(2) Pulverize 2 g to powder, ultrasonicate in 20 ml of methanol for 15 minutes, wash the residue with a small quantity of methanol, filter, combine the filtrate and adjust the solution to 20 ml, evaporate 10 ml of the filtrate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 2 g of Radix Polygoni Multiflori reference drug in the same manner as the reference drug solution. Dissolve emodin CRS and physcion CRS in methanol to prepare a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance mixed with 0.5% solution of sodium hydroxide and a mixture of toluene, ethyl acetate and formic acid (15∶2∶1) as the mobile phase. Apply 2 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution. The colour of the spots turns to red on exposure to ammonia vapour.

(3) Evaporate 10 ml of the methanol extract obtained under Identification (2) to dryness, dissolve the residue in 2 ml of ethyl acetate. Apply the solution to a column packed with neutral aluminium oxide (100-120 mesh, 3 g, 1 cm in internal diameter), elute with 10 ml of ethyl acetate, evaporate the eluate to dryness, dissolve the residue in 0.5 ml of ethyl acetate as the test solution. Dissolve psoralen CRS and isopsoralen CRS separately in methanol to prepare two solutions containing 0.2 mg of each per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (4∶1) as the mobile phase. Apply separately 2 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% solution of potassium hydroxide and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To reinforce the liver and kidney, tone up the muscles and bones and blacken beard and hair.

Indications Dizziness, tinnitus, aching of the lower back, numbness of limbs, and early graying of beard and hair due to deficiency in the liver and kidney; hyperlipemia with above symptoms.

Usage and dosage 6 g, twice a day.

Storage Preserve in tightly closed containers.

Shuangdan Koufuye
(双丹口服液)

Shuangdan Mixture

Ingredients Radix et Rhizoma Salviae Miltiorrhizae 600 g; Cortex Moutan 300 g.

Procedure Distill volatile oil of Cortex Moutan, collect the distillation in another container. Decoct the drug residue and Radix et Rhizoma Salviae Miltiorrhizae with water twice, 2 hours for the first time and 1 hours for the second time, combine the decoctions and filter. Concentrate the filtrate to a relative density of 1.14-1.16 (60℃), add ethanol to a content of 60%, stir thoroughly and stand for 24 hours, filter and recover ethanol and concentrate to a thick extract with a relative density of 1.14-1.16 (60℃). Add the distillation of Cortex Moutan and water to about 900 ml, stir thoroughly, allow it to stand for 48 hours, filter, add 150 g of honey, 3 g of sodium benzoate into the filtrate, and add water to 1000 ml, stir thoroughly and pack.

Description A reddish-brown liquid; taste, pungent and slightly bitter.

Identification Extract 20 ml of the mixture with three 10-ml quantities of ether, collect the ether extracts, evaporate to dryness at a lower temperature. Dissolve the residue in 1 ml of acetone as the test solution. Dissolve paeonol CRS in acetone to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of cyclohexane and ethyl acetate (3∶1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% ferric chloride in ethanol, and heat to the spots clear. The spot in the chromatogram obtained with test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Relative density Not less than 1.05 (Appendix Ⅶ A).

pH value 4.0-5.0 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J)

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol and 1% solution of acetic acid (8∶92) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of danshensu.

Reference solution Weigh accurately a quantity of sodium danshensu CRS, dissolve in methanol to produce a solution containing 40 μg per ml (correspond to 36 μg danshensu per ml).

Test solution Measure accurately 5 ml of the mixture and transfer to a 50 ml volumetric flask, add water to volume, and mix well. Measure accurately 10 ml of the solution and transfer to a 50 ml volumetric flask, add water to volume. Mix well and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column respectively and calculate the content.

It contains not less than 2.0 mg of danshensu ($C_9H_{10}O_5$) per ml, referred to Radix et Rhizoma Salviae Miltiorrhizae.

Action To promote blood circulation to resolve stagnated blood and dredge meridians to kill pain.

Indications Impeded flow of *yang-qi* in the chest due to stagnated blood with manifestations of constriction in the chest and heart pain.

Usage and dosage 20 ml, twice a day.

Strength 10 ml per phial

Storage Preserve in tightly closed containers.

Shuanghuanglian Keli
(双黄连颗粒)

Shuanghuanglian Granule

Ingredients Flos Lonicerae Japonicae 1500 g; Radix Scutellariae 1500 g; Fructus Forsythiae 3000 g.

Procedure Decoct Radix Scutellariae with water for 3 times, 2 hours for the first time, 1 hour for the second and third time respectively, combine the decoctions, filter, concentrate the filtrate to a thin extract with a relative density of 1.05-1.10 (80℃), adjust pH value to 1.0-2.0 with 2 mol/L solution of hydrochloric acid at a temperature of 80℃, keep the temperature for 1 hour, allow to stand for 24 hours, filter, wash the precipitate with water to pH 5.0, continue to wash with 70% ethanol to pH 7.0, dry at a lower temperature to obtain the reserved extract. Macerate warmly Flos Lonicerae Japonicae and Fructus Forsythiae in water for half an hour, decoct for 2 times, 1.5 hours every time, filter separately, combine the filtrate and concentrate to a thick extract with a relative density of 1.20-1.25 (70-80℃), cool to 40℃, gently add ethanol, stir constantly to a content of 75% ethanol, stir thoroughly, allow to stand for 12 hours, filter to obtain the supernatant liquid, stir well the precipitate in a quantity of 75% ethanol, allow to stand for 12 hours, filter, combine the ethanol liquid, completely recover ethanol, concentrate to a thick extract with a relative density of 1.30-1.32 (60-65℃), dry in vacuum, combine with the above reserved extract and pulverize to fine powder, add a quantity of excipient including dextrin, mix thoroughly, make granules, dry and make to 1000 g; or add a quantity of excipient including sucrose and dextrin, mix thoroughly, make granules, dry and make to 2000 g.

Description brownish-yellow granules; odourless; taste, bitter and slightly sweet.

Identification (1) Dissolve 1 g or 2 g (granules with sucrose) in 10 ml of 75% ethanol on a water bath, filter, use the filtrate as the test solution. Dissolve respectively chlorogenic acid CRS and baicalin CRS in 75% ethanol to produce two solutions containing 0.1 mg each per 1 ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide membrane as the coating substance and acetic acid as the mobile phase. Apply separately 1-2 μl of each of the above three solutions to the membrane. After developing and removal of the membrane, dry in air, examine under ultraviolet light at 365 nm. The fluorescence spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

(2) Dissolve 0.5 g or 1 g (granules with sucrose) in 10 ml of methanol by heating on a water bath, filter, use the

filtrate as the test solution. Heat under reflux 0.5 g of Fructus Forsythiae reference drug in 10 ml of methanol for 20 minutes, filter, and use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform and methanol (5∶1) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ for several minutes. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and acetic acid (50∶50∶1) as the mobile phase. As detector a spectrophotometer set at 274 nm. The number of the theoretical plates of the column is not less than 1500, calculated with reference to the peak of baicalin.

Reference solution Dissolve a quantity of baicalin CRS, accurately weighted, in 50% methanol to produce a solution containing 0.1 mg per ml.

Test solution Weigh accurately 0.5 g or 1 g (granules with sucrose), obtained in the test of weight variation, and triturated to fine powder, in a 100 ml volumetric flask, add a quantity of 50% methanol, ultrasonicate for 20 minutes to dissolve, stand to room temperature, dilute with 50% methanol to the volume, shake well, filter, discard the initial filtrate, measure accurately 5 ml of the successive filtrate to a 10 ml volumetric flask, dilute with 50% methanol to the volume and mix well.

Procedure Inject accurately 5 μl of each of the reference and the test solution into the column and calculate the content.
It contains not less than 160 mg or 80 mg (granules with sucrose) of baicalin ($C_{21}H_{18}O_{11}$) per pack, referred to Radix Scutellariae.

Action To disperse *wind* to release the exterior, and clear *heat* to relieve *toxicity*.

Indications Common cold due to affliction from external *wind-heat* with manifestations of fever, coughing and sore throat.

Usage and dosage Taken after dissovled in boiled water 5 g, 3 times a day; 1.0-1.5 g, for the infants under 6 months; 1.5-2.0 g, for infants of 6-12 months; 2.0-2.5 g, for children of 1-3 years old; appropriate reduction of dosage or follow doctor's advice for children over 3 years old.

Strength 5 g per pack.
(1) Granules without sucrose (equivalent to 60 g crude drugs);
(2) Granules with sucrose (equivalent to 30 g crude drugs)

Storage Preserve in well closed containers.

Shuanghuanglian Koufuye (双黄连口服液)

Shuanghuanglian Mixture

Ingredients Flos Lonicerae Japonicae 375 g; Radix scutellariae 375 g; Fructus Forsythiae 750 g.

Procedure Cut Radix Scutellariae into slices, decoct with water for 3 times, 2 hours for the first time, 1 hour for the second and third time respectively, combine the decoctions, filter, concentrate the filtrate, adjust pH value to 1.0-2.0 with a quantity of 2 mol/L solution of hydrochloric acid at a temperature of 80℃, keep the temperature for 1 hour, allow to stand for 12 hours, filter. Stir the precipitate in 6-8 times amount of water, adjust to pH value to 7.0 with 40% solution of sodium hydroxide and add a equal quantity of ethanol to dissolve by stirring, filter, adjust the filtrate to pH value to 2.0 with 2 mol/L solution of hydrochloric acid at a temperature of 60℃, keep the temperature for 30 minutes, allow to stand for 12 hours, filter, wash the precipitate with ethanol to pH value to 7.0, completely expel ethanol to obtain the reserved extract. Macerate warmly Flos Lonicerae Japonicae and Fructus Forsythiae in water for half an hour, decoct for 2 times, 1.5 hours for each, combine the decoctions, filter, concentrate the filtrate to a thin extract with a relative density of 1.20-1.25 (70-80℃), allow to cool to 40℃, gently add ethanol, stir constantly, to a content of 75% ethanol, stir thoroughly, allow to stand for 12 hours, filter to obtain the supernatant liquid, stir well the residue in a quantity of 75% ethanol solution, allow to stand for 12 hours, filter, combine the ethanol liquid, completely recover ethanol, add the above reserved extract and a quantity of water, adjust to pH value to 7.0 with 40% solution of sodium hydroxide, stir well, refrigerate for 72 hours under 4-8℃, filter, dissolve 300 g of sucrose in the filtrate by stirring, add a quantity of essence and adjust to pH value to 7.0, add water to produce 1000 ml, stir well, allow to stand for 12 hours, filter, pack and sterilize.

Description A clear, brownish-red liquid; taste, sweet and slightly bitter.

Identification (1) Mix well 1 ml of the mixture with 5 ml of 75% ethanol as the test solution. Dissolve respectively chlorogenic acid CRS and baicalin CRS in 75% ethanol to produce two solutions containing 0.1 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide membrane as the coating substance and acetic acid as the mobile phase. Apply separately 1-2 μl of each of the above three solutions to the membrane. After developing and removal of the membrane, dry in air, examine under ultraviolet light at 365 nm. The fluorescence spots in the chromatogram obtained with the reference solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.
(2) Dissolve 1 ml of the mixture in 5 ml of methanol with shaking, allow to stand, use the supernatant liquid as the test solution. Heat under reflux 0.5 g of Fructus Forsythiae reference drug with 10 ml of methanol for 20 minutes, filter, use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform and methanol (5∶1) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After

developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ for several minutes. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

pH value 5.0-7.0 (Appendix Ⅶ G).

Relative density Not less than 1.12 (Appendix Ⅶ A).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay ***Radix Scutellariae*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and acetic acid (50∶50∶1) as the mobile phase. As detector a spectrophotometer set at 274 nm. The number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of baicalin.

Reference solution Weigh accurately 10 mg of baicalin CRS, in a 100 ml volumetric flask, add a quantity of 50% methanol, shake to dissolve on a water bath, stand to room temperature, dilute with 50% methanol to the volume and mix well (containing 0.1 mg of baicalin per ml).

Test solution Measure accurately 1 ml of the mixture, obtained in the test of filling variation, in a 50 ml volumetric flask, add a quantity of 50% methanol, ultrasonicate for 20 minutes, stand to room temperature, dilute with 50% methanol to the volume and mix well.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column and calculate the content.
It contains not less than 8.0 mg of baicalin ($C_{21}H_{18}O_{11}$) per ml, referred to Radix Scutellariae.

Flos Lonicerae Japonicae Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and acetic acid (20∶80∶1) as the mobile phase. As detector a spectrophotometer set at 324 nm. The number of theoretical plates of the column is not less than 6000, calculated with reference to the peak of chlorogenic acid.

Reference solution Dissolve a quantity of chlorogenic acid CRS, accurately weighted, in water in an amber volumetric flask to produce a solution containing 40 μg per ml.

Test solution Measure accurately 2 ml of the mixture in a 50 ml amber volumetric flask, add water to the volume and mix well.

Procedure Inject accurately 10 μl of the reference solution and 10-20 μl of the test solution into the column and calculate the content.
It contains not less than 0.60 mg of chlorogenic acid ($C_{16}H_{18}O_9$) per ml, referred to Flos Lonicerae Japonicae.

Fructus Forsythiae Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (25∶75) as the mobile phase. As detector a spectrophotometer set at 278 nm. The number of theoretical plates of the column is not less than 6000, calculated with reference to the peak of forsythin.

Reference solution Dissolve a quantity of forsythin CRS, accurately weighted, in 50% methanol to produce a solution containing 60 μg per ml.

Test solution Measure accurately 1 ml of the mixture, apply to a column packed with neutral aluminium oxide (100-200 mesh, 6 g, 1 cm in inner diameter), elute with 40 ml of 70% ethanol and collect the elute. Evaporate to the dryness and dissolve the residue in a quantity of 50% methanol to a 5 ml volumetric flask, and dilute to the volume and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 0.30 mg of forsythin ($C_{29}H_{36}O_{15}$) per ml, referred to Fructus Forsythiae.

Action To disperse *wind* to release the exterior, and clear *heat* to relieve *toxicity*.

Indications Common cold due to affliction from external *wind-heat* with manifestations of fever, coughing and sore throat.

Usage and dosage 20 ml, 3 times a day; appropriate reduction of the dosage or follow doctor's advice for children.

Strength 10 ml per phial

Storage Preserve in tightly closed containers, protected from light, and store in a dark and cool place.

Shuanghuanglian Pian
(双黄连片)

Shuanghuanglian Tablets

Ingredients Fructus Forsythiae 3750 g; Flos Lonicerae Japonicae 1875 g; Radix Scutellariae 1875 g.

Procedure Slice Radix Scutellariae, and decoct it with water three times, 2 hours for the first time and 1 hour for the second and third times. Combine the decoctions and filter. Concentrate the decoction to a relative density of 1.03-1.08 (80℃), adjust pH value to 1.0-2.0 with 2 mol/L solution of hydrochloric acid at 80℃. Dry at low temperature for use. Macerate Flos Lonicerae Japonicae, Fructus Forsythiae warm with water for half an hour, decoct it with water twice, 1.5 hours for each time. Combine the decoctions and filter. Concentrate the filtrate to a relative density of 1.20-1.25 (80℃), cool to 40℃. Add ethanol to a content of 75% ethanol, stir thoroughly and stand by for 12 hours, and filter. Separate the supernatant, and add 75% ethanol to the residue, stir thoroughly, stand by for 12 hours, filter. Combine the two filtrates, recover ethanol to no ethanol smell and concentrate to a thick extract with a relative density of 1.34-1.40 (60℃). Dry in vaccum, and add extract of Radix Scutellariae, pulverize to fine power, add microcrystalline cellulose and sodium cellulose glycolate, mix thoroughly, make granules and dry. Add magnesium stearate, mix thoroughly, compress into 1000 tablets, and coated with film or sugar.

Description Film coated or sugar coated tablets with brownish-yellow or brownish-red core; odour, slight; taste, bitter.

Identification (1) Triturate 1 tablet, removed film coat, to fine powder, add 10 ml of 75% methanol, ultrasonicate for 10 minutes, and filter. Use the filtrate as the test solution. Dissolve separately baicalin CRS and chlorogenic acid CRS in methanol to produce two solutions each containing 0.1 mg per ml as the reference solutions. Carry

out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide membrane as the coating substance and acetic acid as the mobile phase. Apply separately 1-2 μl of the above solutions to the membrane. After developing and removal of the membrane, dry in air and examine under ultraviolet light at 365nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

(2) To 0.5 g Fructus Forsythiae reference drug, add 10 ml of methanol, heat under reflux for 20 min, filter and use the filtrate as reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose, as the coating substance, and a mixture of chloroform and methanol (5∶1) as the mobile phase. Apply separately 5 μl of each of the test solution obtained under Identification (1) and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol, and heat at 105℃ to spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay ***Radix Scutellariae*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol, water, and glacial acetic acid (50∶50∶1) as the mobile phase. As detector a spectrophotometer set at 274 nm. The number of theoretical plates of the column is not less than 1500, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin CRS, dissolve in 50% solution of methanol to produce a solution containing 0.1 mg per ml.

Test solution Weigh accurately 0.2 g of the tablets, obtained under the test of weight variation, pulverized to fine powder, place in a 50 ml volumetric flask, add a quantity of 50% solution of methanol. Ultrasonicate for 20 minutes (power, 250 W; frequency, 33 kHz), cool, add 50% solution of methanol to volume, mix well and filter. Discard the initial filtrate, and transfer accurately 2 ml of the successive filtrate to a 10 ml volumetric flask, add 50% solution of methanol to volume, mix well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution. The whole process should be protected from light.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column respectively and measure.

It contains not less than 50 mg of baicalin ($C_{21}H_{18}O_{11}$) per tablet, referred to Radix Scutellariae.

Flos Lonicerae Japonicae Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol, water, and glacial acetic acid (15∶85∶1) as the mobile phase. As detector a spectrophotometer set at 324 nm. The number of theoretical plates of the column is not less than 6000, calculated with the reference to the peak of chlorogenic acid.

Reference solution Weigh accurately a quantity of baicalin CRS in a amber volumetric flask, dissolve in 50% solution of methanol to produce a solution containing 60 μg per ml.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, obtained under Assay of Radix Scutellariae, into the column respectively and calculate the content.

It contains not less than 5.5 mg of chlorogenic acid ($C_{16}H_{18}O_9$) per tablet, referred to Flos Lonicerae Japonicae.

Action To disperse *wind* to release the exterior, and clear *heat* to relieve *toxicity*.

Indications Common cold due to affliction from external *wind-heat* with manifestations of fever, coughing and sore throat.

Usage and dosage 4 tablets, 3 times a day, appropriate reduction of dosage for children or follow doctor's advice.

Strength 0.50 g per core

Storage Preserve in tightly closed containers.

Shuanghuanglian Shuan (双黄连栓)

Shuanghuanglian Suppositories

Ingredients Flos Lonicerae Japonicae 2500 g; Radix Scutellariae 2500 g; Fructus Forsythiae 5000 g.

