g of Rhizoma et Radix Notopterygii reference drug with 20 ml of ether for 15 minutes, filter, expel the ether and dissolve the residue in 2 ml of ethyl acetate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel as the coating substance and a mixture of petroleum ether (30-60℃) and ethyl acetate (3 : 1) as the mobile phase. Apply separately 5 μl of the above two kinds of solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(5) Heat under reflux the reserved residue under Identification (4) with 100 ml of methanol for 1 hour, allow standing to cool and filter, evaporate the filtrate to dryness. Dissolve the residue in 40 ml of water and filter, extract the filtrate with three 30-ml quantities of *n*-butanol. Combine the extract and wash with three 30-ml quantities of water, discard the water, evaporate the *n*-butanol extract to dryness. Dissolve the residue in 5 ml of methanol as the test solution. Prepare a solution of 1 g of Radix et Rhizoma Glycyrrhizae in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel mixed with 1% solution of sodium hydroxide as the coating substance and a mixture of ethyl acetate, formic acid, glacial acetic acid and water (15 : 1 : 1 : 2) as the mobile phase. Apply separately 1-3 μl of the above two kinds of solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Total ash Not more than 7.0 per cent (Appendix Ⅸ K).

Acid-insoluble ash Not more than 2.0 per cent (Appendix Ⅸ K).

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Volatile ether extractives Place 2 g of the coarse powder, carry out the method for determination of volatile ether extractives (Appendix Ⅹ A), not less than 0.30 per cent.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilance bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (47 : 53 : 0.2) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of baicalin.

Reference solution Dissolve a quantity of baicalin CRS, accurately weighed, in methanol to prepare a solution containing 60 μg per ml.

Test solution Triturate pills to fine powder, weigh accurately 0.5 g of the powder, add accurately 50 ml of methanol and weigh. Heat under reflux for 1 hour, cool, weigh again and replenish the lost weight with methanol. Mix thoroughly and filter.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 5.0 mg of baicalin ($C_{21}H_{18}O_{11}$) per gram, referred to Radix Scutellariae.

Action To disperse *wind* to release the exterior, and remove *cold* and *dampness*.

Indications Common cold due to affliction from external *wind-cold* and *dampness* with manifestations of aversion to cold, fever, adiaphoresis, heavy-headedness and headache and aching pain of limbs.

Usage and dosage 6-9 g, 2-3 times a day, taken with ginger and Chinese onion soup or warm boiled water.

Storage Preserve in tightly closed containers, protected from moisture.

Jiuwei Shihuihua San
(九味石灰华散)

Jiuwei Shihuihua Powder

Jiuwei Shihuihua Powder is a prescription used by Tibetan Nationality.

Ingredients Calx Pulveratum 100 g; Flos Carthami 80 g; Calculus Bovis 4 g; Radix et Rhizoma Rhodiolae Crenulatae 80 g; Herba Aconiti 100 g; Radix et Rhizoma Glycyrrhizae (peeled) 80 g; Herba Pegaeophyti 80 g; Lignum Santali Albi 100 g; Herba Lagotidis 100 g.

Procedure Pulverize the above ingredients, except Calculus Bovis, to fine powder. Triturate Calculus Bovis with the above powder, sift and mix well.

Description A pale yellow powder; odour, aromatic; taste, sweet and slightly bitter.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Action To remove *toxic heat*, relieve cough, and to induce sedation.

Indications Pneumonia with high fever, restlessness and cough in children.

Usage and dosage 0.6-0.9 g, twice a day; appropriate reduction of the dosage for children under 3 years of age.

Storage Preserve in tightly closed containers, protected from moisture.

Jiuyi San
(九一散)

Jiuyi Powder

Ingredients Gypsum Fibrosum (Praeparatum) 900 g; Hydrargyri Oxydum Rubrum (levigated) 100 g.

Procedure Pulverize Gypsum Fibrosum and levigate Hydrargyri Oxydum Rubrum to very fine powder. Triturate to mix and sift through the sieve made of thin and tough silk (do not use the sieve made of metallic wire), then mix well.

Description A pale orange or pale pink fine powder.

Identification (1) Shake 0.1 g of the powder with 10 ml of water, and filter. The filtrate yields the reactions charcteristic of calcium salts (Appendix Ⅳ) and sulfates (Appendix Ⅳ).

(2) Shake 0.5 g of the powder with 10 ml of dilute nitric

acid, and filter. To 1 ml of the filtrate add 1 drop of potassium iodide TS; a scarlet precipitate is produced, which is dissolved on adding excess of potassium iodide TS.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Assay Weigh accurately 2 g of the powder, add 25 ml of dilute nitric acid to dissolve Hydrargyri Oxydum Rubrum, and filter. Wash the residue with about 80 ml of water in several portions. Combine the filtrate and washings, add 2 ml of ammonium ferric sulfate IS and titrate with ammonium thiocyanate (0.1 mol/L) VS. 1 ml of ammonium thiocyanate (0.1 mol/L) corresponds to 10.83 mg of HgO.
It contains not less than 90 mg and not more than 110 mg of HgO per gram, referred to Hydrargyri Oxydum Rubrum.

Action To drain pus to eradicate *toxicity* and remove necrotic tissues to promote growth of new tissues.

Indications Ulcers due to abundant retained *heat* with manifestations of bright red ulcerous wound in which pus and nectrotic tissues are almost exhausted.

Usage and dosage For external use, appropriate quantity of the powder is sprinkled to the affected area evenly. For deep wound or fistulae, medicated thread is insert in, and the wound is dressed with ointment or gauze. Change the dressing daily or follow the surgeon's order.

Precaution For external use only, never for oral administration, and contraindicated for patients with wounds at the area of thin soft tissue where suppuration is impossible, or patients with wounds of much thick secretion.

Strength 1.5 g per bottle

Storage Preserve in tightly closed containers, protected from light and moisture.

Jizhi Tangjiang (急支糖浆)

Jizhi Syrup

Ingredients Herba Houttuyniae; Rhizoma Fagopyri Dibotryis; Folium Ilicis Chinensis; Herba Ephedrae; Radix et Rhizoma Asteris; Radix Peucedani; Fructus Aurantii; Radix et Rhizoma Glycyrrhizae.

Procedure Distill Herba Houttuyniae and Fructus Aurantii with water, collect the distillation. Decoct the residue and other six ingredients twice, filter, combine the filtrate and concentrate to an appropriate amount. Boil a quantity of sucrose with water, filter, combine it with the above distillation and concentrated solution, add a quantity of preservative, or add a quantity of flavoring agents and preservative. Add water to the specified quantity, mix well and fill into appropriate bottles.

Description Brownish-black thick liquid; taste, sweet, slightly bitter.

Identification (1) To 20 ml of the syrup, add dilute hydrochloric acid to adjust to pH 2-3. Transfer the solution to a separating funnel, extract with two 20-ml quantities of ether, combine the ether solutions and evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve separately a quantity of ferulic acid CRS and protocatechuic acid CRS in methanol to prepare two kinds of solutions each containing 1 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance, and a mixture of benzene, ethyl acetate and formic acid (20 : 10 : 1) as the mobile phase. Apply separately 5 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.
(2) Dilute 10 ml of the syrup with 20 ml of water, and transfer to a separating funnel, adjust to pH 10-12 with concentrated ammonia TS. Extract with two 15-ml quantities of ether. Combine the ether solutions and evaporate to dryness on a water bath. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of ephedrine hydrochloride CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of chloroform, methanol and concentrated ammonia TS (40 : 10 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with ninhydrin TS, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Transfer 20 ml of the syrup to a separating funnel, extract with two 20-ml quantities of ether and discard the ether solution. Extract the water layer with two 30-ml quantities of ethyl acetate. Combine the ethyl acetate solutions and evaporate to dryness on a water bath. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of naringin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and the lower layer of chloroform, methanol and water (32 : 17 : 5) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 2% aluminium trichloride in methanol, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot in the chromatogram obtained with the reference solution.

Relative density Not less than 1.17 (Appendix Ⅶ A).

pH value 4.0-5.5 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for syrups (Appendix Ⅰ H).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 1% solution of acetic acid (40 : 60) as the mobile phase. As detector a spectrophotometer set at 283 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference of the peak of naringin.

Reference solution Weigh accurately a quantity of naringin CRS, previously dried to a constant weight at 110℃, dissolve in methanol to prepare a solution containing 80 μg per ml as the reference solution.

Test solution Transfer exactly 10 ml of the syrup to a 50 ml volumetric flask, add dilute ethanol to volume, mix thoroughly, centrifuge at 4000 rpm for 10 minutes. Filter the supernatant and use the successive filtrate as the test

solution.

Procedures Inject accurately 10 μl of each of the reference solution and test solution into the column, and calculate the content.

It contains not less than 0.20 mg of naringin ($C_{27}H_{32}O_{14}$), referred to Fructus Aurantii.

Action To clear *heat* and resolve *phlegm*, and disseminate the lung and stop coughing.

Indications Coughing due to affliction from external *wind-heat* with manifestations of fever, aversion to cold, fullness in the chest, coughing and painful throat; acute bronchitis, acute attack of chronic bronchitis with above symptoms.

Usage and dosage 20-30 ml, 3-4 times a day. 5 ml, for children under 1 year old; 7 ml, for children 1-3 years old; 10 ml, for children 3-7 years old; 15 ml, for children over 7 years old.

Storage Preserve in tightly closed containers.

Juanxiao Pian
(蠲哮片)

Juanxiao Tablets

Ingredients Semen Lepidii seu Descurainiae; Pericarpium Swertiae Mileensis; Pericarpium Citri Reticulatae; Fructus Viticis Negundinis; Semen Arecae; Radix et Rhizoma Rhei; Rhizoma Zingiberis Recens.

Procedure Squeeze Rhizoma Zingiberis Recens, pulverize Radix et Rhizoma Rhei to fine powder. Distill Semen Lepidii seu Descurainiae (packaged with calico), Pericarpium Swertiae Mileensis, Pericarpium Citri Reticulatae, Fructus Viticis Negundinis and Semen Arecae, collect the distillate, filter the water solution after distilling for latter use. Decoct the residue with water one time and filter. Combine the filtrate with the above filtrate and concentrate to form a thin extract with relative density of 1.08-1.15 (80℃), add ethanol to a content of 65% ethanol, stand for 24 hours, and filter. Recover ethanol from the filtrate, concentrate to form a thick extract with a relative density of 1.25-1.30 (80℃), mix with the powder of Radix et Rhizoma Rhei, dry, pulverize to fine powder, add a quantity of starch and ethanol, make granules and dry. Spray the juice of Rhizoma Zingiberis Recens and the distillate, mix well, add a quantity of starch, make to 1000 tablets and coated with film.

Description Film coated tablets with brown colour core; odour, delicately aromatic; tast, bitter.

Identification (1) Pulverize 5 tablets, removed the coats, to fine powder. Add 30 ml of ethyl acetate, heat under reflux for 30 minutes, filter. Extract the filtrate two 15-ml quantities of 5% sodium carbonate solution. Separate the alkaline solution, adjust to pH 2-3 with hydrochloric acid. Extract with two 15-ml quantities of ethyl acetate, combine the ethyl acetate extract, wash with water to neutral. Evaporate the ethyl acetate extract to dryness, dissolve the residue in 2.5 ml of methanol as the test solution. Prepare a solution of 0.2 g of Fructus Viticis Negundinis reference drug in the same manner as the reference drug solution. Carry out the method for the thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of *n*-hexane, chloroform, methanol and formic acid (5 : 3.6 : 0.3 : 0.1) as the mobile phase. Apply separately 2 μl of each of the test solution and the reference drug solution in strips to the plate. After developing and removal of the plate, dry in air, spray with a mixture of acetic anhydride, sulfuric acid and dehydrated ethanol (1 : 1 : 1.5), heat at 105℃ to the spots clear. Examine under ultraviolet light at 365 nm. The fluorescent strips in the chromatogram obtained with the test solution correspond in position and colour to the strips in the chromatogram obtained with the reference drug solution.

(2) Pulverize 10 tablets, removed the coats, to fine powder. Add 50 ml of methanol, ultrasonicate for 20 minutes, filter. Evaporate 5 ml of the filtrate to dryness, dissolve the residue in 10 ml of water, add 1 ml of hydrochloric, heat on a water bath for 30 minutes, cool immediately. Extract with two 20-ml quantities of ether, combine the ether extract, and expel the solvent to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 0.1 g of Radix et Rhizoma Rhei reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H containing sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (60-90℃), ethyl acetate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 4 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, expose the plate to ammonia vapour until the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Pulverize 10 tablets, removed the coats, to fine powder. Moisten with 1 ml of ammonia TS, add 20 ml of chloroform, heat under reflux for 1 hour, filter. Extract the filtrate with 20 ml of 5% solution of hydrochloric acid by shaking. Separate the acidified solution, adjust to pH 8-9 with ammonia TS. Extract with two 5-ml quantities of chloroform, combine the chloroform extracts, expel the solvent at a lower temperature to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 1.5 g of Semen Arecae reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and the upper layer of chloroform and methanol (19 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference drug solution in strips to the plate. After developing and removal of the plate, dry in air, spray with potassium iodobismuthate TS, expose the plate to iodine vapour until the strips clear. The strips in the chromatogram obtained with the test solution correspond in position and colour to the strips in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of methanol, water and glacial acetic acid (30 : 70 : 1) as the mobile phase. As detector a spectrophotometer set at 285 nm. The number of theoretical plates of the column is not less than 1500, calculated with the reference to the peak of hesperidin.

Reference solution Dissolve a quantity of hesperidin CRS, accurately weighed, in methanol to prepare a solution containing 30 μg per ml as the reference solution.

Test solution Pulverize 10 tablets, removed coats, to fine

powder. To about 0.2 g of the powder, weigh accurately, in a Soxhlet's extractor, add a quantity of methanol, heat under reflux at 80℃ on the water bath for 4 hours until the extracts to colourless. Transfer the extracts to 100 ml volumetric flask, wash the container with a small quantity of methanol, combine the washings to the same volumetric flask, cool, add methanol to volume. Mix thoroughly, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contents not less than 3.0 mg of hesperidin ($C_{28}H_{34}O_{15}$) per table, referred to Pericarpium Citri Reticulatae Viride and Pericarpium Citri Reticulatae.

Action To purge the lung to eliminate stagnated *qi*, expel *phlegm* and stasis, and send *qi* downward to relieve asthma.

Indications Bronchial asthma at the stage of acute attack due to *heat* and phlegm retained in the lung, with manifestations of harsh breathing with profuse phlegm, rale, paroxysmal coughing with expectoration of thick yellow phlegm.

Usage and dosage 8 tablets, 3 times a day, taken after meals. 7 days making one course of treatment.

Precaution (1) It is forbidden to prescribe to pregnant women and debilitated patients with chronic diseases, or those with loose stools due to weakness of the spleen and stomach.
(2) It is normal to see loose stools and mild abdominal pain after taking it. Administer it continuously or reduce the dosage.

Strength 0.3 g per tablet

Storage Preserve in tightly closed containers.

Jufang Zhibao San
(局方至宝散)

Jufang Zhibao Powder

Ingredients Pulvis Cornus Bubali Concentratus 200 g; Calculus Bovis 50 g; Carapax Eretmochelydis 100 g; Moschus 10 g; Cinnabaris 100 g; Realgar 100 g; Succinum 100 g; Benzoinum 150 g; Borneolum Syntheticum 10 g.

Procedure Pulverize Carapax Eretmochelydis, Benzoinum and Succinum to fine powder separately. Levigate Cinnabaris and Realgar to very fine powder. Triturate Pulvis Cornus Bubali Concentratus, Calculus Bovis, Moschus and Borneolum Syntheticum with the above fine powders, sift and mix well.

Description Orange to pale brown powder; odour, strong aromatic; taste, slightly bitter.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Action To clear *heat* to relieve *toxicity*, and resuscitate and relieve convulsion.

Indications Febrile diseases, invasion of the pericardium by *heat*, stirring of *wind* by intense *heat* with manifestations of convulsion due to high fever, restlessness, coma, delirium and child acute convulsion due to high fever.

Usage and dosage 2 g, once a day; 0.5 g, for children under 3 years old; 1 g, for children of 4-6 years old; or follow doctor's advice.

Strength 2 g per bottle

Storage Preserve in tightly closed containers.

Juhong Tanke Ye
(橘红痰咳液)

Juhong Tanke Mixture

Ingredients Exocarpium Citri Grandis 300 g; Radix Stemonae (stir-baked with honey) 30 g; Poria 30 g; Rhizoma Pinelliae (praeparata) 30 g; Rhizoma et Radix Cynanchi Stauntonii 50 g; Rhizoma et Radix Glycyrrhizae 10 g; Semen Armeniacae Amarum 100 g. Fructus Schisandrae Chinensis 20 g.

Procedure Distill Exocarpium Citri Grandis and Semen Armeniacae Amarum, collect 80 ml of the distillate. Decoct the residue and the other 6 ingredients with water for 2 times, 2 hours for each time, combine the decoctions and filter. Concentrate the filtrate to form a thin extract with a relative density of 1.25-1.35 (80℃), add ethanol to a content of 70%-80% ethanol, stand for 24 hours. Separate the supernatant, recover the ethanol and concentrate to form a thin extract with a relative density of 1.18-1.20 (80℃), add 400 g of sucrose, 100 g of refined honey, 3 g of benzoic acid and 0.3 g of ethyl *p*-hydroxybenzoate, stir well, add the above distillate. Mix well, filter and allow to cool, add an appropriate amount of essence and menthol, adjust the total volume to 1000 ml with water and stir well.

Description A brown liquid; odour, aromatic; taste, sweet, slightly bitter.

Identification Extract 5 ml of the mixture with 10 ml of ethyl acetate by shaking, evaporate the ethyl acetate extract to dryness and dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Heat under reflux 0.3 g of the Exocarpium Citri Grandis reference drug for 20 minutes with 10 ml of methanol, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of dehydrated ethanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate, formic acid and water (2 : 3 : 0.3 : 0.3) as the mobile phase. Apply separately 2 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with 3% aluminum trichloride in ethanol. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Relative density Not less than 1.16 (Appendix Ⅶ A).

pH value 4.0-6.0 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay Carry out the method for high performance liquid chromatographys (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and glacial acetic acid (70 : 130 : 3) as the mobile phase. As detector a spectrophotometer set at 283 nm. The number of the theoretical plates of the column is not less than 4500, calculated with the reference to the peak of naringin.

Reference solution Weigh accurately 10 mg of naringin CRS, dried previously to constant weight at 110℃, in a 50 ml volumetric flask, dilute with methanol to volume, and mix well. Measure accurately 3 ml in a 10 ml volumetric flask, dilute with methanol to volume, and mix well

(containing 60 μg of naringin per ml).

Test solution Measure accurately 10 ml of the mixture, extract the mixture with six 10-ml quantities of ethyl acetate by shaking, combine the ethyl acetate extract, recover to dryness. Dissolve the residue in methanol and transfer to 100 ml volumetric flask, dilute with methanol to volume, and mix well, and filter the supernatant, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 1.0 mg of naringin ($C_{27}H_{32}O_{14}$) per ml, referred to Exocarpium Citri Grandis.

Action To regulate *qi* flow and resolve phlegm, and moisten the lung and stop coughing.

Indications Coughing with expectoration of copious phlegm and shortness of breath due to block of the lung by phlegm; common cold, bronchitis, pharyngitis and laryngitis with above symptoms.

Usage and dosage 10-20 ml, 3 times a day.

Precaution Contraindicated for patients with external *wind-heat*.

Strength 10 ml per vial

Storage Preserve in tightly closed containers.

Juhong Wan
(橘红丸)

Juhong Pills

Ingredients Exocarpium Citri Grandis 75 g; Pericarpium Citri Reticulatae 50 g; Rhizoma Pinelliae (processed) 37.5 g; Poria 50 g; Radix et Rhizoma Glycyrrhizae 25 g; Radix Platycodonis 37.5 g; Semen Armeniacae Amarum 50 g; Fructus Perillae (stir-baked) 37.5 g; Radix et Rhizoma Asteris 37.5 g; Flos Farfarae 25 g; Pericarpium Trichosanthis 50 g; Bulbus Fritillariae Thunbergii 50 g; Radix Rehmanniae 50 g; Radix Ophiopogonis 50 g; Gypsum Fibrosum 50 g.

Procedure Pulverize the above fifteen ingredients to fine powder, sift, mix well. To each 100 g of powder add 20-30 g of refined honey and a quantity of water to make water-honeyed pill and dry; or add 90-110 g of refined honey to make small honeyed pills or big honeyed pills.

Description Brown water-honeyed pills, small honeyed pills or big honeyed pills; odour, slightly aromatic, taste, sweet and slightly bitter.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Stone cells orange, mussel-shaped, walls relatively thickened, pits distinct at the broader side. Cells of testa subrounded, oblong or irregular, walls thickened reticulately, like flowerage striations. Pollen grains globular, up to about 32 μm in diameter, with sharper spines on the extine. Hypodermis cells rectangular, anticlinal walls sinuous, some cells containing violet pigments.
(2) Heat under reflux 5 g of the small or big honeyed pills, cut into pieces and ground well with 3 g of kieselguhr, or 3.6 g of the pulverized water-honeyed pills, with 40 ml of ethyl acetate for 1 hour, allow to stand to cool, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of methanol as the test solution. To 1 g of Pericarpium Citri Reticulatae reference drug, add 10 ml of methanol, ultrasonicate for 10 minutes, filter and use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (19 : 1) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The main fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(3) Triturate well 6 g of the small or big honeyed pills, or 3.6 g of the water-honeyed pills with 30 ml of water, add 1 ml of hydrochloric acid and heat under reflux for 1 hour. Allow to stand to cool, filter and transfer the filtrate to a separating funnel. Extract with two 30-ml quantities of chloroform by shaking, combine the chloroform extracts, evaporate to dryness, dissolve the residue in 2 ml of chloroform as the test solution. Prepare a solution of 1 g of Radix Ophiopogonis reference drug and 30 ml of water in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and acetone (4 : 1) as the mobile phase. Apply separately 5 μl of the test solution, 2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to spots clear. The deep green spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilance bonded silica gel as the stationary phase and a mixture of methanol, acetic acid and water (30 : 4 : 60) as the mobile phase. As detector a spectrophotometer set at 283 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of naringin.

Reference solution Weigh accurately a quantity of naringin CRS, dried previously to constant weight at 110℃, add methanol to prepare a solution containing 70 μg per ml.

Test solution Pulverize a quantity of water-honeyed pills to powder, weigh accurately 1.5 g of powder; or cut a quantity of small honeyed pills and big honeyed pills, obtained under the test of variation weight, into pieces, and weigh accurately 2 g. Place the powder or pieces of pills to a stopper conical flask, add accurately 50 ml of the solution of mobile phase, stopper closely and weigh. Allow disintegrating thoroughly, ultrasonicate (power, 250 W; frequency, 20 kHz) for 30 minutes, allow standing to cool, Weigh again and replenish the loss of the weight with the solution of mobile phase, Mix well; filter; if difficult to filter, then centrifuge and filter the supernatant, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 10-20 μl of the test solution into the column, and calculate the content.
It contains not less than 1.0 mg of naringin ($C_{27}H_{32}O_{11}$) per gram for water-honeyed pills; or not less than 0.6 mg per gram for small honeyed pills; or not less than 1.9 mg per

pill for the strength of 3 g of big honeyed pills, not less than 3.8 mg per pill for the strength of 6 g of big honeyed pills; all referred to Exocarpium Citri Grandis.

Action To clear the lung and resolve phlegm, and relieve coughing.

Indications Coughing with copious yellow sticky phlegm and constriction in the chest and dry mouth.

Usage and dosage 7.2 g of water-honeyed pills, 12 g of small honeyed pills or 2 big honeyed pills (the strength of 6 g per big honeyed pill) or 4 big honeyed pills (the strength of 3 g per big honeyed pill), twice a day.

Strength 10 g per 100 water-honeyed pills; 3 g or 6 g per big honeyed pill

Storage Preserve in tightly closed containers.

Kaixiong Shunqi Wan
(开胸顺气丸)

Kaixiong Shunqi Pills

Ingredients Semen Arecae 300 g; Semen Pharbitidis (stir-baked) 400 g; Pericarpium Citri Reticulatae 100 g; Radix Aucklandiae 75 g; Cortex Magnoliae Officinalis (processed with ginger) 100 g; Rhizoma Sparganii (processed with vinegar) 100 g; Rhizoma Curcumae (processed with vinegar) 100 g; Fructus Gleditsiae Abnormalis 50 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix well, make pills with water and dry at a low temperature.

Description Pale brown to brown watered pills; taste, slightly bitter and pungent.

Identification (1) Microscopical: Gelatinized starch masses pale yellowish. Fragments of endosperm cells colourless, with relatively thickened walls and subrounded pits. Palisade cells of testa brownish or purplish-brown, 48-80 μm long. Prisms of calcium oxalate abundant in parenchyma. Fibre bundles pale yellow, surrounded by cells containing prisms and less clusters of calcium oxalate, forming crystal fibres, and often accompanied with subsquare sclerenchymatous cells. Stone cells branched, with thickened walls and distinct striations. Secretory cells containing reddish-brown or yellowish-brown secretion.

(2) To 4 g, cut into pieces, add 20 ml of chloroform and 3 ml of concentrated ammonia TS, heat under reflux for 1 hour and filter. To the filtrate add 5 ml of dilute hydrochloric acid TS and 20 ml of water, and shake. Separate the aqueous layer, add concentrated ammonia TS to adjust pH value to 8-9, and extract with two 5-ml quantities of chloroform. Separate the chloroform layer, evaporate to dryness, dissolve the residue in 0.2 ml of methanol as the test solution. Prepare a solution with 1 g of Semen Arecae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 1% solution of sodium hydroxide as the coating substance and the lower layer of a mixture of chloroform, ethyl acetate, methanol and water (2 : 4 : 2 : 1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% potassium iodobismuthate TS. The orange spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) To 3 g, cut into pieces, macerate in 25 ml of methanol for 30 minutes with constant shaking. Filter, evaporate the filtrate to about 1 ml as the test solution. Dissolve magnolol CRS and honokiol CRS in methanol to produce a mixture containing 1 mg each per ml as the reference solution. Carry out the method for thin layer chromatograph (Appendix Ⅵ B), using silica gel GF_{254} mixed with 1% solution of sodium hydroxide as the coating substance and a mixture of benzene and ethyl acetate (6 : 1) as the mobile phase. Apply separately 4 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution. Spray with 5% vanillin in sulfuric acid and heat at 80℃ for several minutes to spots clear. The colour of the spots turns purplish-red to purplish-brown.

(4) Grind 4 g, add 30 ml of 2 mol/L solution of hydrochloric acid in ethanol, heat under reflux for 1.5 hours, and filter. To the filtrate add 40 ml of water, evaporate on a water bath until no ethanol is smelled. Transfer the aqueous solution to a separating funnel, extract with 30 ml of benzene, allow to stand, separate the benzene layer, and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Prepare a solution of 1 g of Semen Pharbitidis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 5-10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid and heat at 105℃ to spots clear. The yellow spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(5) Triturate 3 g of pills, add 20 ml of methanol, ultrasonicate for 20 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 20 ml of water, adjust pH value to 1-2 with hydrochloric acid, extract with two 20-ml quantities of ethyl acetate, combine the ethyl acetate extracts. Evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of hesperidin CRS in methanol to prepare a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of chloroform, methanol and water (28 : 10 : 1) as the mobile phase. Apply separately 4-8 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 1% aluminum trichloride in ethanol. Examine under ultraviolet light at 365 nm, the fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

(6) Triturate 3 g of pills, heat under reflux with 25 ml of chloroform for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 1 g of Radix Aucklandiae reference drug and 15 ml of chloroform in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of cyclohexane and acetone (10 : 3) as the mobile phase. Apply separately 1-3 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with

5% vanillin in sulfuric acid. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, water and glacial acetic acid (60 : 38 : 2) as the mobile phase. As detector a spectrophotometer set at 294 nm. The number of the theoretical plates of the column is not less than 3000, calculated with the reference to the peak of magnolol.

Reference solution Dissolve separately a quantity of magnolol CRS and honokiol CRS, weighed accurately, in methanol to prepare two kinds of reference solutions, containing 40 μg of magnolol per ml and 20 μg of honokiol per ml.

Test solution Triturate a quantity of pills to fine powder. Weigh accurately 2 g, place to a stopper conical flask, add exactly 50 ml of methanol and weigh. Ultrasonicate for 40 minutes and allow standing to cool. Weigh again and replenish the lost weight with methanol, mix well and filter. Measure accurately 10 ml of the successive filtrate, evaporate the filtrate to dryness. Dissolve the residue with 20 ml of solution of hydrochloric acid (1→10), in portions, and transfer to a separator. Then dissolve the residue with 15 ml of chloroform, in portions, and transfer to the same separator, extract by shaking. Separate the chloroform solution for later use, extract the water solution with two 15-ml quantities of chloroform. Combine the chloroform solution; wash with 20 ml of water. Extract the washing with 10 ml of chloroform. Combine the chloroform extracts, recover the solvent to dryness. Dissolve the residue in 90% methanol, by slightly heating if necessary, and transfer to a 10 ml volumetric flask. Dilute with methanol to volume, and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 1.1 mg of the total amount of magnolol ($C_{18}H_{18}O_2$) and honokiol ($C_{18}H_{18}O_2$) per 1 g, referred to Cortex Magnoliae.

Action To remove retained, undigested food, and promote *qi* flow to kill pain.

Indications Fullness in the chest and hypochondria, gastric pain, belching, nausea, vomiting and anorexia due to stagnation of *qi* and retained food.

Usage and dosage 3-9 g, 1-2 times a day.

Precaution Contraindicated for pregnant women; be cautious about aged and debilitated patients.

Storage Preserve in well closed containers, protected from moisture.

Kanggan Keli
(抗感颗粒)

Kanggan Granules

Ingredients Flos Lonicerae Japonicae 700 g; Radix Paeoniae Rubra 700 g; Rhizoma Dryopteridis Crassirhizomae 233 g.

Procedure Decoct the above three ingredients twice for 1.5 hours each, combine the decoctions, filter, concentrate the filtrate to 830 ml, add ethanol to prepare a solution containing 50% of ethanol, stir well, stand overnight, filter, concentrate the filtrate to an appropriate amount. Make granules with a quantity of sucrose and dextrin, dry, and make to 1000 g of granules.

Description Yellowish-brown granules; taste, sweet, slightly bitter.

Identification (1) To 4 g, pulverize to fine powder, add 15 ml of ethyl acetate, heat under reflux on a water bath for 1 hour, cool, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of chlorogenic acid CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of butyl acetate, formic acid and water (14 : 5 : 5) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Ultrasonicate 1 g of granules with 25 ml of methanol for 10 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve a quantity of paeoniflorin CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid, and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ Ç).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and glacial acetic acid (30 : 70 : 0.5) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of the theoretical plates of the column is not less than 4000, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, accurately weighed, in 20% methanol to prepare a solution containing 64 μg per ml.

Test solution Pulverize granules, obtained under the test of weight variation, to fine powder. Weight accurately 0.6 g of the powder, place to a stopper conical flask, add accurately 50 ml of methanol and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 10 minutes, allow to cool, weigh again and replenish the lost weight with methanol, mix well and filter. Measure accurately 10 ml of the successive filtrate, evaporate the filtrate to dryness. Dissolve the residue in 20% methanol and transfer to a 10 ml

volumetric flask, dilute with 20% methanol to volume, and mix well, Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 55.0 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per pack, referred to Radix Paeoniae Rubra.

Action To clear *heat* to relieve *toxicity*.

Indications Common cold due to affliction from external *wind-heat*, with manifestations of fever, Fever, headache, stuffy nose, sneezing, sore throat, lassitude and aching pain.

Usage and dosage 10 g, 3 times a day, taken with boiled water. Appropriately reduce the dosage for children or follow doctor's advice.

Precaution Be cautious about pregnant women.

Strength 10 g per pack

Storage Preserve in tightly closed containers.

Kanggu Zengsheng Jiaonang (抗骨增生胶囊)

Kanggu Zengsheng Capsules

Ingredients Radix Rehmanniae Praeparata 175 g; Caulis Spatholobi 117 g; Herba Cistanches (steamed with wine) 117 g; Semen Raphani (stir-backed) 58 g; Rhizoma cibotii (processed with salt) 117 g; Rhizoma Drynariae 117 g; Fructus Ligustri Lucidi (processed with salt) 58 g; Radix Achyranthis Bidentatae 117 g; Herba Epimedii 117 g.

Precedure Pulverize 117 g of Radix Rehmanniae Praeparata, 58 g of Rhizoma cibotii and Herba Epimedii to fine powder. Decoct the other six ingredients and the remained portion of Radix Rehmanniae Preparata and Herba Epimedii twice, 1.5 hours each. Filter, combine the filtrates and concentrate to a quantity, add the above fine powder and a quantity of excipient, mix well, dry, pulverize, make granules, and make to 1000 capsules.

Description Hard capsules with brownish-yellow to brownish-black granules and powders; taste, sweet, slightly astringent or slightly bitter and astringent.

Identification (1) Microscopical: Parenchyma brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleous-like mass. Scalariform tracheid pale yellow to golden yellow, pits tidely-arranged. Epidermal cells of leaf with deep sinuous walls.
(2) Extract 4 g of the content with 30 ml of methanol under reflux on a water bath for 1 hour, filter, and evaporate the filtrate to dryness. Dissolve the residue in 30 ml of 25% solution of sulfuric acid, heat under reflux for 2 hours, cool, extract with two 30-ml quantities of ether by shaking. Combine the ether extracts, evaporate to dryness, and dissolve the residue in 2 ml of ethanol as the test solution. Prepare a solution with 2 g of Radix Acanthopanacis Bidentatae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of toluene, ethyl acetate and formic acid (4 : 1 : 0.5) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(3) Evaporate 10 ml of the test solution, obtained in the test of Assay, to dryness, dissolve the residue in 2 ml of methanol as the test solution. Dissolve epimedoside CRS in methanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica HF_{254} mixed with sodium carboxymethylcellulose as the coating substance and a mixture of ethyl acetate, acetone, methanol and water (10 : 1 : 1.5 : 1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (30 : 70) as the mobile phase. As detector a spectrophotometer set at 270 nm. The number of theoretical plates of the column is not less than 1500, calculated with the reference to the peak of icariine.

Reference solution Dissolve a quantity of icariine CRS, accurately weighed, in methanol to prepare a solution containing 20 μg per ml as the reference solution.

Test solution Grind the content, obtained under the test of weight variation, to fine powder, weigh accurately 1 g in a 100 ml stopper conical flask, add accurately 50 ml of dilute ethanol TS, stopper tightly, and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 1 hour, cool, weigh again, replenish the loss of weight with dilute ethanol TS, and shake well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 0.30 mg of icariine ($C_{33}H_{40}O_{15}$) per capsule, referred to Herba Epimedii.

Action To reinforce the lower back and kidney, strengthen the tendons and bones and promote blood circulation to kill pain.

Indications Osteoarthritis due to deficiency in the liver and kidney and meridians obstructed by blood stasis with manifestations of swollen numb joints pain and immobilization.

Usage and dosage 5 capsules, 3 times a day.

Strength 0.35 g per capsule

Storage Preserve in tightly closed containers.

Kanggu Zengsheng Wan (抗骨增生丸)

Kanggu Zengsheng Pills

Ingredients Radix Rehmanniae Praeparata 210 g; Herba Cistanches (steamed) 140 g; Rhizoma Cibotii (Processed with salt) 140 g; Fructus Ligustri Lucidi (processed with

salt) 70 g; Herba Epimedii 140 g; Caulis Spatholobi 140 g; Semen Raphani (stir-baked) 70 g; Rhizoma Drynariae 140 g; Radix Achyranthis Bidentatae 140 g.

Procedure Pulverize 70 g of Rhizoma Cibotii, 140 g of Radix Rehmanniae Praeparata and 70 g of Herba Epimedii to fine powder. Decoct the remains of Radix Rehmanniae Praeparata and Herba Epimedii and the other six ingredients with water twice, combine the decoctions, filter, concentrate the filtrate to a thick extract, mix with the above fine powder, dry and pulverize to fine powder, sift, and mix well. To each 100 g of the powder add 20-30 g of refined honey and a quantity of water to make water-honeyed pills, coat with carbonized Radix Glycyrrhizae, polish and dry, alternatively, add 55-65 g of refined honey to make small honeyed pills or big honeyed pills.

Description Black concentrated water-honeyed pills, concentrated small honeyed pills or concentrated big honeyed pills; taste; sweet, slightly astringent.

Identification (1) Microscopical: Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, containing brown nucleus-like mass. Scalariform tracheids pale yellow to golden yellow, pits arranged regularly. Epidermal cell of leaf with deeply sinuous walls.
(2) To 6 g add 25 ml of 70% acidic ethanol solution, reflux on a water bath for 15 minutes, filter, evaporate 5 ml of the filtrate on a water bath to dryness, dissolve the residue in 5% solution of sulfuric acid, filter, transfer 3 ml of the filtrate into 3 test tubes, 1 ml for each tube. Add 1-2 drops of potassium iodobismuthate TS to one tube, a red precipitate is produced. To the second tube add 1-2 drops of mercuric potassium iodide TS, a white precipitate is produced. Add 1-2 drops of silicowolframic acid TS to the third tube, a white precipitate is produced.
(3) Macerate 6 g in 10 ml of methanol for 2 hours and filter. To 1 ml of the filtrate add 3-4 drops of hydrochloric acid and a small amount of magnesium, heat on a boiling water bath for 3 minutes; a reddish-brown colour is produced.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To reinforce the lower back and kidney, strengthen the tendons and bones and promote blood circulation to kill pain.

Indications Osteoarthritis due to deficiency in the *liver* and kidney and meridians obstructed by blood stasis with manifestations of swollen numb joints, pain and immobilization.

Usage and dosage 2.2 g of water-honeyed pills, 3 g of small honeyed pills or 1 big honeyed pill; 3 times a day.

Strength 3 g per big honeyed pill

Storage Preserve in tightly closed containers.

Kanlisha
(坎离砂)

Kanli Coarse Powder

Ingredients Radix Angelicae Sinensis 3.75 g; Rhizoma Chuanxiong 5.0 g; Radix Saposhnikoviae 5.0 g; Caulis Impatientis Balsaminae 5.0 g.

Procedure Pulverize the above four ingredients to coarse powder, add a quantity of Pulvis Ferri, wood powder, active carbon and sodium chloride mix well, make to 1000 g of powder.

Description A blackish-brown coarse powder; texture heavy.

Identification Place 1 pack of the content into a stopper conical flask, add 60 ml of ether, heat under reflux for 30 minutes, and filter. Evaporate the filtrate to 1 ml as the test solution. To 0.5 g each of Radix Angelicae Sinensis reference drug and Rhizoma Chuanxiong reference drug, add respectively 20 ml of ether to prepare two kinds of solutions in the same manner as the reference drug solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica H mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (19 : 1) as the mobile phase. Apply separately 8 μl of the test solution and 4 μl of each of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the major fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference drug solutions.

Heating effect To 2 packs, remove the outside packaging, oscollate for 10-15 minutes, put the side without hole complete together, insert a thermometer (0-100℃, graduated in ±1℃ subdivisions) and set the mercury bulb in the central part between the two packs, fix up with tape, cover with 3 towels, respective, place on a wooden desk. Examine the result every 30 minutes, the highest temperature should not less than 75℃.

Action To expel *wind* and *cold*, and promote blood circulation to kill pain.

Indications Impediment diseases due to *wind*, *cold* and *dampness* with manifestations of numbness of limbs, arthralgia, or cold pain in the stomach and abdomen.

Usage and dosage For external use. To shake the pack until it gets warm, and apply it to the affected part. 1 pack each time.

Precaution For external use only, never for per os; contraindicated for pregnant women.

Strength Each carton cylinder contains 62.5 g of the powder

Storage Preserve in tightly closed containers, protected from sunlight.

Keshangtong Chaji
(克伤痛搽剂)

Keshangtong Liniment

Ingredients Radix Angelicae Sinensis; Radix Chuanxiong; Flos Carthami; Flos Caryophylli; Rhizoma Zingiberis Recens; Camphor; Oleum Terebinthinae.

Procedure To Rhizoma Zingiberis Recens, cut into pieces, macerate with 70% ethanol for 48 hours, filter and reserve the filtrate for later use. Pulverize Radix Angelicae Sinensis, Radix Chuanxiong, Flos Carthami and Flos Caryophylli to coarse powder, then combine with the above residue of Rhizoma Zingiberis Recens; carry out the method for percolation described under liquid extracts and extracts (Appendix Ⅰ O), using 75% ethanol as solvent to macerate for 48 hours and then to take percolating. Collect the percolations and concentrate to a appropriate amount, filter; combine this filtrate with the above reserved filtrate. Dissolve Camphor and Oleum Terebinthinae in ethanol, add the filtrate and 70% ethanol to regular volume; mix thoroughly, seal. Allow to stand and filter.

Description A clear, reddish-brown colour liquid; odour,

aromatic.

Identification (1) Evaporate 30 ml of the liniment to dryness on a water bath, dissolve the residue in 30 ml of water by heating lightly. Allow standing to cool, then transfer to a separating funnel; extract with two 20-ml quantities of ether, combine ether extracts and evaporate to dryness; dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of ferulic acid CRS in methanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ether, chloroform and formic acid (10 : 50 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.
(2) Place 10 ml of the liniment, evaporate the ethanol on a water bath, extract the residue with 10 ml of ether, evaporate the extract to about 2 ml as the test solution. Dissolve a quantity of eugenol CRS in ether to prepare a solution containing 15 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (9 : 1) as the mobile phase. Apply separately 10 μl of each of the reference solution and the test solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid, and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

Ethanol content 60 per cent to 70 per cent (Appendix Ⅸ M).

Total solids Measure accurately 25 ml of the liniment in a evaporating dish, previously dried to constant weight, evaporate to dryness on a water bath. Dry the residue at 105℃ for 3 hours, allow to stand to cool in a desiccator for 30 minutes and weigh immediately. The residue is not less than 1.5 per cent.

Other requirements Comply with the general requirements for liniments (Appendix Ⅰ V).

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use 10% macrogol 20000 (PEG-20M) as the stationary phase. Column temperature gradient: initial temperature at 125℃, maintain 6 minutes; increase at 8℃ per minute to 175℃, then maintain 17 minutes. The number of theoretical plates of the column is not less than 2900, calculated with the reference to the peak of camphor.

Correction factor Dissolve a quantity of biphenyl in ethanol to prepare a solution containing 9 mg per ml as internal standard solution. Dissolve a quantity of camphor CRS and eugenol CRS in ethanol separately to prepare two kinds of solutions containing 10 mg of camphor and 6 mg of eugenol per ml as the reference solutions. Transfer accurately 1 ml of each of the above three kinds of solutions to a 10 ml volumetric flask, dilute with ethanol to volume, mix thoroughly. Inject accurately 1 μl of this solution into the column; calculate the correction factor for camphor and eugenol separately.

Procedure Place 5 ml of the liniment, measured accurately, to a 10 ml volumetric flask, add accurately 1 ml of the internal standard solution, dilute with 70% ethanol to volume and mix thoroughly. Inject accurately 1 μl of the solution into the column, and calculate the content.
It contains not less than 1.7 mg and no more than 2.3 mg of camphor ($C_{10}H_{16}O$) per ml; and not less than 0.45 mg of eugenol ($C_{10}H_{12}O_2$) per ml, referred to Flos Caryophylli.

Action To promote blood circulation to resolve stagnated blood and reduce swelling to kill pain.

Indications Acute soft tissue injury with manifestations of purpura and hematoma with pain.

Usage and dosage For external use, spread on the affected part and do rubbing until the skin became warm, 2-3 times a day.

Strength (1) 30 ml per bottle (2) 40 ml per bottle
(3) 100ml per bottle

Storage Preserve in tightly closed containers.

Kongxian Wan
(控涎丸)

Kongxian Pills

Ingredients Radix Kansui (processed with vinegar) 300 g; Radix Knoxiae 300 g; Semen Sinapis Albae 300 g.

Procedure Pulverize the above three ingredients to fine powder, sift, mix well, make pills with dilute rice paste prepared from 240 g of rice powder or yellow rice powder and water, and dry.

Description Dark brown pasted pills with pale yellow spots on the surface; taste, slightly pungent.

Identification Microscopical: Acondylose laticiferous tubes occurring in parenchyma. Pigment cells yellowish-brown or reddish-brown, oblong or tubular; needle crystals of calcium oxalate in bundles or scattered. Palisade cells of testa small, polygonal, in surface view, with thickened walls; subrectangle in lateral view, the lateral and inner walls thickened.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To eliminate *phlegm* and expel morbid fluid.

Indications Dull pain in the chest aggravated by coughing and asthma, difficulty in expectoration of phlegm, scrofula, or subcutanous nodules due to accumulation of phlegm-fluid in the chest.

Usage and dosage 1-3 g, 1-2 times a day, to be taken with warm boiled water, date soup or rice soup.

Precaution Contraindicated for pregnant women; be cautious about debilitated patients.

Storage Preserve in well closed containers, protected from moisture.

Kouyanqing Keli
(口炎清颗粒)

Kouyanqing Granules

Ingredients Radix Asparagi; Radix Ophiopogonis; Radix Scrophulariae; Flos Lonicerae Japonicae; Radix et Rhizoma Glycyrrhizae.

Procedure Decoct the above five ingredients with water

twice, 2 hours for the first time, 1.5 hours for the second time. Combine the decoctions, and filter. Concentrate the filtrate to a thin extract with a relative density of 1.29 (80℃), add ethanol to a content of 50%, allow to stand over 12 hours. Separate the supernatant, filter, recover ethanol, and concentrate to a thick extract. Add a quantity of sucrose and dextrin, make granules, dry, and make to 1000 g granules; or add a quantity of soluble starch, dextrin, and aspartame, make granules, dry, and make to 300 g granules without sucrose.

Description Brownish-yellow to dark brown granules; taste, sweet or slightly sweet (granules without sucrose), slightly bitter.

Identification (1) To 1 pack of the granules, add 30 ml of methanol, ultrasonicate for 15 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 2 ml of methanol as the test solution. To 0.5 g of Radix et Rhizoma Glycyrrhizae reference drug, decoct with 50 ml of water for 30 minutes, allow to cool and filter. Add the same volume of dehydrated ethanol, mix well and centrifuge. Separate the supernatant, and evaporate to dryness, dissolve the residue in 2 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl formate, and formic acid (15 : 8 : 1.5) as the mobile phase. Apply separately 4 μl of each of the test solution and the reference drug solution to the plate. After developing about 15 cm, remove the plate, dry in air. Examine under the ultraviolet light at 365 nm. The fluorescent spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.

(2) To 2 g of Flos Lonicerae Japonicae reference drug, carry out the preparation of Radix et Rhizoma Glycyrrhizae reference drug solution as described under Identification (1) to prepare a solution as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of butyl acetate, formic acid and water (7 : 2.5 : 2.5) as the mobile phase. Apply separately 2 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under the ultraviolet light at 365 nm. The fluorescent spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.

Other requirements Comply to the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.4% solution of phosphoric acid (13 : 87) as the mobile phase. As detector a spectrophotometer set at 327 nm. The number of theoretical plates of the column is not less than 1000, calculated with the reference to the peak of chlorogenic acid.

Reference solution Weigh accurately a quantity of chlorogenic acid CRS in an amber volumetric flask, dissolve in 50% methanol to produce a solution containing 25 μg per ml as the reference solution.

Test solution Pulverize the granules, obtained under the test of weight variation, to fine powder, weigh accurately 1.5 g or 0.5 g (granules without sucrose) to a stopper conical flask, add accurately 50 ml of 50% methanol. Stopper tightly, allow to stand for 15 minutes, mix well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 4.0 mg of chlorogenic acid ($C_{16}H_{18}O_9$) per pack, referred to Flos Lonicerae Japonicae.

Action To nourish *yin* to clear *heat*, and relieve *toxicity* and reduce swelling.

Indications Inflammation of the mouth due to flaming of *fire* from *yin* deficiency.

Usage and dosage 2 pack, 1-2 times a day.

Strength (1) 10 g per pack
(2) 3 g per pack (granules without sucrose)

Storage Preserve in tightly closed containers.

Langchuang Wan
(狼疮丸)

Langchuang Pills

Ingredients Flos Lonicerae Japonicae 53.6 g; Fructus Forsythiae 53.6 g; Herba Taraxaci 53.6 g; Rhizoma Coptidis 13.4 g; Radix Rehmanniae 53.6 g; Radix Et Rhizoma Rhei (stir-baked with wine) 20.1g; Radix Et Rhizoma Glycyrrhizae 13.4 g; Scolopendra (discarded head, tail and feet) 2.42 g; Radix Paeoniae Rubra 26.8 g; Radix Angelicae Sinensis 13.4 g; Radix et Rhizoma Salviae Miltiorrhizae 13.4 g; Radix Scrophulariae 53.6g; Semen Persicae (stir-baked) 26.8 g; Flos Carthami 20.1 g; Periostracum Cicadae 53.6 g; Bulbus Fritillariae Thunbergii 26.8 g.

Procedure Pulverize the above sixteen ingredients to fine power, sift and mix well. To each 100 g of power add 10-30 g of refined honey and a quantity of water to make water-honeyed pills and dry, coat with Radix Sanguisorbae (carbonized). Or add 90-110 g of refined honey to make small honeyed pills or big honeyed pills.

Description Black coated water-honeyed pills, with dark brown to blackish-brown core, or blackish-brown small honeyed pills or big honeyed pills; odour, slight; taste, pungent, astringent and slightly bitter.

Identification (1) Pulverize 5 g of water-honeyed pills; or triturate well 5 g of small honeyed pills or big honeyed pills with 4 g of kieselguhr. Ultrasonicate with 20 ml of ether for 5 minutes, allow to cool and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 1 g of Radix Angelicae Sinensis reference drug and 20 ml of ether in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference drug solution.

(2) Pulverize 5 g of water honeyed pills; or triturate well 5 g of small honeyed pills or big honeyed pills with 4 g of kieselguhr. Ultrasonicate with 30 ml of methanol for 20 minutes and filter. Evaporate the filtrate to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Prepare a solution of 1 g of Fructus Forsythiae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 0.1% solution of sodium hydroxide as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 2 μl of each of the above solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Evaporate the test solution obtained under Identification (2) to dryness, dissolve the residue in 20 ml of water, add 2 ml of hydrochloric acid and heat under reflux for 30 minutes. Cool, and extract with two 20-ml quantities of ether, combine the ether extracts, evaporate to dryness, and dissolve the residue in 1 ml of chloroform as the test solution. Ultrasonicate 0.1 g of the Radix et Rhizoma Rhei reference drug with 20 ml of methanol for 20 minutes and filter. Evaporate the filtrate to dryness, and dissolve the residue in 10 ml of water, add 2 ml of hydrochloric acid to prepare a solution in the same manner as the reference drug solution. Dissolve a quantity of emodin CRS and chrysophanol CRS in ethanol to prepare a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl acetate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 4 μl of each of the above three solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, 0.05 mol/L solution of potassium dihydrogen phosphate (28 : 72) as the mobile phase. As detector a spectrophotometer set at 265 nm, maintain the column temperature at 35℃. The number of the theoretical plates of the column is not less than 3000, calculated with the reference to the peak of berberine hydrochloride.

Reference solution Dissolve a quantity of berberine hydrochloride CRS, accurately weighed, in methanol to prepare a solution containing 20 μg per ml.

Test solution Pulverize 0.5 g of water-honeyed pills; or triturate 5 g of small honeyed pills or big honeyed pills, obtained under the test of weight variation, and mix well. Weigh accurately, place to a stopper conical flask, add exactly 50 ml of mixture of hydrochloric acid and methanol (1 : 100), and weigh. Heat under reflux for 1 hour and allow to cool. Weigh again and replenish the lost weight with the above mixture, mix well and filter. Use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of the reference solution and 10 μl of the test solution into the column, and calculate the content.

It contains not less than 0.80 mg per gram of water-honeyed pills, 0.40 mg per gram of small honeyed pill, or 2.0 mg per big honeyed pill, of berberine hydrochioride ($C_{20}H_{18}ClNO_4$) referred to Rhizoma Coptidis.

Action To clear *heat* and *toxicity*, and cool blood and promote blood circulation.

Indications Systemic lupus erythematosus, or systemic sclerosis, or dermatomyositis, or panniculitis, or Behcet disease or connective tissue disease due to accumulated toxic-heat and stagnation of blood and *qi*.

Usage and dosage Water honey pill, 5.4 g each time, honey pill, 10 g each time, honey bolus, 2 big honeyed pills each time; During acute stage of systemic dermatitis glandularis erythematosa: double the dosage and 3 times a day.

Precaution Contraindicated for pregnant women.

Strength (1) 30 g per 100 water-honeyed pills
(2) 5 g per big honeyed pills

Storage Preserve in tightly closed containers.

Lemai Keli
(乐脉颗粒)

Lemai Granules

Ingredients Radix et Rhizoma Salviae Miltiorrhizae 499 g; Rhizoma Chuanxiong 249.5 g; Radix Paeoniae Rubra 249.5 g; Flos Carthami 249.5 g; Rhizoma Cyperi 124.75 g; Radix Aucklandiae 124.75 g; Fructus Crataegi 62.4 g.

Procedure Decoct the above seven ingredients with water for 3 times, 1 hour for each time, filter, concentrate the filtrate in a membrane rotating evaporator at a lower temperature (45-50℃) to a thin extract with a relative density of 1.10-1.30; mix with lactose on a interval flowing bed, dry, and make to 1000 g of granules.

Description Yellowish-brown to brown granules; taste, slightly bitter.

Identification (1) Shake 5 g with 30 ml of water, add 40 ml of ether and shake for 3 minutes and centrifuge. Separate the ether extract, add 1 g of anhydrous sodium sulfate, shake, filter, wash the residue with 10 ml of ether in two portions, combine the filtrate with the washings, evaporate to dryness, dissolve the residue in 1 ml of ether as the test solution. Dissolve tanshinone ⅡA CRS in ether to prepare a solution containing 0.7 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and chloroform as the mobile phase. Apply separately 10-15 μl of each of above two solutions to the plate. After developing and removal of the plate, dry in air. The red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) To 1 g of Rhizoma Chuanxiong reference drug add 30 ml of water, shake, extract with 40 ml of ether and shake strongly for 3 minutes and centrifuge. Separate the ether extract, add 1 g of anhydrous sodium sulfate, shake, filter, wash the residue with 10 ml of ether in two portions, combine the filtrate and the washings, evaporate to dryness, dissolve the residue in 1 ml of ether as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ether and *n*-hexane (2 : 1) as the mobile phase. Apply separately 5 μl of each of the test solution obtained under Identification (1) and the above reference drug solution to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescence spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) To 5 g of the granules add 30 ml of water, shake, extract with 40 ml of ether and shake for 3 minutes and centrifuge. Separate the ether extract, transfer to a separator, wash with 15 ml of a 4% solution of sodium hydroxide, shake strongly, separate the ether extract, add 1 g of anhydrous sodium sulfate, shake and filter. Wash the residue with 10 ml of ether in two portions, combine the filtrate and the washings, evaporate to dryness and dissolve the residue in 1 ml of ether as the test solution. Prepare a solution with 0.5g of Radix Aucklandiae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ether and *n*-hexane (2 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with anisaldehyde TS, heat at 105℃ for 5 minutes. The bluish-purple spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, isopropanol, acetic acid and water (25 : 2 : 2 : 71) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of paeoniflorin.

Reference solution Dissolve paeoniflorin CRS, dried at 80℃ for 1 hour and weighed accurately, in 50% methanol to prepare a solution containing 0.1 mg per ml as the reference solution.

Test solution Weigh accurately 0.5 g, obtained in the test of weight variation and triturated to fine powder, dissolve with a small quantity of dilute ethanol TS, transfer to a 50 ml volumetric flask, wash with a quantity of dilute ethanol TS, and transfer the washings to the same flask, dilute with dilute ethanol TS to volume, ultrasonicate for 1 hour at 25±2℃, allow to stand, filter, use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 15 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per pack, referred to Radix Paeoniae Rubra.

Action To promote *qi* flow and promote blood circulation, and resolve stagnant blood to dredge meridians.

Indications Headache, dizziness, chest pain, palpitation due to stagnation of *qi* and blood; angina pectoris in coronary heart disease and multiple cerebral infarction with above symptoms.

Usage and dosage Taken after dissolved in boiled water. 1-2 packs, 3 times a day.

Strength 3 g per pack

Storage Preserve in tightly closed containers.

Liangfu Wan
(良附丸)

Liangfu Pills

Ingredients Rhizoma Alpiniae Officinarum 500 g; Rhizoma Cyperi (processed with vinegar) 500 g.

Procedure Pulverize the two ingredients to fine powder, sift and mix well, make pills with water and dry.

Description Brownish-yellow to yellowish-brown watered pills; odour, slightly aromatic; taste, pungent.

Identification (1) Microscopical: Starch granules clavet, 24-44 μm in length or longer; hilum pointed, short cleft or trichotomous. Secretory cells subrounded, containing pale yellowish-brown to reddish-brown masses, surrounded by

radially arranged cells; fibre bundles reddish-brown or yellowish-brown, slender, walls thickened.
(2) Pulverize 1 g of pills, add 10 ml of methanol, ultrasonicate for 10 minutes, allow to cool, and filter, use the filtrate as the test solution. Prepare a solution of 0.25 g of Rhizoma Alpiniae Officinarum reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel GF_{254} as the coating substance and a mixture of toluene, acetone and formic acid (5 : 1 : 0.1) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Examine separately in daylight and under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix I A).

Action To warm the stomach and regulate *qi*.

Indications Epigastric pain and casting up of gastric acid, chest and abdominal fullness due to accumulation of *cold* and *qi* stagnation.

Usage and dosage 3-6 g, twice a day.

Storage Preserve in well closed containers, protected from moisture.

Lidan Paishi Pian
(利胆排石片)

Lidan Paishi Tablets

Ingredients Herba Lysimachiae 250 g; Herba Artemisiae Scopariae 250 g; Radix Scutellariae 75 g; Radix Aucklandiae 75 g; Radix Curcumae 75 g; Radix et Rhizoma Rhei 125 g; Semen Arecae 125 g; Fructus Aurantii Immaturus (stir-baked with bran) 50 g; Natrii Sulfas 25 g; Cortex Magnoliae Officinalis (processed with ginger) 50 g.

Procedure Pulverize Radix Aucklandiae, Radix et Rhizoma Rhei and Natrii Sulfas to fine powder. Decoct the other ingredients, filter, concentrate the filtrate to an appropriate amount, add the above powder and a quantity of excipients, mix well, make granules, make to 1000 tablets and coat with sugar or film.

Description Sugar-coated tablets or film-coated tablets with brown core; taste, bitter and salty.

Identification (1) Microscopical: Clusters of calcium oxalate 60-140 μm in diameter. Wood fibres long fusiform, 16-24 μm in diameter, with slightly thickened walls, showing transverse slit-shaped, crossed, V-shaped pit apertures. When observed on mounting in ethanol, irregular crystals almost colourless, with uneven edge, showing slender fissures and granules on the surface.
(2) Grind 5 tablets, removed the coats, add 20 ml of methanol, ultrasonicate for 15 minutes, and filter. Evaporate the filtrate to about 2 ml as the test solution. Prepare a solution of 0.5 g of Radix et Rhizoma Rhei reference drug and 20 ml of methanol in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 1 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the five orange-yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Expose to ammonia vapour and examine in sunlight, the colour of the spots turns to red.
(3) Grind 10 tablets, remove the coats, to fine powder, macerate with 20 ml of ether for 4 hours by constantly shaking, filter and expel ether. Dissolve the residue in 1 ml ethyl acetate as the test solution. Prepare a solution of 1 g of Radix Aucklandiae reference drug and 10 ml of ether in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance, and a mixture of cyclohexane and acetone (10 : 3) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(4) Grind 5 tables, remove the coats, to fine powder, add 20 ml of methanol, ultrasonicate for 20 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Dissolve a quantity of baicalin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G mixed with sodium carboxymethylcellulose containing 4% solution of sodium acetate as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase, pre-equilibrated the plate with the above mobile phase for 30 minutes. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(5) Dissolve hesperidin CRS in methanol to prepare a saturated solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G containing 0.5% solution of sodium hydroxide as the coating substance and a mixture of ethyl acetate, methanol and water (100 : 17 : 13) as the mobile phase. Apply separately 5 μl of each of the reference solution and the test solution, obtained under Identification (4) to the plate. After developing about 8 cm and removal of the plate, dry in air, and then use the upper layer of a mixture of toluene, ethyl acetate, formic acid and water (20 : 10 : 1 : 1) as the mobile phase, after developing 8 cm and removal of the plate, dry in air. Spray with aluminum trichloride TS. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix I D).

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (47 : 53 : 0.2) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of the theoretical plates of the column is not less than 2000, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin

CRS, dissolve in 70% ethanol to prepare a solution containing 20 μg per ml as the reference solution.

Test solution Weigh accurately 20 tablets, remove the coats, and triturate to fine powder. Weigh accurately 0.5 g in a stopper conical flask, add accurately 50 ml of 70% ethanol and weigh. Ultrasonicate (power 300 W, frequency 50 kHz) for 30 minutes, allow to cool, weigh again and replenish the lost weight with ethanol, mix well and filter. Measure accurately 5 ml of the successive filtrate in a 10 ml volumetric flask, dilute with 70% ethanol to volume, mix well and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 2.0 mg of baicalin ($C_{21}H_{18}O_{11}$) per tablet, referred to Radix Scutellariae.

Action To clear *heat* and drain *dampness*, and promote bile flow and remove calculi.

Indications Hypochondriac pain and distention of the gallbladder due to retention of *damp-heat* and obstruction of *qi* of the *fu-organs*, with manifestations of distending pain in the hypochondriac region, fever, yellow urine and constipation; cholecystitis and cholelithiasis with above symptoms.

Usage and dosage 6-10 tablets for expelling calculi, 4-6 tablets for treating inflammation, twice a day.

Precaution Be cautious about debilitated patients and those with impaired liver function; it is forbidden to prescribe to pregnant women.

Storage Preserve in tightly closed containers.

Lingbao Huxin Dan
(灵宝护心丹)

Lingbao Huxin Pills

Ingredients Moschus; Venenum Bufonis; Calculus Bovis; Borneolum Syntheticum; Radix et Rhizoma Ginseng Rubra; Radix et Rhizoma Notoginseng; Succinum; Radix et Rhizoma Salviae Miltiorrhizae; Styrax.

Procedure Heat Radix et Rhizoma Salviae Miltiorrhizae under reflux with ethanol three times, 2 hours each, filter. Combine the filtrates, recover ethanol and concentrate to a quantity. Pulverize Radix et Rhizoma Ginseng Rubra, Radix et Rhizoma Notoginseng and Succinum to fine powder, mix with the extract of Radix et Rhizoma Salviae Miltiorrhizae and Venenum Bufonis, dry and pulverize to fine powder. Triturate Calculus Bovis, Moschus and Borneolum Syntheticum with the above fine powder, sift and mix well. Take the above fine powder and Styrax to make pills with water, dry and polish.

Description Reddish-brown concentrated watered pills. Odour, aromatic; taste, bitter, pungent and slightly numb.

Identification (1) Microscopical: Clusters of calcium oxalate 20-68 μm in diameter, with acute angles.

(2) Pulverize 25 pills to fine powder, add 3 ml of dehydrated ethanol, and continue to grind well and filter. To 1 ml of the filtrate, add about 0.3 g of antimony trichloride and 1 ml of chloroform, heat, a red colour is produced. Continue to heat, the solution turns rose-red or purple.

(3) Pulverize 0.5 g of the pills to fine powder, add 10 ml of water, extract with successive quantities of 20, 10 and 10 ml of ether. Combine the ether extracts, evaporate to dryness. Dissolve the residue in 2 ml of ethyl acetate as the test solution. Dissolve a quantity of a mixture of (±)-borneol and (±) isoborneol CRS in ethyl acetate to prepare a solution containing 3 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (19 : 2) as the mobile phase. Apply separately 2-5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Triturate a quantity of pills to fine power. Weigh accurately 0.5 g, place to a stopper conical flask, and macerate with 4 ml of petroleum ether (60-90℃) for 1 hour. Filter, expel petroleum ether from the residue and the filter paper, transfer them into the same conical flask, add accurately 15 ml of the solution of glacial acetate acid and dehydrated ethanol (1 → 10), stopper tightly, weigh, macerate for 12 hours. Weigh again and replenish the lost weight with the above mixture, mix well and filter. Use the successive filtrate as the test solution. Dissolve a quantity of cholic acid CRS, accurately weighed, in the above mixture to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexene, ethyl acetate, acetic acid and formic acid (6 : 32 : 1 : 1) as the mobile phase. Apply accurately 10 μl of the test solution, 2 μl and 4 μl of the reference solution alternatively, to the plate. After developing and removal of the plate, dry in air. Spray with 10% phosphomolybdic acid in dehydrated ethanol, and heat at 105℃ to the spots clear. Allow to cool, cover the plate with a piece of glass of the same size and fix up with tape. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan at the wavelength of λs=620 nm. Measure the integration values of the absorbance from the test solution and the reference solution, respectively, and calculate the content.

It contents not less than 2.5 mg of cholic acid ($C_{24}H_{40}O_5$) per gram, referred to Calculus Bovis.

Action To strengthen the heart and replenish *qi*, unblock *yang* to restore normal pulse-beat, induce resuscitation with aromatics, and promote blood circulation to kill pain.

Indications Chest impediment due to *qi* deficiency and blood stagnation, with manifestations of constriction in the chest, shortness of breath, precordial pain, knotted and intermittent pulse; bradycardiac sick sinus syndrome, angina pectoris and arrhythmia from coronary heart disease with above symptoms.

Usage and dosage 3-4 pills, 3-4 times a day. Taken after meals or follow doctor's advice.

Precaution It is forbidden to prescribe to pregnant women. Mild abdominal bloating and thirsty are seen in a few patients sometimes at the initial stage of peros, for which it is unnecessary to cease medication. Spontaneous remission of the symptoms will be found after continuous taking of it.

Strength 0.08 g per 10 pills

Storage Preserve in well closed containers, protected from

moisture.

Lingyang Ganmao Pian
(羚羊感冒片)

Lingyang Ganmao tablets

Ingredients Cornu Saigae Tataricae 3.4 g; Fructus Arctii 109 g; Semen Sojae Praeparatum 68 g; Flos Lonicerae Arctii 164 g; Herba Schizonepetae 82 g; Fructus Forsythiae 164 g; Herba Lophatheri 82 g; Radix Platycodi 109 g; Oleum Menthae Dementholatum 0.68 ml; Radix et Rhizoma Glycyrrhizae 68 g.

Procedure Pulverize Cornu Saigae Tataricae to fine powder. Pulverize Radix Platycodi and 82 g of Flos Lonicerae Arctii to fine powder and sift respectively, and triturate well with powder of Cornu Saigae Tataricae. Distil volatile oil from Herba Schizonepetae and Fructus Forsythiae, collect the water solution after distilation in a seperate container. Decoct Herba Lophatheri; Fructus Arctii, Radix et Rhizoma Glycyrrhizae, Semen Sojae Praeparatum and the above residue with water twice, 2 hours for each time, combine the decoctions and filter. Combine the filtrate and the above water solution and evaporate appropriately. Macerate the rest of Flos Lonicerae Arctii in warm water twice, 2 hours for each time, combine the liquid and filter. Evaporate the filtrate appropriately, mix with the above evaporated solution, continue to concentrate to a thick extract, add the fine powder of Cornu Saigae Tataricae, Radix Platycodi and Flos Lonicerae and a quantity of excipients, mix well, make granules, dry. Or dry by spraying the mixture of evaporated solution to dry, add the fine powder of Cornu Saigae Tataricae, Radix Platycodi and Flos Lonicerae and a quantity of excipients, mix well, make granules. Add the Oleum Menthae Dementholatum and the above volatile oil by spraying, mix well, make to 1000 tablets, coat with sugar or film.

Description Sugar coated or film coated tablets with yellowish brown to dark brown core. Odour, aromatic; taste, sweat.

Identification (1) Triturate 7 tablets, remove the coats, to fine powder, heat under reflux with 50 ml of water for 30 minutes, cool and filter, adjust the pH value of the filtrate to 2 with a solution of hydrochloric acid (1→2), extract with two 30-ml quantities of ether, combine the ether extracts, and evaporate to dryness. Dissolve the residue in 2 ml of ethanol, filter, use the filtrate as the test solution. Prepare a solution of 1 g of Fructus Forsythiae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and acetic acid (20 : 10 : 0.5) as the mobile phase. Apply separately 5-7 μl of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105°C to the spots clear. The spots in the chromatogram obtained with test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) Triturate 10 tablets, remove the coats, to powder, heat under reflux with 50 ml of the mixture of 7% solution of sulfuric acid in ethanol and water (1 : 1) for 3 hours, cool and extract with two 20-ml quantities of chloroform, combine the chloroform extracts, wash with 30 ml of water, discard the washings. Dehydrate the chloroform extracts with anhydrous sodium sulphate, filter, evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 1 g of Radix Platycodi reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and ether (1 : 1) as the mobile phase. Apply separately 5-7 μl of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105°C to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Triturate 10 tablets, remove the coats, to powder, add 20 ml of ethanol, ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 15 ml of water, extract with three 15-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, wash with two 15-ml of water saturated with *n*-butanol, evaporate the *n*-butanol extracts to dryness. Dissolve the residue in 1 ml of methanol, apply to a small column (1.0 cm in diameter) packed with neutral aluminium oxide (60-100 mesh, 2 g). Elute with 50 ml of methanol, collect the eluates, evaporate to dryness. Dissolve the residue in 2 ml of methanol as the test solution. To 1 g of Radix et Rhizoma Glycyrrhizae reference drug, carry out the method described under the preparation of the test solution, ending at the words "evaporate the *n*-butanol extracts to dryness", dissolve the residue in 1 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and methanol (7 : 3 : 1) as the mobile phase. Apply separately 3-5 μl of the above two solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluoresent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (25 : 75) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the colunm is not less than 4000, calculated with reference to the peak of arctiin.

Reference solution Dissolve a quantity of arctiin CRS, accurately weighed, in methanol to prepare a solution containing 0.1 mg per ml as the reference solution.

Test solution Pulverize 10 tablets, remove the coats, to fine powder. Weigh accurately a quantity of powder (equivalent to the weight of 1 tabet) in a stopper conical flask, add accurately 20 ml of 50% methanol, stopper tightly, and weigh. Ultrasonicate for 20 minutes (power 250 W, frequency 50 kHz), stand to cool, and weigh again. Replenish the loss of the weight with 50% methanol, mix well, filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 1.52 mg of arctiin ($C_{27}H_{34}O_{11}$) per tablet, referred to Fructus Arctii.

Action To clear *heat* and release the exterior.

Indications Influenza with manifestations of fever, aversion

to wind, headache, dizziness, coughing, constriction in the chest and swollen painful throat.

Usage and dosage 4-6 tablets, twice a day.

Strength (1) 0.32 g per film coated tablet
(2) 0.36 g per film coated tablet

Storage preserved in tightly closed containers.

Lingyang Qingfei Wan
(羚羊清肺丸)

Lingyang Qingfei Pills

Ingredients Bulbus Fritillariae Thunbergii 40 g; Cortex Mori (stir-baked with honey) 25 g; Radix Peucedani 25 g; Radix Ophiopogonis 25 g; Radix Asparagi 25 g; Radix Trichosanthis 50 g; Radix Rehmanniae 50 g; Radix Scrophulariae 50 g; Herba Dendrobii 100 g; Radix Platycodonis 50 g; Folium Eriobotryae (stir-baked with honey) 50 g; Semen Armeniacae Amarum (stir-baked) 25 g; Radix Tinosporae 25 g; Flos Lonicerae Japonicae 50 g; Folium Isatidis 25 g; Fructus Gardeniae 50 g; Radix Scutellariae 25 g; Radix Isatidis 25 g; Cortex Moutan 25 g; Herba Menthae 25 g; Radix et Rhizoma Glycyrrhizae 15 g; Radix et Rhizoma Rhei (Prepared) 25 g; Pericarpium Citri Reticulatae 30 g; Pulvis Cornus Saigae Tataricae 6 g.

Procedure Pulverize the above twenty three ingredients, except Pulvis Cornus Saigae Tataricae, to fine powder, sift. Triturate Pulvis Cornus Saigae Tataricae with the above powder, sift and mix well. To each 100 g of the powder add 140-160 g of refined honey to make big honeyed pills.

Description Black big honeyed pills; taste, slightly bitter.

Identification (1) Microscopical: Clusters of calcium oxalate large, 60-140 μm in diameter. Pollen grains subrounded, up to about 76 μm in diameter, extine with spinous sculptures and 3 germinal apertures. Fibres pale yellow, fusiform, with thickened walls and fine pit-canals. Stone cells yellowish-brown or colourless, subrectangular, subrounded or irregular, up to 94 μm in diameter, lumina relatively large. Subrounded cells surrounding fibres containing small rounded silica bodies, arranged in rows. Stone cells of testa yellow or brownish yellow, mostly broken, the whole, ones elongated polygonal, rectangular or irregular, with thickened walls and large rounded pits, lumina brownish-red.
(2) Triturate well 20 g of the pills with 10 g of kieselguhr. Ultrasonicate with 60 ml of *n*-butanol saturated with water for 20 minutes and filter. Evaporate the filtrate to dryness, and dissolve the residue in 2 ml of ethanol, add a quantity of neutral aluminium oxide, stir well on a water bath, dry. Apply to a column (1.0-1.5 cm in internal diameter) packed with neutral aluminium oxide (100-200 mesh, 3 g). Elute with 50 ml of methanol, collect the methanol eluate. Evaporate to dryness and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve a quantity of geniposide CRS in ethanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of ethyl acetate, acetone, formic acid and water (5 : 5 : 1 : 1) as the mobile phase. Apply separately 15 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in ethanol, and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Triturate well 12 g of the pills with 6 g of kieselguhr. Ultrasonicate with 50 ml of methanol for 20 minutes and filter. Evaporate the filtrate to dryness, dissolve the residue with 20 ml of water, add 2 ml of hydrochloric acid and heat under reflux for 30 minutes. Cool, and extract with two 25-ml quantities of chloroform, combine the chloroform extracts and evaporate to dryness, and dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 0.1 g of the Radix et Rhizoma Rhei reference drug with 15 ml of methanol in the same manner as the reference drug solution. Dissolve a quantity of emodin CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 4 μl of each of the reference solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, expose to ammonia vapour for 2 minutes. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for pills (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (20 : 80 : 0.1) as the mobile phase. As detector a spectrophotometer set at 327 nm, maintain the column temperature at 40℃. The number of the theoretical plates of the column is not less than 2500, calculated with the reference to the peak of chlorogenic acid.

Reference solution Dissolve a quantity of chlorogenic acid CRS in an amber volumetric flask, accurately weighed, in methanol to prepare a solution containing 30 μg per ml.

Test solution Triturate the pills, obtained under the test of weight variation. Weigh accurately 1 g, place to a stopper conical flask, add accurately 25 ml of 70% methanol and weigh. Heat under reflux for 30 minutes, allow to cool, weigh again and replenish the lost weight with 70% methanol, mix well and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 2.0 mg of chlorogenic acid ($C_{16}H_{18}O_9$) per pill, referred to Flos Lonicerae Japonicae.

Action To clear the lung and ease the throat, and threat epidemics and relieve cough.

Indications Fever, dizziness, weakness of limbs, cough with much expectoration, swollen painful throat, epistaxis, hemoptysis and dry mouth and tongue due to extremely abundant *heat* in the lung and stomach and affliction from seasonal pathogenic factors.

Usage and dosage 1 pill, 3 times a day.

Strength 6 g per pill

Storage Preserve in tightly closed containers.

Liquor Leonuri
(益母草口服液, Yimucao Koufuye)

Motherwort Herb Mixture

Motherwort herb mixture is prepared from Herba Leonuri.

Procedure Decoct 500 g of Herba Leonuri with water for 3 times, 2 hours, 1.5 hours and 1 hour respectively, filter, combine the filtrates, and concentrate to about 250 ml. Allow to cool, add the same volume of ethanol, stir well, stand for 24 hours. Filter, recover ethanol in vacuum and concentrate to a thick extract. Dilute with water to 500 ml, refrigerate for 24 hours, filter, add an appropriate quantity of flavoring agents to the filtrate, adjust the total volume to 1000 ml with water, stir well, filter, pack and sterilize.

Description A clear, brownish-red liquid; taste, sweet, slightly bitter.

Identification Measure 10 ml of the mixture, add 50 ml of ethanol, stir and filter. Concentrate the filtrate to 5 ml, add 45 ml of dehydrated ethanol, stir, filter, concentrate the filtrate to dryness, and dissolve the residue in 0.5 ml of dehydrated ethanol as the test solution. Dissolve stachydrine hydrochloride CRS in dehydrated ethanol to prepare a solution containing 5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substances and a mixture of *n*-butanol, hydrochloric acid and water (8 : 2 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with dilute Potassium Heptaiodobismuthate TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Relative density 1.01-1.03 (Appendix Ⅶ A).

pH value 5.0-6.0 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay ***Reference solution*** Weigh accurately 25 mg of stachydrine hydrochloride CRS, previously dried to constant weight at 105 ℃, place in a 25 ml volumetric flask, dissolve in 0.1 mol/L solution of hydrochloric acid, dilute to volume and mix well (containing 1 mg of stachydrine hydrochloride per ml).

Standard curve Transfer accurately 2.0, 4.0, 6.0 ml, and 8.0 ml of the reference solution to 25 ml beakers respectively, adjust the volume to 10 ml with 0.1 mol/L solution of hydrochloric acid. Add 0.5 g of active charcoal (dried at 140 ℃ for 4-5 hours) separately, heat 0.5 minute on a boiling water bath, and stir constantly. Filter to 25 ml volumetric flasks respectively, wash the beakers and filter funnels with 10 ml of 0.1 mol/L solution of hydrochloric acid in portions, combine the washings to the same flask. Measure 20 ml of 0.1 mol/L solution of hydrochloric acid in a 25 ml volumetric flask, used as blank solution. Add accurately 3 ml of freshly prepared 2% solution of ammonium reineckate to each flask, mix well, dilute with 0.1 mol/L solution of hydrochloric acid to volume and mix well. Allow to stand on an ice-water bath for 1 hour, filter through dry filter paper and use the successive filtrate. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance of the successive filtrate at 520nm, perform 0.1 mol/L solution of hydrochloric acid as blank. Subtract the absorbance of the reference solution from the absorbance of blank solution, plot the standard calibration curve, using difference of absorbance as ordinate and concentrate as abscissa.

Procedure Transfer accurately 10ml of the mixture, obtained in the test of content variation, to a 25 ml volumetric flask, dilute with 0.1 mol/L solution of hydrochloric acid to volume and mix well. Filter with dry filter paper, measure accurately 10 ml of the successive filtrate in a 25 ml beaker, carry out the same method described under the preparation of standard curve, beginning at the word "add 0.5 g of active charcoal,...", measure the absorbance. Subtract the absorbance of test solution from the absorbance of blank solution. Calculate the content of stachydrine hydrochloride from the standard curve.

It contains not less than 1.0 mg of alkaloids per ml, calculated as stachydrine hydrochloride ($C_7H_{13}NO_2 \cdot HCl$).

Action To promote blood circulation to regulate menstruation.

Indications Menstrual disorders and lochiorrhea after childbirth due to stagnation of blood with manifestations of hypomenorrhea, continuous dripping of menstrual blood postpartum subinvolution of the uterus with above symptoms.

Usage and dosage 10-20 ml, 3 times a day, or follow doctor's advice.

Precaution Contraindicated for pregnant women.

Strength 10 ml per phial

Storage Perverse in well closed containers.

Liquor Sarcandrae
(血康口服液, Xuekang Koufuye)

Xuekang Mixture

Xuekang Mixture is prepared from the extract of Herba Sarcandrae.

Procedure Boil the extract powder of Herba Sarcandrae with water, to dissolve, concentrate and cool. Add ethanol to a content of 70% of ethanol and stand for 48 hours. Recover ethanol from the supernatant liquid, add a quantity of water and filter. Mix the filtrate with a quantity of simple syrup and sodium benzoate, add water to a regulated volume, stir well and pack.

Description A clear, reddish-brown liquid; taste, bitter, astrigent and slightly sweet.

Identification (1) Heat gently 0.5 ml to dryness in a test tube, add a small quantity of zinc powder and 1 drop of a 0.1% solution of ammonium chloride, heat on a gentle fire to dryness. Cover the test tube mouth with a filter paper, moistened with a mixture solution of 5% *p*-dimethylaminobenzaldehyde and 20% trichloroacetic acid in benzene, continue heating gently, the evaporating vapour turn the filter paper to pink or purple colour.