Procedure Decoct Radix Scutellariae with water for 3 times, 2 hours for the first time and each 1 hour for other times. Combine the decoctions, filter and concentrate the filtrate to a quantity, adjust pH value to 1.0-2.0 at 80℃ with 2 mol/L solution of hydrochloric acid, keep the temperature for 1 hour, stand for 24 hours and filter. Add 6-8 quantities of water to the precipitate, adjust pH value to 7.0-7.5 with a 40% solution of sodium hydroxide, then add the equal quantity of ethanol, stir to dissolve and filter. Adjust the pH of the filtrate to 2.0 with 2 mol/L solution of hydrochloric acid, keep temperature at 60℃ for 30 minutes, stand for 12 hours and filter. Wash the precipitate with water to pH 5.0, rinse with 70% ethanol pH value to 7.0. Add a quantity of water to the precipitate, adjust to pH 7.0-7.5 with a 40% solution of sodium hydroxide and stir to dissolve. Decoct Flos Lonicerae Japonicae and Fructus Forsythiae with water twice, 1.5 hours for each time, combine the decoctions, filter and concentrate to a thick extract with a relative density of 1.20-1.25 (70-80℃). Cool to 40℃, add ethanol slowly to a content of 75% ethanol, stand for 12 hours. Separate and filter the supernatant, recover ethanol from the filtrate and concentrate to a quantity, add ethanol again to a content of 85% ethanol, stir thoroughly and stand for 12 hours. Separate the supernatant, filter, recover ethanol from the filtrate until the odour of ethanol is no longer detectable, add the solution of Radix Scutellariae, stir well and adjust to pH 7.0-7.5. Concentrate in vacuum to a thick extract, dry at lower temperature and pulverize. Heat 780 g of semi-synthetic fatty acid ester to melt, mix at temperature of 38-42℃ with the above powder, pour into moulds and make 1000 suppositories.

Description Brown or dark brown suppositories.

Identification To 1 suppository add 20 ml of water, adjust pH value to 7.0-7.5 with 10% solution of sodium hydroxide, heat on a warm water bath to melt, then leave it in a cool place until the suppository bases is solidified and filter. To 1 ml of the filtrate add 4 ml of dehydrated ethanol, shake on a water bath for several minutes, allow to stand and use the supernatant as the test solution. Dissolve chlorogenic acid CRS and baicalin CRS in ethanol to produce a mixture containing 0.4 mg of each per ml as the reference solution.

Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of butyl acetate, formic acid and water (7∶4∶3) as the mobile phase. Apply separately 3-5 μl of each of the three solutions to the plate. Pre-equilibriate the plate in a chamber with the mobile phase for 30 minutes. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Other requirements Comply with the general requirements for suppositories (Appendix Ⅰ W).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water, and glacial acetic acid (40∶60∶1) as the mobile phase. As detector a spectrophotometer set at 276 nm. The number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of baicalin.

Reference solution Dissolve a quantity of baicalin CRS, accurately weighted, in 50% methanol to produce a solution containing 0.1 mg per ml as the reference solution.

Test solution Weigh accurately 10 suppositories and pulverize. Transfer about 0.3 g weighed accurately to a beaker, dissolve in 40 ml of water on a warm water bath. Adjust pH to 7.0-7.5 with a 10% solution of sodium hydroxide, then transfer to a 50 ml volumetric flask, allow to cool to room temperature, dilute with water to volume, mix well and filter. Measure accurately 2 ml of the successive filtrate, transfer to a 10 ml volumetric flask, dilute with water to volume and mix well.

Procedure Accurately inject 20 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 65 mg of baicalin ($C_{21}H_{18}O_{11}$) per suppository, refered to Radix Scutellaria.

Action To disperse *wind* to release the exterior, and clear *heat* to relieve *toxicity*.

Indications Common cold due to affliction from external *wind-heat* with manifestations of fever, coughing, sore throat; upper respiratory tract infection and pneumonia with above symptoms.

Usage and dosage 1 suppository for child, 2-3 times a day, to be administrated through rectal.

Strength 1.5 g per suppository

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Shufeng Dingtong Wan
(疏风定痛丸)

Shufeng Dingtong Pills

Ingredients Semen Strychni Pulveratum 200 g, Herba Ephedrae 300 g; Olibanum (processed with vinegar) 100 g; Myrrha (processed with vinegar) 100 g; Rhizoma Homalomenae 30 g; Pyritum (calcined) 30 g; Cortex Illicii 30 g; Ramulus Cinnamoni 30 g; Radix Achyranthis Bidentatae 30 g; Fructus Chaenomelis 30 g; Radix et Rhizoma Glycyrrhizae 30 g; Cortex Eucommiae (Processed with salt) 30 g; Radix Saposhnikoviae 30 g; Rhizoma et Radix Notopterygii 30 g; Radix Angelicae Pubescentis 30 g.

Procedure Except Semen Strychni pulveratum, the other fourteen ingredients to fine powders and sift. Triturate the Semen Strychni pulveratum with the other powder and mix thoroughly. To each 100 g of the powder add 140-160 g of refined honey to make big honeyed pills. Description Greyish-black big honeyed pills; odour, pungent and aromatic; taste, bitter and sour.

Identification (1) Microscopical: Stomata characteristic, guard cells dumbbell-shaped in lateral view. Stone cells large, subtriangular, ellipsoidal or irregular, 198-253 μm in diameter, with thickened walls and distinct striations, lumina containing dark red substances.

(2) Cut 3 g of the pills well with a quantity of kieselguhr. Add 1 ml of concentrated ammonia TS and 30 ml of chloroform, ultrasonicate for 30 minutes, and filter. Extract the filtrate twice with 30 ml of sulfuric acid solution (3→100), combine the sulfuric acid extracts, adjust with concentrated ammonia TS to alkaline. Then extract with 30 ml of chloroform for two times, combine the chloroform extracts, evaporate to dryness. Dissolve the residue in 5 ml of chloroform as the test solution. Dissolve strychnine CRS in chloroform to produce a solution containing 0.4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of the mixture of toluene, acetone, ethanol and concentrated ammonia TS (16∶12∶1∶4) as the mobile phase. Apply separately 5-10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and a mixture of equal quantity of 0.01 mol/L sodium heptanesulfonate solution and 0.02 mol/L potassium dihydrogen phosphate solution (adjust to pH 2.8 with 10% phosphoric acid solution) (21∶79) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of strychnine.

Reference solution Dissolve 6 mg of strychnine CRS, accurately weighted, in a 10 ml volumetric flask and dilute with chloroform to volume, and mix well. Accurately measure 2 ml in a 10 ml volumetric flask, dilute with methanol to volume, and mix well (containing 0.12 mg of strychnine per ml).

Test solution Weigh accurately 5 g of the pills, obtained under the test of weight variation, in a stopper conical flask, add 3 ml of sodium hydroxide TS, mix well, stand for 30 minutes, add accurately 25 ml of Chloroform, weigh, heat under reflux for 2 hours, allow to cool and weigh again. Replenish the loss of weight with chloroform and mix well. Filter with filter paper spread with small quantity of anhydrous sodium sulfate, measure accurately 10 ml of the filtrate in a separator, extract with successive quantities of 15 ml, 15 ml, 10 ml, 10 ml and 10 ml of 1% solution of sulphuric acid. Combine the acid solution, adjust pH value

to 10-11 with 30% solution of sodium hydrate, extract with successive quantities of 20 ml, 20 ml, 15 ml, 15 ml and 15 ml of chloroform, combine the chloroform extract, evaporate to dryness in vacuum, dissolve the residue with methanol, transfer to a 10 ml volumetric flask, dilute to volume and mix well, filter and take the filtrate.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 3.3 mg and no more than 4.1 mg of strychnine ($C_{21}H_{22}N_2O_2$) per pill, referred to Semen Strychni.

Action To expel *wind* and disperse *cold*, and promote blood circulation to kill pain.

Indications Obstruction of *qi* and blood with pain due to accumulation of *wind*, cold and *dampness* and blood stasis blocking meridians, with manifestations of pain or cold pain or pricking pain of joints, or severe pain with immobilization, local aversion to *cold*, or pain of the lower back and legs, numbness of limbs and local swelling caused by traumatic injuries.

Usage and dosage 1 pill, twice a day.

Precaution Avoid overdosage; be cautious about debilitated patients; it is forbidden to prescribe to pregnant women.

Strength 6 g per pill

Storage Preserve in tightly closed containers.

Shugan Hewei Wan (舒肝和胃丸)

Shugan Hewei Pills

Ingredients Rhizoma Cyperi (processed with vinegar) 45 g; Radix Paeoniae Alba 45 g; Fructus Citri Sarcodactylis 150 g; Radix Aucklandiae 45 g; Radix Curcumae 45 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 60 g; Pericarpium Citri Reticulatae 75 g; Radix Bupleuri 15 g; Herba Pogostemonis 30 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 15 g; Semen Raphani 45 g; Semen Arecae (stir-baked to charred) 45 g; Radix Linderae 45 g.

Procedure Pulverize the above thirteen ingredients to fine powder, sift and mix thoroughly. To each 100 g of the powder add 70-85 g of refined honey and a quantity of water to make water-honeyed pills and dry; or add 120-130 g of refined honey to make big honeyed pills.

Description Dark brown or brownish-black water-honeyed pills or big honeyed pills; odour, characteristic; taste, sweet.

Identification (1) Microscopical: Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells. Clusters of calcium oxalate 18-32 μm in diameter, occurring in parenchymatous cells, often arranged in rows, or several in one cell. Wood fibres long fusiform, 16-24 μm in diameter, walls slightly thickened, pit aperturoid transverse-cracked, cross-shaped, or V-shaped. Prisms of calcium oxalate abundant in parenchyma. Fragments of endosperm cells colourless, walls relatively thickened with numerous large subrounded pits. Secretory cells subrounded, containing pale yellowish-brown to reddish-brown secretion, surrounded by radially arranged cells. Vittae containing pale yellow or yellowish-brown strip-shaped secretion, 8-25 μm in diameter. Palisade cells of testa yellow or brownish-red, surface view polygonal, with thickened walls.

(2) Triturate 7 g of the water-honeyed pills to powder, or grind 9 g of the big honeyed pills, cut into pieces, with an equal quantity of kieselguhr, add 50 ml of methanol, ultrasonicate for 20 minutes and filter. Evaporate the filtrate to dryness, dissolve the residue in 30 ml of water, filter, extract the filtrate with two 15-ml quantities of chloroform, discard the chloroform extract, continue to extract with successive quantities of 15, 15, 10 and 10 ml of *n*-butanol saturated with water, combine the *n*-butanol extracts, evaporate to about 1 ml on a water bath, add a quantity of neutral aluminium oxide, stir well and dry on a water bath. Apply to a column (1.0 cm, in internal diameter) packed with neutral aluminium oxide (100 mesh, 4 g), pre-elute with 30 ml of a mixtare of ethanol and ethyl acetate (1:1) and continue to elute with 40 ml of methanol. Collect the methanol eluate, evaporate to dryness. Dissolve the residue in 0.5 ml of ethanol as the test solution. Dissolve paeoniflorin CRS in ethanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40:5:10:0.2) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid and heat to the spot clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Triturate 9 g of the water-honeyed pills to powder, or grind well 12 g of the big honeyed pills, cut into pieces, with 5 g of kieselguhr, add 40 ml of dehydrated ethanol, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness and dissolve the residue in 0.5 ml of dehydrated ethanol as the test solution. Prepare a solution of 0.5 g of Fructus Citri Sarcodactylis reference drug and 10 ml of dehydrated ethanol as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (3:1) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.05 mol/L solution of potassium dihydrogen phosphate (14:86) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS in diluted ethanol to prepare a solution containing 16 μg per ml as the reference solution.

Test solution Triturate well the water-honeyed pills or cut the big honeyed pills, obtained under the test of weight variation, to powder or into pieces. Weigh accurately 0.55 g of the water-honeyed pills or 0.75 g of the big honeyed pills

in a conical flask with stopper, add accurately 25 ml of dilute ethanol, stopper well, weigh and ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes. Allow to cool, weigh again and replenish the lost weight with dilute ethanol, mix well, centrifuge and filter the supernatant, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 0.32 mg per gram of water-honeyed pills, or not less than 1.44 mg per big honeyed pill of paeoniflorin ($C_{23}H_{28}O_{11}$), referred to Radix Paeoniae Alba.

Action To soothe the liver to alleviate stagnation of *liver-qi*, and harmonize the stomach to kill pain.

Indications Fullness in the hypochondriac, pain in the stomach, anorexia, hiccuping, vomiting, and irregular bowel movements due to disharmony between the liver and stomach.

Usage and dosage 9 g of water-honeyed pills, or 2 big honeyed pills, twice a day.

Strength 20 g per 100 water-honeyed pills, or 6 g per big honeyed pill

Storage Preserve in tightly closed containers.

Shugan Wan
(舒肝丸)

Shugan Pills

Ingredients Fructus Toosendan 150 g; Rhizoma Corydalis (processed with vinegar) 100 g; Radix Paeoniae Alba (stir-baked with wine) 120 g; Rhizoma Wenyujin Concisum 100 g; Radix Aucklandiae 80 g; Lignum Aquilariae Resinatum 100 g; Fructus Amomi Rotundus 60 g; Fructus Amomi 80 g; Cortex Magnoliae Officinalis (processed with ginger) 60 g; Pericarpium Citri Reticulatae 80 g; Fructus Aurantii (stir-baked) 100 g; Poria 100 g; Cinnabaris 27 g.

Procedure Levigate Cinnabaris to very fine powder, pulverize Fructus Toosendan and other eleven ingredients to fine powder. Triturate Cinnabaris with the above powders, sift and mix thoroughly. To each 100 g of the powder add 65-85 g of refined honey and a quantity of water to make water-honeyed pills and dry; or add 170-180 g of refined honey to make big honeyed pills, or add water (with 4% refined honey) to make watered pills and dry.

Description Brownish-red to brown water-honeyed pills, big honeyed pills and watered pills; odour, slight; taste, sweet and then slightly bitter.

Identification (1) Microscopical: Irregularly branched masses colourless, dissolved in chloral hydrate solution; hyphae colourless or pale brown, 4-6 μm in diameter. Fibre bundles in pericarp surrounded by cells containing prisms of calcium oxalate or a few clusters, forming crystal fibres, walls of crystal cells varying in thickness, lignified. Sclerenchymatous cells of endotesta yellowish-brown or brownish-red, subpolygonal in surface view, walls thickened, containing silica body. Stone cells branched, with thickened walls, striations distinct. Prisms of calcium oxalate abundant in parenchyma. Clusters of calcium oxalate occurring in parenchymatous cells, 18-32 μm in diameter, often arranged in rows or several in one cell. Irregular fine granules dark brownish-red, luster with dark edge.

(2) Wash 2.5 g of the watered pills, or 4 g of the water-honeyed pills, or 6 g of the big honeyed pills with water; a small quantity of vermilion precipitate is produced. Take out the precipitate, moisten with hydrochloric acid, rub gently on a bright and clean copper plate; the surface of the copper plate shows silvery-white lustre, which disappears on heating.

(3) Triturate 2.5 g of watered pills, or 4 g of water-honeyed pills or 6 g of big honeyed pills, in pieces, with 5 ml of the mixture ethanol and ammonia TS (1:1), heat under reflux with 30 ml of benzene on a water bath for 2 hours and filter. Extract the filtrate with successive quantities of 20, 15 and 15 ml of 20% solution of hydrochloric acid. Combine the acid extracts, adjust to alkaline with ammonia TS, extract with successive quantities of 25, 20 and 20 ml of chloroform. Combine the chloroform extracts, wash with water, dehydrate over anhydrous sodium sulphate, concentrate to about 1 ml as the test solution. Prepare a solution of 1 g of Rhizoma Corydalis reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and ethanol (4:1) as the mobile phase. Apply separately to the plate 10 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with potassium iodobismuthate TS and ethanolic sodium nitrite TS successively. The brown spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Triturate 7 g of the watered pills or 12 g of the water-honeyed pills, or pulverize 18 g of the big honeyed pills with 10 g of kieselguhr, heat under an ultra-red lamp to dryness. Add 90 ml of methanol, ultrasonicate for 30 minutes, filter, use 30 ml of the filtrate as the test solution. Dissolve hesperidin CRS in methanol to prepare a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 1% solution of sodium hydroxide as the coating substance and a mixture of ethyl acetate, methanol and water (100:17:13) as the mobile phase. Apply separately 2-4 μl of the test solution and 2 μl of the reference solution to the plate, develop to about 3 cm, remove the plate, dry in air. Then develop to 8 cm using the upper layer of the mixture of toluene, acetyl acetate, formic acid and water (20:10:1:1) as the mobile phase. After removal of the plate, dry in air, spray with 1% aluminium chloride in methanol, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot in the chromatogram obtained with the reference solution.

(5) Evaporate the remainder of the methanol extract obtained under Identification (4) to dryness and dissolve the residue in 40-ml of dilute hydrochloric acid. Extract with three 20-ml quantities of chloroform, combine the chloroform extracts. Extract with three 20-ml quantities of 2% solution of sodium hydroxide, combine the alkaline extracts. Adjust to pH 1-2 with hydrochloric acid, extract with three 20-ml quantities of chloroform, combined chloroform extracts, wash with water. Dehydrate the chloroform extracts with anhydrous sodium sulphate, evaporate to dryness, dissolve the residue in 2 ml of methanol as the test solution. Dissolve magnolol CRS and honokiol CRS in methanol to prepare two solutions containing 2 mg and 1 mg per ml respectively as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of chloroform, benzene and ethyl

acetate (5:4:1) as the mobile phase. Apply separately 2 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions. Then spray with 5% vanillin in sulfuric acid and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

(6) Triturate 4 g of the watered pills or 6 g of the water-honeyed pills, or pulverize 6 g of the big honeyed pills with 10 g of kieselguhr. Add 30 ml of chloroform, ultrasonicate for 30 minutes, filter, and dissolve the residue in 2 ml of chloroform as the test solution. Prepare a solution of 1 g of Radix Aucklandiae reference drug and 10 ml of chloroform in the same manner as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and chloroform (1 : 5) as the mobile phase. Apply separately 6 μl of the test solution and the reference solution to the plate. After removal of the plate, dry in air, spray with 1% vanillin in sulfuric acid and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and phosphate BS [a mixture of 0.067 mol/L disodium hydrogen phosphate and 0.067 mol/L potassium dihydrogen phosphate (5:1), pH 7.4] (23:77) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, accurately weighted, in methanol to prepare a solution containing 20 μg per ml as the reference solution.

Test solution Triturate well the watered pills or the water-honeyed pills, or pulverize the big honeyed pills obtained under the test of weigh variation, weigh accurately 1 g each of the three pills separately in a stopper conical flask, add accurately 50 ml of dilute ethanol, stopper well, weigh and ultrasonicate (power, 260 W; frequency, 40 kHz) for 45 minutes. Allow to cool, weigh again and replenish the lost weight with dilute ethanol, mix well and filter. Measure accurately 5 ml of the filtrate and evaporate to the dryness, dissolve the residue in 5 ml of water and apply to a GDX-201 macroreticular resin column (0.9 cm in inner diameter and 12 cm in length). Elute with 100 ml of 30% methanol, and collect the eluates. Evaporate to dryness, dissolve the residue in methanol in a 5 ml volumetric flask, dilute with methanol to the volume, mix well and filter, use the filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 5-15 μl of the test solution into the column, and calculate the content.

It contains not less than 0.72 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per gram of watered pills, not less than 0.42 mg per gram of water-honeyed pills, not less than 1.6 mg per gram of big honeyed pills, referred to Radix Paeoniae Alba.

Action To soothe the liver and harmonize the stomach, and regulate *qi* flow to kill pain.

Indications Distending pain in the chest and hypochondria, stomachache, gastric discomfort with vomiting, belching, and casting up of gastric acid due to stagnation of *liver-qi*.

Usage and dosage 4 g water-honeyed pills, or 1 big honeyed pill, 2.3 g of watered pills, 2-3 times a day.

Precaution Be cautious about pregnant women.

Strength 20 g per 100 water-honeyed pills; 6 g per big honeyed pill; 2.3 g per 20 watered pills

Storage Preserve in tightly closed containers.

Shujin Huoluo Jiu
(舒筋活络酒)

Shujin Huoluo Wine

Ingredients Fructus Chaenomelis 45 g; Herba Taxilli 75 g; Rhizoma Polygonati Odorati 240 g; Radix Dipsaci 30 g; Radix Cyathulae 90 g; Radix Angelicae Sinensis 45 g; Rhizoma Chuanxiong 60 g; Flos Carthami 45 g; Radix Angelicae Pubescentis 30 g; Rhizoma et Radix Notopterygii 30 g; Radix Saposhnikoviae 60 g; Rhizoma Atractylodis Macrocephalae 90 g; Faeces Bombycis 60 g; Semen Oryzae cum Monasco Fermentatum 180 g; Radix et Rhizoma Glycyrrhizae 30 g.

Procedure Pulverize the above ingredients, except Semen Oryzae cum Monasco Fermentatum, to coarse powder, and mix thoroughly with Semen Oryzae cum Monasco Fermentatum. Dissolve 555 g of brown sugar in 11100 g of white wine. Carry out the method for percolation as described under liquid extracts and extracts (Appendix Ⅰ O), using the sugar wine as the solvent, macerate for 48 hours, percolate slowly at a speed of 1-3 ml per minute, collect the percolate, allow to stand, and filter.

Description A brownish-red clear liquid; odour, aromatic; taste, slightly sweet and bitter.

Ethanol content 50-57 per cent (Appendix Ⅸ M).

Other requirements Comply with the general requirements for medicinal wines (Appendix Ⅰ M).

Action To expel *wind* and eliminate *dampness*, promote blood circulation to dredge meridians, and nourish *yin* to generate fluid.

Indications Obstruction of *qi* and blood with pain due to *wind-dampness* blocking meridians and blood stasis in vessels accompanied with *yin* deficiency with manifestations of painful and immobilized joints and numbness of limbs.

Usage and dosage 20-30 ml, twice a day.

Precaution Be cautious about pregnant women.

Storage Preserve in tightly closed containers, stored in a cool place.

Shujin Wan
(舒筋丸)

Shujin Pills

Ingredients Semen Strychni Pulveratum 115 g; Herba Ephedrae 80 g; Radix Angelicae Pubescentis 6 g; Rhizoma et Radix Notopterygii 6 g; Ramulus Cinnamomi 6 g; Radix

et Rhizoma Glycyrrhizae 6 g; Rhizoma Homalomenae 6 g; Radix Achyranthis Bidentatae 6 g; Olibanum (processed with vinegar) 6 g; Fructus Chaenomelis 6 g; Myrrha (processed with vinegar) 6 g; Radix Saposhnikoviae 6 g; Cortex Eucommiae (processed with salt) 3 g; Cortex Illicii 6 g; Radix Dipsaci 3 g.

Procedure Pulverize the above ingredients, except semen strychni pulveratum, to fine powder, and mix throughly with semen strychni pulveratum, and sift. To each 100 g of the powder add 150-170 g of refined honey to make big honeyed pills.

Description Brown big honeyed pills; taste, bitter.

Identification (1) Moisten 3 g of the pills, in pieces, in 2 ml of concentrated ammonia TS, add 20 ml of chloroform, ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 2 ml of chloroform as the test solution. Dissolve strychnine CRS and brucine CRS in chloroform to prepare a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅳ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of toluene, acetone, ethanol and concentrated ammonia TS (20 : 25 : 3 : 2) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and spray with dilute potassium iodobismuthate TS. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.
(2) Dissolve ephedrine hydrochloride CRS in methanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅳ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of chloroform, ethanol, cyclohexane and concentrated ammonia TS (45 : 15 : 15 : 2) as the mobile phase. Apply separately 10 μl of each of the reference solution and the test solution obtained under the test of Identification (1) to the plate. After developing and removal of the plate, dry in air, spray with ninhydrin TS, and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use silica gel as the stationary phase and a mixture of acetonitrile and fifty-fifty mixture of 0.01 mol/L sodium heptanesulfonate solution and 0.02 mol/L potassium dihydrogen phosphate solution (adjust to pH 2.8 with 10% solution of phosphoric acid) (21 : 79) as the mobile phase. As detector a spectrophotometer set at 260 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of strychnine.

Reference solution Dissolve 6 mg of strychnine CRS, accurately weighted, in a 10 ml volumetric flask and dilute with chloroform to volume, and mix well. Accurately measure 2 ml in a 10 ml volumetric flask, dilute with methanol to volume and mix well (containing 0.12 mg of strychnine per ml).

Test solution Pulverize the pills obtained under the test of weight variation, weigh accurately 3 g in a stopper conical flask, add 3 ml of sodium hydroxide TS, mix thoroughly, allow to stand for 30 minutes, add accurately 20 ml of chloroform, weigh, heat under reflux for 2 hours, allow to cool and weigh again. Replenish the lost weight with chloroform. Filter with filter paper spread with small quantity of anhydrous sodium sulfate, measure accurately 10 ml of the successive filtrate in a separator, extract with successive quantities of 15, 15, 10, 10 and 10 ml of 1% solution of sulphuric acid. Combine the acid solutions, adjust to pH 10-11 with 30% solution of sodium hydroxide, extract with successive quantities of 20, 20, 15, 15 and 15 ml of chloroform, combine the chloroform extracts, evaporate to dryness, dissolve the residue with methanol, transfer to a 10 ml volumetric flask, dilute to the volume and mix well, filter and take the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column and calculate the content.
It contains not less than 3.5 mg and not more than 4.3 mg of strychnine ($C_{21}H_{22}N_2O_2$) per pill, referred to Semen Strychni.

Action To expel *wind* and eliminate *dampness*, and relax muscles and tendons and promote blood circulation.

Indications Obstruction of *qi* and blood with pain due to *wind*, *cold* and *dampness* with manifestations of numbness of limbs, painful tendons and bones and walking with difficulty.

Usage and dosage 1 pill, once a day.

Precaution Contraindicated for pregnant women.

Strength 3 g per pill

Storage Preserve in tightly closed containers.

Shuxin Koufuye (舒心口服液)

Shuxin Mixture

Ingredients Radix Codonopsis; Radix Astragali; Flos Carthami; Radix Angelicae Sinensis; Rhizoma Chuanxiong; Rhizoma Sparganii; Pollen Typhae.

Procedure Sack Pollen Typhae in calico bag, decoct with the other ingredients, except Flos Carthami, with water for 2 times, 2 hours for the first time and 1.5 hours for the second time, then add Flos Carthami, decoct for 20 minutes. Combine the decoctions, filter, concentrate the filtrate to about 500 ml, add 1250 ml of ethanol, stir thoroughly, stand for 24 hours, filter and concentrate in vacuum to a thick extract. Dilute with a quantity of water, filter, add 100 g sucrose or 0.3 g stevioside (without sucrose) and 3 g sodium benzoate, and preservatives, adjust pH to regulating range, add water to 1000 ml. Stir well, stand, filter, pack and sterilize.

Description A brownish-red and clear liquid; odour, slightly aromatic; taste, sweet, slightly bitter and astringent.

Identification Evaporate 20 ml of mixture to dryness, dissolve the residue in 20 ml of chloroform, heat under reflux for 30 minutes, allow to cool, filter, evaporate the filtrate to 1 ml as the test solution. Prepare a solution of 1.5 g of Radix Codonopsis reference drug, add a quantity of water, decoct for 2 times, 1 hour for each time, combine the decoction, filter, the filtrate in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed

with sodium carboxymethyl cellulose as the coating substances and the mixture of toluene, ethyl acetate and glacial acetic acid (1∶1∶0.1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Relative density Not less than 1.05 or 1.03 (with sucrose) (Appendix Ⅶ A).

pH value 4.5-6.5 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for mixture (Appendix Ⅰ J).

Assay Measure accurately 20 ml of the mixture, extract with chloroform by shaking for 2 times, 10 ml for each time, discard the chloroform extract. Extract with four 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extract, wash with successive quantities 50, 50 and 30 ml of ammonia TS, take the *n*-butanol solution, then wash with two 50-ml quantities of water saturated *n*-butanol. Evaporate the *n*-butanol solution to dryness, dissolve the residue in a quantity of methanol, transfer to a 2 ml volumetric flak, dilute to the volume and mix well, used as the test solution. Dissolve astragaloside Ⅳ CRS in methanol to prepare a reference solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of the upper layer of *n*-butanol, ethyl acetate and water (4∶1∶5) and methanol (10∶1) as the mobile phase. Apply accurately 5 μl of the test solution, 2 μl and 6 μl of the reference solution alternatively to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat to the spot clear at 100℃, remove, allow to cool, cover the plate with a glasses plate of the same size and fix up with adhesive plaster. Carry out the method for thin layer chromatography (Appendix Ⅵ A thin layer chromatographic scanning method), scan at the wavelength of $\lambda_S = 530$ nm, $\lambda_R = 700$ nm. Measure the integration values of the absorbance from the test solution and the reference solution respectively, and calculate the content.
It contains not less than 30 μg of astragaloside Ⅳ ($C_{41}H_{68}O_{14}$) per ml, referred to Radix Scutellariae.

Action To replenish *heart-qi* and promote blood circulation to resolve stagnated blood.

Indications Impeded flow of *yang-qi* in the chest due to a deficiency of *heart-qi* and accumulation of stagnated blood with manifestations of constriction in the chest and stabbing pain in the precardium, shortness of breath and lassitude; angina pectoris in coronary heart disease with above symptoms.

Usage and dosage 20 ml, twice a day.

Precaution Be cautious about pregnant women.

Strength 20 ml per phial

Storage Preserve in tightly closed.

Shuxiong Pian
(舒胸片)

Shuxiong Tablets

Ingredients Radix et Rhizoma Notoginseng 100 g; Flos Carthami 100 g; Rhizoma Chuanxiong 200 g.

Procedure Pulverize Radix et Rhizoma Notoginseng to fine powder, sift. Decoct Rhizoma Chuanxiong with water for 2 hours, filter, collect the filtrate in another container. Decoct the residue and Flos Carthami with water twice, each for 1 hour. Combine all decoctions, filter, allow the filtrate to stand for 24 hours. Separate the supernatant, filter, concentrate the filtrate, dry to a dry extract, then pulverize to fine powder, mix with the powder of Radix Notoginseng thoroughly, make granules and compress into 1000 tablets, coat with sugar.

Description Sugar coated tablets with brown core; odour, slight; taste, bitter.

Identification (1) Pulverize 20 tablets, removed the sugar coats, to fine powder, heat under reflux with 20 ml of ether for 1 hour, and filter. Evaporate the filtrate to dryness. Dissolve the residue in 2 ml of ether as the test solution. To 2 g of Rhizoma Chuanxiong reference drug, macerate in 10 ml of ether for 1 hour and filter. Evaporate the filtrate to dryness, dissolve the residue in 2 ml of ether as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃) and chloroform (1∶9) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug, solution.
(2) To 0.5 g of Radix et Rhizoma Notoginseng reference drug, add 20 ml of *n*-butanol saturated with water, ultrasonicate for 20 minutes, filter, wash with two 10-ml quantities of water and discard the washings. Evaporate the *n*-butanol solution to dryness, dissolve the residue in 1 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of chloroform, ethyl acetate, methanol and water (15∶40∶22∶10), stood at 5-10℃ for 12 hours, as the mobile phase. Apply separately 10 μl of the test solution obtained under Assay and 2 μl of the above reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat to the spots clear at 110℃. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Triturate 10 tablets, removed sugar coat and weighed accurately, to fine powder, weigh accurately 1 g of the powder, place in a Soxlhet's extractor, heat under reflux in 60 ml of ether for 2 hours, discard the ether extract, expel solvent from the drug residue. Heat the drug residue under reflux in 60 ml of methanol until the extract colourless, recover methanol to dryness. Dissolve the residue in 30 ml of water, extract with successive quantities of 20, 20, 10, 10, and 10 ml, of *n*-butanol saturated with water. Combine the extracts, wash with two 20-ml quantities of water, discard the washings. Recover *n*-butanol extract to dryness, dissolve the residue in a quantity of methanol, transfer to a 10 ml volumetric flask, dilute with methanol to the volume and mix well as the test solution. Dissolve ginsenoside Rg_1 CRS, accurately weighed, in methanol to prepare a solution containing 1.4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica

gel G as the coating substance and the lower layer of chloroform, ethyl acetate, methanol and water (15∶40∶22∶10), stood at 5-10℃ for 12 hours, as the mobile phase. Apply accurately to the plate 6 μl of the test solution, 1 μl and 4 μl of the reference solution alternatively. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. Cover with a same size glass on the plate, fix with an adhesive plaster. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan at the wavelength: λ_S = 540 nm, λ_R = 700 nm. Measure the integration values of absorbance of the test solution and the reference solution and calculate the content.

It contains not less than 1.0 mg of ginsenoside Rg_1 ($C_{42}H_{72}O_{14}$) per tablet, referred to Radix et Rhizoma Notoginseng.

Action To promote blood circulation to resolve stagnated blood and dredge meridians to kill pain.

Indications Chest impediment due to stagnated blood with manifestations of constriction in the chest and stabbing pain in the precardium; angina pectoris in coronary heart disease with above symptoms.

Usage and dosage 5 tablets, 3 times a day.

Precaution Be cautious about pregnant women; it is forbidden to prescribe to patients with *blood stagnation* in a *heat* syndrome.

Storage Preserve in tightly closed containers.

Shuzheng Pian
(暑症片)

Shuzheng Tablets

Ingredients Fructus Gleditsiae Abnormalis 80 g; Radix et Rhizoma Asari 80 g; Herba Menthae 69 g; Herba Pogostemonis 69 g; Radix Aucklandiae 46 g; Radix Angelicae Dahuricae 23 g; Radix Saposhnikoviae 46 g; Pericarpium Citri Reticulatae 46 g; Rhizoma Pinelliae (processed) 46 g; Radix Platycodonis 46 g; Radix et Rhizoma Glycyrrhizae 46 g; Rhizoma Dryopteris 46 g; Alumen (calcined) 23 g; Realgar 57 g; Cinnabaris 57 g.

Procedure Levigate Cinnabaris and Realgar to very fine powders, respectively. Pulverize Fructus Gleditsiae Abnormalis, Radix et Rhizoma Asari, Radix Angelicae Dahuricae, Alumen, and Radix Aucklandiae to fine powders, sift. Extract the volatile oil from Herba Pogostemonis, Herba Menthae and Pericarpium Citri Reticulatae, and filter the aqueous solution. Decoct Radix Platycodonis, Radix Saposhnikoviae, Rhizoma Dryopteris, Rhizoma Pinelliae, and Radix et Rhizoma Glycyrrhizae with water. Combine the decoctions and the above aqueous solution, concentrate to a quantity. Add starch to prepare a paste, then add the above powders, make granules and dry at a lower temperature. Add the volatile oil, mix thoroughly, compress into 1000 tablets.

Description Pale brownish-yellow tablets; odour, aromatic; taste, pungent.

Identification (1) Place 1 tablet, finely powdered, in a test tube, add 5 ml of water, shake, allow to stand, the vermilion precipitate and the orange precipitate are produced at the bottom of the test tube.

(2) Grind well 10 tablets to fine powder, add 40 ml of ether, ultrasonicate for 15 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 0.5 g of Radix Aucklandiae reference drug and 15 ml of ether as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and acetone (10∶3) as the mobile phase. Apply separately 4 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid, heat to the spots clear. The purplish-red to purplish-blue spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Extractives Carry out the method for determination of water-soluble extractives (Appendix Ⅹ A, the cold extraction method); not less than 25.0 per cent.

Assay Weigh accurately and pulverize 20 tablets, weigh accurately a quantity of the fine powder (equivalent to about 2 tablets), place in a 250 ml conical flask, add 25 ml of sulfuric acid and 2 g of potassium nitrate, heat until the extract becomes milky-white. Allow to cool, add 50 ml of water, mix well. Add dropwise 1% solution of potassium permanganate to the solution until the pink colour is produced, and add dropwise 2% solution of ferrous sulfate until the pink colour just disappears. Add 2 ml of the ferric ammonium sulfate IS, titrate with ammonium thiocyanate (0.1 mol/L) VS. 1 ml of ammonium thiocyanate (0.1 mol/L) VS corresponds to 11.63 mg of HgS.

It contains not less than 48 mg and not more than 60 mg of HgS per tablet, referred to Cinnabaris.

Action To expel *cold* and treat epidemic diseases, and resolve turbidity and resuscitate.

Indications Syncope, lockjaw, abdominal pain, vomiting, diarrhea and numbness of limbs due to affliction from pathogenic factors in summer.

Usage and dosage 2 tablets, 2-3 times a day, if necessary, a small quantity is insufflated into the nostrils for sneezing after ground into fine powder.

Precaution Contraindicated for pregnant women.

Storage Preserve in tightly closed containers.

Sijunzi Wan
(四君子丸)

Sijunzi Pills

Ingredients Radix Codonopsis 200 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 200 g; Poria 200 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 100 g.

Procedure Pulverize the four ingredients to fine powder, sift and mix thoroughly. Decoct 50 g of Rhizoma Zingiberis Recens and 100 g of Fructus Jujubae with water in portions and filter. Make pills with the decoctions and dry.

Description Brown watered pills; taste, slightly sweet.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate solution; hyphae colourless or pale brown, 4-6 μm in diameter. Anastomosing laticiferous tube 12-15 μm in diameter, containing fine granule-like contents. Needle crystals of

calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres.

(2) Pulverize 2 g of the pills, add 10 ml of *n*-hexane, ultrasonicate for 15 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of *n*-hexane as the test solution. Prepare a solution of 0.2 g of Rhizoma Atractylodis Macrocephalae reference drug and 2 ml of *n*-hexane in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (20∶0.1) as the mobile phase. Apply separately 10 μl of each of the two freshly prepared solutions to the plate. After developing and removal of the plate, dry in air. Spraying with 5% vanillin in sulfuric acid and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Grind well 5 g, add 40 ml of water, decoct for 30 minutes, and filter. Extract the filtrate with three 15-ml quantities of *n*-butanol. Combine the *n*-butanol extracts, wash with three 10-ml quantities of water. Evaporate the *n*-butanol liquid to dryness, and dissolve the residue in 0.5 ml of methanol as the test solution. Prepare a solution of 0.5 g of Radix et Rhizoma Glycyrrhizae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance mixed with 1% solution of sodium hydroxide and a mixture of ethyl acetate, formic acid, glacial acetic acid and water (15∶1∶1∶2) as the mobile phase. Apply separately 4 μl of the test solution and 1 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulphuric acid in ethanol and heat at 105℃ to the spots clear. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To invigorate the spleen and replenish *qi*.