(2) Extract 20 ml with two 20-ml quantities of ethyl acetate and evaporate the combined extracts to dryness. Dissolve the residue in 1 ml of methanol to prepare a solution as the test solution. To 2 g of Herba Sarcandrae reference drug add 50 ml of water, ultrasonicate for 30 minutes and filter. Extract the filtrate with two 25-ml quantities of ethyl acetate and evaporate the combined extracts to dryness. Dissolve the

residue in 1 ml of methanol to prepare a solution as the reference drug solution. Dissolve isofraxidin CRS in methanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of toluene, ethyl acetate and formic acid (9 : 4 : 1) as the mobile phase. Apply separately 4 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution. Expose the plate to ammonia vapour for 10 minutes. Examine in daylight, the spot due to isofraxidin turns to yellowish-green.

Relative density Not less than 1.04 (Appendix Ⅷ A).

pH value 4.0-6.0 (Appendix Ⅷ G).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% solution of phosphoric acid (20 : 80) as the mobile phase. As detector a spectrophotometer set at 344 nm. The number of theoretical plates of the column is not less than 1200, calculated with reference to the peak of isofraxidin.

Reference solution Dissolve a quantity of isofraxidin CRS, weighed accurately, in methanol to prepare a solution containing 4 μg per ml.

Test solution Extract 10 ml, measured accurately, with successive quantities of 10,10,10,10 and 5 ml of ethyl acetate in a separator, combine the extracts, transfer to a 50 ml volumetric flask, add ethyl acetate to volume and mix well. Measured accurately 3 ml of the solution, evaporate to dryness, dissolve the residue in methanol then transfer to a 25 ml volumetric flask, dilute to volume with methanol and shake well.

Procedure Accurately inject 20 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.90 mg of isofraxidin ($C_{11}H_{10}O_5$) per phial, referred to Herba Sarcandrae.

Action To promote blood circulation to resolve stagnated blood, reduce swelling and dissipate nodulation, and cool blood to stop hemorrhage.

Indications Purpura due to *heat* in blood; primary and secondary thrombocytopenic purpura with above symptoms.

Usage and dosage 10-20 ml, 3-4 times a day; appropriate reduction of the dosage for children. One month continously taking is permitted.

Precaution Mild nausea and somnolence in some patients after taking it will be spontaneously remitted if it is continuously taken.

Strength 10 ml per phial

Storage Preserve in tightly closed containers, stored in a cool place.

Liuhe Dingzhong Wan
(六合定中丸)

Liuhe Dingzhong Pills

Ingredients Herba Pogostemonis 16 g; Folium Perillae 16 g; Herba Moslae 16 g; Radix Aucklandiae 36 g; Lignum Santali Album 36 g; Cortex Magnoliae Officinalis (processed with ginger) 48 g; Fructus Aurantii (stir-baked) 48 g; Pericarpium Citri Reticulatae 48 g; Radix Platycodi 48 g; Radix et Rhizoma Glycyrrhizae 48 g; Poria 48 g; Fructus Chaenomelis 48 g; Semen Lablab Album (stir-baked) 16 g; Fructus Crataegi (stir-baked) 48 g; Massa Medicata Fermentata (stir-baked) 192 g; Fructus Hordei Germinatus (stir-baked) 192 g; Fructus Oryzae Germinatus (stir-baked) 192 g.

Procedure Pulverize the above seventeen ingredients to fine powder, sift and mix well. Make pills with water and dry.

Description Yellowish-brown watered pills; odour, slightly aromatic; taste, slightly sour and bitter.

Identification (1) Microscopical; Compound starch granules ovoid or subrounded, consisting of numerous polygonal components. Irregular branched masses colourless, dissolved in chloral hydrate solution TS; hyphae colourless or pale brown, 4-6 μm in diameter. Needles of calcium oxalate fine, scattered in mesophyll. Mesophyll containing small clusters of calcium oxalate of 4-8 μm in diameter. Parenchymatous cells containing prisms of calcium oxalate, crystal cells square or rectangular, with lignified and thickened walls, showing distinct striations. Prisms of calcium oxalate abundant in parenchyma. Prisms of calcium oxalate scattered in the fragments of mesophyll. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibre. Wood fibres long fusiform, 16-24 μm in diameter, with slightly thickened walls and transversal cleft, crossed or V-shaped pit apertures. Epidermal cells arranged longitudinally, often with one long cell connected to two short cells, walls of long cells thickened, sinuous and lignified. Stone cells of pericarp pale purplish-red, red or yellowish-brown, subrounded or polygonal, up to 125 μm in diameter. Stone cells branched, with thickened and distinctly striated walls. Palisade cells of testa abundant, colourless, 26-213 μm long, 5-26 μm wide.

(2) Grind 15 g to fine powder, macerate in 40 ml of ether for 4 hours with frequently shaking, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ethanol and use the supernatant as the test solution. Prepare a solution with 0.5 g of Radix Aucklandiae reference drug and 10 ml of ether in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of petroleum ether (60-90℃) and ethyl acetate (9 : 1) as the mobile phase. Apply separately 2-4 μl of the test solution and 2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 1% vanillin in sulfuric acid and visualize under a current of hot air. A blue spot in the chromatogram obtained with test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

(3) Grind 12 g to fine powder, ultrasonicate with 30 ml of methanol for 15 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 5 ml of methanol, filter and use the filtrate as the test solution. Ultrasonicate 0.5 g of Pericarpium Citri Reticulatae reference drug with 5 ml of methanol for 15 minutes, filter and use the filtrate as the

reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of *n*-hexane and ethyl acetate (2 : 3) as the mobile phase. Apply separately 2-5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The main fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the main fluorescent spots in the chromatogram obtained with the reference drug solution.

(4) Grind 12 g to fine powder, heat under reflux with 30 ml of ethyl acetate for 30 minutes, cool and filter. Extract the filtrate with three 20-ml quantities of 2% solution of sodium hydroxide. Combine the alkaline solutions, adjust pH to 1-2 with hydrochloric acid, extract with three 20-ml quantities of chloroform. Combine the chloroform extracts, wash with water, dehydrate with anhydrous sodium sulfate and evaporate to dryness on a water bath at 80℃. Dissolve the residue in 1 ml of methanol and use the supernatant as the test solution. Dissolve magnolol CRS and honokiol CRS in methanol to produce a mixture containing 1 mg of each per ml as reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} mixed with 1% solution of sodium hydroxide as the coating substance, and a mixture of benzene and ethyl acetate (6 : 1) as the mobile phase. Apply separately, in strip, to the plate 20 μl of the test solution and 5 μl of the reference solution. After developing and removal of the plate, dry in air and examine under ultraviolet light at 254 nm. The strips in the chromatogram obtained with the test solution correspond in position and colour to the strips in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To clear *summer-heat* and *dampness*, and regulate the *middle-energizer* to promote digestion.

Indications Chills and fever, headache, constriction in the chest, nausea, vomiting, diarrhea with abdominal pain due to affliction from *summer-heat* and *dampness* with retention of undigested food.

Usage and dosage 3-6 g, 2-3 times a day.

Storage Preserve in well closed containers, protected from moisture.

Liuwei Anxiao San
(六味安消散)

Liuwei Anxiao Powder

Liuwei Anxiao powder is a prescription used by Mongolian and Tibetan Nationalities.

Ingredients Radix Inulae 50 g; Radix et Rhizoma Rhei 200 g; Rhizoma Kaempferiae 100 g; Cypsum Rubrum (calcined) 250 g; Fructus Chebulae 150 g; Trona 300 g.

Procedure Pulverize the above six ingredients to fine powder, sift and mix well.

Description A greyish-yellow or yellowish-brown powder; odour, aromatic; taste, bitter, astringent and slightly salty.

Identification (1) Microscopical: Starch granules spheroid, ellipsoidal or subtriangular, 10-30 μm in diameter; hila and striations faint. Clusters of calcium oxalate large, 60-140 μm in diameter. Parenchymatous cells colourless, oblong or elongated polyangular, containing fan-shaped inulin masses.

(2) To 0.1 g add 5 ml of dilute sulfuric acid TS, effervescence is produced.

(3) Ultrasonicate 1.5 g of the powder with 25 ml of methanol for 10 minutes, and filter. Concentrate the filtrate to 2-5 ml as the test solution. Dissolve a quantity of ethyl-*p*-methoxycinnamate CRS in methanol to prepare a solution containing 5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of *n*-hexene and ethyl acetate (18 : 1) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Macerate 2.5 g of the powder in 20 ml of methanol for 1 hour, and filter. Evaporate the filtrate to dryness, dissolve the residue in 10 ml of water, add 1 ml of hydrochloric acid, heat under reflux on a water bath for 30 minutes, and cool immediately. Extract with two 20-ml quantities of ether, combine the ether extracts, evaporate to dryness. Disslove the residue in 1 ml of chloroform as the test solution. Prepare a solution of 0.1 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Dissolve respectively a quantity of emodin CRS and chrysophanol CRS in ethanol to prepare two kinds of reference solutions each containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 8 μl of each of the above four solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in positions and colour to the spots in chromatogram obtained with the reference solutions; and five orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference drug solution. Expose to ammonia vapour, examine in daylight, the spots become red.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 1% solution of phosphoric acid (85 : 15) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of the theoretical plates of the column is not less than 5000, calculated with the reference to the peak of emodin.

Reference solution Dissolve separately a quantity of emodin CRS and chrysophanol CRS, weigh accurately, in methanol to prepare two kinds of reference solutions, containing 2.5 μg of emodin per ml and 8 μg of chrysophanol per ml.

Test solution Weigh accurately 0.5 g of the powder, place to a stopper conical flask, add exactly 25 ml of methanol and weigh. Heat under reflux on a water bath for 30 minutes, and allow standing to cool. Weigh again and replenish the lost weight with methanol, mix well and filter. Measure accurately 5 ml of the successive filtrate to a conical flask, epeal the methanol, add 10 ml of 2.5 mol/L solution of sulfuric acid, ultrasonicate for 5 minutes, add 10 ml of the chloroform. Heat under reflux for 1 hour, cool, transfer to

a separator, wash the container with a small quantity of chloroform and transfer to the same separator, extract by shaking. Separate the chloroform solution for later use, extract the water layer with two 8-ml quantities of chloroform. Combine the chloroform extracts, dehydrate with anhydrous sodium sulphate, recover the solvent to dryness. Add accurately 10 ml of methanol and weigh. Heat slightly on a water bath, weigh again, replenish the lost weight with methanol. Mix well and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.70 mg of the total amount of emodin ($C_{15}H_{10}O_5$) and chrysophanol ($C_{15}H_{10}O_4$) per gram, referred to Radix et Rhizoma Rhei.

Action To harmonize the stomach and invigorate the spleen, promote digestion to remove stagnancy and obstruction, and promote blood circulation to kill pain.

Indications Gastric distending pain, indigestion, constipation or dysmenorrhea due to disharmony between the spleen and stomach, and retention of food in the stomach.

Usage and dosage 1.5-3 g, 2-3 times a day.

Precaution Contraindicated for pregnant women.

Strength 18 g per pack

Storage Preserve in well closed containers, protected from moisture.

Liuwei Dihuang Keli (六味地黄颗粒)

Liuwei Dihuang Granules

Ingredients Radix Rehmanniae Praeparata 320g; Fructus corni (processed) 160g; Cortex Moutan 120g; Rhizoma Dioscoreae 160g; Poria 120g; Rhizoma Alismatis 120g.

Procedure Decoct Radix Rehmanniae Praeparata, Poria and Rhizoma Alismatis with water for 2 times, filter and concentrate to a thick extract with a relative density of 1.32-1.35 (80℃). Pulverize Fructus Corni, Cortex Moutan and Rhizoma Dioscoreae to fine powder, combine with the extract. Add a quantity of dextrin, solution of stevioside and 75% ethanol, make to 1000 g of granules and dry.

Description Brown granules; taste, slightly sweet, sour and slightly bitter; odour, specifically aromatic.

Identification Pulverize 5 g of granules, heat under reflux with 40 ml of ether for 1 hour, filter, expel ether, and dissolve the residue in 1 ml of acetone as the test solution. Dissolve paeonol CRS in acetone to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (3 : 1) as the mobile phase. Apply separately 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% ferric chloride in ethanol acidified with hydrochloric acid and heat to the spots clear. The purplish-brown spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay ***Cortex Moutan*** Weigh accurately 2 g of the powdered granules, obtained under the test of weight variation, distil by water steam distillation, collect 450 ml of distillate in a 500 ml of volumetric flask, and dilute with water to volume. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 274 nm, taking 862 as the value of A (1%, 1cm) and calculate.

It contains not less than 6.0 mg of paeonol ($C_9H_{10}O_3$) per pack, referred to Cortex Moutan.

Fructus Corni Dissolve 5 g of the powdered granules, obtained under the test of weight variation and accurately weighed, in 30 ml of water, filter, wash the residue with 30ml of water, dry the drug residue at room temperature to a loose powder and heat to dryness at 100℃. Heat under reflux the residue together with the filter paper with a quantity of ether in a Soxhlet's extractor for 4 hours. Recover ether and macerate the residue with two 15-ml quantities of petroleum ether (30-60℃) for about 2 minutes each time. Decant out petroleum ether, dissolve the residue in a mixture of dehydrate ethanol and chloroform (3 : 2) with warming. Transfer the solution quantitatively to a 5 ml volumetric flask, dilute to volume, and mix well as the test solution. Dissolve ursolic acid CRS, weighed accurately, in dehydrated ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform, ethyl acetate and formic acid (20 : 5 : 8 : 0.1) as the mobile phase. Apply accurately 5 μl and 10 μl of the test solution, 4 μl and 8 μl of the reference solution separately to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat at 110℃ for 5-7 minutes until spots are observed. Cover the thin layer plate with a same size glass, fixed with adhesive plaster. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan at the wavelength: λ_S = 520nm, λ_R = 700 nm. Measure the integration values of absorbance of the test solution and the reference solution, and calculate.

It contains not less than 1.2 mg of ursolic acid ($C_{30}H_{48}O_3$) per pack, referred to Fructus Corni.

Action To nourish *yin* to reinforce the kidney.

Indications Dizziness, tinnitus, weakness and aching in the lower back and knees, steaming of bone with hectic fever, night sweat, seminal emission or diabetes due to a deficiency of *kidney-yin*.

Usage and dosage 5g, twice a day, taken after dissolved in boiled water.

Strength 5g per pack

Storage Preserve in well closed containers, and store in cool and dry place.

Liuwei Dihuang Wan (六味地黄丸)

Liuwei Dihuang Pills

Ingredients Radix Rehmanniae praeparata 160 g; Fructus Corni (processed) 80 g; Cortex Moutan 60 g; Rhizoma Dioscoreae 80 g; Poria 60 g; Rhizoma Alismatis 60 g.

Procedure Pulverize the above six ingredients to fine powder, sift and mix well. To each 100 g of the powder add 35-50 g of refined honey and a quantity of water to make pills and dry; or add 80-110 g of refined honey to make small

honeyed pills or big honeyed pills.

Description Brownish-black water-honeyed pills, blackish-brown small honeyed pills or big honeyed pills; taste, sweet and sour.

Identification (1) Microscopical: Starch granules triangular-ovoid or oblong, 24-40 μm in diameter, hila short cleft or V-shaped. Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless, 4-6 μm in diameter. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Clusters of calcium oxalate occurring in colourless parenchymatous cells, sometimes several clusters arranged in rows. Epidermal cells of pericarp orange-yellow, polygonal in surface view, with somewhat beaded anticlinal walls. Parenchymatous cells subrounded, with elliptical pits, gathered into pit groups, anticlinal walls of the endodermis cells sinuous, thickened, lignified, with slender pit-canals.

(2) Pulverize 6 g of the water-honeyed pills, or triturate 9 g of the small honeyed pills or big honeyed pills with 4 g of kieselguhr and triturate well. Heat under reflux with 40 ml of ether at a low temperature for 1 hour, filter and expel ether. Dissolve the residue in 1 ml of acetone as the test solution. Dissolve paeonol CRS in acetone to prepare a solution containing 1 mg per ml, as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and cyclohexane and ethyl acetate (3 : 1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% ferric chloride in ethanol acidified with hydrochloric acid and heat to the spots clear. The bluish-brown spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay ***Fructus Corni*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of tetrahydrofuran, acetonitrile, methanol and 0.05% solution of phosphoric acid (1 : 8 : 4 : 87) as the mobile phase. As detector a spectrophotometer set at 236 nm, maintain the column temperature at 40℃. The number of the theoretical plates of the column is not less than 4000, calculated with the reference to the peak of loganin.

Reference solution Dissolve a quantity of loganin CRS, accurately weighed, in 50% methanol to prepare a solution containing 20 μg per ml.

Test solution Pulverize 0.7 g of water-honeyed pills or small honeyed pills; or triturate 1 g of big honeyed pills, obtained under the test of weight variation, and mix well, weigh accurately, place to a stopper conical flask, add exactly 25 ml of 50% methanol, and weigh. Ultrasonicate (power 250 W, frequency 33 kHz) for 15 minutes, heat under reflux for 1 hour and cool. Weigh again and replenish the lost weight with 50% methanol, mix well and filter. Measure accurately 10 ml of the successive filtrate, apply to a column (1 cm in internal diameter) packed with neutral aluminium oxide (100-200 mesh, 4 g). Elute with 50 ml of 40% methanol, collect the eluate. Evaporate to dryness and dissolve the residue in a quantity of 50% methanol, transfer to a 10 ml volumetric flask, dilute with 50% methanol to volume, and mix well.

procedure Inject accurately 10 μl of the reference solution and 10 μl of the test solutions into the column, and calculate the content.

It contains not less than 0.70 mg per gram of water-honeyed pills, 0.50 mg per gram of small honeyed pills, or 4.5 mg per big honeyed pill, of loganin ($C_{17}H_{26}O_{10}$), referred to Fructus Corni.

Cortex Moutan Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (70 : 30) as the mobile phase. As detector a spectrophotometer set at 274 nm. The number of the theoretical plates of the column is not less than 3500, calculated with the reference to the peak of paeonol.

Reference solution Dissolve a quantity of paeonol CRS, accurately weighed, in 50% methanol to prepare a solution containing 20 μg per ml.

Test solution Pulverize 0.3 g of water-honeyed pills or small honeyed pills; or triturate 0.4 g of big honeyed pills, obtained under the test of weight variation, into pieces, mix well, weigh accurately, place to a stopper conical flask, add exactly 50 ml of 50% methanol, stopper tightly, and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 45 minutes, allow to cool. Weigh again and replenish the lost weight with 50% methanol, mix well and filter. Use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 20 μl of the test solution into the column, and calculate the content.

It contains not less than 0.90 mg per gram of water-honeyed pills, 0.70 mg per gram of small honeyed pills, or 6.3 mg per big honeyed pill, of paeonol ($C_9H_{10}O_3$), referred to Cortex Moutan.

Action To nourish *yin* to reinforce the kidney.

Indications Dizziness, tinnitus, weakness and aching in the lower back and knees, bone-steaming with tidal fever, night sweat, seminal emission or diabetes due to a deficiency of *kidney-yin*.

Usage and dosage 6 g of water-honeyed pills, 9 g of small honeyed pills or 1 big honeyed pill, twice a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Liuwei Muxiang San
(六味木香散)

Liuwei Muxiang Powder

Liuwei Muxiang Powder is a prescription used by Mongolian Nationality.

Ingredients Radix Aucklandiae 200 g; Fructus Gardeniae 150 g; Fructus Granati 100 g; Flos Rhododendri 100 g; Fructus Amomi Rotundus 70 g; Fructus Piperis Longi 70 g.

Procedure Pulverize the above six ingredients to fine powder, sift and mix well.

Description A yellow powder; odour, aromatic; taste, pungent and bitter.

Identification (1) Microscopical: Stone cells of testa yellow or pale brown, mostly broken, the whole ones elongated polygonal, rectangular or irregular, with thickened walls and big rounded pits, lumina brownish-red. Stone cells

colourless, elliptical or subrounded, thick-walled, with fine and dense pit-canals. Stone cells of endotesta yellowish-brown or brownish-red, subpolygonal in surface view, thick-walled, lumina containing silica bodies. Cells of testa reddish-brown, elongated polygonal, with beaded walls. Reticulate vessels 32-90 μm in diameter. Pollen grains in tetragonal tetrad, with 3 germinal apertures.

(2) To 1 g add 15 ml of ether, shake for 10 minutes and discard the ether solution. To the residue, expel ether, add 15 ml of ethyl acetate, heat under reflux on a water bath for 1 hour, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 2 ml of ethanol as the test solution. Dissolve geniposide CRS in ethanol to prepare a solution containing 4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, acetone, formic acid and water (10 : 7 : 2 : 0.5) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 10% sulfuric acid in ethanol, and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) To 0.5 g of each of Radix Aucklandiae reference drug and Fructus Piperis Longi reference drug, add separately 10 ml of ether, shake for 10 minutes. Discard the ether solution and expel the remained ether. To the residues, add 10 ml of ethyl acetate for each, heat under reflux on a water bath for 1 hour, and filter. Evaporate the filtrates to dryness and dissolve the residues in 2 ml of ethanol as the reference drug solutions. Dissolve piperine CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and cyclohexane and acetone (10 : 3) as the mobile phase. Apply separately 5 μl of each of the above three solutions and the test solution obtained under Identification (2) to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, allow to dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with Fructus Piperis Longi reference drug solution and piperine reference solution. Heat to the spots distinct, examine in daylight. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with Radix Aucklandiae reference drug solution.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Assay Place 2.5 g of the powder, weighed accurately, in a brown stopper flask, exactly add 25 ml of chloroform and 1 ml of concentrated ammonia TS, shake well and weigh. Allow to stand overnight, protected from light, weigh again, replenish the lost weight with chloroform and filter. Exactly measure 5 ml of the successive filtrate, evaporate to dryness on water bath at 60℃, dissolve the residue in dehydrated ethanol, transfer it to a brown volumetric flask, dilute to volume and mix well, used as the test solution. Dissolve piperine CRS in dehydrated ethanol, in a brown volumetric flask to prepare a reference solution containing 0.5 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate and dehydrated methanol (8 : 2 : 0.5) as the mobile phase. Apply accurately 6 μl of the test solution and 2 μl and 4 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan at the wavelength of λ_S = 335 nm, λ_R = 215 nm. Measure the integrated absorbance values of the test solution and reference solution, and calculate the content.

It contains not less than 2.2 mg of piperine ($C_{17}H_{19}NO_3$) per gram, referred to Fructus Piperis Longi.

Action To promote *qi* flow and remove stagnation to kill pain.

Indications Fullness and pain in stomach, gastric discomfort with acid regurgitation, bleeding, abdominal bloating and incontinously bowels movement due to *cold-heat* in complexity and *qi* stagnated in the *middle-energizer*.

Usage and dosage 2-3 g, 1-2 times a day.

Strength 15 g per pack

Storage Preserve in well closed containers, protected from moisture.

Liuying Wan (六应丸)

Liuying Pills

Ingredients Flos Caryophylli; Venenum Bufonis; Realgar; Calculus Bovis; Margarita; Borneolum Syntheticum.

Procedure Levigate Realgar to fine powder, pulverize the other five ingredients to fine powder, respectively, add a quantity of starch, mix well, make pills, dry and coat with ferriferros oxide.

Description Black small pills, lustrous, fracture deep yellow; taste, bitter, pungent and numb.

Identification (1) Pulverize 30 pills, extract, with three 15-ml quantities of chloroform and filter. Concentrate the filtrate to dryness, dissolve the residue in 0.5 ml of chloroform as the test solution. Dissolve separately eugenol CRS, a mixture of (±)-borneol and (±) isoborneol CRS in chloroform to prepare two solutions containing 1 μl per ml and 1 mg per ml respectively as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and acetone (9 : 1) as the mobile phase. Apply separately 4 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid and heat to the spots distinct. The brown spot due to eugenol in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution of eugenol; and the another spots due to (±)-borneol and (±)-isoborneol correspond in position and colour to the spots in the chromatogram obtained with the reference solution of (±)-borneol and (±)-isoborneol.

(2) Pulverize 30 pills, add 1 ml of chloroform, shake and stand for 1 hour. Use the supernatant as the test solution. Dissolve bufogenin CRS in chloroform to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform and acetone (4 : 3 : 3) as the mobile phase. Apply separately 4 μl of each of the test solution and the reference solution to the plate. After developing in a chamber pre-equilibriated with mobile phase for 15 minutes and removal of the plate, dry in air. Spray

with 10% sulfuric acid in ethanol and heat to the spots clear. The bluish-green spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Pulverize 40 pills, add 20 ml of chloroform, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve separately a quantity of cholic acid CRS and deoxycholic acid CRS in ethanol to prepare two solutions containing 2 mg per ml and 1 mg per ml respectively as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of isooctane, ethyl acetate and glacial acetic acid (5 : 5 : 1) as the mobile phase. Apply separately 1 μl of each of the above three solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to spots clear. Examine in daylight, the spots in the chromatogram obtained with the test solutions correspond in position and colour to the spots in the chromatogram obtained with the reference solutions. Examine under ultraviolet light at 365 nm, the fluorescent spots with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Arsenic trioxide Pulverize a quantity of the pills, to 0.5 g, accurately weighed, add 25 ml of dilute hydrochloric acid TS, stir constantly for 30 minutes, filter, wash the residue with three 20-ml quantities of dilute hydrochloric acid TS by stirring for 10 minutes. Combine the filtrate and washings into a 100 ml volumetric flask, add dilute hydrochloric acid TS to volume, mix well. Measure accurately 10 ml into a 50 ml volumetric flask, dilute with water to volume and mix well. To 2 ml, accurately measured, add 5 ml of hydrochloric acid and 21 ml of water. Carry out the limit test for arsenic (Appendix Ⅸ F, method 1), any stain produced the test solution is not more intense than that produced by the standard arsenic solution.

Weight variation Weigh separately 10 portions, each of 5 pills and carry out the method for weight variations of pills (Appendix Ⅰ A, method 1). The result should comply with the requirements.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.5% solution of potassium dihydrogen phosphate (50 : 50) (adjust pH value to 3.2 with phosphoric acid) as the mobile phase. As detector a spectrophotometer set at 296 nm. The number of the theoretical plates of the column is not less than 9000, calculated with the reference to the peak of cinobufagin.

Reference solution Dissolve separately a quantity of bufogenin CRS and cinobufagin CRS, weigh accurately, in methanol to prepare two kinds of reference solutions, containing 80 μg of bufogenin per ml and 50 μg of cinobufagin per ml.

Test solution Pulverize a quantity of the pills, to 0.3g, accurately weighed, add accurately 20 ml of methanol, heat under reflux for 1.5 hours, allow to cool. Weigh again and replenish the lost weight with the mobile phase, mix well and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solutions into the column, and calculate the content.

It contains not less than 6.5 mg of the total amount of bufogenin ($C_{24}H_{32}O_4$) and cinobufagin ($C_{26}H_{34}O_6$) per gram referred to Venenum Bufonis.

Action To clear *heat* and *toxicity*, and reduce swelling and pain.

Indications Inflammation of the throat, tonsillitis due to abundant fire in the interior with manifestations of swollen painful throat, bitter taste in the mouth, dry throat, swollen reddened tonsil, or carbuncles and boils with swelling and hot pain, insect bites with swelling and pain; laryngopharyngitis and tonsillitis with above symptoms.

Usage and dosage 10 pills for adults, 5 pills for children, 2 pills for infants, 3 times a day, taken after meal; appropriate quantity mixed with cool boiled water or vinegar for topical application.

Strength 19 mg per 5 pills

Storage Preserve in tightly closed containers.

Liuyi San
(六一散)
Liuyi Powder

Ingredients Pulvis Talci 600 g; Radix et Rhizoma Glycyrrhizae 100 g.

Procedure Pulverize Radix et Rhizoma Glycyrrhizae to fine powder, mix well with Pulvis Talci and sift.

Description A pale yellowish-white powder; taste, characteristic sweet of Radix et Rhizoma Glycyrrhizae, unctuous to touch.

Identification (1) Microscopical: Irregular pieces colourless, with traces of exfoliation. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres.

(2) To 2 g of the powder add 1 ml of hydrochloric acid and 15 ml of chloroform, heat under reflux for 1 hour, allow to cool, and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethanol as the test solution. Dissolve glycyrrhetinic acid CRS in dehydrated ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃), benzene, ethyl acetate and glacial acetic acid (10 : 20 : 7 : 0.5) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% phosphomolybdic acid in ethanol, heat at 105 ℃ for about 5 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and ammonia dihydrogen phosphate solution (Dissolve 1.725 g of ammonia dihydrogen phosphate in 300 ml of water, adjust pH value to 3.5 with phosphoric acid) (65 : 35) as the mobile phase. As detector

a spectrophotometer set at 250 nm. The number of the theoretical plates of the column is not less than 3000, calculated with the reference to the peak of glycyrrhizic acid.

Reference solution Weigh accurately 12 mg of ammonium glycyrrhizinate CRS, in a 50 ml of volumetric flask, dilute with the mobile phase to volume, and mix well (containing 0.24 mg per ml, 0.2351 mg calculated for glycyrrhizic acid).

Test solution Weigh accurately 1.5 g of the powder, add accurately 25 ml of the mobile phase, and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, allow to cool. Weigh again and replenish the lost weight with the mobile phase, mix well and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 2.8 mg of glycyrrhizic acid ($C_{42}H_{62}O_{16}$) per gram, referred to Radix et Rhizoma Glycyrrhizae.

Action To clear *summer-heat* and drain *dampness*.

Indications Fever, lassitude, thirst, diarrhea and oliguria with dark urine due to affliction from *summer-heat* and *dampness*; also used for prickly heat exteriorly.

Usage and dosage 6-9 g, 1-2 times a day, taken after mixing with liquid or making decoction with wrapping; appropriate quantity to be dabbed on the affected part externally.

Storage Preserve in well closed containers, protected from moisture.

Liyan Jiedu Keli
(利咽解毒颗粒)

Liyan Jiedu Granules

Ingredients Radix Isatidis; Flos Lonicerae Japonicae; Fructus Forsythiae; Herba Menthae; Fructus Arctii (stir-baked); Fructus Crataegi (charred); Radix Platycodonis; Folium Isatidis; Bombyx Batryticatus; Radix Scrophulariae; Radix Scutellariae; Radix Rehmanniae; Radix Trichosanthis; Radix et Rhizoma Rhei; Bulbus Fritillariae Thunbergii; Radix Ophiopogonis.

Procedure Distill volatile oil of Herba Menthae, the aqueous solution for further use. Decoct the drug residue and the other fifteen ingredients with water for 2 times, 1.5 hours for each. Combine the decoction and filter. Combine the filtrate and the above aqueous solution, concentrate to an appropriate amount. Add a quantity of sucrose and starch, make granules. Dry, add the volatile oil and mix thoroughly; or concentrate the combined solution to an appropriate amount, add a quantity of dextrin, make without sucrose granules, dry, spray the volatile oil and mix thoroughly.

Description Yellowish-brown to brown granules; taste, sweet and slightly bitter, or bitter (without sucrose).

Identification (1) To 5 g, or 3 g (without sucrose) of granules, add 20 ml of methanol, ultrasonicate for 30 minutes and filter. Evaporate the filtrate to dryness, dissolve the residue in 20 ml of water, add 2 ml of hydrochloric acid, and heat on a water bath for 30 minutes. Allow to cool, extract with two 20-ml quantities of ether, combine the extract, expel ether and dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 0.1 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air and examine under the ultraviolet light at 365 nm. The five orange fluorescence spots in the chromatogram obtained with the test solution correspond in position and colour to the fluorescence spots in the chromatogram obtained with the reference drug solution. Expose the plate to ammonia vapour, the spots turn to red colour.

(2) Heat under reflux 15 g, or 4.5 g (without sucrose) of granules, in 40 ml of methanol for 1 hour, filter and evaporate the filtrate to dryness. Dissolve the residue in 15 ml of water, adjust pH value to 2 with dilute hydrochloride acid TS, extract with two 20-ml of ethyl acetate, combine the extracts and evaporate to dryness. Dissolve the residue in 0.5 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 1% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to that in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (47 : 53 : 0.2) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of the theoretical plates of the column is not less than 3500, calculated with reference to the peak of baicalin.

Reference solution Dissolve a quantity of baicalin CRS, weighed accurately in methanol to prepare a solution containing 60 μg per ml as the reference solution.

Test solution Weigh accurately 4 g, or 1.2 g (without sucrose) of the granules, obtained under the test of weight variation and mixed thoroughly and triturated, in a stopper conical flask, add accurately 50 ml of 50% methanol, weigh and ultrasonicate (power 250 W, frequency 33 kHz) for 30 minutes, and allow to cool, weigh again and replenish the lost weight with the same solvent. Mix thoroughly, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 12.0 mg of baicalin ($C_{21}H_{18}O_{11}$) per pack, referred to Radix Scutellariae.

Action To clear the lung and ease the throat, and relieve *toxicity* and subside fever.

Indications Dry and painful pharynx, red swollen tonsil,

swollen painful cheeks, fever and aversion to cold due to affliction from external *wind-heat*; acute tonsillitis, acute pharyngitis and mumps with above symptoms.

Usage and dosage Taken after dissolved in boiled water. 1 pack, 3-4 times a day.

Precaution Avoid pungent, spicy and too salty foods.

Strength (1) 20 g per pack (equivalent to 19 g of crude drugs) (2) 6 g per pack (without sucrose, equivalent to 19 g of crude drugs)

Storage Preserve in well closed containers.

Longdan Xiegan Wan (Damiwan) (龙胆泻肝丸，大蜜丸)

Longdan Xiegan Pills (Big Honeyed pills)

Ingredients Same as Longdan Xiegan Pills (Shuiwan).

Procedure Pulverize the above 10 ingredients to fine powder, sift and mix well. To each 100 g of powder add 160-170 g of refined honey to make big honeyed pills.

Description Yellowish-brown big honeyed pills; taste, bitter and slightly sweet.

Identification Comply with the test of Identification (1) as described under Longdan xiegan pills (shuiwan).

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To clear the liver and gallbladder and remove *damp-heat*.

Indications Dizziness, bloodshot eyes, tinnitus, poor hearing or deafness, swollen painful ears, hypochondriac pain, bitter taste in the mouth, deep-coloured urine and difficult painful urination, or morbid leukorrhea due to *damp-heat* in the liver and gallbladder.

Usage and dosage 1-2 pills, 2 times a day.

Precaution Be cautious about pregnant women.

Strength 6 g per pill

Storage Preserve in tightly closed containers.

Longdan Xiegan Wan (Shuiwan) (龙胆泻肝丸，水丸)

Longdan Xiegan Pills (Watered pills)

Ingredients Radix et Rhizoma Gentianae 120 g; Radix Bupleuri 120 g; Radix Scutellariae 60 g; Fructus Gardeniae (stir-baked) 60 g; Rhizoma Alismatis 120 g; Caulis Akebiae 60 g; Semen Plantaginis (stir-baked with salt) 60 g; Radix Angelicae Sinensis (stir-baked with wine) 60 g; Radix Rehmanniae 120 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 60 g.

Procedure Pulverize the above ten ingredients to fine powder, sift and mix well. Make pills with water and dry.

Description Dark yellow watered pills; taste, bitter.

Identification (1) Microscopical: Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Fibres pale yellow, fusiform, with thickened walls and fine pit-canals. Stone cells of testa yellow or brownish, mostly broken, the whole ones elongated polygonal, rectangular or irregular, with thickened walls and large rounded pits, lumina brownish-red. Parenchymatous cells subrounded, with elliptical pits gathered into pit groups the anticlinal walls of the endodermis cell sinuous, thickened, lignified, with slender pit-canals. Hypodermal cells of testa narrow and long in surface view, walls slightly sinuous, several cells arranged in a group and somewhat parqueted. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a nucleus-like mass. Exodermal cells fusiform in surface view, each divided into several small cells by transversal walls. Vittae containing yellow or brownish-yellow strip secretion, 8-25 μm in diameter.

(2) Heat under reflux 14 g of the pills, in fine powder, with 20 ml of *n*-hexane on a water bath for 2 hours, filter and discard the filtrate. Heat under reflux the residue with 20 ml of acetone on a water bath for 30 minutes, filter and discard the filtrate. Macerate the residue in 20 ml of methanol for 12 hours and filter. Concentrate the filtrate to about 1 ml, apply to a column, (15 mm in inner diameter), packed with neutral aluminium oxide (120 mesh, 1 g) and elute with methanol until the eluate becomes colourless. Concentrate the eluate to 1 ml as the test solution. Dissolve gentiopicrin CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and the lower layer of a mixture of chloroform, methanol and water (30 : 10 : 3) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Pulverize 7 g of the pills, add 100 ml of the ethanol, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 20 ml of water, wash with three 15-ml quantities of ether, discard the ether washings. Extract the water layer with three 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts. Evaporate the *n*-butanol extract to dryness, and dissolve the residue in 1 ml of ethanol, add a quantity of neutral aluminium oxide, stir well on a water bath, dry. Apply to a column (1.0-1.5 cm in internal diameter) packed with neutral aluminium oxide (100-200 mesh, 2 g). Elute with 50 ml of methanol, collect the methanol eluate. Evaporate to dryness and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve a quantity of geniposide CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, acetone, formic acid and water (5 : 5 : 1 : 1) as the mobile phase. Apply separately 5 μl of each of the above solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and heat at 110℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (23 : 77) as the mobile phase. As detector a spectrophotometer set at 270 nm,

maintain the column temperature at 40℃. The number of the theoretical plates of the column is not less than 2500, calculated with the reference to the peak of gentiopicrin.

Reference solution Dissolve a quantity of gentiopicrin CRS, accurately weighed, in methanol to prepare a solution containing 40 μg per ml.

Test solution Pulverize a quantity of granules to fine powder. Weigh accurately 1 g, place to a stopper conical flask and add accurately 25 ml of methanol, and weigh. Ultrasonicate (power 250 W, frequency 33 kHz) for 45 minutes, allow to cool. Weigh again and replenish the lost weight with methanol, mix well and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 20 μl of the test solution into the column, and calculate the content.

It contains not less than 0.80 mg of gentiopicrin ($C_{16}H_{20}O_9$) per gram, referred to Radix et Rhizoma Gentianae.

Action To clear the liver and gallbladder and remove *damp-heat*.

Indications Dizziness, bloodshot eyes, tinnitus, poor hearing or deafness, swollen painful ears, hypochondriac pain, bitter taste in the mouth, deep-coloured urine and difficult painful urination, or morbid leukorrhea due to *damp-heat* in the liver and gallbladder.

Usage and dosage 3-6 g, twice a day.

Precaution Used with caution in pregnancy.

Storage Preserve in well closed containers, protected from moisture.

Longmu Zhuanggu Keli (龙牡壮骨颗粒)

Longmu Zhuanggu Granules

Ingredients Radix Codonopsis; Radix Astragali; Radix Ophiopogonis; Carapax et Plastrum Testudinis (processed with vinegar); Rhizoma Atractylodis Macrocephalae (baked); Rhizoma Dioscoreae; Fructus Schisandrae Chinensis (processed with vinegar); Os Draconis; Concha Ostreae (calcined); Poria; Fructus Jujubae; Radix et Rhizoma Glycyrrhizae; Calcium Lactate; Endothelium Corneum Gigeriae Galli (baked); Vitamine D_2; Calcium Gluconate.

Procedure Decoct Radix Codonopsis, Radix Astragali, Radix Ophiopogonis, Rhizoma Atractylodis Macrocephalae, Rhizoma Dioscoreae, Fructus Schisandrae Chinensis, Poria, Fructus Jujubae and Radix et Rhizoma Glycyrrhizae with water for three times, 2 hours for each time, combine the decoction, filter; decoct Carapax et Plastrum Testudinis, Os Draconis and Concha Ostreae with water for four times, 2 hours for each time, combine the decoction, filter. Combine all the filtrate, concentrate to a thin extract with a relative density of 1.32 (20℃). To the thin extract, add sucrose, powder of Endothelium Corneum Gigeriae Galli, Calcium Lactate, Calcium Gluconate and Vitamine D_2, mix thoroughly, make granules, dry and make to 1000 g.

Description Yellow or yellowish-brown granules; taste, sweet.

Identification (1) Triturate 3g, add 15 ml of water, then add a small amount of active carbon to decolourize, filter, adjust pH of the filtrate to acidity, add ammonium oxalate TS; a white precipitate is produced; centrifuge, the precipitate is insoluble in acetic acid, but soluble in hydrochloric acid.

(2) Triturate 30 g, add 100 ml of *n*-butanol, ultrasonicate for 1 hour, filter, wash the filtrate with three 35-ml quantities of 1% solution of sodium hydroxide. Discard the alkaline solution, continue to wash with water saturated with *n*-butanol to neutral. Discard the aqueous layer, evaporate the *n*-butanol extract to dryness on a water bath, dissolve the residue in 1 ml of methanol as the test solution. Dissolve astragaloside Ⅳ CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, ethyl acetate, methanol and water (10 : 20 : 11 : 5), stood at a temperature below 10℃, as the mobile phase. Apply separately 10μl of the test solution and 2μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ for about 5 minutes. The brown spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution; examine under ultraviolet light at 365 nm, the fluorescence spots are shown.

(3) Triturate 10g, add 35 ml of petroleum ether (30-60℃), ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 10 ml of methanol as the test solution. Dissolve vitamin D_2 in methanol to produce a solution containing 0.01 mg per ml as the reference solution. Carry out the method for high performance liquid chromatography (Appendix Ⅵ D), using a column packed with octadecylsilane bonded silica gel as the stationary phase and methanol as the mobile phase, detect at the wavelength of 265 nm, inject separately 10μl of each of above two solutions into the column and measure; the retention time of principal peak in the chromatogram obtained with the test solution corresponds to that of the peak in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C), except solubility.

Assay ***Reference solution*** Weigh accurately 60 mg of calcium carbonate, dried to constant weight at 110℃, in a 100 ml volumetric flask, moisten with 10 ml of water, and add 5 ml of dilute hydrochloric acid TS to dissolve, dilute with water to volume and mix well. Measure accurately 25 ml in a 100 ml volumetric flask and dilute with water to volume and mix well. Transfer 1.0, 1.5, 2.0, 2.5, and 3.0 ml, accurately measured, to a 25 ml volumetric flasks separately, add separately 1 ml of lanthanum TS, dilute with water to volume and mix well.

Test solution Weigh accurately 0.5 g, obtained in the test of weight variation and triturated to fine powder, in a 100 ml volumetric flask, moisten with 10 ml of water, add 5 ml of hydrochloric acid to dissolve, dilute with water to volume and mix well. Filter, measure accurately 2 ml of the successive filtrate in a 25 ml volumetric flask, add 1 ml of lanthanum TS, dilute with water to volume and mix well.

Procedure Carry out the method for atomic absorption spectrophotometry (Appendix Ⅴ D, method I), measure separately the absorbance of above two solutions at 422.7 nm and calculate.

It contains not less than 45.0 mg of calcium (Ca) per pack.

Action To strengthen the muscles, tendons and bones, and harmonize the stomach and invigorate the spleen.

Indications Used for treatment and prevention of child rachitis and rickets; also for child profuse perspiration,

night-terrors, anorexia, dyspepsia, developmental retardation, etc.

Usage and dosage Taken after dissolved in boiled water, 5 g, for children younger than 2 years old; 7 g, for children between 2 and 7 years old; 10 g, for children older than 7 years; 3 times a day.

Strength 5 g per pack

Storage Preserve in tightly closed containers.

Longqing Pian
(癃清片)
Longqing Tablets

Ingredients Rhizoma Alismatis; Semen Plantaginis; Herba Patriniae; Flos Lonicerae Japonicae; Cortex Moutan; Herba Hedyotis Diffusae; Radix Paeoniae Rubra; Herba Agrimoniae; Rhizoma Coptidis; Cortex Phellodendri Chinensis.

Procedure Pulverize Rhizoma Alismatis to fine powder and sift. Decoct Herba Hedyotis Diffusae, Herba Agrimoniae, Flos Lonicerae Japonicae and Herba Patriniae with water twice, 1 hour for each time, combine the decoction, filter and concentrate the filtrate to a thin extract with a relative density of 1.25-1.30 (50℃). Heat under reflux the other five ingredients with 60% ethanol for 3 times, 3 hours for the first time, 2 hours for the second, and 1 hour for the third, combine the extract, filter and recover ethanol, concentrate to a thin extract with a relative density of 1.25-1.30 (50℃). Combine the above two thin extracts, add the fine powder, mix thoroughly, make granules, dry and make to tablets.

Description Brown tablets; odour, aromatic; taste, slightly bitter.

Identification (1) Microscopical: Parenchymatous cells subrounded, with many elliptical pits crowed into pitted area; anticlinal walls of endodermis cells sinuous, relatively thick, lignified, with sparse and minute pit-canals.
(2) Heat under reflux 8 tablets, triturated to fine powder, with 40 ml of methanol for 1 hour, filter and concentrate the filtrate to 5 ml as the test solution. Dissolve berberine hydrochloride CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅳ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase, pre-equilibrated the chamber with ammonia vapour. Apply separately 2 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Macerate 8 tablets, triturated to fine powder, in 10 ml of ether, ultrasonicate for 20 minutes, filter, expel the solvent and dissolve the residue in 2 ml of acetone as the test solution. Dissolve paeonol CRS in acetone to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substances and a mixture of cyclohexane and ethyl acetate (3 : 1) as the mobile phase. Apply separately 10 μl each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% ferric chloride in ethanol acidified with hydrochloric acid, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(4) Heat 16 tablets, triturated to fine powder, with 50 ml of water on a water bath for 30 minutes, filter, extract the filtrate with three 30-ml quantities of ethyl acetate, combine the extract, recover the solvent and concentrate to 2 ml as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substances and the lower layer of a mixture of chloroform, methanol and water (7 : 3 : 1) as the mobile phase. Apply separately 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with sulfuric acid in ethanol (1→2), heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ O).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of 0.05 mol/L solution of sodium dihydrogen phosphate (adjust pH value to 3 with phosphoric acid) and acetonitrile (70 : 30) as the mobile phase. As detector a spectrophotometer set at 270 nm. The number of theoretical plates of the column is not less than 4200, calculated with the reference to the peak of berberine hydrochloride.

Reference solution Dissolve a quantity of berberine hydrochloride CRS, weighed accurately, in dilute ethanol TS to prepare a solution containing 25 μg per ml as the reference solution.

Test solution Weigh accurately 20 tablets, triturate to fine powder, weigh accurately 100 mg of the fine powder in a stopper conical flask, add accurately 50 ml of dilute ethanol TS, weigh, ultrasonicate (power 250 W, frequency 33 kHz) for 30 minutes, allow to cool, weigh again and replenish the lost weight with dilute ethanol TS, mix thoroughly, filter. Use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column and determine. It contains not less than 3.0 mg of berberine hydrochloride ($C_{20}H_{18}ClNO_4$) per tablet, referred to Rhizoma Coptidis and Cortex Phellodendri Chinensis.

Action To clear *heat* and relieve *toxicity*, and cool blood to relieve stranguria.

Indications Stranguria due to *damp-heat* in the *lower-energizer* with manifestation of frequency, urgency and pain in micturition, lower back pain, bearing-down feeling in the lower abdomen.

Usage and dosage 6 tablets, 2 times a day; 8 tablets, 3 times a day for serious patients.

Precaution Contraindicated for debilitated patients or patients with *stomach-cold*.

Strength 0.6 g per tablet

Storage Preserve in tightly closed containers.

Lusika Wan
(鹭鸶咯丸)

Lusika Pills

Ingredients Herba Ephedrae 12 g; Semen Armeniacae Amarum 60 g; Gypsum Fibrosum 60 g; Radix et Rhizoma Glycyrrhizae 12 g; Radix et Rhizoma Asari 6 g; Fructus Perillae (stir-baked) 60 g; Semen Sinapis (stir-baked) 12 g; Fructus Arctii (stir-baked) 30 g; Pericarpium Trichosanthis 60 g; Rhizoma Belamcandae 30 g; Indigo Naturalis 30 g; Concha Meretricis seu Cyclinae 60 g; Radix Trichosanthis 60 g; Fructus Gardeniae (stir-baked with ginger) 60 g; Calculus Bovis Artifactus 5 g.

Procedure Pulverize the above ingredients, except Calculus Bovis Artifactus, to fine powder. Triturate Calculus Bovis Artifactus with the above fine powder, sift and mix well. To each 100 g of the powder add 90-100 g of refined honey to make big honeyed pills.

Description Blackish-green big honeyed pills; odour, slight; taste, sweet and bitter.

Identification (1) Microscopical: Irregular plate crystals colourless, with straight striations. Bordered pitted vessels large, mostly broken, some bordered pits hexagonal or rhombic, closely arranged. Stone cells of pericarp subrounded or polygonal, 17-31 μm in diameter, wall-thickened, lumina containing prisms of calcium oxalate. Cells of testa subrounded, oblong or irregular, walls thickened reticulately, like flowerage striation. Irregular pieces or grains blue. Cylindrical crystals of calcium oxalate, up to 34 μm in diameter. Stomata characteristic, guard cells dumbbell-shaped in lateral view. Palisade cells of testa short fusiform in surface view and oblique rectangular in lateral view, walls relatively thickened, slightly lignified, and often adhered with brown endocarp cells containing prisms of calcium oxalate. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres.

(2) Heat under reflux 9 g of the pills, cut into pieces, with 20 ml of ethyl acetate on a water bath for 0.5 hour. Filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of chloroform as the test solution. Dissolve a quantity of indigotin CRS and indirubin CRS in chloroform to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, chloroform and acetone (5 : 4 : 1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, the spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(3) Triturate well 15 g of the pills with 7.5 g of kieselguhr. Heat under reflux with 30 ml of chloroform for 1 hour and filter. Evaporate the filtrate to dryness, dissolve the residue in 10 ml of ethanol as the test solution. Dissolve a quantity of arctiin CRS in ethanol to produce a solution containing 5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of chloroform and methanol (20 : 3) as the mobile phase. Apply separately 3 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Examine under the ultraviolet light at 254 nm, the spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the the reference solution.

(4) Triturate well 6 g of the pills with 3 g of kieselguhr. Macerate in 25 ml of ether for 1 hour and shake, filter. Discard the ether extract, evaporate the drug residue to dryness, add 25 ml of ethyl acetate, ultrasonicate for 30 minutes, allow to cool, filter, dissolve the residue in 1 ml of ethanol as the test solution. Prepare a solution of 0.5 g of the Frutus Gardeniae reference drug in the same manner as the reference drug solution. Dissolve a quantity of geniposide CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, acetone, formic acid and water (12 : 10 : 1 : 1) as the mobile phase. Apply separately 5 μl of the test solution and 3 μl of each of the reference solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in ethanol, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

(5) Dissolve separately a quantity of cholic acid CRS and hyodeoxycholic acid CRS in ethanol to prepare two kinds of reference solutions containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ether and glacial acetic acid (2 : 2 : 1) as the mobile phase. Apply separately 1 μl of the test solution of Identification (4) and 3 μl of each of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and heat at 105℃ to the spots clear. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (15 : 85) as the mobile phase. As detector a spectrophotometer set at 238 nm. The number of the theoretical plates of the column is not less than 1500, calculated with the reference to the peak of geniposide.

Reference solution Dissolve a quantity of geniposide CRS, accurately weighed, in methanol to prepare a solution containing 30 μg per ml.

Test solution Triturate the pills, obtained under the test of weight variation. Weight accurately 0.5 g, place to a stopper conical flask and add accurately 50 ml of methanol, and weigh. Ultrasonicate (power, 250 W; frequency, 50 kHz) for 30 minutes, allow to cool. Weigh again and replenish the lost weight with methanol, mix well and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 20 μl of the test solution into the column, and calculate the content.

It contains no less than 1.4 mg of geniposide ($C_{17}H_{24}O_{10}$) per pill, referred to Frutus Gardeniae

Action To disseminate the lung, resolve *phlegm* and stop coughing.

ɹughing or coughing due to phlegm with manifestations of paroxysmal dry throat and hoarseness; whooping ɹptoms.

pill, twice a day. Taken with decoction of pear ɹ. ɹled water.

Strength 1. 5 g per pill

Storage Preserve in tightly closed containers.

Maiwei Dihuang Wan
(麦味地黄丸)

Maiwei Dihuang Pills

Ingredients Radix Ophiopogonis 60 g; Fructus Schisandrae Chinensis 40 g; Radix Rehmanniae Praeparata 160 g; Fructus Corni (processed) 80 g; Cortex Moutan 60 g; Rhizoma Dioscoreae 80 g; Poria 60 g; Rhizoma Alismatis 60 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix well. To each 100 g of the powder add 35-50 g of refined honey and a quantity of water, make water-honeyed pills and dry; alternatively, add 80-110 g of refined honey, to make small honeyed pills or big honeyed pills.

Description Brownish-black water-honeyed pills, blackish-brown small honeyed pills or big honeyed pills; taste, slightly sweet and sour.

Identification (1) Microscopical: Starch granules triangular-ovoid or oblong, 24-40 μm in diameter, hilum short cleft or V-shaped. Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken and each containing a brown nucleus-like mass. Needles of calcium oxalate in bundles or scattered, 24-50 μm long, about 3 μm in diameter. Clusters of calcium oxalate occurring in colourless parenchymatous cells, sometimes several in rows. Epidermal cells of pericarp orange yellow, subpolygonal in surface view, with beaded anticlinal walls. Stone cells of epidermis of testa pale yellowish-brown, subpolygonal in surface view, walls relatively thickened, with fine and dense pit-canals, lumina containing dark brown contents. Parenchymatous cells subrounded, with elliptical pits gathered into pit groups. Anticlinal walls of endodermal cells sinuous, relatively thickened, lignified, with sparse and fine pit-canals.

(2) Triturate well 9 g of small or big honeyed pills with 4 g of kieselguhr to powder, or pulverize 6 g of water honeyed pills to fine powder, heat under reflux with 40 ml of ether for 1 hour, filter and remove the ether. Dissolve the residue in 1 ml of acetone as the test solution. Dissolve paeonol CRS in acetone to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (3 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the two solutions in strip. After developing and removal of the plate, dry in air, spray with 5% ferric chloride in ethanol acidified with hydrochloric acid, and heat to the spots clear. The bluish-brown band in the chromatogram obtained with the test solution corresponds in position and colour to the band in the chromatogram obtained with the reference solution.

(3) Dissolve ursolic acid CRS in ethyl acetate to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and glacial acetic acid (12 : 4 : 0.5) as the mobile phase. Apply separately to the plate 5 μl each of the test solution obtained under the test of Identification (2) and the reference solution. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol and heat at 105℃ for several minutes. The purplish-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Dissolve deoxyschizandrin CRS in ethyl acetate to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately to the plate 10 μl of the reference solution and 15 μl of the test solution obtained under the test of Identification (2). After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay ***Fructus Corni*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of tetrahydrofuran, acetonitrile, methanol and 0.1% phosphoric acid (1 : 8 : 4 : 87) as the mobile phase. As detector a spectrophotometer set at 236 nm. Maintain the column temperature at 40℃. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of loganin.

Reference solution Dissolve a quantity of loganin CRS, accurately weighed, in 50% methanol to prepare a solution containing 40 μg per ml as the reference solution.

Test solution Grind the water-honeyed pills or small honeyed pills, weigh accurately 0.7 g, or cut the big honeyed pills, obtained under the test of weight variation, into pieces, weigh accurately 1 g, in a stopper conical flask, add accurately 25 ml of 50% methanol, and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 15 minutes, heat under reflux for 1 hour, cool, weigh again, replenish the loss of weight with 50% methanol, shake well and filter. Apply accurately 10 ml of the successive filtrate to a neutral alumina column (100-200 mesh, 4 g, 1 cm in diameter), elute with 50 ml of 40% methanol, collect the eluates, and evaporate to dryness. Dissolve the residue in 50% methanol and transfer to a 5 ml volumetric flask, add 50% methanol to volume, and shake well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 0.50 mg per gram of the water-honeyed pills, 0.35 mg per gram of the small honeyed pills, and 3.1 mg per big honeyed pill, of loganin ($C_{17}H_{26}O_{10}$), referred to Fructus Corni.

Cortex Moutan Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use

octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (70 : 30) as the mobile phase. As detector a spectrophotometer set at 274 nm. The number of theoretical plates of the column is not less than 3500, calculated with the reference to the peak of paeonol.

Reference solution Dissolve a quantity of paeonol CRS, accurately weighed, in methanol to prepare a solution containing 15 μg per ml as the reference solution.

Test solution Grind the water-honeyed pills or small honeyed pills, weigh accurately 0.4 g, or cut the big honeyed pills, obtained under the test of weight variation, into pieces, weigh accurately 0.5g, in a stopper conical flask, add accurately 50 ml of 50% methanol, stopper well, and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 45 minutes, cool, weigh again, replenish the loss of weight with 50% methanol, and shake well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 20 μl of the test solution into the column, respectively, and calculate the content.
It contains not less than 0.80 mg per gram of the water-honeyed pills, 0.60 mg per gram of the small honeyed pills, and 5.40 mg per big honeyed pill, of paeonol ($C_9H_{10}O_3$), referred to Cortex Moutan.

Action To nourish the kidney and lung.

Indications Tidal fever and night sweat, dry throat, or hemoptysis, dizziness, tinnitus, aching and weakness in the lower back and knees, and diabetes due to a *yin* deficiency of the kidney and the lung.

Usage and dosage 6 g of water-honeyed pills, 9 g of small honeyed pills or 1 big honeyed pill, twice a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Maqianzi San
(马钱子散)

Maqianzi Powder

Ingredients Semen Strychni (scalded with sand), a quantity (equal to 8.0 g of strychnine); Pheretima (removed from mud and baked to brown) 93.5 g.

Procedure Pulverize separately the above two ingredients to fine powder, triturate together and sift.

Description Yellowish-brown powder; odour, slight; taste, bitter.

Identification To 1 g of the powder, add several drops of concentrated ammonia TS and 10 ml of chloroform, macerate for several hours, filter, evaporate 1 ml of the filtrate to dryness. Dissolve the residue in 1 ml of dilute hydrochloric acid TS, and add 1-2 drops of potassium iodobismuthate TS, a yellowish-brown precipitate is produced.

Other requirements Comply with the general requirements for powders (Appendix I B).

Assay To 0.5 g of the powder, obtained under the test of weight variation, weighed accurately, in a stopper conical flask, add 20 ml of chloroform and 1 ml of concentrated ammonia TS accurately, shake gently and weigh, allow to stand at the room temperature for 24 hours, weigh again, replenish the lost weight, shake thoroughly and filter, use the filtrate as the test solution. Dissolve strychnine CRS, weighed accurately, in chloroform to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel GF_{254} as the coating substance and the upper layer of toluene, acetone, ethanol and concentrated ammonia TS (16 : 12 : 1 : 4) as the mobile phase. Apply accurately 8 μl of the test solution and 4 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Carry out the method for thin layer chromatography (thin layer chromatographic scanning method, Appendix VI B), scan at wavelength of $\lambda_S = 257$ nm and $\lambda_R = 300$ nm. Measure the integrated absorbance values both of the test solution and reference solution respectively. Calculate the content.
It contains 7.2-8.8 mg of strychnine ($C_{21}H_{22}N_2O_2$) per bag referred to semen strychni.

Action To expel *wind-dampness* and dreadge meridians.

Indications Impediment disease due to accumulation of *wind-dampness* with manifestations of painful joints, arms and lower back, and muscular atrophy of limbs.

Usage and dosage 0.2 g or 0.4 g if no side-effects observed; maximum dosage 0.6 g, appropriate reduction of the dosage for aged and delibitated patients, taken with yellow rice wine or boiling water at night.

Precaution Heavy dosage is forbidden as it contains poisonous ingredients. Genelralized sweating, itching and shivery may occur 1 hour after taking it. Consult physicians in serious cases. It is forbidden to prescribe to children under 13 years old, pregnant women, debilitated persons and patients with heart disease, severe tracheitis or simple hypertention. Avoid raw and cold foods.

Strength 0.6 g per bag

Storage Preserve in tightly closed containers.

Maren Runchang Wan
(麻仁润肠丸)

Maren Runchang Pills

Ingredients Fructus Cannabis 120 g; Semen Armeniacae Amarum (peeled and stir-baked) 60 g; Radix et Rhizoma Rhei 120 g; Radix Aucklandiae 60 g; Pericarpium Citri Reticulatae 120 g; Radix Paeoniae Alba 60 g.

Procedure Pulverize the above six ingredients to fine powder, sift and mix well. To each 100 g of the powder add 140-160 g of refined honey to make big honeyed pills.

Description Yellowish-brown big honeyed pills; odour, slightly aromatic; taste, bitter, slightly sweet.

Identification (1) Microscopical: Clusters of calcium oxalate large, 60-140 μm in diameter. Prisms of calcim oxalate numerous, occurring in parenchymatous cells. Clusters of calcium oxalate 18-32 μm in diameter, occurring in parenchymatous cells, often arranged in rows or several in one cell.
(2) Heat under reflux 6 g of the pills, cut into pieces, triturate with 6 g of kieselguhr, in 50 ml of methanol for 30 minutes. Filter and evaporate the filtrate to dryness, dissolve the residue in 20 ml of water, add 1 ml of hydrochloric acid, heat under reflux for 30 minutes. Allow to cool, extract with two 20-ml quantities of ether, combine the ether extracts, evaporate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 0.5 g of Radix et Rhizoma Rhei reference drug and 20 ml of methanol in the same manner as the reference drug solution. Carry out the method for thin layer

chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of the mixture of petroleum ether (30-60℃), ethyl formate, and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 1-2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm, the five orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution; expose to ammonia vapour, the spots turn red.

(3) To 6 g of the pills, cut into pieces, triturate well with 6 g of kieselguhr, add 50 ml of ether, and heat under reflux for 30 minutes. Filter, and evaporate to 2 ml as the test solution. Prepare a solution with 0.5 g of Radix Aucklandiae reference drug and 20 ml of ether in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and acetone (10 : 3) as the mobile phase. Apply separately 2 μl of the test solution and 1μl of the reference drug solution to the plate. After developing and removing the plate, dry in air. Spray with 1% vanillin in sulfuric acid, and heat at 105℃ for several minutes. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) To 6 g of the pills, cut into pieces and triturate well with 6 g of kieselguhr, add 50 ml of methanol, and heat under reflux for 30 minutes. Filter, evaporate the filtrate to dryness, and dissolve the residue in 2 ml of ethanol as the test solution. Dissolve hesperidin CRS in methanol to produce a saturation solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 0.5% solution of sodium hydroxide as the coating substance and a mixture of ethyl acetate, butanone, formic acid, and water (5 : 3 : 3 : 1) as the mobile phase. Apply separately 1 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removing the plate, dry in air. Spray with 1% aluminium trichloride in methanol, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.1% solution of phosphoric acid (85 : 15) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of emodin.

Reference solution Weigh accurately a quantity of emodin CRS and chrysophanol CRS, dissolve in methanol to produce a mixture containing 5 μg of emodin per ml and 10 μg of chrysophanol per ml as the reference solution.

Test solution Cut a quantity of pills, obtained under the test of weight variation, into pieces. Weigh accurately 1g, triturate well with 1.5 g of kieselguhr, transfer to a Soxhlet's extractor, add a quantity of ethanol TS, and heat under reflux to the extract colourless. Transfer the extractive solution into a 50 ml volumetric flask, dilute to volume with dilute ethanol TS, and shake well. Measure accurately 10 ml of the solution into a flask, and evaporate to nearly dryness on a water bath. Add 15 ml of a mixture of hydrochloric acid and 30% solution of methanol (1 : 10), heat on a water bath for 1 hour, and cool immediately. Extract the solution with four 15-ml quantities of chloroform by shaking, combine the chloroform solution, and recover to dryness. Dissolve the residue in a quantity of methanol, transfer to a 10 ml volumetric flask, dilute to volume, mix well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 4.0 mg of total amount of emodin ($C_{15}H_{10}O_5$) and chrysophanol ($C_{15}H_{10}O_4$) per pill, referred to Radix et Rhizoma Rhei.

Action To moisten the intestines to relieve constipation.

Indications Fullness in the chest and abdomen and constipation due to *heat* accumulated in the intestines and stomach.

Usage and dosage 1-2 pills, twice a day.

Precaution Contraindicated for pregnant women.

Strength 6 g per pill

Storage Preserve in tightly closed containers.

Maren Wan
(麻仁丸)

Maren Pills

Ingredients Fructus Cannabis 200 g; Semen Armeniacae Amarum 100 g; Radix et Rhizoma Rhei 200 g; Fructus Aurantii Immaturus (stir-baked) 200 g; Cortex Magnoliae Officinalis (processed with ginger) 100 g; Radix Paeoniae Alba (stir-baked) 200 g.

Procedure Pulverize the above six ingredients, except Fructus Cannabis and Semen Armeniacae Amarum, to fine powder, then pulverize with Fructus Cannabis and Semen Armeniacae Amarum to fine powder, sift and mix well. To each 100 g of the powder add 30-40 g of refined honey and appropriate quantity of water, make water-honeyed pills and dry. Alternatively, add 90-110 g of refined honey to make small honeyed pills or big honeyed pills.

Description Yellowish-brown water-honeyed pills, small honeyed pills or big honeyed pills; taste, bitter.

Identification (1) Microscopical: Stone cells of pericarp pale yellow to reddish-brown, polygonal in surface view, walls thickened. Stone cells orange, conchoidal, walls relatively thickened, with distinct pits in the broad side. Clusters of calcium oxalate large, 60-140 μm in diameter. Clusters of calcium oxalate 18-32 μm in diameter, occurring in parenchymatous cells, frequently in rows or several clusters in one cell. Prisms of calcium oxalate abundant in parenchyma. Oil cells elliptical or subrounded, 50-80 μm in diameter, containing brownish-yellow oily contents.

(2) Pulverize 2.5 g of water-honeyed pills to fine powder; or triturate well 5 g of small honeyed pills or big honeyed pills, in pieces, with 3 g of kieselguhr. Add 10 ml of ether, and ultrasonicate for 10 minutes. Filter, and evaporate the filtrate to about 5 ml as the test solution. Prepare 1 ml of a solution with 0.5 g of Fructus Aurantii Immaturus reference drug in the same manner as the Fructus Aurantii Immaturus reference drug solution. To 0.1 g of Radix et Rhizoma Rhei reference drug, ultrasonicate with 20 ml of methanol for 15

minutes. Filter, evaporate 5 ml of the successive filtrate to dryness, and dissolve the residue in 10 ml of water. Add 1 ml of hydrochloric acid, heat on a water bath for 30 minutes, allow to cool, extract with two 20-ml quantities of ether, and combine the ether extracts and evaporate to dryness. Dissolve the residue in 1 ml of chloroform as the Radix et Rhizoma Rhei reference drug solution. Dissolve magnolol CRS in methanol to produce a solution containing 1 mg per ml as reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and the upper layer of the mixture of petroleum ether (30-60℃), ethyl formate, and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 4 μl of each of the test solution and the two reference drug solutions, and 2 μl of the reference drug solution to the plate. After developing and removing the plate, and dry in the air. Examine under ultraviolet light at 365 nm, the main fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solutions; examine under ultraviolet light at 254 nm, the spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solutions and the reference solution.

(3) Pulverize 2 g of water-honeyed pills to fine powder; or triturate well 4 g of small honeyed pills or big honeyed pills, in pieces, with 3 g of kieselguhr. Add 20 ml of ethanol, and ultrasonicate for 20 minutes. Filter, evaporate the filtrate to dryness, dissolve the residue in 20 ml of water, and extract with three 20-ml quantities of ether. Discard the ether solution, and extract the water solution with with three 20-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol solution, evaporate to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 1 mg per ml as reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and chloroform, ethyl acetate, methanol, and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 2 μl of each of the reference solution and the test solution to the plate. After developing and removing the plate, dry in air. Spray with 5% vanillin in sulfuric acid, heat to the spot clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A), except that the water-honeyed pills must disintegrate within two hours.

Assay Carry out the method for high performance liquid chromatographic (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.1% solution of phosphoric acid (85 : 15) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of emodin.

Reference solution Weigh accurately a quantity of emodin and chrysophanol CRS, dissolve in a mixture of ethyl acetate and dehydrated ethanol (1 : 2) to produce a mixture containing 10μg of emodin per ml and 50 μg of chrysophanol per ml as the reference solution.

Test solution Pulverize 20 g of water-honeyed pills or small honeyed pills to fine powder, or cut into pieces, mix well, and weigh accurately 0.8 g; or take a quantity of big honeyed pills, obtained under the test of weight variation, cut into pieces, mixed well, and weigh accurately 0.8 g. Transfer the pills into a Soxhlet's extractor, extract with a quantity of ethanol under reflux until the extract colourless, evaporate the extract to dryness on a water bath, dissolve the residue with 15 ml of a mixture of hydrochloric acid and 30% methanol (1 : 10), heat on a water bath for 50 minutes, and cool immediately. Extract the solution with five 15-ml quantities of chloroform by shaking, combine the chloroform solution, and recover to dryness. Dissolve the residue with a mixture of ethyl acetate and dehydrated ethanol (1 : 2), transfer to a 25 ml volumetric flask, dilute to volume, mix well and filter, and use the filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 1.0 mg of total amount of emodin ($C_{15}H_{10}O_5$) and chrysophanol ($C_{15}H_{10}C_4$) per gram of the water honeyed pills, 0.50 mg per gram of the small honeyed pills, and 4.5 mg per big honeyed pill, referred to Radix and Rhizoma Rhei.

Action To moisten the intestines to relieve constipation.

Indications Constipation due to intestinal *heat* and consumption of *fluid* with manifestations of dry feces and abdominal fullness and discomfort.

Usage and dosage 6 g of water-honeyed pills, 9 g of small honeyed pills or 1 big honeyed pill, 1-2 times a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Mayinglong Shexiang Zhichuang Gao (马应龙麝香痔疮膏)

Mayinglong Shexiang Zhichuang Ointments

Ingredients Moschus; Calculus Bovis Artifactus; Margarita; Calamina (calcined); Borax; Borneolum syntheticum; Succinum.

Procedure Pulverize the above seven ingredients to fine powder respectively, mix thoroughly; weigh 785 g of vaseline and 50 g of lanoline, heat and filter; cool to about 50℃, add the fine powders, stir well to a congealed fat state, make to 1000 g.

Description Pale greyish-yellow or pink ointments; odour, aromatic, followed by a sensation of cool.

Identification (1) Place 2g of ointments in a test tube with stopper, add 10ml of chloroform, dissolve the ointment base by shaking, allow to stand. Decant out the supernatant liquid, dry the residue, and observe. Microscopical: Irregular fragments colourless or pale green, semi-transparent, lustrous, and some showing very fine wavy striation.

(2) Heat 2g of ointments with 5ml of diluted hydrochloric acid on a water bath for 5 minutes, cool in ice water, filter. Add 6ml of 10% solution of sodium hydroxide to the filtrate, mix well and filter. To 1ml of filtrate, add 2ml of dilute hydrochloric acid and 2 drops of potassium ferrocyanide TS; a white precipitate is produced.

(3) Heat and melt 10g of ointments with 5ml of water on a water bath, stir well, cool, filter. Acidulate the filtrate with diluted hydrochloric acid, apply on a curcuma TP; a brownish-red spot is shown; allow it to dry in air, the colour deepens; moisten with ammonia TS, the spot becomes bluish-black immediately.

(4) Heat and melt 10g of ointments with 20ml of ethanol on a water bath. Stir for about 5 minutes, cool on an ice water bath for a while, remove and filter. Evaporate the filtrate to dryness on a water bath until no odour of borneol; dissolve the residue in 1ml of ethanol as the test solution. Dissolve cholic acid CRS in ethanol to produce a solution containing 0.5mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, *n*-hexane, acetic acid, and methanol (32 : 6 : 1 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% solution of phosphomolybdic acid in ethanol, heat at 110℃ for about 10 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for ointments (Appendix Ⅰ R).

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use 15% diethylene glycol succinate (DEGS) as the stationary phase, and maintain the column temperature at 105℃. Weigh 40 mg of a mixture of (±) bornel and (±) isoborneol CRS in a 10 ml volumetric flask, dissolve and dilute to volume with internal standard solution, and mix well as the system suitability test solution. Exactly inject 1μl of the solution into the column and measure. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of methyl salicylate. The resolution factor between peaks of (±) bornel, (±) isoborneol and the internal standard substance should comply with the related requirement.

Correction factor Weigh accurately a quantity of methyl salicylate CRS, dissolve in a mixture of cyclohexane and ethyl acetate (1 : 1) to produce a internal standard solution containing 3 mg per ml. Weigh accurately 20 mg of (±)-borneol CRS, place in a 10 ml volumetric flask, dissolve and dilute to volume with the internal standard solution, and shake well. Exactly inject 1 μl of the solution into the column, calculate the correction factor.

Procedure Weigh accurately 1 g of the ointments in a stopper conical flask, add accurately 10 ml of the internal standard solution, mix well and weigh, ultrasonicate for 15 minutes, cool, weigh again, and replenish the lost weight with a mixture of cyclohexane and ethyl acetate (1 : 1). Shake well, filter, and discard the initial filtrate. Inject accurately 1 μl of the solution into the column and calculate the content.

It contains not less than 19 mg of (±)-borneol ($C_{10}H_{18}O$) per gram, referred to Borneolum Syntheticum.

Action To clear *heat* and *dampness*, promote blood circulation to reduce swelling, and remove necrotic tissues and promote regeneration of tissues.

Indications Hemorrhoids and anal fissure due to retention of *damp-heat* with manifestations of hematochezia or pain, bearing-down feeling on bowels movement; also used for perianal eczema.

Usage and dosage For external use, spread on the affected part.

Precaution Be cautious about pregnant women or follow the doctor's order.

Storage Preserve in tightly closed containers.

Meihua Dianshe Wan
(梅花点舌丸)

Meihua Dianshe Pills

Ingredients Calculus Bovis 60 g; Margarita 90 g; Moschus 60 g; Venenum Bufonis (processed) 60 g; Pulvis Fel Ursi 30 g; Realgar 30 g; Cinnabaris 60 g; Borax 30 g; Semen Lepidii seu Descurainiae 30 g; Olibanum (processed) 30 g; Myrrha (processed) 30 g; Resina Draconis 30 g; Lignum Aquilariae Resinatum 30 g; Borneolum Syntheticum 30 g.

Procedure Pulverize or levigate Margarita to very fine powder; levigate Cinnabaris to very fine powder, and levigate Realgar to very fine powder; Pulverize Borax, Semen Lepidii, Olibanum, Myrrha, Resina Draconis and Lignum Aquilariae Resinatum to fine powder. Grind Moschus, Calculus Bovis, Venenum Bufonis, Pulvis Fel Ursi and Borneolum Syntheticum to fine powder, mix with the above powder (except Cinnabaris), sift. Make pills with water, dry at a lower temperature, coat with Cinnabaris powder and polish.

Description Red watered pills, with brownish-yellow to brown core; odour, aromatic; taste, bitter and numb.

Identification (1) Microscopical: Hypodermal cells of testa yellow, polygonal or long polygonal, walls slightly thickend. Walls of fibre tracheid slightly thickened, with bordered pits, pit apertures V-shaped or cross-shaped. Irregular fragments sanguine, the surrounding liquid turns from yellow to red gradually. Irregular fragments colourless or pale green, translucent, lustrous, some times fine dense sinuous striations visible. Amorphous masses pale yellowish-brown, embedded with fine prisms. Irregular fragments golden-yellow or orange-yellow, lustrous.

(2) Pulverize 3 g to fine power, and heat under reflux in 20 ml of methanol for 1 hours. Cool, filter, measure 10 ml of the filtrate, and evaporate to dryness. Dissolve the residue in 5 ml of 10% solution of sodium hydrate, heat at 120℃ for 2 hours, and cool. Add 10 ml of water, extract with two 20-ml quantities of ehtyl acetate, discard the solution of ethyl acetate, and acidify the water solution to pH 2-3 with hydrochloric acid . Extract with two 30-ml quantities of ether, combine the solution of ether, evaporate to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve cholic acid CRS, ursodeoxycholic acid CRS, and chenodeoxycholic acid CRS in ethanol to produce a mixture containing 1 mg of each per ml of each as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of isooctane-ethyl acetate-acetic acid (15 : 7 : 5) as the mobile phase. Apply separately 2 μl of each of the reference solution and the test solution to the plate. After developing and removing the plate, dry in air, Spray with the 10% solution of sulfuric acid in ethanol, heat at 105℃ for several minutes, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(3) Pulverize 3 g to fine power, add 10 ml of ether, well close, shake for 10 minutes and filter, and use the filtrate as the test solution Dissolve muscone CRS in ethanol to produce a reference solution containing 5 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and methylene chloride (2 : 3) as

the mobile phase. Apply separately to the plate 10 μl of the test solution and 2 μl of the reference solution. After developing and removing the plate, dry in air, and spray with dinitrophenylhydrazine TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Pulverize 6 g to fine power, sublimation a small quantity of the powder, and dissolve the sublimates in 1 ml of dehydrated ethanol as the test solution. Weigh a quantity of a mixture of (±)-borneol and (±)-isoborneol CRS, dissolve in dehydrated ethanol to produce a reference solution containing 2 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (17 : 3) as the mobile phase. Apply separately to the plate 3 μl of the test solution and 1 μl of the reference solution. After developing and removing the plate, dry in air. Spray with 1% vanillin in sulfuric acid, and heat at 105℃ to spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (65 : 35) as the mobile phase. As detector a spectrophotometer set at 296 nm. The number of theoretical plates of the column is not less than 1500, calculated with the reference to the peak of cinobufagin.

Reference solution Weigh accurately a quantity of cinobufagin CRS, dissolve in methanol to produce a reference solution containing 30 μg per ml.

Test solution Pulverize the pills obtained under the test of weight variation to fine powder, and weigh accurately 0.4 g to a 50 ml volumetric flask. Add 40 ml of methanol, ultrasonicate (power 250 W, frequency 50 kHz) for 30 minutes, cool, dilute to volume with methanol, shake well. Filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 0.16 mg of cinobufagin per pill, referred to Venenum Bufonis.

Action To clear *heat* and *toxicity*, and reduce swelling and pain.

Indications Furuncles and carbuncles at the initial stage, swollen painful throat and gums, sores on the mouth and tongue due to abundant internal *toxic-fire*.

Usage and dosage 3 pills, 1-2 times a day; for external use, appropriate quantity to be dissolved in vinegar and applied topically.

Precaution Contraindicated for pregnant women

Strength 1 g per 10 pills

Storage Preserve in tightly closed containers.

Mengshi Guntan Wan
(礞石滚痰丸)

Mengshi Guntan Pills

Ingredients Lapis Micae Aureus (calcined) 40 g; Lignum Aquilariae Resinatum 20 g; Radix Scutellariae 320 g; Radix et Rhizoma Rhei (steamed) 320 g.

Procedure Pulverize the above four ingredients to fine powder, sift, mix well, make pills with water and dry.

Description Yellow to brown watered pills; taste, bitter.

Identification (1) Microscopical: Clusters of calcium oxalate large, 60-140 μm in diameter. Walls of fibre-tracheids slightly thickened, with bordered-pits, pit aperture V-shaped or cross-shaped. Bast fibres pale yellow, fusiform, walls thickened, with fine pit-canals. Subrectangular or irregular fragments pale yellowish-brown.

(2) Grind 0.5 g of the pills to fine powder, macerate in 20 ml of methanol for 1 hours, filter and evaporate the filtrate to dryness. Dissolve the residue in 10 ml of water, then add 1 ml of hydrochloride acid, heat under reflux for 30 minutes, allow to cool immediately, extract with two 20-ml quantities of ether. Combine the ether extracts, evaporate to dryness, dissolve the residue in 1 ml of chloroform as the test solution. Prepare a sloution of 0.1 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and the upper layer of petroleum ether (30-60℃), ethyl formate, and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 10 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The spots turn red in daylight after exposing to ammonia vapour.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To expel *phlegm* and *fire*.

Indications Mania and palpitation with fear due to *phlegm-fire* disturbing the mind, or coughing and asthma with expectoration of sticky sputum and constipation.

Usage and dosage 6-12 g, once a day.

Precaution Contraindicated for pregnant women.

Storage Preserve in well closed containers, protected from moisture.

Miaoji Wan
(妙济丸)

Miaoji Pills

Ingredients Auricularia auricula-judae (processed with vinegar) 300 g; Radix Angelicae Sinensis 32 g; Radix Paeoniae Alba (stir-baked with wine) 10 g; Rhizoma Chuanxiong 12 g; Fructus Chaenomelis 16 g; Cortex Eucommiae (stir-baked with salt) 20 g; Radix Dipsaci 32 g; Radix Cyathulae (steamed with wine) 32 g; Rhizoma Atractylodis 32 g; Fructus Foeniculi (stir-fried with salt) 8

g; Radix Aucklandiae 6 g; Flos Caryophylli 6 g; Fructus Eugeniae Caryophyllatae 6 g; Resina Olibani (processed) 8 g; Poria 50 g; Rhizoma Smilacis Glabrae 32 g; Carapax et Plastrum Testudinis (processed) 50 g.

Procedure Pulverize the above seventeen ingredients to fine powder, sift, mix well. To each 100 g of the powder add 200 g of refined honey and 16.6 g of butter (filtered after melting by heating) to make big honeyed pills.