Indications Anorexia and loose stools due to *qi* deficiency in the spleen and stomach.

Usage and dosage 3-6 g, 3 times a day.

Storage Preserve in tightly closed containers, protected from moisture.

Sini Tang (四逆汤)

Sini Mixture

Ingredients Radix Aconiti Lateralis Praeparata 300 g; Rhizoma Zingiberis 200 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 300 g.

Procedure Decoct Radix Aconiti Lateralis Praeparata and Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle twice for 2 and 1.5 hours respectively. Combine the decoctions and filter. Extract the volatile oil from Rhizoma Zingiberis by steam distillation and collect in a separate container. Decoct the residue of Rhizoma Zingiberis with water for 1 hour. Combine the decoction with the solution remained after distillation and filter. Combine the filtrate with the decoction of Radix Aconiti and Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle and concentrate to about 400 ml. Allow to cool, add 1200 ml of ethanol, stir thoroughly. Allow to stand for 24 hours, filter and concentrate in vacuum to a thick extract. Dilute the extract with a quantity of water, preserve in cool place for 24 hours and filter. Add 300 ml of simple syrup, a quantity of preservatives and the above volatile oil. Add water to make to 1000 ml, stir thoroughly, pack and sterilize.

Description A brownish-yellow liquid; odour, aromatic; taste, sweet and pungent.

Identification (1) Extract 20 ml of the mixture with 20 ml of *n*-butanol by shaking, evaporate the *n*-butanol extract to dryness and dissolve the residue in 2 ml of methanol as the test solution. To 1 g of Radix et Rhizoma Glycyrrhizae reference drug, add 40 ml of ether, heat under reflux for 1 hour, filter, discard the ether extract. Add 30 ml of methanol to the drug residue, heat under reflux for 1 hour, filter, evaporate the filtrate to dryness, dissolve the residue in 20 ml of water as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 1% solution of sodium hydroxide as the coating substance and a mixture of ethyl acetate, glacial acetic acid, formic acid and water (15∶1∶1∶2) as the mobile phase. Apply separately 2 μl of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with 10% solution of sulfuric acid in ethanol, heat to the spots clear at 105℃, examine under ultraviolet at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference drug solution.

(2) To 5 g of Rhizoma Zingiberis reference drug, add 30 ml of water, heat under reflux for 1 hour, allow to cool, filter, extract the filtrate with 40 ml of *n*-butanol by shaking, evaporate the *n*-butanol to dryness and dissolve the residue in 2 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of cyclohexane and ether (1∶1) as the mobile phase. Apply separately 5 μl of the test solution obtained under the test of Identification (1) and the reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with solution of vanillin in sulfuric acid TS, heat to the spots clear at 105℃, examine under ultraviolet at 365 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference drug solution.

Limit test for aconitine Measure 70 ml of the mixture, adjust to pH 10 with concentrated ammonia TS, extract with three 100-ml quantities of ether, recover the ether to dryness, and dissolve the residue in 2 ml of dehydrated ethanol as the test solution. Dissolve aconitine CRS and hypaconitine CRS in dehydrated ethanol to prepare a mixture containing 2 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and the lower layer of a mixture of chloroform, ethyl acetate and concentrated ammonia TS (5∶5∶1) as the mobile phase. Apply separately 6 μl of the test solution and 5 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with dilute solution of potassium heptaiodobismuthate. The spots in the chromatogram obtained with the test solution are smaller or no in position and colour than the spots in chromatogram

obtained with the reference solution.

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, 0.2 mol/L solution of ammonium acetate and glacial acetic acid (67∶33∶1) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of glycyrrhizinate.

Reference solution Dissolve 10 mg of ammonium glycyrrhizinate CRS, weigh accurately in a 25 ml volumetric flask, dilute with mobile phase to volume, and mix well. (containing 0.40 mg of ammonium glycyrrhizinate per ml, equivalent to 0.3918 mg of glycyrrhizinate).

Test solution Measure accurately 10 ml of the mixture to a 50 ml volumetric flask, dilute with mobile phase to the volume, mix well, and filter.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.50 mg of glycyrrhizinate ($C_{42}H_{62}O_{16}$) per ml, referred to Radix et Rhizoma Glycyrrhizae.

Action To warm the *middle-energizer* and expel *cold*, and restore *yang* from collapse.

Indications Collapse due to severe *yang* deficiency with manifestations of cold sweating, cold limbs, diarrhea with undigested food, and faint pulse.

Usage and dosage 10-20 ml, 3 times a day or follow doctor's advice.

Strength 10 ml per phial

Storage Preserve in tightly closed containers, stored in a cool place.

Sishen Wan
(四神丸)

Sishen Pills

Ingredients Semen Myristicae (simmered) 200 g; Fructus Psoraleae (stir-baked with salt) 400 g; Fructus Schisandrae Chinensis (processed with vinegar) 200 g; Fructus Evodiae (processed) 100 g; Fructus Jujubae (removed from kernel) 200 g.

Procedure Pulverize the above five ingredients to fine powder, sift and mix thoroughly. Crush 200 g of Rhizoma Zingiberis Recens into pieces, add a quantity of water and press for juice. Make pills with the fine powder and the juice, and dry.

Description Pale brown to brown watered pills; odour, slightly aromatic; taste, bitter and salty, slightly sour and pungent.

Identification (1) Microscopical: Stone cell of epidermis of testa pale yellowish-brown, subpolygonal in surface view, with relatively thickened walls and fine pit-canals, lumina containing dark brown contents. Nonglandular-hair 2-6-celled sometimes lumina containing reddish-brown contents. Glandular hairs with a multicellular elliptical head, containing brownish-yellow to brownish-red contents, and a 2-5-celled stalk. Epidermis cells of pericarp yellowish-brown to reddish-brown, subpolygonal in surface view, the thickness of cuticle about 10 μm in sectional view.

(2) To 10 g, finely powdered, carry out the method for the determination of volatile oil (Appendix Ⅹ D), add 2 ml of benzene and a quantity of water, heat under reflux for 1 hour, and use the benzene liquid as the test solution. Prepare a solution of 1 g of Semen Myristicae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and benzene (1∶1) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with a 10% sulphuric acid in ethanol and heat to the spots clear. The major spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) To 2 g, finely powdered, add 20 ml of ethyl acetate, heat under reflux for 10 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 2 ml of ethyl acetate as the test solution. Dissolve psoralen CRS and isopsoralen CRS in ethyl acetate to prepare a mixture containing 2 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (4∶1) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 10% potassium hydroxide in methanol. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(4) To 1 g, finely powdered, add 10 ml of ethanol, heat under reflux on a water bath for 1 hour, filter, and use the filtrate as the test solution. Prepare a solution of 0.1 g of Fructus Evodiae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of *n*-butanol, acetic acid and water (2∶1∶1) as the mobile phase. Apply separately to the plate 2 μl of each of the two solutions. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A), except that the times limitation for disintegration time is within 2 hours.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (30∶70) as the mobile phase. As detector a spectrophotometer set at 245 nm. The number of theoretical plates of the column is not less than 6000, calculated with the reference to the peak of psoralen.

Reference solution Dissolve respectively a quantity of psoralen CRS and isopsoralen CRS, weighed accurately, in methanol to prepare a mixture containing 16 μg of each per ml as the reference solution.

Test solution Grind well the pills, weigh accurately 1 g in a stopper conical flask, add accurately 100 ml of 70% methanol, stopper well, and weigh. Ultrasonicate (power,

300 W; frequency, 33 kHz) for 20 minutes, cool, weigh again, replenish the lost weight with 70% methanol, mix well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 3.0 mg of the total amount of psoralen ($C_{11}H_6O_3$) and isopsoralen ($C_{11}H_6O_3$) per gram, referred to Fructus Psorled.

Action To warm the kidney and disperse *cold*, astringe the intestines to check diarrhea.

Indications Diarrhea due to a deficiency of *kidney-yang* with manifestations of borborygmus, abdominal bloating, or dawn diarrhea, poor appetite, indigestion, or chronic diarrhea with sallow complexion and cold limbs.

Usage and dosage 9 g, 1-2 times a day.

Storage Preserve in tightly closed containers, protected from moisture.

Siwei Tumuxiang San (四味土木香散)

Siwei Tumuxiang Powder

Siwei Tumuxiang Powder is a prescription used by Mongolian Nationality.

Ingredients Radix Inulae Racfmosae 200 g; Radix Sophorae Flavescentis (barked) 200 g; Caulis Rubi Idaei (barked and pithed) 100 g; Rhizoma Kaempferiae 50 g.

Procedure Pulverize the above four ingredients to coarse powder, sift and mix thoroughly.

Description A yellowish-white powder; odour, aromatic; taste, extremely bitter and slightly astringent.

Identification (1) Starch granules rounded, elliptical or subtriangle, 10-30 μm in diameter, sometimes showing striations. Parenchymatous cells colourless, oblong or long polygonal, containing fan-shaped inulin masses. Fibre bundles colourless, surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres.

(2) Take 0.5 g of the powder, add 4 ml of methanol, tightly stopper, extract by shaking, allow to stand for 30 minutes, filter and use the filtrate as the test solution. Dissolve alantolactone CRS and isoalantolactone CRS in methanol to prepare a mixture containing 2 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 0.25% solution of silver nitrate as the coating substance and a mixture of petroleum ether (60-90℃), benzene and ethyl acetate (5∶1∶1) as the mobile phase. Apply separately 5 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 5% anise aldehyde in sulfuric acid and heat to the spots clear. Two bluish-purple spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(3) Take 1 g of the powder, add 25 ml of chloroform and 0.3 ml of concentrated ammonia TS, allow to stand overnight, filter, evaporate the filtrate to the dryness and dissolve the residue in 0.5 ml of chloroform as the test solution. Dissolve matrine CRS and sophoridine CRS in ethanol to prepare a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 2% solution of sodium hydroxide as the coating substance and a mixture of benzene, acetone and methanol (8∶3∶0.5) as the mobile phase. Apply separately 6 μl of the test solution and the reference solution to the plate. After developing to 8 cm and removal of the plate, dry in air, and then using the upper layer of the mixture of toluene, ethyl acetate, methanol and water (2∶4∶2∶1), stored at 10℃, as the mobile phase. After developing to the same distance and removal of the plate, dry in air, spray with potassium heptaiodobismuthate TS. The orange-red spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(4) Take 3 g of the powder, add 20 ml of methanol, ultrasonicate for 10 minutes, filter and use the filtrate as the test solution. Dissolve ethyl-*p*-methoxycinnamate CRS in methanol to prepare a solution containing 5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of hexane and ethyl acetate (18∶1) as the mobile phase. Apply separately 4 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for teas (Appendix Ⅰ T).

Action To cure exterior syndromes in epidemic diseases.

Indications Epidemic diseases at the early stage with chills, fever, headache, cough, sore throat and chest pain.

Usage and dosage 2.5-3.6 g, 2-3 times a day in decoction form.

Strength 20 g per pack

Storage Preserve in tightly closed containers, protected from moisture.

Siwei Zhenceng Bingpeng Diyanye (四味珍层冰硼滴眼液)

Siwei Zhenceng Bingpeng Eye Drops

Ingredients Pearl Powder; Borneolum, Borax; Boric Acid.

Procedure To Pearl Powder, add the distilled water, stir well, heat to boil, macerate warmly for 48 hours with stirring one time per 2 hours, allow to cool, and filter. Evaporate the filtrate to an appropriate quantity, allow to cool, filter, and examine the total amount of nitrogen. Dissolve borax, Boric Acid and a quantity of sodium chloride in water by heating and stirring, add warmly an appropriate quantity of ethylene glycol monophenyl ether and the above solution of the pearl powder, stir well, heat to 100℃ for 30 minutes, and allow to cool. Dissolve Borneolum in an appropriate quantity of ethanol, add slowly the above solution with stirring, stir well, dilute to volume with the distilled water, mix well and filter.

Description A clear, nearly colourless or pale yellow liquid; odour, aromatic.

Identification (1) To 1 ml, add 2 drops of 10% solution of sodium hydroxide, shake well, add dropwise 0.5% cupric sulfate TS, shake well; a violet-red colour is produced.

(2) To 1 ml, add 3 ml of sulfuric acid, shake well, add

12 ml of methanol, fire; flame with green colour edge is produced.
(3) To 15 ml, extract with two 10-ml quantities of ether, combine the extracts, evaporate to 2 ml as the test solution. Dissolve 2 mg of (+) borneol CRS in ether to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and petroleum ether (30-60℃) and ethyl acetate (9 : 1) as the mobile phase. Apply separately 2 μl of each of the two solutions to a plate. After developing and removal of the plate, dry in air, spray with 1% vanillin of 10% sulfuric acid in ethanol, heat at 105℃ until the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(4) To 15 ml, add 0.3 ml of sulfuric acid, heat on a water bath for 2 hours, stand to cool, apply to a column of hydrogen type of cation exchange resin (1.5 cm in diameter, 10 cm high), wash with 200 ml of water, discard the washing, elute with 100 ml of 10% solution of ammonia, collect the eluate, evaporate to dryness, and dissolve with 1 ml of dilute ethanol as the test solution. Dissolve a quantity of DL-aminopropionic acid CRS and glycine CRS with dilute ethanol to prepare a mixture solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of *n*-butanol, glacial acetic acid and water (4∶1∶1) as the mobile phase. Apply separately 4 μl of the test solutions and 1 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with ninhydrin TS and heat at 105℃ to spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

pH value 7.0-7.8 (Appendix Ⅶ G).

Other requirements Comply with general requirements for eye preparation (Appendix Ⅰ Y).

Assay ***Total Nitrogen*** Measure accurately 10 ml, carry out the method for the determination of Nitrogen (Appendix Ⅸ L, Method 2).
It contains not less than 93 μg and not more than 107 μg per ml of total amount of nitrogen.

Borneolum Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and system suitability Use a column packed with 10% polyethylene glycol (PEG)-20 M as the stationary phase, column temperature gradient: initial temperature 140℃, maintain 12 minutes, increase at 10℃ per minute to 170℃, maintain 10 minutes. The number of theoretical plates of the column is not less than 1900, calculated with reference to the peak of (+)-borneol.

Correction factor Dissolve a quantity of methylsalicylate, accurately weighed, in ethyl acetate to prepare a solution containing 1 mg per ml as internal standard solution. Dissolve a quantity of (+)-borneol CRS, accurately weighed, in a 25 ml volumetric flask, dissolve with the internal standard solution and dilute to volume. Inject accurately 2 μl of the solution into the column, and calculate the correction factor.

Procedure Measure accurately 5 ml of the eye drops in a stopper tube, add accurately 5 ml of the internal standard solution, shake, and extract. Stand for layer separation, separate the supernatant liquid, inject 2 μl into the column and calculate the content.
It contains not less than 0.28 mg of (+)-borneol ($C_{10}H_{18}O$) per ml, referred to Borneolum.

Action To clear *heat* and relieve spasm, and remove nebula to improve vision.

Indications Unable to stare, mild distending pain of eyes, ophthalmalgia, or juvenile decline of distant vision due to a deficiency of *liver-yin* and abundance of *liver-qi*; juvenile pseudomyopia, asthenopia and mild glaucoma with above symptoms.

Usage and dosage Drop inside the eyelids. 1-2 drops, 3-5 times a day.

Strength (1) 8 ml per bottle (2) 15 ml per bottle

Storage Preserve in tightly closed container, stored in a cool place.

Siwu Heji (四物合剂)

Siwu Mixture

Ingredients Radix Angelicae Sinensis 250 g; Rhizoma Chuanxiong 250 g; Radix Paeoniae Alba 250 g; Radix Rehmanniae Praeparata 250 g.

Procedure Macerate Radix Agelicae Sinensis and Rhizoma Chuanxiong for 0.5 hour, steam distill, collect 250 ml of the distillation, store the distillation aqueous liquid for later use. Decoct the drug residue left by distillation, Radix Paeoniae Rubra and Radix Rehmanniae Praeparata with water for 3 times, 1 hour for the first time, 1.5 hour for the second and third times respectively, combine the decoction, filter, combine the filtrate and the distillation aqueous liquid, evaporate to sufficient quantity, add ethanol to a content of 55% ethanol, allow to stand for 24 hour, filter, recover the ethanol, evaporate to a thin extract with a relative density of 1.26-1.30 (55-65℃), add the above distillation, 3 g of sodium benzoate and a quantity of correctant, add water to 1000 ml, filter and pack.

Description Brownish-red or dark brown liquid; odour, aromatic; taste, slightly bitter and slightly sweet.

Identification (1) Extract 20 ml of the mixture with three 20-ml quantities of ether, combine the ether extracts, evaporate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. To 0.5 g of Radix Angelicae Sinensis reference drug and Rhizoma Chuanxiong reference drugs add respectively 15 ml of ether, ultrasonicate for 5 minutes, filter, evaporate the filtrates to dryness, dissolve the residue in 1 ml of ethyl acetate as the reference drug solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9∶1) as the mobile phase. Apply separately 5 μl of each of above three solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The main fluorescence spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solutions.
(2) Extract the aqueous liquid obtained under the test of Identification (1) with two 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, wash with water saturated with *n*-butanol for 2 times, evaporate the *n*-butanol extract to dryness, dissolve the residue in 1 ml of ethanol as the test solution. Dissolve paeoniflorin CRS in ethanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer

chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40∶5∶10∶0.2) as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Extract 30 ml of the mixture with two 20-ml of ethyl acetate, combine the ethyl acetate extracts and evaporate to about 1 ml as the test solution. Prepare a solution of 3 g of Radix Rehmanniae reference drug, add 60 ml of water, decoct for 1 hour, filter, and the filtrate in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of toluene and ethyl acetate (1∶1) as the mobile phase. Apply separately 5-10 μl of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, and spray with Dinitriophenylhydrazine TS. The main yellowish-brown spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Relative density Not less than 1.06 (Appendix Ⅶ A).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of isopropanol, methanol, acetic acid and water (2∶25∶2∶71) as the mobile phase. As detector a spectrophotometer set at 230 nm. Maitain the column temperature at 35℃. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, weighed accurately, in water to prepare a solution containing 0.1 mg per ml as the reference solution.

Test solution Measure accurately 1 ml of the mixture in a 25 ml volumetric flask, dilute with water to the volume, mix thoroughly, filter and use the filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 1.6 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per ml, referred to Radix Paeoniae Alba.

Action To nourish blood and regulate menstruation.

Indications Sallow complexion, dizziness, blurred vision, palpitation, shortness of breath, and menstrual disorders due to blood deficiency.

Usage and dosage 10-15 ml, 3 times a day.

Strength (1) 10 ml per phial (2) 100 ml per bottle

Storage Tightly closed, stored in a cool and dark place.

Sizheng Wan
(四正丸)

Sizheng Pills

Ingredients Herba Pogostemonis 90 g; Herba Moslae 90 g; Folium Perillae 90 g; Radix Angelicae Dahuricae 90 g; Lignum Santali Albi 30 g; Fructus Chaenomelis 90 g; Rhizoma Pinelliae Praeparata 90 g; Cortex Magnoliae Officinalis (stir-baked with ginger juice) 90 g; Pericarpium Arecae 90 g; Pericarpium Citri Reticulatiae 90 g; Rhizoma Atractylodis Macrocephalae (processed with bran) 90 g; Radix Platycodonis 90 g; Poria 90 g; Semen Arecae 30 g; Fructus Aurantii (stir-baked with bran) 90 g; Fructus Crataegi (stir-baked) 30 g; Massa Medicata Fermentata (stir-baked with bran) 90 g; Fructus Hordei Germinatus (stir-baked) 30 g; Semen Lablab Album (removed from testa) 90 g; Radix et Rhizoma Glycyrrhizae 90 g.

Procedure Pulverize the above 20 ingredients to fine powder, sift and mix thoroughly. To each 100 g of the powder add 170-180 g of refined honey to make big honeyed pills.

Description Dark brown big honeyed pills; odour, aromatic; taste, sweet and slightly bitter.

Identification (1) Microscopical: Mesophyll tissues containing tinny clusters of calcium oxalate, 4-8 μm in diameter. Irregular branched masses colourless, dissolved gradually on mounting in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Fibres in bundles, thickened and, surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Pieces of endoblastic cells white, walls thickened, with numerous large subrounded pits.

(2) Grind well 6 g, cut into pieces, with 4 g of kieselguhr, add 30 ml of methanol, ultrasonicate for 10 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 20 ml of dilute hydrochloric acid, and extract with three 20-ml quantities of chloroform. Combine the chloroform extracts, then extract with three 20-ml quantities of 2% solution of sodium hydroxide. Combine the sodium hydroxide extracts, adjust to pH 1-2 with hydrochloric acid. Extract with three 20-ml quantities of chloroform. Combine the chloroform extracts, dehydrate with anhydrous sodium sulphate, evaporate to dryness, and dissolve the residue in 0.5 ml of methanol as the test solution. Dissolve magnolol CRS and honokiol CRS in methanol to prepare a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and methanol (27∶1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulphuric acid and heat at 105℃ for several minutes. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.5% solution of acetic acid (39∶

61) as the mobile phase. As detector a spectrophotometer set at 283 nm. Maintain the column temperature at 40℃. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of hesperidine.

Reference solution Dissolve ammonium hesperidine CRS in methanol to prepare a solution containing 40 μg per ml as the reference solution.

Test solution Pulverize 2 g of the pills, obtained under the test of weight variation, weigh accurately to a stopper conical flask, add accurately 50 ml of methanol, weigh, ultrasonicate (power, 250 W; frequency, 33 kHz) for 45 minutes. Allow to cool, weigh again, replenish the lost weight with methanol, mix well, filter and use the filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 7.0 mg of hesperidine ($C_{28}H_{34}O_{15}$) per pill, referred to Pericarpium Citri Reticulatiae and Fructus Aurantii.

Action To clear *summer-heat* and release the exterior, and resolve *dampness* to arrest diarrhea.

Indications Dizziness, heavy body, aversion to cold and fever, nausea, vomiting, poor appetite, abdominal bloating and diarrhea due to retention of *dampness* in the interior and affliction from external *wind-cold*.

Usage and dosage 2 pills, 2 times a day, taken with ginger soup or boiled water.

Strength 6 g per pill

Storage Preserve in tightly closed containers.

Songling Xuemaikang Jiaonang (松龄血脉康胶囊)

Songling Xuemaikang Capsules

Ingredients Song Leaf Recence; Radix Puerariae Lobatae; Pearl Powder.

Procedure Decoct Song Leaf Recence and Radix Puerariae Lobatae with water twice, 1.5 hours for each time, filter, combine the filtrate, concentrate to a quantity, dry by spraying, add Pearl Powder; a quantity of starch; talcum powder and magnesium stearate, mix well, pack into capsules.

Description Capsules containing pale brown to brown powder; odour, slight; taste, bitter.

Identification (1) To 3 g of the contents, add 50 ml of water, macerate for 2 hours, and filter, add 10 g of polyamide to the filtrate, stir well, macerate for 40 minutes, filter. Wash the polyamide with water to the washing nearly colourless, filter, discard the filtrate, macerate the residue with 30 ml of acetone for 12 hour, filter. Evaporate the filtrate to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Dissolve puerarin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance, and a mixture of chloroform, ethyl acetate, methanol, diethylamine and water (13∶20∶14∶1∶5) as the mobile phase. Apply separately 5 μl of the above two solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) To 5 g of Song Leaf reference drug, add 100 ml of water, boil for 30 minutes, cool and filter. Prepare the filtrate in the same manner as described under the test solution obtained under the test of Identification (1), beginning at the words "add 10 g of polyamide", to prepare a solution as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance, and a mixture of chloroform, ethyl acetate and formic acid (14∶6∶1) as the mobile phase. Apply separately 10 μl of the test solution of the Identification (1) and 10 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Expose to ammonia vapour, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use Octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, acetic acid and water (25∶3∶72) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of puerarin.

Reference solution Dissolve a quantity of puerarin CRS, accurately weighed, in dilute ethanol to prepare a solution containing 40 μg per ml.

Test solution Weigh accurately about 0.15 g of the mixed contents, obtained under the test of weight variation, place in a stopper conical flask, add accurately 50 ml of dilute ethanol, weigh and ultrasonicate (power, 250 W; frequency, 50 kHz) for 30 minutes, allow to cool, weigh again, replenish the lost weight with dilute ethanol, mix well and filter, using the filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, calculate the content.
It contains not less than 7.5 mg of puerarin ($C_{21}H_{20}O_9$) per capsule, referred to Radix Puerariae.

Action To pacify the liver to restrain hyperactivity of *yang*, and anchor the mind.

Indications Headache, dizziness, restlessness, palpitation, insomnia due to hyperactivity of *liver-yang*; hypertension and primary hyperlipemia with above symptoms.

Usage and dosage 3 capsules, 3 times a day, or follow doctor's advice.

Strength 0.5 g per capsule

Storage Preserve in tightly closed containers.

Suhexiang Wan
(苏合香丸)

Suhexiang Pills

Ingredients Styrax 50 g; Benzoinum 100 g; Borneolum Syntheticum 50 g; Pulvis Cornus Bubali Concentratus 200 g; Moschus 75 g; Lignum Santali Albi 100 g; Lignum Aquilariae Resinatum 100 g; Flos Caryophylli 100 g; Rhizoma Cyperi 100 g; Radix Aucklandiae 100 g; Olibanum (processed) 100 g; Fructus Piperis Longi 100 g; Rhizoma Atractylodis Macrocephalae 100 g; Fructus Chebulae (cored) 100 g; Cinnabaris 100 g.

Procedure Levigate Cinnabaris to very fine powder. Pulverize the other ingredients except Styrax, Moschus, Borneolum Syntheticum and Pulvis Cornus Bubali Concentratus, to fine powder. Triturate Moschus, Borneolum Syntheticum and Pulvis Cornus Bubali Concentratus with the above powders, sift and mix thoroughly. Melt Styrax, mix well with the above powder, add a quantity of refined honey and water to make 960 water-honeyed pills and dry at a lower temperature; or add a quantity of refined honey to make 960 big honeyed pills.

Description Vermilion water-honeyed pills or ochre big honeyed pills; odour, aromatic, taste, slightly bitter and pungent.

Identification (1) Microscopical: Secretory cells subrounded, containing yellowish-brown to reddish-brown secretion and surrounded by radially arranged cells. Crystal cells square or rectangular, with thickened and lignified walls, striation well-defined containing prisms of calcium oxalate. Bordered pitted vessels with dense pits, containing pale yellow or yellowish-brown resinous contents. Fibre layers of pericarp pale yellow, obliquely crisscrossed, with thin and pitted walls. Pollen grains triangular, about 16 μm in diameter. Irregular fragments greyish white pale greyish-yellow, slightly lustrous, densely covered with minute greyish-brown granules and irregular longitudinal clefts on the surface. Irregular fine granules dark brownish-red, lustrous, with dark black edge.

(2) To 0.3 g of the pills, pulverize the water-honeyed pills to fine powder or cut the big-honeyed pills into pieces, add 15 ml of ethyl acetate, ultrasonicate for 2 minutes and filter. Concentrate the filtrate to almost dryness, and then dissolve in 0.5 ml of ethyl acetate as the test solution. Dissolve a mixture of (±)-borneol and (±)-isoborneol CRS in ethyl acetate to prepare a mixture containing 2.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and acetone (9∶1) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, and dry in air. Spray with 5% vanillin in sulfuric acid and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(3) To 1 g of the pills, pulverize the water-honeyed pills to fine powder or cut the big honeyed pills into pieces, add 25 ml of chloroform, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of chloroform as the test solution. Dissolve piperine CRS in chloroform to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (1∶1) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, and dry in air. Spray with a solution of sulfuric acid in ethanol (1→10), and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot in the chromatogram obtained with the reference solution.

(4) Pulverize 1 g of the pills, pulverize the water-honeyed pills to fine powder or cut the big honeyed pills into pieces, add 5 ml of ether, shake and filter, use the filtrate as the test solution. Dissolve muscone CRS in ether to prepare a solution containing 0.1 mg per ml as the reference solution. Carry out the method for gas chromatography (Appendix Ⅵ E), using a 2 m long column packed with a mixture of 1.64% polyethylene glycol (PEG)-20M and 1.32% methyl polysiloxane (SE-30) as the stationary phase, maintain the column temperature at 180℃. Inject a quantity volume of the test solution and the reference solution respectively into the column, the retention time of the peaks obtained with the test solution and the reference solution is concordant with each other.

(5) To 6 g of the pills, pulverize the water-honeyed pills to fine powder or cut the big-honeyed pills into pieces, mix well with 3 g of kieselguhr, add 50 ml of ether, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of ether, apply to a column (1.5 cm in inner diameter) packed with neutral alumina (100-200 mesh, 8 g). Elute with 30 ml of ether, and collect the eluates. Evaporate to dryness and dissolve the residue in 1 ml of petroleum ether (60-90℃) as the test solution. Dissolve Styrax reference drug in petroleum ether (60-90℃) to prepare a solution containing 25 μl per ml as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (30-60℃), *n*-hexane, ethyl acetate and formic acid (10∶30∶15∶1) as the mobile phase. Apply separately 3 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, macerate in the solution of sulphuric acid in ethanol (1→10) for a moment, remove, blow to dry, heat at 105℃ to the spots clear, examine under the ultraviolet light at 254 nm. The main fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(6) To 6 g of the pills, pulverize the water-honeyed pills to fine powder or cut the big-honeyed pills into pieces, mix well with 3 g of kieselguhr, add 50 ml of ethyl acetate, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 25 ml of water by ultrasonicating, filter, wash the residue with two 20-ml quantities of *n*-butanol saturated with water, filter, combine the filtrate and the above filtrate, shake. Separate the *n*-butanol extracts, wash with two 30-ml quantities of water saturated with *n*-butanol. Evaporate the n-butanol extracts to dryness and dissolve the residue in 1 ml of ethyl acetate as the test solution. To 1 g of Fructus Chebulae reference drug, add 20 ml of ethyl acetate, ultrasonicate for 20 minutes, filter and use the filtrate as the reference drug solution. Dissolve gallic acid CRS in ethyl acetate to prepare a solution containing 0.3 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, ethyl acetate and formic acid (5∶4∶1) as the mobile phase. Apply separately 3 μl of the test solution, the reference drug solution, and the reference

solution to the plate. After developing and removal of the plate, dry in air, spray with 2% ferric chloride in ethanol. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and reference solution.

(7) Apply the test solution obtained under the test of Identification (6) to a column (1.5 cm in inner diameter) packed with neutral alumina (100-200 mesh, 6 g). Elute with 80 ml of ethyl acetate, and collect the eluates. Evaporate to dryness and dissolve the residue in 1 ml of ethyl acetate as the test solution. To 0.5 g of Radix Aucklandiae reference drug, add 20 ml of ethyl acetate, ultrasonicate for 20 minutes, filter and use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (17∶3) as the mobile phase. Apply separately 5 μl of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with a solution of sulphuric acid and ethanol (1→10), heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To resuscitate with aromatics, and move *qi* to kill pain.

Indications Syncope or coma due to *phlegm*, hemiplegia in stroke, immobilized limbs, sunstroke and pain in the heart and stomach due to *phlegm* misting the heart.

Usage and dosage 1 pill, 1-2 times a day.

Precaution Contraindicated for pregnant women.

Storage Preserve in tightly closed containers.

Suoyang Gujing Wan
(锁阳固精丸)

Suoyang Gujing Pills

Ingredients Herba Cynomorii 20 g; Herba Cistanches (steamed) 25 g; Radix Morindae Officinalis (processed) 30 g; Fructus Psoraleae (stir-baked with salt) 25 g; Semen Cuscutae 20 g; Cortex Eucommiae (carbonized) 25 g; Fructus Anisi Stellati 25 g; Semen Allii Tuberosi 20 g; Semen Euryales (stir-baked) 20 g; Semen Nelumbinis 20 g; Stamen Nelumbinis 25 g; Concha Ostreae (calcined) 20 g; Os Dragonis (calcined) 20 g; Cornu Cervi Degelatinatum 20 g; Radix Rehmanniae Praeparata 56 g; Fructus Corni (processed) 17 g; Cortex Moutan 11 g; Rhizoma Dioscoreae 56 g; Poria 11 g; Rhizoma Alismatis 11 g; Rhizoma Anemarrhenae 4 g; Cortex Phellodendri 4 g; Radix Achyranthis Bidentatae 20 g; Halitum 25 g.

Procedure Pulverize the above twenty-four ingredients to fine powder, sift, mix thoroughly. To each 100 g of powder add 30-40 g of refined honey and a quantity of water to make water-honeyed pills, dry, coat with corn protein, dry in air; or add 110-130 g of refined honey to make big honeyed pills.

Description Brown to blackish-brown water-honeyed pills or big honeyed pills; odour, slight; taste, bitter.

Identification (1) Microscopical: Irregular branched masses, colourless, dissolved in chloral hydrate solution; hyphae colourless or pale brown, 4-6 μm in diameter. Palisade cells of testa, 2 rows, with inner cells longer than outer ones, and lustrous band. Stone cells of testa subpolygonal, walls extremely thickened, sinuous, lumina branched, contain brownish-dark content. Stone cells slightly branched or fibre-shaped. Fibre bundles, bright yellow, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres, walls of crystal cells thickened and lignified. Wood fibres in bundles, walls thin, unlignified; pit obliquely fissured, V-shaped or cross-shaped. Rubber slivers strip-shaped or twisted into masses, surface granular. Parenchyma greyish-brown to blackish-brown, cells mostly shrun-ken, and each containing a brown nucleus-like mass. Parenchymatous cells subrounded, pits elliptical, gathered in pit areas. Raphides of calcium oxalate occurring in mucilage cells, 80-240 μm long, needle crystals 2-5 μm in diameter. Needle crystals of calcium oxalate in bundles or scattered, 26-110 μm long. Epidermal cells of pericarp orange-yellow, subpolygonal in surface view, anticlinal walls slightly beaded. Cork cells pale red to slight violet, walls slightly thickened, frequently overlapped. Irregular fragments translucent, edge strongly refractive, surface showing fine, short striations, small holes, and narrow fissures. Irregular fragments pale greyish-brown, some with uneven striations. Irregular fragments colourless or pale yellowish-brown, with fine striations on surface.

(2) Pulverize 6 g of the water-honeyed pills to fine powder, or cut 9 g of the big-honeyed pills into pieces and mix well with 5 g of kieselguhr, add 30 ml of petroleum ether (60-90℃), heat under reflux for 30 minutes, filter, dry the drug residue in the air, add 30 ml of ethyl acetate, heat under reflux for 30 minutes, filter. Evaporate the filtrate to dryness and dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 0.2 g of Fructus Psoraleae reference drug in the same manner as the reference drug solution. Dissolve psoralen CRS and isopsoralen CRS in ethyl acetate to prepare a mixture containing 1 mg of each per ml as the reference resolution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (60-90℃), chloroform and ether (5∶5∶1) as the mobile phase. Apply separately 10 μl of the test solution and the reference drug solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, examine under the ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

(3) Pulverize 6 g of the water-honeyed pills to fine powder, or cut 9 g of the big-honeyed pills into pieces and mix well with 6 g of kieselguhr, add 30 ml of ether, heat under reflux for 1 hour, filter, recover the ether to dryness and dissolve the residue in 1 ml of acetone as the test solution. Dissolve paeonol CRS in acetone to prepare a solution containing 1 mg of per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of cyclohexane and ethyl acetate (3∶1) as the mobile phase. Apply separately 10-20 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spry with 5% ferric chloride in ethanol acidified with hydrochloride acid, heat to the spots clear. The bluish-brown spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Pulverize 6 g of the water-honeyed pills to fine powder, or cut 9 g of the big-honeyed pills into pieces, add 30 ml of methanol, ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 5 ml of methanol, filter and use the filtrate as the test solution. Prepare a solution of 0.05 g of Cortex Phellodendri Chinensis reference drug in the same manner as the reference drug solution. Dissolve stachydrine hydrochloride CRS in methanol to prepare a solution containing 0.05 mg of per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia TS (12:6:3:3:1) as the mobile phase. Apply separately 2 μl of the test solution, and 1 μl of each of the reference drug solution and the reference solution to the plate. After developing in the chamber filled with ammonia vapour and removal of the plate, dry in air, examine under the ultraviolet light at 365 nm. The yellow fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To warm the kidney to control seminal emission.

Indications Aching and weakness of the lower back and knees, dizziness and tinnitus, seminal emission and premature ejaculation due to insufficiency of *kidney-yang*.

Usage and dosage 6 g of water-honeyed pills, or 1 big honeyed pill, twice a day.

Strength 10 g per 100 water-honeyed pills, 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Syrups Rhododendri Daurici (消咳喘糖浆, Xiaokechuan Tangjiang)

Dahurian Rhododendron Syrup

Dahurian Rhododendron Syrup is prepared from Folium Rhododendri Daurici.

Procedure Macerate 200 g of Folium Rhododendri Daurici in about 950 ml of 40% ethanol (add 1.9 ml of poly ethylene glycol for the syrups without ethanol) at 30-40℃ for 7 days in a well closed container, stir 2-3 times a day, filter and squeeze the residue. Combine the squeezed solution and the filtrate, recover ethanol for the syrups without ethanol, allow to stand, filter, add 350 g (600 g of sucrose for syrups without ethanol) of sucrose to the filtrate, heat and stir to dissolve, boil for 30 minutes, allow to cool to 30 ℃, add 3 g of potassium sorbate and 0.1 g of menthol, stir to dissolve, add 40% ethanol to (add water for the syrups without ethanol) to 1000 ml, stir well, allow to stand, and filter.