Description Blackish-brown big honeyed pills; odour, characteristic; taste, slightly sweet, bitter and pungent.

Identification Microscopical: Irregularly branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Raphides of calcium oxalate 40-144 μm long, 5 μm in diameter. Needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells. Clusters of calcium oxalate 18-32 μm in diameter, present in parenchymatous cells, often arranged in line or several clusters in one cell. Clusters of calcium oxalate fine, 7-11 μm in diameter, present in parenchymatous cells, often arranged in line. Sandy crystals of calcium oxalate present in parenchymatous cells. Rubber thread strip-shaped or twisted into masses, and granular on surface. Irregular masses greyish-yellow, with fine striations and holes on surface. Fragments of sporophores pale greyish-brown to dark brown, hyphae interlaced.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To reinforce the liver and kidney, expel *dampness* and dredge meridians, and promote blood circulation to kill pain.

Indications Impediment disease due to deficiency in the liver and kidney and accumulation of *wind-damp* with manifestations of pain in the bones and joints, aching pain and weakness of the lower back and kness, and numbness and contracture of limbs.

Usage and dosage 1-2 pills, twice a day, taken with yellow rice wine.

Strength 6 g per pill

Storage Preserve in well closed containers.

Mingmu Dihuang Wan
(明目地黄丸)

Mingmu Dihuang Pills

Ingredients Radix Rehmanniae Praeparate 160 g; Fructus Corni (processed) 80 g; Cortex Moutan 60 g; Rhizoma Dioscoreae 80 g; Poria 60 g; Rhizoma Alismatis 60 g; Fructus Lycii 60 g; Flos Chrysanthemi 60 g; Radix Angelicae Sinensis 60 g; Radix Paeoniae Alba 60 g; Fructus Tribuli 60 g; Concha Haliotidis (calcined) 80 g.

Procedure Pulverize the above twelve ingredients to fine powder, sift and mix well. To each 100 g of powder add 35-50 g of refined honey and a quantity of water, make pills and dry. Alternatively, add 90-110 g of refined honey to make small honeyed pills or big honeyed pills.

Description Blackish-brown to black water-honeyed pills, black small honeyed pills or big honeyed pills; odour, slightly aromatic; taste, sweet, then bitter and astringent.

Identification (1) Microscopical: Starch granules triangular-ovoid or oblong, 24-40 μm in diameter, hila short-cleft or V shaped. Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Epidermal cells of pericarp orange-yellow, subpolygonal in surface view, with beaded anticlinal walls. Parenchymatous cells subrounded with elliptical pits gathered into pitted areas. Anticlinal walls of endodermal cells sinuous, relatively thickened, lignified, with sparse and fine pit-canals Stone cells of testa irregular polygonal in surface view, walls thickened and sinuous with well-defined striations. Pollen grains subrounded, 24-34 μm in diameter, extine spiny, 3-5 μm long, with 3 germinal pores. Fibres 15-35 μm in diameter, walls thickened and slightly lignified, with large rounded pits. Pericarp fibres lignified, with upper and lower layers in crisscross arrangment. Irregular masses dark grey, opaque, effervesces on adding acid.

(2) To 24 g of small honeyed pills or big honeyed pills, cut into pieces, or 18 g of water-honeyed pills, pulverized to powder; moisten with 10 ml of ether, and add 40 ml of petroleum ether (30-60℃), ultrasonicate for 15 minutes, allow to stand overnight, filter. Evaporate the filtrate to dryness, dissolve the residue in 2 ml of acetone as the test solution. Dissolve paeonol CRS in acetone to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (3∶1) as the mobile phase. Apply separately 6 μl of the test solution and 4 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 5% ferric chloride in ethanol acidified with hydrochloric acid. Heat at 105℃ for about 5 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Grind well 6 g of the water-honeyed pills to pieces; or cut 9 g of the small honeyed pills or big honeyed pills into pieces, triturate well with 5 g of kieselguhr, dry in oven. Ultrasonicate with 30 ml of hexane for 15 minutes, filter and concentrate the filtrate to about 1 ml as the test solution. Prepare a solution of 1 g of Radix Angelicae Sinensis reference drug and 20 ml of hexane in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of *n*-hexane and ethyl acetate (9∶1) as the mobile phase. Apply separately 4 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the fluorescent spots in the chromatogram obtained with the reference drug solution.

(4) Grind well 6 g of water-honeyed pills, or triturate 9 g of small honeyed pills or big honeyed pills, cut into pieces, with 4 g of kieselguhr. Ultrasonicate with 50 ml of ethanol for 20 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in 20 ml of water and extract with three 20-ml quantities of *n*-butanol saturated with water by shaking. Combine the *n*-butanol solutions, evaporate to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve Paeoniflorin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40∶5∶10∶0.2) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air. Spray with a 5% solution of vanillin in sulfuric acid and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution

corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay ***Fructus Corni*** Weigh accurately 18 g of small honeyed pills or big honeyed pills obtained under the test of weight variation, or 10 g of water-honeyed pills, cut into pieces and mixed well, add 50 ml of water, allow to stand for disintegration, filter, wash the residue with 80 ml of water and dry at room temperature to a loose powder, and heat at 100℃ to dryness. Place the residue along with the filter paper to a Soxhelt's extractor and heat under reflux with a quantity of ether for 4 hours. Recover the ether thoroughly and macerate the residue in two 20-ml quantities of petroleum ether (30-60℃) for about 2 minutes each. Decant the petroleum ether, dissolve the residue in a mixture of dehydrate ethanol and chloroform (3 : 2) by warming. Transfer accurately the solution to a 5 ml volumetric flask, dilute to volume with the same mixture solvent and shake well, used as the test solution. Dissolve a quantity of ursolic acid CRS in dehydrate ethanol to produce a reference solution containing 0.5 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform, ethyl acetate and glacial acetic acid (20 : 5 : 8 : 0.5) as the mobile phase. Apply accurately 5 μl of test solution 2 μl and 5 μl of the reference solution to the plate, spotted alternatively. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 110℃ for 4-5 minutes to the spots distinct, and cool. Cover the plate with a same size glass and fix with tape. Carry out the method for thin layer chromatographic scanning (Appendix Ⅵ B), scan at the wavelength of $\lambda_S = 540$ nm, $\lambda_R = 700$ nm. Measure the integrated absorbance values of the test solution and reference solution, respectively, and calculate the content.

It contains not less than 90 μg per gram of the water-honeyed pills, 70 μg per gram of the small honeyed pills, 0.63 mg per big honeyed pill, of ursolic acid ($C_{30}H_{48}O_3$), referred to Fructus Corni.

Cortex Moutan Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (70 : 30) as the mobile phase. As detector a spectrophotometer set at 274 nm. The number of theoretical plates of the column is not less than 3500, calculated with the reference to the peak of paeonol.

Reference solution Dissolve a quantity of paeonol CRS, accurately weighed, in methanol to prepare a solution containing 15 μg per ml as the reference solution.

Test solution Grind well the water-honeyed pills or small honeyed pills, or chip the big honeyed pills, obtained under the test of weight variation, into pieces, weigh accurately 0.5 g in a stoppered conical flask, add accurately 50 ml of 70% methanol, stopper well, and weigh. Ultrasonicate (power 250 W, frequency 33 kHz) for 45 minutes, cool, weigh again, replenish the loss of weight with 70% methanol, and shake well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 20 μl of the test solution into the column, respectively, and calculate the content.

It contains not less than 0.50 mg per gram of the water-honeyed pills, 0.40 mg per gram of the small honeyed pills, 3.6 mg per big honeyed pill, of paeonol ($C_9H_{10}O_3$), referred to Cortex Moutan.

Radix Paeoniae Alba and Cortex Moutan Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% phosphoric acid (14 : 86) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 4500, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, accurately weighed, in methanol to produce a solution containing 50 μg per ml as the reference solution.

Test solution Measure accurately 25 ml the test solution obtained under the assay of Cortex Mudan, and evaporate to dryness. Dissolve the residue in 25 ml of water by warming, cool, extract with three 25-ml quantities of *n*-butanol saturated with water, combine the n-butanol extracts and evaporate to dryness. Dissolve the residue in methanol and transfer to a 5 ml volumetric flask, add methanol to volume, and shake well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 0.80 mg per gram of the water-honeyed pills, 0.60 mg per gram of the small honeyed pills, 5.4 mg per big honeyed pill, of paeoniflorin ($C_{23}H_{28}O_{11}$), referred to Radix Paeoniae Alba and Cortex Moutan.

Action To nourish the kidney and liver, improve eyesight.

Indications Dryness of eyes, photophobia, blurred vision, and lacrimation irritated by the *wind* due to *yin* deficiency of the liver and the kidney.

Usage and dosage 6 g of water-honeyed pills, 9 g of small honeyed pills or 1 big honeyed pill, twice a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Mugua Wan
(木瓜丸)
Mugua Pills

Ingredients Fructus Chaenomelis 80 g; Radix Angelicae Sinensis 80 g; Rhizoma Chuanxiong 80 g; Radix Angelicae Dahuricae 80 g; Radix Clematidis 80 g; Rhizoma Cibotii (processed) 40 g; Radix Achyranthis Bidentatae 160 g; Caulis Spatholobi 40 g; Caulis Piperis Kadsurae 80 g; Radix et Rhizoma Ginseng 40 g; Radix Aconiti Praeparata 40 g; Radix Aconiti Kusnezoffii Praeparata 40 g.

Procedure Pulverize Fructus Chaenomelis, Radix Clematidis, Caulis Spatholobi, Radix Achyranthis Bidentatae, Radix Aconiti Praeparata, Radix Aconiti Kusnezoffii Praeparata and Radix et Rhizoma Ginseng to fine powder, sift and mix well. Decoct the other five ingredients twice with water. Combine the decoctions and filter. Concentrate the filtrate, make pills with the above powder and dry. Coat with sugar and polish.

Description Sugar-coated concentrative watered pills, with yellowish-brown to blackish-brown core; taste, sour and bitter.

Identification (1) Microscopical: Sand crystals of calcium oxalate occurring in parenchymatous cells. Clusters of calcium oxalate 20-68 μm in diameter, with acute angles. Stone cells rectangular or subsquare, with slightly thickened walls. Stone cells rounded, oblong or subpolygonal, with thickened walls, and lumina containing orange-red or brown contents.
(2) Pulverize 5 g of the pills, removed the sugar coats, to fine powder, add 20 ml of ether, heat under reflux on a water bath for 30 minutes, cool, filter, evaporate the filtrate to dryness, dissolve the residue with 1 ml of ethyl acetate as the test solution. Prepare a solution of 0.5 g of Fructus Chaenomelis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, acetone and ethly acetate (12 : 3 : 1) as the mobile phase. Apply separately to the plate 1-2 μl of the test solution and 1 μl of the reference drug solution. After developing and removal of the plate, dry in air, spray with a 10% solution of sulfuric acid in ethanol, and heat at 100℃ to the spot clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution, and then examine under ultraviolet light at 365 nm, the same spots, show the same colour of fluorescence.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To expel *wind* and disperse *cold*, and eliminate *dampness* and dredge meridians.

Indications Impediment disease due to accumulation of *wind*, *cold* and *dampness* with manifestations of painful, swollen and immobilized joints, local aversion to *wind-cold*, numbness of limbs, and aching and weakness in the lower back and knees.

Usage and dosage 30 pills, twice a day.

Precaution Contraindicated for pregnant women.

Storage Preserve in tightly closed containers.

Muxiang Binglang Wan
(木香槟榔丸)

Muxiang Binglang Pills

Ingredients Radix Aucklandiae 50 g; Semen Arecae 50 g; Fructus Aurantii (stir-baked) 50 g; Pericarpium Citri Reticulatae 50 g; Pericarpium Citri Reticulatae Viride (processed with vinegar) 50 g; Rhizoma Cyperi (processed with vinegar) 150 g; Rhizoma Sparganii (processed with vinegar) 50 g; Rhizoma Curcumae (processed with vinegar) 50 g; Rhizoma Coptidis 50 g; Cortex Phellodendri Chinensis (stir-fried with wine) 150 g; Radix et Rhizoma Rhei 150 g; Semen Pharbitidis (stir-baked) 200 g; Natrii Sulfas 100 g.

Procedure Pulverize the above thirteen ingredients to fine powder, sift and mix well. Make pills with water and dry.

Description Greyish-brown watered pills; taste, bitter and slightly salty.

Identification (1) Microscopical: Wood fibres in bundles, long fus-iform, 16-24 μm in diameter, with slightly thickened walls and transverse cleft, crossed or V-shaped pit. Fibre bundles bright yellow, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres, walls of crystal cells lignified and thickened. Fragments of endosperm cell colourless, with relatively thickened walls and numerous large subrounded pits. Prisms of calcium oxalate abundant in parenchyma. Clusters of calcium oxalate large, 60-140 μm in diameter. Secretory cells subrounded, containing yellowish-brown to reddish-brown secretion, surrounded by radially arranged cells. Palisade cells of testa pale brown or brown, 48-80 μm long.
(2) Macerate 0.8 g of the powder in 20 ml of methanol for 1 hour, filter and evaporate 5 ml of the filtrate to dryness. Dissolve the residue in 10 ml of water, add 1 ml of hydrochloric acid, heat on a water bath for 30 minutes, cool immediately and extract with two 20-ml quantities of ether. Combine the ether extracts and evaporate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 0.1 g of Radix et Rhizoma Rhei reference drug in the same manner, as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H containing sodium carboxymethylcellulose as the coating substance and the upper layer of petroleum ether (30-60℃), ethyl formate, and formic acid (15 : 5 : 1) as the mobile phase. Apply separately to the plate 4 μl of each of the two solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The five orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The spots turn red on exposing to ammonia vapour.
(3) Heat under reflux 1.2 g of the powder with 10 ml of methanol on a water bath for 15 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 5 ml of methanol, as the test solution. Prepare a solution with 50 mg of Rhizoma Coptidis reference drug and 5 ml of methanol in the same manner as the reference drug solution. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol, and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately to the plate 1 μl of each of the three solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The yellow fluorescent spot in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.
(4) To 4 g of the powder, add 10 ml of water, then distil the volatile oils by steam. Collect about 100 ml of the distillate, carry out the method for spectrophotometry (Appendix Ⅴ A). The distillate exhibits a maximum absorbance at 253 nm.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To promote *qi* flow to remove obstruction, and purge *heat* to relax bowels.

Indications Dysentery, tenesmus, distending pain in the abdomen, or constipation due to accumulation of *damp-heat*.

Usage and dosage 3-6 g, 2-3 times a day.

Precaution Contraindicated for pregnant women.

Storage Preserve in well closed containers, protected from moisture.

Muxiang Fenqi Wan
(木香分气丸)

Muxiang Fenqi Pills

Ingredients Radix Aucklandiae 192 g; Fructus Amomi 48 g; Flos Caryophylli 48 g; Lignum Santali Alba 48 g; Rhizoma Cyperi (stir-baked with vinegar) 384 g; Herba Pogostemonis 48 g; Pericarpium Citri Reticulatae 192 g; Cortex Magnoliae Officinalis (stir-baked with ginger juice) 384 g; Fructus Aurantii Immaturus 192 g; Semen Myristicae 48 g; Rhizoma Curcumae (stir-baked with vinegar) 384 g; Fructus Crataegi (stir-baked) 192 g; Rhizoma Atractylodis Macrocephalae (stir-baked with bran) 192 g; Radix et Rhizoma Nardostachyos 192 g; Semen Arecae 96 g; Radix et Rhizoma Glycirrhizae 192 g.

Procedure Pulverize the above 16 ingredients to fine powder, sift, mix well and make pills with water.

Description Yellowish-brown watered pills; odour, aromatic; taste, slightly pungent.

Identification (1) Microscopical: Stone cells branched, walls thickened, with distinct striations. Pericarp stone cells pale purplish-red, red or yellowish-brown, subrounded or polygonal, about 125 μm in diameter. Pieces of endosperm cell colourless, walls relatively thickened, with numerous large subrounded pits. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres.

(2) Pulverize 10 g to fine powder, add 20 ml of methanol, ultrasonicate for 5 minutes, filter, and use the filtrate as the test solution. Prepare a solution with 0.5 g of Radix Aucklandiae and 10 ml of methanol in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and methanol (27 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid and heat to the spot clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Evaporate the test solution obtained in the test for Identification (2) to dryness, dissolve the residue in 20 ml of diluted hydrochloric acid, then extract with three 20-ml quantities of chloroform. Combine the chloroform extracts, extract with three 20-ml quantities of 2% solution of sodium hydroxide. Combine the sodium hydroxide extracts, adjust to pH 1-2 with dilute hydrochloric acid. Extract with three 20-ml quantities of chloroform. Combine the chloroform extracts, dehydrate the chloroform solution with anhydrous sodium sulphate, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve magnolol CRS and honokiol CRS in methanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thinlayer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and methanol (27 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the test solution and the reference solution. After developing and removal of the plate, dry in air. Spray with a 5% solution of vanillin in sulfuric acid and heat at 105℃ for several minutes. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To soothe the chest to eliminate fullness, and regulate flow of *qi* to stop vomiting.

Indications Epigastric stuffiness and oppression, distension of the hypochondria, epigastric pain, stomach distension, gastric upset, nausea and vomiting, belching and acid regurgitation.

Usage and dosage 6 g, twice, a day.

Precaution Be cautious about pregnant women.

Strength 6 g per 100 pills

Storage Preserve in tightly closed containers.

Naodesheng Pian
(脑得生片)

Naodesheng Tablets

Ingredients Radix et Rhizoma Notoginseng 78 g; Rhizoma Chuanxiong 78 g; Flos Carthami 91 g; Radix Puerariae Lobatae 261 g; Fructus Crataegi (removed from seeds) 157 g.

Procedure Pulverize Radix et Rhizoma Notoginseng and 130.5 g of Radix Puerariae Lobatae to fine powders respectively. Decoct the other three ingredients and the remained Radix Puerariae Lobatae with water twice, 1.5 hours for the first time, 1 hour for the second time, combine the decoctions, filter and concentrate the filtrate to a thin extract with a relative density of 1.22-1.25 (80℃). Add the above two powders, mix well, make granules, dry, make into 1000 tablets, and coat with sugar.

Description Sugar coated tablets with yellowish-brown core; taste, slightly bitter.

Identification (1) Microscopical: Fibers in bundles, surrounded by cells containing prisms of calcium exalate, forming crystal fibers, walls of crystal cells lignified and thickened. Fragments of resin canals containing yellow secretion.
(2) Take 2 tablets, removed sugar coats, pulverize, carry out the test of Identification (2) described in the monograph of Naodesheng Pills, the result should be the same.
(3) Take the test solution described under Assay as the test solution, carry out the test of Identification (3) described in the monograph of Naodesheng Pills, the result should be the same.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and acetonitrile as the mobile phase A, water as the mobile phase B, elute in gradient as the following. As detector a spectrophotometer set at 203 nm. The number of theoretical plates of the column is not less than 8000, calculated with the reference to the peak of ginsenoside Rg_1.

Time(min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0-20	20→40	80→60
20-26	20	80

Reference solution Dissolve a quantity of each of ginsenoside Rb_1 CRS, ginsenoside Rg_1 CRS and notoginsenoside R_1 CRS, accurately weighed, in methanol to prepare a mixture containing 0.75 mg per ml for each of ginsenoside Rb_1 CRS and ginsenoside Rg_1 CRS, and 0.15 mg per ml for notoginsenoside R_1 CRS as the reference solution.

Test solution Take 20 tablets with sugar coating removed, weigh accurately, grind well, weigh accurately 1 g in a stopper conical flask, add accurately 50 ml of *n*-butanol saturated with water, stopper well, and weigh. Ultrasonicate (power 250 W, frequency 33 kHz) for 20 minutes, cool, weigh again, replenish the loss of weight with *n*-butanol saturated with water, shake well and filter. Measure accurately 25 ml of the successive filtrate in a separating funnel, and wash with ammonia TS for 2 times (15 ml, 10 ml). Evaporate the *n*-butanol solution to dryness, dissolve the residue in methanol, transfer to a 5 ml volumetric flask, add methanol to volume, and shake well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.
It contains not less than 0.28 mg of notoginsenoside R_1 ($C_{47}H_{80}O_{18}$), 2.5 mg of the total amount of ginsenoside Rb_1 ($C_{54}H_{92}O_{23}$) and ginsenoside Rg_1 ($C_{42}H_{72}O_{14}$) per tablet, referred to Radix et Rhizoma Notoginseng.

Action To promote blood circulation to resolve stagnant blood, and dredge and activate meridians.

Indications Vertigo and stroke due to blockage of meridians by stagnated blood with manifestations of apraxia, dysphasia and dizziness; cerebral arteriosclerosis, ischemic stroke and sequelae of cerebral hemorrhage with above symptoms.

Usage and dosage 6 tablets, 3 times a day.

Storage Preserve in tightly closed containers.

Naodesheng Wan
(脑得生丸)

Naodesheng Pills

Ingredients Radix et Rhizoma Notoginseng 78 g; Rhizoma Chuanxiong 78 g; Flos Carthami 91 g; Radix Puerariae Lobatae 261 g; Fructus Crataegi (removed from seeds) 157 g.

Procedure Pulverize the above five ingredients to fine powder, sift and mix well. To each 100 g of the powder add 140-150 g of refined honey to make big honeyed pills.

Description Brown big honeyed pills; odour, slightly aromatic; taste, slightly sweet and sour.

Identification (1) Microscopical: Pollen grains rounded or elliptical, up to about 60 μm in diameter, with spinous extine and 3 germinal apertures. Fibres in bundles, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres, walls of crystal cells lignified and thickened. Stone cells of pericarp pale purplish-red, red or yellowish-brown, subrounded or polygonal, up to 125 μm in diameter.
(2) Add 3 g of kieselguhr to 9 g of chopped sample, grind homogeneously, add 20 ml of a mixture of ethyl acetate-formic acid (9.5 : 0.5), heat under reflux on a water bath for 4 hours, filter, evaporate the filtrate to dryness, dissolve the residue in 2 ml of methanol, used as the test solution. Dissolve ferulic acid CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, chloroform, glacial acetic acid (6 : 5 : 1) as the mobile phase. Apply separately 5-10 μl of the test solution and 2-4 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with fresh prepared a mixture of 1% solution of ferric chloride and 1% solution of potassium ferricyanide (1 : 1). The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Dissolve puerarin CRS in methanol to produce a solution containing 0.5 mg per ml, used as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, ethyl acetate,

methanol, and water (15 : 40 : 22 : 10) stored below 10℃ for 12 hours as the mobile phase. Apply separately 5-10 μl of the test solution described in Assay and 2-4 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm, the fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Acid-insoluble ash Not more than 1.0 per cent (Appendix Ⅸ K).

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Mix 2 g, in pieces, weighed accurately, with 2 g of kieselguhr and grind homogeneously, take it to Soxhlet's extractor and add an appropriate quantity of ether, heat under reflux on a water bath for 2 hours, discard the ether extract, after removing the ether in the filter paper cartridge case, put it in the Soxhlet's extractor again, add an appropriate quantity of methanol, allow to stand overnight, heat under reflux on a water bath until the solution colourless, remove the methanol and evaporate to dryness. Dissolve the residue in 30 ml of water, transfer it to a separating funnel, extract by shaking with *n*-butanol saturated with water for 5 times (25, 20, 20, 10, 10 ml), wash the combined extract with three 25-ml quantities of water saturated with *n*-butanol, discard the washings, evaporate the *n*-butanolic solution in vacuum to dryness, dissolve the residue in methanol and transfer to a 5 ml volumetric flask, dilute to volume, shake well, used as the test solution. Dissolve ginsenoside Rg_1 CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using high performance silica gel as the coating substance and the lower layer of a mixture of chloroform, ethyl acetate, methanol, and water (15 : 40 : 22 : 10) stored below 5-10℃ for 12 hours as the mobile phase. Apply accurately 2-4 μl of the test solution, 2 μl and 4 μl of the reference solution to the plate alternatively. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 110℃ until the colour of the spot distinct, cover the plate with a same size glass, fix the edge with tape. Carry out the method for thin layer chromatography (thin layer chromatographic scanning method, Appendix Ⅵ B), scan at the wavelength of $\lambda_s = 525$ nm and $\lambda_R = 700$ nm, measure the integration value of the absorbance of the test solution and the reference solution respectively, calculate the content.
It contains not less than 6.0 mg of ginsenoside Rg_1 ($C_{42}H_{72}O_{14}$) per pill, referred to Radix et Rhizoma Notoginseng.

Action To promote blood circulation to resolve stagnated blood, and dredge and activate meridians.

Indications Vertigo and stroke due to blockage of meridians by stagnated blood with manifestations of apraxia, dysphasia and dizziness; cerebral arteriosclerosis, ischemic stroke and sequelae of cerebral hemorrhage with above symptoms.

Usage and dosage 9 g, 3 times a day.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Naolejing
(脑乐静)

Naolejing Syrup

Ingredients Extractum Glycyrrhizae 35.4 g; Fructus Jujubae 125 g; Fructus Tritici 416 g.

Procedure To Extractum Glycyrrhizae add a quantity of water, heat to dissolve, filter, concentrate the filtrate to an appropriate volume. Decoct Fructus Jujubae with water twice, each for 2 hours, combine the decoctions, filter, concentrate the filtrate to a thin extract with a relative density of 1.10 (80℃), allow to cool, add an equal quantity of ethanol, stir well, allow to stand for 24 hours. Boil Fructus Tritici with water for 10 minutes, macerate at a temperature of 70-80℃ twice, each for 2 hours, combine the macerates and filter, concentrate the filtrate to a thin extract with a relative density of 1.10 (80℃), add an equal quantity of ethanol, stir well, allow to stand for 24 hours. Combine the supernatants of the above Fructus Jujubae and Fructus Tritici liquids, filter, recover ethanol, and concentrate to a thin extract with a relative density of 1.05-1.10 (80℃), add 750 g of sucrose, the above concentrated solution of Extractum Glycyrrhizae and a quantity of sodium benzoate, boil to dissolve, filter, add water and make to 1000 ml, stir well.

Description A plae brown glutinous liquid; odour, slight; taste, sweet.

Identification (1) Measure 5 ml of the syrup, add 15 ml of water, mix well. Extract with three 20-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extracts, wash with three 10-ml quantities of water. Evaporate the *n*-butanol solution to dryness, dissolve the residue in 1 ml of methanol as the test solution. Heat under reflux 0.2 g of Radix et Rhizoma Glycyrrhizae reference drug in 20 ml of water for 1 hour, filter and treat the filtrate in the same manner as the reference drug solution. Dissolve ammonium glycyrrhizinate CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance mixed with 1% solution of sodium hydroxide and a mixture of ethyl acetate, formic acid, glacial acetic acid, and water (15 : 1 : 1 : 2) as the mobile phase. Apply separately 5 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution; the orange fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) Measure 20 ml of the syrup, extract with 50 ml of ether, and concentrate the extract to 1 ml as the test solution. Decoct 1 g of Fructus Jujubae reference drug with 100 ml of water for 1 hour. Filter, evaporate to 20 ml, and extract with 50 ml of ether, and concentrate the extract to 1 ml as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and ethyl acetate as the mobile phase. Apply separately 5 μl of each of the reference drug solution and the test solution to the plate. After developing and removing the plate, dry in air. Heat at 105℃ to spots

clear, and examine under ultraviolet light at 254 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the fluorescent spots in the chromatogram obtained with the reference drug solution.

Relative density Not less than 1.27 (Appendix Ⅶ A).

Other requirements Comply with the general requirements for syrups (Appendix Ⅰ H).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 2.5% solution of acetic acid (35 : 65) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of glycyrrhizinic acid.

Reference solution Weigh accurately a quantity of ammonium glycyrrhizinate CRS, and dissolve in dilute ethanol TS to produce a solution containing 40 μg per ml as reference solution (correspond to 39 μg of glycyrrhizinic acid per ml).

Test solution Measure 10 ml of the syrup, accurately weighed, in a 50 ml volumetric flask, dilute to volume with dilute ethanol TS, shake well, and filter. Discard the initial filtrate, measure accurately 1 ml of the filtrate, in a 10 ml volumetric flask, dilute to volume with dilute ethanol TS, shake well and filter, and use the filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.
It contains not less than 1.0 mg of glycyrrhizic acid ($C_{42}H_{62}O_{16}$) per gram, referred to Extractum Glycyrrhizae.

Action To nourish the heart to anchor the mind.

Indication Depression, hyperarousal, insomnia and restless due to malnourishment of the heart.

Usage and dosage 30 ml, 3 times a day; appropriate reduction of the dosage for children.

Storage Preserve in tightly closed containers.

Naoliqing Wan
(脑立清丸)

Naoliqing Pills

Ingredients Magnetitum 200 g; Haematitum 350 g; Concha Margaritifera 100 g; Rhizoma Pinelliae (processed with alum) 200 g; Saccharomyces Cerevisiae Fermentata 200 g; Saccharomyces Cerevisiae Fermentata (stir-baked) 200 g, Radix Achyranthis Bidentatae 200 g; Mentholum 50 g; Borneolum Syntheticum 50 g; Fel Suillus Liquidum 350 g (or Pulvis Fellis Suis 50 g).

Procedure Pulverize Magnetitum, Haematitum, Concha Margaritifera, Rhizoma Pinelliae (processed with alum), Radix Achyranthis Bidentatae, Saccharomyces Cerevisiae Fermentata and Saccharomyces Cerevisiae Fermentata (stir-baked) to fine powders respectively, sift, take out 100 g of Haematitum powder for coating. Grind Mentholum and Borneolum Syntheticum to fine powder, triturate with the above powders, sift. Boil Fel Suillus Liquidum with a quantity of water, filter, use the bile solution to make pills; or grind Mentholum and Borneolum Syntheticum to fine powder, triturate with the above powders and Pulvis Fel suillus well, sift and make pills with water. Coat with the remained Haematitum powder, dry at 40℃.

Description Dark brown watered pills; odour, aromatic; taste, slightly bitter.

Identification (1) Place 0.6 g, finely powdered, in a stopper centrifugal tube, add 4 ml of 6 mol/L of solution of hydrochloric acid, shake, and centrifuge for 5 minutes at 3000 round per minute. To 2 drops of the supernatant, add 2 drops of ammonium thiocyanate TS, the solution turns to blood red; to 0.5 ml of the supernatant, add 1-2 drops of potassium ferrocyanide TS, a blue precipitate is produced; add 0.5-1 ml of 25% solution of sodium hydroxide, the precipitate turns to brown.
(2) Pulverize 3 g to fine powder, heat under reflux in 20 ml of ethanol for 40 minutes, and filter. To 10 ml of the filtrate, add 1 ml of hydrochloric acid, and heat under reflux on a water bath for 1 hour. Concentrate the extract to about 5 ml, add 10 ml of water, and extract with two 20-ml quantities of petroleum ether (60-90℃). Combine the petroleum ether extracts, evaporate to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve a quantity of oleanolic acid CRS in ethanol to produce a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (40 : 1) as the mobile phase. Apply separately 5 μl of each of the reference solution and the test solution to the plate. After developing and removing the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Pulverize 1 g to fine powder, add 10 ml of 10% solution of sodium hydroxide, and heat at 120℃ for 4 hours. Cool, add 20 ml of water and filter, adjust the filtrate to pH 2-3 with hydrochloric acid, shake, and extract with with three 20-ml quantities of ethyl acetate. Combine the ethyl acetate solution, evaporate to dryness, dissolve the residue in 2 ml of ethanol as the test solution. Dissolve Hyodeoxycholic acid CRS in ethanol to produce a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of isooctane, ether, *n*-butanol, acetic acid and water (10 : 5 : 3 : 5 : 1) as the mobile phase. Apply separately 2 μl of each of the reference solution and the test solution to the plate. After developing and removing the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use 10% polyethylene glycol (PEG)-20 M as the stationary phase, maintain the column temperature at 120℃. The number of theoretical plates of the column is not less than 1900, calculated with the reference to the peak of (±)-borneol. The resolution of the (±)-borneol peak with the internal standard peak must be larger than 2.

Correction factor Weigh accurately a quantity of methylsalicylate, and dissolve in ethanol to produce a internal standard solution containing 0.13 mg per ml. Weigh

accurately 8 mg of (±) -borneol CRS, place in a 100 ml volumetric flask, dissolve and dilute to volume with the internal standard solution, and shake well. Inject 2 μl of the solution into the column, calculate the correction factor.

Procedure Pulverize 30 pills to fine powder, weigh accurately 1 g of the powder in a stopper conical flask, add accurately 25 ml of the internal standard solution, well close. Ultrasonicate (power, 250 W; frequence, 50 kHz) for 30 minutes, cool, Shake well, filter, and discard the initial filtrate. Inject 2 μl of the solution into the column, and calculate the content.
It contains not less than 0.22 mg of (±)-borneol ($C_{10}H_{18}O$) per pill, referred to Borneolum Syntheticum.

Action To pacify the liver to restrain hyperactivity of *yang*, and induce resuscitation and anchor the mind.

Indications Dizziness, tinnitus, bitter taste in the mouth, restlessness and insomnia due to hyperactivity of *liver-yang*; hypertension with above symptoms.

Usage and dosage 10 pills, twice a day.

Precaution Contraindicated for pregnant women and debilitated persons in a *deficiency-cold* condition.

Strength 1.1 g per 10 pills

Storage Perserve in tightly closed containers.

Niuhuang Baolong Wan
(牛黄抱龙丸)

Niuhuang Baolong Pills

Ingredients Calculus Bovis Artifactus 8 g; Arisaema cum Bile 200 g; Concretio Silicea Bambusae 70 g; Poria 100 g; Succinum 50 g; Moschus 4 g; Scorpio 30 g; Bombyx Batryticatus (stir-baked) 60 g; Realgar 50 g; Cinnabaris 30 g.

Procedure Levigate Cinnabaris and Realgar to very fine powder. Pulverize Arisaema cum Bile, Concretio Silicea Bambusae, Poria, Succinum, Scorpio and Bombyx Batryticatus to fine powder. Triturate Moschus and Calculus Bovis Artifactus with the above powder, sift and mix well. To each 100 g of powder add 90-100 g of refined honey to make big ho neyed pills.

Description Yellowish-brown to reddish-brown big honeyed pills; odour, slightly aromatic; taste, slightly bitter.

Identification Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Fragments of body walls pale yellow to yellow, with reticulate striations and rounded alveoli, sometimes showing brown seta. Fragments of body walls colourless, with minute hyphae on the surface. Irregular pieces pale yellowish-green or brownish-yellow, transparent or translucent. Irregular pieces golden-yellow or orange-yellow, lustrous. Irregular minute granules dark brownish-red, lustrous, with dark black edge.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To clear *heat* and relieve convulsion, and expel *wind* and resolve *phlegm*.

Indications Child convulsion due to excessive *wind-phlegm* with manifestations of high fever, coma and convulsion.

Usage and dosage 1 pill, 1-2 times a day; appropriate reduction of the dosage for children under one year of age.

Strength 1.5 g per pill

Storage Preserve in tightly closed containers.

Niuhuang Jiangya Jiaonang
(牛黄降压胶囊)

Niuhuang jiangya Capsules

Ingredients Cornu Saigae Tataricae; Margarita; Pulvis Cornus Bubali Concentratus; Calculus Bovis Artifactus; Borneolum Syntheticum; Radix Paeoniae Alba; Radix Codonopsis; Radix Astragali; Semen Cassiae; Rhizoma Chuanxiong; Extractum Scutellariae Siccus; Radix et Rhizoma Nardostachyos; Herb Menthae; Radix Curcumae.

Procedure Levigate or Pulverize Margarita and Cornu Saigae Tataricae separately to very fine powder, Pulverize the other nine ingredients into fine powder except Calculus Bovis Artifactus, Borneolum Syntheticum, Pulvis Cornus Bubali Concentratus. Grind Calculus Bovis Artifactus, Borneolum Syntheticum, and Pulvis Cornus Bubali Concentratus to fine powder, and mix well with above powders, sift, mix thoroughly, pack into capsules.

Description Capsules containing grayish-yellow powder; odour, slightly aromatic; taste, slightly sweet and bitter, with cool sensation.

Identification (1) To 1 g of the content, add 30 ml of chloroform, ultrasonicate for 30 minutes, filter, and use the filtrate as the test solution. Dissolve a mixture of (±) borneol and (±) isoborneol CRS in chloroform to produce a solution containing 0.2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 2 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% phosphomolybdic acid in ethanol, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.
(2) To 1 g of the content, add 30 ml of methanol, ultrasonicate for 30 minutes, filter, and concentrate the filtrate to 2 ml as the test solution. Dissolve cholic acid CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of isooctane, butyl ether, and glacial acetic acid (8 : 5 : 5) as the mobile phase. Apply separately 6 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% phosphomolybdic acid in ethanol, and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) To 5 g of the content, add 30 ml of ether, ultrasonicate for 15 minutes. Add a quality of carbon active, stir thoroughly to make the solution almost colourless and filter. Evaporate the filtrate to dryness, and dissolve the residue in 0.5 ml of ethyl acetate as the test solution. To 1 g of Rhizoma Chuanxiong reference drug, add 20 ml of ether, ultrasonicate for 15 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane

and ethyl acetate (9 : 1) as the mobile phase. Apply separately to the plate 6-10 μl of the test solution and 2 μl of the reference drug solution. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) To 5 g of the content, add 50 ml of water, heat under reflux for 20 minutes, and cool. Centrifuge for few minutes, and extract the supernatant with two 20-ml quantities of ethyl acetate. Discard the ethyl acetate extracts, and extract the water solution with three 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanolic extracts, wash with two 20-ml quantities of ammonia TS, discard the ammonia solutions, evaporate the butanol solution to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve Astragaloside IV CRS in ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol, and water (13 : 6 : 2) (keep under 10℃ overnight) as the mobile phase. Apply separately to the plate 6-10 μl of the test solution and 2 μl of the reference solution. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, and heat at 105℃ to visualize clearly. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay ***Radix Paeoniae Alba*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of acetonitrile and water (15 : 85) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of paeoniflorin.

Reference solution Weigh accurately a quantity of paeoniflorin CRS, dissolve with dilute ethanol TS, to produce a solution containing 0.1 mg per ml.

Test solution Weigh accurately 1 g of the content obtained under the test of weight variation, pulverize to fine powder, place in a stopper conical flask, add accurately 50 ml of water, closely stopper and weigh. Ultrasonicate for 45 minutes (power, 250 W; frequency, 33 kHz), cool, weigh again, replenish the loss weight with water, stir well and centrifuge (3000 rpm). Apply 10 ml of the supernatant to a packed with polyamide column 15 mm in internal diameter (3 g) and elute with water, collect 60 ml of the elute. Evaporate the eluate on a water bath to dryness, dissolve the residue in dilute ethanol TS, transfer to a 10 ml volumetric flask and add dilute ethanol TS to volume, mix well and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column respectively and measure.

It contains not less than 0.60 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per capsule, referred to Radix Paeoniae Alba.

Extractum scutellariae siccus Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol, water, and glacial acetic acid (50 : 50 : 1) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin CRS, dissolve in dilute ethanol, to produce a solution containing 60 μg per ml.

Test solution Weigh accurately 0.5 g of the content obtained under the test of weight variation, pulverized to fine powder, in a stopper conical flask. Add accurately 50 ml of dilute ethanol TS, weigh. Heat under reflux for 30 minutes, cool, weigh again, replenish the loss weight with dilute ethanol TS, and stir well. Transfer accurately 5 ml of the solution to a 100 ml volumetric flask and add dilute ethanol to volume, mix well and filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column respectively and measure.

It contains not less than 38 mg of baicalin ($C_{21}H_{18}O_{11}$) per capsule, referred to Extractum Scutellariae siccus.

Action To clear the heart and resolve *phlegm*, and pacify the liver and anchor the mind.

Indications Dizziness, headache, insomnia and restlessness due to hyperactivity of *heart-fire* and *liver-fire* and excessive *phlegm-heat*; hypertension with above symptoms.

Usage and dosage 2-4 capsules, once a day.

Precaution Contraindicated for diarrhea patients.

Strength 0.4 g per capsule

Storage Preserve in tightly closed containers.

Niuhuang Jiangya Wan (牛黄降压丸)

Niuhuang Jiangya Pills

Ingredients Cornu Saigae Tataricae; Margarita; Pulvis Cornus Bubali Concentratus; Calculus Bovis Artifactus; Borneolum Syntheticum; Radix Paeoniae Alba; Radix Codonopsis; Radix Astragali; Semen Cassiae; Rhizoma Chuanxiong; Extractum Scutellariae Siccus; Radix et Rhizoma Nardostachyos; Herba Menthae; Radix Curcumae.

Procedure Levigate or pulverize Margarita to very fine powder, file Cornu Saigae Tataricae to fine powder, pulverize Radix Paeoniae Alba, Radix Codonopsis, Radix Astragali, Semen Cassiae; Rhizoma Chuanxiong, Extractum Scutellariae Siccus, Radix et Rhizoma Nardostachyos, Herba Menthae and Radix Curcumae to fine powder. Grind well Calculus Bovis Artifactus, Borneolum Syntheticum, Pulvis Cornus Bubali Concentratus, and triturate with the above powders, sift and mix well. To each 100 g of the powder add 65-75 g of refined honey to make small honeyed pills, or add 100-120 g of refined honey to make big honeyed pills.

Description Yellowish-brown big honeyed pills or small honeyed pills; odour, slightly aromatic; taste, slightly sweet, bitter, and cool.

Identification (1) Triturate well 2 g, in pieces, with 2 g of kieselguhr, add 30 ml of chloroform, ultrasonicate for 30 minutes and filter. Use 2 ml of the filtrate as the test solution. Dissolve a mixture of (±) borneol and (±)

isobornel CRS in chloroform to produce a solution containing 0.2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (17 : 1) as the mobile phase. Apply separately to the plate 1-2 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with 5% phosphomolybdic acid in ethanol and heat at 105 ℃ to the spots clear. The blue spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(2) Triturate well 2 g of the pills, in pieces, with 2 g of kiselguhr, ultrasonicate it in 30 ml of chloroform for 30 mintues and filter. Evaporate the filtrate to about 2 ml as the test solution. Dissolve cholic acid CRS in methanol to produce a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of isooctane, ethyl acetate, and glacial acetic acid (8 : 5 : 5) as the mobile phase. Apply separately 6 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 10% phosphomolybdic acid in ethanol, heat at 105℃ to the spots clear minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Triturate well 5 g of the pills, in pieces, with 2 g of kieselguhr, add 30 ml of ether, ultrasonicate for 15 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 1 g of Rhizoma Chuanxiong reference drug and 20 ml of ether in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately to the plate 6-10 μl of the test solution and 2 μl of the reference drug solution. After developing and removing the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Triturate well 5 g of the pills, in pieces, with 2 g of kieselguhr, add 50 ml of water, and heat under reflux for 20 minutes. Cool, centrifuge, and separate the supernatant. Extract the supernatant with three 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extract, and extract with two 20-ml quantities of ammonia TS. Discard the solution of ammonia, and evaporate the solution of *n*-butanol to dryness. Dissolve the residue in 1 ml of methanol, and use the supernatant as the test solution. Dissolve astragaloside Ⅳ CRS in methanol to produce a reference solution containing 0.5 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol, and water (13 : 6 : 2) standing below 10℃ over night as the mobile phase. Apply separately 6-10 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removing the plate, dry in the air. Spray with the 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay ***Radix Paeoniae Alba*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (15 : 85) as the mobile phase. As detector a spectrophotometer set at 230 nm, The number of theoretical plates of the column is not less than 3000, calculated with the reference of the peak of paeoniflorin.

Reference solution Weigh accurately a quantity of paeoniflorin CRS, dissolve in dilute ethanol TS to produce a reference solution containing 0.1 mg per ml.

Test solution Cut a quantity of the small or big honeyed pills to pieces. Place 2 g, accurately weighed, in a stopper conical flask, add exactly 50 ml of water, ultrasonicate for 45 minutes and centrifuge at 3000 rpm. Apply exactly 10 ml of the supernatant to a column (15 mm in inner diameter), packed with 3 g of dry polyamide, using water as the eluent. Collect 60 ml of the eluates, evaporate it to dryness on a water bath, dissolve the residue in dilute ethanol TS, transfer to a 10 ml volumetric flask, dilute to volume, shake well.

Procedure Exactly inject 5 μl of each of the reference solution and the test solution into the column, respectively, determine and calculate the content.

It contains not less than 0.70 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per gram for small honeyed pills, and 1.12 mg for each big honeyed pill, referred to Radix Paeoniae Alba.

Extractum Scutellariae Siccus Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water, and acetic acid (40 : 60 : 1) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin CRS, dissolve in dilute ethanol TS to produce a reference solution containing 60 μg per ml.

Test solution Weigh accurately about 1 g of the small or big honeyed pills, in pieces, and add accurately 50 ml of the dilute ethanol. Weigh, heat under reflux for 30 minutes, cool, weigh again, replenish the lost weight with dilute ethanol TS. Filter, and measure accurately 5 ml of the successive filtrate, in a 100 ml volumetric flask. Dilute to volume with dilute ethanol TS, shake well, and use the solution as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 55 mg of baicalin ($C_{21}H_{18}O_{11}$) per gram for small honeyed pills, and 70 mg for each big honeyed pills, referred to Extractum Scutellariae Siccus.

Action To clear the heart and resolve *phlegm*, and pacify the liver and anchor the mind.

Indications Dizziness, headache, insomnia, restlessness due to blazing of *heart-fire* and *liver-fire*, and excessive *phlegm-heat*; hypertension with above symptoms.

Usage and dosage 20-40 small honeyed pills, once a day; or 1-2 big honeyed pills, once a day.

Precaution Contraindicated for diarrhea patients.

Strength (1) 1.3 g per 20 small honeyed pills
(2) 1.6 g per big honeyed pill

Storage Preserve in tightly closed containers.

Niuhuang Jiedu Pian (牛黄解毒片)

Niuhuang Jiedu Tablets

Ingredients Calculus Bovis Artifactus 5 g; Realgar 50 g; Gypsum Fibrosum 200 g; Radix et Rhizoma Rhei 200 g; Radix Scutellariae 150 g; Radix Platycodi 100 g; Borneolum Syntheticum 25 g; Radix et Rhizoma Glycyrrhizae 50 g.

Procedure Levigate Realgar to very fine powder, pulverize Radix et Rhizoma Rhei to fine powder and triturate Calculus Bovis Artifactus and Borneolum Syntheticum to fine powder. Decoct the other four ingredients with water twice, two hours for each. Combine the decoctions and filter. Evaporate the filtrate to a thick extract, add the powder of Radix et Rhizoma Rhei and Realgar, make granules and dry. Add the powders of Calculus Bovis and Borneolum Syntheticum, mix well, make to 1000 tablets (big tablets) or 1500 tablets (small tablets); or coat the tablets with sugar or film.

Description Tablets or coated tablets with brownish-yellow core; odour, aromatic of borneol; taste, slightly bitter and pungent.

Identification (1) Microscopical: Clusters of calcium oxalate large, 60-140 μm in diameter. Irregular pieces golden-yellow or orange-yellow, lustrous.

(2) Triturate 1 tablet to fine powder and carry out micro-sublimation. To the white sublimate obtained add 1-2 drops of freshly prepared 1% vanillin solution in sulfuric acid, a rose-red colour is produced gradually on the edge of liquid drop.

(3) Grind 2 tablets to fine powder with 10 ml of chloroform and filter. Evaporate the filtrate to dryness, dissolve the residue in 0.5 ml of ethanol as the test solution. Carry out the test for Identification (2) described under Niuhuang Jiedu Pills, beginning at the words "Dissolve cholic acid CRS...". It complies with the same result.

(4) Grind 1 tablet to fine powder, ultrasonicate with 20 ml of methanol for 15 minutes and filter. Evaporate 10 ml of the filtrate to dryness, dissolve the residue in 10 ml of water, add 1 ml of hydrochloric acid, heat under reflux for 30 minutes, allow to cool, extract with two 20-ml quantities of ether. Combine the ether extracts, evaporate to dryness, dissolve the residue in 2 ml of chloroform as the test solution. Prepare a reference drug solution in the same manner of 0.1 g of Radix et Rhizoma Rhei reference drug. Dissolve emodin CRS in methanol to produce a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose solution as the coating substance, and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate, and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 4 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The five orange yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The orange yellow fluorescent spot in the chromatogram obtained with test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. The spots turn red on exposure to ammonia vapour.

(5) Grind 4 tablets to fine powder, ultrasonicate with 30 ml of ether for 15 minutes, filter and discard the ether extract. Expel the ether from the residue on a water bath, ultrasonicate the residue with 30 ml of methanol for 15 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 20 ml of water by heating, add dropwise hydrochloric acid to adjust to pH 2-3, extract with 30 ml of ethyl acetate. Evaporate the ethyl acetate extract to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to produce a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose containing 4% solution of sodium acetate as the coating substance, and a mixture of ethyl acetate, butanone, formic acid, and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 1% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Arsenic trioxide Grind 4 tablets, removed the coating for coating tablets, to fine powder. Weigh accurately 1.52 g of the powder, add 20 ml of dilute hydrochloric acid TS, and stirring frequently for 1 hour. Filter, and wash the residue with two 10-ml quantities of dilute hydrochloric acid TS. Stir for 10 minutes, combine the washings with the filtrate to a 500 ml volumetric flask, dilute to volume with water, and shake well. Measure accurately 2 ml of the solution, carry out the method for the limit test for arsenic (Appendix Ⅸ F, method 1), any stain produced is not more intense than that produced by standard arsenic solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water, and phosphoric acid (45 : 55 : 0.2) as the mobile phase. As detector a spectrophotometer set at 315 nm, The number of theoretical plates of the column is not less than 3000, calculated with the reference of the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin CRS, dissolve it in methanol to produce a reference solution containing 30 μg per ml.

Test solution Grind 20 tablets, weighed accurately, removed the coating for coating tablets, to fine powder. To 0.6 g, weighed accurately, add 30 ml of 70% ethanol, ultrasonicate (powder, 250 W; frequence, 33 kHz) for 20 minutes, allow to cool and filter. Transfer the filtrate to a 100 ml of volumetric flask, wash the container and residue with small quantity of 70% ethanol in portions, combine the washings to the same volumetric flask, dilute to volume with 70% ethanol and shake well. Measure accurately 2 ml of the solution to a 10 ml volumetric flask, dilute to volume with 70% ethanol and shake well.

Procedure Exactly inject 5 μl of the test solution and 10 μl of the reference solution into the column, respectively, determine and calculate the content.

It contains not less than 3.0 mg of baicalin ($C_{21}H_{18}O_{11}$) per small tablet, or 4.5 mg per big tablet, referred to Radix Scutellariae.

Action To clear *heat* and *toxicity*.

Indications Swollen painful throat, swollen painful gums, sores on the mouth and tongue or swollen bloodshot eyes with pain due to hyperactivity of interior *heat*.

Usage and dosage 2 big tablets or 3 small tablets, 2-3 times a day.

Precaution Contraindicated for pregnant women.

Storage Preserve in tightly closed containers.

Niuhuang Jiedu Wan
(牛黄解毒丸)

Niuhuang Jiedu Pills

Ingredients Calculus Bovis Artifactus 5 g; Realgar 50 g; Gypsum Fibrosum 200 g; Radix et Rhizoma Rhei 200 g; Radix Scutellariae 150 g; Radix Platycodi 100 g; Borneolum Syntheticum 25 g; Radix et Rhizoma Glycyrrhizae 50 g.

Procedure Levigate Realgar to very fine powder, pulverize Gypsum Fibrosum, Radix et Rhizoma Rhei, Radix Scutellariae, Radix Platycodi and Radix et Rhizoma Glycyrrhizae to fine powder. Triturate Borneolum Syntheticum and Calculus Bovis Artifactus with the above fine powders, sift and mix well. To each 100 g of the powder add 100-110 g of refined honey to make big honeyed pills.

Description Brownish-yellow big honeyed pills; odour, aromatic and characteristic of Borneolum Syntheticum; taste, slightly sweet, then bitter and pungent.

Identification (1) Microscopical: Fibres pale yellow, fusiform, with thickened walls and minute pit-canals. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Clusters of calcium oxalate large, 60-140 μm in diameter. Anastomosing laticiferous tubes 14-25 μm in diameter, containing pale yellow granular contents. Irregular pieces golden-yellow or orange-yellow, lustrous. Irregular plate crystals colourless, with straight striations.

(2) To 3 g of the pill, in pieces, triturate well with 2 g of kieselguhr, ultrasonicate with 15 ml of chloroform for 20 minutes, filter and keep the residue for later use. Evaporate the filtrate to dryness, dissolve the residue in 0.5 ml of ethanol as the test solution. Dissolve cholic acid CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of *n*-hexane, ethyl acetate, methanol, and acetic acid, (20 : 25 : 3 : 2) as the mobile phase. Apply separately 5 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat at 105 ℃ for about 10 minutes, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Dissolve a mixture of (±)-borneol and (±) isoborneol CRS in dehydrated ethanol to produce a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of cyclohexane and ethyl acetate (17 : 3) as the mobile phase. Apply separately 2 μl of each of the test solution obtained under the test of Identification (2) and the above reference solution to the plate. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulfuric acid and heat to the spots distinct. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(4) Expel the solution from the residue obtained under the test of Identification (2), ultrasonicate it with 30 ml of methanol for 20 minutes and filter. Evaporate 5 ml of the filtrate to dryness (evaporate the spare filtrate to dryness for later use), dissolve the residue in 10 ml of water and 1 ml of hydrochloride acid, heat on a water bath for 30 minutes, cool immediately, extract with four 10-ml quantities of ether by shaking. Combine the ether extracts, evaporate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 0.1 g of Radix et Rhizoma Rhei reference drug and 20 ml of methanol in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxy-methylcellulose as the coating substance, and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 3 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. Five orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The spots turn red in daylight on exposure to ammonia vapour.

(5) Dissolve the residue, obtained under the test of Identification (4), in a quantity of ethanol, apply it to a column packed with polyamide (14-30 meshes), elute firstly with 125 ml of water, discard the eluate, then continuously elute with 50 ml of 85% ethanol, collect the eluates, evaporate to dryness on a water bath. Dissolve the residue in 2 ml of dehydrated ethanol as the test solution. Dissolve baicalin CRS in dehydrated ethanol to produce a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose containing 4% solution of sodium acetate as the coating substance, and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately 6 μl of the test solution and 3 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 1% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Arsenic trioxide Cut a quantity of the pills to pieces, weigh accurately 2.9 g, add 20 ml of dilute hydrochloric acid TS, stirring frequently for 40 minutes, and filter. Wash the residue with two 10-ml quantities of dilute hydrochloric acid TS, and stir for 10 minutes. Combine the washings with the filtrate to a 500 ml volumetric flask, dilute to volume with water and shake well. Measure accurately 2 ml of the solution, add 5 ml of hydrochloric acid and 21 ml of water, carry out the method for the limit test for arsenic (Appendix Ⅸ F, method 1), any stain produced is not more intense than that produced by standard arsenic solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (45 : 55 : 0.2) as the mobile phase. As detector a spectrophotometer set at 315 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference of the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin CRS, dissolve in methanol to produce a reference solution containing 30 μg per ml.

night-terrors, anorexia, dyspepsia, developmental retardation, etc.

Usage and dosage Taken after dissolved in boiled wat g, for children younger than 2 years old; 7 g, for between 2 and 7 years old; 10 g, for children old years; 3 times a day.

Strength 5 g per pack

Storage Preserve in tightly closed contair

Longqing Pian
(瘰清片)

Longqing Tablets

Ingredients Rhizoma Patriniae; Flos Herba Hedyotis Agrimoniae; Chinensis.

Procedure sift. Flos and two

ngredients Scorpio 120 g; Bombyx Batryticatus (processed) 120 g; Calculus Bovis Artifactus 24 g; Cinnabaris 160 g; Borneolum Syntheticum 20 g; Rhizoma Coptidis 160 g; Arisaema cum Bile 80 g; Rhizoma Gastrodiae 160 g; Radix et Rhizoma Glycyrrhizae 80 g.

Procedure Levigate Cinnabaris to very fine powder. Pulverize Scorpio, Bombyx Batryticatus, Rhizoma Coptidis, Arisaema cum Bile, Rhizoma Gastrodiae and Radix et Rhizoma Glycyrrhizae to fine powder. Triturate Calculus Bovis Artifactus and Borneolum Syntheticum with the above powder, sift and mix well.

Description A brownish-red powder; odour, aromatic; taste, pungent, cool and bitter.

Identification (1) Microscopical: Fragments of body wall pale yellow to yellow, with reticulate striations and rounded alveoli, sometimes showing brown seta. Fragments of body wall colourless, with minute hyphae. Sclerenchymatous cells polygonal or elongated polygonal, 70-180 μm in diameter, with slightly lignified, thickened walls and distinct pits. Fibre bundles bright yellow, walls slight thickened, with distinct pits, surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Irregular and minute granules deep brownish-red, lustrous, with dark black edge.

(2) Take 0.6 g of the powder, rinse with water untill a small quantity of dark red precipitate is obtained. Carry out the test of Identification (2) as described under Cinnabaris, using the precipitate, the same reaction is produced.

(3) Ultrasonicate 0.6 g of the powder, in 5 ml of ethanol for 20 minutes, filter and use the filtrate as the test solution. Dissolve cholic acid CRS in ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of *n*-hexane, ethyl acetate, acetic acid, and

add 25 ml of chloroform,
nd filter. Keep the residue
ate to dryness, and dissolve
he test solution. Dissolve a
...col and (±)-isoborneol CRS in
...ated ethanol to produce a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (17 : 3) as the mobile phase. Apply separately 4 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removing the plate, dry in air. Spray with the vanillin in sulfuric acid TS, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(6) To the residue, obtained under the Identification (5), add 25 ml of *n*-butanol saturated with water, and ultrasonicate for 30 minutes and filter. Evaporate the filtrate to dryness, stir well with a small quantity of neutral aluminium oxide. Heat to dryness and apply to a column (1-1.5 cm in diameter) packed with neutral aluminium oxide (100-200 meshs, 4 g). Elute with 25 ml of 10% ethanol, collect the eluates, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve gastrodin CRS in dehydrated ethanol to produce a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane-methanol (7 : 3) as the mobile phase. Apply separately 8 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removing the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Complies with the general requirements for powders (Appendix Ⅰ B).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (50 : 50) (containing 0.34

g of potassium dihydrogen phosphate and 0.17 g of sodium dodecylsulphonate per 100 ml) as the mobile phase. As detector a spectrophotometer set at 346 nm. The number of theoretical plates of the column is not less than 6000, calculated with the reference to the peak of berberine hydrochloride.

Reference solution Weigh accurately a quantity of berberine hydrochloride CRS, dissolve in a mixture of hydrochloric acid and methanol (1 : 100) to produce a reference solution containing 20 μg per ml.

Test solution Weigh accurately about 0.5 g of the powder, mixed well, place in a stopper conical flask, add accurately 50 ml of a mixture of hydrochloric acid and methanol (1 : 100), weigh. Heat under reflux on a water bath at 60℃ for 15 minutes Ultrasonicate (power 250 W, frequency 50 kHz) for 30 minutes, cool, weigh again, and replenish the lost weight with a mixture of hydrochloric acid and methanol (1 : 100). Shake well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 6.0 mg of berberine hydrochloride ($C_{20}H_{18}ClNO_4$) per gram, referred to Rhizoma Coptidis.

Action To clear *heat* and relieve *toxicity*, and arrest spasm and convulsion.

Indications Child convulsion, high fever, tic of hands and feet, excessive *phlegm*, coma and delirium.

Usage and dosage 0.6-0.9 g, 2-3 times a day; appropriate reduction of the dosage for children under 3 years of age.

Strength 0.6 g per bottle

Storage Preserve in tightly closed containers.

Niuhuang Qingxin Wan (牛黄清心丸)

Niuhuang Qingxin Pills

Ingredients Calculus Bovis 25.7 g; Radix Angelicae Sinensis 45 g; Rhizoma Chuanxiong 39 g; Radix et Rhizoma Glycyrrhizae 150 g; Rhizoma Dioscoreae 210 g; Radix Scutellariae 45 g; Semen Armeniacae Amarum (stir-baked) 37.5 g; Semen Sojae Germinatum 57 g; Fructus Jujubae (cored) 90 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 75 g; Poria 48 g; Radix Platycodi 39 g; Radix Saposhnikoviae 45 g; Radix Bupleuri 39 g; Colla Corii Asini 51 g; Rhizoma Zingiberis 25 g; Radix Paeoniae Alba 75 g; Radix et Rhizoma Ginseng 75 g; Massa Medicata Fermentata (stir-baked) 75 g; Cortex Cinnamomi 54 g; Radix Ophiopogonis 44 g; Radix Ampelopsis 22.5 g; Pollen Typhae (stir-baked) 7.5 g; Moschus 6.4 g; Borneolum Syntheticum 16.1 g; Pulvis Cornus Bubali Concentratus 28.5 g; Cornu Saigae Tataricae 28.4 g; Cinnabaris 69.7 g; Realgar 24 g.

Procedure Levigate Cinnabaris and Realgar to very fine powder respectively. File Cornu Saigae Tataricae to fine powder. Pulverize the other ingredients, except Calculus Bovis, Moschus, Borneolum Syntheticum and Pulvis Cornus Bubali Concentratus to fine powder. Triturate Calculus Bovis, Moschus, Borneolum Syntheticum and Pulvis Cornus Bubali Concentratus with the above powders, sift and mix well. To each 100 g of the powder add 90-110 g of refined honey to make big honeyed pills or add water and amount of refined honey to make water-honeyed pills.

Description Reddish-brown big honeyed pills or water-honeyed pills; odour, aromatic; taste, slightly sweet.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate solution; hyphae colourless or pale brown, 4-6 μm in diameter. Clusters of calcium oxalate 18-32 μm in diameter, occurring in parenchymatous cells, often arranged in rows or several clusters in one cell. Needles of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells. Raphides of calcium oxalate 24-50 μm long, present in subrounded or elliptical mucilage cells. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Fibres pale yellow, fusiform, with thickened walls and fine pit-canals. Anastomosing laticiferous tubes 14-25 μm in diameter, containing yellowish granular contents. Stone cells orange, conchoidal, with relatively thickened walls, showing distinct pits at the broader side. Epidermal cells of pericarp yellowish-brown to reddish-brown, subpolygonal in surface view; cuticle thickened up to 10 μm in sectional view. Paraside cells of testa pale yellow, 45-80 μm long. Pollen grains yellow, subrounded or ellipsoidal, about 30 μm in diameter, extine with minute warty protuberances. Irregular small granules dark brownish-red, lustrous, dark black edged. Irregular pieces golden-yellow or orange yellow, lustrous. Irregular pieces greyish-white or pale greyish-yellow, slightly lustrous, surface with pigment granules and irregular longitudinal fissures.

(2) Triturate well 3 g of the big honeyed pills with 2 g of kiselguhr or pulverize 2 g of water-honeyed pills, add 30 ml of chloroform, ultrasonicate for 30 minutes and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethanol as the test solution. Dissolve cholic acid CRS in ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of isooctane, ethyl acetate, and glacial acetic acid (15 : 7 : 5) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat at 105 ℃ to the spots clear and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Triturate well 6 g of the big honeyed pills, in pieces, with 3 g of kieselguhr; or pulverize 2 g of the water-honeyed pills to fine powder. Add 30 ml of ether, and ultrasonicate for 10 minutes and filter. Expel the ether from the residue, add 30 ml of ethanol, and ultrasonicate for 30 minutes. Filter, evaporate the filtrate to dryness, and dissolve the residue in 15 ml of water by heating gently. Adjust to pH1-2 with hydrochloric acid, and extract with two 20-ml quantities of ethyl acetate. Combine the ethyl acetate extract, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve baicalein CRS in methanol to produce a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate-butanone, formic acid, and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately 4-6 μl of each of the reference solution and the test solution to the plate. After developing and removing the plate, dry in air. Spray with 2% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Triturate well 15 g of the big honeyed pills, in pieces, with 7g of kieselguhr; or pulverize 8 g of the water-honeyed

pills to fine powder. Add 50 ml of chloroform, ultrasonicate for 30 minutes, and filter. Discard the chloroform extract, and expel the ether from the residue. Add 50ml of *n*-butanol saturated with water to the residue, and ultrasonicate for 40 minutes. Filter, wash the filtrate with three times quantity of ammonia TS. Separate the layer of *n*-butanol, evaporate to dryness, and dissolve in 1 ml of methanol as the test solution. Dissolve ginsenoside Rb_1 CRS, ginsenoside Re CRS, and ginsenoside Rg 1 CRS in methanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol, and water (65 : 35 : 10) standing below 10 ℃ over 12 hous as the mobile phase. Apply separately 4-6 μl of each of the reference solution and the test solution to the plate. After developing and removing the plate, dry in air. Spray with 10% sulfuric acid in ethanol. Heat at 105 ℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(5) Triturate well 12 g of the big honeyed pills, in pieces, with 6 g of kieselguhr; or pulverize 8 g of the water-honeyed pills to fine powder. Add 30 ml of ether, and heat under reflux for 30 minutes and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 0.5 g of Radix Angelicae Sinensis reference drug and 20 ml of ether in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane-ethyl acetate (9 : 1) as the mobile phase. Apply separately 6-10μl of each of the reference drug solution and the test solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To clear the heart and resolve *phlegm*, and relieve convulsion and expel *wind*.

Indications Dizziness, excessive *phlegm*, coma, aphasia, convulsion and epilepsy due to *wind-phlegm* obstructing the orifices.

Usage and dosage 1 big honeyed pill, or 1.5 g of the water-honeyed pills, once a day.

Precaution Be cautious about pregnant women.

Strength (1) 1.5 g per 20 pills for water-honeyed pills
(2) 3 g per big honeyed pill

Storage Preserve in tightly closed containers.

Niuhuang Shangqing Jiaonang (牛黄上清胶囊)

Niuhuang Shangqing Capsules

Ingredients Calculus Bovis Artifactus 2.9 g; Herba Menthae 44.1 g; Flos Chrysanthemi 58.5 g; Flos Schizonepetae 23.5 g; Radix Angelicae Dahuricai 23.5 g; Rhizoma Chuanxiong 23.5 g; Fructus Gardeniae 73.5 g; Rhizoma Coptidis 23.5 g; Cortex Phellodendri Chinensis 14.7 g; Radix Scutellariae 73.5g; Radix et Rhizoma Rhei 117.7 g; Fructus Forsythiae 73.5 g; Radix Paeoniae Rubra 23.5 g; Radix Angelicae Sinensis 73.5 g; Radix Rehmanniae 94.1 g; Radix Platycodonis 23.5 g; Radix et Rhizoma Glycyrrhizae 14.7 g; Gypsum Fibrosum 117.7 g; Borneolum Syntheticum 14.7 g.

Procedure Pulverize Radix et Rhizoma Rhei, Borneolum Syntheticum, Calculus Bovis Artifactus to fine power respectively, and sift for later use. Distill volatile oil of Herba Menthae, Flos Schizonepetae, Radix Angelicae Dahuricai, Rhizoma Chuanxiong, Flos Chrysanthemi, and Fructus Forsythiae, and collect aqueous extract solution in another container for later use. Decoct the drug residue and Fructus Gardeniae and other eight ingredients with water twice, 1.5 hours for each time. Combine the decoctions, filter, mix the filtrate and the above aqueous extract solution and concentrate to a thick extract with a relative density of 1.32-1.36 (55℃), add the powder of Radix et Rhizoma Rhei, dry at 80℃, pulverize to fine powder and sift. Pulverize Calculus Bovis Artifactus and Borneolum Syntheticum with the above powder. Spray with the volatile oil dissloved in ethanol, mix thoroughly, sift and make to 1000 capsules.

Description Capsules containing brownish-yellow to dark brown powder; odour, aromatic; taste, slightly bitter.

Identification (1) To 1.2 g of the content, add 20 ml of chloroform, ultrasonicate for 20 minutes, filter and use the filtrate as the test solution. Dissolve a mixture of (±)-borneol and (±)-isoborneol CRS in chloroform to produce a solution containing 0.4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene and ethyl acetate (17 : 1) as the mobile phase. Apply separately 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% phosphomolybdic acid in ethanol, and heat at 105℃ to the spots clear. The blue spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(2) Evaporate the remainder test solution under Identification (1), and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve cholic acid CRS and hyodeoxycholic acid CRS in ethanol to produce a solution containing 2 mg per ml of each as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of isooctane, ethyl acetate and glacial acetic acid (15 : 7 : 5) as the mobile phase. Apply separately 2 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and heat at 105 ℃ to the spots clearly. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(3) To 0.9 g of the content, add 10 ml of methanol, ultrasonicate for 20 minutes, filter and use the filtrate as the test solution. Prepare a solution of 0.2 g of Rhizoma Coptidis reference drug in the same manner as the reference drug solution. Dissolve Berberine hydrochloride CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate, isopropanol, methanol and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of each of the reference drug solution and the reference solution to the plate. After developing in a chamber pre-equilibrated with ammonia vapor for few minutes and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent

spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

(4) To 4.5 g of the content, add 50 ml of ethanol, heat under reflux for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 10 ml of water, and extract with two 20-ml and one 10-ml quantities of n-butanol saturated by water, combine the n-butanol extracts, and wash with 20 ml of water saturated by n-butanol. Evaporate the n-butanol extracts to dryness, and dissolve the residue in 4 ml ethanol. Apply the methanol solution to a column (10-15 mm in internal diameter) packed with neutral aluminum oxide (100-200 mesh, 3 g) and elute with 100 ml of ethanol. Collect the eluate, evaporate eluate on a water bath to dryness, and dissolve the residue in 2 ml of ethanol as the test solution. Dissolve geniposide CRS in ethanol to produce a solution containing 4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance, and a mixture of chloroform and methanol (3 : 1) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay ***Radix et Rhizoma Rhei*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol and 0.1% solution of phosphoric acid (90 : 10) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of emodin.

Reference solution Weigh accurately a quantity of emodin CRS, dissolve in methanol, to produce a solution containing 20 μg per ml.

Test solution Weigh accurately 0.3 g of the content obtained under the test of weight variation, pulverized to fine powder, in a ground-bottom flask. Add a quantity of 2.5 mol/L solution of sulfuric acid and heat under reflux for 2 hours, cool. Extract with 20 ml of chloroform under reflux for 1 hour and repeat the process for 3 times, combine the chloroform extracts and wash with 40 ml of water. Evaporate the chloroform extract on a water bath to dryness, and dissolve the residue in methanol. Transfer to a 25 ml volumetric flask, dilute with methanol to volume, mix well, and filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column respectively and measure.

It contains not less than 0.22 mg of emodin ($C_{15}H_{10}O_5$) per capsule, referred to Radix et Rhizoma Rhei.

Borneolum Syntheticum Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use 10% polyethylene glycol (PEG)-20 M as the stationary phase and maintain the column temperature at 140 ℃. The number of theoretical plates of the column is not less than 4000, calculated with the reference of the peak of (±)-borneol.

Correction factor Dissolve a quantity of methyl salicylate, accurately weighed, in ethyl acetate to produce a solution containing 2 mg per ml as internal standard solution. Dissolve 20 mg of (±)-borneol CRS, accurately weighed, in a 10 ml volumetric flask and dilute with the internal standard solution to volume, and mix well. Inject 1 μl of the solution into column, calculate the correction factor.

Procedure Weigh accurately 0.5 g of the content, obtained under the test of packing variation, pulverized to fine powder, in a stopper conical flask, add accurately 10 ml of the internal standard solution, weigh. Ultrasonicate for 15 minutes (power, 300 W; frequency, 25 kHz), cool, weigh again, replenish the loss weight with ethyl acetate, stir well and filter. Discard the initial fitrate, and use the successive filtrate as the test solution. Inject 1 μl of the test solution into the column and calculate the contents.

It contains not less than 6.2 mg of (±)-borneol ($C_{10}H_{18}O$) per capsule, referred to Borneolum Syntheticum.

Action To clear *heat* and purge *fire*, and disperse *wind* and kill pain.

Indications Headache, dizziness, bloodshot eyes, tinnitus, sore throat, sores on the mouth and tongue, or swollen painful gums and constipation due to abundant *heat* in the interior and upward attacking by *wind-fire*.

Usage and dosage 3 capsules, twice a day.

Precaution Be cautious about pregnant women.

Strength 0.3 g per capsule

Storage Preserve in tightly closed containers.

Niuhuang Shangqing Wan (牛黄上清丸)

Niuhuang Shangqing Pills

Ingredients Calculus Bovis Artifactus 2 g; Herba Menthae 30 g; Flos Chrysanthemi 40 g; Spica Schizonepetae 16 g; Radix Angelicae Dahuricae 16 g; Rhizoma Chuanxiong 16 g; Fructus Gardeniae 50 g; Rhizoma Coptidis 16 g; Cortex Phellodendri Chinensis 10 g; Radix Scutellariae 50 g; Radix et Rhizoma Rhei 80 g; Fructus Forsythiae 50 g; Radix Paeoniae Rubra 16 g; Radix Angelicae Sinensis 50 g; Radix Rehmanniae 64 g; Radix Platycodonis 16 g; Radix et Rhizoma Glycyrrhizae 10 g; Gypsum Fibrosum 80 g; Borneolum Syntheticum 10 g.

Procedure Pulverize the above ingredients, except Calculus Bovis Artifactus and Borneolum Syntheticum, to fine powder. Triturate Calculus Bovis Artifactus and Borneolum Syntheticum with the fine powder mentioned above, sift and mix well. To each 100 g of the powder add 120-130 g of refined honey to make big honeyed pills; or make watered pills with 4% refined honey and water.

Description Reddish-brown to blackish-brown big honeyed pills or brownish-yellow watered pills; odour, aromatic; taste, bitter.

Identification (1) Microscopical: Fibre bundles bright yellow, with slightly thickened walls and distinct pits. Fibres pale yellow, fusiform, with thickened walls and minute pit-canals. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Fibres of endocarp short fusiform, the upper and lower layers crisscrossly arranged. Stone cells bright yellow, branched, with thickened walls and distinct striations. Stone cells of testa yellow or pale brown, mostly broken, the whole ones

long polygonal, rectangular or irregular, with thickened walls and big rounded pits, lumina brownish-red. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, each containing a brown nucleus-like mass. Clusters of calcium oxalate large, 60-140 μm in diameter. Pollen grains subrounded, 24-34 μm in diameter, extine with spinules of 3-5 μm long, and 3 germinal apertures. Glandular scales with a 8-celled head, oblate, up to 90 μm in diameter, and a unicellular short stalk. Irregular plate crystals colourless, with straight striations.

(2) Cut 3 g of the big honeyed pills into pieces, or pulverize 2 g of the watered pills to fine powder, add 50 ml of methanol, ultrasonicate for 20 minutes, filter and evaporate 5 ml of the filtrate to dryness and keep the other filtrate for latter use. Dissolve the residue in 10 ml of water, add 1 ml of hydrochloric acid, heat on a water bath for 30 minutes, cool immediately and extract with two 10-ml quantities of ether. Combine the ether extracts and evaporate to dryness. Dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 0.1 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate, and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The five orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Exposure to ammonia vapour and examine under sunlight, the colour of the spots turns red.

(3) Use the methanolic extract obtained under Identification (2) as the test solution. Prepare of solution with 0.1 g of Rhizoma Coptidis reference drug and 10 ml of methanol in the same manner as the reference drug solution. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 1 mg per ml as reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol, and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately 3-5 μl of the test solution and 1-2 μl of each of the reference drug solution and the reference solution to the plate. After developing in a chamber pre-equilibration with ammonia vapour and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with reference drug solution; and one yellow fluroescent spot corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Cut 12 g of the big honeyed pills into pieces; or pulverize 1 g of the watered pills to fine powder; add 30 ml of ether, heat under reflux for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution with 0.1 g of Radix Angelicae Sinensis reference drug and 20 ml of ether in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 2-10 μl of each of the reference drug solution and the test solution to the plate. After developing and removial the palte, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (40 : 60 : 0.2) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin CRS, dissolve it in methanol to produce a reference solution containing 60 μg per ml.

Test solution Cut a quantity of the big honeyed pills to pieces, to 1 g, accurately weigh, add exactly 50 ml of dilute ethanol TS and weigh; or pulverize a quantity of the watered pills to fine powder, weight accurately 1 g of the powder, add exactly 100 ml of dilute ethanol TS and weight, ultrasonicate for 30 minutes, heat under reflux for 3 hours, cool, weigh again, replenish the loss weight with each ethanol. Allow to stand and use the supernatant as the test solution.

Procedure Exactly inject 5 μl of each of the reference solution and test solution into the column, respectively, determine and calculate the content.

It contains not less than 15 mg of baicalin ($C_{21}H_{18}O_{11}$) per big honeyed pill, and 3.5 mg per germ for watered pills, referred to Radix Scutellariae.

Action To clear *heat* and purge *fire*, and disperse *wind* and kill pain.

Indications Headache, dizziness, bloodshot eyes, tinnitus, sore throat, or sores on the mouth and tongue, swollen painful gums and constipation due to abundant *heat* in the interior and upward attacking by *wind-fire*.

Usage and dosage 1 big honeyed pill or 3 g watered pills, twice a day.

Precaution Be cautious about pregnant women.

Strength (1) 3 g per 16 watered pills
(2) 6 g per big honeyed pill

Storage Preserve in tightly closed containers.

Niuhuang Xiaoyan Pian (牛黄消炎片)

Niuhuang Xiaoyan Tablets

Ingredients Calculus Bovis Artifactus 4.8 g; Concha Margaritifera Usta 9.6 g; Venenum Bufonis 2.9 g; Indigo Naturalis 3.8 g; Radix Trichosanthis 9.6 g; Radix et Rhizoma Rhei 9.6 g; Realgar 9.6 g.

Procedure Levigate Realgar to very fine powder. Pulverize Concha Margaritifera Usta to very fine powder, pulverize Radix et Rhizoma Rhei and Radix Trichosanthis to fine powder, grind Indigo Naturalis to fine powder. Triturate Venenum Bufonis with alcohol to a paste, mix well with the above powders and a quantity of adjuvant, make granules, and dry. Grind Calculus Bovis Artifactus to fine powder, add it to the above granules, mix well, make to 1000 tablets, and coat with sugar or film.

Description Sugar coated or film coated tablets with yellowish-

browm core; taste, bitter, with numb and acrid feelings.

Identification (1) Microscopical: Stone cells yellowish-green, rectangular, elliptical, subsquare, polygonal or fusiform, 27-72 μm in diameter, wall relatively thickened, with fine and dense pits. Clusters of calcium oxalate large, 60-140 μm in diameter. Irregular pieces or granules blue. Irregular pieces golden-yellow or orange-yellow, lustrous.
(2) Grind 10 tablets, removal of coat, to fine powder, shake with 5 ml of methanol for 30 minutes, filter and use the filtrate as the test solution. Prepare a solution of 0.3 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Dissolve indirubin CRS in chloroform to prepare a solution containing 0.2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 5-7 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the indirubin reference solution. Examine under ultraviolet light at 365 nm, the fluorescent spots in chromatogram obtained with the test solution correspond in position and colour to the fluorescent spots in the chromatogram obtained with the Radix et Rhizoma Rhei reference drug solution.
(3) Dissolve cholic acid CRS in ethanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of isooctane, ethyl acetate and glacial acetic acid (15 : 7 : 5) as the mobile phase. Apply separately 5 μl of each of the test solution obtained under Identification test (1) and the reference solution to the plate. After developing and removal of the plate, and dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105 ℃ to the spost clear, and examine under ultraviolet light at 365 nm. The fluorescent spot in chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix I D).

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.5% potassium dihydrogen phosphate (adjust to pH 3.2 with phosphoric acid) (50 : 50) as the mobile phase. As detector a spectrophotometer set at 296 nm. The number of theoretical plates of the column is not less than 4000, calculated with reference to the peak of cinobufagin.

Reference solution Dissolve a quantity of cinobufagin CRS and bufogenin CRS, accurately weighed, in methanol to produce a mixture solution containing 50 μg each per ml as the reference solution.

Test solution Weigh accurately 20 tablets, with coating removed, grind to fine powder, weigh accurately a quantity, equal to 10 tablets, in a stopper conical flask, add accurately 25 ml of methanol, stopper tightly, weigh, shake well, allow to stand overnight, ultrasonicate (power 250 W, frequency 50 kHz) for 20 minutes, cool, weigh again, replenish the loss of weight with methanol, shake well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, repectively, and calculate the content.
It contains not less than 0.10 mg of the total amount of cinobufagin ($C_{26}H_{34}O_6$) and bufogenin ($C_{24}H_{32}O_4$) per tablet, referred to Venenum Bufonis.

Action To clear *heat* and *toxicity*, reduce swelling and pain.

Indications Sore throat, furuncles and carbuncles due to accumulated *heat* in the interior.

Usage and dosage 1 tablet, 3 times a day, appropriate reduction of the dosage for children. For external use, ground to powder and applied topically.

Precaution Contraindicated for pregnant women.

Storage Preserve in tightly closed containers.