Description A reddish-brown liquid; odour, aromatic; taste, sweet, pungent and bitter.

Identification Extract 25 ml of the syrup with two 15-ml quantities of ether, combine the extract and evaporate to dryness. Dissolve the residue with three 10-ml quantities of 40% ethanol by heating on a water bath, filter while hot, combine the filtrate, evaporate the ethanol on a water bath. Extract the remaining aqueous solution with two 15-ml quantities of ether, combine the ether extract, evaporate to dryness, dissolve the residue in 1 ml of chloroform as the test solution. To 5 g of Folium Rhododendri Daurici reference drug add 50 ml of ether, ultrasonicate for 15 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 30 ml of 40% ethanol, and prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane, ethyl acetate and methanol (5:5:0.2) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Ethanol content 20-28 per cent (Appendix Ⅸ M).

Relative density Not less than 1.08 (Appendix Ⅶ A).

Other requirements Comply with the general requirements for syrups (Appendix Ⅰ H).

Assay ***Total flavonoids*** *Reference solution* Weigh accurately 30 mg of rutin CRS, previously dried to constant weight in vacuum at 120℃, place in a 100 ml volumetric flask, dissolve in a quantity of 60% ethanol, dilute to volume, and mix well. Measure accurately 10 ml of the solution to a 50 ml volumetric flask, dilute with 60% ethanol to volume and mix well (containing 60 μg of anhydrous rutin per ml).

Calibration curve Measure accurately 0.5,1,2,3,4 and 5 ml of the reference solution in 10 ml volumetric flask separately, add 2 ml of 0.1 mol/L solution of aluminium chloride, 3 ml of 1 mol/L solution of potassium acetate to each flask, dilute with 60% ethanol to volume, mix well and allow to stand for 30 minutes. Carry out the method for spectrophotometry (Appendix Ⅴ A), using the corresponding solvent as blank, measure the absorbance at 420 nm, plot the calibration curve, using absorbance as ordinate and concentration as abscissa.

Procedure Measure accurately 2 ml of the syrup, transfer to a 50 ml volumetric flask, add 60% ethanol, dilute to volume, and mix well. Measure accurately 1 ml of the solution, transfer to a 10 ml volumetric flask, carry out the procedure as described under preparation of calibration curve, beginning at the words "add 2 ml of 0.1 mol/L aluminium chloride solution" to prepare the test solution. In addition, transfer 2 ml of the syrup, dilute with 60% ethanol to 50 ml. Measure accurately 1 ml of the ethanol solution, add 60% ethanol solution to 10 ml as the blank. Measure the absorbance, read out the weight of rutin (μg) in the test solution from the calibration curve and calculate.

It contains not less than 2.0 mg of total flavonoids per ml, calculated as rutin ($C_{27}H_{30}O_{16}$).

Farrerol Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (60:40) as the mobile phase. As detector a spectrophotometer set at 295 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of farrerol.

Reference solution Dissolve a quantity of farrerol CRS in methanol to prepare a solution containing 10 μg per ml as the reference solution.

Test solution Measure accurately 3 ml of the syrup to a 25

ml volumetric flask, dilute with methanol to the volume, mix well, filter and use the filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 50 μg of farrerol ($C_{17}H_{16}O_5$) per ml, referred to Folium Rhododendri Daurici.

Action To relieve cough and dyspnea, and expel phlegm.

Indications Cough and dyspnea with expectoration of white phlegm due to phlegm-cold retained in the lung; chronic bronchitis with above symptoms.

Usage and dosage 10 ml, 3 times a day; appropriate reduction of the dosage for children.

Strength (1) 50 ml per bottle (2) 100 ml per bottle

Storage Preserve in tightly closed containers.

Tabellae Acanthopanacis Senticosi (刺五加片, Ciwujia Pian)

Manyprickle Acanthopanax Tablets

Manyprickle Acanthopanax Tablets are the tablets prepared from Extractum Acanthopanacis Senticosi.

Procedure Mix well 150 g of Extractum Acanthopanacis Senticosi with a quantity of excipients, granulate, compress into 1000 tablets, and coat with sugar.

Description Sugar coated tablets with brown core; taste. slightly bitter and astringent.

Identification Triturate 6 tablets, removed sugar coat, to fine powder, add 20 ml of methanol, ultrasonicate for 10 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. To 5 g of Radix et Caulis Acanthopanacis Senticosi dug reference, add 20 ml of methanol, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the reference drug solution. Dissolve isofraxidin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol, and water (8 : 1 : 0.1) as the mobile phase. Apply separately to the plate 5 μl of each of the test solution and the reference drug solution, and 1 μl of the reference solution. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Extractive Remove the sugar coats of 10 tablets. weigh accurately and pulverize. Weigh accurately a quantity (equivalent to about 0.75 g of Extractum Acanthopanacis Senticosi) and carry out the hot extraction method for the determination of ethanol soluble extractives (Appendix Ⅹ A) using methanol as the solvent. It contains not less than 80 mg of methanol extractive per tablet.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol and water (20 : 80) as the mobile phase. As detector a spectrophotometer set at 265 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of syringoside.

Reference solution Weigh accurately a quantity of syringoside CRS, dissolve in methanol to prepare a solutions containing 80 μg per ml.

Test solution With 10 tablets, removed sugar coat, pulverize to fine powder, and weigh accurately a quantity of the powder, equivalent to 2 tablets, in a stopper conical flask, add accurately 25 ml of methanol, closely stopper and weigh. Ultrasonicate for 10 minutes (power, 250 W; frequency, 33 kHz), cool, weigh again, replenish the lost weight with methanol, mix well and filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference

solution and the test solution into the column respectively and measure.
It contains not less than 0.40 mg of syringoside ($C_{17}H_{24}O_9$) per tablet.

Action To replenish *qi* and invigorate the spleen, and nourish the kidney and anchor the mind.

Indications Lassitude, anorexia, aching pain in the lower back and knees, insomnia and dreamfulness due to *yang* deficiency in the spleen and kidney.

Usage and dosage 2-3 tablets, twice a day.

Storage Preserve in tightly closed containers.

Tabellae Andrographitis (穿心莲片, Chuanxinlian Pian)

Common Andrographis Tablets

Common Andrographis Tablets are the tablets prepared from Herba Andrographis.

Procedure To 1000 g of Herba Andrographis add a quantity of 85% ethanol, extract by heating for 2 times, 2 hours each, combine the extract and filter. Recover the ethanol, concentrate, and dry. Add a quantity of excipients, to make granules, compress into 1000 small tablets or 500 big tablets and coat with sugar or film.

Description Sugar or film coated tablets with greyish-brown to dark brown core; taste, bitter.

Identification To 0.5 g of Herba Andrographis reference drug add 30 ml of methanol, ultrasonicate for 30 minutes, filter, concentrate the filtrate to about 5 ml as the reference drug solution. Dissolve dehydroandrographolide CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of chloroform, ethyl acetate, and methanol (20 : 15 : 2) as the mobile phase. Apply separately to the plate 5 μl of each of the three solutions. After developing below 28℃ and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm, the spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution. Spray with a mixture of equal volume of 2% 3,5-dinitrobenzoic acid in ethanol and 2 mol/L solution of potassium hydroxide (freshly prepared), examine in sunlight immediately. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol and water (60 : 40) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of andrographolide.

Reference solution Weigh accurately a quantity of andrographolide CRS, dissolve in methanol to prepare a solution containing 0.1 mg per ml.

Test solution With 20 small tablets or 10 big tablets, pulverize to fine powder, and weigh accurately 0.5 g of the powder in a stopper conical flask, add accurately 25 ml of methanol, closely stopper and weigh. Macerate for 1 hour, and ultrasonicate for 30 minutes (power, 250 W; frequency, 33 kHz), cool, weigh again, replenish the lost weight with methanol, mix well and filter. Measure accurately 10 ml of the successive filtrate, apply to a prepared neutral aluminiaum oxide column (200-300 mesh, 5 g, 1.5 cm in internal diameter) and elute with 20 ml of methanol, collect the eluate to a 50 ml of volumetric flask, dilute with methanol to volume, mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column respectively and measure.
It contains not less than 4.0 mg of andrographolide ($C_{20}H_{28}O_4$) per small tablet, and 8.0 mg per big tablet.

Action To clear *heat-toxicity*, and cool blood and reduce swelling.

Indications Common cold, fever, swollen painful throat, or sores on the mouth and tongue, or whooping cough, cough from consumption, or diarrhea, dysentery, or stranguria with pain, or carbuncles and abscesses due to abundant internal *toxic-heat* or poisonous snake bite.

Usage and dosage 2-3 small tablets, 3-4 times a day; or 1-2 big tablets, 3 times a day.

Storage Preserve in tightly closed containers.

Tabellae Belladonnae (颠茄片, Dianqie Pian)

Belladonna Tablets

Belladonna Tablets are the tablets of Extractum Belladonnae.

Procedure To 10 g of Extractum Belladonnae add a quantity of excipient and compress into 1000 tablets.

Description Pale brown or brown tablets.

Identification (1) Pulverize 10 tablets to fine powder, add 10 ml of ethanol, grind and extract, filter and evaporate the filtrate to dryness. Dissolve the residue in 5 ml of 1% solution of sulfuric acid, filter, adjust the filtrate to alkaline by adding ammonia TS, extract with two 2-ml quantities of chloroform. Combine the chloroform extracts and evaporate to dryness, the residue yields the reactions characteristic of tropane alkaloids (Appendix Ⅳ).
(2) Extract by shaking 20 tablets, pulverized, with 2 ml of concentrated ammonia TS and 25 ml of chloroform, allow to stand overnight. Filter, evaporate the filtrate and add 1 ml of methanol to dissolve the residue as the test solution. Dissolve atropine sulfate CRS in methanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, methanol and concentrated ammonia TS (17 : 2 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with dilute potassium Iodobismuthate TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Action Anticholinergic, to relieve spasm of smooth muscles and inhibit secretion of glands.

Indications Gastric and duodenal ulcer, colicky pain in the gastrointestinal tract, kidney, gallbladder and so on.

Usage and dosage Usual dose, 10-30 mg, 30-90 mg a day; maximum dose, 50 mg, 150 mg a day.

Precaution Contraindicated for glaucoma patients.

Strength 10 mg of Extractum Belladonnae per tablet

Storage Preserve in tightly closed containers.

Tabellae Clinopodii (断血流片, Duanxueliu Pian)

Chinese Clinopodium Tablets

Chinese Clinopodium Tablets are the tablets prepared from Herba Clinopodii.

Procedure Decoct 4500 g of the sections of Herba Clinopodii twice with water, each for 1.5 hours. Combine the decoctions, filter, and evaporate the filtrate to an extract with a relative density of 1.15 (determined at 80℃), add 1.7 volumes of ethanol, mix thoroughly, allow to stand for 24 hours, concentrate the supernatant in vacuum to a thick extract, then dry to a solid extract. Add a quantity of excipients, to make granules and compress into 1000 tablets and coat with sugar or film.

Description Sugarcoated or film coated tablets with brown core; taste, bitter, slightly astringent.

Identification Triturate 2 tablets to fine powder, add 10 ml of methanol, heat under reflux for 30 minutes, and filter. Apply the filtrate to a prepared neutral aluminia oxide column (100-200 mesh, 10 g, 1-1.5 cm in internal diameter) and elute with 40 ml of 40% methanol, collect the eluate, and evaporate the filtrate to dryness. Dissolve the residue in 30 ml of water, and extract with two 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, and wash with two 20-ml quantities of water saturated with *n*-butanol. Evaporate the *n*-butanol extracts to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve buddlejasaponin Ⅳ b CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of chloroform, methanol, glacial acetic acid and water (7 ∶ 3 ∶ 1 ∶ 0.3) as the mobile phase. Apply separately to the plate 2 μl of each of the above two solutions. After developing and removal of the plate. dry in air. Spray with a 10% sulfuric acid in ethanol, and heat at 105℃ to the spots clear. The purplish-blue spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol and water (80 ∶ 20) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of buddlejasaponin Ⅳ b.

Reference solution Weigh accurately a quantity of buddlejasaponin Ⅳ b CRS, dissolve in methanol to prepare a solution containing 15 μg per ml.

Test solution To 20 tablets, removed the coats, pulverize to fine powder, and weigh accurately 0.3 g of the powder in a stopper conical flask, add accurately 20 ml of methanol, ultrasonicate for 15 minutes (power, 220 W; frequency, 50 kHz), filter. Add accurately 20 ml of methanol, and ultrasonicate for 15 min again, filter. Combine the filtrate, evaporate to dryness, dissolve the residue in 30 ml of water, and transfer to a separating funnel, extract with four 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extract, wash with two 30-ml quantities of ammonia TS saturated with *n*-butanol. Evaporate *n*-butanol solution to dryness, dissolve the residue in methanol, and transfer to a 100 ml volumetric flask, add methanol to volume, mix well and filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column respectively and measure.

It contains not less than 1.2 mg of buddlejasaponin Ⅳ b ($C_{48}H_{78}O_{18}$) per tablet.

Action To cool blood to arrest bleeding.

Indications Hypermenorrhea, metrorrhagia and metrostaxis, hematemesis, epistaxis, hemoptysis, hematuria and hematochezia marked by bright red or purple blood; dysfunctional uterine bleeding, bleeding due to hysteromyoma and various kinds of bleeding, simple purpura and primary thrombocytopenic purpura with above symptoms.

Usage and dosage 3-6 tablets, 3 times a day.

Strength 0.35 g per tablet (film coated tablets)

Storage Preserve in tightly closed containers.

Tabellae Cyclovirobuxinum D (黄杨宁片, Huangyangning Pian)

Cyclovirobuxine D Tablets

Cyclovirobuxine D Tablets are prepared from Cyclovirobuxinum D ($C_{26}H_{46}N_2O$).

Procedure To 0.5 g of Cyclovirobuxine D, add a quantity of excipient, make granules, dry and compress into 1000 tablets or 500 tablets.

Description White or pale yellow tablets; taste, bitter.

Identification (1) Grind a quantity of the tablets to fine powder. To a quantity of the powder (equivalent to 10 mg of Cyclovirobuxine D), add 20 ml of chloroform, stir thoroughly, filter, divide the filtrate into 2 portions and evaporate to dryness on a water bath. Dissolve one portion in 1 ml of a solution of glacial acetic acid (1→20), add 1-2 drops of potassium iodobismuthate TS; a orange precipitate is produced; add 1 ml of ethanol and 2 ml of sulfuric acid in the other portion, a orange colour is produced.

(2) Grind the tablets to fine powder, transfer a quantity of the powder (equivalent to 10 mg of Cyclovirobuxine D) to a separator, add 2 ml each of water and sodium hydroxides TS, stir thoroughly. Extract with 10 ml of chloroform for 10 minutes, stand, separate chloroform layer, filter, use the filtrate as the test solution. Dissolve cyclovirobuxine D CRS in chloroform to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G

as the coating substance and the upper layer of chloroform, acetone and diethylamide (25 : 20 : 2) as the mobile phase. Apply separately to the plate 10 μl of each of the above two solutions. After developing and removal of the plate, dry in air, spray with dilute potassium iodobismuthate TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Content uniformity Transfer separately 10 tablets in volumetric flasks (0.5 mg tablet in 50 ml volumetric flasks, 1 mg tablet in 100 ml volumetric flasks), add respectively 0.05 mol/L sodium dihydrate phosphate BS to volume and stand in a 80℃ water bath for 1.5 hours. Cool to ambient temperature, shake thoroughly, centrifuge for 6 minutes (3000 rpm) and use the supernatant as the test solution. Carry out the method described under Assay and determine the content of each tablet. Compare the content of tablet with average content; not more than 1 tablet with limit of content variation greater than ±15%, and none greater than ±25%.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay *Reference solution* Weigh accurately 25 mg of cyclovirobuxine D CRS, previously dried to constant weight at 105℃, in a 250 ml volumetric flask, dissolve with 70 ml of methanol, and dilute with 0.05 mol/L sodium dehydrate phosphate BS to volume and mix well. Measure accurately 10 ml to a 100 ml volumetric flask, dilute with 0.05 mol/L sodium dehydrate phosphate BS to volume, and mix well (containing 10 μg Cyclovirobuxine D per ml).

Test solution Weigh accurately 20 tablets and triturate to fine powder. Weigh accurately a quantity of the powder (equivalent to 0.5 g of cyclovirobuxine D) in a 50 ml volumetric flask, add a quantity of 0.05 mol/L sodium dehydrate phosphate BS, stand in a 80℃ water bath for 1.5 hours, cool to ambient temperature, dilute with 0.05 mol/L sodium dehydrate phosphate BS to volume, mix thoroughly, centrifuge for 6 minutes (3000 rpm), use the supernatant as the test solution.

Procedure Measure accurately 5 ml of each of the reference solution and the test solution separately in separators, add accurately 5 ml of bromothymol blue solution (dissolve 18 mg of bromothymol blue with 5 ml of methanol in a 250 ml volumetric flask, dilute with 0.05 mol/L sodium dehydrate phosphate BS to volume and mix well) separately, mix well and add accurately 10 ml of chloroform immediately, shake for 2 minutes, and stand for 1.5 hours. Separate the chloroform layer in test tubes with stopper containing 0.5 g of anhydrous sodium sulfate, shake and stand. Use the supernatant. Carry out the method for spectrophotometry (Appendix Ⅴ A), measure the absorbance of the supernatant at the wavelength of 410 nm and calculate.
It contains not less than 90.0 per cent and not more than 110.0 per cent of the labeled amount of cyclovirobuxine D ($C_{26}H_{46}N_2O$).

Action To move *qi* to promote blood circulation, and dredge meridians to kill pain.

Indications Chest impediment, heart pain, knotted and intermittent pulse due to stagnation of *qi* and blood; coronary heart disease and arrhythmia with above symptoms.

Usage and dosage 1-2 mg, 2-3 times a day.

Strength (1) 0.5 mg of cyclovirobuxine D per tablet
(2) 1 mg of cyclovirobuxine D per tablet

Storage Preserve in well closed containers and protected from light.

Tabellae Desmodii Styracifolii (石淋通片, Shilintong Pian)

Snowbellleaf Tickclover Tablets

Snowbellleaf Tickclover Tablets are the tablets prepared from Herba Desmodii Styracifolii.

Procedure Decoct Herba Desmodii Styracifolii 3125 g with water twice, 1.5 hours each time. Combine the decoctions and filter. Concentrate the filtrate in vacuum, add 5 times quantity of 85% ethanol, stir thoroughly, allow to stand for 24 hours, filter and concentrate the filtrate to a thick extract. Dry to dry extract, add a quantity of excipients, make granules, and compress into 1000 tablets or coat with sugar.

Description Sugar coated tablets with brown core or brown extract tablets; taste, bitter and astringent.

Identification (1) To 1 g, in powder, add 10 ml of 1% solution of hydrochloric acid in 70% ethanol, warm for 10 minutes, filter and evaporate to remove ethanol. Dissolve the residue in 5 ml of water and filter. Transfer 1 ml of the filtrate to two test tubes respectively. To one tube add 2 drops of potassium iodobismuthate TS; an orange red precipitate is produced. To another tube add 2 drops of trinitrophenol TS; a yellow precipitate is produced.
(2) To 1 g of the tablets, triturate to fine powder, add 20 ml of dilute ethanol, ultrasonicate for 20 minutes, and filter, evaporate the ethanol solution to dryness, dissolve the residue in 5 ml of water, and extract with two 15-ml quantities of ethyl acetate, combine ethyl acetate solution, evaporate to dryness, dissolve the residue in 1 ml of dehydrated ethanol as the test solution. To 2 g of Herba Desmodii Styracifolii reference drug, add 30 ml of dilute ethanol, and process to prepare a reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose, containing 1% sodium hydroxide, as the coating substance, and a mixture of chloroform, methanol and butanone (6 : 1 : 1) as the mobile phase. Apply separately to the plate 2 μl of each of the above two solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Expose the plate to ammonia vapour and examine in sunlight, the colour of the spots turn darker.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Action To clear *heat* and induce urination, relieve stranguria and remove urethral calculus.

Indications Stranguria caused by *heat* or urolithiasis due to pouring of *damp-heat* with manifestations of frequent, urgent, and painful urination, or passing sand-like urine; lithangiuria and pyelonephritis with above symptoms.

Usage and dosage 5 tablets, 3 times a day.

Strength 0.12 g of dry extract per tablet

Storage Preserve in tightly closed containers.

Tabellae Folium Crataegi
(益心酮片, Yixintong Pian)

Yixintong Tablets

Yixintong Tablets are prepared by the extracts of Folium Crataegi.

Procedure Extract of 32 g Folium Crataegi, starch 32 g, dextrin 25 g, sucrose 5 g, mix thoroughly, make granules, dry below 60℃. Add 5 g of talcum and 1 g of magnesium stearate, mix thoroughly, compress into 1000 tablets, coat with sugar or film.

Description Sugar coated tablets or film coated tablets with brownish-yellow core; odour, characteristic; taste, astringent and slightly bitter.

Identification Triturate the tablets to fine powder, weigh 0.2 g, add 5 ml of ethanol, ultrasonicate for 5 minutes, and filter. Use the filtrate as the test solution. Dissolve separately rutin CRS and hyperoside CRS in ethanol to prepare two solutions each containing 0.2 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide membrane as the coating substance, and a mixture of ethanol, acetone, and water (7 : 5 : 6) as the mobile phase. Apply separately to the plate 1 μl of each of the above two reference solutions and test solution. After developing and removal of the plate, dry in air, and spray with alumina chloride TS, and blow to dryness, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay ***Hyperoside*** Carry out the method for hight performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol, acetonitrile, tetrahydrofuran, and 5% solution of glacial acetic acid (1 : 1 : 19.4 : 78.6) as the mobile phase. As detector a spectrophotometer set at 363 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of hyperoside.

Reference solution Weigh accurately a quantity of hyperoside CRS, dissolve in dilute ethanol to prepare a solution containing 25 μg per ml.

Test solution To 20 tablets, removed the coats, pulverize to fine powder, and weigh accurately 0.5 g of the powder in a 50 ml volumetric flask, add 40 ml of dilute ethanol, ultrasonicate for 30 minutes (power, 300 W; frequency, 50 kHz), cool, and dilute ethanol to volume, and mix well. Centrifuge for 10 minutes (12000 rpm), or filter by microporous membrane (0.45 μm), and use the supernatant or the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column respectively and measure.

It contains not less than 0.13 mg of hyperoside ($C_{21}H_{20}O_{12}$) per tablet, refered to the extracts of Folium Crataegi.

Action To promote blood circulation to resolve stagnated blood, and remove obstruction from blood vessels.

Indications Chest impediment due to stagnated blood with manifestations of constriction in the chest and stabbing pain in the precardium, palpitation, amnesia, dizziness and tinnitus; angina pectoris in coronary heart disease, hyperlipemia and deficient arterial blood supply with above symptoms.

Usage and dosage 2-3 tablets, 3 times a day.

Storage Preserve in tightly closed containers.

Attached:

Extractum Folium Crataegi
(山楂叶提取物, Shanzhaye Tiquwu)

Pocedure Pulverize Folium Crataegi to powder, comply with the method for percolation described under Liquid Extracts and Extracts (Appendix Ⅰ O). Add 6 times quantity of ethanol, and macerate for 48 hours, percolate and collect the percolation. Recover the ethanol in vacuum and concentrate to an extract with a relative density of 1.04 (60℃), dilute with same volume of water, extract with 1/6 volume of petroleum ether (60-90℃) to eliminate the pigment, and extract water layer again with 0.7 time volume of ethyl acetate. Recovery ethyl acetate in vacuum to dryness as extracts of Folium Crataegi.

Description Pale brown to yellowish-brown powder; odour, characteristic; taste, bitter, hygroscopic.

Identification To 50 mg of the powder, add 5 ml of ethanol, ultrasonicate for 5 minutes, and filter. Use the filtrate as the test solution. Dissolve separately rutin CRS and hyperoside CRS in ethanol to prepare two solutions each containing 0.2 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide membrane as the coating substance, and a mixture of ethanol, acetone and water (7 : 5 : 6) as the mobile phase. Apply separately to the plate 1 μl of each of the above two reference solutions and test solution. After developing and removal of the plate, dry in air, and spray with aluminium chloride TS, and blow to dryness, allow to stand for 1 hour, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Loss on drying Weigh accurately 1 g of the powder to a weighting bottle previously dried to constant weight. Dry for 24 hours in a desiccator with sulfuric acid as desiccant, loses not more than 2.0 per cent.

Assay ***Total flavone*** *Reference solution* Weigh accurately 25 mg of rutin CRS, previously dried in vacuum to constant weight at 120℃, in a 50 ml volumetric flask, add a quantity of ethanol and ultrasonicate (power, 300 W; frequency, 50 kHz) to dissolve, cool and dilute with ethanol to volume, and mix well (containing 0.20 mg of anhydrous rutin per ml).

Standard curve Measure accurately 1 ml, 2 ml, 3 ml, 4 ml, 5 ml, and 6 ml of the reference solution in 25 ml volumetric flask separately, add water for each to 6 ml and 1 ml of 5% solution of sodium nitrite separately, mix well, allow to stand for 6 minutes, then add 1 ml of 10% solution of aluminium nitrate, mix well and allow to stand for 6 minutes, add 10 ml of sodium hydroxide TS and dilute to volume with water. Mix well and allow to stand for 15 minutes. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 500 nm, taking the reagent solution as a blank, plot the standard curve, using absorbance as ordinate and concentration as abscissa.

Procedure Weigh accurately 0.15 g of the powder in a stopper conical flask, add accurately 25 ml of dilute ethanol, stopper closely, mix well and ultrasonicate for 5 minutes, allow to stand for over 3 hours, and filter. Transfer accurately 2 ml of the successive filtrate to a 25 ml volumetric flask, dilute with water to volume, mix well as the test solution. Transfer accurately 2 ml of the test solution to a 25 ml volumetric flask, dilute with water to volume, mix well as the test solution. Transfer accurately 2 ml of the test solution to a 25 ml volumetric flask, carry out the method as described under the preparation of standard curve, beginning at the

words "add water for each to 6 ml", at the same time, transfer accurately 2 ml of the test solution to a 25 ml volumetric flask, add water to volume, and mix well as the blank. Measure the absorbance, read out the weight of rutin in the test solution from the standard curve, and calculate the content.
It contains not less than 80.0 per cent of total flavone calculated as anhydrous rutin ($C_{27}H_{30}O_{16}$).

Hyperoside Weigh accurately 0.15 g of the powder, determine with the same manner as described under Assay of Yixintong Tablets.
It contains not less than 0.40 per cent of hyperoside ($C_{21}H_{20}O_{12}$) calculated with reference to the dried drug.

Tabellae Folium Ginkgo (银杏叶片, Yinxingye Pian)

Ginkgo Tablets

Ginkgo Tablets are tablets prepared from Extractum Folium ginkgo.

Procedure To 40 g or 80 g of Extractum Folium ginkgo, add a quantity of adjuvants, to make granules and compress into 1000 tablets and coat with sugar of film.

Description Sugar or film coated tablets with pale brownish-yellow to brown core; taste, slightly bitter.

Identification (1) Pulverize a quantity of tablets removed the sugar coats, equivalent to about 48 mg of total flavonoid glycosides, to fine powder, add 15 ml of *n*-butanol. Macerate warmly on a water bath for 15 minutes with frequently shaking, cool and filter, evaporate the filtrate to dryness, dissolve the residue in 2 ml of ethanol as the test solution. Prepare a solution of 0.2 g of Folium Ginkgo reference extract in the same manner as the reference extract solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose containing 4% solution of sodium acetate as the coating substance, and a mixture of ethyl acetate, butanone, methanol and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately 3 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 3% aluminium chloride in ethanol. Examine in daylight, the spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference extract solution. Examine under ultraviolet light at 365 nm, the fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference extract solution.
(2) Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose containing 4% solution of sodium acetate as the coating substance, and a mixture of toluene, ethyl acetate, acetone and methanol (10 : 5 : 5 : 0.6) as the mobile phase. Apply separately 15 μl of each of the reference solution and the test solution obtained under Assay ginkgolides to the plate. After developing below 15℃ and removal of the plate, dry in air. Expose to acetic anhydride vapor for 15 minutes and heat at 140-160℃ for 30 minutes to the spot clear. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution and the reference solution.

Peak area ratio of flavone aglycone Calculate the peak areas from the flavonol aglycone chromatogram, obtained under Assay, the peak area ratio of quercetin to kaempferide is 0.8 to 1.5.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay ***Total flavonoid glycosides*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use Octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.4% solution of phosphoric acid (50 : 50) as the mobile phase. As detector a spectrophotometer set at 360 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of quercetin.

Reference solution Dissolve quercetin CRS, kaempferol CRS and Isorhamnetin CRS in methanol to prepare a mixed solution respectively containing 30 μg、30 μg、20 μg per ml as the reference solution, or weigh accurately 35 mg of Folium Ginkgo reference extract, marked the content of quercetin, kaempferol and Isorhamnetin, add 25 ml of a mixture of methanol and 25% solution of hydrochloric acid (4 : 1), prepare a solution in the same manner of the test solution, beginning at the words "heat under reflux on a water bath...", as the reference extract solution.

Test solution Weigh accurately 10 tablets, removed sugar coats, pulverize to fine powder. Weigh accurately the powder, equal to 19.2 mg of total flavonoid glycosides, to a stopper conical flask add accurately 20 ml of methanol, stopper tightly, weigh and ultrasonicate (power, 250 W, frequency, 33 kHz) for 20 minutes, allow to cool, weigh again, replenish the lost weight with methanol, mix well and filter. Measure accurately 5 ml of the successive filtrate in a 100 ml conical flask, add 10 ml of methanol, 5 ml of 25% solution of hydrochloride acid, mix well, heat under reflux on a water bath for 30 minutes, cool immediately to room temperature, and transfer to a 50 ml volumetric flask, dilute with methanol to the volume, mix well and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution or the reference extract solution and 10 μl of the test solution into the column, calculate respectively the content of quercetin, kaempferol and Isorhamnetin and the content of total flavonoid glycosides from the following expression.

The content of total flavonoid glycosides
= (the content of quercetin + the content of kaempferol + the content of isorhamnetin) × 2.51

It contains not less than 9.6 mg of the total flavonoid glycosides for strength (1), or 19.2 mg of the total flavonoid glycosides for strength (2).

Terpene lactones Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use Octadecylsilane bonded silica gel as the stationary phase and a mixture of *n*-propanol, THF and water (1 : 15 : 84) as the mobile phase. With Evaporative Light Scattering Detector. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of bilobalide.

Reference solution Dissolve bilobalide CRS, ginkgolide A, B and C CRS in methanol to prepare a mixed solution respectively containing 1 mg、1 mg、1 mg、0.5 mg per ml as the reference solution, or weigh accurately 0.15 g of Folium Ginkgo reference extract, marked the content of bilobalide, ginkgolide A, B and C, add 10 ml of water, prepare a solution in the same manner of the test solution, beginning at the words "heat for disintegrating on a water bath...", as the reference extract solution.

Test solution Weigh accurately 20 tablets, removed sugar coats, pulverize to fine powder. Weigh accurately the powder in a stopper conical flask, equal to 19.2 mg of ginkgolides, add accurately 50 ml of methanol, stopper tightly and weigh, ultrasonicate (power, 250 W, frequency, 33 kHz) for 20 minutes, allow to cool, weigh again, replenish the lost weight with methanol, mix well and filter. Measure accurately 20 ml of the successive filtrate, recover methanol to dryness, dissolve the reside in 10 ml of water, heat for disintegrating on a water bath, add 2 drops of 2% solution of hydrochloride acid, extract separately with 15 ml of ethyl acetate and three 10-ml quantities of ethyl acetate by shaking, combine the extracts, washed with 20 ml of 5% solution of sodium acetate, separate the layer of sodium acetate, wash with 10 ml of ethyl acetate. Combine the ethyl acetate extracts and washing, wash with two 20-ml quantities of water, combine the water layer, wash with 10 ml of ethyl acetate, combine the ethyl acetate washings, recover to dryness, dissolve the residue in a 5 ml volumetric flask, dilute with methanol to the volume, mix well.

Procedure Inject accurately 5 μl and 20 μl of the reference solution or the reference extract solution and 20 μl of the test solution into the column, calculate separately the content of bilobalide, ginkgolide A, B and C, using a calibration equation of logarithm alteration of two external standards.
It contains not less than 2.4 mg of ginkgolides for strength (1), or 4.8 mg of ginkgolides for strength (2), referred to the amount of bilobalide ($C_{15}H_{18}O_8$), ginkgolide A ($C_{20}H_{24}O_9$), B ($C_{20}H_{24}O_{10}$) and C ($C_{20}H_{24}O_{11}$).

Action To promote blood circulation to resolve stagnated blood and dredge meridians.

Indications Chest impediment, heart pain, stroke, hemiplegia and dysphasia due to blockage of meridians; angina pectoris of the stable type in coronary heart disease and cerebral infarction with above symptoms.

Usage and dosage 2 tablets for strength (1), 1 tablet for strength (2), 3 times a day; or follow doctor's advice.

Strength (1) 9.6 mg of Total flavonoid glycosides, 2.4 mg of Ginkgolides per tablet
(2) 19.2 mg of Total flavonoid glycosides, 4.8 mg of Ginkgolides per tablet

Storage Preserve in tightly closed containers.

Tabellae Menispermi (北豆根片, Beidougen Pian)

Asiatic Moonseed Tablets

Asiatic Moonseed Tablets are the tablets containing the total alkaloids extracted from Rhizoma Menispermi.

Description Sugar coated tablets with blackish-brown core; taste, bitter.

Identification To 1 tablet, remove the sugar coat, triturate to fine powder, add 15 ml of ethyl acetate and 0.5 ml of ammonia TS. Extract by shaking for 10 minutes, filter, and evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. To 0.5 of Rhizoma Menispermi reference drug, add 15 ml of ethyl acetate and 0.5 ml of ammonia TS, heat under reflux for 30 minutes, filter and prepare a reference drug solution in the same manner as described in the test solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance, and a mixture of chloroform, methanol, and ammonia TS (9 : 1 : 1) as the mobile phase. Apply separately to the plate 1-2 μl of each of the above two solutions. After developing and removal of the plate, dry in air, and spray with potassium iodobismuthate TS. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Weigh accurately 20 tablets and triturate to fine powder. Weigh accurately a quantity (equivalent to about 80 mg of total alkaloids) in a stopper conical flask. Add 25 ml of ethyl acetate, shake for 30 minutes and filter. Wash the container and the residue with 10 ml of ethyl acetate in 3 portions. Combine the washings and the filtrate, evaporate to dryness on a water bath. Dissolve the residue in 10 ml of dehydrated ethanol, add accurately 25 ml of sulfuric acid (0.01 mol/L) VS and 2 drops of methyl red IS, titrate with sodium hydroxide (0.02 mol/L) VS. Each ml of sulfuric acid (0.01 mol/L) VS is equivalent to 6.248 mg of dauricine ($C_{38}H_{44}N_2O_6$).
It contains not less than 90.0 per cent and not more than 110.0 per cent of the labelled amount of total alkaloids, calculated as dauricine ($C_{38}H_{44}N_2O_6$).

Action To clear *heat* and *toxicity*, reduce swelling and ease the throat.

Indications Swollen painful throat due to fire accumulation in the interior; acute pharyngitis or tonsillitis with above symptoms.

Usage and dosage 60 mg, 3 times a day.

Strength (1) 15 mg per tablet (2) 30 mg per tablet

Storage Preserve in tightly closed containers.

Tabellae Physochlainae (华山参片, Huashanshen Pian)

Funneled Physochlaina Tablets

Funneled Physochlaina Tablets are the tablets prepared from Radix Physochlainae.

Procedure Comply with the method for percolation described under liquid extracts and extracts (Appendix Ⅰ O), using ethanol containing 0.1% of hydrochloric acid as the solvent, macerate the coarse powder of Radix Physochlainae for 24 hours, then percolate until the colour of percolated solution is pale, concentrate the solution in vacuum to a thick extract, determine the content of alkaloids. To the extract add a quantity of excipients, make granules, compress into tablets and coat with sugar.

Description Sugar coated tablets, with brown core; taste, bitter.

Identification Pulverize 20 tablets, removed sugar coats, moisten with 2 ml of the mixture of concentrated ammonia TS and ethanol (1 : 1) solution, add 20 ml of chloroform, heat under reflux for 1 hour, filter and evaporate the filtrate to dryness, dissolve the residue with 0.5 ml of chloroform as the test solution. Dissolve atropine sulfate CRS, scopolamine hydrobromide CRS, anisodamine hydrobromide CRS and scopoletin CRS in ethanol separately to prepare solutions containing 1 mg of each per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance

and a mixture of ethyl acetate, methanol and concetrated ammonia TS (17 : 2 : 1) as the mobile phase. Apply separately to the plate 5-6 μl of each of the five solutions. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm, the fluorescent spot due to scopoletin in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. And then spray successively with potassium iodobismuthate TS and ethanolic sodium nitrite TS, examine in sunlight, the four spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay *Reference solution* Weigh accurately a quantity of atropin sulfate CRS, dried to constant weight at 120℃, dissolve in water to prepare a solution containing 7 μg per ml of hyoscyamine as the reference solution.

Test solution Weigh accurately 40 tablets, removed sugar coats, pulverize to fine powder. Weigh accurately a quantity of the powder (equivalent to about 12 tablets) in a stopper conical flask, add accurately 25 ml of citric acid-sodium dihydrogen phosphate BS (pH 4.0), shake for 5 minutes, and allow to stand for overnight. Filter with dry filter paper, discard the intial filtrate and use the successive filtrate as the test solution.