Niuhuang Zhenjing Wan
(牛黄镇惊丸)

Niuhuang Zhenjing Pills

Ingredients Calculus Bovis 80 g; Scorpio 300 g; Bombyx Batryticatus (stir-baked) 100 g; Margarita 100 g; Moschus 40 g; Cinnabaris 100 g; Realgar 100 g; Rhizoma Gastrodiae 200 g; Ramulus Uncariae cum Uncis 100 g; Radix Saposhnikoviae 200 g; Succinum 60 g; Arisaema cum Bile 100 g; Rhizoma Typhonii (processed) 100 g; Rhizoma Pinelliae (processed) 100 g; Concretio Silicea Bambusae 100 g; Borneolum Syntheticum 40 g; Herba Menthae 100 g; Radix et Rhizoma Glycyrrhizae 400 g.

Procedure Levigate Realgar, Cinnabaris and Margarita to very fine powder separately. Pulverize Scor-pio, Bombyx Batryticatus, Rhizoma Gastrodiae, Ramulus Uncariae cum Uncis, Radix Saposhnikoviae, Succinum, Arisaema cum Bile, Rhizoma Typhonii, Rhizoma Pinelliae, Concretio Silicea Bambusae, Herba Menthae and Radix et Rhizoma Glycyrrhizae to fine powder. Triturate Calculus Bovis, Moschus and Borneolum Syntheticum with the above powders, sift and mix well. To each 100 g of the powder add 35-50 g of refined honey and a quantity of water to make pills and dry at a lower temperature; alternatively, add 110-140 g of refined honey to make small honeyed pills or big honeyed pills.

Description Yellowish-brown water-honeyed pills, small honeyed pills or big honeyed pills; odour, slightly aromatic; taste, sweet, slightly cool and bitter.

Identification (1) Microscopical: Sclerenchymatous cells polygonal or elongated polygonal, 70-180 μm in diameter, with slightly lignified and relatively thickened walls, and distinct pits. Vittae containing golden-yellow secretion, about 30 μm in diameter. Sand crystals of calcium oxalate occurring in parenchymatous cells, sometimes crystal cells connected in rows. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Glandular scales with a 8-celled head, oblate, up to 90 μm in diameter, and a unicellular short stalk. Irregular pieces colourless or pale green, translucent, lustrous, sometimes with fine and dense sinuous striations. Irregular pieces pale yellowish-green or brownish-yellow, transparent or translucent. Irregular pieces golden-yellow or orange-yellow, lustrous. Irregular minute granules dark brownish-red, lustrous, with dark black edge. Fragments of body walls colourless, with minute hyphae. Fragments of body walls pale yellow to yellow, with reticulate striations and rounded alveoli, sometimes showing brown setae.
(2) Grind well 8 g of small honeyed pills or big honeyed

pills, cut into pieces, with 5 g of kieselguhr, or pulverize 5 g of the water-honeyed pills, add 25 ml of chloroform, ultrasonicate for 30 minutes, filter and keep the residue for latter use. Evaporate filtrate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve a mixture of (±)-borneol and (±)-isoborneol CRS in ethyl acetate to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of cyclohexane and ethyl acetate (17 : 3) as the mobile phase. Apply separately 4 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Expel solvent remained in the residue, obtained under the test for Identification (2), add 50 ml of 7% sulfuric acid in 45% ethanol, heat under reflux for 1 hour, cool, and filter. Evaporate the ethanol from the filtrate, extract under shaking with three 10-ml quantities of petroleum ether (30-60℃), combine the petroleum ether extracts, and evaporate to dryness. Dissolve the residue in 0.5 ml of dehydrated ethanol as the test solution. Dissolve glycyrrhetinic acid in dehydrated ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (60-90℃), benzene, ethyl acetate, and glacial acetic acid (10 : 20 : 7 : 0.5) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To relieve convulsion and anchor the mind, and expel *wind* and eliminate *phlegm*.

Indications Child convulsion with manifestations of convulsion, high fever, lockjaw and restlessness.

Usage and dosage 1 g of water-honeyed pills, 1.5 g of small honeyed pills or 1 big honeyed pill, 1-3 times a day; appropriate reduction of the dosage for children under 3 years of age.

Strength 1.5 g per big honeyed pill

Storage Preserve in tightly closed containers.

Niuhuang Zhibao Wan
(牛黄至宝丸)

Niuhuang Zhibao Pills

Ingredients Fructus Forsythiae 120 g; Fructus Gardeniae 120 g; Radix et Rhizoma Rhei 60 g; Natrii Sulfas 60 g; Gypsum Fibrosum 60 g; Herba Artemisiae Annuae 60 g; Pericarpium Citri Reticulatae 60 g; Radix Aucklandiae 45 g; Herba Pogostemonis 75 g; Calculus Bovis Artifactus 5 g; Borneolum Syntheticum 10 g; Realgar 15 g.

Procedure Levigate Realgar to very fine powder; grind Calculus Bovis Artifactus and Borneolum Syntheticum to fine powder respectively. Pulverize the other nine ingredients to fine powder, triturate with the powders of Calculus Bovis Artifactus, Borneolum Syntheticum, and Realgar, sift, and mix well. To 100 g of the powder add 145-150 g of refined honey to make big honeyed pills.

Description Pale brownish-yellow big honeyed pills; odour, slightly aromatic; taste, bitter and pungent.

Identification (1) Microscopical: Prisms of calcium oxalate clustered in parenchyma. Clusters of calcium oxalate large, 60-140 μm in diameter. Nonglandular hairs 1 ~ 6-celled, walls warted. Irregular species golden-yellow or orange-yellow, lustrous. Fibres of endocarp with the up and low layers arranged in crisscross, fibres short fusiform. Stone cells of testa yellow or pale brown, mostly broken, the whole ones long polygonal, rectangular or irregular, walls thickened, with large rounded pits, lumina brownish-red.

(2) Cut 6 g to pieces, ultrasonicate with 25 ml of chloroform for 30 minutes, filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve Cholic acid CRS in methanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of hexane, ethyl acetate, methanol, and acetic acid (20 : 25 : 3 : 2) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, spray with 10% sulfuric acid in ethanol, heat at 105 ℃ for 10 minutes, and examine under ultraviolet light at 365 nm. The fluorescent spot in chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot in the chromatogram obtained with the reference solution.

(3) Take 0.2 g of Radix et Rhizoma Rhei, ultrasonicate with 20 ml of chloroform for 30 minutes, filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the reference drug solution. Dissolve emodin CRS and chrysophanol CRS in methanol to produce a solution containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of hexane, ethyl acetate and formic acid (30 : 10 : 0.5) as the mobile phase. Apply separately 5 μl of each of the test solution obtained under Identification test (2), the reference drug solution and the reference solution to the plate. After developing and removal of the plate, examine under ultraviolet light at 365 nm. The orange-yellow fluorescent spots in chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution. Expose the plate to ammonia vapour, the colour of the spots turn red.

(4) Take 0.5 g of Radix Aucklandia reference drug, shake with 20 ml of ether for 15 minutes, filter, evaporate the filtrate to 4 ml, and use it as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and cyclohexane (5 : 1) as the mobile phase. Apply separately to the plate 2 μl of each of the test solution obtained under Identification test (2) and the reference drug solution. After developing and removal of the plate, spray with 5% vanillin in sulfuric acid, heat at 105℃ for about 5 minutes. The spots in chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, water and phosphoric acid (14 : 86 : 0.05) as the mobile phase. As detector a spectrophotometer set at 239 nm. Maintain the column temperature at 40℃. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of geniposide.

Reference solution Dissolve a quantity of geniposide CRS, accurately weighed, in methanol to prepare a solution containing 20 μg per ml as the reference solution.

Test solution Cut the pills, obtained under the test of weight variation, into pieces, weigh accurately 3 g, add accurately 3 g of kieselguhr, and triturate well. Weigh accurately 1 g of the powder in a stopper conical flask, add accurately 50 ml of methanol, stopper tightly and weigh. Ultrasonicate (power 100 W, frequency 40 kHz) for 30 minutes, cool, weigh again, replenish the loss of weight with methanol, and shake well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.
It contains not less than 8.0 mg of geniposide ($C_{17}H_{24}O_{10}$) per pill, referred to Fructus Gardeniae.

Action To clear *heat* and *toxicity*, and purge *fire* and relax bowels.

Indications Headache, dizziness, bloodshot eyes, tinnitus, dry mouth and throat and constipation due to accumulated *heat* in the stomach and intestines.

Usage and dosage 1-2 pills, twice a day.

Precaution Contraindicated for pregnant women.

Strength 6 g per pill

Storage Preserve in tightly closed containers.

Nuanqi Gao
(暖脐膏)

Nuanqi Plaster

Ingredients Radix Angelicae Sinensis 80 g; Radix Angelicae Dahuricae 80 g; Radix Linderae 80 g; Fructus Foeniculi 80 g; Fructus Anisi Stellati 80 g; Radix Aucklandiae 40 g; Rhizoma Cyperi 80 g; Olibanum 20 g; Fructus Caryophylli 20 g; Myrrha 20 g; Cortex Cinnamomi 20 g; Lignum Aquilariae Resinatum 20 g; Moschus 3 g.

Procedure Pulverize Olibanum, Fructus Caryophylli, Myrrha, Cortex Cinnamomi, and Lignum Aquilariae Resinatum to fine powder, triturate with Moschus, sift, mix well. Break Radix Angelicae Sinensis and other 6 ingredients, deep-fry with 4800 g of edible vegetable oil, discard the residue, filter, concentrate the oily filtrate until it condenses to pills on dripping. Add 1500-2100 g of Plumbi Oxydum Flavum to the above oil, stir well to make plaster, and soak the plaster in water. Melt the plaster by gentle heat, add the above powder, stir-well, divide and spread on paper or cloth.

Description A black plaster spread on paper or cloth.

Other requirements Complies with the general requirements for plasters (Appendix Ⅰ P).

Action To warm the interior to disperse *cold*, and promote *qi* flow to kill pain.

Indications Cold pain in the lower abdomen, fullness in the stomach and abdomen and loose stools due to accumulation of *cold* and stagnation of *qi*.

Usage and dosage Soften the plaster by heat and stick it over the umbilicus.

Precaution Contraindicated for pregnant women.

Strength Net weight per piece (1) 3 g (2) 15 g (3) 30 g

Storage Preserve in well closed containers, stored in a cool, shady and dry place.

Nüjin Wan
(女金丸)

Nüjin Pills

Ingredients Radix Angelicae Sinensis 140 g; Radix Paeoniae Alba 70 g; Rhizoma Chuanxiong 70 g; Radix Rehmanniae Praeparata 70 g; Radix Codonopsis 55 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 70 g; Poria 70 g; Radix et Rhizoma Glycyrrhizae 70 g; Cortex Cinnamomi 70 g; Herba Leonuri 200 g; Cortex Moutan 70 g; Myrrha (processed) 70 g; Rhizoma Corydalis (processed with vinegar) 70 g; Rhizoma et Radix Ligustici 70 g; Radix Angelicae Dahuricae 70 g; Radix Scutellariae 70 g; Radix et Rhizoma Cynanchi Atrati 70 g; Rhizoma Cyperi (processed with vinegar) 150 g; Fructus Amomi 50 g; Pericarpium Citri Reticulatae 140 g; Halloysitum Rubrum (calcined) 70 g; Cornu Cervi Degelatinatum 150 g; Colla Corii Asini 70 g.

Procedure Pulverize the above twenty-three ingredients to fine powder, sift and mix well. To each 100 g of the powder add 35-50 g of refined honey and a quantity water to make water-honeyed pills; alternatively, add 120-150 g of refined honey to make big honeyed pills.

Description Brown to blackish-brown big honeyed pills; odour, aromatic; taste, sweet and slightly bitter.

Identification (1) Microscopical: Compound starch granules consisting of 8-12 components. Gelatinized starch masses pale yellow. Irregularly branched masses colourless, dissolved in chloral hydrate TS, hyphae colourless or pale brown, 4-6 μm in diameter. Irregular transparent pieces slight yellow, with rounded pits and minute pores, and secreted oily droplets dissolved on long standing. Cork cells yellowish-brown, with slight sinuous thin walls overlapped in many layers. Cork cells reddish to slight purple, with slightly thickened walls. Needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells. Prisms of calcium oxalate abundant in parenchyma. Stone cells subrounded or subrectangular, walls thin on one side. Sclerenchymatous cells of endotesta yellowish-brown or brownish-red, subpolygonal in surface view, with thickened walls, lumina containing silica bodies. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibers. Bast fibres pale yellow, fusiform, with thickened walls and minute pit-canals. Fibres in bundles, dark brown or reddish-brown, with thickened walls. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Parenchymatous cells spindle-shaped, with slightly thickened walls and very fine oblique crisscross striations. Irregular pieces translucent, strongly refractive on edge, with short fine striations, small openings and fine slits.
(2) Triturate well 2 big honeyed pills (or 10 g of water-honeyed pills) with 8 g of kieselguhr, grind and mix well, add 50 ml of ether, reflux for 1 hour, and filter. Wash the residue with 20 ml of ether, Keep the residue for later use,

and combine the filtrates. Evaporate the ether at a lower temperature, and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve paeonol CRS in ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and cyclohexane and ethyl acetate (3 : 1) as the mobile phase. Apply separately 15 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 2% ferric chloride in ethanol acidified by hydrochloric acid, and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Dissolve cinnamaldehyde CRS in ethanol to produce a solution containing 2 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and benzene as the mobile phase. Apply separately 5 μl of the test solution obtained under the test of Identification (2) and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with a solution of alcohdic dinitrophenyldrazine TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Add 50 ml of methanol to the residue, evaporating the ether, obtained under the test of Identification (2), ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness, add a quantity of water, transfer to a colume (1.5 cm in internal diameter, 20 cm long), packed with D101 largeporous absorbent resin (successively pre-eluted with 50 ml of acetone, ethanol and water respectively), elute with 80 ml of water, evaporate the eluate to dryness, dissolve the residue in 2 ml of methanol and filter, using the filtrate as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and *n*-butanol, glacial acetic acid, and water (7 : 1 : 2) as the mobile phase. Apply separately to the plate 4 μl of each of the two solutions. After developing and removal of the plate, dry in air. Spray with 2% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To replenish *qi* and nourish blood, regulate the flow of *qi* and promote blood circulation to kill pain.

Indications Menstrual disorders due to a deficiency and stagnation of *qi* and blood, with manifestations of preceded or delayed menstrual cycle, menorrhagia, lassitude, persistent dribbling of menstrual blood and dysmenorrhea.

Usage and dosage 5 g of the water-honeyed pills, or 1 big honeyed pill, twice a day.

Precaution Be cautious about pregnant women.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Paishi Keli
(排石颗粒)

Paishi Granules

Ingredients Herba Glechomae; Semen Plantaginis (stir-baked with salt water); Caulis Aristolochiae Manshuriensis; Radix Cynanchi Paniculati; Folium Pyrrosiae; Herba Dianthi; Caulis Lonicerae; Talcum; Semen Abutili; Radix et Rhizoma Glycyrrhizae.

Procedure Decoct 156 g of Herba Glechomae with water for 2 times, 3 hours and 2 hours respectively, combine the decoctions, filter and concentrate the filtrate to a thick extract with a relative density of 1.20 (50℃). Decoct the surplus Herba Glechomae and other nine ingredients with water for 2 times, 3 hours for the first time and 2 hours for the second, combine the decoctions, filter, concentrate the filtrate to a *thin* extract with a relative density of 1.24 (50℃), stand to cool, add a quantity of ethanol and stand. To the supernatant, recover ethanol and concentrate to a thick extract with a relative density of 1.20 (50℃). Mix thoroughly the above two extracts, dry by spraying, add a quantity of sucrose, make 1000 g granulas; or add a quantity of sucrose and other excipient, make 1000 g granulas; or add a quantity of dextrin, make granules and dry, make 250 g (without sucrose).

Description Yellowish-brown or brown granules; odour, slight; taste, sweet, slightly bitter; or grey or greyish-brown granules; taste, slightly sweet and slightly bitter (without sucrose granules).

Identification Pulverize 1 bag of the granules, add 50 ml of ethyl acetate, ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness and dissolve the residue with 0.5 ml of ethanol as the test solution. Dissolve ursolic acid CRS in dehydrated ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate, and formic acid (24 : 10 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with 10% solution of sulfuric acid in ethanol, heat at 105℃ to visualize clearly. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay *Reference solution* Weigh accurately 20 mg of rutin CRS, previously dried to constant weight at 120℃, in a 100 ml volumetric flask, dissolve in 50% methanol by shaking, dilute to the volume and mix well (containing 0.2 mg of dehydrated rutin per ml).

Standard calibration Measure accurately 1, 2, 3, 4 ml and 5 ml of the reference solution in 10 ml volumetric flasks separately, add 5 ml of 50% methanol and 0.3 ml of 5% sodium nitrite solution respectively, mix well, stand for 6 minutes. Add 0.3 ml of 10% solution of aluminum nitrate, mix well, stand for 6 minutes, add 4 ml of sodium hydroxide TS, dilute with 50% methanol to the volume and mix well. Carry out the method for ultraviolet spectrophtometry and colourimetry (Appendix Ⅴ A), measure the absorbency at the wavelength of 510 nm, perform the same reagents as the blank. Plot calibration curve, using absorbency as

ordinate and concentration as abscissa.

Procedure Weigh accurately 5 g or 1 g (without sucrose), obtained under the test of packing variation and pulverized to fine powder, in a stopper conical flask, add accurately 100 ml of methanol, stopper and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 20 minutes, allow to cool, weigh and replenish the lost weight with methanol, shake thoroughly and filter. Measure accurately 25 ml of the successive filtrate in a 50 ml volumetric flask, dilute with water to the volume and mix well. Measure accurately 2 ml in a 10 ml volumetric flask, carry out the method described under the preparation of standard calibration, beginning at the word "add 5 ml of 50% methanol,...", measure accurately 2 ml of the filtrate in a 10 ml volumetric flask, dilute with 50% methanol to the volume and mix well as the blank. Measure the absorbance and read out the weight of dehydrated rutin in the test solution from standard calibration curve and calculate.

It contains not less than 0.12 g of total flavone per bag. calculated as dehydrated rutin ($C_{27}H_{30}O_{16}$).

Action To clear *heat* and induce urination, and relieve stranguria and remove stones.

Indications Urolithic stranguria due to *damp-heat* in the *lower-energizer* with manifestations of lumbar and abdomenal pain, and dysuria or sometimes hematuria; stones in the urinary system with above symptoms.

Usage and dosage To be taken after dissolving in boiled water. 1 bag, 3 times a day, or follow doctor's advice.

Strength (1) 20 g per bag
(2) 5 g per bag (without sucrose)

Storage Preserve in well closed containers.

Pilulae Olei Rhododendri Daurici (满山红油胶丸, Manshanhongyou Jiaowan)

Daurian Rhododendron Oil Soft Capsules

Daurian Rhododendron Oil Soft Capsules are prepared from Oleum Rhododendri Daurici with a quantity of diluent.

Description Yellowish-brown soft capsules. Odour, characteristic and aromatic.

Identification (1) Steam distill a quantity of the capsules (equivalent to 1 ml of Oleum Rhododendri Daurici), the volatile oil complies with tests for Identification described under Oleum Rhododendri Daurici.

(2) Dissolve 0.5 g of the content in 25 ml of *n*-hexane, transfer 5 ml of the solution to a column (1 cm in diameter) packed with silica gel (120-150 meshs, packed with *n*-hexane, and apply 3 g of anhydrous sodium sulfate on the top of the silica gel). Elute firstly with 50 ml of *n*-hexane, discard the eluate, then elute with 50 ml mixture of *n*-hexane and ethyl acetate (50 : 1), and collect the eluate as the test solution. Dissolve farrerol CRS in *n*-hexane to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (14 : 1) as the mobile phase. Apply separately 10 μl of each of the reference solution and the test solution to the plate. After developing and removing the plate, dry in air. Spray with vanillin in sulfuric acid TS, heat at 105℃ to the spots clear. The spot in the chromatography obtained with the test solution corresponds in position and colour to the spot in the chromatography obtained with the reference solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for determination of volatile oil (Appendix Ⅹ D, method 1), using 40 capsules, weigh accurately calculate the content of volatile oil with 0.940 as the relative density.

It contains not less than 90.0 per cent and not more than 110.0 per cent of the labelled amount of daurian rhododendron oil.

Action To stop coughing and expel *phlegm*.

Indications Coughing with expectoration of white *phlegm* due to invasion of the lung by *cold* and *phlegm*; acute and chronic bronchitis with above symptoms.

Usage and dosage 0.05-0.1 g, 2-3 times a day.

Strength (1) 0.05 g
(2) 0.1 g of Oleum Rhododendri Daurici per capsule

Storage Preserve in tightly closed containers.

Pilulae Siegesbeckiae (豨莶丸, Xixian Wan)

Siegesbeckia Pills

Siegesbeckia Pills are the honeyed pills prepared from Herba Siegesbeckiae.

Procedure Cut 1000 g of Herba Siegesbeckiae into pieces. Decoct 500 g of wide stems with water twice, each for 2 hours. Combine the decoctions and filter, concentrate the filtrate to a thick decoction. Infuse the other 500 g with 1000 g of yellow rice wine in a jar, stoppered well, heat on a water bath until the wine is absorbed completely and take out. Mix with the above thick decoction, dry, pulverize to fine powder, sift and mix thoroughly. To each 100 g of the powder, add 170-200 g of refined honey to make big honeyed pills.

Description Black big honeyed pills; odour, slight; taste, sweet, slightly bitter.

Other requirements Comply with the general requirments for pills (Appendix Ⅰ A).

Action To clear *heat* and eliminate *dampness*, and disperse *wind* and kill pain.

Indications Obstruction of *qi* and blood with pain due to retention of *wind-dampness*, and *heat* in meridians with manifestations of numbness of limbs, aching and weakness of the lower back and knees, weakness of tendons and bones and joint pain; hemiplegia, rubella, and sores due to *dampness*.

Usage and dosage 1 pill, 2-3 times a day.

Strength 9 g per pill

Storage Preserve in well closed containers.

Pinggan Shuluo Wan (平肝舒络丸)

Pinggan Shuluo Pills

Ingredients Radix Bupleuri 45 g; Pericarpium Citri Reticulatae Viride (stir-baked with vinegar) 30 g; Pericarpium Citri

Reticulatae 45 g; Fructus Citri Sarcodactylis 45 g; Radix Linderae 45 g; Rhizoma Cyperi (stir-baked with vinegar) 45 g; Radix Aucklandiae 45 g; Lignum Santali Albi 45 g; Flos Caryophylli 30 g; Lignum Aquilariae Resinatum 150 g; Herba Pogostemonis 45 g; Fructus Amomi 45 g; Fructus Amomi Rotundus 45 g; Cortex Magnoliae Officinalis (stir-baked with ginger juice) 45 g; Fructus Aurantii (removed from pulp and stir-baked with bran) 45 g; Rhizoma et Radix Notopterygii 45 g; Radix Angelicae Dahuricae 45 g; Radix Smilacis Sieboldi (stir-baked with wine) 45 g; Herba Asari 45 g; Fructus Chaenomelis 45 g; Radix Saposhnikoviae 45 g; Ramulus Uncariae cum Uncis 45 g; Bombyx Batryticatus (stir-baked with barn) 45 g; Arisaema cum Bile (stir-baked with wine) 75 g; Concretio Silicea Bambusae 30 g; Herba Taxilli 45 g; Radix Polygoni Multiflori (stir-baked with decoction of black soybean) 45 g; Radix Achyranthis Bidentatae 45 g; Radix Chuanxiong 30 g; Radix Rehmanniae Praeparata 45 g; Carapax et Plastrum Testudinis (scalded with sand and quenched with vinegar) 45 g; Rhizoma Corydalis (stir-baked with vinegar) 45 g; Olibanum (stir-baked with vinegar) 45 g; Myrrha (stir-baked with vinegar) 45 g; Rhizoma Bletillae 45 g; Radix Ginseng 45 g; Rhizoma Atractylodis Macrocephalae (stir-baked with bran) 45 g; Poria 45 g; Cortex Cinnamomi 30 g; Rhizoma Coptidis 45 g; Borneolum Syntheticum 45 g; Cinnabaris 150 g; Cornu Saigae Tataricae Powder 15 g.

Procedure Levigate Cinnabaris to very fine powder; triturate Borneolum Syntheticum to fine powder; pulverize the other ingredients, except Cornu Saigae Tataricae powder, to fine powder. Mix and triturate with the above powders, sift and mix thoroughly. To each 100 g of the powder add 140-160 g of refined honey to make big honeyed pills.

Description Brownish-red big honeyed pills; odour, cool and aromatic; taste, bitter and pungent.

Identification (1) Grind well 2 pills, cut into pieces, with 12 g of kieselguhr, add 50 ml of ether, heat under reflux for 30 minutes, and filter. Concentrate the filtrate to 1 ml as the test solution. Prepare a solution with 1 g Rhizoma Chuanxiong reference drug and 20 ml of ether as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 5 μl of the test solution and 1-2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry it in air. Examine under ultraviolet light (365 nm), the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. (2) Expel the solvent remained in the drug residue, obtained in the test for Identification (1), add 40 ml of ethanol, heat under reflux for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 3 ml of methanol as the test solution. Prepare a solution of 0.1 g of Rhizoma Coptidis reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-butanol, glacial acetic acid, and water (7 : 1 : 2) as the mobile phase. Apply separately 5 μl of the test solution and 1 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To pacify the *liver* and dredge meridians, and promote blood circulation and expel *wind*.

Indications Stuffiness and pain in the chest and hypochondria, scurrying pain over the shoulder and back, numb hands and feet or muscular contracture due to stagnation of *liver-qi* and block of meridians.

Usage and dosage 1 pill, 2 times a day, taken with warm yellow wine or boiled water.

Strength 6 g per pill

Storage Preserve in tightly closed containers.

Qianbai Biyan Pian
(千柏鼻炎片)

Qianbai Biyan Tablets

Ingredients Herba Senecionis Scandentis 2424 g; Herba Selaginellae 404 g; Rhizoma et Radix Notopterygii 16 g; Semen Cassiae 242 g; Herba Ephedrae 81 g; Rhizoma Chuanxiong 8 g; Radix Angelicae Dahuricae 8 g.

Procedure Pulverize Rhizoma et Radix Notopterygii, Rhizoma Chuanxiong and Radix Angelicae Dahuricae to fine powder. Decoct the other 4 ingredients with water twice, combine the decoctions, filter and concentrate to a thick extract. Add the above fine powder of Rhizoma et Radix Notopterygii and Rhizoma Chuanxiong, mix thoroughly, dry, pulverize to fine power, make granules, press into 1000 tablets and coat with sugar.

Description Sugar coated tablets with brownish-black core; taste, bitter.

Identification (1) To 20 tablets, removed the sugar coats and grind finely, add 35 ml of ethanol, heat under reflux for 1 hour, and filter. Evaporate 15 ml of the filtrate to dryness, and dissolve in 2 ml of ethanol as the test solution. To 25 g of Herba Senecionis Scandentis reference drug, decoct with water for 1 hour, and filter. Concentrate the filtrate, add 40 ml of ethanol to produce a solution as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and formic acid (5∶4∶1) as the mobile phase. Apply separately to the plate 3 μl of each of the two solutions. After developing and removal of the plate, dry in air. Spray with ferric chloride TS. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) To the remainder solution of ethanol, obtained under the Identification (1), evaporate to dryness, dissolve the residue in 10 ml of water, add 1 ml of hydrochloric acid, heat for 30 minutes, and cool immediately. Extract with two 20-ml quantities of ether, combine the ether extracts, and evaporate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. To 1 g of the Semen Cassiae reference drug, decoct with water for 1 hour, and filter. Evaporate the solution to dryness, and dissolve the residue in 10 ml of methanol. Prepare a solution in the same manner as the reference drug solution. Dissolve chrysophanol CRS in methanol to produce a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (30-60 ℃), ethyl formate, and formic acid (15∶5∶1) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of each of the reference drug and reference solutions to the plate. After developing and removing the plate, dry in the air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug and the reference solution.

(3) To 20 tablets, removed the sugar coats and ground finely, add 1 ml of concentrated ammonia TS and 20 ml of chloroform, heat under reflux on a water bath for 1 hour, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution with 1 g of Herba Ephedrae reference drug in the same manner as the reference drug solution. Dissolve ephedrin hydrochloride CRS in methanol to produce a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol, and concentrated ammonia TS (20∶5∶0.5) as the mobile phase. Apply separately to the plate 5-10 μl of the test solution, 5 μl of the reference drug solution, and 2 μl of the reference solution. After developing and removing the plate, dry in the air. Spray with the ninhydrin TS, and heat at 105℃ to the spots clear. The red spot in the chromatography obtained with the test solution corresponds in position and colour to the spots in the chromatography obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Action To clear *heat* and *toxicity*, promote blood circulation and expel *wind*, disseminate *lung-qi* and free the orifices.

Indications Stuffy nose, itching nose, yellow-thick nasal discharge or hyposmia due to invasion of the *lung* by *wind-heat*, which transforms into *fire*, hampering normal flow of *qi* and blood; acute and chronic rhinitis, acute and chronic sinusitis with above symptoms.

Usage and dosage 3-4 tablets, 3 times a day.

Storage Preserve in tightly closed containers.

Qiangyang Baoshen Wan
(强阳保肾丸)

Qiangyang Baoshen Pills

Ingredients Herba Epimedii (proccessed) 36 g; Actinolitum (calcined and stir-baked with wine) 36 g; Herba Cistanches (processed with wine) 36 g; Semen Trigonellae (stir-baked with salt water) 48 g; Fructus Psoraleae (stir-baked with salt water) 48 g; Fructus Schisandrae Chinensis (processed with vinegar) 42 g; Semen Astragali Complanati 36 g; Fructus Cnidii 36 g; Fructus Rubi 48 g; Semen Allii Tuberosi 42 g; Semen Euryales (stir-baked with bran) 60 g; Cortex Cinnamomi 24 g; Fructus Foeniculi (stir-baked with salt water) 30 g; Poria 36 g; Radix Polygalae (processed with Radix Glycyrrhizae) 36 g.

Procedure Pulverize the above fifteen ingredients to fine powder, sift and mix thoroughly, make pills with water and dry. To each 1000 g of the pills coat with 111 g of talc powder for the inner layer and a mixture of 28 g of Cinnabaris powder and 111 g of talc powder for the outer layer, polish, and dry.

Description Pink and lustrous watered pills with greyish-black core; taste, slightly bitter.

Identification Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Starch granules mostly compound, subspheroidal, composed of numerous components, components minute, subpolygonal or polygonal, 1-5 μm in diameter. Palisade cells of testa pale brown or reddish-brown, subpolygonal in surface view, walls slightly thickened; lumina containing reddish-brown contents. Stone cells of epidermis of testa pale yellowish-brown, polygonal in surface view, walls thickened, with fine and dense pit-canals, lumina containing dark brown

contents. Non-glandular hairs unicellular, with thickened and lignified walls, scars stone cell in shape. Fibres single, long fusiform, 24-50 μm in diameter, with thickened and lignified walls.

Other requirements Comply with the general requirements for pills (Appendix I A).

Action To reinforce the kidney to support *yang*.

Indications Aching and weakness of the lower back and legs, lassitude, impotence and seminal emission due to a deficiency of *kidney-yang*.

Usage and dosage 6 g, 2 times a day.

Strength 6 g per 100 pills

Storage Preserve in well closed containers, protected from moisture.

Qianjin Zhidai Wan (Damiwan) (千金止带丸，大蜜丸)

Qianjin Zhidai Pills (big honeyed pills)

Ingredients Identical with Qianjin Zhidai Pills (Watered Pills).

Procedure Pulverize the above 17 ingredients to fine powder, sift and mix thoroughly. To each 100 g of the powder add 140-160 g of refined honey to make big honeyed pills.

Description Blackish-brown big honeyed pills. Odour, slightly aromatic; taste, sweet, astringent and slightly bitter.

Identification Comply with Identification test (1) as described under Qianjin Zhidai Wan (shuiwan).

Other requirements Comply with the general requirements for pills (Appendix I A).

Action To invigorate the spleen and kidney, and regulate menstruation and cure leukorrhagia.

Indications Menstrual disorders and morbid leukorrhea due to deficiency in the spleen and kidney, with manifestations of irregular menstrual cycles, menorrhagia or metrostaxis with pale red menstrual blood without clots, or leukorrhagia with thin white vaginal discharge, aching and weakness of the lower back and knees.

Usage and dosage 1 pill, 2 times a day.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Qianjin Zhidai Wan (Shuiwan) (千金止带丸，水丸)

Qianjin Zhidai Pills (Watered pills)

Ingredients Radix Codonopsis 50 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 50 g; Radix Angelicae Sinensis 100 g; Radix Paeoniae Alba 50 g; Rhizoma Chuanxiong 100 g; Rhizoma Cyperi (processed with vinegar) 200 g; Radix Aucklandiae 50 g; Fructus Amomi 50 g; Fructus Foeniculi (stir-baked with salt) 50 g; Rhizoma Corydalis (processed with vinegar) 50 g; Cortex Eucommiae (stir-baked with salt) 50 g; Radix Dipsaci 50 g; Fructus Psoraleae (stir-baked with salt) 50 g; Flos Celosiae Cristatae 200 g; Indigo Naturalis 50 g; Cortex Ailanthi (stir-baked) 200 g; Concha Ostreae (calcined) 50 g.

Procedure Pulverize the above seventeen ingredients to fine powder, sift and mix thoroughly. Make pills with water and dry.

Description Greyish-black watered pills; odour, slightly aromatic; taste, astringent and slightly bitter.

Identification (1) Microscopical: Anastomosing laticiferous tubes 12-15 μm in diameter, containing minute granules. Secretory cells subrounded, containing pale yellowish-brown to reddish-brown secretion, surrounded by radially arranged cells. Palisade cells of testa pale brown or brownish-red, subpolygonal in surface view, with slightly thickened walls, lumina containing reddish-brown contents. Needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells. Rubber threads strip-shaped or twisted into masses with granular surface. Stone cells subrounded or subpolygonal, lumina containing prisms of calcium oxalate. Sclerenchymatous cells of endotesta yellowish-brown or brownish-red, subpolygonal in surface view, with thickened walls, lumina containing silica bodies. Fragments of sclerenchyma greenish-yellow, cells subpolygonal or slightly elongated, with somewhat sinuous and sometimes beaded walls, showing minute and dense pits. Pollen grains spheroidal, up to about 37 μm in diameter, extine with minute warts and diffuse pores. Irregular pieces or granules blue in colour.

(2) Triturate well 10 g, add 100 ml of methanol, macerate warmly for 1 hour, shake constantly, and filter. Recover the filtrate to dryness, dissolve the residue in 30 ml of water, extract with three 30-ml quantities of ether with shaking, and discard the ether solution. Extract the water solution with three 30-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extracts, wash with two 30-ml quantities of water saturated with *n*-butanol, and discard the water solution. Recover the *n*-butanol extracts to dryness, dissolve the residue in about 1 ml of ethanol, add a quantity of alumina, mix thoroughly on a water bath, dry, and apply to a column packed with neutral alumina (200-300-mesh, 1 g, 10-15 mm in diameter), and elute with 60 ml of methanol. Collect the eluate and recover it to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing about 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol, and formic acid (40∶5∶10∶0.2) as the mobile phase. Apply separately to the plate 4 μl of the test solution and 2 μl of the reference solution. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid, and heat to visualize clearly. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Triturate well 4 g, add 30 ml of methanol, ultrasonicate for 20 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 2 ml of ethyl acetate, and apply to a column (10-15 mm in diameter) packed with neutral alumina (100-200 mesh, 3 g). Elute with 10 ml of ethyl acetate, collect the eluate and evaporate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve psoralen, isopsoralen CRS, indirubin CRS, and indigotin CRS in chloroform to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of n-hexane and ethyl acetate (4∶1) as the mobile phase. Apply separately to the plate 5 μl of the test solution, 2 μl of the reference drug solution, and 1 μl of the

reference solutions. After developing and removing the plate, dry in the air. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots of indirubin, and indigotin CRS in the chromatogram obtained with the reference solution; spray with 10% potassium hydroxide in methanol and examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots of psoralen, isopsoralen CRS in chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (12∶88) as the mobile phase. As detector a spectrophotometer set at 230 nm. Maintain the column temperature at 40℃. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of paeoniflorin.

Reference solution Weigh accurately a quantity of paeoniflorin CRS, dissolve in methanol to produce the reference solution containing 20 μg per ml.

Test solution Pulverize the pills to fine powder, weigh accurately about 1 g in a stoppered conical flask, add accurately 25 ml of 30% ethanol solution, stopper, and weigh accurately. Ultrasonicate (power 100 W, frequency 40 kHz) for 30 minutes, cool, weigh accurately again, and replenish the lost weight with 30% solution of methanol. Mix well, filter with microporous film (0.45 μm), and use successive filtrate as the test solution.

Procedures Inject accurately 10 μl of the reference solution and 15 μl of the test solution into the column, respectively, and calculate the content.
It contains not less than 0.3 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per gram, referred to Radix Paeoniae Alba.

Action To invigorate the spleen and kidney, and regulate menstruation and cure leukorrhagia.

Indications Menstrual disorders and morbid leukorrhea due to deficiency in the spleen and kidney, with manifestations of irregular menstrual cycles, menorrhagia or metrostaxis with pale red menstrual blood without clots, or leukorrhagia with thin white vaginal discharge, aching and weakness of the lower back and knees.

Usage and dosage 6-9 g, 2-3 times a day.

Storage Preserve in well closed containers, protected from moisture.

Qianlieshu Wan
(前列舒丸)

Qianlieshu Pills

Ingredients Radix Rehmanniae Praeparata; Semen Coicis; Semen Benincasae; Fructus Corni; Rhizoma Dioscoreae; Cortex Moutan; Rhizoma Atractylodis; Semen Persicae; Rhizoma Alismatis; Poria; Ramulus Cinnamomi; Radix Aconiti Lateralis Praeparata; Semen Allii Tuberosi; Herba Epimedii; Radix et Rhizoma Glycyrrhizae.

Procedure Pulverize the above fifteen ingredients to fine powder, sift and mix thoroughly. To each 100 g of the powder, add 35-45 g of refined honey and a quantity of water to make water-honeyed pills and dry; or add 110-130 g of refined honey to make big honeyed pills.

Description Brownish-black water-honeyed pills or big honeyed pills; odour, slightly; taste, sweet and sour.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS, hyphae colourless or pale brown, 4-6 μm in diameter. Starch granules deltoidovoid or oblong, 24-40 μm in diameter, hilum shortly cleft or V-shaped. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, each containing a brown nucleus-like mass. Clusters of calcium oxalate occurring in colourless parenchymatous cells, sometimes several crystal cells in one row. Epidermal cells of pericarp orange-yellow, subpolygonal in surface view, with beaded anticlinal walls. Parenchymatous cells subrounded, with elliptical pits gathered into pitted areas. Anticlinal walls of endodermal cells sinuous, relatively thickened, lignified, with sparse and fine pit-canals.
(2) Distill by steaming 10 g of the pills, collect 20 ml of the distillate. To 2 ml of the distillate, add a small quantity of a mixed powder of 1 portion of 2,6-dichloroquinone chlorimide and 32 portions of sodium tetraphenylborate, shake for 4-6 minutes, the solution shows a blue colour.
(3) To 10 g of the pills add 30 ml of water, stand for disintegration, and filter. Wash the residue with 20 ml of water, dry at room temperature, then heat to dryness at 100℃. Heat under reflux the residue in 50 ml of ethanol for 2 hours, filter, and concentrate the filtrate to 5 ml as the test solution. Dissolve ursolic acid CRS in dehydrated ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform and ethyl acetate (20∶5∶7) as the mobile phase. Apply 10 μl of the test solution and 5 μl of the reference solution separately to the plate. After developing and removal of the plate, dry in air, spray with a mixture of acetic anhydride and sulfuric acid (9∶1), heat at 105℃ for about 5 minutes, take out immediately. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Grind well water-honeyed pills, or cut big honeyed pills, obtained under the test of weight variation, into pieces, weigh accurately 2 g, steam distill, collect 450 ml of the distillate in a 500 ml volumetric flask, and dilute with water to volume. Carry out the method for ultraviolet spectrophtometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 274 nm, calculate, taking 862 as the value of A (1%, 1 cm).
It contains not less than 0.35 mg per gram of water-honeyed pills, 3.2 mg per big honeyed pill, of paeonol ($C_9H_{10}O_3$), referred to Cortex Moutan.

Action To support healthy *qi* to restore normal physiological functions, and invigorate the kidney to induce urination.

Indications Stranguria syndrome due to deficiency in the kidney, with manifestations of frequent, urgent urination and urine dribbling after urination; chronic prostatitis and hyperplasia of prostate with above symptoms.

Usage and dosage 6-12 g of water-honeyed pills, 1-2 big honeyed pills, 3 times a day, or follow doctor's advice.

Precaution Contraindicated for patients with retention of urine.

Strength 1.3 g per 10 water-honeyed pills, 9 g per big honeyed pills

Storage Preserve in tightly closed containers.

Qibao Meiran Keli
(七宝美髯颗粒)

Qibao Meiran Granules

Ingredients Radix Polygoni Multiflori Praeparata 128 g; Radix Angelicae Sinensis 32 g; Fructus Psoraleae (stir-baked with Semen Sesami Nigrum) 16 g; Fructus Lycii (steamed with wine) 32 g; Semen Cuscutae (stir-baked) 32 g; Poria 32 g; Radix Achyranthis Bidentatae (steamed with wine) 32 g.

Procedure Pulverize Semen Cuscutae to a coarse powder, carry out the method for percolation described under liquid extracts and extracts (Appendix Ⅰ O), using 60% ethanol as solvent to percolate, recover ethanol from the percolation and concentrate to a quantity; Decoct the other 6 ingredients with water twice, 3 hours for the first time and 2 hours for the second, combine the decoctions and stand. Separate the supernatant and concentrate to a quantity, add the above extract of Semen Cuscutae and stir thoroughly, concentrate to a thin extract with a relative density of 1.13-1.14 (measured by mixing with same quantity of water at 20℃). Take 1 portion of the liquid extract, 4.5 portions of powdered sucrose and 0.5 portion of dextrin, make to granules and dry, make 1000 g of granules.

Description Yellowish-brown granules; taste, sweet, slightly bitter and astringent.

Identification (1) To 10 g, finely powdered, add 20 ml of ethyl acetate and 0.5 ml of hydrochloric acid, ultrasonicate for 20 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 0.5 ml of ethyl acetate as the test solution. Prepare a solution with 0.1 g of Radix polygoni Multiflori reference drug as the reference drug solution in the same manner. Dissolve emodin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of toluene, ethyl acetate and formic acid (20∶2∶1) as the mobile phase. Apply separately 10 μl of the test solution, 2 μl of the reference drug solution and 1 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, expose to ammonia vapour to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and reference solution.

(2) Dissolve separately psoralen CRS and isopsoralen CRS in ethyl acetate to produce two solutions containing 2 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (4∶1) as the mobile phase. Apply separately 5 μl of the test solution obtained under Identification test (2) and 1 μl of each of the above two reference solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% potassium hydroxide in methanol, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

(3) To 8 g of the granules, finely powdered, dissolve in 40 ml of water, extract by shaking with two 30-ml quantities of chloroform, combine the chloroform, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. To 1 g of Fructus Lycii reference drug, decoct with 20 ml of water for 10 minutes, filter, and extract the filtrate with two 30-ml quantities of chloroform. Combine the chloroform extracts, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate, and formic acid (15∶5∶2) as the mobile phase. Apply separately 5 μl of each of the reference drug solution and the test solution to the plate. After developing and removing the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatography obtained with the test solution corresponds in position and colour to the spot in the chromatography obtained with the reference solution.

Other requirements Comply with the general requirements for medical granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (18∶82) as the mobile phase. As detector a spectrophotometer set at 320 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of 2,3,5,4′-tetrahydroxystilbene-2-*O*-β-D-glucoside.

Reference solution Weigh accurately a quantity of 2,3,5,4′-tetrahydroxystilbene-2-*O*-β-D-glucoside CRS, dissolve in methanol to produce the reference solution containing 30 μg per ml.

Test solution Pulverize the granules, obtained under the test of weight variation, to fine powder, weigh accurately 3 g, add accurately 25 ml of methanol, and weigh accurately. Heat under reflux for 30 minutes, cool, and weigh again. Supplement the methanol due to evaporating, mix well, filter, and use the filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 1.5 mg of 2,3,5,4′-tetrahydroxystilbene-2-*O*-β-D-glucoside ($C_{20}H_{22}O_9$) per pack, referred to Radix Polygoni Multiflori Preparata.

Action To nourish the liver and kidney.

Indications Premature graying hair, seminal emission, premature ejaculation, dizziness and tinnitus, aching pain in the back and lower back due to deficiency in the liver and kidney.

Usage and dosage 8 g, 2 times a day, taken with boiled water.

Strength 8 g per pack

Storage Preserve in tightly closed containers.

Qiju Dihuang Wan
(杞菊地黄丸)

Qiju Dihuang Pills

Ingredients Fructus Lycii 40 g; Flos Chrysanthemi 40 g; Radix Rehmanniae Praeparata 160 g; Fructus Corni (processed) 80 g; Cortex Moutan 60 g; Rhizoma Dios-

coreae 80 g; Poria 60 g; Rhizoma Alismatis 60 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix well. To each 100 g of the powder, add 35-50 g of refined honey and a quantity of water to make water-honeyed pills and dry; or add 80-110 g of refined honey to make small honeyed pills or big honeyed pills.

Description Brownish-black water-honeyed pills, blackish-brown small honeyed pills or big honeyed pills; taste, sweet and slightly sour.

Identification (1) Microscopical: Starch granules triangular-ovoid or oblong, 24-40 μm in diameter, hilum short cleft or V-shaped. Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Clusters of calcium oxalate occurring in colourless parenchymatous cells, sometimes several in rows. Epidermal cells of pericarp orange-yellow, subpolygonal in surface view, with beaded anticlinal walls. Parenchymatous cells subrounded, with elliptical pits gathered into pit groups. Anticlinal walls of endodermis cells sinuous, relatively thickened lignified with sparse and fine pit-canals. Stone cells of testa irregular subpolygonal in surface view, walls thickened, sinuous, striations well-defined. Pollen grains subrounded, 24-34 μm in diameter, extine with spinules of 3-5 μm long, and 3 germinal apertures.

(2) Triturate well 9 g of small or big honeyed pills, cut into pieces, with 4 g of kieselguhr; or grind 6 g of water-honeyed pill, and heat under reflux with 40 ml of ether for 1 hour, filter and expel ether from the filtrate. Dissolve the residue in 1 ml of acetone as the test solution. Dissolve paeonol CRS in acetone to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (3∶1) as the mobile phase. Apply separately to the plate 10 μl of each of the two solutions in strip. After developing and removal of the plate, dry in air, spray with a 5% solution of ferric chloride in ethanol acidified by hydrochloric acid, and heat to the strips clear. The bluish-brown strip in the chromatogram obtained with the test solution corresponds in position and colour to the strip in the chromatogram obtained with the reference solution.

(3) Dissolve ursolic acid CRS in ethyl acetate to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and glacial acetic acid (24∶8∶1) as the mobile phase. Apply separately 5 μl of each of the test solution obtained under Identification test (2) and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol and heat at 105℃ for several minutes. The purplish-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Grind well 9 g of water-honeyed pills; or cut 14 g of small or big honeyed pills to pieces. Add 100 ml of water, heat under reflux for 30 minutes, cool, centrifuge, and separate the supernatant. Extract with 50 ml of ethyl acetate by shaking, separate the ethyl acetate layer and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. To 0.5 g of Fructus Lycii reference drug, add 50 ml of water, heat under reflux for 30 minutes, allow to cool, and centrifuge. Separate the supernatant, extract with 30 ml of ethyl acetate by shaking, separate the ethyl acetate layer and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of toluene, ethyl acetate and formic acid (15∶2∶1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay ***Fructus Corni*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, methanol and 0.1% phosphoric acid (10∶5∶85) as the mobile phase. As detector a spectrophotometer set at 236 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of loganin.

Reference solution Weigh accurately a quantity of loganin CRS, dissolve in 50% methanol to prepare a solution containing 40 μg per ml as the reference solution.

Test solution Pulverize the water-honeyed pills or small honeyed pills, or cut the big honeyed pills, obtained under the test of weight variation, into pieces, weigh accurately 1 g in a stopper conical flask, add accurately 25 ml of 50% methanol, stopper tightly and weigh. Heat under reflux for 1 hour, cool, weigh again, replenish the loss of weight with 50% methanol, shake well and filter. Apply accurately 10 ml of successive filtrate to a neutral alumina column (100-200 mesh, 4 g, 1 cm in diameter), elute with 50 ml of 40% methanol, collect the eluates, and evaporate to dryness. Dissolve the residue in 50% methanol and transfer accurately to a 5 ml volumetric flask, add 50% methanol to volume, and shake well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 0.42 mg per gram of the water-honeyed pills, 0.30 mg per gram of the small honeyed pills, 2.7 mg per big honeyed pill, of loganin ($C_{17}H_{26}O_{10}$), referred to Fructus Corni.

Cortex Moutan Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (70∶30) as the mobile phase. As detector a spectrophotometer set at 274 nm. The number of theoretical plates of the column is not less than 3500, calculated with the reference to the peak of paeonol.

Reference solution Weigh accurately a quantity of paeonol CRS, dissolve in 50% methanol to prepare a solution containing 40 μg per ml as the reference solution.

Test solution Pulverize the water-honeyed pills or small honeyed pills, or cut the big honeyed pills, obtained under the test of weight variation, into pieces, weigh accurately 0.5 g in a stopper conical flask, add accurately 50 ml of 70% methanol, stopper tightly and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 45 minutes, cool, weigh again, replenish the loss of weight with 70% methanol, and shake well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 20 μl of the test solution into the column, respectively, and calculate the content.
It contains not less than 0.80 mg per gram of the water-honeyed pills, 0.60 mg per gram of the small honeyed pills, 5.4 mg per big honeyed pill, of paeonol ($C_9H_{10}O_3$), referred to Cortex Moutan.

Action To nourish the kidney and liver.

Indications Dizziness, tinnitus, photophobia, dacryorrhea irritated by wind and blurred vision due to *yin* deficiency in the liver and kidney.

Usage and dosage 6 g of water-honeyed pills, 9 g of small honeyed pills or 1 big honeyed pill, twice a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Qili San
(七厘散)

Qili Powder

Ingredients Sanguis Draconis 500 g; Olibanum (processed) 75 g; Myrrha (processed) 75 g; Flos Carthami 75 g; Catechu 120 g; Borneolum Syntheticum 6 g; Moschus 6 g; Cinnabaris 60 g.

Procedure Levigate Cinnabaris to very fine powder. Pulverize Sanguis Draconis, Olibanum, Myrrha, Flos Carthami and Catechu to fine powder. Triturate Moschus and Borneolum Syntheticum with the above powders, sift and mix thoroughly.

Description Vermilion to purplish-red powder or loose masses; odour, aromatic; taste, pungent, bitter and with cooling sensation.

Identification (1) Microscopical: Irregular pieces sanguineous, arounded with bright yellow liquid and turning gradually to red. Irregular masses colourless or pale yellow, with plenty of minute granules scattered on surface and around, dissolved on long standing Fragments of corolla yellow, with reddish-brown or yellowish-brown long tubular secretory cells. Pollen grains round or ellipsoidal, about 60 μm in diameter, extine with spinules and 3 germinal apertures. Irregular minute granules dark brownish-red, lustrous, and with dark black edges.
(2) To 0.2 g add 2 ml of ethanol, shake and filter. Place 5 drops of the filtrate on a white porcelain dish, add 3 drops of 1% hydrochloric acid solution and 2 ml of 0.5% solution of *p*-dimethyl amino benzaldehyde in ethanol. Heat on a water bath, a purple or purplish-red colour is produced around the solution.
(3) To 0.2 g add 5 ml of ether, stopper closely, shake for 10 minutes, filter and use the filtrate as the test solution. Prepare a solution with 0.1 g of Sanguis Draconis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (19∶1) as the mobile phase. Apply separately to the plate 10 μl of each of the two solutions. After developing and removal of the plate, dry in air. The two spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Extractives To about 2 g, accurately weighed, carry out the hot extraction method under the determination of ethanol soluble extractives (Appendix Ⅹ A), using ethanol as the solvent. It contains not less than 60% of extractive.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, 0.05 mol/L solution of sodium dihydrogen phosphate (50∶50) as the mobile phase. As detector a spectrophotometer set at 440 nm. Maintain the temperature of the column at 40℃. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of dracorhodin.

Reference solution Weigh accurately 9 mg of dracorhodin perchlorate CRS in a 50 ml amber volumetric flask, dissolve and dilute with 3% solution of phosphoric acid in methanol to volume and shake well. Measure accurately 1 ml to a 5 ml amber volumetric flask, dilute with methanol to the volume and shake well (containing 26 μg of dracorhodin per ml) (each mg of dracorhodin perchlorate is equivalent to 0.726 mg of dracorhodin).

Test solution Weigh accurately 0.10-0.15 g of the powder, obtained under the test of packing variation and ground to fine powder, in a 15 ml test tube with stopper, add accurately 10 ml of 3% solution of phosphoric acid in methanol, stopper well, shake for 3 minutes and filter. Measure accurately 1 ml of the successive filtrate in a 5 ml amber volumetric flask, dilute with methanol to volume and shake well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.
It contains not less than 5.5 mg of dracorhodin ($C_{17}H_{14}O_3$) per gram, referred to Sanguis Draconis.

Action To resolve stagnant blood to reduce swelling, and kill pain and arrest bleeding.

Indications Injuries from fall or stumble, bruise and pain and traumatic hemorrhage.

Usage and dosage 1-1.5 g, 1-3 times a day; or mixed with liquid and applied topically.

Precaution Contraindicated for pregnant women.

Strength (1) 1.5 g (2) 3 g per bottle

Storage Preserve in tightly closed containers, store in a cool place.

Qinbaohong Zhike Pian
(芩暴红止咳片)

Qinbaohong Zhike Tablets

Ingredients Folium Rhododendri Daurici 1050 g; Cortex Syringae Amurensis 1050 g; Radix Scutellariae 500 g.

Procedure Decoct Radix Scutellariae with water for three times, 2 hours for the first time, and 1 hour each for the second and third time. Filter the decoction, combine the filtrate and concentrate to a thin extract of relative density of 1.03-1.08 (80℃). Adjust to pH 1.0-2.0 with dilute hydrochloric acid, keep warm at 80℃ for one hour, and stand for 24 hours. Filter, wash the precipitate to pH 4.0 with ethanol, continue wash to pH 7.0 with water, dry at low temperature, and grind. Distil volatile oil of Folium Rhododendri Daurici, keep water solution for further use.

Decoct the residue with water for two times, 2 hours for each, filter, and combine the filtrate. Decoct Cortex Syringae Amurensis with water for three times, 2 hours for the first time, 1 hour each for the second and third time, and filter. Combine the filtrate, mix with the extract of Folium Rhododendri Daurici, and concentrate to a quantity. Dry in vacuum at low temperature, grind, add the above extract of Radix Scutellariae and a quantity of adjuvant, make granules, and dry. Mix thoroughly volatile oil of Folium Rhododendri Daurici with a quantity of calcium carbonate, then mix thoroughly with the above granules, compress into 1000 tablets, and coat with sugar or film.

Description Sugar or film coats tablets with brown colour cores; taste bitter and astringent.

Identification (1) Pulverize 8 film coats tablets or sugar coats tablets, removed sugar coats for sugar coat tablets, add 20 ml of ether, and shake for 15 minutes. Take the ether solution, evaporate to dryness, dissolve the residue in 30 ml of 40% ethanol, by heating on a water bath for three times, and filter in warm. Combine the filtrate, evaporate to dryness, and dissolve the residue with 1 ml of methanol as the test solution. Prepare a solution with 1 g of Folium Rhododendri Daurici reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and formic acid (7∶2∶0.5) as the mobile phase. Apply separately 2 μl of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with alumium chloride TS and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(2) Expel the ether solvent of the residue obtained under Identification (1). To 1 g, add 3 ml of 75% ethanol, filter, and use the filtrate as the test solution. Dissolve a quantity of baicalin CRS in 75% ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using acetic acid as the mobile phase. Apply separately 2 μl of each of the above two solutions to a polyamide membrane. After developing and removal of the membrane, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Pulverize 5 film coats tablets or sugar coats tablets, removed sugar coats for sugar coat tablets, add 20 ml of methanol, and ultrasonicate for 20 minutes. Filter, evaporate the filtrate, dissolve the residue with 40% methanol, apply to a neutral alumina oxide column (100-200 mesh, 10 g, 1 cm in diameter), and elute with 50 ml of 40% methanol. Collect the eluate, evaporate to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Dissolve a quantity of syringoside CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (5∶1∶0.1) as the mobile phase. Apply separately 5 μl of the above two solutions to the plate. After developing and removal of the plate, dry it in air, spray with 10% solution of sulfuric acid in ethanol, and heat at 105℃ to spot distinct. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and glacial acetic acid (45∶55∶1) as the mobile phase. As detector a spectrophotometer set at 276 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of baicalin.

Reference solution Dissolve a quantity of baicalin CRS, weighed accurately, in 50% methanol to produce a solution containing 0.1 mg of baicalin per ml.

Test solution Pulverize 10 tablets, removed coats and weighed accurately, to fine powder, weigh a quantity (equivalent to the weight of 1 tablet) in a stopper conical flask, add accurately 100 ml of 50% methanol, stopper, weigh, ultrasonicate (power 200 W, frequency 40 kHz) for 10 minutes, allow to cool, weigh again, replenish the lost weight with 50% methanol, and mix thoroughly. Filter, and use the filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, determine and calculate.
It contains not less than 13.0 mg of baicalin ($C_{21}H_{18}O_{11}$) per tablet, referred to Radix Scutellariae.

Action To clear *heat* and resolve *phlegm*, and relieve coughing and asthma.

Indications Coughing with copious phlegm due to *phlegm-heat* retained in the lung; acute bronchitis and sudden attack by chronic bronchitis with above symptoms.

Usage and dosage 3-4 tablets, 3 times a day.

Strength 0.4 g per film coated tablet

Storage Preserve in tightly closed container.

Qing'e Wan (青娥丸)

Qing'e Pills

Ingredients Cortex Eucommiae (stir-baked with salt) 480 g; Fructus Psoraleae (stir-baked with salt) 240 g; Semen Juglandis (stir-baked) 150 g; Bulbus Allii 120 g.

Procedure Steam Bulbus Allii, dry and pulverize with Cortex Eucommiae and Fructus Psoraleae to fine powder, and sift. Triturate Semen Juglandis with the above powders, sift and mix thoroughly. To each 100 g of the powder, add 20-30 g of refined honey and a quantity of water, make water-honeyed pills and dry; or add 50-70 g of refined honey to make big honeyed pills.

Description Brown to blackish-brown water-honeyed or big honeyed pills; odour, slightly aromatic; taste, bitter, sweet and pungent.

Identification Microscopical: Rubber threads striped or twisted like a mass with granular surface. Testa palisade cells pale brown or reddish-brown, subpolygonal in surface view, wall slightly thickened, lumina containing reddish-brown substance. Epidermal cells of testa polygonal, sometimes oblate stomata visible, about 66 μm wide, guard cells broad reniform; fatty oil drops numerous.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A), except that disintegration time for water-honeyed pills should be within 2 hours.

Action To reinforce the kidney and strengthen the back.

Indications Lower back pain due to deficiency in the kidney,

accompanied with difficulty in sitting and weakness in knees.

Usage and dosage 6-9 g of water-honeyed pills or 1 big honeyed pill, 2-3 times a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Qingfei Xiaoyan Wan (清肺消炎丸)

Qingfei xiaoyan Pills

Ingredients Herba Ephedrae; Gypsum Fibrosum; Pheretima; Fructus Arctii; Semen Lepidii seu Descurainiae; Calculus Bovis, Artifactus; Semen Armeniacae Amarum (stir-baked); Cornu Saigae Tataricae.

Procedure Grind Cornu Saigae Tataricae to ultra fine powder and pulverize the other ingredients except Calculus Bovis Artifactus to fine powder. Triturate with Cornu Saigae Tatariae and Calculus Bovis Artifactus powders, mix well and sift. To each 100 g of the powder add 60-80 g of refined honey and a quantity of water to make water-honeyed pills.

Description Brown water-honeyed pills; odour, stinking; taste, slightly pungent and bitter.

Identification (1) Microscopical: Stomata Characteristic, guard cells dumbbell-like in lateral view; fibers with fine crystals. Irregular plate crystals colourless with straight striations. Stone cells orange, conchoid-shaped, walls relatively thickened, pits at the broader end well-marked. Muscle fibers colourless to pale brown, undulant or crisscrossing arranged vertically. Endepidermal cells of testa yellow, polygonal or elongated polygonal, walls slightly thickened.

(2) Cut 20 pills into pieces, add 2 ml of dilute hydrochloric acid, stand for 30 minutes to dissolve, filter, the filtrate yields the reactions characteristic of calcium salt and sulfate (Appendix Ⅳ).

(3) Cut 20 pills into pieces, add 4 ml of chloroform, stir well, stand for 1 hour, use the supernatant as the test solution. Dissolve cholic acid CRS in dehydrated ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ether and glacial acetic acid (2∶2∶1) as the mobile phase. Apply separately to the plate 1 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Grind 10 g of the pills into powder, add 20 ml of chloroform and 3 ml of hydrochloric acid, heat under reflux for 1 hour, filter, and evaporate the filtrate to dryness. To the residue add 15 ml of ethyl acetate and 0.5 g of active carbon, heat to boil, filter, concentrate the filtrate to 1 ml and use it as the test solution. Prepare a solution with 0.5 g of Fructus Arctii reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃), toluene, ether acetic, and glacial acetic acid (10∶20∶7∶0.5) as the mobile phase. Apply separately 6-10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% ferric chloride in ethanol (acidified with hydrochloric acid), heat at 105℃ to the spots clear, The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Weigh accurately 3 g, in pieces, macerate with 10 ml of 2% alkaline methanol solution for 30 minutes, ultrasonicate for 10 minutes, centrifuge (3600 rpm) and separate the supernatant. Repeat the above operation for 3 times, combine the supernatants, and evaporate to dryness. Dissolve the residue in 30 ml of saturated sodium chloride solution, adjust to pH 9 with concentrated ammonium TS. Extract with five 20-ml quantities of ether, by shaking, combine the extracts, concentrate the ether extract to nearly dryness. Dissolve the residue with a quantity of methanol, filter to a 10 ml volumetric flask, dilute with methanol to volume and mix well as the test solution. Dissolve ephedrine hydrochloride, weighed accurately, in methanol to produce a solution containing 0.14 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using a procoated high performance silica gel plate as the stationary phase and a mixture of chloroform, methanol and concentrated ammonium TS (20∶3.5∶0.6) as the mobile phase. Apply accurately to the plate 4 μl of the test solution, 2 μl and 4 μl of the reference solution separately. After developing and removal of the plate, dry in air. Spray with 0.2% ninhydrine in ethanol, heat at 105℃ to the spots clear, and stand for 30 minutes. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan at the wavelength: $\lambda_S = 490$ nm, $\lambda_R = 440$ nm. Measure the integration value of absorbance of the test solution and the reference solution and calculate.

It contains not less than 0.10 mg of ephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) per gram, referred to Herba Ephedrae.

Action To clear the lung and resolve *phlegm*, and relieve coughing and asthma.

Indications Stagnation of *phlegm-heat* in the lung, coughing with shortness of breath and expectoration of yellow, sticky *phlegm*, distending pain in the chest and hypochondria; upper respiratory tract infection, acute bronchitis, acute attack of chronic bronchitis and pulmonary infection with above symptoms.

Usage and dosage 10 pills for infants within 1 year old, 20 pills for children from 1 to 3 years old, 30 pills for children from 3 to 6 years old, 40 pills for children from 6 to 12 years old, 60 pills for children over 12 years old and adults, 3 times a day.

Precaution Be cautious with patients with cough due to exterior *wind-cold* and cardiac insufficiency.

Strength 8 g per 60 pills

Storage Preserve in tightly closed containers.

Qingfei Yihuo Wan (清肺抑火丸)

Qingfei Yihuo Pills

Ingredients Radix Scutellariae 140 g; Fructus Gardeniae 80 g; Rhizoma Anemarrhenae 60 g; Bulbus Fritillariae

Thunbergii 90 g; Cortex Phellodendri 40 g; Radix Sophorae Flavescentis 60 g; Radix Platycodonis 80 g; Radix Peucedani 40 g; Radix Trichosanthis 80 g; Radix et Rhizoma Rhei 120 g.

Procedure Pulverize the above ten ingredients to fine powder, sift, mix thoroughly, make pills with water and dry; or to each 100 g of the powder add 130-150 g of refined honey to make big honeyed pills.

Description Pale yellow to yellowish-brown watered pills, or brown big honeyed pills; odour, slight; taste, bitter.

Identification (1) Microscopical: Starch granules ovoid, 35-48 μm in diameter, hilum pointed, V-shaped or hoof-shaped, situated at the smaller end, striations fine and dense. Phloem fibres pale yellow, fusiform, walls thickened, with fine pit-canals. Fibre bundles bright yellow, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres; walls of crystal cells lignified and thickened. Fibre bundles colourless, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres. Needle crystals of calcium oxalate in bundles or scattered, 26-110 μm long. Clusters of calcium oxalate large, 60-140 μm in diameter. Bordered pitted vessels large, frequently broken, some bordered pits hexangular or rhombic, closely arranged. Anastomosing laticiferous tubes 14-25 μm in diameter, containing pale yellow granules. Stone cells of testa yellow or pale brown, mostly broken, when whole, long-polygonal, rectangular or irregular, walls thickened, with big rounded pits, lumina brownish-red.

(2) Pulverize 2 g of the watered pills to powder; or triturate well 3 g of the big honeyed pills, in pieces, with a quantity of kieselguhr. Add 20 ml of methanol, ultrasonicate for 30 minutes, cool, filter, and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 4% sodium acetate in sodium carboxymethylcellulose solution as the coating substance and a mixture of ethyl acetate, butanone, and formic acid (5∶3∶1∶1) as the mobile phase. Apply separately 5 μl of each of the reference solution and the test solution to the plate. After developing and removal of the plate, dry in air, spray with 1% ferric chloride in ethanol. A dark green spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Pulverize 6 g of the watered pills to powder; or triturate well 9 g of the big honeyed pills, in pieces, with a quantity of kieselguhr. Add 30 ml of methanol, ultrasonicate for 20 minutes, cool, filter, and evaporate the filtrate to 10 ml. Apply to a small column (1.5 cm in diameter) packed with neutral aluminium oxide (100-200 mesh, 5 g), elute with 30 ml of methanol, collect the eluates, and evaporate to dryness. Dissolve the residue in 5 ml of methanol as the test solution. Dissolve geniposide CRS in ethanol to produce a solution containing 4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, acetone, formic acid, and water (5∶5∶1∶1) as the mobile phase. Apply separately 5 μl of each of the reference solution and the test solution to the plate. After developing and removal of the plate, dry in air. Spray with sulfuric acid solution in methanol (5→10), heat at 110℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

(4) Pulverize 2 g of the watered pills to powder, add 3 ml of concentrated ammonia TS and 20 ml of chloroform; or triturate well 3 g of the big honeyed pills, in pieces, with a quantity of kieselguhr, add 5 ml of concentrated ammonia TS and 40 ml of chloroform. Heat under reflux for 1 hour, cool, filter, and wash the filtrate with two 20-ml quantities of 1% sodium hydroxide solution. Separate the chloroform layer and evaporate to dryness. Dissolve the residue in 2 ml of methanol as the test solution. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate, isopropanol, methanol, and concentrated ammonia TS (12∶6∶3∶3∶1) as the mobile phase. Apply separately 2 μl of each of the reference solution and the test solution to the plate. After developing in a chamber pre-equilibrated with concentrated ammonia vapour, remove the plate and dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

(5) Pulverize 6 g of the watered pills to powder, add 2 ml of concentrated ammonia TS and 30 ml of chloroform; or triturate well 9 g of the big honeyed pills, in pieces, with a quantity of kieselguhr, add 6 ml of concentrated ammonia TS and 50 ml of chloroform. Allow to stand overnight, filter, evaporate the filtrate to dryness, and dissolve the residue in 2 ml of chloroform as the test solution. Dissolve matrine CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, acetone, ethyl acetate, and concentrated ammonia TS (2∶3∶4∶0.2) as the mobile phase. Apply separately 2 μl of each of the reference solution and the test solution to the plate. After developing and removal of the plate, dry in air. Spray with dilute potassium iodobismuthate TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

(6) Pulverize 2 g of the watered pills to powder; or triturate well 3 g of the big honeyed pills, in pieces, with a quantity of kieselguhr. Add 20 ml of methanol, macerate for 1 hour. Ultrasonicate for 15 minutes, cool, and filter. Evaporate 5 ml of the filtrate to dryness, dissolve the residue in 10 ml of water. Add 1 ml of hydrochloric acid, heat under reflux for 30 minutes, and cool immediately. Extract with two 20-ml quantities of ether, combine the ether extracts, and evaporate to dryness. Dissolve the residue in 2 ml of methanol as the test solution. Prepare a solution with 0.1 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of petroleum ether (60-90℃), ethyl formate, and formic acid (15∶5∶1) as the mobile phase. Apply separately 2 μl of each of the reference drug solution and the test solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. Five orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference drug solution; expose the plate to concentrated ammonia vapour and examine in sunlight, the spots turn to red.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water, and phosphoric acid (38∶62∶0.3) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin, dissolve in 70% methanol to produce the reference solution containing 20 μg per ml.

Test solution Pulverize the watered pills to powder, weigh accurately 0.5 g; or weigh accurately 0.5 g of the big honeyed pills, obtained under the test of weight variation, cut into pieces, and triturate well with a quantity of kieselguhr. Transfer to a 250 ml round-bottomed flask, add accurately 100 ml of 70% methanol and weigh. Heat under reflux for 3 hours, cool, and weigh again. Replenish the loss of weight with 70% methanot, mix well and filter, use the filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.
It contains not less than 4.5 mg of baicalin ($C_{21}H_{18}O_{11}$) per gram for watered pills, 50.0 mg for each big honeyed pills, referred to Radix Scutellariae.

Action To remove *heat* from the lung, relieve cough, resolve *phlegm* and relax bowels.

Indications *Heat* in the lung marked by cough with yellowish sticky *phlegm*, dryness of the mouth, sore throat and constipation.

Usage and dosage 6 g of watered pills, 1 big honeyed pill, 2-3 times a day.

Precaution Be cautious about pregnant women.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Qingguo Wan
(青果丸)

Qingguo Pills

Ingredients Fructus Canarii 100 g; Flos Lonicerae Japonicae 100 g; Radix Scutellariae 100 g; Rhizoma Menispermi 100 g; Radix Ophiopogonis 100 g; Radix Scrophulariae 100 g; Radix Paeoniae Alba 100 g; Radix Platycodonis 100 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix thoroughly. To each 100 g of the powder add 40-50 g of refined honey and a quantity of water to make water-honeyed pills, dry, coat with corn protein, dry in air; or to each 100 g of the powder add 110-130 g of refined honey to make big honeyed pills.

Description Blackish-brown water-honeyed pills or big honeyed pills; taste, slightly bitter.

Identification (1) Microscopical: Stone cells of endocarp pale yellow or almost colourless, walls thick, pit-canals and pits distinct, containing yellowish-brown masses. Pollen grains subrounded, up to about 76 μm in diameter, external walls with spinules and 3 germinal apertures. Phloem fibres pale yellow, fusiform, walls thick, pit-canals fine. Stone cells yellowish-brown or colourless, subrectangular, subrounded or irregular, striations obvious, up to about 94 μm in diameter. Clusters of calcium oxalate 18-32 μm in diameter, occurring in parenchymatous cells, often arranged in rows or several in one cell.
(2) To 60 water-honeyed pills or 1 big honeyed pill, cut into pieces, add 40 ml of methanol, ultrasonicate for 40 minutes, filter, evaporate the filtrate to dryness. Dissolve the residue in 20 ml of water, apply to a column of macroporous resin D101 (2 cm in internal diameter, 15 cm long), elute with 50 ml of water, discard the aqueous solution, and elute again with 50 ml of 20% ethanol, 40 ml of 40% ethanol successively, collect the eluate separately. Evaporate the eluate of 20% ethanol to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve chlorogenic acid CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose prepared with 4% solution of sodium acetate as the coating substance and the upper layer of the mixture of butyl acetate, formic acid and water (2∶1∶1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Evaporate the eluate of 40% ethanol obtained under Identification test (2) to dryness. Dissolve the residue in 5 ml of methanol as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40∶5∶10∶0.2) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 5% solution of vanillin in sulfuric acid and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(4) Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with carboxymethylcellulose sodium prepared with a 4% solution of sodium acetate as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5∶3∶1∶1) as the mobile phase. Apply separately in strips 10 μl of the test solution obtained under Identification test (3) and the above reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% ferric chloride in ethanol acidified with hydrochloric acid. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(5) Pulverize 3 g of the water-honeyed pills to powder; or triturate well 1 big honeyed pill, in pieces, with 2 g of kieselguhr. Add 4 ml of concentrated ammonia TS, mix well, and allow to stand for 1 hour. Add 25 ml of chloroform, heat under reflux for 1 hour, cool, and filter. Separate the chloroform layer, evaporate to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Prepare a solution with 1 g of Rhizoma Menispermi reference drug and 4 ml of concentrated ammonia TS in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of chloroform, acetone, methanol, and ammonia TS (20∶3∶2∶0.1) as the mobile phase. Apply separately 4 μl of the

test solution and 2 μl of the reference drug solution to the plate. After developing and removing the plate, dry in air. Spray with dilute potassium iodobismuthate TS, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(6) Pulverize 5 g of the water-honeyed pills to powder; or triturate well 2 g of big honeyed pill, in pieces, with 2 g of kieselguhr. Triturate with 30 ml of water, and transfer to a conical flask. Add 1 ml of hydrochloric acid, heat under reflux on a water bath for 1 hour, cool, and filter. Extract the filtrate by shaking with two 20-ml quantities of chloroform, combine the chloroform extracts, and wash with 30 ml of water. Separate the chloroform layer, and dehydrate with a quantity of anhydrous sodium sulfate. Filter and evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution with 1 g of Radix Ophiopogonis reference drug and 30 ml of water in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and acetone (4∶1) as the mobile phase. Apply separately 4 μl of the test solution and 2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(7) Pulverize 3 g of the water-honeyed pills to powder; or triturate well 1 big honeyed pill, in pieces, with 2 g of kieselguhr. Add 20 ml of *n*-butanol saturated with water, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol, add 2 g of neutral aluminium oxide, stir well on a water bath, and dry. Apply to a small column (1-1.5 cm in diameter) packed with neutral aluminium oxide (100-200 mesh, 4 g,), and elute with 50 ml of methanol. Collect the eluates, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution with 1 g of Radix Scrophulariae reference drug and 20 ml of *n*-butanol saturated with water in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol, and water (5∶1∶0.1) as the mobile phase. Apply separately 4 μl of each of the reference drug solution and the test solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% vanillin in sulfuric acid, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol-water-phosphoric acid (47∶53∶0.2) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin, dissolve in methanol to produce the reference solution containing 0.1 mg per ml.

Test solution Pulverize 2 g of the weter-honeyed pills to powder, weigh accurately 1 g; or cut a quantity of big honeyed pills, obtained under the test of weight variation, into pieces, weigh accurately 1 g, and triturate well with 0.5 g of kieselguhr. Add 40 ml of 70% ethanol, heat under reflux for 2 hours, cool, and filter. Wash the container and residue with a quantity of 70% ethanol. Combine the washings and the filtrate to a 100 ml volumetric flask, dilute to volume with 70% ethanol, mix well, filter, and use the successive filtrate as the test solution.

procedures Inject accurately 5 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 6.0 mg of baicalin ($C_{21}H_{18}O_{11}$) per gram for water-honeged pills, 25.0 mg for per big honeyed pill, referred to Radix Scutellariae.

Action To clear *heat* to relieve sore throat, and reduce swelling and relieve pain.

Indications Reddened, swollen throat, aphonia, hoarseness, dry mouth and tongue, or dry cough with expectoration of scanty *phlegm* due to accumulation of heat in the lung and stomach.

Usage and dosage 8 g of water-honeyed pills, or 2 big honeyed pills, 2 times a day.

Precaution Avoid pungent and spicy food.

Strength 1 g per 10 water-honeyed pills; 6 g per big honeyed pill

Storage Preserve in tightly closed containers.

Qinghou Liyan Keli
(清喉利咽颗粒)

Qinghou Liyan Granules

Ingredients Radix Scutellariae; Fructus Terminaliae Immaturus; Radix Platycodonis; Caulis Bambusae in Taenia; Semen Sterculiae Lychnophorae; Exocarpium Citri Rubrum; Fructus Aurantii; Folium Mori; Rhizoma Cyperi (processed with vinegar); Fructus Perillae; Caulis Perillae; Lignum Aquilariae Resinatum; Mentholum.

Procedure Distill volatile oil from Lignum Aquilariae Resinatum, and filter the aqueous liquid of distillation. Macerate warmly Semen Sterculiae Lychnophorae with water and filter. Decoct the other ingredients, except mentholum, with water and filter. Combine the above filtrates, stand, filter and concentrate to a thick extract. To the thick extract add a quantity of sucrose and make granules, dry, sift, add mentholum and volatile oil of Lignum Aquilariae Resinatum, make 1155 g of granules; or dry the thick extract, add a quantity of lactose and aspartame, make granules. Dry, sift, add mentholum and volatile oil of Lignum Aquilariae Resinatum, sift and mix thoroughly, make 578 g granules.

Description Yellowish-brown granules; odour, aromatic; taste, sweet and slightly bitter.

Identification (1) To 5 g of the granules or 2.5 g of the granules (with lactose), pulverize to fine powder. Add 20 ml of acetone, ultrasonicate for 10 minutes and filter, and evaporate the filtrate to 2 ml as the test solution. Weigh 1 g of Fructus Chebulae Immaturus reference drug, add 10 ml of acetone, ultrasonicate for 10 minutes, filter, and use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica

gel G as the coating substance and a mixture of chloroform, ethyl acetate, acetone and glacial acetic acid (5∶2∶2∶1) as the mobile phase. Apply separately 5 μl of each of the reference drug solution and the test solution to the plate. After developing and removal of the plate, dry in air. Spray with ammoniated silver nitrate TS, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) To 20 g of the granules or 10 g of the granules (with lactose), pulverize to fine powder. Add 40 ml of ethyl acetate, heat under reflux for 30 minutes, filter, and concentrate the filtrate to 1 ml as the test solution. Dissolve naringin CRS in ethyl acetate to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, butanone, formic acid, and water (5∶3∶1∶1) as the mobile phase. Apply separately 5 μl of each of the reference solution and the test solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% aluminium trichloride in ethanol, heat at 105℃ for several minutes, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution correspond in position and colour to the spot in chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and glacial acetic acid (34∶66∶1) as the mobile phase. As detector a spectrophotometer set at 283 nm. The number of theoretical plates of the column is not less than 3650, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin CRS, dissolve with dilute ethanol to produce a solution containing 50 μg per ml as the reference solution.

Test solution Weigh accurately 1 g or 0.5 g (with lactose), obtained in the test of packing variation and pulverized to fine powder, in a 50 ml stopper conical flask, add accurately 20 ml of water, weigh, dissolve by heating, allow to cool, weigh again, replenish the loss of weight with water, mix well. Add accurately 20 ml of ethanol, mix well, stand overnight and filter with a microporous film (0.45 μm), Use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution to the column and determine. It contains not less than 13.0 mg of baicalin ($C_{21}H_{18}O_{11}$) per pack, referred to Radix Scutellariae.

Action To clear *heat* to relieve the sore throat, soothe the chest and moisten the throat, and protect the vocal cord.

Indications Dry throat and hoarseness due to affliction from external *wind-heat*, acute and chronic pharyngitis or tonsillitis with above symptoms.

Usage and dosage Taken after dissolving in boiled water. 1 bag, 2-3 times a day.

Strength (1) 5 g per bag (lactose granules)
(2) 10 g per pack

Storage Preserve in well closed containers.

Qinghouyan Heji (清喉咽合剂)

Qinghouyan Mixture

Ingredients Radix Rehmanniae 180 g; Radix Ophiopogonis 160 g; Radix Scrophulariae 260 g; Fructus Forsythiae 315 g; Radix Scutellariae 315 g.

Procedure Pulverize the above five ingredients to coarse powder. Carry out the method for percolation as described under extracts and liquid extracts (Appendix Ⅰ O), macerate with 57% ethanol for 24 hours, then percolate slowly at a speed of 1 ml per minute, collect about 6000 ml of percolate, recover ethanol in vacuum and concentrate to about 1400 ml, add 800 ml of water, boil for 30 minutes, allow to stand for 48 hours, filter. Wash the residue with a small quantity of water, combine the washing with the filtrate and concentrate to about 1000 ml in vacuum. Add 3 g of sodium benzoate, stir, allow to stand for 24 hours, filter, add water to 1000 ml and mix well.