Procedure Measure accurately 2 ml of each of the reference solution and the test solution in separators, add accurately 10 ml of citric acid-sodium dihydrogen phosphate BS (pH4.0) and 2 ml of 0.04% bromocresol green solution prepared with above BS respectively, and shake well. Extract with 10 ml of chloroform for 5 minutes by shaking, separate the chloroform layer and filter with filter paper, moisten with chloroform, in 25 ml volumetric flask. Continue to extract the aqueous layer with three 5-ml quantities of chloroform and filter to the flask. Wash the filter paper with chloroform and filter to the flask, dilute with chloroform to the volume. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 415 nm and calculate.
It contains not less than 80 per cent and not more than 120 per cent of the labelled amount of alkaloids, calculated as hyoscyamine ($C_{17}H_{23}NO_3$).

Action To warm the lung and relieve dyspnea, and check coughing and remove phlegm.

Indications Dyspnea and coughing with expectoration of thin phlegm due to invasion of the lung by cold, phlegm or morbid fluid; chronic tracheitis and asthmatic tracheitis with above symptoms.

Usage and dosage Usual dose: 1-2 tablets, 3-6 tablets a day. Maximum dose: 4 tablets, three times a day.

Precaution Contraindicated for glaucoma patients; be cautious about pregnant women and prostatic hyperplasia patients

Strength 0.12 mg per tablet

Storage Preserve in tightly closed containers.

Tabellae Puerariae (愈风宁心片, Yufeng Ningxin Pian)

Yufeng Ningxin Tablets

Yufeng Ningxin Tablets are prepared from the extract of Radix Puerariae.

Procedure Pulverize 150 g of Radix Puerariae to fine powder. Heat 850 g of Radix Puerariae with 80%-90% ethanol under reflux for 3 times, 4 hours for the first time and 3 hours for the second and third time respectively, filter, combine the filtrates, recover ethanol and concentrate in vacuum to a thick extract with a relative density of 1.40 (50℃). Mix the extract with the above powder thoroughly, dry, pulverize, make granules, dry, compress into 1000 tablets and coat with sugar or film.

Description Sugar or film coated tablets with brown core; taste, slightly bitter and sweet.

Identification Pulverize 2 tablets, removed the coats, to fine powder, add 20 ml of ethyl acetate, ultrasonicate for 20 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve puerarin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (7 : 2.5 : 0.25) as the mobile phase. Apply separately to the plate 2 μl of each of the two solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (25 : 75) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates for the column is not less than 2000, calculated with the reference to the peak of puerarin.

Reference solution Dissolve a quantity of puerarin CRS in 30% ethanol to prepare a solution containing 80 μg per ml.

Test solution Weigh accurately 10 tablets, removed the coats, pulverize to fine powder. Place 50 mg of the fine powder, accurately weighed, to a stopper conical flask, add accurately 50 ml of 30% ethanol, stopper tightly, and weigh. Ultrasonicate for 20 minutes (power, 250 W; frequency, 33 kHz) and stand to cool. Weigh again and replenish the lost weight with 30% ethanol, mix well, and filter. Use the successive filtrate as the test solution.

Procedure Accurately inject 10 μl of each of the reference solution and the test solution, respectively, into the column, calculate the content.
It contains not less than 13.0 mg of puerarin ($C_{21}H_{20}O_9$) per tablet, refered to Radix Puerariae.

Action To relieve spasm to kill pain and promote blood circulation of the brain and coronary artery.

Indications Dizziness, headache, painful neck, angina pectoris in coronary heart disease, nervous headache and sudden deafness at the initial stage.

Usage and dosage 5 tablets, 3 times a day.

Storage Preserve in tightly closed containers.

Tabellae Rhei Preparata (新清宁片, Xinqingning Pian)

Xinqingning Tablets

Xinqingning Tablets are prepared from Radix et Rhizoma Rhei (prepared).

Procedure Pulverize Radix et Rhizoma Rhei (prepared) to fine powder, add a quantity of ethanol, make granules, dry, add a quantity of starch and magnesium stearate, mix thoroughly, compress into 1000 tablets and coat with sugar.

Description Sugar coated tablets with brownish-black core; taste, slightly bitter and astringent.

Identification (1) Pulverize the tablets, removed sugar coats, to fine powder, microsublimate a small quantity of the powder, rhombus or feathery crystal is shown.
(2) Macerate 0.1 g of the tablets, removed sugar coats and pulverized, in 20 ml of methanol for 1 hour, filter and evaporate 5 ml of the filtrate to dryness. Dissolve the residue in 10 ml of water, add 1 ml of hydrochloric acid and heat on a water bath for 30 minutes. Allow to cool immediately, extract with two 20-ml quantities of ether by shaking and evaporate the combined extracts to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 0.1 g of Radix et Rhizoma Rhei reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H containing sodium carboxymethylcellulose as the coating substance and the upper layer of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately to the plate 4 μl of the two solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The main five orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The spots turn to red on exposure to ammonia vapour.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of acetonitrile, methanol and 0.1% solution of phosphoric acid (35 : 37 : 28) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of emodin.

Reference solution Weigh accurately a quantity of emodin CRS and chrysophanol CRS, dissolve in methanol to prepare two solutions respectively containing 20 μg of emodin per ml and 40 μg of chrysophanol per ml.

Test solution To 20 tablets, removed the coats, pulverized to fine powder, and weigh accurately 0.1 g of the powder in a stopper conical flask, add accurately 50 ml of methanol, closely stopper and weigh. Heat under reflux on a water bath for 1.5 hour, cool, weigh again, replenish the lost weight with methanol, mix well and filter. Measure accurately 25 ml of the successive filtrate, evaporate the filtrate to dryness, dissolve the residue in 27 ml of hydrochloric acid solution (2→27), add 20 ml of chloroform, heat under reflux for 30 minutes, cool immediately, transfer to a separating funnel, wash the container with a quantity of chloroform, combine the washings to the above separating funnel, separate the chloroform layer, extract the water solution with one 15-ml and two 10-ml quantities of chloroform, combine the chloroform extracts, add a quantity of anhydrous sodium sulphate. Recover the chloroform extracts to dryness, dissolve the residue in 2 ml of ethyl acetate, and transfer to a 10 ml volumetric flask, add methanol to volume, mix well, and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solutions and the test solution into the column respectively and calculate.
It contains not less than 1.8 mg of the summation of emodin ($C_{15}H_{10}O_5$) and chrysophanol ($C_{15}H_{10}O_4$) per tablet, referred to Radix et Rhizoma Rhei (prepared).

Action To clear *heat* and *toxicity*, and purge *fire* and relax bowels.

Indications Swollen throat, toothache, bloodshot eyes, constipation, dysentery, or fever due to excessive *heat* accumulated in the interior; infectious inflammation with above symptoms.

Usage and dosage 3-5 tablets, 3 times a day. increase the dosage if necessary; reduce the dosage appropriately or follow doctor's advice for preschool children. For constipation, 5 tablets, to be taken before sleeping.

Storage Preserve in tightly closed containers.

Tabellae Salviae Miltiorrhizae (丹参片, Danshen Pian)

Danshen Tablets

Danshen Tablets are tablets prepared from Radix Salviae Miltiorrhizae.

Procedure Heat 1000 g of Radix Salviae Miltiorrhizae under reflux with 90% ethanol for 1.5 hours, filter, recover ethanol and concentrate the filtrate to a thick extract. Decoct the residue with water for 1 hour, filter, combine the filter and the above thick extract, concentrate to a quantity in vacuum. Add a quantity of adjurant, mix thoroughly and dry, make granules, compress into 1000 tablets, coat with sugar or film.

Description Film coated or sugar coated tablets with brown to dark brown core; taste, slightly bitter and astringent.

Identification Triturate 10 tablets, removed the coats, to fine powder, add 20 ml of ether, shake, allow to stand for 1 hour, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare 1 g of Radix Salviae Miltiorrhizae reference drug in the same manner as reference drug solution. Dissolve a quantity of tanshinone Ⅱ A CRS in ethyl acetate to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of cyclohexane and ethyl acetate (6 : 1) as the mobile phase. Apply separately to the plate 5 μl of above three solutions. After developing and removal of the plate, dry in air. The three main spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution at least. The dark red spot in the chromatogram obtained with the test solution

corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol, acetonitrile, formic acid, and water (30 : 10 : 1 : 59) as the mobile phase. As detector a spectrophotometer set at 286 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of salvianolic acid B.

Reference solution Weigh accurately a quantity of salvianolic acid B CRS, dissolve in water and mix well, to prepare a solution containing 10 μg per ml.

Test solution Triturate 10 tablets, removed the sugar coats, to fine powder, weigh accurately 0.2 g of the powder, to a 50 ml volumetric flask, add a quantity of water, and ultrasonicate for 20 minutes (power, 250 W; frequency, 33 kHz), cool, add water to volume, mix well and filter. Measure accurately 1 ml of the successive filtrate to a 25 ml volumetric flask, add water to volume, mix well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column respectively and calculate.

It contains not less than 11 mg of salvianolic acid B ($C_{36}H_{30}O_{16}$) per tablet referred to Radix Salviae Miltiorrhizae.

Action To promote blood circulation to resolve stagnant blood.

Indications Chest impediment due to stagnated blood with manifestations of fixed chest pain and dark purple tongue; angina pectoris in coronary heart disease with above symptoms.

Usage and dosage 3-4 tablets, 3 times a day.

Storage Preserve in tightly closed containers.

Tabellae Sarcandra glabra (肿节风片, Zhongjiefeng Pian)

Glabrous Sarcandra Tablets

Glabrous Sarcandra Tablets are tablets prepared from Herba Sarcandrae.

Procedure Pulverize 3125 g of Herba Sarcandrae, decoct with water for 3 times, 1 hour each time, filter, combine the filtrate, concentrate the filtrate to a thick extract, and dry. Add a quantity of excipients, make granules, and dry. Compress into 1000 tablets and coat with sugar.

Prescription Sugar coated tablets with brown to dark brown core; taste, bitter, slightly astringent.

Identification (1) Pulverize 2 tablets, removed the sugar coats, to fine powder. Transfer 0.1 g of the powder to a test tube, add a small amount of zinc powder and two drops of 0.5% solution of ammonia chloride, heat gently to dryness, and put a filter paper, macerated with a solution of 5% dimethylaminobenzaldhyde and 20% trichloroacetic acid in benzene, on the test tube heat gently for a minute, a pink to purple spot appears on the paper.

(2) Pulverize 10 tablets to fine powder, add 20 ml of chloroform, ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness. Dissolve the residue in 1ml of methanol as the test solution. To 2g of Herba Sarcandrae reference drug, add 50 ml of water, ultrasonicate for 30 minutes, and filter. Extract the filtrate with two 25-ml quantities of ethyl acetate by shaking, combine the extracts, and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the reference drug solution. Dissolve isofraxidin CRS in methanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel containing sodium carboxymethylcellulose as the coating substance and a mixture of toluene, ethyl acetate and formic acid (9 : 4 : 1) as the mobile phase. Apply separately the plate 4 μl of each of the three solutions, after developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution and the reference drug solution. Expose to ammonia vapour for 10 minutes, the colour of the spot corresponding to the reference becomes yellowish-green.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Extractives Pulverize 20 tablets removed the coats, weighed accurately, to fine powder, weigh accurately 2 g, carry out the method for determination of ethanol-soluble extractives (Appendix Ⅹ A, hot extraction method), use methanol as the solvent. It contains not less than 80 mg per tablet.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane boned silica gel as the stationary phase and a mixture of acetonitrile and 0.1% solution of phosphoric acid (20 : 80) as the mobile phase. As detector a spectrophotometer set at 344 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of isofraxidin.

Reference solution Dissolve a quantity of isofraxidin CRS in methanol to prepare a solution containing 4 μg per ml as the reference solution.

Test solution Pulverize 10 tablets removed the coats, weighed accurately, to fine powder, weigh accurately 50 mg in a stopper conical flask, add accurately 25 ml of methanol, tightly stopper, weigh and ultrasonicate (power, 300 W; frequency, 25 kHz) for 40 minutes. Allow to cool, weigh again, replenish the lost of the weight with methanol, mix well and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution, separately, into the column, and calculate the content.

It contains not less than 0.50 mg of isofraxidin ($C_{11}H_{10}O_5$) per tablet.

Action To clear *heat* and relieve *toxicity*, and reduce swelling and dissipate nodulation.

Indications Pneumonia, appendicitis and phlegmon due to abundant *heat*; also used for an adjuvant in treatment of cancer.

Usage and dosage 3 tablets, 3 times a day.

Storage Preserve in tightly closed containers.

Tabellae Swertiae Mileensis (青叶胆片, Qingyedan Pian)

Mile Swertia Tablets

Mile Swertia Tablets are the tablets prepared from Herba Swertiae Mileensis.

Procedure Pulverize 70 g of Herba Swertiae Mileensis to fine powder, and pulverize 1500 g of Herba Swertiae Mileensis to coarse powder, decoct the coarse powder with water for 2 times, 4 hours for the first time and 3 hours for the second time. Filter, combine the filtrate, concentrate the filtrate to a thick extract in vacuum. Add 70 g of the fine powder of Herba Swertiae Mileensis and a quantity of excipients, mix thoroughly and dry, make granules then compress into 1000 tablets and coat with sugar.

Description Sugar coated tablets with brownish-green core; taste, bitter.

Identification (1) Heat under reflux 4 tablets, removed the sugar coats and pulverized to fine powder, in 20 ml of methanol for 30 minutes and filter. Concentrate the filtrate to about 10 ml as the test solution. Dissolve oleanolic acid CRS in methanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and a mixture of toluene, ethyl acetate and glacial acetic acid (12 : 4 : 0.5) as the mobile phase. Apply separately to the plate 2 μl of each of the two solutions. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ for 5 minutes. The purplish-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Apply 1 ml of the test solution obtained under the test for Identification (1) to a column of neutral aluminium oxide (1 g, 100-120 mesh, 5mm in inner diameter), elute with 2 ml of methanol, collect the eluate, evaporate to dryness and dissolve the residue in 2 ml of methanol as the test solution. Dissolve swertiamain CRS in methanol to prepare a solution containing 8 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substances and a mixture of chloroform-methanol (17 : 3) as the mobile phase. Apply separately to the plate 1-2 μl of each of the two solutions. After developing and removal of the plate, dry in air, examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol and 0.3% solution of formic acid (25 : 75) as the mobile phase. As detector a spectrophotometer set at 237 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of swertiamain.

Reference solution Dissolve a quantity of swertiamain CRS, weighed accurately, in methanol to prepare a solution containing 0.5 mg per ml.

Test solution To 30 tablets, removed the coats, pulverize to fine powder, and weigh accurately of the powder (about 12 tablets) in a 100 ml volumetric flask, add 80 ml of methanol, macerate for 20 minutes, ultrasonicate for 15 minutes (power, 250 W; frequency, 33 kHz), cool, add methanol to volume, mix well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column respectively and calculate.

It contains not less than 4.0 mg of swertiamain ($C_{16}H_{22}O_{10}$) per tablet.

Action To clear the liver and promote bile flow, and clear *heat* and drain *dampness*.

Indications Jaundice with brown urine, or stranguria due to *heat* with unsmooth and painful urination.

Usage and dosage 4-5 tablets, 4 times a day.

Storage Preserve in tightly closed containers.

Tabellae Tripterygii Hypoglauci (昆明山海棠片, Kunming Shanhaitang Pian)

Kunming Shanhaitang Tablets

Kunming Shanhaitang tablets are prepared from Radix Tripterygii Hypoglauci.

Procedure Cut Radix Tripterygii Hypoglauci to pieces, macerate with 50% ethanol for 1 hour, heat under reflux for three times, 1 hour for each, filter, combine the filtrate, recover ethanol in vacuum, concentrate to a thick extract, then dry in vacuum to dry extract. Pulverize 250 g of the dry extract, add a quantity of excipient, mix thoroughly, make granules, compress into 1000 tablets and coat with sugar.

Description Sugar coated tablets with brown core, taste, slightly bitter and astringent.

Identification Pulverize 2 tablets, removed sugar coats, to fine powder, add 4 ml of ammonia TS and extract with 20 ml of ether by shaking. Separate the ether layer, extract with 5 ml of 1 mol/L hydrochloric acid solution by shaking. Separate the water layer and filter, divide the filtrate into two test tubes. To one tube add several drops of mercuric potassium iodide TS; a white precipitate is produced. To the other tube add several drops of trinitrophenol TS; a yellow precipitate is produced.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Weigh accurately 60 tablets, removed sugar coats, and pulverize to fine powder. Weigh accurately a quantity (equivalent to about 25 tablets) in a 200 ml conical flask, add a quantity of kieselguhr (0.2 g for each gram of the sample), mix thoroughly. Add 70 ml of ethanol, heat under reflux on a water bath for 40 minutes, allow to cool, and filter. To the residue add 50 ml of ethanol and continue to heat under reflux for 30 minutes, cool and filter. Combine the filtrate and evaporate to dryness on a water bath. Dissolve the residue in 30 ml of hydrochloric acid (1→100) with stirring on a water bath, cool and filtre. Extract with a solution of hydrochloric acid (1→200) for three times (20, 15, 15 ml) in the same manner. Combine the filtrates to a separator, add ammonia TS to adjust to alkaline,

extract with successive quantities of 40, 30, 25 and 20 ml of ether by shaking, combine ether extracts, wash with two 10-ml quantities of water by shaking, and filter the ether solution through the filter paper. Transfer the ether solution to an evaporating dish previously dried to constant weight at 100℃, evaporate ether on a water bath at a lower temperature, add a small quantity of dehydrated ethanol to the residue, and continue to evaporate to dryness. Dry to constant weight at 100℃, weigh and calculate.
It contains not less than 1.0 mg of total alkaloids per tablet.

Action To expel *wind* and *dampness*, relax muscles and tendons and activate meridians, and clear *heat* and relieve *toxicity*.

Indications Rheumatoid arthritis and lupus erythematosus.

Usage and dosage 2 tablets, 3 times a day.

Precaution Be cautious about patients with renal insufficiency.

Storage Preserve in tightly closed containers.

Tianma Shouwu Pian
(天麻首乌片)

Tianma Shouwu Tablets

Ingredients Rhizoma Gastrodiae; Radix Angelicae Dahuricae; Radix Polygoni Multiflori; Radix Rehmanniae Praeparata; Radix et Rhizoma Salviae Miltiorrhizae; Rhizoma Chuanxiong; Radix Angelicae Sinensis; Fructus Tribuli (stir-baked); Folium Mori; Herba Ecliptae; Fructus Ligustri Lucidi; Radix Paeoniae Alba; Rhizoma Polygonati; Radix et Rhizoma Glycyrrhizae.

Procedure Pulverize Rhizoma Gastrodiae, Rhizoma Chuanxiong and Radix Polygoni Multiflori to fine powder respectively, sift, and mix thoroughly. Extract volatile oil from Radix Angelicae Dahuricae and Radix Angelicae Sinensis respectively by distillation. Decoct the drug residue together with other 9 ingredients with water twice, each for 2 hours, combine the decoctions, filter, concentrate to a thin extract with a relative density of 1.28-1.30 (measured in warm condition). Add the above fine powder, mix thoroughly, dry, pulverize, sift and make granules. Spray the volatile oils of Radix Angelicae Dahuricae and