Description A brown clear liquid; taste, bitter.

Identification (1) To 1 ml add 25 ml of methanol, ultrasonicate for 20 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 4 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of acetate, butanone, formic acid, and water (5∶3∶1∶1) as the mobile phase. Apply separately 5 μl of each of the reference solution and the test solution to the plate. After developing and removing the plate, dry in air, and spray with 1% solution of ferric chloride. A dark-green spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

(2) Extract 10 ml with three 10-ml quantities of chloroform, combine the extracts, and evaporate to dryness. Dissolve the residue in 2 ml of methanol as the test solution. Dissolve forsythin CRS in methanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, acetone, ethyl acetate, formic acid, and water (7∶8∶5∶1∶1) as the mobile phase. Apply separately 2 μl of each of the reference solution and the test solution to the plate. After developing and removing the plate, dry in air. Spray with vanillin in sulfuric acid TS, and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

(3) Extract 1 ml with two 10-ml quantities of ethyl acetate, and discard the ethyl acetate extracts. Extract again with two 10-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. To 1 g of the Radix Scrophulariae reference drug, add 20 ml of *n*-butanol saturated with water, ultrasonicate for 30 minutes and filter, evaporate the filtrate to dryness, and dissolve the residue in 2 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (13∶2) as the mobile phase. Apply separately 2 μl of each

of the reference drug solution and the test solution to the plate. After developing and removing the plate, dry in air. Spray with the vanillin in sulfuric acid TS, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference drug solution.

Relative density 1.02-1.10 (Appendix Ⅶ A).

pH value 4.0-6.0 (Appendix Ⅶ G).

Other requirements Complies with the general requirements for mixture (Appendix Ⅰ J).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.2% solution of phosphoric acid (28∶72) as the mobile phase. As detector a spectrophotometer set at 278 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin, dissolve in methanol to produce the reference solution containing 0.2 mg per ml.

Test solution Weigh accurately 1.2 g of the mixture to a 50 ml volumetric flask, add a quantity of methanol, ultrasonicate (power 135 W, frequency 59 kHz) for 20 minutes, allow to cool, dilute to volume with methanol, and shake well. Measure accurately 10 ml to a 25 ml volumetric flask, dilute to volume with methanol and mix well. Filter and use the successive filtrate as the test solution.

It contains not less than 14 mg of baicalin ($C_{21}H_{18}O_{11}$) per ml, referred to Radix Scutellariae.

Action To nourish *yin* and clear the lung, and relieve sore throat and remove toxic materials.

Indications Swelling and sore throat, dry throat, swelling of tonsil due to *dry-heat* from *yin* deficiency and internal *toxic-heat* stagnation.

Usage and dosage 20 ml for the first time, and then 10-15 ml, 4 times a day; appropriate reduction of the dosage for children.

Strength (1) 100 ml per bottle (2) 150 ml per bottle

Storage Preserve in tightly closed containers, stored in a cool place.

Qinghuozhimai Pian
(清火栀麦片)

Qinghuozhimai Tablets

Ingredients Herba Andrographis 800 g; Fructus Gardeniae 100 g; Radix Ophiopogonis 100 g.

Procedure Pulverize 140 g of Herba Andrographis and Fructus Gardeniae to fine powder, sift. Decoct the remainder of Herba Andrographis and Radix Ophiopogonis with water twice, 2 hours for each time, combine the decoction, filter and concentrate the filtrate to a thick extract with a relative density of 1.30-1.40. Stir thoroughly with the fine powder, a quantity of excipient, make granules, make into 1000 tablets and coat with sugar.

Description Sugar coated tablets with brownish-green or yellowish-brown to dark brown colour core; taste very bitter.

Identification (1) Pulverize 10 tablets, removed the sugar coats, to fine powder, add 30 ml of petroleum ether (60-90℃), heat under reflux for 30 minutes, discard the petroleum ether, evaporate the residue to dryness, then heat under reflux with 30 ml of dehydrated ethanol for 30 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 2 ml of dehydrated ethanol as the test solution. Dissolve andrographolide CRS in dehydrated ethanol to produce a solution containing 3 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B,) using silica gel GF_{254} as the coating substance, and a mixture of chloroform, ethyl acetate and dehydrated ethanol (9∶6∶1) as the mobile phase. Apply separately 5 μl of the reference solution and 1-4 μl of the test solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Dissolve geniposide CRS in methanol to produce a solution containing 4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of chloroform and methanol (3∶1) as the mobile phase. Apply separately 5 μl of the reference solution and 2 μl of the test solutions obtained under Identification test (1) to the plate. After developing and removal of the plate, dry in air. Spray with a sulfuric acid solution (1→10), heat at 105℃ to the spot clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with and the reference solution.

(3) Pulverize 5 tablets, removed the sugar coats, to fine powder, add 20 ml of 3.6% hydrochloric acid solution, heat under reflux for 1 hour, cool and filter, extract the filtrate with two 10-ml of chloroform, combine the chloroform extracts, evaporate to dryness, dissolve the residue in 2 ml of dehydrated ethanol as the test solution. Decoct 0.5 g of Radix Ophiopogonis reference drug with water for 1 hour, filter, concentrate the filtrate to a thick extract. Prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance, and a mixture of chloroform and acetone (4∶1) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay ***Herba Andrographis*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use Octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (55∶45) as the mobile phase. As detector a spectrophotometer set at 230 nm for andrographolide and 250 nm for dehydroandrographolide. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of andrographolide and dehydroandrographolide separately.

Reference solution Dissolve a quantity of andrographolide CRS and dehydroandrographolide CRS, weigh accurately, in

methanol to produce a mixture containing 20 μg of each per ml as the reference solution.

Test solution Take 20 tablets, removed sugar coats, pulverize to fine powder. Weigh accurately 0.3 g of the powder in a 50 ml volumetric flask, add a quantity of methanol, ultrasonicate (power 250 W, frequency 50 kHz) for 30 minutes, cool. Dilute with methanol to the volume, shake well and filter, use the successive filtrate as the test solution.

procedure Inject accurately 10 μl of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 1.0 mg of the total amount of andrographolide ($C_{20}H_{30}O_5$) and dehydroandrographolide ($C_{20}H_{28}O_4$) per tablet, referred to Herba Andrographis.

Fructus Gardeniae Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use Octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (15 : 85) as the mobile phase. As detector a spectrophotometer set at 238 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of Geniposide.

Reference solution Dissolve a quantity of geniposide CRS, accurately weighed, in ethanol to produce a solution containing 30 μg per ml.

Test solution AS the test solution obtained under Assay of Herba Andrographis

procedure Inject accurately 10 μl of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 1.2 mg of Geniposide ($C_{17}H_{24}O_{10}$) per tablet, referred to Fructus Gardeniae.

Action To clear *heat* and *toxicity*, and cool blood and reduce swelling.

Indications Swollen painful throat, or fever, or toothache or bloodshot eyes due to extremely abundant *heat* in the lung and stomach.

Usage and dosage 2 tablets, 2 times a day.

Storage Preserve in tightly closed containers.

Qingkailing Koufuye (清开灵口服液)

Qingkailing Mixture

Ingredients Cholic acid; Pulvis Concha Margaritifera; Hyodeoxycholic acid; Fructus Gardeniae; Pulvis Cornu Bubali; Radix Isatidis; Baicalin; Flos Lonicerae Japonicae.

Procedure Grind Cornu Bubali to fine powder. Decoct Radix Isatidis, Fructus Gardeniae and Flos Lonicerae Japonicae with water for 2 times, 1 hour for each time, combine the decoctions, filter, concentrate to a thin extract with a relative density of 1.15-1.20 (50℃), stand to cool, add a quantity of ethanol, stand, filter, recover ethanol, add a quantity of water and stand. Hydrolyze Cornu Bubali powder and Concha Margaritifera with a quantity of acid, filter and adjust to pH 4 with 15% solution of calcium hydroxide. Filter, concentrate the filtrate to a thin extract with a relative density of 1.05-1.10 (50℃), allow to cool, add a quantity of ethanol, stand, filter, recover ethanol, add a quantity of water and stand. Dissolve cholic acid, and hyodeoxycholic acid with a quantity of ethanol. Combine the above extracts and hydrolyzate, mix well and add to ethanol solution of cholic acid and hyodeoxycholic acid. Add a quantity of ethanol, stand and filter. Recover ethanol, add a quantity of water, stand, add baicalin, dissolve by adjusting pH, add an appropriate quantity of flavoring agents, dilute to 1000 ml with water, and adjust to pH 7.2-7.5 with sodium hydroxide. Stir thoroughly, stand, and filter.

Description A clear, brownish-red liquid; taste, sweet and slightly bitter.

Identification (1) Evaporate 5 ml to dryness, dissolve the residue in 1 ml of ethanol as the test solution. Dissolve cholic acid CRS and hyodeoxycholic acid CRS in ethanol to produce a mixture solution containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of *n*-hexane, ethyl acetate, acetic acid, and methanol (20 : 25 : 4 : 6) as the mobile phase. Apply separately 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(2) Concentrate 10 ml to 2 ml, apply to a column of macroporous resin D101 (1 cm in internal diameter and 10 cm long), wash with 100 ml of water, and discard the washing. Elute with 50 ml of 70% ethanol, collect the eluate, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve geniposide CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅳ B), using silica gel G as the coating substance and a mixture of ethyl acetate, acetone, formic acid and water (5 : 5 : 1 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the above two solutions. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Relative density Not less than 1.02 (Appendix Ⅶ A).

pH value 6.0-7.8 (Appendix Ⅶ G).

Other requirements Complies with the general requirements for mixtures (Appendix Ⅰ J).

Assay ***Baicalin*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, tetrahydrofuran and 0.055% phosphoric acid (4 : 1 : 6) as the mobile phase. As detector a spectrophotometer set at 278 nm. The number of theoretical plates of the column is not less than 4500, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin CRS, dissolve in 70% ethanol to produce a reference solution containing 30 μg per ml.

Test solution Measure accurately 1 ml, in a centrifugal tube, add a drop of 6 mol/L hydrochloric acid solution, mix well, centrifuge at 4000 rpm and discard the supernatant. Add a quantity of 70% ethanol to precipitate, dissolve on a 70℃ water bath by shaking, transfer to a 50 ml volumetric flask, allow to cool, dilute with 70% ethanol to volume and mix well. Measure accurately 1 ml in a 5 ml volumetric

flask, dilute with 70% ethanol to volume and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and determine.
It contains not less than 3.5 mg of baicalin ($C_{21}H_{18}O_{11}$) per ml.

Total nitrogen content Measure accurately 3 ml, place in a 250 ml Kjeldahl flask, add 0.5 g of a mixture of potassium sulfate (or anhydrous sodium sulfate) and cupric sulfate (10:1) and 5 ml of sulfuric acid, heat until the solution nearly colourless. Allow to cool, transfer to a 25 ml volumetric flask, dilute with water to volume and mix well. Measure accurately 5 ml, carry out the method for determination of nitrogen (Appendix Ⅸ L, method 2) and determine.
It contains not less than 2.2 mg and not more than 3.0 mg of nitrogen per ml.

Action To clear *heat* to relieve *toxicity*, and tranquilize and anchor the mind.

Indications Persistent high fever, restlessness, swollen painful throat, crimson tongue, yellow fur and rapid pulse due to affliction from external *wind-heat* and seasonal pathogenic factor; upper respiratory tract infection, viral influenza, acute suppurative tonsillitis, acute pharyngitis, acute bronchitis and high fever with above symptoms.

Usage and dosage 20-30 ml, 2 times a day. Appropriate reduction of dosage for children.

Precaution Be cautious about diarrhea patients due to chronic disease and debility.

Strength 10 ml per phial

Storage Preserve in tightly closed containers, protected from light.

Attached The standard of baicalin is included in the monograph of Qinkailin Injection.

Qingkailing Zhusheye (清开灵注射液)

Qingkailing Injection

Ingredients Cholic acid; Pulvis Concha Margaritifera; Hyodeoxycholic acid; Fructus Gardeniae; Pulvis Cornu Bubali; Radix Isatidis; Baicalin; Flos Lonicerae Japonicae.

Procedure Decoct Radix Isatidis with water for 2 times, 30 minutes for each time, combine the decoctions and filter. Concentrate the filtrate to 200 ml, add ethanol to a content of 60% ethanol, store in low temperature, filter, recover the ethanol, add a quantity of water and store in low temperature for later use. Decoct Fructus Gardeniae with water for 2 times, 1 hour for the first time and 0.5 hour for the second time, combine the decoctions and filter. Concentrate the filtrate to 25 ml, add ethanol to a content of 60% ethanol, store in low temperature, filer, recover the ethanol, add a quantity of water and store in low temperature for later use. Decoct Flos Lonicerae Japonicae with water for 2 times, 30 minutes for each time, combine the decoctions and filter. Concentrate the filtrate to 60 ml, add ethanol to a content of 75% ethanol, filter, adjust to pH 8.0, store in low temperature, recover the ethanol, add ethanol to a content of 85% ethanol, store in low temperature, filter, add a quantity of water and store in low temperature for later use. Hydrolyze Pulvis Cornu Bubali with a quantity of barium hydroxide solution and hydrolyze Pulvis Concha Margaritifera with a quantity of sulfuric acid for 7-9 hours, and filter, combine the filtrate, adjust to pH 3.5-4.0, filter, add ethanol to a content of 60% ethanol, store in low temperature, filter, recover the ethanol, add a quantity of water and store in low temperature for later use. Combine Fructus Gardeniae extract, Radix Isatidis extract, Cornu Bubali hydrolyzate and Concha Margaritifera hydrolyzate, add to the solution of Cholic acid and Hyodeoxycholic acid in 75% ethanol, mix well, add ethanol to a content of 75% ethanol, adjust to pH 7.0, store in low temperature, filter, recover the ethanol, add a quantity of water and store in low temperature for later use. Dissolve baicalin in water for injection, adjust to pH 7.5, add Flos Lonicerae Japonicae extract, mix well. Combine with the above solution, mix well, add water for injection to 1000 ml, processing with active charcoal, store in low temperature, filter, pack and sterilize.

Description A clear, brownish-yellow or brownish-red liquid.

Identification (1) Evaporate 10 ml of the injection to dryness on a water bath, allow to cool, dissolve the residue in 1 ml of ethanol and use the supernatant as the test solution. Dissolve a quantity of geniposide CRS in ethanol to prepare a solution containing 4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica G as the coating substance and a mixture of ethyl acetate, acetone, formic acid and water (5:5:1:1) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and heat at 105℃ to clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) Mix well 1 ml with 2 ml of ethanol as the test solution. Dissolve a quantity of cholic acid CRS and hyodeoxycholic acid CRS in ethanol to prepare a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of isooctane, ethyl acetate and glacial acetic acid (15:7:5) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and heat at 105℃ to spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Dissolve a quantity of baicalin CRS in 70% ethanol to prepare solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide membrane as the coating substance and acetic acid as the mobile phase. Apply separately 2 μl of each of the reference solution and the test solution obtained under Identification (2) to the film. After developing and removal of the membrane, dry in air. Spray with 1% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

pH value 6.8-7.5 (Appendix Ⅶ A).

Materials about injection Complies with the general requirement for Determination of Materials about Injection (Appendix Ⅸ S), except oxalate.

Oxalate Measure 5 ml in a centrifugal tube, add 6 drops of 6 mol/L hydrochloric acid, mix well, centrifuge. Filter the supernatant, measure 2 ml of the filtrate, adjust the pH value to 5-6, add 2-3 drops of 3% solution of calcium chloride and allow to sand for 10 minutes. No precipitate

should be observed.

Heavy metals Measure accurately 1 ml in a crucible, evaporate to dryness. Ignite slowly to complete charred, allow to cool, carry out the limit test for heavy metal (Appendix Ⅸ E, method 1), not more than 10 ppm.

Undue toxicity Complies with the test for undue toxicity (Appendix Ⅺ C, Volume 2), using 0.5 ml per mice by intravenous administration.

Pyrogens Complies with the test for pyrogens (Appendix Ⅻ A), using 5 ml per kilogram of the rabbit's weight.

Haemolysis and agglutination *Preparation of 2% red blood cell, RBC, suspension* Measure a quantity of blood of rabbit, transfer it into a conical flask with glass beads, shake for 10 minutes, discard the fibrinogen, and collect the defibrin blood. To the defibrin blood, add 10 times volume of saline, shake well and centrifuge to remove supernatant. Wash the pellet with saline for 2 or 3 times until the supernatant becomes transparent, and then prepare the 2% RBC suspension with saline.

Procedure Add the 2% RBC suspension and saline into 6 tubes according to the behind proportions, shake well, and keep it in 37℃ for 30 minutes. Then add the injection according to the behind proportions, shake well, and keep them in 37℃ for 2 hours.

No. of tubes	1	2	3	4	5	6
2% RBC suspension/ml	2.5	2.5	2.5	2.5	2.5	2.5
Saline /ml	2.0	2.1	2.2	2.3	2.4	2.5
Injection /ml	0.5	0.4	0.3	0.2	0.1	0.0

Examine the result every 15 minutes during the first hour and once for the second hour. Haemolysis and agglutination must not appear in the No. 3 tube within 2 hours.

Other requirements Complies with the general requirements for injections (Appendix Ⅰ U).

Assay ***Total nitrogen content*** Measure accurately 0.5 ml of injection, carry out the method for the determination of Nitrogen (Appendix Ⅸ L, method 2).
It contains not less than 2.2 mg and not more than 3.0 mg of nitrogen (N) per ml.

Cholic acid Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, water and phosphoric acid (35∶65∶0.1) as the mobile phase. As detector a spectrophotometer set at 192 nm, maintain the column temperature at 40℃. The number of the theoretical plates of the column is not less than 5000, calculated with the reference to the peak of cholic acid.

Reference solution Dissolve a quantity of cholic acid CRS, accurately weighed, in 60% solution of acetonitrile to prepare a solution containing 1.0 mg per ml.

Test solution Measure accurately 10 ml, add 0.5 ml of dilute hydrochloric acid TS, extract with successive quantities of 20 ml, 20 ml, 15 ml and 15 ml of ethyl acetate. Combine the ethyl acetate extracts, and recover ethyl acetate to dryness. Dissolve the residue in 60% acetonitrile and transfer to a 25 ml volumetric flask, dilute with 60% acetonitrile to volume, and mix well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 1.50 mg and not more than 3.25 mg of cholic acid ($C_{24}H_{40}O_5$) per ml.

Fructus Gardeniae Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (10∶90) as the mobile phase. As detector a spectrophotometer set at 238 nm. The number of the theoretical plates of the column is not less than 3000, calculated with the reference to the peak of geniposide.

Reference solution Dissolve a quantity of geniposide CRS, accurately weighed, in methanol to prepare a solution containing 30 μg per ml.

Test solution Measure accurately 20 ml, place to a stopper conical flask, add accurately 1 ml of a solution of phosphoric acid (1→3), mix well. Allow to stand for 1 hour at 2-10℃, remove the conical flask, allow to room temperature. Centrifuge at 3000 rpm for 20 minutes. Measure accurately 5 ml of the supernatant to a 50 ml volumetric flask, dilute with methanol to volume, and mix well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 0.10 mg of geniposide ($C_{17}H_{24}O_{10}$) per ml, referred to Fructus Gardeniae.

Baicalin Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (47∶53∶0.2) as the mobile phase. As detector a spectrophotometer set at 276 nm. The number of the theoretical plates of the column is not less than 3000, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin CRS in a 100 ml volumetric flask, add a quantity of 70% ethanol to dissolve, add 1 ml of the the solution of mobile phase, dilute with 70% ethanol to volume, and mix well (containing 50 μg of baicalin per ml).

Test solution Measure accurately 1 ml, place in a 100 ml volumetric flask, dilute with 70% ethanol to volume, and mix well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 3.5 mg and not more than 5.5 mg of baicalin ($C_{21}H_{18}O_{11}$) per ml.

Action To clear *heat* to relieve *toxicity*, resolve *phlegm*, and dredge meridians and resuscitate.

Indications Febrile disease, coma, hemiplegia in stroke and delirium; acute hepatitis, upper respiratory tract infection, pneumonia, cerebral thrombosis and cerebral hemorrhage with above symptoms.

Usage and dosage Intramuscular injection, 2-4 ml a day. Intervenous drop infusion for severe case, 20-40 ml a day, used after diluted by 10% amylaceum injection 200 ml or sodium chloride injection 100 ml.

Precaution
(1) Be cautious about those who have chills and fever in an

exterior syndrome or a history of drug allergy.
(2) Cease medication immediately when there occurs allergic reaction, and handle the case with desensitization.
(3) When cloudiness or sedimentation is seen, it cannot be used. If cloudiness occurs when it is diluted with 10% glucose or sodium hydride injection, it cannot be used too.
(4) Compatibility : Up to now it has been confirmed that it is incompatible with Gentamicin, Benzylpenicillin G potassium, Epinephrine, Metaraminol, Erythromycin, Dopamine, Lobeline, Mephentermine sulfate.
(5) It should be used within 4 hours after it is diluted.
(6) Infusion speed : Slow the dropping speed. For children it is proper to give 20-40 drops per minute and for adults 40-60 drops per minute.
(7) Use it according to the description of the "Usage and Dosage". It can be diluted with 5% glucose injection or sodium chloride injection in proportion of 10 ml Qingkailing: 100 ml dilution.

Strength (1) 2 ml per vial (2) 10 ml per vial

Storage Preserve in well closed containers.

Attached:
1. *Cholic acid* Weigh accurately 10 mg in a 10 ml volumetric flask, add a 60% acetonitrile to dissolve and dilute to volume, mix well. Carry out the method described under Assay of *Cholic acid* in Qingkailing Zhusheye.
It contains not less than 80 per cent of cholic acid ($C_{24}H_{40}O_5$).
2. *Baicalin* Weigh accurately 5 mg in a 100 ml volumetric flask, add 70% ethanol to dissolve and mix well. Carry out the method described under of Assay *Baicalin* in Qingkailing Zhusheye.
It contains not less than 90 per cent of baicalin ($C_{21}H_{18}O_{11}$).

Qinglin Keli
(清淋颗粒)

Qinglin Granules

Ingredients Herba Dianthi 111 g; Herba Polygoni Avicularis 111 g; Caulis Akebiae 111 g; Semen Plantaginis (stir-baked with salt) 111 g; Pulvis Talci 111 g; Fructus Gardeniae 111 g; Radix et Rhizoma Rhei 111 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 111 g.

Procedure Decoct the above eight ingredients with water three times, 1 hour for each. Combine the decoctions, filter and evaporate the filtrate to 1332 ml, add ethanol to a content of 65% of ethanol and stir well, stand for 24 hours, separate the supernatant and filter. Mix Precipitate with a quantity of 65% ethanol thoroughly, stand for 4 hours, separate the supernatant and filter. Combine the above filtrate, recover ethanol and concentrate on vacuum to a thin extract with relative density of 1.28-1.30 (80℃), add a quantity of sucrose, mix well, make 1000 g of granules with 45% ethanol, and dry.

Description Yellowish-brown granules; taste, sweet, slightly bitter.

Identification (1) To 10 g, dissolved in 10 ml of water, add 1.5 ml of hydrochloric acid, heat on a water bath for 30 minutes, allow to room temperature. Extract with two 20-ml quantities of chloroform, combine the chloroform extract, and expel the solvent to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution with 0.5 g of Radix et Rhizoma Rhei reference drug as the reference drug solution in the same manner. Dissolve separately emodin CRS, chrysophanol CRS and rhein CRS in methanol to produce a solution containing 0.2 mg of each per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15∶5∶1) as the mobile phase. Apply separately 10 μl of the test solution, 5 μl of each of the reference solutions and the reference drug solution to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The main five fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The orange-yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.
(2) Dissolve glycyrrhetinic acid CRS in dehydrated ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (30-60℃), benzene, ethyl acetate and glacial acetic acid (10∶20∶7∶0.5) as the mobile phase. Apply separately 5 μl of each of the test solution obtained under Identification test (1) and the reference solution to the plate. After developing and removal of the plate. dry in air, spray with 10% phosphomolybdic acid in ethanol and heat at 105℃ to the spot clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of acetonitrile and water (11∶89) as the mobile phase. As detector a spectrophotometer set at 238 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of geniposide.

Reference solution Dissolve a quantity of geniposide CRS, accurately weighed, in methanol to prepare a solution containing 20 μg per ml as the reference solution.

Test solution Pulverize a quantity of the granule, obtained under the test of weigh variation, to fine powder, weigh accurately 0.25 g, in a conical flask with stopper. Add accurately 25 ml of methanol, stopper well, weigh and ultrasonicate (power, 200 W; frequency, 40 kHz) for 20 minutes. Allow to stand to room temperature, weigh again and replenish the loss of weight with methanol. Mix thoroughly, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contents not less than 14.0 mg of geniposide ($C_{17}H_{24}O_{10}$) per pack, referred to Fructus Gardeniae.

Action To clear *heat* and purge *fire*, and induce urination and relieve stranguria.

Indications Stranguria and difficulty in micturition or anuria due to *damp-heat* in the urinary bladder with manifestations of frequent and painful urination with dribbling, distension in the lower abdomen and dry mouth and throat.

Usage and dosage 1 pack, 2 times a day; reduce the dosage

for children.

Precaution Contraindicated for pregnant women and debilitated patients.

Strength 10 g per pack

Storage Preserve in tightly closed containers.

Qingnao Jiangya Pian
(清脑降压片)

Qingnao Jiangya Tablets

Ingredients Radix Scutellariae 100 g; Spica Prunellae 60 g; Flos Sophorae (huaimi) 60 g; Magnetitum (calcined) 60 g; Radix Achyranthis Bidentatae 60 g; Radix Angelicae Sinensis 100 g; Radix Rehmanniae 40 g; Radix et Rhizoma Salviae Miltiorrhizae 40 g; Hirudo 20 g; Ramulus Uncariae cum Uncis 60 g; Semen Cassiae 100 g; Pheretima 20 g; Concha Margaritifera 40 g.

Procedure Pulverize Concha Margaritifera, Magnetitum, Radix Angelicae Sinensis and Ramulus Uncariae cum Uncis to fine powder and sift. Decoct Radix Scutellariae and other eight ingredients with water twice, 3 hours for the first time, 2 hours for the second time, combine the decoctions, filter, concentrate the filtrate to a thick extract in vacuum, add the above powder, mix well, make granules, dry, compress into 1000 tablets and coat with sugar.

Description Sugar-coated tablets with blackish-brown core; taste, slightly bitter.

Identification (1) Pulverize 10 tablets, removed sugar coats, to fine powder, add 20 ml of *n*-hexane, ultrasonicate for 30 minutes. Filter and concentrate the filtrate to about 0.5 ml as the test solution. Prepare a solution with 0.1 g of Radix Angelicae Sinensis reference drug and 10 ml of *n*-hexane as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of *n*-hexane and ethyl acetate (9∶1) as the mobile phase. Apply separately to the plate 5-10 μl of the test solution and 1 μl of the reference drug solution. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) To 0.5 g of Semen Cassiae reference drug, add 10 ml of *n*-hexane, ultrasonicate for 30 minutes, filter and concentrate the filtrate to about 0.5 ml as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of *n*-hexane, ethyl acetate and formic acid (10∶1∶1) as the mobile phase. Apply separately 5 μl of the reference drug solution and 10 μl of the test solution obtained under Identification test (1) to the plate. After developing and removal of the plate, dry in air, expose to ammonia vapour until the spots clear. The orange-red colour spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Action To pacify the liver to restrain hyperactivity of *yang*.

Indications Dizziness due to hyperactivity of *liver-yang* with manifestations of headache, neck rigidity and hypertension.

Usage and dosage 4-6 tablets, 3 times a day.

Precaution Contraindicated for pregnant women.

Storage Preserve in tightly closed containers.

Qingning Wan
(清宁丸)

Qingning Pills

Ingredients Radix et Rhizoma Rhei 600 g; Semen Phaseoli Radiati 25 g; Herba Plantaginis 25 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 25 g; Semen Glycinis 25 g; Rhizoma Pinelliae (processed) 25 g; Rhizoma Cyperi (processed with vinegar) 25 g; Folium Mori 25 g; Ramulus Persicae 5 g; Cor Bovis 50 g; Cortex Magnoliae Officinalis (processed with ginger) 25 g; Fructus Hordei Germinatus 25 g; Pericarpium Citri Reticulatae 25 g; Cacumen Platycladi 25 g.

Procedure Smash Radix et Rhizoma Rhei to small pieces, add 600 g of yellow rice wine, mix thoroughly in a container, stopper well, stew on a water bath until the wine is absorbed, take out and dry at a lower temperature. Pulverize the other twelve ingredients respectively, except Cor Bovis, and decoct for several times with a quantity of water until the decoction becomes tasteless. Discard the residue, combine the decoctions, filter, concentrate the filtrate properly, add Cor Bovis and stir thoroughly with the above Radix et Rhizoma Rhei in a suitable container. Stopper well and stew until the solution is absorbed. Take out and dry at a lower temperature, pulverize to fine powder and sift. To each 100 g of powder add 100-120 g of refined honey and a quantity of water to make water-honeyed pills; or to each 100 g of powder add 100-120 g of refined honey to make big honeyed pills.

Description Black big honeyed pills or brownish-black water-honeyed pills; taste, bitter.

Identification (1) To 0.3 g of the water-honeyed pills, pulverize to fine powder; or to 1.5 g of the big honeyed pills, cut into pieces. Add 10 ml of 25% sulfuric acid and 25 ml of chloroform, and heat under reflux on a water bath for 1 hour. Allow to cool and filter, separate the chloroform layer, and wash to neutral with water. Separate the chloroform layer, evaporate to dryness, and dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution with 0.15 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Dissolve a quantity of emodin CRS in methanol to produce the reference solution containing 0.4 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate, and formic acid (15∶5∶1) as the mobile phase. Apply separately 5 μl of each of the reference drug solution, the reference solution and the test solution to the plate. After developing and removal of the plate, dry in air. A yellow spot in the chromatogram obtained with the test solution corresponds in position and colour to the spots in chromatogram obtained with the reference drug solution and the reference solution, expose the plate in ammonia vapour, the spot turns to red.

(2) To 5 g of the water-honeyed pills, pulverize to fine powder; or to 10 g of the big honeyed pills, cut into pieces, add 10 ml of water, disintegrate by heating gently, triturate well with 5 g of kieselguhr, heat to dryness, and triturate to

fine powder. Add 50 ml of ethyl acetate, and heat under reflux for 2 hour and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution with 1.5 g of Rhizoma Cyperi reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of *n*-hexane, ethyl acetate, and diethylamine (20∶6∶1) as the mobile phase. Apply separately 3 μl of each of the reference drug solution and the test solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.1% phosphoric acid (85∶15) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of emodin.

Reference solution Weigh accurately a quantity of emodin CRS and chrysophanol CRS, dissolve in methanol to produce a mixture containing 15 μg of emodin per ml and 25 μg of chrysophanol per ml as the reference solution.

Test solution Pulverize a quantity of water-honeyed pills to fine powder, weigh accurately 0.1 g to a conical flask, add accurately 25 ml of a mixture of hydrochloric acid and methanol (1∶25) and weigh; or take a quantity of big honeyed pills, obtained under the test of weight variation, cut into pieces and mix well, weigh accurately 0.3 g to a beaker, add 3 ml of water, heat on a water bath in low temperature, disintegrate by stirring, mixed well with 0.5 g of kieselguhr, heat at 100℃ to dryness in a oven, transfer to a conical flask, wash the beaker and the glass rod with 3 ml of water, combine the washing to the conical flask, heat at 100℃ to dryness in a oven, add accurately 25 ml of a mixture of hydrochloric acid and methanol (1∶25), and ultrasonicate (power 300 W, frequency 50 kHz) for 10 minutes. Heat under reflux on a water bath for 2 hours, allow to cool, and replenish the loss of weight with a mixture of hydrochloric acid and methanol (1∶25). Mix well and filter. Measure accurately 5 ml of the successive filtrate to a evaporating disk, evaporate to dryness. Dissolve the residue in a quantity of methanol, transfer to a 5 ml volumetric flask, dilute to volume with methanol, mix well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 6.0 mg of total amount of emodin ($C_{15}H_{10}O_5$) and chrysophanol ($C_{15}H_{10}O_4$) per gram for water-honeyed pills, and 31.5 mg for each big honeyed pill, referred to Radix and Rhizoma Rhei.

Action To clear *heat* and purge *fire*, and reduce swelling and relax bowels.

Indications Sore throat, sores on the mouth and tongue, dizziness, tinnitus, bloodshot eyes, toothache, fullness in the abdomen and constipation due to accumulation of *fire* in the interior.

Usage and dosage Big honeyed pill, 1 pill each time; water-honeyed pill, 6 g each time, 1-2 times a day.

Precaution Contraindicated for pregnant women.

Strength 6 g per pack for water-honeyed pills, 9 g for each big honeyed pill

Storage Preserve in tightly closed containers.

Qingqi Huatan Wan (清气化痰丸)

Qingqi Huatan Pills

Ingredients Radix Scutellariae (stir-baked with wine) 100 g; Semen Trichosanthis Pulveratum 100 g; Rhizoma Pinelliae (processed) 150 g; Arisaema cum Bile 150 g; Pericarpium Citri Reticulatae 100 g; Semen Armeniacae Amarum 100 g; Fructus Aurantii Immaturus 100 g; Poria 100 g.

Procedure Pulverize the above seven ingredients, except Semen Trichosanthis Pulveratum, to fine powder, mix thoroughly with Semen Trichosanthis Pulveratum and sift. Break 100 g of Rhizoma Zingiberis Recens to pieces, add a quantity of water, squeeze juice, make pills with the juice and dry.

Description Greyish-yellow watered pills; odour, slight; taste, bitter.

Identification Microscopical: Gelatinized starch masses colourless. Irregularly branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Raphides of calcium oxalate 32-144 μm long, occurring in mucilage cells or scattered. Prisms of calcium oxalate abundant in parenchyma. Reticulately striated cells elliptical, rectangular or polygonal, walls unlignified, meshes subrounded. Phloem fibres pale yellow, fusiform, with thick walls and fine pit canals. Stone cells orange, conchoidal, walls relatively thickened, pits distinct at the broader side.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To clear the lung and resolve *phlegm*.

Indications Coughing with expectoration of copious yellow sticky *phlegm*, stuffiness in the chest and abdomen due to block of the lung by *phlegm-heat*.

Usage and dosage 6-9 g, 2 times a day; appropriate reduction of the dosage for children.

Storage Preserve in tightly closed containers.

Qingre Jiedu Koufuye (清热解毒口服液)

Qingre Jiedu Mixture

Ingredients Gypsum Fibrosum 670 g; Flos Lonicerae Japonicae 134 g; Radix Scrophulariae 107 g; Radix Rehmanniae 80 g; Fructus Forsythiae 67 g; Fructus Gardeniae 67 g; Herba Gueldenstaedtiae 67 g; Radix Scutellariae 67 g; Radix et Rhizoma Gentianae 67 g; Radix Isatidis 67 g; Rhizoma Anemarrhenae 54 g; Radix Ophiopogonis 54 g.

Procedure Warmly macerate Gypsum Fibrosum and other ingredients, except Flos Lonicerae Japonicae and Radix Scutellariae, with water for 1 hour, decoct twice (after boiling, allow to cool slightly, add Flos Lonicerae Japonicae and Radix Scutellariae), 1 hour for the first time, 40 minutes for the second time, filter. Combine the filtrates and concentrate to a thin extract with a relative density of about 1.17 at 80℃, add ethanol to a content of 65%-70% ethanol, store at a lower temperature for 48 hours, filter. Recover ethanol, add a quantity of flavoring agents and 5 g of active charcoal, heat for 30 minutes and filter. Add water to 1000 ml, filter, pack and sterilize.

Description A brownish-red liquid; taste; sweet, slightly bitter.

Identification (1) Evaporate 10 ml to dryness, dissolve the residue in 5 ml of ethanol, filter and concentrate the filtrate to about 2 ml as the test solution. Dissolve chlorogenic acid CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of butyl acetate, formic acid, and water (14∶5∶5) as the mobile phase. Apply 10 μl of each of the two solutions separately to the plate. After developing and removal of the plate and dry in air, examine under ultraviolet light at 365 nm, the fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Evaporate 10 ml of the mixture to dryness, dissolve the residue in 2 ml of acetone, use the supernatant as the test solution. Dissolve geniposide CRS in acetone to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (3∶1) as the mobile phase. Apply 10 μl of each of the two solutions separately to the plate. After developing and removal of the plate and dry in air, spray with 50% sulfuric acid in ethanol, heat at 100℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) To 20 ml of the mixture, extract by shaking with three 20-ml quantities of ethyl acetate, combine the ethyl acetate extracts, evaporate to dryness, and dissolve the residue in 5 ml of 30% ethanol. Apply to a column (1 cm in diameter, 24 cm long) packed with macroporous resin D101, pre-elute with 50 ml of 30% ethanol, discard the eluates, and elute again with 50 ml of dilute ethanol. Collect the eluates, concentrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of forsythin CRS in methanol to produce a solution containing 0.25 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol, and glacial acetic acid (17∶2∶1) as the mobile phase. Apply separately 4 μl of each of the reference solution and the test solution to the plate. After developing and removal the plate, dry in air. Spray witn 5% vanillin in sulfuric acid, and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

(4) To 40 ml of the mixture, extract by shaking with three 30-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, and evaporate to dryness on a water bath. Dissolve the residue in 20 ml of water, add 2 ml of hydrochloric aicd, heat under reflux for 1 hour, and allow to cool. Extract by shaking with two 20-ml quantities of toluene, combine the toluene extracts, and evaporate to dryness on a water bath. Dissolve the residue in 1 ml of toluene as the test solution. Dissolve a quantity of sarsasapogenin CRS in toluene to produce a solution containing 5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene and acetone (9∶1) as the mobile phase. Apply separately 15 μl of the test solution and 10 μl of the reference solution to the plate. After developing and removal the plate, dry in air. Spray with 5% vanillin in sulfuric acid, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

(5) To 40 ml of the mixture, add 2 ml of hydrochloric acid, boil for 5 minutes, allow to cool, extract by shaking with 30 ml of chloroform, separate the chloroform extract, evaporate to dryness, and dissolve the residue in 1 ml of chloroform as the test solution. To 1 g of Radix Ophiopogonis reference drug, decoct with 20 ml of water for 10 minutes, filter, add 0.5 ml of hydrochloric acid, and prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and acetone (4∶1) as the mobile phase. Apply separately 5 μl of each of the reference solution and the test solution to the plate. After developing and removing the plate, and dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference drug solution.

pH value 4.5-6.5 (Appendix Ⅷ G).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay Carry out the method of high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (50∶50∶0.3) as the mobile phase. As detector a spectrophotometer set at 276 nm. The number of theoretical plates of the column is not less than 1000, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin CRS, dissolve in 70% ethanol to produce a solution containing 20 μg mg per ml as the reference solution.

Test solution Measure accurately 2 ml of the mixture to a 100 ml volumetric flask, add a quantity of 70% ethanol, shake well, dilute with 70% ethanol to volume, shake well, allow to stand, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 1.0 mg of baicalin ($C_{21}H_{18}O_{11}$) per ml, referred to Radix Scutellariae.

Action To clear *heat* and *toxicity*.

Indications Fever, red complexion, irritability, thirst and swollen painful throat due to accumulated *toxic-heat*; influenza, upper respiratory tract infection with above symptoms.

Usage and dosage 10-20 ml, 3 times a day, appropriate reduction of the dosage for children; or follow doctor's advice.

Strength 10 ml per phial

Storage Preserve in tightly closed containers.

Qingwei Huanglian Wan (Damiwan) (清胃黄连丸，大蜜丸)

Qingwei Huanglian Pills (Big Honeyed Pills)

Ingredients Rhizoma Coptidis 80 g; Gypsum Fibrosum 80 g; Radix Platycodonis 80 g; Radix et Rhizoma Glycyrrhizae 40 g; Rhizoma Anemarrhenae 80 g; Radix Scrophulariae 80 g; Radix Rehmanniae 80 g; Cortex Moutan 80 g; Radix Trichosanthis 80 g; Fructus Forsythiae 80 g; Fructus Gardeniae 200 g; Cortex Phellodendri 200 g; Radix Scutellariae 200 g; Radix Paeoniae Rubra 80 g.

Procedure Pulverize the above fourteen ingredients to fine powder, sift and mix well. To each 100 g of the powder add 110-130 g of refined honey to make big honeyed pills.

Description Brown big honeyed pills; taste, slightly sweet, then bitter.

Identification (1) Microscopical: Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Fibre bundles bright yellow surrounded by cells containing prisms of calcium oxalate, forming crystal fibres; walls of crystal cells lignified and thickened. Phloem fibres bundles bright yellow, walls slightly thickened, pits distinct. Fibres pale yellow, fusiform, walls thickened, with fine pit-canals. Fibre bundles almost colourless, surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. The upper and lower layers of the fibres in endocarp crisscross, fibres short fusiform. Needle crystals of calcium oxalate in bundles or scattered, 26-110 μm long. Stone cells of testa yellow or pale brown, mostly broken, long-polygonal, rectangular or irregular when intact; walls thickened, with large rounded pits, lumina brownish-red. Stone cells yellowish-brown or colourless, subrectangular, subrounded or irregular, about 94 μm in diameter. Irregular laminate crystals colourless, with straight striations.

(2) Macerate 5 g of the pills, cut into pieces, in 50 ml of methanol overnight, grind for disintegrating, ultrasonicate for 30 minutes, filter, recover the methanol to dryness. Dissolve the residue with 5 ml of water, apply to a column of macroporous resin D101 (1.5 cm in diameter, 20 cm in length), wash with 100 ml of water, discard the washing, elute with 100 ml of ethanol, collect the eluate and evaporate to dryness. Dissolve the residue with 2 ml of methanol, filter and use the filtrate as the test solution. To 1.2 g of Fructus Gardeniae reference drug add 10 ml of methanol, ultrasonicate for 20 minutes, filter and use the filtrate as the reference drug solution. Dissolve geniposide CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, ethyl acetate, methanol, and water (15∶40∶22∶10) as the mobile phase. Apply 2 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% sulfuric acid in ethanol, heat if necessary to spots clear. The main spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Macerate 5 g of the pills, cut into pieces, in 25 ml of methanol in a stopper conical flask for a moment, mash, filter and discard the filtrate. Add 25 ml of methanol to the drug residue, ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness and dissolve the residue in 5 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxylmethylcellulose prepared with 4% solution of sodium acetate as the coating substance, and a mixture of ethyl acetate, butanone, formic acid and water (5∶3∶1∶1) as the mobile phase. Apply 3 μl of the test solution and 4 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with a 5% solution of ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Macerate 9 g of the pills, cut into pieces, in 50 ml of methanol overnight, grind for disintegrating, ultrasonicate for 30 minutes, filter and recover the methanol to dryness. Dissolve the residue with 10 ml of water, apply to a column of macroporous resin D101 (2.5 cm in internal diameter, 28 cm long), wash with water to the washing colourless, discard the aqueous washing, elute with ethanol, collect 80 ml of the colouring part, add 8 ml of hydrochloric acid, heat under reflux for 1 hour, adjust to neutral with 40% solution of sodium hydroxide. Concentrate to about 10 ml, add 10 ml of water, extract with 25 ml of benzene with shaking, separate the benzene layer, recover the benzene to dryness and dissolve in 0.5 ml of benzene as the test solution. Dissolve sarsasapogenin CRS in benzene to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and acetone (9∶1) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid, heat at 80℃ to spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Weigh accurately 0.8 g of the pills, obtained in the test of weight variation, cut into pieces, in a stopper conical flask, add accurately 25 ml of a mixture of hydrochloric acid and methanol (1∶100), weigh and stand overnight. Shake for disintegrating, ultrasonicate (power, 250 W; frequency, 33 kHz) for 45 minutes, allow to cool, weigh again and replenish the loss of weight with methanol, shake well, filter and use the filtrate as the test solution. Dissolve berberine hydrochloride CRS, weighed accurately, in a mixture of hydrochloric acid and methanol (1∶100) to produce a solution containing 60 μg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia TS (12∶6∶3∶3∶1) as the mobile phase, pre-saturated with concentrated ammonia TS. Apply accurately 4 μl of the test solution, 2 μl and 4 μl of the reference solutions separately to the plate. After developing and removal of the plate, dry in air. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromato-graphic scanning method), scan at the wavelength: $\lambda_S = 340$ nm. Measure the integration value of absorbance of the test solution and

the reference solution and calculate.
It contains not less than 11.7 mg of berberine hydrochloride ($C_{20}H_{18}ClNO_4$) per pill, referred to Radix Coptidis and Cortex Phellodendri.

Action To clear the stomach and purge *fire*, and relieve *toxicity* and reduce swelling.

Indications Sores on the mouth and tongue, or swollen painful gums and throat due to extremely abundant *fire* in the lung and stomach.

Usage and dosage 1-2 pills, 2 times a day.

Precaution Be cautious about pregnant women.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Qingwei Huanglian Wan (Shuiwan) (清胃黄连丸，水丸)

Qingwei Huanglian Pills (watered pills)

Ingredients Rhizoma Coptidis 80 g; Gypsum Fibrosum 80 g; Radix Platycodi 80 g; Radix et Rhizoma Glycyrrhizae 40 g; Rhizoma Anemarrhenae 80 g; Radix Scrophulariae 80 g; Radix Rehamnniae 80 g; Cortex Moutan 80 g; Radix Trichosanthis 80 g; Fructus Forsythiae 80 g; Fructus Gardeniae 200 g; Cortex Phellodendri 200 g; Radix Scutellariae 200 g; Radix Paeoniae Rubra 80 g.

Procedure Pulverize the above fourteen ingredients to fine powder, sift, mix thoroughly, make pills with water and dry.

Description Yellow to dark yellow watered pills; taste, slightly bitter.

Identification (1) Microscopical: Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Fibre bundles bright yellow surrounded by cells containing prisms of calcium oxalate, forming crystal fibres; walls of crystal cells lignified and thickened. Fibre bundles bright yellow, walls slightly thickened, pits distinct. Bast fibres pale yellow, fusiform, walls thickened, with fine pit-canals. Fibre bundles almost colourless, surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. The upper and lower layers of the fibres in endocarp crisscross, fibres short fusiform. Needle crystals of calcium oxalate in bundles or scattered, 26-110 μm long. Stone cells of testa yellow or pale brown, mostly broken, long-polygonal, rectangular or irregular when intact; walls thickened, with large rounded pits, lumina brownish-red. Stone cells yellowish-brown or colourless, subrectangular, subrounded or irregular, about 94 μm in diameter. Irregular laminate crystals colourless, with straight striations.
(2) To 1 g of the pills, pulverized to powder, add 30 ml of methanol, ultrasonicate for 30 minutes, filter, concentrate the filtrate to almost dryness, dissolve in 2 ml of methanol as the test solution. Dissolve geniposide CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of *n*-butanol, glacial acetate acid and water (7:1:2) as the mobile phase. Apply separately 5 μl of the test solution and 3 μl of the reference solution to the plate. After developing and removal of the plate, dry in a current of hot air, spray with 5% vanillin in sulfuric acid and heat to visualize if necessary. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of *n*-butanol, glacial acetate acid, and water (7:1:2) as the mobile phase. Apply separately to the plate 3 μl of the reference solution and 5 μl of the test solution obtained under Identification test (2). After developing and removal of the plate, dry in a current of hot air, spray with a 2% solution of ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(4) Heat under reflux 10 g of the pills, pulverized to fine powder, with 40 ml of ether for 15 minutes and filter. Expel ether remained from the drug residue, add 40 ml of ethanol and heat under reflux for 1 hour. Filter, measure 20 ml of the filtrate, add 2 ml of hydrochloric acid and continue heating under reflux for 1 hour. Concentrate on a water bath to about 5 ml, add 10 ml of water, extract with 20 ml of benzene by shaking. Separate the benzene layer, wash with 10 ml of 1% solution of sodium hydroxide and wash with three 10-ml quantities of water successively. Recover the benzene extract to dryness, and add 1 ml of benzene to dissolve the residue as the test solution. Dissolve sarsasapogenin CRS in benzene to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of benzene and acetone (9:1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with a 5% solution of vanillim in sulfuric acid (heat to visualize if necessary). The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix I A).

Assay Grind 5 g of the pills to fine powder. Weigh accurately 0.3 g in a stopper conical flask, add accurately 25 ml of a mixture of hydrochloric acid and methanol (1:100), stopper, weigh and stand overnight. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 45 minutes, allow to cool, weigh again and replenish the loss of weight with methanol, shake well, filter and use the successive filtrate as the test solution. Dissolve berberine hydrochloride CRS, weighed accurately, in a mixture of hydrochloric acid and methanol (1:100) to produce a solution containing 60 μg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol, and concentrated ammonia TS (12:6:3:3:1) as the mobile phase, pre-equilibrated with concentrated ammonia TS. Apply accurately 4 μl of the test solution, 2 μl and 4 μl of the reference solutions to the plate. After developing and removal of the plate, dry in air. Carry out the method of thin layer chromatography (Appendix VI B, thin layer chromatographic scanning method), scan at the wavelength: $\lambda_S = 340$ nm. Measure the integration value of absorbance of the test solution and the reference solution and calculate.
It contains not less than 3.4 mg of berberine hydrochloride ($C_{20}H_{18}ClNO_4$) per gram, referred to Rhizoma Coptidis and Cortex Phellodendri.

Action To clear the stomach and purge *fire*, and relieve

toxicity and reduce swelling.

Indications Sores on the mouth and tongue, or swollen painful gums and throat due to extremely abundant *fire* in the lung and stomach.

Usage and dosage 9 g, 2 times a day.

Precaution Be cautious about pregnant women.

Storage Preserve in tightly closed containers.

Qingwen Jiedu Wan (清瘟解毒丸)

Qingwen Jiedu Pills

Ingredients Folium Isatidis 100 g; Fructus Forsythiae 75 g; Radix Scrophulariae 100 g; Radix Trichosanthis 100 g; Radix Platycodonis 75 g; Fructus Arctii (stir-baked) 100 g; Rhizoma et Radix Notopterygii 75 g; Radix Saposhnikoviae 50 g; Radix Puerariae 100 g; Radix Bupleuri 50 g; Radix Scutellariae 100 g; Radix Angelicae Dahuricae 50 g; Rhizoma Chuanxiong 50 g; Radix Paeoniae Rubra 50 g; Radix Glycyrrhizae 25 g; Herba Lophatheri 100 g.

Procedure Pulverize the above sixteen ingredients to fine powder, sift and mix well. To each 100 g of the powder add 150-170 g of refined honey to make big honeyed pills.

Description Blackish-brown big honeyed pills; odour, slightly aromatic; taste, sweet, bitter.

Identification (1) Microscopical: Epidermal cells narrow and long, anticlinal walls deep sinuous, with stomata, guard cells dumbbell-shaped; nonglandular hairs unicellular, with an rounded base. Stone cells of endocarp sharp fusiform or oblong in surface view, compactly parquet, subrectangular or slat in lateral view, with thickened and lignified walls, pits elongated. Stone cells yellowish-brown or colourless, subrectangular, subrounded or irregular, with well-marked striations up to 94 μm in diameter. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Phloem fibres pale yellow, fusiform, walls thickened, with fine pit-canals. Upper and lower layers of fibres in endocarp crisscrossed, fibres short fusiform. Bordered pitted vessels large, frequently broken, some bordered pits hexangular or rhombic, closely arranged. Anastomosing laticiferous tubes 14-25 μm in diameter, containing pale yellow granules. Vittae containing golden-yellow secretion.

(2) Triturate well 9 g of the pills, cut into pieces, with 3 g of kieselguhr, add 20 ml of ether, ultrasonicate for 5-10 minutes, filter, and remain the residue drug for later use. Evaporate the filtrate to dryness, and add 1 ml of chloroform to dissolve the residue as the test solution. Dissolve indigotin CRS in chloroform to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, chloroform and acetone (5∶4∶1) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air, the blue spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Expel ether from the residue drug obtained under Identification test (2), add 20 ml of ethyl acetate, ultrasonicate for 20 minutes and filter. Evaporate the filtrate to dryness and dissolve the residue in 1 ml of methanol as the test solution. Dissolve puerarin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (28∶10∶1) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of the reference solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm, the brilliant green fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Chip 5 g of the pills into pieces, triturate with 2 g of kieselguhr, add 50 ml of 70% ethanol, heat under reflux for 1 hour. Allow to cool, filter, and evaporate the filtrate to dryness. Dissolve the residue in a quantity of water, apply to a prepacked polyamide column (60-80 mesh, 1 g, 10-15 mm in internal diameter), elute with 80 ml of water, discard the water solution, and then elute with 50 ml of 50% methanol. Collect the methanolic eluates, evaporate to dryness and dissolve the residue in 1 ml of methanol as the test solution. Dissolve astragaloside Ⅳ CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide film as the coating substance and a mixture of ethyl acetate, butanone, acetic acid and water (10∶7∶5∶1) as the mobile phase. Apply separately 4 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 1% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(5) Chip 5 g of the pills into pieces, triturate with 2 g of kieselguhr, add 50 ml of dehydrated ethanol, and heat under reflux for 1 hour. Filter, concentrate the filtrate to 1 ml, add 2 g of neutral aluminium oxide, mix well, dry in a oven, and apply to a column prepacked with neutral aluminium oxide (100-200 mesh, 3 g, 10-15 mm in internal diameter). Elute with 50 ml of ethanol, collect the eluates, evaporate to dryness and dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Dissolve arctiin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (40∶8∶1) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (47∶53∶0.2) as the mobile phase. As detector a spectrophotometer set at 280 nm. Maintain the column temperature at 40℃. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of baicalin.

Reference solution Dissolve a quantity of baicalin CRS, accurately weighed, in methanol to prepare a solution containing 60 μg per ml as the reference solution.

Test solution Cut a quantity of the pills, obtained under the test of weight variation, into pieces, mix well, weigh accurately 1.5 g, triturate with 1.5 g of kieselguhr, transfer to a stopper conical flask, add accurately 50 ml of 70% ethanol, stopper well, and weigh. Ultrasonicate (power 250 W, frequency 50 kHz) for 30 minutes, cool, weigh again, replenish the loss of weight with 70% ethanol, and shake well. Filter and used the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.
It contains not less than 20.0 mg of baicalin ($C_{21}H_{18}O_{11}$) per pill, referred to Radix Scutellariae.

Action To clear *toxins* of epidemic disease.

Indications Aversion to *cold*, high fever, headache, absence of sweat, thirst, dry throat, mumps and infectious swollen head due to seasonal epidemic disease.

Usage and dosage 2 pills, 2 times a day; appropriate reduction of the dosage for children.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Qingxuan Wan
(清眩丸)

Qingxuan Pills

Ingredients Rhizoma Chuanxiong 200 g; Radix Angelicae Dahuricae 200 g; Herba Menthae 100 g; Spica Schizonepetae 100 g; Gypsum Fibrosum 100 g.

Procedure Pulverize the above five ingredients to fine powder, sift, mix thoroughly. To each 100 g of the powder add 110-130 g of refined honey to make big honeyed pills.

Description Blackish-brown big honeyed pills; odour, slightly aromatic; taste, slightly sweet, then pungent and cool.

Identification (1) Microscopical: Compound starch granules consisting of 8-12 components. Spiral or reticular-spiral vessels 14-50 μm in diameter. Glandular scales with a 8-celled head, oblate, up to about 90 μm in diameter, and a unicellular and short stalk, Epidermal cells of calyx pale yellow, anticlinal walls sinuous. Irregular plate crystals colourless, with straight striations.
(2) Grind well 6 g of the pills, cut into pieces, with 3 g of kieselguhr, add 20 ml of petroleum ether (60-90℃), stopper well, shake frequently and macerate overnight. Filter and concentrate the filtrate to about 1 ml as the test solution. Prepare separately solutions with 1 g of each of Rhizoma Chuanxiong reference drug and Radix Angelicae Dahuricae reference drug as the reference drug solutions in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (17∶3) as the mobile phase. Apply separately to the plate 20 μl of each of the three solutions. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm, the brilliant blue fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the Rhizoma Chuanxiong reference drug solution. The two yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the Radix Angelicae Dahuricae reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (63∶37) as the mobile phase. As detector a spectrophotometer set at 248 nm, maintain the column temperature at 40℃. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of imperatorin.

Reference solution Weigh accurately a quantity of imperatorin CRS, dissolve in methanol to produce a reference solution containing 10 μg per ml.

Test solution Cut a quantity of big honeyed pills, obtained under the test of weight variation, into pieces, weigh accurately about 1 g to a stopper conical flask. Add accurately 25 ml of methanol, stopper well and weigh, ultrasonicate (power 250 W, frequency 33 kHz) for 45 minutes. Allow to cool, weigh again, replenish the loss of weight with methanol, mix well and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of the reference solution and 10 μl of the test solution into the column, respectively, and calculate the content.
It contains not less than 0.40 mg of imperatorin ($C_{16}H_{14}O_4$) per pill, referred to Radix Angelicae Dahuricae.

Action To disperse *wind* and clear *heat*.

Indications Dizziness, headache or migraine, stuffy nose and toothache due to *wind-heat*.

Usage and dosage 1-2 pills, 2 times a day.

Strength 6 g per pill

Storage Preserve in tightly closed containers.

Qingyan Wan
(清咽丸)

Qingyan Pills

Ingredients Radix Platycodonis 100 g; Gypsum Rubrum 100 g; Herba Menthae 100 g; Fructus Chebulae (removed from seed) 100 g; Radix et Rhizoma Glycyrrhizae 100 g; Fructus Mume (removed from seed) 100 g; Indigo Naturalis 20 g; Borax (calcined) 20 g; Borneolum Syntheticum 20 g.

Procedure Grind Indigo Naturalis and Borneolum Syntheticum to fine powder. Pulverize Radix Platycodi and other six ingredients to fine powder. Triturate the above two powder together, sift and mix thoroughly. To each 100 g of the powder add 100-130 g of refined honey to make small honeyed pills or big honeyed pills.

Description Blackish-brown big honeyed pills; odour, cool; taste, sweet, sour, and slightly bitter.

Identification (1) Heat under reflux 12 g of the pills, cut into pieces, in 50 ml of chloroform for 3 hours, filter and concentrate the filtrate to about 1 ml as the test solution. Dissolve indigotin CRS and indirubin CRS in chloroform to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and ethanol

(9∶1) as the mobile phase. Apply separately to the plate 3 μl of each of the two solutions. After developing and removing of the plate, dry in air, the spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(2) Cut 2 g of the pills into pieces, triturate well with 1 g of kieselguhr, add 30 ml of dehydrated ethanol, and ultrasonicate for 30 minutes and filter. Concentrate the filtrate to 1 ml as the test solution. Prepare a solution with 0. 2 g of Fructus Chebulae reference drug in the same manner as the reference drug solution. Dissolve a quantity of Gallic acid CRS in dehydrated ethanol to prepare a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate, formic acid, and water (7∶10∶3∶4) as the mobile phase. Apply separately 5 μl of the test solution and 4 μl of each of the reference solution and the reference drug solution to the plate. After developing and removing the plate, dry in air, and spray with 2% ferric chloride in ethanol. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference solution and the reference drug solution.

(3) Cut 3 g of the pills into pieces, triturate well with 1. 5 g of kieselguhr, add 10 ml of ethyl acetate, and ultrasonicate for 30 minutes in a ice water bath. Centrifuge, and use the supernatant as the test solution. Dissolve a quantity of menthol CRS in ethyl acetate to prepare a reference solution containing 2 mg per ml. Carry out the method for gas chromatography (Appendix Ⅵ E), use the chromatography system under Assay. Inject 1 μl of each of the test solution and the reference solution, respectively, into the column, the retention time of the peaks obtained with the test solution and the reference solution is concordant with each other.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use an elasticity quartz capillary column (30 m long, 0. 25 mn in diameter, 0. 25 μm in film thickness) packed with polyethylene glycol (PEG)-M as the stationary phase, maintain the column temperature at 120℃. The number of theoretical plates of the column is not less than 40000, calculated with the reference to the peak of (±)-borneol.

Reference solution Weigh accurately a quantity of a mixture of (±) borneol and (±) isoborneol CRS, dissolve in ethyl acetate to produce a reference solution containing 0. 8 mg per ml.

Test solution Weigh accurately 1 g of the small honeyed pills, or cut the big honeyed pills, obtained under the test of weight variation, into pieces, weigh accurately about 1 g, and triturate well with 0. 5 g of kieselguhr. Add accurately 10 ml of ethyl acetate, stopper well, and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, cool, weigh again, replenish the loss of weight with ethyl acetate, mix well, centrifuge for 5 minutes at 3000 round per minute, and use the supernatant as the test solution.

Procedure Inject accurately 1 μl of each of the reference solution and 10 μl of the test solution into the column, respectively, and calculate the content with the total amount of (±)-borneol and (±)-isoborneol.

It contains not less than 5. 6 mg of the total amount of (±)-borneol and (±)-isoborneol ($C_{10}H_{18}O$) per gram for small honeyed pills, and 33. 6 mg per big honeyed pills.

Action To clear *heat* to relieve sore throat, and promote fluid production to stop thirst.

Indications Swollen painful throat, hoarseness, dry mouth and tongue and discomfort in the throat due to excessive *heat* in the lung and stomach.

Usage and dosage 1 pill, 2-3 times a day; or kept in mouth to dissolve gradually.

Precaution Avoid smoking, wine, pungent and spicy foods.

Strength 6 g per pill

Storage Preserve in tightly closed containers.

Qingyin Wan
(清音丸)

Qingyin Pills

Ingredients Fructus Chebulae; Bulbus Fritillariae Cirrhosae; Bai Yao Jian; Fructus Mume; Radix Puerariae; Poria; Radix Glycyrrhizae; Radix Trichosanthis.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix well. To each 100 g of the powder, add 40-50 g of refined honey and a quantity of water to make water-honeyed pills and dry; or add 110-130 g of refined honey to make big honeyed pills.

Description Brown water-honeyed pills or big honeyed pills; taste, sweet, slight sour and astringent.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS, hyphae colourless or pale brown, 4-6 μm in diameter. Starch granules broad ovoid or mussel-shaped, 40-64 μm in diameter, hilum short-cleft. V-shaped or U-shaped, striations visible. Pericarp fibers pale yellow, arranged in oblique crisscross, walls thin, with pits. Nonglandular hairs of pericarp unicellular, straight or curve, lumen filled with yellowish-brown contents.

(2) Grind well 10 g of water-honeyed pills or cut 12 g of big honeyed pills into pieces and triturate well with 6 g of kieselguhr. Add 10 ml of ammonia TS and 30 ml of chloroform, heat under reflux for 1 hour, allow to cool, filter and extract the filtrate with two 20-ml quantities of 0. 1 mol/L hydrochloric acid by shaking. Combine the extracts and adjust to pH 10 with concentrated ammonia TS, and extract with two 20-ml quantities of chloroform by shaking. Combine the chloroform extracts, evaporate to dryness and dissolve the residue in 0. 5 ml of ethanol as the test solution. Prepare a solution with 2 g Bulbus Fritillariae Cirrhosae reference drug in 10 ml of ammonia TS in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of hexane, ethyl acetate and diethylamine (12∶10∶1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removing of the plate, dry in air, spray with a dilute potassium iodobismuthate TS and a sodium nitrite TS in order. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Grind well 2 g of water-honeyed pills or cut 3 g of big honeyed pills into pieces, ultrasonicate with 10 ml of methanol for 30 minutes, allow to cool, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of

methanol as the test solution. Dissolve puerarin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H as the coating substance and a mixture of chloroform, methanol and water (28∶10∶1) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removing of the plate, dry in air. Expose to ammonia vapour for several minutes, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Grind well 2 g of water-honeyed pills or cut 3 g of big honeyed pills into pieces and triturate well with 6 g of kieselguhr. Add 2 ml of hydrochloric acid and 20 ml of chloroform, heat under reflux for 1 hour cool, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of ethanol as the test solution. prepare a solution with 0.5 g Radix Glycyrrhizae reference drug in 1 ml of hydrochloric acid and 15 ml of chloroform in the same manner as the reference drug solution. Dissolve glycyrrhetinic acid CRS in dehydrate ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃), benzene, ethyl acetate and glacial acetic acid (10∶20∶7∶0.5) as the mobile phase. Apply separately 5 μl of the test solution, 3 μl of each of the reference solution and reference drug solution to the plate. After developing and removing of the plate, dry in air. Spray with 10% phosphomolybdic acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.5% acetic acid (20∶80) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of puerarin.

Reference solution Dissolve a quality of puerarin CRS, accurately weighed, in methanol to produce a solution containing 30 μg per ml as the reference solution.

Test solution Grind the water-honeyed pills, weigh accurately 0.6 g, or chip the big honeyed pill, obtained under the test of weight variation, into pieces, weigh accurately 1 g, in a stopper conical flask, add accurately 50 ml of methanol, stopper tightly, and weigh. Ultrasonicate (power 250 W, frequency 33 kHz) for 30 minutes, cool, weigh again, replenish the loss of weight with methanol, shake well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 5-10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 2.3 mg per gram of water-honeyed pill, 4.5 mg per big honeyed pill, of puerarin ($C_{21}H_{20}C_9$), referred to Radix Puerariae.

Action To clear *heat* to relieve the sore throat, and promote fluid production to moisten *dryness*.

Indications Discomfort in the throat, dry mouth and tongue, hoarseness and aphonia due to insufficiency of body fluids resulted from *lung-heat*.

Usage and dosage Taken with warm water or sucking in the mouth. 2 g of water-honeyed pill; 1 big honeyed pill, 2 times a day.

Precaution Avoid pungent and spicy foods.

Strength 10 g per 100 water-honeyed pills, 3 g per big honeyed pill

Storage Preserve in tightly closed containers.

Qinlian Pian
(芩连片)

Qinlian Tablets

Ingredients Radix Scutellariae 213 g; Fructus Forsythiae 213 g; Rhizoma Coptidis 85 g; Cortex Phellodendri 340 g; Radix Paeoniae Rubra 213 g; Radix et Rhizoma Glycyrrhizae 85 g.

Procedure Pulverize Radix Paeoniae Rubra and Rhizoma Coptidis to fine powder; Decoct other 4 ingredients with water for three times, combine the decoctions, filter, concentrate the filtrate to a quantity, mix thoroughly with the above powder, dry, pulverize to fine powder, mix well with a quantity of excipients, make granules and dry, make into 1000 tablets.

Description Yellow to brownish-yellow tablets, odour slightly aromatic; taste, bitter.

Identification (1) Microscopical: Fibre bundles bright yellow, walls relatively thickened, pits distinct; clusters of calcium oxalate 7-41 μm in diameter, occurring in parenchymatous cells, often in rows or several in one cell.

(2) Grind well 4 tablets, add 10 ml of ethanol, ultrasonicate for 15 minutes, filter, and use the filtrate as the test solution. Dissolve berberine hydrochloride CRS in ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol, and concentrated ammonium TS (12∶6∶3∶3∶1) as the mobile phase. Apply separately to the plate 1 μl of each of the two solutions. Develop in a chamber pre-equilibrated with ammonia vapour. Remove the plate, and allow to dry in air. Examine under ultraviolet light at 365 nm, the fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Grind well 0.5 g of the tablets, add 20 ml of methanol, ultrasonicate for 20 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of baicalin CRS in methanol to prepare a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance an a mixture of ethyl acetate, butanone, formic acid, and water (5∶3∶1∶1) as the mobile phase. Apply separately 2 μl of each of the test solution and the reference solutions to the plate. After developing and removing the plate, dry in air. Spray with 1% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

(4) To 0.5 g of Radix Paeoniae Rubra reference drug, add 10 ml of methanol, ultrasonicate for 15 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol as the reference drug solution. Dissolve a quantity of paeoniflorin CRS in methanol to prepare a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol, and formic acid (40∶5∶10∶0.2) as the mobile phase. Apply separately 5 μl of each of the test solution, obtained under the Identification (3), the reference solution and reference drug solution to the plate. After developing and removing the plate, dry in air. Spray with 5% vanillin in sulfuric acid, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference solution and reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water, and glacial acetic acid (50∶50∶1) as the mobile phase. As detector a spectrophotometer set at 277 nm. The number of theoretical plates of the column is not less than 3500, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin, dissolve in methanol to produce the reference solution containing 60 μg per ml.

Test solution Pulverize 20 tablets, obtained under the test of weight variation, to fine poweder, and weigh accurately 0.3 g, to a 50 ml volumetric flask. Add 40 ml of 70% ethanol, ultrasonicate (power 250 W, frequency 33 kHz) for 20 minutes, allow to cool, dilute to volume with 70% ethanol, and mix well. Allow to stand, separate the supernatant and filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.
It contains not less than 5.5 mg of baicalin ($C_{21}H_{18}O_{11}$) per tablet, referred to Radix Scutellariae.

Action To clear *heat* and *toxicity*, and reduce swelling and pain.

Indications Headache, bloodshot eyes, or sores on the mouth and nose, or dysentery with abdominal pain, or swollen painful carbuncles or boils due to retained *heat* in the *zang-fu* organs.

Usage and dosage 4 tablets, 2-3 times a day.

Strength 0.55 g per tablet

Storage Preserve in tightly closed containers.

Qipi Wan
(启脾丸)

Qipi Pills

Ingredients Radix et Rhizoma Ginseng 100 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 100 g; Poria 100 g; Radix et Rhizoma Glycyrrhizae 50 g; Pericarpium Citri Reticulatae 50 g; Rhizoma Dioscoreae 100 g; Semen Nelumbinis (stir-baked) 100 g; Fructus Crataegi (stir-baked) 50 g; Massa Medicata Fermentata (stir-baked) 80 g; Fructus Hordei Germinatus (stir-baked) 50 g; Rhizoma Alismatis 50 g.

Procedure Pulverize the above eleven ingredients to fine powder, sift and mix thoroughly. To each 100 g of the powder add 120-140 g of refined honey to make big honeyed pills.

Description Brown big honeyed pills; taste, sweet.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Clusters of calcium oxalate 20-68 μm in diameter, acutangular. Raphides of calcium oxalate occurring in mucilage cells, 80-240 μm long and needles 2-8 μm in diameter. Prisms of calcium oxalate abundant in parenchyma. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibre. Stone cells of pericarp pale purplish-red, red or yellowish-brown, subrounded or polygonal, up to 125 μm in diameter.
(2) Grind well 6 g of the pills with 4 g of kieselguhr, heat under reflux in 20 ml of methanol for 1 hour, filter, use the filtrate as the test solution. Dissolve hesperidin CRS in methanol to produce a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (32∶17∶5) as the mobile phase. Apply separately to the plate 2-5 μl of each of the two solutions. After developing and removing of the plate, dry in air. Spray with 1% solution of aluminium chloride in ethanol, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Grind well 9 g of the pills, cut into pieces, with 5 g of kieselguhr, add 40 ml of chloroform, ultrasonicate for 30 minutes and filter. Evaporate the filtrate to dryness. Dissolve the residue in 5 ml of ethyl acetate as the test solution. Dissolve ursolic acid CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance prepared with 0.5% boric acid and a mixture of cyclohexane and ethyl acetate (3∶1) as the mobile phase. Apply separately to the plate 10 μl of the test solution and 2 μl of the reference solution. After developing and removing of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol and heat at 105℃ to spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(4) To the drug residue extracted with chloroform under Identification test (3), add 50 ml of methanol, heat under reflux on a water bath for 1 hour, filter. Evaporate the filtrate to dryness. Dissolve the residue in 5 ml of methanol. Apply to a neutral aluminium oxide column (1-1.5 cm in internal diameter, 15 g, 100-200 mesh) and elute with 150 ml of 40% methanol. Collect the eluate, evaporate to dryness. Dissolve the residue in 30 ml of water, extract with two 25-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extracts, wash with three 20-ml quantities of water saturated with *n*-butanol, evaporate the *n*-butanol extracts to dryness. Dissolve the residue in 0.5 ml of methanol as the test solution. Prepare a solution with 1 g of Radix et Rhizoma Glycyrrhizae reference drug as the reference drug solution in the same manner. Dissolve ginsenoside Re CRS, ginsenoside Rg_1 CRS in methanol to

produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer solution of a mixture of chloroform, ethyl acetate, methanol, and water (15∶40∶22∶10, stand under 10℃) as the mobile phase. Apply separately to the plate 1 μl of each of the test solution and the reference drug solution, 5 μl of the reference solution. After developing and removing of the plate, dry in air. Spray with 10% solution of sulfuric acid in ethanol and heat at 105℃ to spots clear. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, 0.2 mol/L solution of ammonium acetate, and glacial acetic acid (62∶37∶1) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of glycyrrhizinic acid.

Reference solution Weigh accurately a quantity of ammonium glycyrrhizinate CRS, dissolve in mobile phase to produce a reference solution containing 20 μg per ml (correspond to 19.59 μg of glycyrrhizinic acid per ml).

Test solution Cut the pills, obtained under the test of weight variation, into pieces, mix well, measure accurately 1 g of the pills to a stopper conical flask, add accurately 50 ml of the mobile phase, and weigh. Allow to stand overnight, ultrasonicate (power 250 W, frequency 20 kHz) for 30 minutes, allow to cool, weigh again, and replenish the loss of weight with mobile phase. Mix well and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 20 μl of the test solution into the column, respectively, and calculate the content.

It contains not less than 1.3 mg of glycyrrhizinic acid ($C_{42}H_{62}O_{16}$) per pill, referred to Radix et Rhizoma Glycyrrhizea.

Action To invigorate the spleen and harmonize the stomach.

Indications Indigestion, abdominal bloating and loose stools due to hypofunctioning of the spleen and stomach.

Usage and dosage 1 pill, 2-3 times a day; appropriate reduction of the dosage for children under 3 years of age.

Strength 3 g per pill

Storage Preserve in tightly closed containers.

Qishiwei Zhenzhu Wan
(七十味珍珠丸)

Qishiwei Zhenzhu Pills

Qishiwei Zhenzhu Pills are prescription used by Tibetan Nationality, and prepared from Margarita, Lignum Santali Albi, Lignum Dalbergiae Odoriferae, Jiuyanshi, Stigma Croci, Calculus Bovis and Moschus, etc.

Description Black watered pills; odour, aromatic; taste, sweet, and bitter.

Identification (1) Microscopical: Irregular pieces colourless or pale green, translucent and lustrous, sometimes with fine wavy striations on the surface. Irregular red, green or blue transparent crystals available. Purplish-red fibres and crystal fibres in bundles or separated, walls thickened and all lignified.

(2) Pulverize 2 g of the pills, to fine powder, add 30 ml of methanol, ultrasonicate for 20 minutes and filter. Evaporate the filtrate to dryness, dissolve the residue in 20 ml of sulfuric acid (2→500), transfer to a separating funnel, and extract with two 15-ml quantities of ethyl acetate. Evaporate the ethyl acetate extracts to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of cholic acid CRS in methanol to prepare a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, and formic acid (5∶5∶0.5) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removing the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. Examine under ultraviolet light at 365 nm. A blue fluorescent spot in the chromatography obtained with the test solution corresponds in position and colour to the spot in the chromatography obtained with the reference solution.

(3) Pulverize 1 g of the pills, to fine powder, add 20 ml of methanol, ultrasonicate for 20 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. To 20 mg of Stigma Croci reference drug, add 4 ml of methanol, ultrasonicate for 20 minutes, allow to stand, and use the supernatant as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of ethyl acetate, formic acid, and water (4∶1∶1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference drug solution to the plate. After developing and removing the plate, dry in air. The yellow spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.

(4) Pulverize 2 g of the pills, to fine powder, add 30 ml of ether, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. To 0.3 g of Lignum Aquilariae Resinatum reference drug, add 5 ml of methanol, ultrasonicate for 10 minutes, allow to stand, and use the supernatant as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of *n*-hexane, ethyl acetate, and formic acid (9∶1∶0.2) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference drug solution to the plate. After developing and removing the plate, dry in air. Spray with 1% vanillin in 10% ethanol, heat to the spots clear. The violet-red spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.

(5) To 0.1 g of Benzoinum reference drug, add 5 ml of methanol, ultrasonicate for 10 minutes, allow to stand, and use the supernatant as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose

as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (7∶3) as the mobile phase. Apply separately 10 μl of the test solution, obtained under the Identification (4), and 5 μl of the reference drug solution to the plate. After developing and removing the plate, dry in air. Spray with 10% sulfuric acid in ethanol. Examine under ultraviolet light at 365 nm. The yellow-green fluorescent spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.

(6) Pulverize 1 g of the pills, to fine powder, add 4 ml of 80% acetone, ultrasonicate for 10 minutes. Allow to stand, use the supernatant as the test solution. Prepare a solution with 0.5 g of Flos Carthami reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of ethyl acetate, methanol, formic acid, and water (7∶2∶3∶0.4) as the mobile phase. Apply separately 15 μl of the test solution and 5 μl of the reference drug solution to the plate. After developing and removing the plate, dry in air. Examine under ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A), except disintegration test.

Action To induce sedation, promote blood circulation, regulate *qi and* blood, and promote the restoration of consciousness.

Indications Treating "HeiBai Mai" and "Longxue Butiao" diseases, apoplexy, paralysis, hemiplegia, epilepsy, cerebral hemorrhage, cerebral concussion, cardiac diseases, hypertension and mental disorders.

Usage and dosage 1 g in serious cases; normally 1 g for every 3-7 days, taken after dispersing in boiled water.

Precaution Contraindicated for taking stale and sour foods.

Strength (1) 1 g per 30 pills (2) 1 g per pill

Storage Preserve in tightly closed containers.

Qiwei Duqi Wan
(七味都气丸)

Qiwei Duqi Pills

Ingredients Fructus Schisandrae Chinensis (processed) 150 g; Fructus Corni (processed) 200 g; Poria 150 g; Cortex Moutan 150 g; Radix Rehmanniae Preparata 400 g; Rhizoma Dioscoreae 200 g; Rhizoma Alismatis 150 g.

Procedure Pulverize the above 7 ingredients to fine powder, sift and mix well. To each 100 g of the powder add 30 g of refined honey and a quantity of water to make pills and dry.

Description Blackish-brown water-honeyed pills; odour, slightly aromatic; taste, sweet and slightly sour.

Identification (1) Microscopical: Irregularly branched masses colourless, dissolved in chloral hydrate TS, hyphae colourless or pale brown, 4-6 μm in diameter. Parenchyma greyish-brown to blackish-brown, cells usually shrunken, each cell containing a nucleus-like mass. Parenchymatous cells subrounded, with elliptical pits, gathering into pitgroups. Anticlinal walls of endodermal cells sinuous, relatively thickened, lignified, with sparse and fine pit-canals.

(2) To 10 g of the pills, add 30 ml of ether, ultrasonicate for 15 minutes and filter. Evaporate the filtrate to dryness and dissolve the residue in 0.5 ml of ethyl acetate as the test solution. Prepare a solution with 0.5 g of Fructus Schisandrae Chinensis reference drug as the reference drug solution in the same manner. Dissolve deoxyschisandrin CRS and γ-schisandrin CRS in chloroform separately to produce two solutions containing 1 mg each per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15∶5∶1) as the mobile phase. Apply separately to the plate 2 μl of each of the test solution and the reference drug solution and 5 μl of each of the two reference solutions. After developing and removing of the plate, dry in air, examine under ultraviolet light at 254 nm. The major spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution, and the spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solutions.

(3) Dissolve ursolic acid CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G prepared with a 0.5% solution of boric acid as the coating substance and a mixture of cyclohexane and ethyl acetate (3∶1) as the mobile phase. Apply separately to the plate 2 μl of each of the reference solution and the test solution obtained under the test of Identification (2). After developing and removing of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 100℃ to the spots clear. The spot under the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Dissolve paeonol CRS in acetone to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, ethyl acetate and glacial acetic acid (9∶3∶0.25) as the mobile phase. Apply separately to the plate 10 μl of each of the reference solution and the test solution obtained under the test of Identification (2). After developing and removing of the plate, dry in air. Spray with 5% ferric chloride in ethanol acidified with hydrochloric acid, and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills. (Appendix Ⅰ A).

Action To reinforce the kidney to improve inspiration and arrest seminal emission and enuresis.

Indications Wheezing, constriction in the chest, chronic coughing, shortness of breath, dry throat, seminal emission, night sweating and frequent urination due to failure of the kidney to improve inspiration.

Usage and dosage 9 g, 2 times a day.

Precaution Contraindicated for patients with cough or dyspnea caused by external contraction.

Strength About 3 g per 40 pills

Storage Preserve in tightly closed containers.

Qiwei Guangzao Wan
(七味广枣丸)

Qiwei Guangzao Pills

Qiwei Guangzao Pills is a prescription used by Mongolian Nationality.

Ingredients Fructus Choerospondiatis 450 g; Semen Myristicae 75 g; Flos Caryophylli 75 g; Radix Aucklandiae 75 g; Resina Liquidambaris 75 g; Lignum Aquilariae Resinatum 75 g; Pulvis Coris Bovis seu Bubali 75 g.

Procedure Pulverize the above seven ingredients to fine powder, sift and mix thoroughly. To each 100 g of the powder add 80-100 g of refined honey to make big honeyed pills, and coat with powder of Cinnabaris.

Description Red big honeyed pills with dark brown core; odour, aromatic; taste, sweet, bitter, pungent and slightly sour.

Identification (1) Microscopical: Endocarp fibres pale yellow, the upper and lower layers mostly crisscrossed, with slightly thickened walls and containing yellowish-brown matters. Pollen grains triangular, 16 μm in diameter. Walls of fibre-tracheids slightly thickened, with bordered pits, pit apertures V-shaped or crossed. Inulin bodies irregular, occasionally showing fine radial striations, dissolved on heating. Fibres of striated muscles colourless or pale yellow, with fine and dense, straight, or wavy striations.
(2) Grind well 12 g of the pills, cut into pieces, with 4 g of kieselguhr, macerate overnight in 30 ml of ethyl acetate, and filter. Evaporate the filtrate to dryness at a lower temperature. Dissolve the residue in 5 ml of methanol as the test solution. Prepare a solution with 1 g of Radix Aucklandiae reference drug and 5 ml of ethyl acetate as the reference drug solution in the same manner. Dissolve eugenol CRS in methanol to produce a solution containing 1 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and ethyl acetate (19:1) as the mobile phase. Apply separately to the plate 5 μl of each of the three solutions. After developing and removing of the plate, dry in air. Spray with a solution of 5% vanillin in sulfuric acid, and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To nourish blood, replenish *qi*, and induce tranquilization.

Indications Distress and pain in the chest, palpitation, shortness of breath, restlessness, insomnia and forgetfulness.

Usage and dosage 1 pill, 1-2 times a day.

Strength 6 g per pill

Storage Preserve in tightly closed containers.

Qiwei Ketengzi Wan
(七味榼藤子丸)

Qiwei Ketengzi Pills

Qiwei Ketengzi Pills are prescription used by Dai Nationality.

Ingredients Semen Entadae (stir baked) 220 g; Caulis et Folium Crotonis Caudati 220 g; Resina Ferulae 3 g; Fructus Piperis 13 g; Fructus Viticis 66 g; Folium Viticis 154 g; Semen Nigellae Sativae 220 g; Herba Ecliptae 220 g.

Procedure Pulverize the above ingredients, except Herba Ecliptae, to fine powder and mix thoroughly. Decoct Herba Ecliptae with water two times, 1 hour for each, filter, combine the filtrates, concentrate to thin extract with relative density of 1.1-1.2 (determine at 20℃ by adding 1 times quantity of water to the concentrated extract), use as juice of Herba Ecliptae. Mix well the fine powder, juice of Herba Ecliptae, and a quantity of refined honey. Make to 1000 g of pills, dry at 60℃.

Description Dark brown to blackish-brown watered pills; odour, alliaceous; taste, pungent and slightly bitter.

Identification (1) Microscopical: Starch granules sub-rounded, ovoid or helmeted, 5-10 μm in diameter, hilum pointed, V-shaped, cleft, I-shaped or crossed, compound granules composed of 2-3 components. Stellate trichomes yellow, composed of 5-12 sharpened conical cells, sometimes one cell elongated particularly. Clusters of calcium oxalate obtuse angled, 5-50 μm in diameter. Non-glandular hair 2-5-celled, 45-175 μm long, with warty walls. Glandular hairs 27-65 μm long, with a 1-2-celled stalk and a 1-2-celled head, secreting yellowish substances. Cells of fragments of calyx with sinuous walls. Cells of testa polygonal, with beaded walls. Stone cells pale yellow, grouped or scattered, subrounded or polygonal, 20-35 μm in diameter, with thickened, lignified walls and distinct pit-canals, each with a large lumen.
(2) Pulverize 5 g of the pills to fine powder, triturate well with 2.5 g of kieselguhr, add 40 ml of ethanol, and ultrasonicate for 30 minutes. Allow to cool, filter, evaporate the filtrate to dryness, and dissolve the residue in 3 ml of methanol as the test solution. To 1 g of the Semen Nigellae reference drug, add 10 ml of ethanol, ultrasonicate for 30 minutes, and prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, methanol, and formic acid (18:3:0.2) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference drug solution to the plate. After developing and removing the plate, dry in air. Spray with 5% vanillin in sulfuric acid, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference solution and the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (50 : 50) as the mobile phase. As detector a spectrophotometer set at 258 nm. The

number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of vitexicarpin.

Reference solution Weigh accurately a quantity of vitexicarpin CRS, and dissolve in methanol to produce a reference solution containing 20 μg per ml.

Test solution Pulverize the pills to fine powder, weigh accurately 5 g of the powder to a stopper conical flask. Add accurately 25 ml of the dehydrated ethanol, weigh, and ultrasonicate (power, 300 W; frequency, 50 kHz) for 30 minutes. Allow to cool, weigh again, replenish the loss of weight with dehydrated ethanol, and filter. Measure accurately 10 ml of the filtrate, add 2.5 ml of water and mix well, and wash with petroleum ether (60-90℃) for 3 times, 15 ml for the first and second times, and 10 ml for the third time. Wash the petroleum ether extracts with 10 ml of ethanol, combine the solution of ethanol, and evaporate to dryness. Dissolve the residue in methanol, transfer to a 10 ml volumetric flask, dilute to volume with methanol, and mix well as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and 10 μl of the test solution into the column, respectively, and calculate the content.
It contains not less than 66 μg of vitexicarpin ($C_{19}H_{18}O_8$) per gram, referred to Fructus Viticis and Folium Viticis.

Action To expel *summer-heat*, regulate the function of the spleen and stomach, and relieve spasm and pain.

Indications Vomiting, diarrhea, feeling of stuffiness in the chest, costal pain, headache and fever.

Usage and dosage 3-6 g, 3 times a day; for external application after grinding and mixing with sesame oil.

Strength 3 g per bag

Storage Preserve in tightly closed containers, protected from moisture.

Qiwei Putao San
(七味葡萄散)

Qiwei Putao Powder

Qiwei Putao Powder is a prescription used by Mongolian Nationality.

Ingredients Fructus Vitis Viniferae 180 g; Gypsum Fibrosum 90 g; Flos Carthami 90 g; Radix Glycyrrhizae 90 g; Rhizoma Cyperi 60 g; Cortex Cinnamomi 60 g; Fructus Punicae Granati 60 g.

Procedure Pulverize the above ingredients, except Fructus Vitis Viniferae, to coarse powder. Triturate Fructus Vitis Viniferae with the above coarse powder to powder, heat to dryness, pulverize to fine powder, sift and mix well.

Description A yellowish-brown powder; odour, aromatic; taste, sweet and slightly astringent.

Identification (1) Microscopical: Fragments of corolla yellow, with reddish-brown or yellowish-brown tubular secretory cells. Secretory cells subrounded, containing pale yellowish-brown to reddish-brown secretion with adjacent cells arranged in radiation. Stone cells subsquare or subrounded, 32-88 μm in diameter with thin walls at one side. Stone cells colourless, elliptical or subrounded, with thickened walls and fine and dense pit-canals. Irregular plate crystals colourless, with straight striations.
(2) To 5 g add 1 ml of hydrochloric acid and 15 ml of chloroform, heat under reflux for 1 hour, cool, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 2 ml of ethanol as the test solution. Dissolve glycyrrhetinic acid CRS in dehydrated ethanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of benzene, petroleum ether (30-60℃), ethyl acetate and glacial acetic acid (10∶5∶4∶0.6) as the mobile phase. Apply separately 1-2 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removing of the plate, dry in air. Spray with a 10% solution of phosphomolybdic acid in ethanol and heat to the spots distinct. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) To 5 g add 20 ml of ether, extract by shaking for 15 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Dissolve cinnamaldehyde CRS in dehydrated ethanol to produce a solution containing 1 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (17∶3) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removing of the plate, dry in air. Spray with alcoholic dinitrophenylhydrazine TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(4) To 3 g add 10 ml of 80% acetone, stopper well, shake for 15 minutes, allow to stand, and use the supernatant as the test solution. Prepare a solution with 0.5 g of Flos Carthami reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethycellulose as the coating substance and a mixture of ethyl acetate, methanol, formic acid and water (7∶0.4∶2∶3) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removing of the plate, and dry in air. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(5) To 10 g add 50 ml of ether, macerate for 30 minutes with occasional shaking, filter, and evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of ethanol as the test solution. Prepare a solution with 2 g of Rhizoma Cyperi reference drug in the same manner as the reference drug solution. Dissolve α-cyperone CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethycellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (6∶4) as the mobile phase. Apply separately 10 μl of each of the three solutions to the plate. After developing and removing of the plate, dry in air. Spray with 1% vanillin in sulfuric acid, heat at 105℃ for 10 minutes and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements

for powder (Appendix Ⅰ B).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, 0.2 mol/L ammonium acetate and glacial acetic acid (67∶33∶1) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of glycyrrhizinic acid.

Reference solution Dissolve a quantity of ammonium glycyrrhizinate, accurately weighed, in mobile phase to prepare a solution containing 0.2 mg per ml, equivalent to 0.1959 mg per ml of glycyrrhizinic acid, as the reference solution.

Test solution Weigh accurately 1 g in a stopper conical flask, add 25 ml of the mobile phase, and weigh. Ultrasonicate for 30 minute, cool, weigh again, replenish the loss of weight with mobile phase, shake well and filter. Measure accurately 10 ml of the successive filtrate, evaporate to dryness, dissolve the residue in 20 ml of water, and extract with four 20-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extracts, recover the solvent to dryness, dissolve the residue in mobile phase, transfer to a 10 ml volumetric flask, dilute to volume, and shake well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 2.3 mg of glycyrrhizinic acid ($C_{42}H_{62}O_{16}$) per gram, referred to Radix Glycyrrhizae.

Action To remove *heat* from the lung, and relieve cough and dyspnea.

Indications Cough in phthisis, dyspnea in the aged, depressed sensation and stuffiness in the chest.

Usage and dosage 3 g, 1-2 times a day.

Strength 3 g per bag

Storage Preserve in tightly closed containers, protected from moisture.

Qiwei Tiexie Wan
(七味铁屑丸)

Qiwei Tiexie Pills

Qiwei Tiexie Pills are prescription used by Tibetan Nationality.

Ingredients Pulvis Ferri (processed with Fructus Chebulae) 250 g; Gypsum Rubrum (processed with milk) 300 g; Radix Inulae 150 g; Radix Aucklandiae 100 g; Herba Dracocephali Tangutici 150 g; Flos Carthami 150 g; Extractum Faeces Trogopterori 80 g.

Procedure Pulverize the above seven ingredients, except Extractum Faeces Trogopterori, to fine powder, sift and mix thoroughly. Make pills with Extractum Faeces Trogopterori and a quantity of water, then polish with a quantity of paste of Pulvis Ferri (to 1 portion of Pulvis Ferri processed with Fructus Chebulae add 4 portions of water and mix well) and dry.

Description Black watered pills; odour, aromatic; taste, bitter.

Identification (1) Microscopical: Irregular pieces dark black, lustrous on edge. Crystals in irregular pieces, glassy lustrous, with straight striations on edge. Wood fibres in bundles, long-fusiform, with oblique pits. Wood fibres in bundles, long-fusiform, 16-24 μm in diameter, walls thickened, with cleft, crossed or V-shaped pits. Epidermal cells of leaves subpolygonal in surface view, periclinal walls with cuticle striations and the scars of hairs, anticlinal walls beaded. Pollen grains rounded or ellipsoidal, up to 60 μm in diameter, extine with spinules, and 3 germinal apertures. Irregular masses brownish-black, dissolved immediately on adding of 50% sulfuric acid solution.

(2) To 0.5 g, in powder, add 10 ml of water, warm slightly and filter. Acidify 2 ml of the filtrate slightly with dilute hydrochloric acid, add 5 drops of potassium ferrocyanide TS, allow to stand; a bluish-green colour is produced, which disappeare on adding 3 drops of sodium hydroxide TS.

(3) Macerate 4 g, in powder, with 10 ml of water for 10 minutes, add 10 ml of a mixture of *n*-hexane and ethyl acetate (1∶1), macerate for 3 hours, centrifuge, concentrate the supernatant to about 1 ml as the test solution. Prepare a solution with 0.1 g of Radix Aucklandiae reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carbonmethylcellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (4∶1) as the mobile phase. Apply separately 4 μl of each of the two solutions to the plate. After developing and removing of the plate, dry in air. Spray with 5% vanillin in sulfuric acid, heat to spots clear. The blue main spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) To 4 g, in powder, add 20 ml of 80% solution of acetone, and ultrasonicate for 30 minutes. Filter, concentrate the filtrate to 2 ml as the test solution. Prepare a solution with 0.1 g of Flos Carthami reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of ethyl acetate, formic acid, water, and methanol (7∶2∶3∶0.4) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference drug solution to the plate. After developing and removing the plate, dry in air. The spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.

(5) To 1 g of Herba Dracoephali Tangutici reference drug, prepare a solution in the same manner of the method of test solution under the Identification (3) as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform and methanol (9.5∶0.5) as the mobile phase. Apply separately 10 μl of each of the test solution under Identification (3) and the reference drug solution to the plate. After developing and removing the plate, and dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To promote the flow of *qi* and blood, to subdue the hyperactivity of the liver, and to relieve pain.

Indications Pain in the hepatic region, enlargement of the liver.

Usage and dosage 1 pill, twice a day.

Strength 1 g per pill

Storage Preserve in tightly closed containers, protected from moisture.

Qiye Shen'an Pian
(七叶神安片)

Qiye Shen'an Tablets

Qiye Shen'an Tablets are prepared from total sapogium of Folium Notoginseng.

Procedure Make granules with 50 g or 100 g of total sapogium of Folium Notoginseng and a quantity of excipient, make into 1000 tablets and coat with sugar or film.

Description Sugar of film coated tablets with pale yellow to brownish-black core; taste, bitter, slightly sweet.

Identification Dissolve ginsenoside Rb_1 and ginsenoside Rb_3 CRS in methanol to produce solutions containing 0.5 mg of each per ml as the reference solutions. Carry out the method under Assay, inject 10 μl of each of the two reference solutions and the test solution under Assay into the column, respectively, the retention time of the peaks obtained with the test solution and the ginsenoside Rb_1 and Rb_3 reference solution is concordant with each other.

Other requirements Comply to the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, acetonitril as the mobile phase A, 0.2% phosphoric acid as the mobile phase B, elute in gradient as the following:

Time (minute)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0-19	30→35	70→65
19-21	35→50	65→50
21-26	50	50

As detector a spectrophotometer set at 203 nm. The number of theoretical plates for the column is not less than 6000, calculated with the reference to the peak of ginsenoside Rb_3.

Reference solution Weigh accurately a quantity of ginsenoside Rb_3 CRS, dissolve in methanol to produce a reference solution containing 0.5 mg per ml.

Test solution To 10 tablets, with coating removed, weigh accurately. Pulverize to fine powder, weigh accurately a quantity of the powder (correspond to about 100 mg of total sapogium of Folium Notoginseng) to a 100 ml stopper conical flask, add accurately 20 ml of ethanol, stopper and weigh. Ultrasonicate (power, 300 W; frequency, 50 kHz) for 15 minutes, allow to cool, and weigh again. Replenish the loss of weight with ethanol, mix well and filter. Collect the successive filtrate, filter again with microporous film (0.45 μm), use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 5.0 mg of ginsenoside Rb_3 ($C_{53}H_{90}O_{22}$) per tablet for Strength (1), and 10.0 mg for Strength (2), referred to total sapogium of Folium Notoginseng.

Action To nourish *qi* and anchor the *mind*, and promote blood circulation to kill pain.

Indications Palpitation, insomnia, pain and constriction in the chest due to stagnation of *heart-blood* from a deficiency of *heart-qi*.

Usage and dosage 50-100 mg, 3 times a day; taken after meals, or follow doctor's advice.

Strength (1) 50 mg
(2) 100 mg of total sapogium of Folium Notoginseng per tablet

Storage Preserve in tightly closed containers.

Attached:

Sanqiye zongzaogan
(三七叶总皂苷)

Total sapogium of Folium Notoginseng

Total sapogium of Folium Notoginseng is prepared from Folium Notoginseng.

Procedure Decoct Folium Notoginseng with water twice, 3 hours for each, combine the decoctions, filter, and concentrate the filtrate to a thin extract with a relative density of 1.2 (60℃). Add ethanol to a content of 60%, allow to stand to precipitate, filter the supernatant, decolourize, recover ethanol, concentrate to a thin extract with a relative density of 1.2 (60℃) and dry.

Description Pale yellow to brownish-yellow; taste, bitter and than slightly sweet, hygroscipic.

Identification (1) Dissolve the sample in 1 ml of acetic anhydride, add 1-2 drops sulfuric acid along the wall of test tube. A violet-red colour is produced. Mix well and allow to stand, it become violet.
(2) Comply with the test for Identification of Qiye Shen'an Tablets.

Loss on drying When dried to constant weight at 80℃, loses not more than 5.0 per cent of its weight (Appendix Ⅸ G).

Residue on ignition Not more than 0.4 per cent (Appendix Ⅺ J).

Assay Weigh accurately 50 mg to a 10 ml volumetric flask, dissolve in ethanol and dilute to volume. Mix well and filter, use the successive filtrate as the test solution. Carry out the method as described under the Assay of Qiye Shen'an Tablets.
It contains not less than 10 per cent of ginsenoside Rb_3 ($C_{53}H_{90}O_{22}$), referred to total sapogenin of Folium Notoginseng.

Storage Preserve in tightly closed containers, protected from light.

Preparation Qiye Shen'an Tablets

Qizhen Wan
(七珍丸)

Qizhen Pills

Ingredients Bombyx Batryticatus (stir-baked) 160 g; Scorpio 160 g; Moschus 16 g; Cinnabaris 80 g; Realgar 80 g; Arisaema cum Bile 80 g; Concretio Silicea Bambusae 80 g; Semen Crotonis Pulveratum 32 g; Massa Hanshi

Fermentata 160 g.

Procedure Levigate Realgar and Cinnabaris to very fine powder respectively. Pulverize Bombyx Batryticatus, Scorpio, Arisaema cum Bile, Concretio Silicea Bambusae and Mass Hanshi Fermentata to fine powder. Triturate Moschus with the above powders (reserve a quantity of Cinnabaris for coating), sift and mix well. Make pills with water, dry at a lower temperature and coat with the reserved powder of Cinnabaris.

Description Vermilion watered pills; odour, strongly aromatic; taste, pungent and slightly bitter.

Identification Microscopical: Irregular pieces colourless and transparent, with straight and angulate edges, dissolved in chloral hydrate TS. Clusters of calcium oxalate 8-24 μm in diameter, occurring in subrounded parenchymatous cells. Fragments of body wall colourless, covered with minute hyphae. Fragments of body wall pale yellow to yellow, with reticulate striations and rounded alveoli, sometimes showing brown setae. Irregular fragments golden-yellow or orange-yellow, lustrous. Irregular fine granules dark brownish-red, lustrous, with dark black edge.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To relieve convulsion and eliminate *phlegm*, and promote digestion and bowels movement.

Indications Child acute convulsion, fever, lethargy, harsh breathing, restlessness, excessive *phlegm*, no desire for food or milk and constipation.

Usage and dosage 3 pills for children of 3-4 months, 4-5 pills for children of 5-6 months, 6-7 pills for children of 1 year, 1-2 times a day; appropriate increasement of the dosage for children over 1 year and the sturdy children; or follow doctor's advice.

Strength About 3 g per 200 pills

Storage Preserve in tightly closed containers.

Qizhi Weitong Keli
(气滞胃痛颗粒)

Qizhi Weitong Granules

Ingredients Radix Bupleuri; Rhizoma Corydalis (baking); Fructus Aurantii; Rhizoma Cyperi; Radix Paeoniae Alba; Radix et Rhizoma Glycyrrhizai Preparata cum Melle.

Procedure Distill volatile oil of Fructus Aurantii and Rhizoma Cyperi, stand the volatile oil and the aqueous extract solution for further use. Discard the drug residue. Decoct the other 4 ingredients with water twice, 2 hours for the fist time and 1 hour for the second time. Combine the decoctions and the aquaefer extract solution of Fructus Aurantii and Rhizoma Cyperi, filter and concentrate the filtrate to a relative density of 1.18-1.23 (50℃), add a quantity of excipient, make granules, spray the volatile oil, and mix thoroughly.

Description Pale brown to brownish-yellow granules; odour, characteristically aromatic; taste, sweet, slightly bitter and pungent.

Identification (1) To 15 g of the granules, add 40 ml of ethanol, macerate for 1 hour, shake constantly, and filter. Evaporate the filtrate to dryness. Dissolve the residue in 5 ml of water, and extract with 30 ml of *n*-butanol saturated with water. Wash the *n*-butanol extract with three 20-ml quantities of water. Evaporate the *n*-butanol extracts to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of chloroform and methanol (4∶1) as the mobile phase. Apply separately to the plate 4 μl of each of the above two solutions. After developing and removing of the plate, and dry in air. Spray with a 5% solution of vanillin in sulfuric acid, and heat to spots clear. The bluish-purple spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) To 5 g of the granules, add 50 ml of methanol, ultrasonicate for 30 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in 10 ml of 2% hydrochloric acid, extract with two 15-ml quantities of ether, discard the ether layer, add ammonia TS to water layer, adjust to pH 9. Extract with two 15-ml quantities of ether again, combine the ether extracts. Evaporate the ether extracts to dryness, and dissolve the residue in 1 ml of chloroform as the test solution. Dissolve tetrahydropalmatine CRS in chloroform to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G prepared with 1% solution of sodium hydroxide as the coating substance and a mixture of *n*-hexane, chloroform, and methanol (10∶6∶1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removing of the plate, dry in air, expose to iodine vapour to spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for medicinal granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol and 0.02 mol/L solution of potassium dihydrogen phosphate (28∶72) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of paeoniflorin.

Reference solution Weigh accurately a quantity of paeoniflorin CRS, dissolve in ethanol and mix well, to produce a solution containing 80 μg per ml.

Test solution Weigh accurately 2 g of the granules, obtained under the test of weight variation, pulverized to fine powder, in a stopper conical flask. Add accurately 50 ml of water, closely stopper and weigh. Ultrasonicate for 60 minutes (power 250 W, frequency 50 kHz), cool, weigh again, replenish the loss of weight with water, shake well and filter. Use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column respectively and calculate the content.

It contains not less than 7.5 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per bag, referred to Radix Paeoniae Alba.

Action To soothe the liver to regulate the flow of *liver-qi*, and harmonize the stomach and kill pain.

Indications Stuffiness in the chest and gastralgia due to stagnation of *liver-qi*.

Usage and dosage 5 g, 3 times a day, taken with boiled water.

Precaution Be cautions about pregnant women.

Strength 5 g per bag

Storage Preserve in tightly closed containers.

Qufeng Shujin Wan (祛风舒筋丸)

Qufeng Shujin Pills

Ingredients Radix Saposhnikoviae 50 g; Ramulus Cinnamomi 50 g; Herba Ephedrae 50 g; Radix Clematidis 50 g; Radix Aconiti Preparata 50 g; Radix Aconiti Kusnezoffii Preparata 50 g; Rhizoma Atractylodis (stir-baked) 50 g; Poria 50 g; Fructus Chaenomelis 50 g; Radix Gentianae Macrophyllae 50 g; Rhizoma Drynariae (stir-baked) 50 g; Radix Achyranthis Bidentatae 50 g; Radix et Rhizoma Glycyrrhizae 50 g; Caulis Piperis Kadsurae 50 g; Caulis Sinomenii 50 g; Rhizoma Dioscoreae Nipponicae 50 g; Herba Erodii seu Geranii 50 g; Radix et Caulis Solani Melongenae 50 g.

Procedure Pulverize the above eighteen ingredients to fine powder, sift and mix thoroughly. To each 100 g of the powder add 160-180 g of refined honey to make big honeyed pills.

Description Blackish-brown big honeyed pills; odour, slight; taste, sweet and bitter.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Stomata characteristic, guard cells dumbbell-like in lateral view. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filled in parenchymatous cells. Vittae containing golden-yellow secretion, about 30 μm in diameter. Non-glandular hairs unicellular, mostly broken, 15-20 μm in diameter, with warty walls. Stone cells rectangular or subsquare, with slightly thickened walls. Stone cells rounded, rectangular or subpolygonal, walls thickened, lumina containing orange or brown contents.

(2) Grind well 28 g of the pills, cut into pieces, with 5 g of kieselguhr, add 30 ml of ethyl acetate, heat under reflux on a water bath for 30 minutes. Filter and concentrate the filtrate to about 1 ml on a water bath of lower temperature as the test solution. Dissolve cinnamaldehyde CRS in ethanol to produce a solution containing 1 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (17∶3) as the mobile phase. Apply separately to the plate 5 μl of the test solution and 2 μl of the reference solution. After developing and removing of the plate, dry in air, spray with dinitrophenylhydrazine TS, the orange colour spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Grind well 28 g of the pills, cut to pieces, with 5 g of kieselguhr, add 2 ml of concentrated ammonium TS and 50 ml of chloroform, heat under reflux for 1 hour. Filter and evaporate the filtrate to dryness. To the residue add 1 ml of methanol as the test solution. Dissolve ephedrine hydrochloride CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and concentrated ammonia TS (40∶7∶1) as the mobile phase. Apply separately to the plate 5 μl of the test solution and 2 μl of the reference solution. After developing and removing of the plate, dry in air, spray with triketohydrindene TS, heat at 105℃ for 10 minutes, the purplish-red colour spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Heat under reflux 0.5 g of Radix Saposhnikoviae reference drug in 20 ml of chloroform and 1 ml of concentrated ammonium TS for 1 hour. Filter and evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (7∶3) as the mobile phase. Apply separately to the plate 10 μl of the test solution obtained under Identification test (2) and 5 μl of the reference drug solution. After developing and removing of the plate, dry in air, examine under ultraviolet light at 365 nm, the bluish-purple colour spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To expel *wind* and disperse *cold*, eliminate *dampness* and invigorate meridians.

Indications Obstruction of *qi* and blood with pain due to accumulation of *wind*, *cold* and *dampness* with manifestations of painful and immobilized joints, local aversion to *cold*, numbness of limbs, and painful lower back and legs.

Usage and dosage 1 pill, twice a day.

Precaution Be cautious about pregnant women.

Strength 7 g per pill

Storage Preserve in tightly closed containers.

Qufeng Zhitong Pian (祛风止痛片)

Qufeng Zhitong Tablets

Ingredients Herba Erodii seu Geranii 334 g; Herba Visci 167 g; Radix Dipsaci 167 g; Radix Clematidis 83 g; Radix Angelicae Pubescentis 83 g; Radix Aconiti Kusnezoffii Preparata 83 g; Flos Carthami 83 g.

Procedure Pulverize Radix Clematidis and Radix Angelicae Pubescentis to fine powders and sift. Decoct the other five ingredients with water twice, each for 3 hours, filter, and combine the filtrate. Concentrate the filtrate to a thin extract with a relative density of 1.18-1.20 (80℃). Add the above powder, mix thoroughly, dry, pulverize, add a quantity of syrups simplex, make granules, dry, make into 1000 tablets and coat with sugar.

Description Sugar-coated tablets with brownish-black core; taste, bitter, astringent.

Identification Pulverize 6 tablets to fine powder, add 10 ml of ether, ultrasonicate for 15 minutes. Filter and evaporate the filtrate, dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution with 0.2 g of Radix Angelicae Pubescentis reference drug in the same manner as

the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane, benzene and ethyl acetate (2∶1∶1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removing of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Action To expel *cold* and *wind*, reinforce the liver and kidney, and tone up tendons and bones.

Indications Obstruction of *qi* and blood with pain due to accumulation of *wind*, *cold* and *dampness* and deficiency in the liver and kidney with manifestations of swollen joints, painful lower back and knees and numbness of limbs.

Usage and dosage 6 tablets, 2 times a day.

Precaution Contraindicated for pregnant women.

Storage Preserve in tightly closed containers.

Renqing Changjue (仁青常觉)

Renqing changjue Pills

Renqing Changjue pills are prescription used by Tibetan Nationality, prepared from Margarita, Cinnabaris, Lignum Santali Albi, Lignum Dalbergiae Odoriferae, Lignum Aquilariae Resinatum, Fructus Chebulae, Calculus Bovis, Moschus and Stigma Croci, etc.

Description Black watered pills; odour, slightly aromatic; taste, sweet, slightly bitter and astringent.

Identification (1) To 1 g of the pills, finely powdered, add 20 ml of methanol, ultrasonicate for 20 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution with 20 mg Stigma Croci reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of ethyl acetate, formic acid, and water (4∶1∶1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference drug solution to the plate. After developing and removing the plate, dry in air. The yellow spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.

(2) To 1 g of the pills, finely powdered, add 20 ml of a mixture of hydrochloric acid and methanol (1∶100), ultrasonicate for 20 minutes and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of a mixture of hydrochloric acid and methanol (1∶100) as the test solution. Dissolve a quantity of berberine hydrochloride CRS in methanol to prepare a reference solution containing 0.2 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of toluene, ethyl acetate, isopropanol, methanol, and water (6∶3∶1.5∶1.5∶0.3) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing in a chamber pre-equilibrated with concentrated ammonia vapour for 15 minutes, remove the plate, dry in air. Examine under ultraviolet light at 365 nm. The bright-yellow fluorescent spot in the chromatography obtained with the test solution corresponds in position and colour to the spot in the chromatography obtained with the reference solution.

(3) To 2 g of the pills, finely powdered, add 30 ml of ether, and heat under reflux for 30 minutes. Filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of chloroform as the test solution. To 0.3 g of Fructus Cnidii reference drug, add 5 ml of methanol, ultrasonicate for 10 minutes, allow to stand, and use the supernatant as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (30-60℃) and ethyl acetate (4∶1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference drug solution to the plate. After developing and removing the plate, dry in air. Examine under ultraviolet light at 365 nm. The blue fluorescent spots in the chromatography obtained with the test solution correspond in position and colour to the

spots in the chromatography obtained with the reference drug solution.
(4) Dissolve a quantity of dehydrocostuslactone CRS in methanol to prepare a reference solution containing 0.5 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of cyclohexane, chloroform, and ethyl acetate (10∶1∶1) as the mobile phase. Apply separately 10 μl of the test solution, obtained under the Identification (3), and 5 μl of the reference solution to the plate. After developing and removing the plate, dry in air. Spray with 1% vanillin in 10% ethanol, and heat to the spots clear. The blue spot in the chromatography obtained with the test solution corresponds in position and colour to the spot in the chromatography obtained with the reference solution.
(5) To 0.1 g of Benzoinum reference drug, add 5 ml of methanol, and ultrasonicate for 10 minutes. Allow to stand, use the supernatant as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (7∶3) as the mobile phase. Apply separately 10 μl of the test solution, obtained under the Identification (3), and 5 μl of the reference drug solution to the plate. After developing and removing the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and examine under ultraviolet light at 365 nm. The yellow-green fluorescent spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.
(6) To 1 g of the pills, finely powdered, add 20 ml of ethanol, ultrasonicate for 20 minutes. Filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethanol as the test solution. Dissolve a quantity of gallic acid CRS in ethanol to prepare a reference solution containing 0.5 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, ethyl acetate, and formic acid (6∶4∶1) as the mobile phase. Apply separately 10 μl of the test solution, and 5 μl of the reference solution to the plate. After developing and removing the plate, dry in air. Spray with 2% solution of ferric chloride in ethanol. The dark spot in the chromatography obtained with the test solution corresponds in position and colour to the spot in the chromatography obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A), except disintegration test.

Action To remove *heat* and conteract *toxicity*, and build up health by regulation of the stomach.

Indications "*Long*, *Chiba*, *peigen*" diseases, chronic gastrointestinal inflammation, ulcer, "*Mubu*" disease, atrophic gastritis, poisoning, syphilis, leprosy and febrile diseases, anthrax, pain due to the sores, "*Gan Huang Shui*" and purulence, etc.

Usage and dosage 1 g, once a day in serious cases; generally, once for every 3-7 or 10 days; or infuse it in boilling water or wine, taken at dawn with an empty stomach.

Precaution It is forbidden to eat any kind of meat and sour food and have sexual activity 3 days before taking it; avoid sour, rotten, raw or cold foods; never cateh cold.

Strength (1) 1 g per 4 pills (2) 1 g per pill

Storage Preserve in tightly closed containers.

Renqing Mangjue (仁青芒觉)

Renqing Mangjue Pills

Renqing Mangjue pills are prescription used by Tibetan Nationality, prepared from Fructus Terminaliae Billericae, Fructus Syzygii, Stigma Croci, Calculus Bovis, Moschus, Semen Strychni, and Cinnabaris, etc.

Description Blackish-brown watered pills; odour, aromatic; taste, bitter, sweet and astringent.

Identification (1) To 1 g of the pills, finely powdered, add 4 ml of methanol, stopper closely, shake for 5-10 minutes, allow to stand, and use the supernatant as the test solution. Prepare a solution with 20 mg of Stigma Croci reference drug as in the same manner the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, formic acid, and water (4∶1∶1) as the mobile phase. Apply separately 10 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air. The yellow spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(2) To 2 g of the pills, finely powdered, add 30 ml of ether, and heat under reflux for 30 minutes. Filter, and keep the residue for latter use. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of chloroform as the test solution. Dissolve a quantity of dehydrocostuslactone CRS in chloroform to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of cyclohexane, chloroform and ethyl acetate (10∶1∶1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 1% vanillin in 10% ethanol, heat to the spots clear. The blue spot in the chromatography obtained with the test solution corresponds in position and colour to the spot in the chromatography obtained with the reference solution.
(3) Evaporate the residue, obtained under Identification (2), to dryness, add 20 ml of ethyl acetate, and heat under reflux for 30 minutes. Filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. To 0.2 g of Rhizoma Curcumae Longae reference drug, add 5 ml of methanol, ultrasonicate for 10 minutes, allow to stand, and use the supernatant as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, methanol, and formic acid (9∶0.4∶0.6) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The bright-yellow fluorescent spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.
(4) To 0.2 g of Flos Caryophylli reference drug, add 5 ml of methanol, ultrasonicate for 10 minutes, allow to stand,

and use the supernatant as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (60-90℃), ethyl acetate, and formic acid (9 : 1 : 0.2) as the mobile phase. Apply separately 10 μl of the test solution, obtained under Identification (2), and 5 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and heat to the spots clear. Examine under ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.

(5) To 2 g of the pills, finely powdered, add 30 ml of a mixture of chloroform, methanol, and concentrated ammonia TS (75 : 25 : 5), ultrasonicate for 20 minutes. Filter, evaporate the filtrate to dryness, and dissolve the residue in 20 ml of chloroform. Transfer to a separating funnel, extract by shaking with two 10-ml quantities of water, separate the chloroform layer, and dehydrate with anhydrous sodium sulfate. Filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of chloroform as the test solution. To 0.5 g Radix Gentianae Macrophyllae reference drug, add 5 ml of methanol, ultrasonicate for 20 minutes, allow to stand, and use the supernatant as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of benzene and ethanol (9:1.5) as the mobile phase. Apply separately 15 μl of the test solution and 10 μl of the reference drug solution to the plate. After developing in a chamber pre-equilibrated with concentrated ammonia vapour for 15 minutes, remove the plate and dry in air. Examine under ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference drug solution.

(6) To 2 g of the pills, finely powdered, add 30 ml of methanol, ultrasonicate for 20 minutes. Filter, evaporate the filtrate to dryness, and dissolve the residue in 20 ml of sulfuric acid solution (2→500). Transfer to a separating funnel, extract by shaking with two 15-ml quantities of ethyl acetate. Combine the ethyl acetate extracts, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of cholic acid CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, ethyl acetate, and formic acid (1:1:0.1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and heat to the spots clear. Examine under ultraviolet light at 365 nm. A blue fluorescent spot in the chromatography obtained with the test solution corresponds in position and colour to the spot in the chromatography obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A), except disintegration test.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and a solution of potassium dihydrogen phosphate (0.01 mol/L, adjust pH value to 2.5 with 10% solution of phosphate acid) (25:75) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of strychnine.

Reference solution Weigh accurately about 100 mg of strychnine CRS to a 50 ml of volumetric flask, dissolve in methanol and dilute to volume, mix well. Measure accurately 1 ml to a 10 ml of volumetric flask, dilute to volume with mobile phase, mix well as the reference solution.

Test solution Weigh accurately 0.9 g of the powder (through No. 3 sieve), to a stopper conical flask, add accurately 50 ml of chloroform and 2 ml of concentrated ammonia TS, stopper well, and shake gently. Weigh, allow to stand for 24 hours, weigh again, replenish the lost weight with chloroform, mix well, and filter. Measure accurately 20 ml of the successive filtrate to a separating funnel, and extract by shaking with five 20-ml quantities of sulfuric acid solution (3→100). Combine the extracts, adjust pH value to 9-10 with concentrated ammonia TS, extract with five 20-ml quantities of chloroform, combine the chloroform extracts, and recover to dryness in vacuum. Dissolve the residue in mobile phase, transfer to a 10 ml of volumetric flask, dilute to volume, and mix well. Filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of the reference solution and 10 μl of the test solution into the column, and calculate the content.

It contains not less than 0.20 mg and not more than 0.60 mg of strychnine ($C_{21}H_{22}N_2O_2$) per pill, referred to Semen Strychni.

Action To remove heat and contract toxicity, reinforce the liver and stomach, cure sores, improve vision, induce resuscitation and build up heacth.

Indications Various kinds of poisoning, "Peigen" and "Mubu" diseases, digestive ulcers, acute and chronic gastrointestinal disorders, atrophic gastritis, ascites and leprosy.

Usage and dosage 1 pill, once a day, crushed and taken with boiled water.

Precaution It is forbidden to eat sour, rotten, raw and cold foods. Never catch cold.

Strength 1-1.5 g per pill

Storage Preserve in tightly closed containers.

Renshen Jianpi Wan (人参健脾丸)

Renshen Jianpi Pills

Ingredients Radix et Rhizoma Ginseng 25 g; Rhizoma Atractylodis Macrocephalae (stir-baked with bran) 150 g; Poria 50 g; Rhizoma Dioscoreae 100 g; Pericarpium Citri Reticulatae 50 g; Radix Aucklandiae 12.5; Fructus Amomi 25 g; Radix Astragali Praeparata Cum Melle 100 g; Radix Angelicae Sinensis 50 g; Semen Ziziphi Spinosae (stir-baked) 50 g; Radix Polygalae (Processed) 25 g.

Procedure Pulverize the above eleven ingredients to fine powder, sift and mix well. To each 100 g of the powder add 40-50 g refined honey and a quantity of water to make water-honeyed pills and dry; or add 110-120 g of refined honey to make big honeyed pills.

Description Brown to brownish-black water-honeyed pills or

big honeyed pills; odour, aromatic; taste, sweet, and slightly bitter.

Identification (1) Microscopical: Raphides of calcium oxalate occurring in mucilage cells, 80-240 μm long, 2-5 μm in diameter. Clusters of calcium oxalate 20-68 μm in diameter, with acute angles. Sclerenchymatous cells of tegmen yellowish-brown or brownish-red, subpolygonal in surface view, walls thickened, lumina containing silica bodies.
(2) Pulverize 8 g of the water-honeyed pills to fine powder, or triturate well 12 g of the big honeyed pills, in pieces, with 6 g of kieselguhr. Transfer to a Soxhlet's extractor, and heat under reflux with 100 ml of methanol for 3 hours. Allow to cool, filter, evaporate the filtrate to dryness, and dissolve the residue in 30 ml of water. Transfer to a separating funnel, extract with three 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, and wash with two 20-ml quantities of ammonia TS. Separate the *n*-butanol, evaporate to dryness, dissolve the residue in 30 ml of water and filter. Apply the filtrate to a column (1.5 cm in diameter, 12 cm long) packed with macroporous absorbance resin D101, pre-elute first with 50 ml of water, and then elute with 30 ml of 70% ethanol, discard the eluates. Elute again with 50 ml of 70% ethanol, collect the 70% ethanol eluates and evaporate to dryness, dissolve the residue in 0.5 ml of methanol as the test solution. Dissolve ginsenoside Rg_1 CRS, ginsenoide Re CRS, ginsenoide Rb_1 CRS and astragaloside Ⅳ CRS in methanol respectively to produce reference solutions containing 1 mg of each per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol, and water (13∶6∶2), standing below 10℃ over night, as the mobile phase. Apply separately 5-10 μl each of the test solution and the four reference solutions to the plate. After developing and removing the plate, dry in air. Spray with the 10% sulfuric acid in ethanol, and heat at 105℃ to the spots clear. The spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference solutions.
(3) Pulverize 8 g of the water-honeyed pills to fine powder, or triturate well 12 g of the big honeyed pills, in pieces, with 6 g of kieselguhr. Add 30 ml of ether, heat under reflux for 20 minutes, and allow to cool. Filter, evaporate the filtrate to dryness, and dissolve the residue in 0.5 ml of ethyl acetate as the test solution. Prepare a solution with 1 g of Radix Angelicae Sinensis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9∶1) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference drug solution to the plate. After developing and removing the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.
(4) To 0.5 g of Rhizoma Atractylodis Macrocephalae reference drug, add 2 ml of *n*-hexane, and ultrasonicate for 15 minutes. Filter, and use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (50∶1) as the mobile phase. Apply separately 10 μl of each of the test solution, obtained under Identification (3), and the reference drug solution to the plate. After developing in a chamber pre-equilibrated with the mobile phase for 15 minutes, remove the plate, and dry in air. Spray with 5% vanillin in sulfuric acid, and heat to the spots clear. The spots, including a pink spot as the main spot, in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, acetate acid, and water (35∶4∶61) as the mobile phase. As detector a spectrophotometer set at 284 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of hesperidin.

Reference solution Weigh accurately a quantity of hesperidin CRS, dissolve in methanol to produce a reference solution containing 0.25 mg per ml.

Test solution Pulverize a quantity of the water-honeyed pills to fine powder, weigh accurately 4 g; or cut a quantity of big honeyed pills into pieces, weigh accurately about 6 g, triturate well with 6 g of kieselguhr to form a flake, and cut into pieces. Transfer to a Soxhlet's extractor, heat under reflux with 80 ml of petroleum ether (60-90℃) for 3 hours. Discard the petroleum ether extract, expel solvent remained in the residue, add 80 ml of methanol, heat under reflux for 5 hours, allow to cool, and filter. Transfer the filtrate to a 100 ml volumetric flask, wash the container with a small quantity of methanol for several times, filter the washings to the same flask, dilute with methanol to volume, and mix well as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.
It contains not less than 6.9 mg of hesperidin ($C_{28}H_{34}O_{15}$) per pill for each big honeyed pills, and 1.7 mg per gram for small honeyed pills, referred to Pericarpium Citri Reticulatae.

Action To invigorate *spleen-qi* and harmonize the stomach function to stop diarrhea.

Indications Indigestion, fullness and discomfort in the stomach, nausea, vomiting, abdominal pain, loose stools, poor appetite, and lassitude due to deficiency in the spleen and stomach.

Usage and dosage 2 big honeyed pills or 8 g of water-honeyed pills, twice a day.

Strength 6 g per big honeyed pill

Storage Preserve in tightly closed containers.

Renshen Yangrong Wan (人参养荣丸)

Renshen Yangrong Pills

Ingredients Radix et Rhizoma Ginseng 100 g; Rhizoma Atractylodis Macrocephalae (stir-baked with Terra Flava Usta) 100 g; Poria 75 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 100 g; Radix Angelicae Sinensis 100 g; Radix Rehmanniae Praeparata 75 g; Radix Paeoniae Alba (stir-baked with bran) 100 g; Radix Astragali Praeparata 100 g; Pericarpium Citri Reticulatae 100 g; Radix Polygalae (processed) 50 g; Cortex Cinnamomi 100 g; Fructus

Schisandrae Chinensis (steamed with wine) 75 g.

Procedure Pulverize the above twelve ingredients to fine powder, sift and mix well. Decoct 50 g of Rhizoma Zingiberis Recens and 100 g of Fructus Jujubae with water in portions until the drugs are exhausted, filter. To 100 g of the powder add 35-50 g of refined honey and the above filtrate, make water-honeyed pills; or add 90-100 g of refined honey and the above filtrate, stir well, and make big honeyed pills.

Description Brown water-honeyed pills or big honeyed pills; taste, sweet and slightly pungent.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown. Clusters of calcium oxalate 20-68 μm in diameter, acute angled. Stone cells subrounded or rectangular, 32-88 μm in diameter with very thin walls at one side. Fibres in bundles or scattered, thick-walled, with longitudinal fissures on the surface, both ends usually broken to broom-like or relatively truncate. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Stone cells of testa pale yellow or pale yellowish-brown, polygonal in surface view, walls relatively thickened, with fine and dense pit-canals, lumina containing dark brown contents. Clusters of calcium oxalate 18-32 μm in diameter, occurring in parenchymatous cells, often arranged in rows, or several clusters in a cell. Parenchymatous cells brownish-yellow to blackish-brown, cells mostly shrunken and each containing a brown nucleous-like mass. Needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells. Parenchymatous cells fusiform, walls slightly thickened, with extremely minute oblique crisscross striations, prisms of calcium oxalate aggregated in parenchyma in group. Cork cells polygonal, subsquare and subrectangular in surface view, anticlinal walls relatively thin, pitted and interrupted.

(2) Triturate well 18 g with 10 g of kieselguhr, extract with successive quantities of 100, 50 and 50 ml of 7% solution of sulfuric acid under grinding, and centrifuge. Heat the acid-aqueous solution under reflux on a water bath for 1 hour, and cool. Extract with three 50-ml quantities of petroleum ether (30-60℃) by shaking, combine the petroleum ether solutions, and evaporate to dryness. Dissolve the residue in 0.5 ml of dehydrated ethanol as the test solution. Dissolve separately panaxadiol CRS and panaxatriol CRS in dehydrated ethanol to produce two solutions containing 1 mg of each per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ether and chloroform (1∶1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of each of the reference solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulphuric acid in ethanol and heat at 105℃ to the spots clear. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

(3) Triturate well 9 g with 9 g of kieselguhr, transfer to a Sohxlet's extractor, add a quantity of methanol, extract under reflux on a water bath until the extract becomes colourless, evaporate the extract to dryness. Dissolve the residue in 30 ml of water, extract with three 20-ml quantities of *n*-butanol saturated with water by shaking. Combine the *n*-butanol extracts, wash with 20 ml of water, and discard the water solution. Evaporate the *n*-butanol extracts to about 1 ml, add 2 g of neutral aluminium oxide, mix stir well on a water bath, dry, and apply it to a previously prepared small column (1-1.5 cm in diameter) packed with neutral aluminium oxide (200 mesh, 2 g), elute with 50 ml of the mixture of ethyl acetate and methanol (1∶1). Collect the eluate and evaporate to dryness. Dissolve the residue in 1 ml of ethanol and use the supernatant as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40∶5∶10∶0.2) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Cut 9 g into pieces, transfer to a round-bottomed flask and add 200 ml of water. Carry out the method for determination of volatile oil (Appendix Ⅹ D). Add water through the top of the apparatus until fills the collector and overflows to the flask, then add 2 ml of ethyl acetate, heat under reflux for 1 hour, separate the ethyl acetate layer, and evaporate to about 0.25 ml as the test solution. Prepare a solution with 0.5 g of Radix Angelicae Sinensis reference drug in the same manner as the reference drug solution. Dissolve cinnamaldehyde CRS in ethyl acetate to produce a solution containing 1 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9∶1) as the mobile phase. Apply separately 2-6 μl of the test solution, 2 μl of each of the reference drug solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Spray with a solution of alcoholic dinitrophenylhydrazine TS and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(5) Triturate well 9 g with 4.5 g of kieselguhr, add 50 ml of water, grind well and centrifuge, discard the supernatant, and dissolve the residue in 50 ml of water. Repeat these procedures twice, then dry at 50℃ for 3 hours, transfer the residue to a Sohxlet's extractor. Add 80 ml of petroleum ether (60-90℃), heat under reflux on a water bath for 1 hour, and discard the petroleum ether. Evaporate the residue to dryness, add 80 ml of methanol, heat under reflux on a water bath until the extract solution becoming colourless. Cool, filter, and evaporate the filtrate to about 1 ml as the test solution. To 0.5 g of Pericarpium Citri Reticulatae reference drug, add 5 ml of methanol, ultrasonicate for 5 minutes, filter and use the filtrate as the reference drug solution. Dissolve hesperidin CRS in methanol to produce a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance mixed with 0.5% solution of sodium hydroxide and a mixture of ethyl acetate, methanol and water (100∶17∶13) as the mobile phase. Apply separately 0.5 μl of each of the three solutions to the plate. Develop the chromatogram until the solvent front has moved about 3 cm, remove the plate and allow to dry in air. Develop the chromatogram once more, using the upper layer of a mixture of toluene, ethyl acetate, formic acid and water (20∶10∶1∶1) as the mobile phase, until the solvent front has moved about 8 cm, remove the plate, and allow to dry in air. Spray with 1% aluminium chloride TS. Examine under

ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with both the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.11% solution of acetic acid (40∶60) as the mobile phase. As detector a spectrophotometer set at 283 nm, the number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of hesperidin.

Reference solution Dissolve a quantity of hesperidin CRS, accurately weighed, in methanol to prepare a solution containing 30 μg per ml as the reference solution.

Test solution Pulverize the water-honeyed pills, weigh accurately 0.8 g; or cut the big honeyed pills, obtained in the test of packing variation, into pieces, weigh accurately 1.0 g; Transfer to a stopper conical flask, add accurately 50 ml of methanol, stopper well, and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 1 hour, cool, weigh again, replenish the loss of weight with methanol, shake well, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 5-10 μl of the test solution into the column, and calculate the content.
It contains not less than 2.0 mg of hesperidin ($C_{28}H_{34}O_{15}$) per gram for water-honeyed pill, 13 mg per pill for big honeyed pill, referred to Pericarpium Citri Reticulatae.

Action To reinforce *qi* and blood with herbs warm in property.

Indications Emaciation, lassitude, loss of appitite and loose stools due to a deficiency of *qi* and blood, and weakness after an illness.

Usage and dosage 6 g of water-honeyed pills, 1 big honeyed pill, 1-2 times a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Renshen Zaizao Wan
(人参再造丸)

Renshen Zaizao Pills

Ingredients Radix et Rhizoma Ginseng 100 g; Agkistrodon (stir-baked with wine) 100 g; Herba Pogostemonis 100 g; Lignum Santali Albi 50 g; Fructus Caryophylli 50 g; Radix Scrophulariae 100 g; Radix et Rhizoma Aseri 50 g; Rhizoma Cyperi (processed with vinegar) 50 g; Pheretima 25 g; Radix Rehmanniae Praeparata 100 g; Radix et Rhizoma Notoginseng 25 g; Olibanum (processed with vinegar) 50 g; Pericarpium Citri Reticulatae Viride 50 g; Fructrus Amomi Rotundus 50 g; Radix Saposhnikoviae 100 g; Radix Polygoni Multiflori Praeparata Cum Succo Glycines Sotae 100 g; Rhizoma Chuanxiong 100 g; Rhizoma Wenyujin Concisum 12.5 g; Radix Astragali 100 g; Radix et Rhizoma Glycyrrhizae 100 g; Rhizoma Coptidis 100 g; Poria 50 g; Radix Paeoniae Rubra 100 g; Radix et Rhizoma Rhei 100 g; Herba Taxilli 100 g; Radix Puerariae Lobatae 75 g; Herba Ephedrae 100 g; Rhizoma Drynarize (stir-baked) 50 g; Scorpio 75 g; Os Pardi (processed) 50 g; Bombyx Batryticatus (stir-baked) 50 g; Radix Aconiti Lateralis (processed) 50 g; Succinum 25 g; Plastrum Testudinis (processed with vinegar) 50 g; Rhizama Dioscoreae Hypoglaucae 100 g; Rhizoma Atractylodis Macrocephalae (stir-baked with bran) 50 g; Lignum Aquilariae Resinatrm 50 g; Rhizoma Gastrodiae 100 g; Cortex Cinnamoni 100 g; Radix Angelicae Dahuricae 100 g; Myrrha (processed with vinegar) 50 g; Radix Angelicae Sinensis 50 g; Semen Alpiniae katsumadai 100 g; Radix Clematidis 75 g; Radix Linderae 50 g; Rhizoma seu Radix Notopterygii 100 g; Exocarpium Citri Rubrum 200 g; Massa Medicata Fermentata (stir-baked with bran) 200 g; Cinnabaris 20 g; Sanguis Draconis 15 g; Moschus 5 g; Broneolum Syntheticum 5 g; Calculus Bovis 5 g; Concretio Silicea Bambusae 50 g; Arisaema Cum Bile 50 g; Pulvis Cornus Bubali Concentratus 30 g.

Procedure Levigate respectively Cinnabaris and Succinum to fine powder, pulverize Radix Ginseng and the other forty-seven ingredients, except Broneolum Suntheticum, Sanguis Draconis, Calculus Bovis, Pulvis Cornus Bubali Concentratus, Moschus and Concretio Silicea Bambusae, to fine powder. Triturate Broneolum Suntheticum, Sanguis Draconis, Calculus Bovis, Cornu Bubali, Moschus and Concretio Silicea Bambusae with the above two fine powders, sift and mix well. To each 100 g of the powder add 100-110 g of refined honey to make big honeyed pills.

Description Black big honeyed pills; taste, sweet, slightly bitter.

Identification (1) Microscopical: Fragments of body walls pale yellow to yellow, with reticulated striations and rounded seta pits, brown setae visible sometimes. Fragments of body walls colourless, with very fine hyphae on surface. Resin canal containing yellow secretion.
(2) Cut 20 g of pills into pieces, add a quantity of kieselguhr, grind well, extract with a quantity of ether in a Soxhlet's extractor for 1 hour, remaining the residue for later use. Evaporate the ether extract to dryness at a lower temperature, and dissolve the residue in 1 ml of dehydrated ethancl as the test solution. Prepare solutions separately with 0.2 g of each of Radix Angelicae Sinensis reference drug and Rhizoma Chuanxiong reference drug in the same manner as the reference drug solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene and ethyl acetate (30∶1) as the mobile phase. Apply separately 10 μl of each of the solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the Radix Angelicae Sinensis reference drug solution and the Rhizoma Chuanxiong reference drug solution.
(3) Expel the solvent from the residue remained under Identification test (2), ultrasonicate with 50 ml of methanol for 30 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in 20 ml of water, extract with two 25-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, wash with two 20-ml quantities of ammonia TS and evaporate the *n*-butanol extracts to dryness. Dissolve the residue in 10 ml of water, apply to a column (1.5 cm in diameter, 15 cm long) packed with D 101 macroporous resin. Elute with 50 ml of water, discard the water eluates, elute with 50 ml of 20% ethanol, and discard the eluates. Elute with 80 ml of 80% ethanol, collect the eluates, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve ginsenoside Re

CRS and ginsenoside Rg_1 CRS in methanol to produce a mixture containing 0.5 mg each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, ethyl acetate, methanol and water (15∶40∶22∶10), standing below 10℃, as the mobile phase. Apply separately 10 μl of each of the two solutions in strip to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference solution.

(4) Take 10 ml of the extract of a mixture of hydrochloric acid and methanol (1∶100) obtained under Assay, and concentrate to 2 ml as the test solution. Ultrasonicate 0.5 g of Rhizoma Coptidis reference drug with 5 ml of a mixture of hydrochloric acid and methanol (1∶100) for 10 minutes and use the supernatant as the reference drug solution. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 0.2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, isopropanol, methanol and concentrated ammonia TS (12∶6∶3∶3∶1) as the mobile phase. Apply separately 5 μl of each of the three solutions to the plate. After developing in a chamber pre-equilibriated with ammonia vapour and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A)

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.05 mol/L solution of potassium dihydrogen phosphate (28∶72) as the mobile phase. As detector a spectrophotometer set at 345 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of berberine hydrochloride.

Reference solution Dissolve a quantity of berberine hydrochloride CRS, accurately weighed, in methanol to prepare a solution containing 0.05 mg per 1 ml as the reference solution.

Test solution Cut the pills, obtained under the test of weight variation, into pieces, mix well, weigh accurately 5 g in a stopper conical flask, add accurately 50 ml of a mixture of hydrochloric acid and methanol (1∶100), stopper tightly, and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, cool, weigh again, replenish the loss of weight with a mixture of hydrochloric acid and methanol (1∶100), shake well, and filter. Measure accurately 25 ml of the successive filtrate, concentrate to about 10 ml, and apply to a neutral aluminium oxide column (0.9 cm in diameter, 100-200 mesh, pre-eluted with 30 ml of methanol). Elute with 25 ml of ethanol, and collect the eluates in a 50 ml volumetric flask, dilute with ethanol to volume, shake well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 1.0 mg of berberine hydrochloride ($C_{20}H_{18}ClNO_4$) per pill, referred to Rhizoma Coptidis.

Action To replenish *qi* and nourish blood, expel *wind* and resolve *phlegm*, and promote blood circulation to dredge meridians.

Indications Stroke due to *qi* deficiency, stagnation of blood and blockage of meridians by *wind-phlegm*, with manifestations of deviated mouth and eye, hemiplegia, numb hands and feet, pain, muscular contracture and dysphasia.

Usage and dosage 1 pill, twice a day.

Precaution Contraindicated for pregnant women.

Strength 3 g per pill

Storage Preserve in tightly closed containers.

Reyanning Keli
(热炎宁颗粒)

Reyanning Granules

Ingredients Herba Taraxaci; Rhizoma et Radix Polygoni Cuspidati; Herba Sonchi Arvensis; Herba Scutellariae Barbatae.

Procedure Decoct the above four ingredients with water twice, 2 hours for the first time and 1 hour for the second time. Combine the decoctions, filter and concentrate the filtrate to a thin extract, add a quantity of sucrose powder and dextrin, mix thoroughly, dry in vacuum, pulverize to fine powder, make granules and dry; or concentrate the filtrate to a thin extract, dry by spraying, add a quantity of dextrin and stevioside, stir thoroughly, dry in vacuum, pulverize to fine powder, make granules without sucrose and dry.

Description Brown granules; taste, sweet, slightly bitter.

Identification (1) Pulverize 10 g of the granules with sucrose or 2.5 g of granules without sucrose to fine powder, add 25 ml of chloroform and ultrasonicate for 10 minutes. Filter and evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution with 0.5 g of Rhizoma et Radix Polygoni Cuspidati reference drug in the same manner as the reference drug solution. Dissolve emodin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate, and formic acid (15∶2∶1) as the mobile phase. Apply 5 μl of the test solution and 2 μl of each of the reference drug solution and reference solution to the plate separately. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm, the yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and reference solution.

(2) Pulverize 20 g of the granules with sucrose or 5 g of granules without sucrose to fine powder, add 50 ml of methanol, ultrasonicate for 20 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 20 ml of water, and adjust the pH to 2-3 with dilute hydrochloric acid TS. Extract by shaking with two 20-ml quantities of ethyl acetate, combine the ethyl acetate extracts, and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of caffeic acid CRS in methanol to prepare a solution containing

0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of toluene, ethyl acetate, and formic acid (5∶4∶1) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removing the plate, dry in air. Spray with 1% aluminium trichloride in ethanol, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatography obtained with the test solution corresponds in position and colour to the spot in the chromatography obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.1% solution of phosphoric acid (85∶15) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of emodin.

Reference solution Weigh accurately a quantity of emodin CRS, dissolve in methanol to prepare a reference solution containing 10 μg per ml.

Test solution Pulverize the content, obtained under the test of weight variation, to fine powder. Weigh accurately 2 g of the granules or 0.5 g of granules without sucrose to a 50 ml stopper conical flask, add accurately 25 ml of methanol, stopper well, and weigh. Ultrasonicate (power, 250 W, frequency, 33 kHz) for 30 minutes, allow to cool, and weigh again. Replenish the lost weight with methanol, mix well, and filter. Measure accurately 10 ml of the successive filtrate to a round-bottom flask, recover methanol in vacuum, add 10 ml of 2.5 mol/L solution of sulfuric acid, and ultrasonicate for 5 minutes. Add 10 ml of chloroform, heat under reflux for 1 hour, allow to cool, transfer to a separating funnel, wash the container with a quantity of chloroform, combine the washings to the same separating funnel, separate the chloroform layer, extract the water layer with two 10-ml quantities of chloroform, and combine the chloroform solutions. Dehydrate with a quantity of anhydrous sodium sulfate, wash the container and the filter paper with a quantity of chloroform, combine the washings with the chloroform extracts, and recover chloroform in vacuum. Dissolve the residue in a quantity of methanol, transfer to a 10 ml volumetric flask, dilute to volume with methanol, mix well, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 1.5 mg of emodin ($C_{15}H_{10}O_5$) per pack, referred to Radix et Rhizoma Polygoni Cuspidati.

Action To clear *heat* to relieve *toxicity*.

Indications Common cold due to affliction from external *wind-heat*, which transforms into *fire*, with manifestations of fever, swollen painful and dry throat, bitter taste in the mouth, coughing with expectoration of yellow sputum, brown urine and constipation; suppurative tonsillitis, acute pharyngitis, acute bronchitis or simple pneumonia with above symptoms.

Usage and dosage 1-2 sachet to be infused in boiling water for oral administration, 2-4 times a day, or follow doctor's advice.

Strength (1) 16 g per pack
(2) 4 g per pack (with out sucrose)

Storage Preserve in tightly closed containers.

Rujiling Keli (乳疾灵颗粒)

Rujiling Granules

Ingredients Radix Bupleuri; Rhizoma Cyperi (processed with vinegar); Pericarpium Citri Reticulatae Viride; Radix Paeoniae Rubra; Radix et Rhizoma Salviae Miltiorrhizae; Semen Vaccariae (stir-baked), Caulis Spatholobi; Concha Ostreae; Sargassum; Thallus Laminariae seu Eckloniae; Herba Epimedii; Semen Cuscutae.

Procedure Decoct Semen Vaccariae with water twice, 1.5 hours for the first time, 1 hour for the second time. Combine the decoctions, filter. Concentrate the filtrate to a solution with a relative density of 1.10 (70-80℃), cool to the room temperature. Add a quantity of ethanol, equivalent to the above solution, and produce precipitate. Filter, recover ethanol from the filtrate. Decoct the other eleven ingredients with water twice, 2 hours for the first time, 1.5 hours for the second time, combine the decoction, and filter. Concentrate the filtrate with the above decoction to a thick extract with relative density of 1.40 (50-60℃), add a quantity of sucrose and dextrin to make granules, and dry.

Description Brownish-yellow or dark brown granules. Taste, bitter and slightly sweet.

Identification (1) Pulverize 5 g to fine powder, add 20 ml of ethanol, ultrasonicate for 20 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 10 ml of water, then extract with three 15-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extractions, wash with water twice, each 10 ml. Separate the *n*-butanol extracts and concentrate to about 1 ml on a water bath, mix with a quantity of aluminium oxide, and dry on a water bath. Apply to a column pack with neutral aluminium oxide (200 mesh, 1 g, 1 cm internal diameter), elute with 50 ml of ethanol. Collect the eluate, evaporate to dryness, and dissolve the residue in 0.5 ml of methanol as the test reference solution. Dissolve paeoniflorin CRS in 1 ml of methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol, and formic acid (40∶5∶10∶0.2) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid, and heat to the spots clear. The blueish-violet spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Pulverize 10 g to fine powder, add 40 ml of methanol, ultrasonicate for 20 minutes, filter, and evaporate to dryness. Dissolve the residue in 20 ml of water, adjust pH value to 2 with dilute hydrochloric acid TS, and extract with two 20-ml quantities of ethyl acetate. Combine the extracts and evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of sodium danshensu CRS in methanol to prepare a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254}

mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, acetone, and formic acid (4:2:1) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. Develop in a chamber pre-equilibriated with formic acid vapour for 10 minutes, remove the plate, and dry in air. Expose the plate to ammonia vapour for 10 minutes, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatography obtained with the test solution corresponds in position and colour to the spot in the chromatography obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and the mixture of acetonitrile and 0.075 mol/L phosphoric acid (adjust pH value to 4.5 with triethylamine) (73:27) as the mobile phase. AS detector a spectrophotometer set at 270 nm. The number of theoretical plates of the column is not less than 4000, calculated with reference to the peak of icariin.

Reference solution Weigh accurately about 10 mg of icariine CRS, dried to constant at 105℃ previously, to a 100 ml volumetric flask, dissolve and dilute to volume with methanol, and mix well. Transfer accurately 1 ml to a 25 ml volumetric flask, dilute to volume with the mobile phase, and mix well, producing a solution containing 4 μg of icariine per ml as the reference solution.

Test solution Pulverize the mixed contents obtained under the test of weight variation to fine powder, weigh accurately 2 g to a stopper conical flask, add accurately 50 ml of 70% ethanol, stopper well, weigh and allow to stand overnight. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 20 minutes, cool, and weigh again. Replenish the loss of weight with 70% ethanol, mix well and filter. Use the filtrate as the test solution.

Procedure Inject Accurately 20 μl of each of the reference solution and the test solution into the column, and determine the content.

It contains not less than 1.1 mg of icariine ($C_{33}H_{40}O_{15}$) per pack, referred to Herba Epimedii.

Action To soothe the liver and promote blood circulation, and expel *phlegm* and soften hard masses.

Indication Mammary nodules due to stagnation of *liver-qi* and accumulation of *phlegm* with manifestations of breast lumps or nodules in different size, soft or moderately hard in quality, or abdominal pain before the menstrual cycle; hyperplasia of the mammary gland with above symptoms.

Usage and dosage 1-2 sachet infused in boiling water for oral administration, 1-2 sachet, 3 times a day.

Precaution Contraindicated for pregnant women.

Strength 14 g per pack

Storage Preserve in tightly closed container.

Rukuaixiao Pian
(乳块消片)

Rukuaixiao Tablets

Ingredients Folium Citri Reticulatae 825 g; Radix et Rhizoma Salviae Miltiorrhizae 825 g; Spina Gleditsiae 550 g; Semen Vaccariae 550 g; Fructus Toosendan 550 g; Pheretima 550 g.

Procedure Decoct the above ingredients, except Pheretima and Semen Vaccariae, with water for twice, 1 hour for each, filter, combine the filtrate and concentrate to a thin extract with a relative density of 1.25-1.30 (85℃), and allow to cool. Heat under reflux Pheretima and Semen Vaccariae with 70% ethanol for twice, 2 hours and 1 hour for each respectively, filter, combine the filtrate, add to the above thin extract, adjust ethanol content to 70%, stir thoroughly, and stand. Recover ethanol, concentrate to a thick extract, and dry in vacuum, pulverize to powder, add a quantity of excipients, mix thoroughly, making granules and compress into 1000 tablets, coated with sugar or film.

Description Sugar or film coated tablets with brown core; taste, bitter.

Identification (1) Pulverize 10 tablets, removed the coats, add 20 ml of chloroform, ultrasonicate for about 20 minutes and filter. Evaporate the filtrate to 1 ml as the test solution. Prepare a solution of 1 g of Pheretima reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gal G as the coating substance and a mixture of benzene and ethyl acetate (9:1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) Pulverize 5 tablets, removed the coats, to fine powder, and dissolve in 20 ml of water by pulverizing. Centrifuge, and extract the supernatant with petroleum ether (60-90℃) for three times, 20 ml for the first and second times, and 15 ml for the third time. Discard the petroleum ether extracts. Extract the water with three 20-ml quantities of ethyl acetate, combine the ethyl acetate extracts, evaporate to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Decoct 3 g of Radix et Rhizoma Slaviae Miltiorrhizae reference drug with 60 ml of water for 1 hour, filter, concentrate the filtrate to about 10 ml, add ethanol to a content of 70%, filter, evaporate the filtrate to dryness, and dissolve the residue in 20 ml of water. Prepare a solution in the same manner as described under the preparation of test solution, start at "Extract the water with three 20-ml quantities of ethyl acetate", as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, acetone, and formic acid (25:10:4) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference drug solution to the plate. After developing and removing the plate, dry in air. Expose the plate to ammonia vapour, and spray with 5% ferric chloride in ethanol. The spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.

(3) Pulverize 5 tablets, removed the coats, to fine powder, add 50 ml of 70% ethanol, and heat under reflux for 1 hour. Filter, evaporate the filtrate to dryness, and dissolve the residue in 30 ml of water. Extract by shaking with three 30-ml quantities of ether, and discard the ether extracts. Evaporate the ether in the water layer, apply the water to a column packed with polyamide (80-100 meshs, 2 g, 1 cm in diameter, packed with water), pre-elute with 100 ml water, elute again with 50 ml of 70% ethanol, collect the ethanol eluates, and evaporate to dryness. Dissolve the residue in 15 ml of water, extract with two 15-ml quantities of ethyl acetate, combine the ethyl acetate extracts, and evaporate to

dryness. Dissolve the residue in 1 ml of ethanol as the test solution. Decoct 3 g of Folium Citri Reticulatae reference drug with 60 ml of water for 1 hour, filter and concentrate the filtrate to about 10 ml, and add ethanol to a content of 70%. Filter and evaporate the filtrate to dryness, dissolve the residue in 30 ml of water, apply to a column packed with polyamide (80-100 meshs, 2 g, 1 cm in diameter, packed with water), pre-elute with 100 ml water, elute again with 50 ml of 70% ethanol, collect the ethanol eluates, and evaporate to dryness. Dissolve the residue in 1 ml of ethanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide as the coating substance and a mixture of butanone, acetylacetone, ethanol, and water (4∶3∶3∶13) as the mobile phase. Apply separately 2 μl of each of the test solution and the reference drug solution to the membrane. After developing in a chamber pre-equilibriated with glacial acetic acid vapour, remove the membrane, and dry in air. Spray with 1% aluminium trichloride in ethanol, heat at 105℃ for 3 minutes, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, methanol, water, and glacial acetic acid (0.5∶8∶92∶1) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 3500, calculated with the reference to the peak of danshensu.

Reference solution Weigh accurately a quantity of sodium danshensu CRS, and dissolve in 5% oxalic acid to produce a reference solution containing 48 μg per ml (correspond to 43 μg of danshensu per ml).

Test solution To 10 tablets, with coating removed, weigh accurately. Pulverize to fine powder, weigh accurately 0.3 g to a centrifugal tube, add 2 ml of water and 1.5 g of neutral aluminium oxide (100-200 meshs), and mix well. Wash with two 20-ml quantities of water, centrifuge, discard the washings, and extract by stirring with three 8-ml quantities of 5% oxalic acid. Centrifuge, combine the oxalic acid solution to a 25 ml volumetric flask, and dilute to volume with 5% oxalic acid. Mix well and filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.8 mg of danshensu ($C_9H_{10}O_5$) per tablet, referred to Radix et Rhizoma Slaviae Miltiorrhizae.

Action To soften hard masses to disintegrate them, promote blood circulation to eliminate acute mastitis, and clear *heat* and remove toxic materials.

Indications Mammary nodules, acute mastitis at the initial stage due to accumulation of *phlegm* and *heat*, hyperplasia of the mammary gland and mastadenitis at the initial state with above symptoms.

Usage and dosage 4-6 tablets, 3 times a day.

Precaution Contraindicated for pregnant women.

Strength 0.36 g per film coated tablet

Storage Preserve in tightly closed containers.

Rupixiao Pian
(乳癖消片)

Rupixiao Tablets

Ingredients Cornu Cervi; Herba Taraxaci; Thallus Laminariae seu Eckloniae; Radix Trichosanthis; Caulis Spatholobi; Radix et Rhizoma Notoginseng; Radix Paeoniae Rubra; Sargassum; Radix Rhapontici; Radix Aucklandiae; Radix Scrophulariae; Cortex Moutan; Spica Prunellae; Fructus Forsythiae; Flos Carthami.

Procedure Pulverize Radix Scrophulariae, Radix et Rhizoma Notoginseng, Cornu Cervi to fine powder respectively. Decoct the other twelve ingredients with water for 2 times, 3 hours for the first time and 2 hours for the second. Combine the decoction, filter and concentrate to an appropriate amount. Mix thoroughly with the above fine powder and a quantity of excipients, make granules, dry, compress into 1000 tablets and coat with sugar or film; or compress into 500 tablets, coat with film.

Description Sugar or film coated tablets with dark brown to brownish-black core; odour, slight; taste, bitter and salty.

Identification (1) Microscopical: Stone cells yellowish-brown or colourless, subrectangular, subrounded or irregular, striation distinct, up to about 94 μm in diameter. Irregular pieces translucent, edge with relatively strong refractive light, surface with fine and short striations, small pits and fine fissures.

(2) Pulverize a quantity of film coated tablets or sugar coated tablets, removed coats for sugar coated tablets, into fine powder, weigh 2 g of the powder, add about 1 ml of water, shake well, and add 10 ml of *n*-butanol saturated with water, shake for about 10 minutes, stand for 2 hours, centrifuge. To the supernatant add three times of water saturated with *n*-butanol, shake well, stand for layer separating (centrifuge if necessary). Separate the *n*-butanol layer, evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve ginsenoside Rb_1 CRS, ginsenoide Rg_1 CRS and notoginsenoside R_1 CRS in methanol to produce a mixture containing 1.5 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and the lower layer of a mixture of chloroform, methanol, and water (13∶7∶2), stand below 10℃, as the mobile phase. Apply separately 1-2 μl of each of the two solutions to the plate. After developing in a chamber pre-equilibrated with the mobile phase for 15 minutes and removal of the plate, dry in air. Spray with dilute sulfuric acid TS, heat at 100℃ to the spots clear. Examine in sunlight and under ultraviolet light at 365 nm. The spots or fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Action To soften hard masses and disintegrate them, promote blood circulation to reduce pain, and clear *heat* and remove toxic materials.

Indications Mammary glands, acute mastitis due to accumulation of *phlegm-heat* with manifestations of soft mammary lumps in different size and shape, or red and swollen mammary nodules; hyperplasia of the mammary

gland at the initial stage with above symptoms.

Usage and dosage 5-6 small tablets or 3 big tablets, 3 times a day.

Precaution Be cautious about pregnant women.

Strength (1) 0.34 g per film coated tablet
(2) 0.67 g per film coated tablet

Storage Preserve in tightly closed containers.

Ruyi Jinhuang San
(如意金黄散)

Ruyi Jinhuang Powder

Ingredients Rhizoma Curcumae Longae 160 g; Radix et Rhizoma Rhei 160 g; Cortex Phellodendri Chinensis 160 g; Rhizoma Atractylodis 64 g; Cortex Magnoliae Officinalis 64 g; Pericarpium Citri Reticulatae 64 g; Radix et Rhizoma Glycyrrhizae 64 g; Rhizoma Arisaematis 64 g; Radix Angelicae Dahuricae 160 g; Radix Trichosanthis 320 g.

Procedure Pulverize the above ten ingredients to fine powder, sift and mix thoroughly.

Description A yellow to golden-yellow powder; odour, slightly aromatic bitter and slightly sweet.

Identification (1) Microscopical: Clusters of calcium oxalate large, 60-140 μm in diameter. Prisms of calcium oxalate abundant in parenchyma. Needles of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells. Needles of calcium oxalate in bundles or scattered, up to about 90 μm long. Fibre bundles bright yellow, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres, crystal cells with lignified and thickened walls. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Stone cells colourless, branched, with thickened and distinctly striated walls. Bordered pitted vessels large, mostly broken, some bordered pits hexagonal or rhombic, arranged closely.
(2) To 1 g, add 20 ml of methanol, ultrasonicate for 20 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 40 ml of water, add 4 ml of hydrochloric acid, heat on a water bath for 30 minutes, and cool immediately. Extract with two 20-ml quantities of ether, combine the ether extract, evaporate to dryness. Dissolve the residue in 2 ml of ethyl acetate as the test solution. Prepare a solution of 0.1 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate, and formic acid (15∶5∶1) as the mobile phase. Apply separately 1-2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the five orange-yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Expose to ammonia vapour, examine in sunlight, the colour of the spots turns red.
(3) Apply 3 g of the powder to a previously prepared small column packed with neutral aluminium oxide (120-mesh, 5 g, 1.5 cm in diameter), elute with 30 ml of dehydrated ethanol. Collect the eluate, evaporate to dryness, dissolve the residue in 2 ml of ethanol, filter, and use the filtrate as the test solution. To 0.1 g of Cortex Phellodendri Chinensis reference drug add 5 ml of methanol, ultrasonicate for 15 minutes, and filter. Concentrate the filtrate to about 1 ml as the reference drug solution. Dissolve berberine hydrochloride CRS and palmatine hydrochloride CRS in methanol to prepare a mixture containing 0.5 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol, and concentrated ammonia TS (12∶6∶3∶3∶1) as the mobile phase. Apply separately 1 μl of each of the three solutions to the plate. Develop in a chamber pre-equilibriated with the mobile phase for 15 minutes. Remove the plate, and dry in air. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution, and the major fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(4) To 10 g of the powder add 40 ml of methanol, ultrasonicate for 15 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 40 ml of dilute hydrochloric acid TS, extract with three 20-ml quantities of chloroform. Combine the chloroform extracts, extract with three 20-ml quantities of 2% solution of sodium hydroxide. Combine the sodium hydroxide extracts, adjust pH to 1-2 with dilute hydrochloric acid TS. Extract under shaking with three 20-ml quantities of chloroform. Combine the chloroform extracts, wash with 20 ml of water, dehydrate the chloroform liquid with anhydrous sodium sulphate, evaporate to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Dissolve magnolol CRS and honokiol CRS in methanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of benzene and methanol (27∶1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with a 5% vanillin in sulfuric acid and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.
(5) To 10 g of the powder add 30 ml of chloroform and 2 ml of hydrochloric acid, heat under reflux for 1 hour, cool, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve glycyrrhetinic acid CRS in dehydrated ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃), benzene, ethyl acetate, and glacial acetic acid (20∶40∶14∶1) as the mobile phase. Apply separately 1 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% phosphomolybdic acid in ethanol and heat at 105℃ for 5 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(6) To 5 g of the powder add 20 ml of petroleum ether (60-90℃), ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 1 g of Radix Angelicae Dahuricae reference drug and 10 ml of petroleum ether (60-90℃) in the same manner as the reference drug solution. Dissolve imperatorin CRS and isoimperatorin CRS in ethyl acetate to produce a mixture

containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (30-60℃) and ether (3∶2) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of each of the reference drug solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The major fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution, and the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of isopropanol, methanol, and 0.5% solution of acetic acid (25∶19∶56) as the mobile phase. As detector a spectrophotometer set at 430 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of curcumin.

Reference solution Weigh accurately a quantity of curcumin CRS, dissolve in methanol to produce a reference solution containing 40 μg per ml.

Test solution Measure accurately 0.25 g of the powder to a stopper conical flask, add accurately 10 ml of methanol, stopper well, and weigh, Allow to stand for 1 hour, weigh again, replenish the lost weight with methanol, centrifuge, and use the supernatant as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 1.0 mg of curcumin ($C_{21}H_{20}O_6$) per tablet, referred to Rhizoma Curcumae Longae.

Action To clear *heat* and toxic materials, and to reduce swelling to kill pain.

Indications Swollen and painful pyogenic skin infection, or erysipelas and metastatic abscesses due to *heat* retained in the skin, with manifestations of red, swollen, hot and painful skin, also used for traumatic injuries.

Usage and dosage Applied externally after mixing with tea for one of the symptoms of redness, swelling, hotness and pain; or mixing with vinegar, green onion and wine, or vegetable oil and honey for only swelling without suppuration, several times a day.

Precaution For external use, not for per os.

Storage Preserve in well closed containers.

Sanbao Jiaonang
(三宝胶囊)

Sanbao Capsules

Ingredients Radix et Rhizome Ginseng 20 g; Cornu Cervi Pantotrichum 20 g; Radix Angelicae Sinensis 40 g; Rhizoma Dioscoreae 60 g; Carapax et Plastrum Testudinis (stir-baked with vinegar) 20 g; Fructus Amomi (stir-baked) 10 g; Fructus Corni 20 g; Ganoderma 20 g; Radix Rehmanniae praeparata 60 g; Radix et Rhizoma Salviae Miltiorrhiae 100 g; Fructus Schisandrae Chinensis 20 g; Semen Cuscutae (stir-baked) 30 g; Herba Cistanches 30 g; Radix Polygoni Multiflori 40 g; Flos Chrysanthemi 20 g; Cortex Moutan 20 g; Radix Paeoniae Rubra 20 g; Cortex Eucommiae 40 g; Raidix Ophiopogonis 10 g; Rhizoma Alismatis 20 g; Raidix Scrophulariae 20 g.

Procedure Pulverize Radix et Rhizoma Ginseng, Cornu Cervi Pantotrichum, Rhizoma Dioscoreae, Carapax et Plastrum Testudinis, Radix Angelicae Sinensis, Fructus Amomi and Fructus Corni to fine powder, sift, and mix well. Decoct the other fourteen ingredients with water two times, each for 1.5 hours, combine the decoctions, filter, and concentrate the filtrates to a thin extract with a relative density of 1.20-1.25 (85℃). Add the above fine powder, mix well, dry below 60℃, pulverize to fine powder, and make to 1000 capsules.

Description Hard capsules with dark brown powder; odour, slight; taste, slightly sour and sweet.

Identification (1) Microscopical: Sclerenchymatous cells of endotesta yellowish-brown or reddish-brown, polygonal in surface view, thick-walled, lumen containing silica bodies. Irregular pieces grayish-yellow, with fine striations or splits on the surface. Starch granules triangular ovoid or rectangular rounded, 24-40 μm in diameter, hilum short-cleft or V-shaped. Epidermal cells of pericarp orange-yellow, subpolygonal in surface view, anticlinal walls beaded.

(2) Apply 5 g of the content into a Soxhlet's extractor, extract with 80 ml of ether under reflux until the extract colourless, and collect the ether extracts for later use. Extract the residue, expelled ether, with 60 ml of *n*-butanol saturated with water under reflux for 30 minutes, and filter. Wash the filtrate with three 15-ml quantities of 0.1% solution of sodium hydroxide saturated with *n*-butanol, and then wash with two 20-ml of water saturated with *n*-butanol. Evaporate the *n*-butanol solution to dryness and dissolve the residue in 1 ml of methanol as the test solution. Dissolve ginsenoside Re CRS, ginsenoside Rg_1 CRS and ginsenoside Rb_1 CRS in methanol respectively to produce solutions each containing 1 mg pre ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13∶7∶2), standing below 10℃, as the mobile phase. Apply separately 5 μl of the test solution and 3 μl of each of the reference solutions to the plate. After developing and removal of the plate, spray with 10% sulfuric acid in ethanol, heat at 100℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference solutions. Examine under ultraviolet light at 365 nm, the fluorescent spots in chromatogram obtained with the test solution correspond in position and colour to the fluorescent spots in the chromatograms obtained with the reference solutions.

(3) Take one third volume of the ether extract obtained under Identification (2), evaporate at a lower temperature to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Ultrasonicate 0.5 g of Radix Angelicae Sinensis reference drug with 20 ml of ethanol for 20 minutes, filter, concentrate the filtrate to dryness, and dissolve the residue in 5 ml of ethanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of hexane and ethyl acetate (9∶1) as the mobile phase. Apply separately to the plate 10 μl of the test solution and 1 μl of the reference drug solution. After developing and removal of the plate, dry in air. Examine

under ultraviolet light at 365 nm. The fluorescent spots in chromatogram obtained with the test solution correspond in position and colour to the fluorescent spots in the chromatogram obtained with the reference drug solution.

(4) Take one third volume of the ether extract obtained under Identification (2), evaporate at a lower temperature to dryness, dissolve the residue in 1 ml of a mixture of dehydrated ethanol and chloroform (3 : 2) as the test solution. Dissolve ursolic acid CRS in dehydrated ethanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform, ethyl acetate and glacial acetic acid (20 : 5 : 8 : 0.5) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, spray with 10% sulfuric acid in ethanol, heat at 100℃ to the spots clear. The spot in chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatograms obtained with the reference solutions

(5) Ultrasonicate 2 g of the content with 15 ml of methanol for 20 minutes, filter, evaporate the filtrate to dryness, heat the residue in 10 ml of water and 1 ml of hydrochloric acid on a boiling water bath for 30 minutes, and cool immediately. Extract the acidic solution by shaking with four 10-ml quantities of ether, combine the ether extracts, evaporate at a lower temperature, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve emodin CRS in ethyl acetate to prepare a solution containing 0.25 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 1 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. The spot in chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatograms obtained with the reference solution. The spots turn red on exposing to ammonia vapour.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 1% acetic acid (12 : 88) as the mobile phase. As detector a spectrophotometer set at 279 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of protocatechuic aldehyde.

Reference solution Dissolve a quantity of protocatechuic aldehyde CRS, accurately weighed, in methanol to prepare a solution containing 12 μg per ml as the reference solution.

Test solution Take the content of 20 capsules, weighed accurately, grind well, weigh accurately 2 g in a stopper conical flask, add accurately 50 ml of methanol, stopper tightly and weigh. Heat under reflux for 1 hour, cool, weigh again, replenish the loss of weight with methanol, shake well and filter. Measure accurately 25 ml of the successive filtrate and evaporate to dryness. Dissolve the residue in 10 ml of water and adjust pH to 2 with dilute hydrochloric acid TS, extract with four 10-ml quantities of ether, combine the ether extracts, expel the ether and dissolve the residue in methanol, transfer to a 10 ml volumetric flask, add methanol to volume, shake well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 22 μg of protocatechuic aldehyde ($C_7H_6O_3$) per capsule. referred to Radix et Rhizoma Salviae Miltiorrhizae.

Action To replenish *kidney-essence* and nourish the *heart* to anchor the mind.

Indications Aching of the lower back and weakness of legs, impotence, seminal emission, dizziness, blurred vision, tinnitus, poor hearing, palpitation, insomnia and loss of appitite due to a deficiency of *kidndy-essence and heart-blood*.

Usage and dosage 3-5 capsules, twice a day.

Strength 0.3 g per capsule

Storage Preserve in tightly closed containers.

Sangju Ganmao Pian (桑菊感冒片)

Sangju Ganmao Tablets

Ingredients Folium Mori 465 g; Flos Chrysanthemi 185 g; Fructus Forsythiae 280 g; Oleum Menthae Dementholatum 1 ml; Semen Armeniacae Amarum 370 g; Radix Platycodonis 370 g; Radux et Rhizoma Glycyrrhizae 150 g; Rhizoma Phragmitis 370 g.

Procedure Pulverize Radix Platycodonis to fine powder, sift. Fructus Forsythiae distil volatile oil, decoct the drug residue of distillation, Folium Mori, Flos Chrysanthemi, Semen Armeniacae Amarum, Radux et Rhizoma Glycyrrhizae and Rhizoma Phragmitis with water twice (Semen Armeniacae Amarum After press to make oil, and put into at a temperature of 100℃), 2 hours for each time, combine the decoction, filter and concentrate the filtrate to a thick extract. Stir thoroughly with the fine powder of Radix Platycodonis and a quantity of excipient, make granules and dry, After cooling, spray the Oleum Menthae Dementholatum, mix thoroughly and compress into 1000 tablets or coat with sugar.

Description Tablets with pale-brown to dark-brown colour, or sugar coated tablets with pale-brown to dark-brown colour core; odour, slightly aromatic; taste, slightly bitter.

Identification (1) Pulverize 5 tablets or sugar coated tablets, removed the sugar coats, to fine powder, add 20 ml of methanol, ultrasonicate for 30 minutes, filter. Evaporate the filtrate to dryness. dissolved the residue in 20 ml of water, extract with two 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, wash with 20-ml of water saturated with *n*-butanol, separate the *n*-butanol layer and evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve forsythin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of chloroform, methanol and formic acid (9 : 1 : 0.1) as the mobile phase. Apply separately 5 μl of each of the reference solution and the test solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained

with the reference drug solution and the reference solution.
(2) Heat under reflux 7 tablets or sugar coated tablets, removed the sugar coats, ground to fine powder, on a water bath, in 30 ml of the mixture of chloroform, water and hydrochloric acid (10 : 10 : 3) for 1 hour. Separate the chloroform layer and evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 2 g of Radix Platycodonis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance, and the lower layer of a mixture of chloroform and methanol (20 : 1) as the mobile phase. Apply separately 10 μl of the reference drug solution and 10-20 μl of the test solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.
(3) Heat under reflux 1 g of Radix et Rhizoma Glycyrrhizae reference drug, in 20 ml of ethanol for 30 minutes, cool and filter, evaporate the filtrate, dissolved the residue in 1 ml of ethanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G mixed with 1% solution of sodium hydroxide as the coating substance, and a mixture of ethyl acetate, formic acid, glacial acetic acid, and water (15 : 1 : 1 : 2) as the mobile phase. Apply separately 5 μl of each of the reference drug solution and the test solution obtained under Identification (1). After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix I D).

Assay Carry out the method for high performance liquid chromatography (Appendix VI D)

Chromatographic system and system suitability Use Octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (25 : 75) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of forsythin.

Reference solution Dissolve a quantity of forsythin CRS, accurately weighed, in methanol to produce a solution containing 40 μg per ml.

Test solution Weigh accurately 20 tablets or sugar coated tablets, removed sugar coats, pulverize to fine powder. Weigh accurately 2 g of the powder in a stopper conical flask, add accurately 25 ml of methanol, weigh and ultrasonicate (power, 250 W; frequency, 50 kHz) for 30 minutes, allow to cool, weigh again, replenish the lost weight with methanol, mix well and filter. Exactly measure 5 ml of the successive filtrate, evaporate to dryness, dissolve the residue in 20 ml of water, extract with five 20-ml quantities of chloroform, combine the chloroform extracts, evaporate to dryness, dissolve in 50% methanol to a 5 ml volumetric flask and dilute with 50% methanol to the volume, shake well. Centrifuge or filter, use the supernatart or successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, calculate the content.
It contains not less than 0.10 mg of forsythin ($C_{29}H_{36}O_{15}$) per tablet, referred to Fructus Forsythiae.

Action To disperse *wind* and clear *heat*, and disseminate *lung-qi* to relieve coughing.

Indications Common cold at the initial stage due to *wind-heat* with manifestations of headache, coughing, dry mouth and sore throat.

Usage and dosage 4-8 tablets, 2-3 times a day.

Storage Preserve in tightly closed containers.

Sanhuang Pian
(三黄片)
Sanhuang Tablets

Ingredients Radix et Rhizoma Rhei 300 g; Berberine Hydrochloride 5 g; Extractum Scutellariae 21 g (equivalent to 15 g of Baicalin).

Procedure Decoct Radix Scutellariae with water for 3 times, 1.5 hours for the first time, 1 hour for the second time and 40 minutes for the third time respectively, combine the decoctions and filter. Adjust the filtrate to pH 1-2 with hydrochloric acid, allow to stand for 1 hour. Wash the precipitate with water to pH 5-7, heat to dryness and pulverize to fine powder, and determine the content of Baicalin. Pulverize 150 g of Radix et Rhizoma Rhei to fine powder and sift. Heat under reflux the rest of Radix et Rhizoma Rhei, in coarse powder, with 30% ethanol for 3 times, filter, combine the filtrate, recover ethanol and concentrate on vacuum to a thick extract. Add the fine powders of Radix et Rhizoma Rhei, berberine hydrochloride, Extractum Scutellariae and a quantity of excipient, mix thoroughly, make granules, dry, and compress into 1000 tablets and coat with sugar or film.

Description Sugar coated or film coated tablets with brown core; taste, bitter and slightly astringent.

Identification (1) Microscopical: Clusters of calcium oxalate large, 60-140 μm in diameter.
(2) Heat under reflux 5 tablets, removed the coats and finely powdered, with 30 ml of methanol for 30 minutes, allow it to cool, filter, and use the filtrate as the test solution. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 0.2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (10 : 7 : 1 : 1) as the mobile phase. Apply separately 2 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The yellow fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Evaporate 5 ml of the test solution, obtained under Identification (2), to dryness, dissolve the residue by stirring with 15 ml of water, filter, adjust pH to 1-2 with diluted hydrochloric acid TS. Extract with two 10-ml quantities of ethyl acetate, combine the extract, filter, and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to produce a solution mixed with 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of ethyl acetate, butanone, formic acid, and

water (5:3:1:1) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 2% solution of ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Evaporate 5 ml of the test solution, obtained under Identification (2), to dryness, dissolve the residue in 10 ml of water, add 1 ml of hydrochloric acid, heat on a water bath for 30 minutes, cool immediately. Extract with two 10-ml quantities of ether, combine the ether extract, and expel the solvent to dryness. Dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution with 1 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Dissolve chrysophanol CRS and emodin CRS in methanol to produce a mixture containing 0.5 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15:5:1) as the mobile phase. Apply separately 5 μl each of the test solution, the reference solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The orange-yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug and the reference solution. Expose the plate to ammonia vapour, examine in sunlight, the spots turn to red colour.

Rhaponticin Examine the chromatogram of the test solution, obtained under Identification (2), under ultraviolet light at 365 nm, no persistent bright bluish-purple fluorescent spot is shown in front of the spot corresponding to berberine hydrochloride.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.1% phosphoric acid (85:15) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of emodin.

Reference solution Dissolve a quantity of emodin CRS and chrysophanol CRS, accurately weighed, in a mixture of dehydrated ethanol and ethyl acetate (2:1) to produce a solution containing 10 μg emodin and 25 μg of chrysophanol per ml as the reference solution.

Test solution Weigh accurately 20 tablets, removed the coats, and pulverize to fine powder and sift (through No. 3 sieve). Weigh accurately a quantity of the powder (equivalent to the weight of 1 tablet) in a conical flask, add accurately 25 ml of ethanol, stopper closely and weigh. Heat under reflux on a water bath for 1 hour, allow it to cool, replenish the lost weight with ethanol, filter, and discard the initial filtrate. Transfer accurately 10 ml of the successive filtrate to a flask, evaporate to dryness on a water bath. Heat and hydrolyze the residue with 15 ml of a mixture of 30% ethanol and hydrochloric acid (10:1) on a water bath for 1 hour, cool immediately, extract with four 15-ml quantities of chloroform, combine the chloroform extract, evaporate to dryness on a water bath. Dissolve the residue in a mixture of dehydrated ethanol and ethyl acetate (2:1), transfer to a 25 ml volumetric flask, dilute to volume, mix well, filter. Discard the initial filtrate; use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, into the column, and calculate the content.

It contains not less than 1.55 mg of total amount of emodin ($C_{15}H_{10}O_5$) and chrysophanol ($C_{15}H_{10}O_5$) per tablet, referred to Radix et Rhizoma Rhei.

Action To clear *heat* and *toxicity*, and purge *fire* and relax bowels.

Indications Swollen bloodshot eyes with pain, or oronasal sores, or sore throat, or swollen painful gums, irritability, thirst, deep-coloured urine and constipation due to abundant *heat* in the *triple energizer*; acute gastroenteritis and dysentery with above symptoms.

Usage and dosage 4 tablets, twice a day; appropriate reduction of dosage for children.

Precaution Be cautious about pregnant women.

Storage Preserve in tightly closed containers.

Sanjin Pian
(三金片)

Sanjin Tablets

Ingredients Radix Rosae Laevigatae; Rhizoma Smilacis Chinensis; Radix Melastomae Normalis; Herba Lygodii; Herba Centellae

Procedure Decoct the five ingredients with water for 2 times, 2 hours for the first time, and 1 hour for the second. Combine the decoctions, filter and concentrate to a thin extract with a relative density of 1.15-1.20 (50-60℃). Dry, add a quantity of adjuvant, mix thoroughly, make granules, compress into 1000 tablets (small tablet) or 600 tablets (big tablet), and coat with sugar or film.

Description Film coated or sugar coated tablets with blackish-brown colour core; taste, sour, astringent and slightly bitter.

Identification (1) Pulverize 15 tablets (small tablet) or 10 tablets (big tablet) with coating removed, add 15 ml of ethanol, ultrasonicate for 20 minutes, filter and evaporate to dryness. Dissolve the residue in 20 ml of solution of 0.01 mol/L sodium hydroxide, heat gently, extract with 10 ml of ether, discard the ether, extract the aqueous layer with 10 ml of ethyl acetate and evaporate to about 1 ml as the test solution. Prepare a solution of 2.5 g of Radix Rosae Laevigatae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and a mixture of chloroform and methanol (17:3) as the mobile phase. Apply 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat to the spots clear. The main spots in the chromatogram obtained with the test solution correspond in position and colour to that in the chromatogram obtained with the reference drug solution.

(2) Extract the aqueous layer, extracted in the test of Identification (1) with ethyl acetate, with 15 ml of *n*-butanol saturated with water, separate *n*-butanol layer and wash with 5 ml of water saturated with *n*-butanol. Discard the washing, evaporate the *n*-butanol solution to dryness,

and dissolve the residue with 1 ml of methanol as the test solution. Dissolve asiaticoside CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and a mixture of chloroform, methanol and water (7∶3∶0.5) as the mobile phase. Apply 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol and water (48∶52) as the mobile phase. Use an evaporate light scatter detector. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of madecassoside.

Reference solution Weigh accurately a quantity of madecassoside CRS, dissolve in methanol to produce two solutions containing 0.2 mg per ml and 0.6 mg per ml separately.

Test solution Triturate 30 tablets for small tablet or 20 tablets for big tablet, removed the coats, to fine powder. Weigh accurately 1.5 g of the powder in a stopper conical flask, add accurately 50 ml of methanol, closely stopper and weigh. Ultrasonicate for 30 minutes (power, 250 W; frequency, 40 kHz), cool, weigh again, replenish the lost weight with methanol, mix well and filter. Measure accurately 25 ml of the solution, evaporate on a water bath to dryness, dissolve the residue in 20 ml of water, and extract with three 15-ml quantities of *n*-butanol saturated with water. Wash the *n*-butanol solution with two 15-ml quantities of ammonia TS. Evaporate the *n*-butanol extracts to dryness, and dissolve the residue in ethanol and transfer to a 5 ml volumetric flask, add methanol to volume, mix well as the test solution.

Procedure Inject accurately 10 μl of each of the reference solutions and 5-10 μl of the test solution into the column respectively and calculate the content, using a calibration equation of logarithm alteration of two external standards.
It contains not less than 0.22 mg of madecassoside ($C_{48}H_{78}O_{20}$) per small tablet, and 0.35 mg per big tablet, referred to Herba Centellae.

Action To clear *heat-toxicity*, drain *dampness* to relieve stranguria, and reinforce the kidney.

Indications Stranguria due to *damp-heat* in the *lower-energizer* with manifestations of concentrated urine, dribble of urine with pain and frequency and urgency of urination; acute or chronic pyelonephritis, cystitis and urinary tract infection with above symptoms.

Usage and dosage 5 small tablets or 3 large tablets, 3-4 times a day.

Strength (1) Equivalent to 2.1 g of crude drug per small tablet
(2) Equivalent to 3.5 g of crude drug per large tablet

Storage Preverse in tightly closed containers.

Sanliangban Yaojiu
(三两半药酒)

Sanliangban Wine

Ingredients Radix Angelicae Sinensis 100 g; Radix Astragali Praeparata Cum Melle 100 g; Radix Achyranthis Bidentatae 100 g; Radix Saposhnikoviae 50 g.

Procedure Pulverize the above 4 ingredients to coarse powder, carry out the method for percolation descried under liquid extracts and extracts (Appendix Ⅰ O), using a mixture of 2400 ml of white wine and 8000 ml of yellow rice wine as the solvent to macerate for 48 hours and then slowly to take percolating. Add 840 g of sucrose in the percolate, stir to dissolve, allow to stand and filter.

Description A clear, yellowish-brown liquid; odour, aromatic; taste, slightly sweet and pungent.

Identification (1) To 50 ml add 2 ml of hydrochloric acid, heat under reflux for 1 hour. Extract with two 20-ml quantities of petroleum ether (60-90℃) by shaking, combine the petroleum ether extracts, and evaporate to dryness. Dissolve the residue in 1 ml of ethanol as the test solution. Dissolve oleanolic acid CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (40∶3) as the mobile phase. Apply separately 4 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with phosphomolybdic acid TS and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) Evaporate 50 ml to about 30 ml on a water bath, cool, extract with 20 ml of ether, separate the ether layer and evaporate it to dryness. Dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Macerate 0.2 g of Radix Angelicae Sinensis reference drug in 3 ml of ether for 1 hour, and use the supernatant as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9∶1) as the mobile phase. Apply separately 6 μl of the test solution and 1-2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Ethanol content 20 per cent-25 per cent (Appendix Ⅸ M).

Other requirements Complies with the general requirements for medicinal wines (Appendix Ⅰ M).

Action To replenish *qi* and promote blood circulation, and expel *wind* and dredge meridians.

Indications Obstruction of *qi* and blood flow due to disharmony between *qi* and blood and affliction of *wind-dampness*, with manifestations of pain of limbs and muscular spasm.

Usage and dosage 30-60 ml, 3 times a day.

Precaution Be cautious about hypertention patients; contraindicated for pregnant women.

Storage Preserve in tightly closed containers, stored in a cool place.

Sanmiao Wan
(三妙丸)

Sanmiao Pills

Ingredients Rhizoma Atractylodis (stir-baked) 600 g; Cortex Phellodendri Chinensis (stir-baked) 400 g; Radix Achyranthis Bidentatae 200 g.

Procedure Pulverize the above three ingredients to fine powder, sift and mix thoroughly. Make pills with water and dry.

Description Greyish-yellow watered pills; taste, bitter and pungent.

Identification (1) Microscopical: Needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells. Fibre bundles yellow, surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres, walls of crystal cells lignified and thickened. Wood fibres in bundles, with thinner and non-lignified walls; pits sparse, with obligue slit-shapped pit apertures, cross-shape or V-shape.
(2) Triturate 0.1 g to powder, add 10 ml of ether, ultrasonicate for 15 minutes, filter and discard the ether. To the residue add 5 ml of methanol, ultrasonicate for 15 minutes and filter. Concentrate the filtrate to 1 ml as the test solution. Prepare a solution of 0.1 g of Cortex Phellodendri Chinensis reference drug in the same manner as the reference drug solution. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, isopropanol methanol, and concentrated ammonia TS (12∶6∶3∶3∶1) as the mobile phase. Apply separately 2 μl of the test solution, 1 μl of each of the reference drug solution and the reference solution to the plate. After developing in a chamber pre-equilibrated with ammonia vapour and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and reference solutions.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Take 1.5 g of pulverized powder, accurately weighed, to a Soxhlet's extractor, heat under reflux with a quantity of ether for 1-2 hours, filter and expel ether from the residue, add a quantity of methanol, reflux until the solution is colourless. Transfer accurately the solution (concentrate if necessary) to a 50 ml volumetric flask, dilute to volume with methanol, shake well, used as the test solution. Dissolve berberine hydrochloride CRS, weighed accurately, in methanol to produce a solution containing 60 μg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, isopropanol, methanol and concentrated ammonia TS (12∶6∶3∶3∶1) as the mobile phase. Apply separately 1 μl of the test solution, and 1 μl and 3 μl of the reference solution to the plate. After developing in a twin-trough chamber pre-equilibriated with ammonia vapour and mobile phase vapour for 15 minutes and removal of the plate, dry in air. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan at wavelength of $\lambda = 365$ nm with fluorescence mode, measure the integral absorbance both of the test solution and reference solution respectively. Calculate the content.
It contains not less than 2.0 mg per gram of berberine hydrochloride ($C_{20}H_{18}ClNO_4$), referred to the dried drug of Cortex Phellodendri Chinensis.

Action To clear *heat* and *dampness*.

Indications Obstruction of *qi* and blood with pain due to pouring of *damp-heat* with manifestations of red, swollen and painful feet and knees with a hot sensation and leaden legs and scanty deep-coloured urine.

Usage and dosage 6-9 g, 2-3 times a day.

Precaution Be cautious about pregnant women.

Storage Preserve in tightly closed containers, protected from moisture.

Sanqi Pian
(三七片)

Sanqi Tablets

Sanqi Tablets are the tablets prepared from Radix Notoginseng.

Procedure Pulverize 500 g of Radix et Rhizoma Notoginseng to fine powder, and a quantity of excipient, make granules, compress into 1000 (big tablet) or 2000 (small tablet) tablets.

Prescription Greyish-yellow to brownish-yellow tablets; taste, bitter, slightly sweet.

Identification (1) Microscopical: Fragments of resin canals containing yellow secretion.
(2) Macerate 0.5 g, in powder, in 10 ml of methanol by shaking for 30 minutes, filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve notoginsenoside R_1 CRS, ginsenoside Rb_1 CRS and ginsenoside Rg_1 CRS in methanol to produce a mixture containing 0.5 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (7∶3∶0.5) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D)

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, acetonitrile as the mobile phase A, water as the mobile phase B, elute in gradient as the following.

Time (minutes)	mobile phase A (per cent V/V)	mobile phase B (per cent V/V)
0-12	19	81
12-60	19→36	81→64

As detector a spectrophotometer set at 203 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of notoginsenoside R_1.

Reference solution Dissolve a quantity of ginsenoside Rg_1 CRS, ginsenoside Rb_1 CRS, and notoginsenoside R_1 CRS, weighed accurately, in methanol to produce a mixture solution containing 0.4 mg, 0.4 mg, and 0.1 mg per ml respectively as the reference solution.

Test solution Take 10 tablets, ground into fine powder, weigh accurately 0.8 g in a stopper conical flask, add 50 ml of methanol, weigh, allow to stand overnight, heat under reflux on a water bath at 80℃ for 2 hours, cool, weigh again, replenish the loss of weight with methanol, shake well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 10.0 mg of per small tablet, or 20.0 mg of per big tablet, of the total amount of ginsenoside Rg_1 ($C_{42}H_{72}O_{14}$), ginsenoside Rb_1 ($C_{54}H_{92}O_{23}$) and notoginsenoside R_1 ($C_{47}H_{80}O_{18}$), referred to Radix Notoginseng.

Action To dissipate blood stasis to arrest bleeding, and reduce swelling to kill pain.

Indications Hemoptysis, hematemesis, rhinorrhagia, bloody stools, metrorrhagia and metrostaxis, traumatic hemorrhage, stabbing pain in the chest and abdomen, and painful bruise from fall or stumble.

Usage and dosage 4-12 small tablets or 2-6 big tablets, 3 times a day.

Precaution Contraindicated for pregnant women.

Strength 0.25 g of crude drug per small tablet, or 0.5 g of crude drug per big tablet

Storage preserve in tightly closed containers.

Sanqi Shangyao Pian (三七伤药片)

Sanqi Shangyao Tablets

Ingredients Radix et Rhizoma Notoginseng 52.5 g; Radix Aconiti Kusnezoffii (steamed) 52.5 g; Radix Aconiti Brachypodi 23 g; Borneolum Syntheticum 1.05 g; Rhizoma Drynariae 492.2 g; Flos Carthami 157.5 g; Caulis Sambuci 787.5 g; Radix Paeoniae Rubra 87.5 g.

Procedure Pulverize Radix et Rhizoma Notoginseng; Radix Aconiti Kusnezoffii and Radix Aconiti Brachypodi to fine powder, Triturate Borneolum Syntheticum to fine powder. Decoct the other 4 ingredients with water twice, 2 hours for the first time and 1 hour for the second, combine the decoctions and filter. Concentrate the decoction to a thin extract with relative density of 1.05 (80-90℃) and stand by. Separate the supernatant and concentrate to a thick extract with a relative density of 1.40 (80-90℃). Add the above fine powder of Radix et Rhizoma Notoginseng; Radix Aconiti Kusnezoffii and Radix Aconiti Brachypodi, make granules and dry; then add the fine powder of Borneolum Syntheticum, mix thoroughly, make to 1000 tablets and coat with sugar.

Description Sugar coated tablets with dark brown core; taste, slightly bitter.

Identification (1) Pulverize 10 tablets to fine powder, add 15 ml of methanol, ultrasonicate for 1 hour, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 5 ml of methanol as the test solution. Dissolve ginsenoside Rg_1 CRS and notoginsenoside R_1 CRS in methanol to produce a mixture containing 2 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, *n*-butanol, methanol, and water (2∶4∶1∶2) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 10% sulphuric acid in ethanol and heat at 105℃ for several minutes. The purplish-red spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(2) Triturate 6 tablets, removed sugar coats, to fine powder, add 50 ml of methanol, heat under reflux for 1 hour, filter and evaporate the filtrate to dryness. Dissolve the residue in 20 ml of water, and extract with three 25-ml quantities of *n*-butanol saturated by water, combine the *n*-butanol extracts, and wash with two-25 ml quantities of water saturated by *n*-butanol. Evaporate the *n*-butanol extracts to dryness, and dissolve the residue in 1 ml methanol. Apply the methanol solution to a column packed with neutral aluminium oxide (100-120 mesh, 5 g, 10-15 mm in internal diameter) and elute with 50 ml of methanol. Collect the eluate, evaporate the eluate on a water bath to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve paeoniflorin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and the lower layer of a mixture of chloroform, methanol and water (13∶7∶2), standing under 10℃, as the mobile phase. Apply separately 5-10 μl each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid, and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Limit test of aconitine To 30 tablets, removed the sugar coats, pulverize to fine powder, add 150 ml of ether, stir for 10 minutes, then add 10 ml of ammonia TS, shake for 30 minutes, and allow to stand for 2 hours. Separate the ether layer, recover ether to dryness, dissolve the residue in dehydrated ethanol and transfer to a 2 ml volumetric flask, dilute to volume, and mix well as the test solution. Dissolve aconitine CRS in dehydrated ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of hexane, ethyl acetate, and diethylamine (4∶3∶1) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air and spray with dilute potassium iodobismuthate TS. The size of the spot in the chromatogram obtained with the test solution is less than the corresponding spot in the chromatogram obtained with the reference solution or no spot reveals in the chromatogram obtained with the test solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of acetonitrile and water (20∶80) as the mobile phase. As detector a spectrophotometer set at 283 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of naringin.

Reference solution Weigh accurately a quantity of naringin CRS, dried to constant weight at 105℃, dissolve in methanol to produce a solution containing 80 μg per ml.

Test solution With 20 tablets, remove the sugar coat, pulverize to fine powder, and weigh accurately 0.5 g of the powder in a stopper conical flask, add accurately 50 ml of methanol, closely stopper and weigh. Ultrasonicate for 30 minutes (power, 250 W; frequency, 50 kHz), cool, weigh again, replenish the lost weight with methanol, mix well and centrifuge, separate the supernatant, and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solutions and the test solution into the column respectively and calculate the content.
It contains not less than 0.50 mg of naringin ($C_{27}H_{32}O_{14}$) per tablet, referred to Rhizoma Drynariae.

Action To relax muscles and tendons and promote blood circulation, and dissipate blood stasis to kill pain.

Indications Traumatic injuries, retention of *wind-dampness*, arthrosis with pain; acute or chronic strains and neuralgia with above symptoms.

Usage and dosage 3 tablets, 3 times a day; or follow doctor's advice.

Precaution Taken according to the documented dosage for its strong potency; contraindicated for pregnant women; be cautious about patients with cardiovascular diseases.

Storage Preserve in tightly closed containers.

Sanwei Jili San
(三味蒺藜散)

Sanwei Jili Powder

Sanwei Jili Powder is a prescription used by Mongolian Nationality.

Ingredients Fructus Tribuli 250 g; Fructus Malvae 150 g; Eriocheir seu Potamon 150 g.

Procedure Pulverize the above three ingredients to coarse powder, sift and mix well.

Description A greyish-yellow powder; odour, slightly fishy; taste, bitter and slight salty.

Identification (1) Microscopical: Yellow stone cells long ellipsoidal or subrounded, in groups or scattered, with distinct pits. Fibres long fusiform, pale yellow, scattered or in bundles, 250-360 μm long. Polycellular hairs stellate, mostly broken.
(2) To 0.5 g add 5 ml of dilute nitric acid TS, heat on a water bath for 30 minutes and filter. To 1 ml of the filtrate add 1 ml of ammonium molybdate TS and heat; a yellow precipitate is produced. Filter, wash the precipitate with a mixture of 2 ml of dilute nitric acid TS and 1 ml of ammonium molybdate TS, add excessive quantity of ammonia TS; the precipitate is dissolved.

Other requirements Complies with the general requirements for medicinal teas (Appendix Ⅰ T).

Action To remove *damp-heat* and induce diuresis.

Indications Downward flow of *damp-heat*, painful burning sensation during urination.

Usage and dosage 3-4.5 g, 2-3 times a day, taken in decoction form.

Storage Preserve in well closed containers, protected from moisture.

Sanzi San
(三子散)

Sanzi Powder

Sanzi Powder is a prescription used by Mongolian Nationality.

Ingredients Fructus Chebulae 200 g; Fructus Toosendan 200 g; Fructus Gardeniae 200 g.

Procedure Pulverize the above three ingredients to coarse powder, sift and mix well.

Description A gingery-yellow to brownish yellow powder; odour, slight; taste, bitter, astringent and slightly sour.

Identification (1) Microscopical: Fibre bundles of pericarp surrounded by parenchymatous cells containing prisms or clusters of calcium oxalate, forming crystal fibers, crystal cells unevenly thickened-walled, lignified. Stone cells of testa yellow or brownish, mostly broken, when whole, elongated polygonal, rectangular or irregular, with thickened walls, big rounded pits, lumina brownish-red. Fibre layers of pericarp pale yellow, obliquely crisscrossed, with thin walls and pits.
(2) To 1 g of the powder add 10 ml of ether, extract for 10 minutes with shaking, discard the ether solution and evaporate ether from the residue. Add 10 ml of ethyl acetate, heat under reflux on a water bath for 1 hour, cool, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 2 ml of ethanol as the test solution. Prepare a solution of 0.5 g of Fructus Chebulae reference drug in the same manner as the reference drug solution. Dissolve geniposide CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, acetone, formic acid and water (10∶7∶2∶0.5) as the mobile phase. Apply separately 5 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulphuric acid in ethanol and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Complies with the general requirements for tea (Appendix Ⅰ T).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of acetonitrile and water (15∶85) as the mobile

phase. As detector a spectrophotometer set at 238 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of geniposide.

Reference solution Weigh accurately a quantity of geniposide CRS, dissolve in methanol to prepare a solution containing 30 μg per ml.

Test solution Weigh accurately 0.3 g of the powder in a stopper conical flask, add accurately 25 ml of methanol, stopper closely and weigh. Ultrasonicate for 20 minutes (power, 200 W; frequency, 50 kHz), cool, weigh again, replenish the lost weight with methanol, mix well and filter. Measure accurately 10 ml of the successive solution to a 25 ml volumetric flask, dilute with methanol to volume, mix well as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column respectively and calculate the content.
It contains not less than 5.4 mg of geniposide ($C_{17}H_{24}O_{10}$) per gram, referred to Fructus Gardeniae.

Action To reduce *heat* in blood and counteract *toxicity*.

Indications Fever in epidemic diseases or *heat* in blood, either acute or chronic.

Usage and dosage 3-4.5 g, 2-3 times a day, taken in decoction form.

Storage Preserve in well closed containers, protected from moisture.

Shangshi Zhitong Gao (伤湿止痛膏)

Shangshi Zhitong Plaster

Ingredients Extractum Antirheumatici et Analgesic Liquidum 50 g; Methyl Salicylate 15 g; Mentholum 10 g; Borneolum Syntheticum 10 g; Camphora 20 g; Extractum Cymbopogonis 12.5 g; Extractum Belladonnae Liquidum 30 g.

Procedure Pulverize 1 portion each of Radix Aconiti Kusnezoffii, Radix Aconiti, Olibanum, Myrrha, Semen Strychni and Flos Caryophylli, 2 portions each of Cortex Cinnamomi, Herba Schizonepetae, Radix Saposhnikoviae, Herba Erodii seu Geranii, Cortex Periplocae, Herba Centellae and Rhizoma Drynariae and 3 portions each of Radix Angelicae Dahuricae, Rhizoma Kaempferiae and Rhizoma Zingiberis to coarse powder and prepare Extractum Antirheumatici et Analgesit Liquidum with 90% ethanol to a liquid extract with a relative density of about 1.05. Weigh the other ingredients, add 3.7-4.0 fold by weight of the plaster base composed of rubber and rosin to make adhesive masses. Spread the masses on the tape, cut into sections, cover with gauze as liner and cut into small pieces of suitable size.

Description A pale yellowish-green to pale yellow adhesive tape plaster; odour, aromatic.

Identification (1) Heat under reflux 2 pieces, removed the coats, with 50 ml of ethanol for 1 hour. Concentrate the ethanol extract to about 2 ml, add 20 ml of 5% solution of sulfuric acid, stir and filter. Transfer the filtrate to a separator, adjust to alkaline with ammonia TS, extract with 20 ml of chloroform. Separate the chloroform layer and evaporate to dryness. Dissolve the residue in 1 ml of dehydrated ethanol, concentrate to 0.2 ml as the test solution. Dissolve atropine sulfate CRS in dehydrated ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of chloroform, acetone, methanol and concentrated ammonia TS (70∶10∶15∶2) as the mobile phase. Apply separately 15 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air and spray with dilute potassium iodobismuthate TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) Place 8 pieces, removed the coats and cut into pieces, to a 250 ml flask. Add 100 ml of water and connect to a apparatus for the determination of volatile oil. Add water through the apparatus until the graduated tube is filled and overflows to the flask, and then add 5 ml of ethyl acetate. Heat under reflux for 40 minutes. Transfer the liquid from the apparatus to a separator, filter the ethyl acetate layer through a funnel laid with anhydrous sodium sulphate. Use the filtrate as the test solution. Dissolve 20 mg of camphor CRS, 10 mg of menthol CRS, 10 mg of a mixture of (±)-borneol and (±) isoborneol and 15 mg of methyl salicylate CRS in 10 ml of ethyl acetate to produce a solution as the reference solution. Carry out the method for gas chromatography (Appendix Ⅵ E), using a column of 2 m in length, packed with 2.5% ethylene glycol glutarate as the liquid phase on the solid support, maintain the temperature at 75℃. Inject a quantity volume of the test solution and the reference solution respectively to the column, the retention time of the peaks obtained with the test solution and the reference solution corresponds with each other.

Extractive in plaster mass It contains not less than 1.7 g per 100 cm^2 (Appendix Ⅰ I method 1), using ether as the solvent.

Other requirements Comply with the general requirements for adhesive plasters (Appendix Ⅰ D).

Action To expel *wind-dampness*, promote blood circulation to kill pain.

Indications Rheumatic arthritis, muscular pain and swollen and painful joints.

Usage and dosage For external use, spread it onto the lesion.

Precaution Be cautious about pregnant women.

Storage Preserve in tightly closed containers, and store in a cool and dark place.

Shangtongning Pian (伤痛宁片)

Shangtongning Tablets

Ingredients Olibanum (processed) 7 g; Myrrha (processed) 7 g; Radix et Rhizoma Nardostachyos 7 g; Rhizoma Corydalis (processed with vinegar) 14 g; Radix et Rhizoma Asari 14 g; Rhizoma Crperi (processed) 70 g; Rhizoma Kaempferiae 70 g; Radix Angelicae Dahuricae 112 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix well. Add starch and cerealose, make granules, compress into 1000 tablets.

Description Khaki colour tablets; odour, characteristic; taste, pungent and bitter.

Identification (1) To 3 g of the tablets, pulverized to

powder, add 50 ml of ethyl acetate, ultrasonicate for 10 minutes, cool and filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 0.5 g of Radix et Rhizoma Asari reference drug in 30 ml of ethyl acetate in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (16∶5) as the mobile phase. Apply separately 5 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Examine under ultraviolet light at 365 nm. The same red fluorescent spots are shown in both chromatograms.

(2) To 3 g of the tablets, pulverized to powder, add 30 ml of petroleum ether (30-60℃), ultrasonicate for 10 minutes, allow to cool, filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 1 g of Rhizoma Cyperi reference drug in the same manner as the reference drug solution. Dissolve α-Cyperone CRS in ethyl acetate to produce a solution containing 5 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of *n*-hexane and ethyl acetate (17∶3) as the mobile phase. Apply separately 5 μl of the above three solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

(3) To 7 g of the tablets, pulverized to powder, add 50 ml of petroleum ether (60-90℃), ultrasonicate for 15 minutes, cool and filter, evaporate the filtrate to about 1 ml as the test solution. Prepare a solution of 0.5 g of Rhizoma Kaempferiae reference drug and 30 ml of petroleum ether (60-90℃) in the same manner as the reference drug solution. Dissolve ethyl-*p*-methoxycinnamate CRS in petroleum ether (60-90℃) to produce a solution containing 5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of *n*-hexane and ethyl acetate (4∶1) as the mobile phase. Apply separately 1 μl of the test solution, the reference drug solution, and the reference solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (55∶45) as the mobile phase. After the peak of imperatorin obtained, use the mixture of methanol and water (90∶10) as the mobile phase for 20 minutes. As detector a spectrophotometer set at 250 nm. The number of theoretical plates for the column is not less than 9000, calculated with the reference to the peak of imperatorin.

Reference solution Dissolve a quantity of imperatorin CRS, accurately weighed, in methanol to produce a solution containing 20 μg per ml as the reference solution.

Test solution To 20 tablets, accurately weighed, pulverized to fine powder, weighed accurately about 2 g of the powder, in a stopper conical flask, add accurately 25 ml of methanol, weigh accurately, ultrasonicate for 20 minutes, allow to cool, weigh accurately again, replenished the lost weight with methanol, mix well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and the test solution into the column and calculate the content.

It contains not less than 68 μg of imperatorin ($C_{16}H_{14}O_4$) per tablet, referred to Radix Angelicae Dahuricae.

Action To dissipate blood stasis to kill pian.

Indications Traumatic injuries and lumbar sprain with manifestations of bruise, ecchymosis, painful swelling and immobilized body.

Usage and dosage 5 tablets, twice a day.

Precaution Contraindicated for pregnant women.

Strength 0.36 g per tablet

Storage Preserve in tightly closed containers.

Shanju Jiangya Pian (山菊降压片)

Shanju Jiangya Tablets

Ingredients Fructus Crataegi 500 g; Flos Chrysanthemi 83.3 g; Rhizoma Alismatis (processed with salt) 62.5 g; Spica Prunellae 62.5 g; Herba Cirsii 83.3 g; Semen Cassiae (stir-baked) 83.3 g.

Procedure Pulverize Rhizoma Alismatis to fine powder. Decoct the other five ingredients 2 times, 3 hours for the first, and 2 hours for the second time. Combine the decoctions, filter, concentrate the filtrate in vacuum to a thick extract with a relative density of 1.30-1.40 (50℃). Add the fine powder of Rhizoma Alismatis, mix well, dry in vacuum, pulverize, sift, add a quantity of starch, mix well, make granules, compress into 1000 tablets and coat with film.

Description Film-coated tablets with brown core; taste, sour, slightly astringent.

Identification (1) Microscopical: Parenchymateous cells subrounded, with elliptical pits gathered into pit groups. Anticlinal walls of endodermal cells sinuous, relatively thickened, lignified, with sparse and fine pit-canals.

(2) Grind 5 tablets to fine powder, add 20 ml of dilute sulfuric acid TS and 20 ml of chloroform, heat under reflux for 15 minutes, allow to cool, separate the chloroform layer, concentrate to 1 ml and use it as the test solution. Prepare a solution with 0.5 g of Semen Cassiae reference drug in the same manner as the reference drug solution. Dissolve emodin CRS and chrysophanol CRS in methanol to prepare a mixture containing 0.5 mg each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15∶5∶1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of each of the reference drug solution and the reference solution to the plate. After developing and removal of the plate, dry in air, and examine under

ultraviolet light at 365 nm. The orange-yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The orange-yellow fluorescent spots in chromatogram obtained with test solution correspond in position and colour to the spot in the chromatogram obtained with the reference solution. Expose the plate to ammonia vapour, the spots turn red.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ D).

Ethyl acetate extractives Take 30 tablets, weigh accurately, grind to fine powder, weigh accurately 3 g, add accurately 50 ml of ethyl acetate, carry out the method for determination of extractives (Appendix Ⅹ A, the hot extraction method), not less than 7.0 mg per tablet.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.1% solution of phosphoric acid (85∶15) as the mobile phase. As detector a spectrophotometer set at 430 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of chrysophanol.

Reference solution Dissolve a quantity of chrysophanol CRS, accurately weighed, in methanol to prepare a solution containing 4 μg per 1 ml as the reference solution.

Test solution Grind 30 tablets, weighed accurately, to fine powder, weigh accurately 3 g, in a stopper conical flask. Add accurately 50 ml of methanol, stopper tightly, and weigh. Ultrasonicate (power, 160 W; frequency, 50 kHz) for 30 minutes, cool, weigh again, replenish the loss of weight with methanol, mix well, and filter. Measure accurately 25 ml of the successive filtrate, add 2 ml of hydrochloric acid, heat under reflux on a water bath for 1 hour, cool, transfer to a 50 ml volumetric flask, dilute with methanol to volume, mix well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of the reference solution and the test solution into the column, respectively, and calculate the content.
It contains not less than 40 μg of chrysophanol ($C_{15}H_{10}O_4$) per tablet, referred to Semen Cassiae.

Action To pacify the liver to restrain hyperactivity of *yang*.

Indications Headache, dizziness, tinnitus, amnesia, aching and weakness of the lower back and knees, hot sensation in the palms, soles and chest, palpitation and insomnia due to hyperactivity of *yang* and a deficiency of *yin*; hypertension with above symptoms.

Usage and dosage 5 tablets, twice a day, or follow doetor's advice.

Precaution Discomfort of the stomach is seen sometimes, but it will have spontaneous remission.

Strength 0.3 g per tablet

Storage Preserve in tightly closed containers.

Shanzha Huazhi Wan (山楂化滞丸)

Shanzha Huazhi Pills

Ingredients Fructus Crataegi 500 g; Fructus Hordei Germinatus 100 g; Massa Medicata Fermentata 100 g; Semen Arecae 50 g; Semen Raphani 50 g; Semen Pharbitidis 50 g.

Procedure Pulverize the above 6 ingredients to fine powder, sift and mix thoroughly. To each 100 g of the powder add 25 g of brown sugar and 90-100 g of refined honey to make big honeyed pills.

Description Brown big honeyed pills; taste, sour and sweet.

Identification (1) Microscopical: Pericarp stone cells pale purple red, red or yellowish-brown, subrounded or polygonal, up to about 125 μm in diameter. Pericarp cells longitudinally arranged, usually 1 long cells and 2 short cells connected alternatively; walls of the long cells thickened, sinuous and lignified. Endoblastic pieces colourless, walls relatively thickened, with numerous large subrounded pits. Testa palisade cells pale brown or brown, 48-80 μm in length. Testa pieces yellow or brownish-red; cells minor, polygonal, with thickened walls.
(2) Triturate well 9 g with a quantity of kieselguhr, grind and mix thoroughly, add 50 ml of methanol, heat under reflux on a water bath for 30 minutes, and filter. Use the methanol filtrate as the test solution. Dissolve ursolic acid CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, and acetone (9∶1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulphuric acid in ethanol, and heat at 105℃ for several minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Weigh accurately 3 g of the pills, obtained in the test of weight variation and cut into pieces, add 10 ml of water, stand for disintegration. Filter, wash the drug residue with 10 ml of water, dry at room temperature to powder. Dry at 100℃ and place the drug residue and the filter paper in a Soxhlet's extractor, add a quantity of ether, heat under reflux for 4 hours. Recover the solvent of the extract to dryness, macerate the residue with two 5-ml quantities of petroleum ether (30-60℃) for 2 minutes, discard the solution, dissolve the residue in a mixture of dehydrated ethanol and chloroform (3∶2) by heating gently, transfer to a 5 ml volumetric flask, dilute to the volume and mix well. Dissolve a quantity of ursolic acid CRS, weighed accurately, with dehydrated ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and a mixture of cyclohexane, chloroform, ethyl acetate and formic acid (20∶5∶8∶1) as the mobile phase. Apply accurately 6 μl of the test solution, 4 μl and 8 μl of the reference solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 110℃ for 5 to 7

minutes to the spots clear. Cover with a same size glass to the plate and fix with adhesive tape. Carry out the method of thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan at the wavelength: λ_S=535 nm, λ_R=650 nm. Measure the integration value of absorbance of the test solution and the reference solution and calculate.

It contains not less than 4.5 mg of ursolic acid ($C_{30}H_{48}O_3$) per pill, referred to Fructus Crataegi.

Action To promote digestion to remove stagnancy and obstruction.

Indications Indigestion due to improper diet with manifestations of fullness in the stomach and abdomen, loss of appetite and constipation.

Usage and dosage 2 pills, 1-2 times a day.

Precaution Contraindicated for pregnant women.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Shaofu Zhuyu Wan
(少腹逐瘀丸)

Shaofu Zhuyu Pills

Ingredients Radix Angelicae Sinensis 300 g; Pollen Typhae 300 g; Faeces Trogopterori (stir-baked with vinegar) 200 g; Radix Paeoniae Rubra 200 g; Fructus Foeniculi (stir-baked with salt) 100 g; Rhizoma Corydalis (processed with vinegar) 100 g; Myrrha (stir-baked) 100 g; Rhizoma Chuanxiong 100 g; Cortex Cinnamomi 100 g; Rhizoma Zingiberis Praeparatum 20 g.

Procedure Pulverize the above ten ingredients to fine powder, sift and mix thoroughly. To each 100 g of the powder add 100-110 g of refined honey to make big honeyed pills.

Description Brownish-black big honeyed pills; odour, aromatic; taste, pungent and bitter.

Identification (1) Microscopical: Parenchymatous cells fusiform, walls slightly thickened, with very fine oblique crisscross striations. Pollen grains yellow, subrounded or elliptical, about 30 μm in diameter, with fine protuberances on exospores. Clusters of calcium oxalate 7-41 μm in diameter, occurring in parenchymatous cells, often in rows or several clusters contained in one cell. Fibres separated, long fusiform, 24-50 μm in diameter, walls thickened and lignified. Clusters of calcium oxalate fine, about 5 μm in diameter, several clusters contained in one cell. Masses of aleurone grains pale yellow.

(2) Cut 9 g of the pills, into pieces grind with 10 g of kieselguhr, add 50 ml of ethanol, ultrasonicate for 20 minutes, and filter. Evaporate the filtrate to dryness and dissolve the residue in 20 ml of water. Extract with three 20-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extracts, wash with three 15-ml quantities of water saturated with *n*-butanol. Discard the aqueous layer, evaporate the *n*-butanol liquid to dryness, dissolve the residue in 20 ml of ethanol, add 2.5 g of activated charcoal, decolourize under heating on a water bath for 2 minutes, cool, and filter. Concentrate the filtrate to about 1 ml as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40∶5∶10∶0.2) as the mobile phase. Apply separately 5-10 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulphuric acid and heat to the spots distinct. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To warm meridians to promote blood circulation and disperse *cold* to kill pain.

Indications Infrequent menstruation, dysmenorrhea, abdominal pain after childbirth with manifestations of delayed menstrual cycles, cold and painful lower abdomen during periods, purplish menstrual blood with clots or postpartum lower abdominal pain, alleviated with heat and worse when pressed.

Usage and dosage 1 pill, 2-3 times a day, to be taken with warm yellow rice wine or boiled water.

Precaution Contraindicated for pregnant women.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Shaolin Fengshi Dieda Gao
(少林风湿跌打膏)

Shaolin Fengshi Dieda Plaster

Ingredients Radix Aconiti 16 g; Radix Aconiti Kusnezoffii 16 g; Radix Linderae 16 g; Rhizoma Bletillae 16 g; Radix Angelicae Dahuricae 16 g; Radix Ampelopsis 16 g; Eupolyphaga seu Steleophaga 16 g; Fructus Chaenomelis 16 g; Rhizoma Sparganii 16 g; Rhizoma Curcumae 16 g; Radix Angelicae Sinensis 16 g; Radix Paeoniae Rubra 16 g; Cortex Cinnamomi 16 g; Radix et Rhizoma Rhei 32 g; Fructus Forsythiae 32 g; Sanguis Draconis 10 g; Olibanum (stir-baked) 6 g; Myrrha (stir-baked) 6 g; Radix et Rhizoma Notoginseng 6 g; Catechu 6 g; Mentholum 8 g; Methyl Salicylate 8 g; Borneolum Syntheticum 8 g.

Procedure Pulverize Sanguis Draconis, Olibanum, Myrrha, Radix et Rhizoma Notoginseng and Catechu to coarse powder, extract with 90% ethanol to a liquid extract with a relative density of 1.05; Decoct the other ingredients, except Mentholum, Methyl Salicylate and Borneolum Syntheticum, with water 3 times, 3 hours for the first and the second time, 2 hours for the third. Combine the decoctions, filter and concentrate the filtrate to a thin extract with a relative density of 1.25-1.30 (80℃). Combine with the above liquid extract, after cooling, add Mentholum, Methyl Salicylate and Borneolum Syntheticum and stir well. Add in 8.5-9.0 folds by weight of plaster base made from rubber and resin etc. to form adhesive masses. Spread the masses on the tape, cut into sections, cover with liner, make holes and cut into small pieces.

Description Slightly red pieces of adhesive plaster, with small holes on the clothing surface; odour, aromatic.

Identification Place 10 pieces to a 250 ml flat-bottomed flask, add 150 ml of water, carry out the method for the determination of volatile oil (Appendix Ⅹ D). Add water through the top of the apparatus until the graduated tube is filled and overflows to the flask, then add 5 ml of ethyl acetate. Heat under reflux for 40 minutes. Transfer the

liquid from the apparatus to a separator, filter the ethyl acetate layer through a funnel laid with anhydrous sodium sulfate, and use the filtrate as the test solution. Dissolve menthol CRS, a mixture of (±)-borneol and (±) isoborneoc CRS and methyl salicylate CRS in ethanol to produce a solution containing 0.8 mg each per ml as the reference solution. Carry out the method for gas chromatography (Appendix Ⅵ E), using a 2 m long column packed with 10% polyethylene glycol (PEG-20M) as the stationary phase; maintain the column temperature at 130℃. Inject a quantity volume of the reference solution and the test solution, respectively, to the column, the retention time of the peaks obtained with the test solution and the reference solution corresponds with each other.

Extractive in plaste mass Carry out the determination method of plaste content for adhesive plasters (Appendix Ⅰ I method 1), use ether as the solvent, not less than 1.5 g per 100 cm^2.

Other requirements Comply with the general requirements for adhesive plasters (Appendix Ⅰ I).

Action To promote blood circulation to dissipate blood stasis, relax muscles and tendons and expel *wind* to disperse *cold*.

Indications Traumatic injuries, rheumatalgia due to *wind-dampness* with manifestations of painful bruise and aching and numbness of the lower back and limbs.

Usage and dosage Applied to the lesion.

Precaution Be cautious about pregnant women, or follow doctor's advice.

Strength (1) 5 cm×7 cm (2) 8 cm×9.5 cm

Storage Preserve in tightly closed containers, stored in a cool place.

Shaoshangling Ding (烧伤灵酊)

Shaoshangling Tincture

Ingredients Rhizoma et Radix Polygoni Cuspidati; Cortex Phellodendri Chinensis; Borneolum Syntheticum.

Procedure Pulverize Rhizoma et Radix Polygoni Cuspidati and Cortex Phellodendri Chinensis to coarse powder, and stir thoroughly. Carry out the method of percolation as described under liquid extract and extract (Appendix Ⅰ O), macerate the coarse powder with 80% ethanol for 48 hours, then percolate tardily. Collect a quantity of the percolation, adjust the content of ethanol to 70%-75% with 80% ethanol and water. Filter, add Borneolum Syntheticum, stir well and pack.

Description A clear, reddish-brown or brown liquid.

Identification (1) Heat under reflux 10 ml of the tincture on a water bath, with 5 drops of hydrochloric acid, for 20 minutes, stand to room temperature. Add 30 ml of 1% solution of sodium hydroxide, transfer to a separator, extract with 30 ml of ethyl acetate and discard the aqueous layer. Wash the ethyl acetate solution with two 20-ml quantities of 1% solution of sodium hydroxide. Recover ethyl acetate to dryness, dissolve the residue in 2 ml of 2% hydrochloric acid in methanol as the test solution. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 0.1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and water (20:10:5:5:1) as the mobile phase. Apply separately to the plate 4 μl of each of the above two solutions. Pre-equilibrated the chamber with ammonia vapour for 5 minutes. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The yellow fluorescence spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) To 0.5 g of Rhizoma et Radix Polygoni Cuspidati reference drug, add 10 ml of 80% ethanol, shake for 5 minutes, filter, use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), formate acetate and formic acid (15:5:1) as the mobile phase. Apply separately 4 μl each of the tincture and the reference drug solution to the plate. After developing and removal of the plate, dry in air. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution, and examine under ultraviolet light at 365 nm, the spots show the same fluorescent colour.

Relative density 0.84-0.90 (Appendix Ⅶ A).

Ethanol content 70 per cent-75 per cent (Appendix Ⅸ M).

Other requirements Comply with the general requirements for tinctures (Appendix Ⅰ N).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.1% solution of phosphoric acid (85:15) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of emodin.

Reference solution Weigh accurately a quantity of emodin CRS, dissolve in dehydrated ethanol to produce a solution containing 10 μg per ml.

Test solution Measure accurately 2 ml of the tincture to a evaporating dish, add 1 g of silica gel (60-160 mesh), evaporate to dryness on a warm water bath. Apply to a column packed with silica gel (2 g, 17 mm in internal diameter), elute in vacuum with 90 ml of a mixture of petroleum ether (60-90℃), formate acetate and formic acid (100:100:2), collect the eluate to a 100 ml volumetric flask, dilute with the same mixture to the volume and mix well.

Procedure Inject accurately 10 μl of each of the test solution and the reference solution into the column and calculate the content.

It contains not less than 0.35 mg per ml of emodin ($C_{15}H_{10}O_5$), referred to Rhizoma et Radix Polygoni Cuspidati.

Action To remove *heat* and *dampness*, clear *heat* to reduce swelling, and astringe to kill pain.

Indications First-degree burn or second-degree burn of various reasons.

Usage and dosage For external use, spray it onto the cleaned wound surface, no dressing 3-4 times a day.

Strength (1) 50 ml per bottle (2) 100 ml per bottle

Storage Protected from light, preserve in tightly closed containers, stored in a cool and dark place.

Shayao
(痧药)

Shayao Pills

Ingredients Flos Caryophylli 21 g; Rhizoma Atractylodis 110 g; Rhizoma Gastrodiae 126 g; Herba Ephedrae 126 g; Radix et Rhizoma Rhei 210 g; Radix et Rhizoma Glycyrrhizae 84 g; Borneolum Syntheticum 0.5 g; Moschus 10.5 g; Venenum Bufonis (processed) 63 g; Realgar 126 g; Cinnabaris 126 g.

Procedure Levigate Realgar and Cinnabaris to very fine powders respectively. Pulverize Flos Caryophylli, Rhizoma Atractylodis, Rhizoma Gastrodiae, Herba Ephedrae, Radix et Rhizoma Rhei and Radix et Rhizoma Glycyrrhizae to fine powder. Grind Moschus, Venenum Bufonis and Borneolum Syntheticum to fine powder, mix with the above powders (except Cinnabaris), sift, mix thoroughly. Make pills with water and dry at a lower temperature, coat with Cinnabaris powder, and polish.

Description Vermilion luminous watered pills with dark yellow to yellowish-brown core; odour, aromatic; taste, sweet, bitter and numb.

Identification (1) Microscopical: Tissue fragments of gelatinized polysaccharides showing a brown or pale brownish-purple colour with iodine solution. Clusters of calcium oxalate fine, 7-11 μm in diameter, occurring in parenchymatous cells, often arranged in rows. Clusters of calcium oxalate large, 60-140 μm in diameter. Stomata characteristic, guard cells dumbbell-like in lateral view. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Amorphous masses pale yellowish-brown, embeded with fine prisms. Irregular fragments golden or orange-yellow, lustrous. Irregular fragments pale brown.

(2) Grind well 0.4 g of the pills, add 1 ml of concentrated ammonia TS and 15 ml of ether, stopper closely and stand for over night. Ultrasonicate for 15 minutes, add 2 ml of solution of hydrochloric acid in ethanol (1→20), mix well, filter, and evaporate the filtrate to dryness on a water bath. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve ephedrine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of chloroform, methanol, and concentrated ammonia TS (20 : 3.5 : 0.2) as the mobile phase. Apply separately 3 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, and spray with ninhydrin TS, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Grind well 0.4 g of the pills, add 10 ml of ethanol, heat under reflux for 30 minutes, filter, and evaporate the filtrate to dryness on a water bath. Dissolve the residue in 2 ml of ethanol as the test solution. Prepare a solution of 20 mg of Venenum Bufonis reference drug in the same manner as the reference drug solution. Dissolve bufogenin CRS and cinobufagin CRS in methanol to produce two solutions each containing 1 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform, and acetone (4 : 3 : 3) as the mobile phase. Apply separately 3 μl each of the test solution and the reference drug solution, and 2 μl of each of the reference solutions to the plate. After developing and removal of the plate, dry in air, and spray with 10% sulfuric acid in ethanol, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solutions.

(4) Grind well 5 g of the pills, and 10 ml of ether, ultrasonicate for 5 minutes, filter, and use the filtrate as the test solution. Prepare a solution of 0.2 g of Rhizoma Atractylodis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and petrol ether (60-90℃) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, and spray with 5% p-dimethylaminobenzaldehyde in 10% sulfuric acid in ethand, and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol and 0.1% solution of phosphoric acid (78:22) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of emodin.

Reference solution Weigh accurately a quantity of emodin CRS and chrysophanol CRS, dissolve in methanol to produce two solutions each containing emodin 10 μg per ml and 25 μg chrysophanol per ml.

Test solution Weigh accurately 1 g of pills, obtained under the test of weight variation, pulverized to fine powder, in a stoppered conical flask, add accurately 25 ml of ethanol, stopper closely and weigh. Heat under reflux on a water bath for 1 hour, cool, weigh accurately again, replenish the lost weight with ethanol, mix well and filter. Measure accurately 20 ml of the successive filtrate, to a grounded-bottom flask, evaporate the solution to dryness, dissolve the residue in 20 ml of the mixture of 30% solution of ethanol and hydrochloric acid (10:1), heat under reflux for 1 hour, cool immediately, extracted with four 20-ml quantities of dichloride methane, combine the dichloride methane extracts, recover the dichloride methane to dryness, dissolve the residue in methanol and transfer to a 20 ml volumetric flask, add methanol to volume, mix well, and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solutions and the test solution into the column respectively and calculate the content.

It contains not less than 0.67 mg of the total amount of emodin ($C_{15}H_{10}O_5$) and chrysophanol ($C_{15}H_{10}O_4$) per pill, referred to Radix et Rhizoma Rhei.

Action To expel summer-heat and relieve *toxicity*, and expel pathological factors and induce resuscitation.

Indications Sudden constriction in the chest and terribly upset, irritability, abdominal pain, vomiting, diarrhea,

lockjaw and cold limbs due to taking too much cold drinks and affliction from *dampness* in summer.

Usage and dosage 10-15 pills, once a day; appropriate reduction for children or follow the physician's advice. For external use, grind appropriate quantity into fine powder and insufflate into the nostrils for sneezing.

Precaution Avoid overdosage; it is forbidden to prescribe to pregnant women.

Strength 1 g per 33 pills

Storage Preserve in tightly closed containers.

Shedan Chenpi San
(蛇胆陈皮散)

Shedan Chenpi Powder

Ingredients Fel Serpentis Liquidum 100 g; Pericarpium Citri Reticulate (steamed) 600 g.

Procedure Pulverize Pericarpium Citri Reticulatae to fine powder, and mix well with Fel Serpentis Liquidum, dry and pulverize, and sift.

Description A yellowish-brown to reddish-brown powder; odour, slightly aromatic; taste, sweet, pungent and slightly bitter.

Identification (1) Microscopical: Prisms of calcium oxalate abundant in parenchyma.
(2) Warm 1.5 g of the powder in 5 ml of ethanol for 1 hour with constant shaking, filter, use the filtrate as the test solution. Dissolve Fel Serpentis Liquidum reference drug in ethanol to prepare a solution containing 5 mg per ml as the reference drug solution. Dissolve sodium taurocholate CRS in ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of isopentanol, glacial acetic acid and water (9 : 3 : 1) as the mobile phase. Apply separately 3 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.
(3) Prepare a solution of 1 g of Pericarpium Citri Reticulatae reference drug in the same manner, as the preparation of test solution described under Identification (2), as the reference drug solution. Dissolve hesperidin CRS in methanol to prepare a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 0.5% sodium hydroxide as the coating substance and a mixture of ethyl acetate, methanol and water (100 : 17 : 13) as the mobile phase. Apply separately to the plate 2 μl of each of the reference drug solution, the reference solution and the test solution obtained under Identification test (2). After developing to a distance of 3 cm, remove the plate, dry in air. Using the upper layer of a mixture of toluene, ethyl acetate, formic acid and water (20:10:1:1) as the mobile phase. Develope to 8 cm and remove the plate, dry in air, spray with 1% aluminium chloride in methanol, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Action To regulate *qi* flow and resolve phlegm, and expel *wind* and harmonize the stomach.

Indications Coughing and vomiting due to block of the lung by phlegm and failure of *stomach-qi* to descend.

Usage and dosage 0.3-0.6 g, 2-3 times a day.

Strength (1) 0.3 g per bottle
(2) 0.6 g per bottle

Storage Preserve in tightly closed containers.

Shedan Chuanbei San
(蛇胆川贝散)

Shedan Chuanbei Powder

Ingredients Fel Serpentis Liquidum 100 g; Bulbus Fritillariae Cirrhosae 600 g.

Procedure Pulverize Bulbus Fritillariae Cirrhosae to fine powder, mix thoroughly with Fel Serpentis Liquidum, dry, pulverize, and sift.

Description A pale yellow to pale brownish-yellow powder; taste, sweet, slightly bitter.

Identification (1) Microscopical: Starch granules broadly ovoid or conchoidal, 40-64 μm in diameter, hilum short cleft, V-shaped or U-shaped, striations visible.
(2) To 3 g of the powder add 20 ml of a mixture of chloroform and ethanol (7 : 3), shake thoroughly, heat warmly for 20 minutes. Shake constantly, filter and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of ethanol as the test solution. Dissolve Fel Serpentis Liquidum reference drug in ethanol to prepare a solution containing 5 mg per ml as the reference drug solution. Dissolve sodium taurocholate CRS in ethanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of isopentanol, glacial acetic acid and water (9:3:1) as the mobile phase. Apply separately 5 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. Examine under ultraviolet light at 365 nm, the fluorescent spots in chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution.
(3) Heat under reflux the residue obtained under Identification (2), with 20 ml of chloroform and 5 ml of concentrated ammonia TS for 30 minutes, allow to cool, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 3 g of Bulbus Fritillariae Cirrhosae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium caboxymethylcellulose as the coating substance and a mixture of *n*-hexane, ethyl acetate and diethylamine (12 : 10 : 1) as the mobile phase. Apply separately in stripe 20 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with dilute potassium iodobismuthate TS and sodium nitrite TS successively. The stripes in chromatogram obtained with the test solution correspond in position and colour to the stripes in the chromatogram obtained with the

reference drug solution.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Action To clear the lung to relieve coughing and eliminate phlegm.

Indications Coughing with expectoration of much phlegm due to *lung-heat*.

Usage and dosage 0.3-0.6 g, 2-3 times a day.

Strength (1) 0.3 g per bottle (2) 0.6 g per bottle

Storage Preserve in tightly closed containers.

Shengmai Yin
(生脉饮)

Shengmai Yin Oral Liquid

Ingredients Radix et Rhizoma Ginseng Rubra 100 g; Radix Ophiopogonis 200 g; Fructus Schisandrae Chinensis 100 g.

Procedure Pulverize the above three ingredients to coarse powder. Macerate in 65% ethanol for 24 hours and carry out the percolation method described under the liquid extract and extract (Appendix Ⅰ O). Collect about 4500 ml of percolate and concentrate to about 250 ml in vacuum. Allow to cool, dilute with 400 ml of water and filter. Add 300 ml of 60% syrup and a quantity of preservative, adjust pH value to the specified range, and make up to 1000 ml. Stir thoroughly, allow it to stand, filter, pack and sterilize.

Description A clear, yellowish-brown to reddish-brown liquid, slightly turbid on long standing; odour, aromatic; taste, sour, sweet and slightly bitter.

Identification (1) Transfer 20 ml to a separator and extract with 20 ml of *n*-butanol. Evaporate the extract to dryness, dissolve the residue in 15 ml of a mixture of sulfuric acid in 45% ethanol (7→100) and heat under reflux for 1 hour. Evaporate ethanol and extract with 10 ml of chloroform. Separate the chloroform layer, wash with water to pH 7 and dehydrate with anhydrous sodium sulfate, filter. Concentrate the filtrate to about 1 ml as the test solution. Dissolve panaxadiol CRS and panaxatriol CRS in dehydrated ethanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and acetone (2∶1) as the mobile phase. Apply separately to the plate 10 μl each of the two solutions. After developing and removal of the plate, dry in air, spray with sulfuric acid in methanol (1→2), heat at 105℃ for about 10 minutes and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(2) To 10 ml, add 0.5 ml of hydrochloric acid and 1 ml of water, boil for 5 minutes, and cool. Extract under shaking with 20 ml of chloroform, separate the chloroform extracts, and evaporate to 1 ml as the test solution. To 1 g of Radix Ophiopogonis reference drug add 20 ml of water, decoct for 10 minutes, and filter. To the filtrate add 0.5 ml of hydrochloric acid, prepare a solution in the same manner as described above as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and acetone (4∶1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 100℃ to the spots clear. The major spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Relative density Not less than 1.08 (Appendix Ⅶ A).

pH value 4.5-7.0 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for mixtures. (Appendix Ⅰ J).

Action To replenish *qi* and restore normal pulse beating, and nourish *yin* to promote the production of body fluids.

Indications Palpitation, shortness of breath, faint pulse and spontaneous sweating due to a deficiency of *qi* and *yin*.

Usage and dosage 10 ml, 3 times a day.

Strength 10 ml per phial

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Shengxue Wan
(生血丸)

Shengxue Pills

Ingredients Cornu Cervi Pantotrichum; Cortex Phellodendri; Rhizoma Dioscoreae; Rhizoma Atractylodis Macrocephalae (stir-baked); Ramulus Mori; Semen Lablab Album (stir-baked); Fructus Oryzae Germinatus; Placenta Hominis.

Procedure Place Cornu Cervi Pantotrichum and Placenta Hominis in a container, add 150 g of yellow rice wine, stopper tightly, stew until wine being absorbed in a pressure tank or heating the container in boiling water, and dry. Pulverize to fine powder with the other six ingredients, stir thoroughly and sift. To each 100 g of the powder add 50-70 g of refined honey and a quantity of water to make pills and dry.

Description Yellowish-brown to dark brown water-honeyed pills; taste, slightly bitter.

Identification (1) Microscopical: Needle crystals of calcium oxalate fine, 10-32 μm in length, irregularly filling in parenchymatous cells. Fibre bundles bright yellow, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres; walls of the crystaled-cells thickened and lignified. Calcium oxalate filling in mucilage cells, 80-240 μm long. Needle crystals 2-5 μm in diameter. Testa palisade cells 80-213 μm long, 5-26 μm wide. Fibres pale yellow or colourless, very long, 8-23 μm in diameter; walls thickened and non-lignified; lumina very fine.

(2) Macerate 2 g of the pills, pulverized to pieces, in 20 ml of ethanol, for 4 hours, filter, used the filtrate as the test solution. Dissolve 4 mg of berberine hydrochloride CRS in 10 ml of ethanol as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using high performance silica gel G as the coating substance and a mixture of ethyl acetate, dehydrated ethanol and formic acid (7∶1∶2) as the mobile phase. Apply separately 1-2 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of acetonitrile and 0.05 mol/L solution of sodium dihydrogen phosphate (43 : 57), added 1.7 g of sodium dodecylsulphate per 1000 ml, as the mobile phase. As detector a spectrophotometer set at 345 nm. The number of theoretical plates of the column is not less than 6000, calculated with the reference to the peak of berberine hydrochloride.

Reference solution Weigh accurately a quantity of berberine hydrochloride CRS, dissolve in methanol to produce a solution containing 20 μg per ml.

Test solution Pulverize the pills to powder, and weigh accurately 3 g of the powder in a Soxhlet's extractor, add 40 ml of a mixture of methanol and hydrochloric acid (100:1), macerate over night, add a quantity of methanol appropriately, and heat under reflux until the extract is colourless. Cool, concentrate the methanol extracts and transfer to a 50 ml volumetric flask, add methanol to volume, mix well and filter. Use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column respectively and calculate the content.

It contains not less than 0.20 mg of berberine hydrochloride ($C_{20}H_{18}ClNO_4$) per gram, referred to Cortex Phellodendri Amurensin.

Action To reinforce the kidney and spleen, and replenish *essence* and nourish blood.

Indications Sallow complexion and emaciation, tiredness and lassitude, dizziness, poor appetite and loose stools due to deficiency in the spleen and kidney; panhematopenia and aplastic anemia caused by radiotherapy or chemotherapy with above symptoms.

Usage and dosage 5 g, 3 times a day, appropriate reduction of the dosage for children.

Precaution Be cautious about those who have *yin* deficiency and *heat*, and red tongue with scanty coating.

Strength 5 g per bottle

Storage Preserve in tightly closed containers.

Shenjing Zhike Wan
(参精止渴丸)

Shenjing Zhike Pills

Ingredients Radix et Rhizoma Ginseng Rubra; Radix Astragali; Rhizoma Polygonati; Poria; Rhizoma Atractylodis Macrocephalae; Radix Puerariae Lobatae; Fructus Schisandrae Chinensis seu Fructus Schisandrae Sphenantherae; Rhizoma Coptidis; Radix et Rhizoma Rhei; Radix et Rhizoma Glycyrrhizae.

Procedure Pulverize the above ingredients to fine powder, sift and mix well. Use 20% peach glue as the adhesive, make pills with 75% ethanol, dry, coat with the powder of Radix Rehmanniae charcoal and polish the pills.

Description Black lustrous watered pills with brownish-yellow colour core; odour, aromatic; taste, slightly bitter.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Clusters of calcium oxalate big, 60-140 μm in diameter. Fibre bundles bright yellow, walls relatively thickened, with obvious pits. Fibers in bundles or scattered, thick-walled with longitudinal fissures on the surface, both ends often broken to broom like or slightly truncated. Stone cells of epidermis of testa pale yellowish-brown, subpolygonal in surface view, walls relatively thickened, with fine and close pit-canals, lumina containing dark brown substances.

(2) Heat under reflux 5 g of the pills with 20 ml of methanol for 15 minutes, filter and concentrate the filtrate to about 1 ml as the test solution. Dissolve berberine hydrochloride CRS in methanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, isopropanol, methanol and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately 1 μl of each of the two solutions to the plate. After developing in a chamber pre-equilibrated with ammonia vapour and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Triturate 10 g of pills to fine powder, ultrasonicate with 40 ml of ethyl acetate for 30 minutes, filter. Evaporate the filtrate to dryness and dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of puerarin CRS in dehydrated ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, methanol and water (28:10:1) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Exposure to ammonia vapours for 15 minutes. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Triturate 15 g of pills to fine powder, ultrasonicate with 50 ml of methanol for 30 minutes, filter. Evaporate the filtrate to dryness and dissolve the residue in 10 ml of water, add 1 ml of hydrochloric acid and heat on the water bath for 30 minutes, cool immediately. Extract with two 10-ml quantities of ether, combine the ether extract, evaporate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 1 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15:5:1) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The five orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The colour of spots turns into red on exposure to ammonia vapour.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.025 mol/L solution of phosphoric acid (mix 1.7 ml of phosphoric acid and 1.8 ml of triethylamine and dilute to 1000 ml with water) (20:80) as the mobile phase. Column temperature set at 40℃. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of puerarin.

Reference solution Dissolve a quantity of puerarin CRS, accurately weighed, in methanol to prepare a solution containing 15 μg per ml.

Test solution Triturate pills to fine powder, weigh accurately 1.1 g of the powder, to a Soxhlet's extractor, add a quantity of ether, heat under reflux for 1 hour. Discard the ether extract and expel remained in the residue; add a quantity of methanol, further heat under reflux for 3 hours. Transfer the extract, concentrated when necessary, to a 50 ml volumetric flask, dilute with methanol to the volume and mix thoroughly.

Procedures Inject accurately 5 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.50 mg of puerarin ($C_{21}H_{20}O_9$) per gram, referred to Radix Puerariae.

Action To replenish *qi* and nourish *yin*, and promote generation of body fluids to relieve thirst.

Indications Diabetes due to impairment of body fluids by internal *heat* and a deficiency of *qi* and blood, with manifestations of shortness of breath, lassitude, dry mouth and polydipsia, polyphagia, emaciation; diabetes mellitus type Ⅱ with above symptoms.

Usage and dosage 10 g, 2-3 times a day.

Strength 7 g per 100 pills

Storage Preserve in well closed containers.

Shenling Baizhu San
(参苓白术散)

Shenling Baizhu Powder

Ingredients Radix et Rhizoma Ginseng 100 g; Poria 100 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 100 g; Rhizoma Dioscoreae 100 g; Semen Lablab Album (stir-baked) 75 g; Semen Nelumbinis 50 g; Semen Coicis (stir-baked) 50 g; Fructus Amomi 50 g; Radix Platycodonis 50 g; Radix et Rhizoma Glycyrrhizae 100 g.

Procedure Pulverize the above ten ingredients to fine powder, sift, and mix well.

Description Yellow to greyish-yellow powder; odour, aromatic; taste, sweet.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Clusters of calcium oxalate 20-68 μm in diameter, with acute angles. Needles of calcium oxalate minute, 10-32 μm long, irregularly filling in parenchymatous cells. Raphides of calcium oxalate occurring in mucilage cells, 80-240 μm long, needles 2-8 μm in diameter. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. cells of pigment layer yellowish-brown or reddish-brown, subrectangle, subrounded or subpolygonal in surface view. Palisade cells of testa 80-150 μm long. sclerenchymators cells of endotesta yellowish-brown or brownish-red, subpolygonal in surface view, walls thickened, lumina containing silica bodies. Anastomosing laticiferous tubes 14-25 μm in diameter, containing pale yellow granules.

(2) Heat under reflux 4.5 g of the powder with 40 ml of chloroform on a water bath for 1 hour, filter, discard the filtrate. Heat under reflux the residue with 50 ml of methanol on a water bath for 1 hour, filter, evaporate the filtrate to dryness, dissolve the residue in 5 ml of methanol. Apply the solution to a column (1-1.5 cm in inner diameter) packed with neutral aluminium oxide (100-120 mesh, 15 g), elute with 150 ml of 40% methanol. Collect the eluate, evaporate to dryness, dissolve the residue in 30 ml of water, extract with two 25-ml quantities of *n*-butanol saturated with water. Combine the extracts, wash with three 20-ml quantities of water, evaporate to dryness, dissolve the residue in 0.5 ml of methanol as the test solution. Prepare two solutions of each of 1 g Radix et Rhizoma Ginseng reference drug and Radix et Rhizoma Glycyrrhizae reference drug in the same manner as the reference drug solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, ethyl acetate, methanol and water (15:40:22:10, standing below 10℃) as the mobile phase. Apply separately 1 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, spray with sulfuric acid in ethanol (1 → 10), heat at 105℃ for 5-10 minutes, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solutions.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Action To reinforce the spleen and stomach, and replenish *lung-qi*.

Indications Poor appetite and loose stools, shortness of breath, cough and lassitude due to deficiency in the spleen and stomach.

Usage and dosage 6-9 g, 2-3 times a day.

Storage Preserve in tightly closed containers.

Shenqi Wuweizi Pian
(参芪五味子片)

Shengqi Wuweizi Tablets

Ingredients Fructus Schisandrae Sphenantherae 180 g; Radix Codonopsis 60 g; Radix Astragali 120 g; Semen Ziziphi Spinosae (stir-baked) 30 g.

Procedure Pulverize Radix Codonopsis and 60 g of Fructus Schisandrae Sphenantherae to fine powder, carry out the method of percolation as described under Liquid Extracts and Extracts (Appendix Ⅰ O), macerate Radix Astragali, Semen Ziziphi Spinosae and the remained portion of Fructus Schisandrae Sphenantherae with 45% ethanol, 70% ethanol and 60% ethanol for 24 hours, respectively, then percolate and collect the percolates, recover ethanol and combine the extracts, concentrate to a quantity and add the above fine powder and a quantity of excipient, mix thoroughly, make granules and make to 1000 tables, or coated with sugar.

Description Tablets or sugar coated tablets with dark-brown core; taste, slightly bitter.

Identification (1) Microscopical: Anastomosing laticiferous vessels 12-15 μm in diameter, containing fine granules. Epidermis stone cells of testa pale yellowish-brown, polygonal in surface view, walls relatively thickened, with fine and dense pit-canals, containing dark-brown contents.
(2) Grind 10 tablets or sugar coated tablets, removed the sugar coats, to fine powder, add 25 ml of chloroform, heat under reflux for 30 minutes, filter, evaporate to dryness, dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 1 g of Fructus Schisandrae Sphenantherae reference drug and 25 ml of chloroform in the same manner as the reference drug solution. Dissolve deoxyschizandrin CRS in chloroform to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15∶5∶1) as the mobile phase. Apply separately 2 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution.
(3) Grind 10 tablets or sugar coated tablets, removed the sugar coats, to fine powder, add 25 ml of methanol, heat under reflux for 1 hour, filter, and evaporate the filtrate to dryness. Add 10 ml of water to the residue, heat slightly to dissolve, extract the water solution by shaking with two 20-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extract, wash the extract with two 20-ml quantities of ammonia TS, then wash with two 20-ml quantities of water, evaporate the *n*-butanol solution to dryness, and dissolve the residue in 0.5 ml of methanol as the test solution. Dissolve astragaloside Ⅳ CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13∶6∶1) (standing below 10℃) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. Examine under ultraviolet light at 365 nm, the fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D)

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, water and acetic acid (64∶35∶1) as the mobile phase. As detector a spectrophotometer set at 249 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of schisandrin A.

Reference solution Dissolve a quantity of schisandrin A CRS, accurately weighed, in methanol to prepare a solution containing 60 μg per ml as the reference solution.

Test solution Take 20 tablets, or sugar-coating tablets with coating removed, weigh accurately, pulverize to powder. Weigh accurately 1 g in a stopper conical flask, add accurately 25 ml of methanol, stopper tightly, and weigh. Ultrasonicate (power, 250 W; frequency, 50 kHz) for 20 minutes, cool, weigh again, replenish the loss of weight with methanol, mix well, centrifuge, and use the supernatant as the reference solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 0.25 mg of schisandrin A ($C_{24}H_{32}O_6$) per tablet, referred to Fructus schisandrae sphenantherae.

Action To invigorate the spleen and replenish *qi*, and tranquilize the *heart* to anchor the mind.

Indications Insomnia, dreamfulness, amnesia, lassitude, palpitation, shortness of breath and spontaneous sweating due to a deficiency of *spleen-qi* and *heart-blood*.

Usage and dosage 3-5 tablets, 3 times a day.

Strength 0.25 g per tablet

Storage Preserve in tightly closed containers.

Shenrong Baifeng Wan
(参茸白凤丸)

Shenrong Baifeng Pills

Ingredients Radix et Rhizoma Ginseng 8.2 g; Cornu Cervi Pantotrichum (processed with wine) 9.4 g; Radix Codonopsis (stir-baked) 40 g; Radix Angelicae Sinensis (steamed with wine) 39 g; Radix Rehmanniae Praeparata 77.5 g; Radix Astragali (processed with wine) 39 g; Radix Paeoniae Alba (processed with wine) 39 g; Rhizoma Chuanxiong (processed with wine) 30 g; Rhizoma Corydalis (processed) 23 g; Semen Trigonellae (processed with salt) 30 g; Radix Dipsaci (processed with wine) 30 g; Rhizoma Atractylodis Macrocephalae (processed) 30 g; Rhizoma Cyperi (processed) 31 g; Fructus Amomi 23 g; Herba Leonuri (processed with wine) 39 g; Radix Scutellariae (processed with wine) 30 g; Herba Taxilli (steamed) 21 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 30 g.

Procedure Pulverize Cornu Cervi Pantotrichum to fine powder, Pulverize the other seventeen ingredients to fine powder, and mix with the above powder of Cornu Cervi Pantotrichum. To each 100 g of the powder add 35-45 g of refined honey or fructose syrup and a quantity of water to make pills and dry; or add 85-105 g of refined honey (or fructose syrup) to make big honeyed pills.

Description Brown to black water-honeyed pills or big honeyed pills.

Identification Microscopical: Palisade cells of seed coat 1 layer, pale brown or reddish-brown, occurring a light band. Stone cells subsquare, subrounded or irregular, lumina containing prisms of calcium oxalate or reddish-brown masses. Fibres pale yellow, fusiform, thick-walled, with fine pitcanals. Secretory cells subrounded, containing pale yellowish-brown or reddish-brown secretion, with adjacent cells arranged radiately. Sclerenchymatous cells of endotesta yellowish-brown or brownish-red, subpolygonal in surface view, with thickened walls, lumina containing silica bodies. Nonglandular hairs 1-3 celled when whole, slightly curved, with warty walls. Fibres in bundles or scattered throughout, thick-walled, with longitudinal fissures on the surface, both ends often broken to tassel-like, or slightly truncated.

Fibres bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Parenchyma greyish-brown or blackish-brown, cells mostly wrinkled, containing brown nucleus-like substance. Unossified bone tissue pale grey or nearly colourless, uneven both on edges and surfaces, with irregular projecting masses, and belt striations vaguely observed.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To replenish *qi* and nourish blood, and regulate menstruation and prevent miscarriage.

Indications Menstrual disorders, dysmenorrhea, or vaginal bleeding during pregnancy, or premature delivery due to a deficiency of both *qi* and blood.

Usage and dosage 6 g of water-honeyed pills, or 1 big honeyed pill, 1 time a day.

Precaution It is forbidden to prescribe to those with common cold and fever; pregnant woman should follow. doctor's advice

Strength 9.4 g per big honeyed pill

Storage Preserve in tightly closed containers.

Shenrong Baotai Wan
(参茸保胎丸)

Shenrong Baotai Pills

Ingredients Radix Codonopsis 66 g; Arillus Longan 20 g; Semen Cuscutae (processed with salt water) 33 g; Rhizoma Cyperi (processed with vinegar) 41 g; Poria 58 g; Rhizoma Dioscoreae 50 g; Folium Artemisiae Argyi (processed with vinegar) 41 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 50 g; Radix Scutellariae 66 g; Radix Rehmanniae Praeparata 41 g; Radix Paeoniae Alba 41 g; Colla Corii Asini 41 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 28 g; Radix Angelicae Sinensis 50 g; Herba Taxilli 41 g; Rhizoma Chuanxiong (processed with wine) 41 g; Rhizoma et Radix Notopterygii 20 g; Radix Dipsaci 41 g; Cornu Cervi Pantotrichum 20 g; Cortex Eucommiae 58 g; Bulbus Fritillariae Cirrhosae 20 g; Fructus Amomi 33 g; Exocarpium Citri Grandis 41 g.

Procedure Pulverize the twenty three ingredients to fine powder, sift, mix thoroughly. To each 100 g of the powder add 30-45 g of refined honey and a quantity of water to make pills and dry.

Description Dark brown water-honeyed pills; taste, sweet and slightly pungent.

Identification (1) Pulverize 2 g of the pills, add 10 ml of water, warm on a water bath for 10 minutes, cool and filter. Drip the filtrate on a filter paper, add one drop of ninhydrin TS, heat at 105℃ for about 2 minutes; a purple colour is produced.
(2) Pulverize 2 g of the pills, and 5 ml of ethanol, shake for 5 minutes, allow to stand for 20 minutes, and filter. To 1 ml of the filtrate, add a small quantity of magnesium powder and 1 ml of hydrochloric acid; an orange-red colour is produced.
(3) Pulverize 5 g of the pills, add 10 ml of ethanol, shake and stand for 10 minutes. Filter and use the filtrate as the test solution. To 0.1 g of Radix Angelicae Sinensis reference drug, add 5 ml of ethanol, shake and stand for 10 minutes. Filter and use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of benzene and ethyl acetate (9∶1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To nourish the liver, kidney and blood to prevent miscarriage.

Indications Delicate in health, aching pain in the lower back and knees, distension and bearing-down sensation in the lower abdomen, vaginal bleeding during pregnancy or threatened abortion due to deficiency in the liver and kidney, and insufficient blood as well.

Usage and dosage 15 g, twice a day.

Storage Preserve in tightly closed containers.

Shenrong Guben Pian
(参茸固本片)

Shenrong Guben Tablets

Ingredients Radix Angelicae Sinensis 45 g; Rhizoma Dioscoreae (stir-baked) 60 g; Radix Paeoniae Alba (processed with wine) 37.5 g; Poria 60 g; Fructus Corni 60 g; Cortex Eucommiae (carbonized) 45 g; Fructus Lycii 45 g; Cortex Moutan 24 g; Sanguis Cornus Cervi Pantotrichi 0.75 g; Rhizoma Alismatis (processed with salt) 18 g; Radix Rehmanniae praeparata 120 g; Fructus Schisandrae Chinensis 22.5 g; Cornu Cervi Pantotrichum (removed from hairs) 2.5 g; Semen Cuscutae (processed with wine) 60 g; Radix et Rhizoma Ginseng Rubra 15 g.

Procedure Pulverize Cornu Cervi Pantotrichum, Sanguis Cornus Cervi Pantotrichum, Rhizoma Dioscoreae and Radix Angelicae Sinensis to fine powder, and sift. Decoct the other eleven ingredients with water for 2 times, 3 hours for the first time, and 2 hours for the second time. Combine the decoctions, filter and concentrate the filtrate to an extract. Mix the extract with the above powder, dry, pulverize, and sift. Add a quantity of excipients, mix thoroughly, make granules, dry, make to 1000 tablets and coat with sugar.

Description Sugar coated tablets with yellowish-brown core; taste, slightly bitter.

Identification (1) Microscopical: Parenchymatous cells fusiform, walls slightly thickened, with very fine and oblique crisscross striations. Raphides of calcium oxalate occurring in mucilage cells, 80-240 μm long, 2-8 μm in diameter. Unossified bone tissue pale grey or nearly colourless, uneven both on edges and surface, with irregular projecting masses and belt striations vaguely obseved.
(2) Triturate 20 tablets, removed the coats, to fine powder, add 20 ml of ether, ultrasonicate for 10 minutes, filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 1 g of Radix Angelicae Sinensis reference drug and 20 ml of ether in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of cyclohexane and ethyl acetate (17∶3) as the mobile phase. Apply separately 2 μl of each

of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of acetonitrile and water (13∶87) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of paeoniflorin.

Reference solution Weigh accurately a quantity of paeoniflorin CRS, dissolve in dilute ethanol TS to prepare a solution containing 0.2 mg per ml.

Test solution With 20 tablets, remove the sugar coats, pulverize to fine powder, and weigh accurately 3 g of the powder, place in a Soxhlet's extractor, add a quantity of ether, extract under reflux until the extract is colourless. Discard the ether solution, and evaporate the residue to dryness, add a quantity of methanol, heat under reflux until the extract is colourless. Evaporate the methanol extracts to dryness, dissolve the residue in 20 ml of water, apply to a column packed with D-101 macroporous resin (15 cm in height, 1.5 cm in inner diameter), elute separately with 50 ml of water and 2 ml of ammonia TS, then wash with water until the pH value of the eluate to 7, finally elute with ethanol, and collect 150 ml of ethanol eluate, and evaporate the eluate to dryness. Dissolve the residue in dilute ethanol TS, and transfer to a 10 ml volumetric flask, add dilute ethanol TS to volume, mix well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column respectively and calculate the content.

It contains not less than 0.10 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per tablet, referred to Radix Paeoniae Alba and Cortex Moutan.

Action To replenish *qi* and nourish blood.

Indications Weakness of the limbs, lusterless complexion, tinnitus and dizziness due to a deficiency of *qi* and blood.

Usage and dosage 5-6 tablets, 3 times a day.

Storage Preserve in tightly closed containers, protected from moisture.

Shensu Wan
(参苏丸)

Shensu Pills

Ingredients Radix Codonopsis 75 g; Folium Perillae 75 g; Radix Puerariae Lobatae 75 g; Radix Peucedani 75 g; Poria 75 g; Rhizoma Pinelliae (processed) 75 g; Pericarpium Citri Reticulatae 50 g; Fructus Aurantii (stir-baked) 50 g; Radix Platycodonis 50 g; Radix et Rhizoma Glycyrrhizae 50 g; Radix Aucklandiae 50 g.

Procedure Pulverize the above eleven ingredients to fine powder, sift and mix thoroughly. Decoct 30 g of Rhizoma Zingiberis Recens and 30 g of Fructus Jujubae with water in portions and filter. Make pills with the above powder and decoction, and dry.

Description Brown watered pills; odour, slight; taste, slightly bitter.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Raphides of calcium oxalate 32-144 μm long, occurring in mucilage cells or scattered fine. Anastomosing laticiferous tubes 14-25 μm in diameter, containing pale yellow granular substance. Stone cells subrhombic or polygonal with one end slightly sharp, walls relatively thick with few pits. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate forming crystal fibres.

(2) Grind well 12 g of the pills, to a 500 ml ground-bottom flask, add 200 ml of water, connect to an apparatus for the determination of volatile oil. Add water through the top of the apparatus until the graduated tube is filled and overflows to the flask, then add 1.5 ml of petrol eum ether (60-90℃) and connect to the reflux condenser. Heat under reflux and keep boiling for 2 hours, cool, use petrol eum ether layer as the test solution. Prepare a solution of 1 g of Folium Perillae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of petrol eum ether (60-90℃) and ethyl acetate (17∶3) as the mobile phase. Apply separately 5 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, and spray with 1% vanillin in sulfuric acid and heat to the spots distinct. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Grind well 4 g of the pills, add 40 ml of 50% ethanol, heat under reflux for 1 hour, filter, and evaporate the filtrate to dryness on a water bath. Dissolve the residue in 20 ml of water, extract with three 10-ml quantities of ethyl acetate, combine ethyl acetate extracts, evaporate to dryness. Dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 1 g of Radix Peucedani reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of petrol eum ether (60-90℃) and ethyl acetate (3∶2) as the mobile phase. Apply separately 2 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) To 7 g, triturate to powder, macerate with 25 ml of ether for 4 hours, shake frequently, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethanol, and use the supernatant as the test solution. Prepare a solution of 0.5 g of Radix Aucklandiae reference drug and 10 ml of ether in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (9∶1) as the mobile phase. Apply separately 2 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 1% vanillin in sulfuric acid, heat at 105℃ to the spots clear. The two main spots in the chromatogram obtained with the test solution correspond in position and

colour to the spots in the chromatogram obtained with the reference drug solution.
(5) Triturate 4 g of the pills to powder, add 25 ml of methanol, ultrasonicate for 15 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol, filter and use the filtrate as the test solution. To 0.5 g of Pericarpium Citri Reticulatae reference drug add 5 ml of methanol, ultrasonicate for 15 minutes, filter and use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carbonmethylcellulose as the coating substance and a mixture of *n*-hexane and ethyl acetate (2∶3) as the mobile phase. Apply separately 1 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol and water (21∶79) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of puerarin.

Reference solution Weigh accurately a quantity of puerarin CRS, dissolve in dilute ethanol TS to prepare a solution containing 80 μg per ml.

Test solution Pulverize the pills to fine powder, weigh accurately 2 g in a stopper conical flask, add accurately 25 ml of dilute ethanol TS, closely stopper and weigh. Ultrasonicate for 30 minutes (power, 250 W; frequency, 33 kHz), cool, weigh again, replenish the lost weight with dilute ethanol TS. Filter the supernatant, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column respectively and calculate the content.
It contains not less than 0.30 mg of puerarin ($C_{21}H_{20}O_9$) per gram, referred to Radix Puerariae.

Action To replenish *qi* to release the exterior, and disperse *wind* and *cold*, and expel phlegm to relieve cough.

Indications Common cold due to affliction from external *wind-cold* in debilitated patients with manifestations of aversion to cold, fever, headache, stuffy nose, coughing with expectoration of profuse phlegm, constriction in the chest, vomiting, lassitude and shortness of breath.

Usage and dosage 6-9 g, 2-3 times a day.

Storage Preserve in tightly closed containers, protected from moisture.

Shexiang Baoxin Wan
(麝香保心丸)

Shexiang Baoxin Pills

Ingredients Moschus; Extractum Ginseng; Calculus Bovis Artifactus; Cortex Cinnamomi; Styrax, Venenum Bufonis; Borneolum Syntheticum.

Procedure Pulverize the six ingredients except Styrax to fine powder, make pills with Styrax and a quantity of white wine and dry.

Description Blackish-brown watered pills, lustrous; cut surface brownish-yellow; taste, bitter, pungent, cool and numb.

Identification (1) Pulverize 0.9 g of the pills, macerate in 40 ml of petroleum ether (30-60℃) for 30 minutes, shake constantly, discard the petroleum ether solution, evaporate the residue to dryness. Ultrasonicate the residue with 40 ml of chloroform for 20 minutes, filter, reserve drug residue for later use, evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of chloroform as the test solution. Dissolve bufogenin CRS in chloroform to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform and acetone (4∶3∶3) as the mobile phase. Apply separately 6 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, and heat at 105℃ to the spots clear. The bluish-green spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution; then examine under ultraviolet light at 365 nm, the pale greyish-yellow fluorescence spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) Evaporate the drug residue deserved under Identification (1) to dryness. Add 20 ml of *n*-butanol saturated with water, ultrasonicate for 30 minutes, filter, wash the filtrate with two 20-ml quantities of 0.5% solution of sodium hydroxide, then wash with water to neutral. Evaporate the *n*-butanol solution to dryness on a water bath, dissolve the residue in 0.5 ml of methanol as the test solution. Prepare a solution of 1 g of Radix et Rhizoma Ginseng reference drug in the same manner as the reference drug solution. Dissolve ginsenoside Rb_1 CRS, ginsenoside Re CRS, ginsenoside Rg_1 CRS in methanol to produce a mixture containing 2 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, ethyl acetate, methanol and water (15∶40∶22∶10, standing below 10℃) as the mobile phase. Apply separately 1-2 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air immediately, spray with 10% sulfuric acid in ethanol, heat at 110℃ for several minutes to the spots clear, and examine in sunlight and under ultraviolet light at 365 nm, respectively. The spots or the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Three purplish-red spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution in sunlight. One yellow spot and two orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution under ultraviolet light at 365 nm.
(3) To 2 g of the pills, pulverized to powder, add 5 ml of ether, ultrasonicate for 5 minutes, centrifuge, and use the supernatant as the test solution. Dissolve muscone CRS in ether to produce a solution containing 0.1 mg per ml as the reference solution. Carry out the method for gas

chromatography (Appendix Ⅵ E), using a 2 meters long column packed with a mixture of 1.64% polyethylene glycol (PEG)-20 M and 1.32% methyl polysiloxane (SE-30) as the stationary phase; maintain the column temperature at 180℃. Inject a quantity volume of the test solution and the reference solution, respectively, into the column, the retention time of the peaks obtained with the test solution and the reference solution corresponds with each other.

(4) Dissolve cinnamic acid CRS in ether to produce a solution containing 0.2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of petrol eum ether (30-60℃), *n*-hexane, methyl acetate and formic acid (10∶30∶15∶1) as the mobile phase. Apply separately 5 μl of each of the reference solution and the test solution obtained under Identification (3) to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(5) Add 5 ml of methanol to the dried residue reserved under Identification (3), ultrasonicate for 20 minutes, allow to stand, and use the supernatant as the test solution. Dissolve cholic acid CRS and deoxycholic acid CRS in ethanol to produce two solutions separately containing 0.5 mg per ml and 0.1 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ether, and glacial acetic acid (2∶2∶1) as the mobile phase. Apply separately 3 μl each of the reference solutions and the test solution to the plate. After developing and removal of the plate, dry in air, spray with a 10% sulfuric acid in ethanol, and heat at 105℃ to spots clear. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

(6) To 0.5 g of the pills, pulverized to powder, add 10 ml of ethyl acetate, ultrasonicate for 5 minutes, centrifuge, and use the supernatant as the test solution. Dissolve a mixture of (±) borneol and (±) isoborneol CRS in ethyl acetate to produce a solution containing 3 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of toluene and acetone (9∶1) as the mobile phase. Apply separately to the plate 2 μl of each of the reference solution and the test solution. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulfuric acid, and heat at 105℃ to spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Weight variation Carry out the method for test of weight variation under the general requirements for pills (Appendix Ⅰ A, method 1), using 10 pills, not more than ±15.0 per cent.

Disintegration test Not more than 15 minutes (Appendix Ⅰ A).

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of acetonitrile and 0.5% solution of potassium dihydrogen phosphate (50∶50) (adjust the pH value to 3.2 with phosphoric acid) as the mobile phase. As detector a spectrophotometer set at 296 nm. The number of theoretical plates of the column is not less than 9000, calculated with the reference to the peak of cinobufagin.

Reference solution Weigh accurately a quantity of bufogenin CRS and cinobufagin CRS separately, dissolve with methanol, to produce two solutions each containing 50 μg per ml.

Test solution Weigh accurately 80 pills, pulverize to fine powder, and weigh accurately 0.5 g of the powder, place in a stopper conical flask, add accurately 10 ml of methanol, closely stopper and weigh. Ultrasonicate for 30 minutes (power, 250 W; frequency, 33 kHz), cool, weigh again, replenish the loss of weight with methanol, stir well and filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solutions and the test solution into the column respectively and calculate the content.

It contains not less than 18 μg of the total amount of bufogenin ($C_{24}H_{32}O_4$) and cinobufagin ($C_{26}H_{34}O_6$) per pill, referred to Venenum Bufonis.

Action To dredge meridians with aromatics warm in property, and replenish *qi* to reinforce the heart.

Indications Impeded flow of *yang-qi* in the chest due to stagnation of *qi* and blood with manifestations of fixed pain in the precardium; angina pectoris due to myocardial ischemia and myocardial infarction with above symptoms.

Usage and dosage 1-2 pills, 3 times a day, or taken during the attack.

Precaution Contraindicated for pregnant women.

Strength 22.5 mg per pill

Storage Preserve in tightly closed containers.

Shexiang Qutong Chaji (麝香祛痛搽剂)

Shexiang Qutong Liniment

Ingredients Moschus 0.33 g; Flos Carthami 1 g; Camphora 30 g; Radix Angelicae Pubescentis 1 g; Borneolum Syntheticum 20 g; Resina Draconis 0.33 g; Mentholum 10 g; Radix Rehmanniae 20 g; Radix et Rhizoma Notoginseng 0.33 g.

Procedure Macerate separately Moschus, Radix et Rhizoma Notoginseng and Flos Carthami with 10 ml of 50% ethanol in 3 portions, 7 days for each times, combine the extract and filter. Macerate Radix Rehmanniae with 100 ml of 50% ethanol in 3 portions, 7 days for each time, combine the extract and filter. Macerate separately Resina Draconis and Radix Angelicae Pubescentis with 10 ml of ethanol in 3 portions, 7 days for each time, combine the extract and filter. Dissolve Borneolum Syntheticum and Camphora in 100 ml of ethanol by stirring, add 700 ml of 50% ethanol, stir well, add the above extract, mix well. Dissolve Mentholum with a quantity of 50% ethanol, add to the above drug liquid, add 50% ethanol to total amount of 1000 ml, mix well, stand and filter.

Description A clear, orange colour liquid; odour, aromatic.

Identification Inject 1 μl of each of the reference solution and test solution prepared under Assay. Carry out the test

method under Assay, the retention times of the peaks in the chromatogram obtained with the test solution correspond to that of the peaks in the chromatogram obtained with the reference solutions.

Ethanol content 47 per cent-57 per cent (Appendix Ⅸ M).

Other requirements Comply with the general requirements for liniments (Appendix Ⅰ V).

Assay Carry out the method for gas chromatography(Appendix Ⅵ E).

Chromatographic system and system suitability Use a column packed with polyethylene, glycol (PEG)-20 M as the stationary phase (30 m in length 0.53 mm in inner diameter, film thickness 1.0 μm) and maintain the column temperature at 160℃. The number of theoretical plates of the column is not less than 12000, calculated with the reference of the peak of camphor.

Correction factor Dissolve a quantity of naphthalene, accurately weighed, in dehydrated ethanol to produce a solution containing 4 mg per ml as internal standard solution. Dissolve 6 mg of camphor, 2 mg of menthol, and 4 mg of the mixture of (±)-borneol and (±) isoborneol CRS, accurately weighed, in a 10 ml volumetric flask, add accurately 1 ml of internal standard solution, then dilute with dehydrated ethanol to volume, and mix well. Inject accurately 1 μl of the solution into column, calculate the correction factor.

Procedure Measure accurately 1 ml of the liniment in a 50 ml volumetric flask, add accurately 5 ml of internal standard solution, then dilute with dehydrated ethanol to volume, and mix well as the test solution. Inject accurately 1 μl of the test solution into the column and calculate the contents. The content of a mixture of (±)-borneol and (±) isoborneol is calculated with the total amount of (±)-borneol and (±)-borneol.
It contains 25.5-35.5 mg of camphor ($C_{10}H_{16}O$), 8.5-11.5 mg of menthol ($C_{10}H_{20}O$), and 17.0-23.0 mg of Borneolum Syntheticum per ml.

Action To promote blood circulation to expel stagnated blood, relax muscles and tendons, and reduce swelling to kill pain.

Indications Traumatic injuries with bruise and pain, accumulation of *wind-dampness* and arthralgia.

Usage and dosage For external use, apply it to the lesion for 5 to 10 minutes until there is a hot feeling, soaked with the medicine to the lesion in severe sprain of soft tissues or hemorrhage.

Precaution Be cautious about pregnant women and those with ethanol sensitivity.

Strength 56 ml per bottle

Storage Preserve in tightly closed containers and store below 30℃, protected from light.

Shexiang Qutong Qiwuji
麝香祛痛气雾剂
Shexiang Qutong Aerosol

Ingerdients Moschus 0.33 g; Flos Carthami 1 g; Camphora 30 g; Radix Angelicae Pubescentis 1 g; Borneolum syntheticum 20 g; Resina Draconis 0.33 g; Mentholum 10 g; Radix Rehmanniae 20 g; Radix et Rhizoma Notoginseng 0.33 g.

Procedure Macerate separately Moschus, Radix Et Rhizoma Notoginseng and Flos Carthami with 10 ml of 50% ethanol in 3 portions, respectively, 7 days for each times, combine the extracts and filter. Macerate Radix Rehmanniae with 100 ml of 50% ethanol in 3 portions, 7 days for each time, combine the extract and filter. Macerate separately Resina Draconis and Radix Angelicae Pubescentis with 10 ml of ethanol in 3 portions, 7 days for each time, combine the extracts and filter. Dissolve Borneolum Syntheticum and Camphora in 100 ml of ethanol by stirring, add 700 ml of 50% ethanol, stir well, add the above extracts, mix well. Dissolve Mentholum with a quantity of 50% ethanol, add into the above drug liquid, adjust the total volume to 1000 ml with 50% ethanol, mix well, stand and filter, pack, seal and add a quantity of the propellant.

Description A aerosol with non-metered-dose valve system; the drug liquid in the pressure-resistant container is a clear, orangish-red liquid with aromatic odour.

Identification Carry out the test method under Assay, the retention times of the peaks in the chromatogram obtained with the test solution correspond to that of the peaks in the chromatogram obtained with the reference solutions.

Ethanol content 47-57 per cent (Appendix Ⅸ M).

Delivery rate Not less than 0.8 g per second (Appendix Ⅰ Z).

Other requirements Comply with the general requirements for aerosols (Appendix Ⅰ Z).

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use a macrogol-20000 (PEG-20 M) fused quartz capillary column (0.53 mm in internal diameter, 30 meter long and 1.0 μm film thickness) as the stationary phase, maintain the column temperature at 160℃. The number of theoretical plates of the column is not less than 20000, calculated with reference to the peak of camphor

Correlation factor Dissolve a quantity of naphthalene, accurately weighed, in dehydrated ethanol to prepare a solution containing 4 mg per ml, as the internal standard solution. Dissolve 6 mg of camphor CRS, 2 mg of menthol CRS and 4 mg of the mixture of (±)-borneol and (±)-isoborneol CRS, accurately weighed, in the same 10 ml volumetric flask, add accurately 1 ml of the internal standard solution, dilute with dehydrated ethanol to volume, and mix well. Inject 1 μl of the solution into column, calculate the correction factor.

Procedure Remove the cover of the container, cool to 5℃. On the aluminum cover of the container punch a hole and insert an injection needle with a dry rubber tubing into the container (do not contact the surface of the liquid). The other end of the rubber tubing is inserted into water, allow the propellant to expel gently completely, remove the aluminum cover. Measure accurately 1 ml of the drug liquid, to a 50 ml volumetric flask, add accurately 5 ml of the internal standard solution, dilute with dehydrated ethanol to volume, mix well, as the test solution. Inject 1 μl of the test solution into column and calculate the contents.
It contains not less than 25.5 mg and no more than 34.5 mg of camphor ($C_{10}H_{16}O$) per ml. It contains not less than 8.5 mg and no more than 11.5 mg of menthol ($C_{10}H_{20}O$) per ml. It contains not less than 17.0 mg and no more than 23.0 mg of the mixture of (±)-borneol and (±)-isoborneol ($C_{10}H_{18}O$) per ml.

Action To promote blood circulation to expel stagnated blood, dredge meridians to reduce swelling and pain.

Indications Traumatic injuries with bruise and pain, accumulation of *wind-dampness* and arthralgia.

Usage and Dosage Fox external use, spray it to the lesion and rub for 5-10 minutes until there is a hot feeling on the 2-3 times a day; apply a cotton pad soaked the medicine to the lesion in severe sprain of soft tissues or hemorrhage.

Precaution Be cautious about pregnant women and those with ethanol sensitivity.

Strength 72 g of the content per container containing 56 ml of drug liquid

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Shexiang Zhichuang Shuan (麝香痔疮栓)

Shexiang Zhichuang Suppositories

Ingredients Moschus; Margarita; Borneolum Syntheticum; Galamina; Radix et Rhizoma Notoginseng; Galla Chinensis; Calculus Bovis Artifactus; Extractum Belladonnae Liquidum.

Procedure Pulverize separately Moschus, Margarita, Borneolum Syntheticum, Galamina, Radix et Rhizoma Notoginseng and Galla Chinensis to fine powder. Mix Extractum Belladonnae Liquidum with a portion of Galamina fine powder, dry in oven, sift and mix well with the above fine powders. Heat a quantity of fatty glycerides to melt, mix at temperature of 42-45℃ with the above fine powder, stir well, pour into moulds and cool.

Description Grayish-yellow to brown bullet-shaped or torpedo-shaped suppositories; odour, aromatic.

Identification (1) To 5 suppositories, add 5 ml of water and 5 ml of 10% solution of sodium hydroxide, boil for 5 minutes, cool, stand and allow to precipitate, and take some precipitates for microscopical observation: Non-glandular hairs 1 to several-celled, some curved at the apex. Irregular fragments colourless or pale green, translucent, lustrous, sometimes fine and dense sinuose striations visible. Fragments of resin canal containing yellow secretions.

(2) To 3 suppositories, add 50 ml of 5% solution of sodium carbonate, warm on a water bath to melt, cool, allow to stand, and filter. Add dilute hydrochloric acid TS to adjust pH value to 1, extract by shaking with two 20-ml quantities of chloroform and combine the chloroform extracts. Evaporate the extract to dryness and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve cholic acid CRS and hyodeoxycholic acid CRS in ethanol to produce a mixture containing 1 mg each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of *n*-hexane, ethyl acetate, methanol and acetic acid (20 : 25 : 3 : 2) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air and spray with 10% phosphomolybdic acid in ethanol. Heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for suppositories (Appendix Ⅰ W).

Assay Carry out the method for gas chromatography (Appendix Ⅵ E)

Chromatography system and system suitability Use 10% macrogol 20000 (PEG-20 M) as the stationary phase, maintain the column temperature at 115℃, the number of theoretical plates of the column is not less than 1500, calculated with the reference to the peak of naphthalene.

Correction factor Dissolve a quantity of naphthalene, accurately weighed, in cyclohexane to prepare a solution containing 20 mg per ml as the internal standard solution. Weigh accurately 45 mg of borneol CRS and isobornol CRS in a 10 ml volumetric flask, add accurately 2 ml of the internal standard solution, dilute with cyclohexane to volume, inject accurately 1 μl into the column, and calculate the correction factor.

Procedure Chip the suppositories, obtained under the test of weight variation, into pieces, mix well, weigh accurately 1 g in a stopper conical flask, add accurately 2 ml of the internal solution and 10 ml of cyclohexane, shake well, stopper tightly, and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 10 minutes, cool to room temperature, weigh again, replenish the loss of weight with cyclohexane, shake well, centrifuge, and filter. Inject 1 μl of the successive filtrate into the column, calculated with reference to the total peaks areas of (±) borneol and (±) isoborneol.

It contains not less than 36.0 mg of Borneolum Syntheticum ($C_{10}H_{18}O$) per suppository.

Action To clear *heat* and relieve *toxicity*, reduce swelling and kill pain, and stop bleeding and regenerate tissues.

Indications Bright red blood in stools and burning pain of the anus due to excessive *heat* in the large intestine; all types of hemorrhoids and anal fissure with above symptoms.

Usage and dosage Put it into the anus in the early morning and before going to bed, or after bowel movements. 1 suppository, twice a day, or follow doctor's advice.

Precaution Be cautious about pregnant women.

Strength Equivalent to 0.33 g of crude drug per suppository

Storage Preserve in well closed containers, stored below 30℃.

Shidi Shui (十滴水)

Shidi Tincture

Ingredients Camphor 25 g; Rhizoma Zingiberis 25 g; Radix et Rhizoma Rhei 20 g; Fructus Foeniculi 10 g; Cortex Cinnamomi 10 g; Fructus Capsici 5 g; Oleum Eucalypti 12.5 ml.

Procedure Pulverize Rhizoma Zingiberis and other ingredients, except Camphor and Oleum Eucalypti, to coarse powder, and mix thoroughly. Carry out the method for percolation as described under extracts and liquid extracts (Appendix Ⅰ O), macerate with 70% ethanol for 24 hours, then begin to percolate. Collect about 750 ml of percolate, dissolve Camphor and Oleum Eucalypti in the percolate by stirring. Percolate again and collect the percolate to total 1000 ml, and mix well.

Description A brownish-red to dark-brown clear liquid, odour, slightly aromatic; taste, pungent.

Identification Evaporate 20 ml of the tincture to dryness, dissolve the residue in 20 ml of a mixture of 30% ethanol and

hydrochloric acid (10:1), heat under reflux for 1 hour on a water bath, and cool immediately. Extract with two 20-ml quantities of chloroform, combine the chloroform extracts, evaporate to dryness, dissolve the residue in 5 ml of a mixture of dehydrated ethanol and ethyl acetate (2:1) as the test solution. To 1 g of Radix et Rhizoma Rhei reference drug, add 30 ml of methanol, heat under reflux for 30 minutes on a water bath, filter, evaporate the filtrate to dryness, prepare a solution in the same manner as the reference drug solution. Dissolve emodin CRS and chrysophanol CRS in methanol to produce a mixture containing 0.5 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate, and formic acid (15∶5∶1) as the mobile phase. Apply separately 3 μl of each of the reference drug solution, the reference solution, and the test solution to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug and reference solutions; expose the plate to ammonia vapour, the spots turn to red.

Relative density 0.87-0.92 (Appendix Ⅶ A).

Ethanol content 60 per cent-70 per cent (Appendix Ⅸ M).

Total solid Measure accurately 10 ml of the supernatant to an evaporating dish, previously dried to constant weight, evaporate to dryness on a water bath. Dry at 105℃ for 3 hours, allow to cool in a desiccator for 30 minutes, weigh accurately and quickly. The residue is not less than 0.12 g.

Methanol content Comply to the method of Determination of Methanol (Appendix Ⅸ T).

Other requirements Comply to the general requirements for tincture (Appendix Ⅰ N).

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use modified polyethylene glycol (PEG-20M) (30 m long, 0.53 mm in internal diameter, 1 μm in film thickness) as the stationary phase, column temperature gradient: initial temperature at 65℃, increase the temperature at 6℃ per minute to 155℃. The number of theoretical plates of the column is not less than 12000, calculated with the reference to the peak of camphor.

Correction factor Weigh accurately a quantity of cyclohexanone, dissolve in 70% ethanol to produce a internal standard solution containing 10 mg per ml. Weigh accurately 20 mg of camphor CRS and 10 mg of cineole CRS to a same 10 ml volumetric flask, add accurately 1 ml of the internal standard solution, dilute to volume with 70% ethanol, and mix well. Inject accurately 1 μl of the solution into the column, and calculate the correction factor.

Procedure Measure accurately 1 ml of the tincture to a 10 ml volumetric flask, add accurately 1 ml of the internal standard solution, dilute to volume with 70% ethanol, and mix well. Inject accurately 1-2 μl of the solution into the column and calculate the content.
It contains not less than 20.0 mg of camphor ($C_{10}H_{16}O$) and 6.3 mg of cineole ($C_{10}H_{18}O$) per ml.

Action To invigorate the stomach and expel summer-heat.

Indications Dizziness, nausea, abdominal pain and discomfort in the stomach and intestines in heat-stroke.

Usage and dosage 2-5 ml, appropriately reduction of the dosage for children.

Precaution Contraindicated for pregnant women and be cautious about pilots or those engaged in aerial work.

Storage Preserve in tightly closed containers, and protected from light.

Shidishui Ruanjiaonang (十滴水软胶囊)

Shidishui Soft Capsules

Ingredients Camphora 62.5 g; Rhizoma Zingiberis 62.5 g; Radix et Rhizoma Rhei 50 g; Fructus Foeniculi 25 g; Cortex Cinnamomi 25 g; Fructus Capsici 12.5 g; Oleum Eucalypti 31.25 ml.

Procedure Distil volatile oil from Rhizoma Zingiberis, Fructus Foeniculi and Cortex Cinnamomi. Macerate the drug residue of distillation and the coarse powder of Radix et Rhizoma Rhei and Fructus Capsici in 80% ethanol for 24 hours, carry out the percolation method (Appendix Ⅰ O) described under Liquid Extractives and Extractives, and percolate with 70% ethanol. Collect the percolation solution, recover ethanol and concentrate to a thin extract with a relative density of 1.30 (at 50℃), dry in vacuum, pulverize, add a quantity of vegetable oil, the above volatile oil, Camphora and Oleum Eucalypti, mix thoroughly and make to 1000 soft capsules.

Description Brown soft capsules containing a yellow oily liquid with a small amount of solid extractives; odour, fragrant; taste, pungent.

Identification (1) Extract the content of 2 capsules by shaking with two 5-ml quantities of methanol, combine the extracts and evaporate to dryness. Dissolve the residue with 10 ml of water, and add 1 ml of hydrochloric acid. Heat on a water bath for 1 hour, cool, extract with two 20-ml quantities of ethyl acetate, combine the extracts, concentrate to about 1 ml as the test solution. Prepare a solution with 0.1 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15∶5∶1) as the mobile phase. Apply separately 5 μl of the test solution, 2 μl or 4 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(2) To the contents of 2 capsules, add 2 ml of methanol, extract by shaking, and allow to stand, use the supernatant as the test solution. Dissolve cinnamaldehyde CRS in ethanol to produce a solution containing 1 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum (60-90℃) and ethyl acetate (17∶3) as the mobile phase. Apply separately 4 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with alcoholic dinitrophenylhydrazine TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Use the test solution obtained under Assay as the test solution. Dissolve cineole CRS in dehydrated ethanol to

produce a solution containing 2.4 μl per ml as the reference solution. Carry out the method for gas chromatography (Appendix Ⅵ E), using 10% polyethylene glycol 20000 as the stationary phase, maintain column temperature at 150℃. Inject separately 0.2-0.4 μl of each of the test solution and the reference solution into the column. The retention time of the peak in the chromatograph obtained with the test solution corresponds to that in the chromatograph obtained with the reference solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use 10% Polyethylene glycol 20000 as the stationary phase, and maintain column temperature at 150℃. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of camphor. The value of resolution factor between the peaks of camphor and the internal standard substance is not less than 2.

Correlation factor Weigh accurately 50 mg of camphor CRS and 50 mg of menthol (internal standard substance), dissolve with dehydrated ethanol in a 10 ml volumetric flask, and dilute to volume, and mix well. Inject accurately 1-2 μl of the solution into the column, and calculate.

Procedure Weigh accurately 0.8 g of the content, obtained under the test of weight variation. Extract with five 4-ml quantities of dehydrated ethanol, separate the extract, combine and transfer to a 25 ml volumetric flask, add accurately 125 mg of menthol, dissolve, dilute with dehydrated ethanol to volume, and mix well as the test solution. Inject 1-2 μl into the column, and calculate.
It contains not less than 53 mg of camphor ($C_{10}H_{16}O$) per capsule.

Action To invigorate the stomach and dispel summer-heat.

Indications Dizziness, nausea, abdominal pain and discomfort in the stomach and intestines in heat-stroke.

Usage and Dosage 1-2 capsules; appropriate dosage for children.

Precaution Contraindicated for pregnant women.

Strength 0.425 g per capsule

Storage Preserve in a dry and cool place.

Shi'erwei Yishou San (十二味翼首散)

Shi'erwei Yishou Powder

Shi'erwei Yishou Powder is a prescription used by Tibetan Nationality.

Ingredients Herba Pterocephali 100 g; Herba Aconiti 75 g; Herba Hypecoi 75 g; Concretio Silicea Bambusae 75 g; Flos Carthami 60 g; Lignum Santali Abli 50 g; Benzoinum 25 g; Herba Oxytropidis 50 g; Folium Aconiti Szechenyiani 40 g; Extractum Faeces Trogopterori 50 g; Calculus Bovis 0.5 g; Moschus 0.5 g.

Procedure Pulverize the above ingredients, except Calculus Bovis and Moschus, to fine powder and sift. Triturate Calculus Bovis and Moschus with the above fine powder, sift and mix well.

Description A greyish-brown powder; odour, aromatic; taste, bitter and numb.

Identification (1) Microscopical: Unicellular non-glandular hairs colourless; glandular hairs with 2-4-celled head and 1-celled stalk. Scalariform vessels frequently observed, 16-32 μm in diameter, with narrow scalariform pits. Prisms of calcium oxalate relatively numerous, about 32-40 μm in diameter. Irregular fragments colourless, transparent, with straight ledges and angle, dissolved in chloral hydrate TS. Pollen grains rounded or elliptical, up to 60 μm in diameter, extine with thorns and 3 germinal apertures. Wood fibre bundles pale yellow, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres, walls of crystal cells thickened and lignified, with well-defined striations. Resin crystals nonfixiform, reddish-brown, translucent, distinctly acuted. Stone cells separated, elongated, about 70 μm long and 8-14 μm in diameter, walls thickened, with few single pits. Leaf epidermal cells elongated polygonal or irregular, with wavy anticlinal walls; stomata numerous, oblong or subrounded, anisocytic type, with 3-4 subsidiary cells. Cells often in groups, elliptical or half round, pale yellow, with very thickened walls and distinct lumen. Irregular masses yellowish-brown or brownish-red, congregated by many small granules.
(2) To 5 g add 10 ml of methanol, shake, macerate overnight, filter and use the filtrate as the test solution. Prepare a solution with Herba Hypecoe Leptocarpe reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform and methanol (1∶7∶3) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with the modified potassium iodobismuthate TS. The brown spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Action To remove toxic *heat*.

Indications Influenza, dysentery, febrile diseases.

Usage and dosage 1 g, twice a day.

Precaution Contraindicated in pregnancy.

Storage Preserve in tightly closed containers.

Shihu Yeguang Wan (石斛夜光丸)

Shihu Yeguang Pills

Ingredients Herba Dendrobii 30 g; Radix et Rhizoma Ginseng 120 g; Rhizoma Dioscoreae 45 g; Poria 120 g; Radix et Rhizoma Glycyrrhizae 30 g; Herba Cistanches 30 g; Fructus Lycii 45 g; Semen Cuscutae 45 g; Radix Rehmanniae 60 g; Radix Rehmanniae Praeparata 60 g; Fructus Schisandrae Chinensis 30 g; Radix Asparagi 120 g; Radix Ophiopogonis 60 g; Semen Armeniacae Amarum 45 g; Radix Saposhnikoviae 30 g; Rhizoma Chuanxiong 30 g; Fructus Aurantii (stir-baked) 30 g; Rhizoma Coptidis 30 g; Radix Achyranthis Bidentatae 45 g; Flos Chrysanthemi 45 g; Fructus Tribuli (stir-baked with salt) 30 g; Semen Celosiae 30 g; Semen Cassiae 45 g; Pulvis Cornus Bubali Concentratus 60 g; Cornu Saigae Tataricae 30 g.

Procedure File and triturate Cornu Saigae Tataricae to fine powder. Pulverize the other ingredients, except Pulvis

Cornus Bubali Concentratus, to fine powder. Triturate Pulvis Cornus Bubali Concentratus with the above powders, sift and mix thoroughly. To each 100 g of the powder add 35-50 g of refined honey and a quantity of water to make pills and dry; or add 100-120 g of refined honey to make small honeyed pills or big honeyed pills.

Description Brown water-honeyed pills, brownish-black small honeyed pills or big honeyed pills; taste, sweet but with bitter sensation.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate solution; hyphae colourless or pale brown, 4-6 μm in diameter. Subrounded cells surrounding fibres surface, containing small rounded silica bodies, arranged in rows. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Fibre bundles bright yellow, with slightly thickened and distinctly pitted walls. Stone cells of testa pale yellow with sinuous walls, sometimes containing brown contents. Stone cells of epidermis of testa pale yellowish-brown, polygonal in surface view, with thickened walls showing fine and dense pit-canals, lumina containing dark brown contents. Stone cells rectangular or slat-shaped, 50-110 μm in diameter, with fine and dense pits. Stone cells orange-yellow, conchoidal, with thickened walls, showing distinct pits on the broader side. Raphides of calcium oxalate 80-240 μm long, occurring in mucilage cells, needles 2-8 μm in diameter. Prisms of calcium oxalate abundant in parenchyma. Cells of testa dark reddish-brown, polygonal or elongated polygonal in surface view, with reticulate striations. Palisade cells of testa arranged in a row, the cells beneath containing clusters and prisms of calcium oxalate. Pollen grains subrounded, 24-34 μm in diameter, extine with spinules of 3-5 μm long, and 3 germinal apertures. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken and each containing a nucleus-like mass. Vitae containing golden yellow secretion about 30 μm in diameter. Irregular fragments somewhat lustrous, with evenly distributed slit-shaped or rounded pits.

(2) Cut 9 g of the small or the big honeyed pills into pieces, or pulverize 6 g of the water-honeyed pills to powder, add 50 ml of methanol, heat under reflux on a water bath for 1 hour, cool, filter, and use the filtrate as the test solution. To 0.4 g of Rhizoma Coptidis reference drug add 20 ml of methanol, heat under reflux on a water bath for 1 hour, filter, and use the filtrate as the reference drug solution. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia TS (12∶6∶3∶3∶1) as the mobile phase. Apply separately 5 μl of the test solution and 1 μl of each of the reference drug solution and the reference solution to the plate. After developing the plate in a chamber pre-equilibrated with ammonia vapour, remove the plate, and allow to dry in air. Examine under the ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution, and the yellow fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained from the reference solution.

(3) To 1 g of Rhizoma Chuanxiong reference drug add 10 ml of petroleum ether (60-90℃), macerate for 30 minutes, filter, and use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (17∶3) as the mobile phase. Apply separately 10 μl of the test solution obtained under Identification test (2) and 5 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Grind well or cut into pieces 6 g of water honeyed pills, or 9 g of honeyed pills, to a conical flask, add 30 ml of ether. Ultrasonicate for 10 minutes, discard the ether solution. Add 50 ml of *n*-butanol saturated with water to the residue, ultrasonicate for 30 minutes, and filter, wash the filtrate with two 15-ml quantities of 0.5% sodium hydroxide, and wash again with water saturated with *n*-butanol to pH 7. Evaporate the *n*-butanol extracts to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve ginsenoside Rg_1 CRS and ginsenoside Re CRS in methanol to produce two solutions each containing 1 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the layer of lower a mixture of chloroform, methanol, and water (13∶7∶2, after standing below 10℃) as the mobile phase. Apply separately 10 μl the test solution and 6 μl of each of the above two reference solutions to the plate, after developing and removal of the plate, dry in air, and spray with a 10% sulfuric acid in ethanol, and heat at 105℃ to spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

(5) Grind well or cut into pieces 6 g of water-honeyed pills or 9 g of honeyed pills, to a conical flask, add 40 ml of *n*-butanol saturated with water. Ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness. Dissolve the residue in 30 ml of water, and add 3 ml of hydrochloric acid, heat under reflux for 1 hour, cool. Extract with two 20-ml quantities of chloroform, combine chloroform extracts, and evaporate to dryness, dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 1 g of Radix Ophiopogonis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and acetone (4∶1) as the mobile phase. Apply separately 10 μl of each of above solutions to the plate, after developing and removal of the plate, dry in air, and spray with a 10% sulfuric acid in ethanol, and heat at 105℃ to spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

***n*-Butanol Extractives** Triturate or cut into pieces 6 g of water-honeyed pills, or 9 g of honeyed pills, weigh accurately, add accurately the same quantity of kieselguhr, grind to mix well. Weigh accurately 4 g of the mixture to a stopper conical flask, add 50 ml of *n*-butanol saturated with water, weigh, and allow to stand over night. Ultrasonicate for 30 minutes, weigh again, replenish the lost weight with *n*-butanol saturated with water, stir well, and filter. Measure accurately 25 ml of successive filtrate in a evaporating dish, dried to constant weight, evaporate to dryness on a water bath and then dry at 105℃ for 3 hours, move to a desiccator, allow to cool for 30 minutes, weigh accurately immediately, and calculate.

It contains not less than 8.0 per cent *n*-butanol extractives of

water-honeyed pills and 5.5 per cent of big or small honeyed pills.

Action To nourish *kidney-yin* and clear the liver to improve vision.

Indications Cataract with impaired vision, or dim-sightedness due to deficiency in the liver and the kidney and hyperactivity of *fire* from insufficient *yin*.

Usage and dosage 6 g of water-honeyed pills, 9 g of small honeyed pills or 1 honeyed pill, twice a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Shiliuwei Dongqing Wan (十六味冬青丸)

Shiliuwei Dongqing Pills

Shiliuwei Dongqing Pills are prescription used by Mongolian Nationality.

Ingredients Folium Ilicis Chinensis 150 g; Fructus Punicae Granati 25 g; Gypsum Fibrosum 75 g; Cortex Cinnamomi 50 g; Fructus Amomi Rotundus 50 g; Radix Aucklandiae 50 g; Flos Caryophylli 50 g; Radix et Rhizoma Glycyrrhizae 50 g; Fructus Vitis Viniferae 125 g; Lignum Aquilariae Resinatum 75 g; Rhizoma Bistortae 75 g; Fructus Piperis Longi 50 g; Semen Myristicae 50 g; Flos Carthami 50 g; Fructus Choeros-pondiatis 50 g; Eriocheir seu Potamon 50 g.

Procedure Pulverize the above ingredients, except Fructus Vitis Viniferae, to coarse powder. Triturate Fructus Vitis Viniferae with the above coarse powder, dry by heating and then pulverize to fine powder, sift and mix thoroughly. To each 100 g of the powder add 110-130 g of refined honey to make big honeyed pills.

Description Brown big honeyed pills; odour, slightly aromatic; taste, sweet, pungent, slightly bitter and astringent.

Identification (1) Microscopical: Head of glandular scales subrounded, composed of tens of cells, in radial arrangement, 40-80 μm in diameter, brownish-yellow, often broken into fan-shape. Stone cells colourless, elliptical subrounded, or , walls relatively thickened, with distinct striations and fine pit-canals. Fibres separated, long fusiform, 24-50 μm in diameter, walls thickened and lignified. Sclerenchymatous cells of endopleura yellowish-brown or brownish-red, subpolygonal in surface view, walls thickened, lumina containing silica bodies. Pollen grains triangular, 16 μm in diameter. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Walls of fibre-tracheids slightly thickened, with bordered pits, pit apertures V-like or crossed. Clusters of calcium oxalate about 40 μm in diameter. Pollen grains globular or elliptical, about 60 μm in diameter, with thorns on extine, and 3 germinal apertures. Fibres of carpodermis pale yellow, usually twisted, lumina narrow, containing fine brownish-yellow granules. Irregular flat crystals colourless, with straight striations.

(2) Pulverise 5 g of the pills, add 20 ml of ether, shake for 15 minutes, filter and evaporate the filtrate to about 2 ml as the test solution. Prepare a solution of 0.2 g of Radix Aucklandiae reference drug and 10 ml of ether in the same manner as the reference drug solution. Dissolve eugenol CRS in ether to prepare a solution containing 1 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, benzene and acetone (3∶3∶0.2) as the mobile phase. Apply separately 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 1% vanillin in sulfuric acid. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution; heat at 105℃ for 5 minutes, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) To 6 g of big honeyed pills, cut into pieces, place to a stopper conical flask. Add 10 ml of ethanol, macerate for 20 minutes, shake momently, filter, and use the filtrate as the test solution. Dissolve cinnamaldehyde CRS in ethanol to produce a solution containing 1 μg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (17∶3) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, and spray with alcoholic dinitrophenylhydrazine TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use 10% polyethylene glycol (PEG)-20 M as the stationary phase and maintain the column temperature at 190℃, inject inlet temperature at 220℃, and detector at 250℃. The number of theoretical plates of the column is not less than 1000, calculated with the reference of the peak of eugenol.

Reference solution Weigh accurately a quantity of eugenol CRS, dissolve in *n*-hexane to produce a solution containing 2 mg per ml.

Test solution With the pills obtained under the test of weight variation, cut into pieces, weigh accurately 0.5 g to a 1000 ml ground-bottom flask, add 300 ml of water, and few glass balls, connect to an apparatus for the determination of volatile oil. Add water through the top of the apparatus until the graduated tube is filled and overflows to the flask, then add 2 ml of *n*-hhexane and connect to the reflux condenser. Heat under reflux and keep boiling for 5 hours, cool, separate *n*-hexane layer, and wash the apparantus with three 2-ml quantities of *n*-hexane, combine *n*-hexane extract and transfer to a 10 ml volumetric flask, dilute with *n*-hexane to volume, mix well as the test solution.

Procedure Inject accurately 1 μl of the test solution into the column and calculate the contents.

It contains not less than 12 mg of eugenol ($C_{10}H_{12}O_2$) per pill, referred to Flos Carthami.

Action To relieve chest stuffiness, cough and asthma.

Indications Chest stuffiness, abdominal distension, dizziness, edema, cough due to cold and dyspmea caused by phlegm.

Usage and dosage 1 pill, 1-2 times a day.

Strength 6 g per pill

Storage Preserve in tightly closed containers.

Shiquan Dabu Wan
(十全大补丸)

Shiquan Dabu Pills

Ingredients Radix Codonopsis 80 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 80 g; Poria 80 g; Radix et Rhizoma Glycyrrhizae praeparata Cum Melle 40 g; Radix Angelicae Sinensis 120 g; Rhizoma Chuanxiong 40 g; Radix Paeoniae Alba (processed with wine) 80 g; Radix Rehmanniae praeparata 120 g; Radix Astragali praeparata Cum Melle 80 g; Cortex Cinnamomi 20 g.

Procedure Pulverize the above ten ingredients to fine powder, sift and mix thoroughly. To each 100 g of the powder add 30-50 g of refined honey and a quantity of water to make water-honeyed pills and dry; or add 100-120 g of refined honey to make big honeyed pills.

Description Brown to blackish-brown water-honeyed pills or big honeyed pills; odour, aromatic; taste, sweet and slightly pungent.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Anastomosing laticiferous tubes 12-15 μm in diameter, containing minute granular contents. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Fibres in bundles or scattered, with thickened walls, longitudinal fissures on surface, and two ends broken to broom-shape or truncate. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells. Clusters of calcium oxalate 18-32 μm in diameter, scattered in parenchymatous cells, often in rows, or several in a cell. Parenchymatous cells fusiform, with slightly thickened walls, and very fine obliquit crisscross striations. Stone cells subrounded or subrectangular, 32-88 μm in diameter with unevenly thickened walls, thin on one side. Spiral vessels 14-50 μm in diameter, with thickened walls connected each other, like reticular-spiral vessels.

(2) Triturate 18 g, with 10 g of kieselguhr, add 80 ml of ethanol, ultrasonicate for 20 minutes and filter. Evaporate one half of the filtrate to dryness, dissolve the residue in 20 ml of water, extract with three 20-ml quantities of *n*-butanol saturated with water. Combine the extracts, wash with three 15-ml quantities of water, discard the washings, and evaporate the extract to dryness. Dissolve the residue in 2 ml of ethanol as the test solution. Dissolve paeoniflorin CRS in ethanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40∶5∶10∶0.2) as the mobile phase. Apply separately 5-10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulfuric acid and heat to spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Use the ethanol filtrate obtained under Identifiction (2) as the test solution. Prepare a soluiton of 1 g of Radix Angelicae Sinensis reference drug and 10 ml of ethanol in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9∶1) as the mobile phase. Apply separately 5-10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The bright bluish-white fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Triturate or cut into pieces 18 g of water-honeyed pills or big honeyed pills, add a quantity of kieselguhr, grind to mix well, place to a stopper conical flask. Add 80 ml of ether, ultrasonicate for 15 minutes, discard ether solution, and evaporate the residue to dryness. Add 80 ml of methanol, and ultrasonicate for 30 minutes, filter. Evaporate the filtrate to dryness, and dissolve the residue in 20 ml of water, extract with three 20-ml quantities of *n*-butanol saturated with water, combine *n*-butanol solution and extract with two 50-ml quantities of ammonia TS saturated with *n*-butanol, and wash again with 20 ml of water. Evaporate the *n*-butanol solution to dryness, dissolve the residue in 25 ml of water, and apply to a column packed with D-101 macroporous resin (1.5 cm in internal diameter, 13 cm in height) and elute separately with 50 ml of water and 40 ml of 40% ethanol, discard the eluate, then elute with 80 ml of 70% ethanol, and collect the eluate. Evaporate the eluate on a water bath to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve Astragaloside Ⅳ CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of the mixture of chloroform, ethyl acetate, methanol and water (15∶40∶22∶10, standing below 10℃) as the mobile phase. Apply separately 3-8 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, and spray with a 10% sulfuric acid in ethanol, and heat at 105℃ to spots clear. Examine under daylight and ultraviolet light at 365 nm separately. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution, and same fluorescent spot under ultraviolet light.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of acetonitrile and water (17∶83) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of paeoniflorin.

Reference solution Weigh accurately a quantity of paeoniflorin CRS, dissolve in dilute ethanol TS to produce a solution containing 40 μg per ml.

Test solution Triturate water-honeyed pills to powder or cut big honeyed pills, obtained under the test of weight variation, into pieces, weigh accurately 1 g of the powder or pieces in a stopper conical flask, add accurately 25 ml of dilute ethanol TS, closely stopper and weigh. Ultrasonicate for 1 hour (power, 250 W; frequency, 30 kHz), cool, weigh again, replenish the lost weight with dilute ethanol TS, mix well and centrifuge. Use the successive filtrate of the supernatant as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column respectively and calculate the content.
It contains not less than 0.55 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per gram of small water-honeyed pills, and 3.6 mg per pill of big honeyed pills, referred to Radix Paeoniae Alba.

Action To reinforce *qi* and blood with herbal medicines warm in property.

Indications Pallor, shortness of breath, palpitation, dizziness, spontaneous sweating, lassitude and cold extremities, or profuse menstrual blood in periods due to a deficiency of *qi* and blood.

Usage and dosage 6 g of water-honeyed pills or 1 big honeyed pill, 2-3 times a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Shisanwei Bangga San
(十三味榜嘎散)

Shisanwei Bangga Powder

Shisanwei Bangga Powder is a prescription used by Tibetan Nationality.

Ingredients Herba Aconiti 60 g; Semen Herpetospermi Caudigeri 30 g; Flos Gentianae Straminiae 40 g; Herba Swertiae Bimaculatae 40 g; Baxiaga 40 g; Herba Ixeris Chinensis 40 g; Herba Lagotidis 40 g; Cortex Berberidis 40 g; Herba Hypecoe Leptocarpe 40 g; Herba Chrysosplenii 30 g; Calculus Bovis 3 g; Flos Carthami 20 g; Semen Holarrhenae 30 g.

Procedure Pulverize the above ingredients, except Calculus Bovis, to fine powder, sift. Triturate Calculus Bovis and mix thoroughly with the above power, sift and mix well.

Description A green powder; odour, slight aromatic; taste, bitter.

Identification (1) Microscopical: Scalariform vessels often observed, 16-32 μm in diameter, with narrow scalariform pits. Stone cells large, irregularly shaped, about 120 μm long and 23-76 μm in diameter, walls thickened, with distinct striations and faint pit-canals, Pollen grains subspherical in polar view and oblated spherical in equatorial view, with 3 germinal apertures and indistinct sculptured on surface, 36 μm in diameter. Woody fibres in bundles or scattered singly, walls beaded, with oblique pits, about 148 μm long and 18-22 μm in diameter. Leaf epidermal cells irregularly shaped, anticlinal walls straighten or twisted, stomata anomocytic, with 4-5 subsidiary cells. Unicellular non-glandular hairs numerous, scattered or several assembled together, mostly broken; cells branched, about 260 μm long and 10 μm in diameter, with thin walls. Fibrous cells long slat-shaped or long spindle-shaped, about 120 μm long, pits and pit-canals indistinct. Phloem fibres pale yellow, often in bundles and occasionally scattered, long fusiform, straight, 14-20 μm in diameter, walls lignified. Prisms of calcium oxalate relatively numerous, 32-40 μm in diameter. Endodermis cells scarcely observed, with distinct Casparian's thickness. Irregularly masses cloud-like, yellowish-brown or brownish-red, composed of many grains. Pollen grains subspherical or elliptical, about 60 μm in diameter, with thorns, and 3 germinal apertures. Testa epidermal cells yellowish brown, fluff-like projected or short unicellular non-granular hairs-like, with rounded blunt ends and relatively thickened walls, and in various length.

(2) To 5 g add 10 ml of methanol, shake, macerate overnight, filter and use the filtrate as the test solution. Prepare a solution with Herba Swertiae Bimaculatae reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ether, ethyl acetate and methanol (1∶5∶2) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 1% aluminium chloride in ethanol, and dry. Examine under ultraviolet light at 365 nm. The green fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(3) Prepare a solution of 1 g of Cortex Berberis reference drug in the same manner as described under Identification test (2) as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, formic acid and water (1∶1∶1) as the mobile phase. Apply separately 5 μl of each of the test solution obtained under Identification (2) and above reference drug solution to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(4) Prepare two solutions of 1 g of each of Herba Hypecoe Leptocarpe reference drug and Semen Holarrhenae reference drug as the reference drug solutions in the same manner as described under Identification (2) as the reference drug solution. Carry out the method for thin-layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform and diethylamine (8∶1∶1) as the mobile phase. Apply separately 5 μl of each of the test solution obtained under Identification (2) and the reference drug solutions to the plate. After developing and removal of the plate, dry in air, spray with the modified potassium iodobismuthate TS. The brown spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solutions.

Other requirements Complies with the general requirements for powders (Appendix Ⅰ B).

Action To remove *heat* from the liver and clear jaundice.

Indications Icteric hepatitis, cholecystitis.

Usage and dosage 1-1.5 g, twice a day.

Storage Preserve in well closed containers, protected from moisture.

Shiwuwei Chenxiang Wan
(十五味沉香丸)

Shiwuwei Chenxiang Pills

Shiwuwei Chenxiang Pills are prescription used by Tibetan Nationality.

Ingredients Lignum Aquilariaę Resinatum 100 g; Radix Inulae Racfmosae 150 g; Lignum Santali Albi 50 g; Lignum Pterocarpi Santalini 150 g; Flos Carthami 100 g; Semen Myristicae 25 g; Herba Pegaeophyti 150 g; Caulis Rubi (barked and pithed) 200 g; Caulis Polygoni Aubertii (barked) 100 g; Rhizoma zingiberis 50 g; Calx Pulveratum

100 g; Fructus Choerospondiatis 50 g; Fructus Chebulae (cored) 80 g; Fructus Terminaliae Billericae (cored) 80 g; Fructus Phyllanthi 100 g.

Procedure Pulverize the above fifteen ingredients to fine powder, sift and mix well. Make pills with water and dry.

Description Yellowish-brown, brownish-red to brown watered pills; odour, aromatic; taste, bitter.

Identification (1) Microscopical: Bordered pitted vessels with closely arranged pits, containing pale yellow or yellowish-brown resin masses. Wood fibres in bundles, pale yellow, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres, walls of crystal cells thickened and lignified, with distinct striations. Wood ray cells subrounded or subtriangular in tangential sectional view, walls slightly thickened and lignified, with distinct pit-canals, lumina containing prisms of calcium oxalate. Pollen grains rounded or ellipsoidal, up to 60 μm in diameter, extine with spinules and 3 germinal apertures. Fatty oil drops gradually forming clustered needle crystals on heating in chloral hydrate TS. Double spiral vessels 10-26 μm in diameter. Fibres mostly broken, thick-walled, with fissures, faint pits and pit-canals. Sclerenchymatous cells subsquare or subrounded, walls unevenly thickened and lignified, with inconspicuous striations, lumina containing prisms of calcium oxalate. Starch granules single, long-ovoid, broadly ovoid, or irregularly shaped 25-32 μm in diameter, hilum pointed, at the narrow end, striations well-defined. Crystals of calcium carbonate short clavate or columned, 2-4 μm in diameter, up to 65 μm long. Epidermal cells of pericarp in groups, subrounded or subpolygonal in surface view, lumina containing granular contents. Lignified cells rectangular, containing clusters of calcium oxalate, walls lignified, with oblique slit-like pits. Non-glandular hairs 1-2-celled, 7-20 μm in diameter, some cells containing yellow or yellowish-brown contents. Parenchymatous cells subrounded or subpolygonal, containing prisms, rounded clusters or sand crystal of calcium oxalate.

(2) To 0.5 g, in powder, add 10 ml of water, warm slightly and filter. The filtrate releases the characteristic odour of Lignum Santali Albi on heating. Cool the filtrate, add 1 drop of ferric chloride TS; a bluish-black colour is produced, which disappears on adding a drop of sulfuric acid.

(3) To 0.5 g, in powder, add 5 ml of 0.1% solution of potassium hydroxide, boil, cool, add 5 ml of water and filter. Acidified the filtrate slightly with dilute hydrochloric acid TS, add 5 ml of ether and shake. Separate the ether solution, add 5 drops of ammonia TS, a brownish-red colour is produced immediately.

(4) Moister 3 g, in fine powder, with strong ammonia TS. Add 10 ml of ether, stopper well, shake, stand for 12 hours, filter, and evaporate the filtrate to 1 ml as the test solution. Prepare a solution of 2 g of Radix Inulae Racfmosae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of cyclohexane and ethyl acetate (3:1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. and spray with a dilute potassium iodobismuthate TS. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To regulate the flow of *qi* and blood, relieve cough, and induce tranquilization.

Indications Stagnation of *qi* and blood marked by chest pain; dry cough with shortness of breath; insomnia.

Usage and dosage 3-4 pills, twice a day.

Precaution Be cautious about the patients with kidney disease.

Specification 0.5 g per pill.

Storage Preserve in well closed containers, protected from moisture.

Shixiang Fansheng Wan
(十香返生丸)

Shixiang Fansheng Pills

Ingredients Lignum Aquilariae Resinatum 30 g; Flos Caryophylli 30 g; Lignum Santali Albi 30 g; Radix Aristolochiae 30 g; Rhizoma Cyperi (processed with vinegar) 30 g; Lignum Dalbergiae Odoriferae 30 g; Herba Pogostemonis 30 g; Olibanum (processed with vinegar) 30 g; Rhizoma Gastrodiae 30 g; Bombyx Batryticatus (stir-baked with bran) 30 g; Radix Curcumae 30 g; Plumula Nelumbinis 30 g; Semen Trichosanthis (stir-baked with honey) 30 g; Lapis Micae Aureus (calcined) 30 g; Fructus Chebulae (cored) 30 g; Radix et Rhizoma Glycyrrhizae 60 g; Styrax 30 g; Benzoinum 30 g; Moschus 15 g; Borneolum Syntheticum 7.5 g; Cinnabaris 30 g; Succinum 30 g; Calculus Bovis 15 g.

Procedure Levigate Cinnabaris to very fine powder, pulverize separately Succinum, Benzoinum, Moschus, Borneolum Syntheticum and Calculus Bovis to fine powder. Stew Styrax to melt and filter. Pulverize the other sixteen ingredients to fine powder, sift, mix thoroughly, and triturate with the above six powders, sift and mix thoroughly. To each 100 g of the powder add 90-100 g of refined honey and Styrax to make big honeyed pills.

Description Dark brown big honeyed pills; odour, aromatic; taste, sweet and bitter.

Identification (1) Microscopical: embedded with minute prisms of calcium oxalate. Needle crystals of calcium oxalate in bundles or scattered, 25-75 μm long. Fragments of tissue containing gelatinized polysaccharides stained brown or light brown-violet on adding iodine TS.

(2) To 6 g, cut into pieces, add 10 ml of ether, shake for 15 minutes, filter, and use the filtrate as the test solution. Prepare a solution of 0.15 g of Styrax reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (30-60℃), *n*-hexane, ethyl formate and formic acid (10:30:15:1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing at 11-13℃ and removal of the plate, dry in air, examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) To 10 g, cut into pieces, add 50 ml of ethanol and heat under reflux for 1 hour. Cool, filter and use the filtrate as the test solution. Dissolve cholic acid CRS in ethanol to produce a solution containing 0.2 mg per ml as the reference solution. Carry out the method for thin layer

chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of chloroform, ether and glacial acetic acid (2∶2∶1) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 10% phosphomolybdic acid in ethanol and heat at 105℃ for 10 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) To 12 g of big honeyed pills, cut into pieces, carry out the method for determination of volatile oil (Appendix X D). Add 1 ml of *n*-hexane, heat and keep boiling for 3 hour, allow stand for 30 minutes, then add some of anhydrous sodium sulphate. Use the supernatant as the test solution. Dissolve a quantity of the mixture of (±)-borneol and (±)-isoborneol CRS in *n*-hexane to produce a solution containing 2.5 mg per ml as the reference solution. Carry out the method for gas chromatography (Appendix VI E). Use a 2 m long column packed with 10% phenyl OV-17 as the stationary phase. Maintain the column temperature at 150℃. Inject a quantity volume of the test solution and the reference solution respectively to the column, the retention time of the peaks obtained with the test solution and the reference solution corresponds with each other.

Other requirements Comply with the general requirements for pills (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol, water, and phosphoric acid (65∶35∶0.05) as the mobile phase. As detector a spectrophotometer set at 203 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of eugenol.

Reference solution Weigh accurately 10 mg of eugenol CRS to a 50 ml of volumetric flask, dissolve in methanol to volume, and mix well. Measure accurately 2 ml of the solution, transfer to a 50 ml of volumetric flask, dilute with methanol to volume, and mix well, to produce a solution containing eugenol 8 μg per ml.

Test solution Cut into pieces some of big honeyed pills obtained under the test of weight variation, weigh accurately 0.5 g in a stopper conical flask, add accurately 50 ml of methanol, closely stopper and weigh. Ultrasonicate for 30 minutes (power, 100 W; frequency, 40 kHz), cool, weigh again, replenish the lost weight with methanol, mix well and filter. Measure accurately 2 ml of the successive filtrate, transfer to a 5 ml of volumetric flask, dilute with methanol to volume, mix well and filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column respectively and calculate the content.

It contains not less than 13 mg of eugenol ($C_{10}H_{12}O_2$) per pill, referred to Flos Carthami.

Action To resuscitate and resolve *phlegm*, and tranquilize and anchor the *mind*.

Indications Aphasia, coma, excessive phlegm and lockjaw in stroke due to *phlegm* misting the *heart*.

Usage and dosage 1 pill, twice a day, or follow doctor's advice.

Precaution Contraindicated for pregnant women.

Strength 6 g per pill

Storage Preserve in tightly closed containers.

Shixiang Zhitong Wan (十香止痛丸)

Shixiang Zhitong Pills

Ingredients Rhizoma Cyperi (stir-baked with vinegar) 160 g; Radix Linderae 80 g; Lignum Santali Albi 40 g; Rhizoma Corydalis (Stir-baked with vinegar) 80 g; Fructus Citri 80 g; Pollen Typhae 40 g; Lignum Aquilariae Resinatum 10 g; Cortex Magnoliae Officinalis (stir-baked with ginger juice) 80 g; Herba Lysimachiae Foenum-graeci 80 g; Lignum Dalbergiae Odoriferae 40 g; Flos Caryophylli 10 g; Faeces Trogopterori (stir-baked with vinegar) 80 g; Radix Aucklandiae 40 g; Rhizoma et Radix Anisochili 10 g; Fructus Amomi 10 g; Myrrha (stir-baked with vinegar) 40 g; Rhizoma Alpiniae Officinarum 6 g; Radix et Rhizoma Rhei (prepared) 80 g.

Procedure Pulverize the above 18 ingredients to fine powder, sift and mix thoroughly. To each 100 g of the powder add 140-160 g of refined honey to make big honeyed pills.

Description Dark brown big honeyed pills; odour, aromatic; taste, slightly bitter.

Identification (1) Microscopical: Secretory cells subrounded, containing pale yellowish-brown to redish-brown secretions, surrounding cells arranged radially. Crystal cells square or rectangular, walls thickened, lignified and with distinct striations; lumina containing prisms of calcium oxalate. Pollen grains yellow, subrounded or elliptical, about 30 μm in diameter, with reticulated sculptures. Stone cells branched, walls thickened and with distinct striations. Clusters of calcium oxalate large, 60-140 μm in diameter.

(2) Grind 9 g of the pills, cut into pieces, with 5 g of kieselguhr, add 40 ml of ether, heat under reflux for 30 minutes, and filter. Evaporate the filtrate to dryness and dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve α-cyperone CRS in ethyl acetate to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel GF_{254} mixed with sodium carboxymethylcellulose as the coating substance and a mixture of toluene and ethyl acetate (9∶1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Grind 9 g of the pills, cut into pieces, with 5 g of kieselguhr, add 40 ml of chloroform, heat under reflux for 30 minutes, and filter. Extract the filtrate with three 20-ml quantities of 2% solution of sodium hydroxide, combine the alkaline liquids, adjust pH value to 1-2 with hydrochloric acid. Extract with three 20-ml quantities of chloroform, combine the chloroform extracts and wash with water. Dehydrate the chloroform extracts with anhydrous sodium sulphate and evaporate to dryness. Dissolve the residue in 0.5 ml of ethyl acetate as the test solution. Dissolve magnolol CRS and honokiol CRS in ethyl acetate to prepare a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel GF_{254} mixed with sodium carboxymethylcellulose as the coating

substance and a mixture of cyclohexane and ethyl acetate (3∶1) as the mobile phase. Apply separately 3 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(4) Heat under reflux 6 g of the pills, cut into pieces, in 20 ml of ethanol for 30 minutes, and filter. Evaporate the filtrate to dryness and dissolve the residue in 20 ml of water. Add 2 ml of hydrochloric acid, heat on a boiling water bath for 30 minutes, cool, extract with two 20-ml quantities of ether. Combine the ether extracts and evaporate to dryness. Dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 0.1 g Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of the mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15∶5∶1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Expose to ammonia vapour, the spots turns red.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To regulate *qi* flow to alleviate stagnation, and disperse cold to kill pain.

Indications Fullness in the hypochondria, stabbing pain in the stomach, or dull pain in the abdomen due to stagnation of *qi* and cold in the stomach.

Usage and dosage 1 pill, twice a day.

Precaution Be cautious about pregnant women.

Strength 6 g per pill

Storage Preserve in tightly closed containers.

Shiyiwei Nengxiao Wan
(十一味能消丸)

Shiyiwei Nengxiao Pills

Shiyiwei Nengxiao Pills are prescription used by Tibetan Nationality.

Ingredients Radix Inulae 30 g; Fructus Sinopodophylli 50 g; Rhizoma Hedychii 40 g; Extractum Hippophae Rhamnoidis 38 g; Fructus Chebulae (removed kernal) 75 g; Musculus Bungari (processed with Moschus) 25 g; Rhizoma et Radix Rhei 90 g; Eriocheir seu Potamon 25 g; Calcitum (calcined) 100 g; Salmiacum 17 g; Trona 125 g.

Procedure Pulverize the eleven ingredients to fine powder, sift and mix thoroughly. Make pills with water and dry.

Description Brownish-yellow to yellowish-brown watered pills; odour, slight; taste, salty, slightly bitter and astringent.

Identification (1) Microscopical: Fibre layers of pericarp pale yellow, crisscrossed obliquely, with thinner and pitted walls; clusters of calcium oxalate large, 60-140 μm in diameter.

(2) To 1 g, in powder, add 5 ml of water, shake and filter, To 1 ml of water add nitric acid to adjust the solution acidic, add 2 drops of silver nitrate TS, a gelatinous precipitate is produced, which is soluble in ammonia TS, but insoluble in nitric acid.

(3) Macerate 2 g of the pills, in powder, in 20 ml of methanol for 1 hour, filter, evaporate the filtrate to dryness. Dissolve the residue in 10 ml of water, add 1 ml of hydrochloric acid, heat under reflux for 30 minutes, cool immediately, extract with two 10-ml quantities of ether, combine the extract, evaporate to dryness, dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 0.5 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of *n*-hexane, ethyl acetate and formic acid (6∶2∶0.1) as the mobile phase. Apply separately 4 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution; exposure to ammonia vapour, examine in sunlight, the spots turn to red colour.

(4) Triturate 4 g of watered pills to fine powder, to a conical flask, add 30 ml of ether. Ultrasonicate for 30 minutes, and filter, and concentrate the filtrate to 2 ml as the test solution. Dissolve alantolactone CRS in ether to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petrol ether (60-90℃) and ethyl acetate (17∶3) as the mobile phase. Apply separately 10 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills except for Disintegration test (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol and 0.1% solution of phosphoric acid (85∶15) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of emodin.

Reference solution Weigh accurately a quantity of emodin CRS and chrysophanol CRS, dissolve in methanol to produce two solutions containing emodin 10 μg per ml and 20 μg chrysophanol per ml seperately.

Test solution With the pills obtained under the test of weight variation, pulverize to fine powder, and weigh accurately 2 g in a stopper conical flask, add accurately 50 ml of methanol, closely stopper and weigh. Heat under reflux on a water bath for 30 minutes, cool, weigh again, replenish the lost weight with methanol, mix well and filter. Measure accurately 5 ml of the successive solution to a conical flask, evaporate the solution to dryness, dissolve the residue in 10 ml of 2.5 mol/L solution of sulfuric acid, ultrasonicate for 5 minutes, add 10 ml of chloroform, heat under reflux for 1 hour, cool immediately, extracted with three 8-ml quantities of chloroform, add a quantity of anhydrous sodium sulphate. Transfer the chloroform

solution to a conical flask, recover chloroform to dryness, add 10 ml of methanol to the residue, weigh, dissolve the residue by heat on a water bath, cool, weigh again, replenish the lost weight with methanol, mix well, and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solutions and the test solution into the column respectively and calculate the content.

It contains not less than 1.8 mg of the total amount of emodin ($C_{15}H_{10}O_5$) and chrysophanol ($C_{15}H_{10}O_4$) per pill, referred to Radix et Rhizoma Rhei.

Action To remove blood stasis and promote blood flow, stimulate menstrual discharge, and induce labour.

Indications Amenorrhea, menstrual disorders, difficult labour, retention of placenta, postpartum abdominal pain due to blood stasis.

Usage and dosage Taken with boiled water after crushed. 1-2 pills each time, twice a day.

Precaution Contraindicated in pregnancy.

Strength 1.5 g per pill

Storage Preserve in tightly closed containers, protected from moisture.

Shouwu Wan
(首乌丸)

Shouwu Pills

Ingredients Radix Polygoni Multiflori Praeparata Cum Succo Glycines Sotae 360 g; Radix Rehmanniae 20 g; Radix Achyranthis Bidentatae (processed with wine) 40 g; Fructus Mori 182 g; Fructus Ligustri Lucidi (processed with wine) 40 g; Herba Ecliptae 235 g; Folium Mori (processed) 40 g; Semen Sesami Nigrum 16 g; Semen Cuscutae (processed with wine) 80 g; Fructus Rosae Laevigatae 259 g; Fructus Psoraleae (processed with salt) 40 g; Herba Siegesbeckiae (processed) 80 g; Flos Lonicerae (processed) 20 g.

Procedure Pulverize the above ingredients, except Fructus Mori, Herba Ecliptae and Fructus Rosae Laevigatae, to fine powder, sift, mix thoroughly. Decoct Fructus Mori and Fructus Rosae Laevigatae separately with water twice, 3 hours for the first time and 2 hours for the second; Combine the decoctions, stand for 12 hours, concentrate the supernatants to thin extracts with relative density of 1.35. Decoct Herba Ecliptae with water twice, 1 hour for each time; Combine the decoctions, stand for 12 hours, concentrate the supernatant to a thin extract with a relative density of 1.38. Mix the above fine kinds of powder with the thin extracts of Fructus Mori, Fructus Rosae Laevigatae and part of extract of Herba Ecliptae, 10 g of refined honey and a quantity of water to make water-honeyed pills, dry briefly, coat with the remained extract of Herba Ecliptae and 10 g of refined honey, polish and dry.

Description Black water-honeyed pills; taste, sweet, slightly bitter.

Identification (1) Microscopical: Clusters of calcium oxalate up to about 80 μm in diameter. Parenchymatous tissues greyish-brown, cells mostly shrunken, and each containing a brown, nucleus-like mass. Clusters of calcium oxalate occurring in mesophyll, prisms observed occasionally. Sand crystals of calcium oxalate occurring in parenchymatous cells. Epidermal cells of pericarp subpolygonal in surface view, anticlinal walls uneven in thickness, lumina containing pale brown contents. Epidermal cells of testa pale yellow, polygonal in surface view, anticlinal walls 6-10 μm in thickeness, lignified, lumina containing subrounded crystals of calcium oxalate. Palisade cells of testa 2 rows, the inner row longer than the outer one, with light line. Palisade cells of testa pale brown or reddish-brown, polygonal in surface view, walls slightly thickened, containing reddish-brown contents. Non-glandular hairs 3-4 celled, one cell often slightly shrunken. Pollen grains subrounded, up to about 76 μm in diameter, extine with spine-like sculptures and three germinal apertures.
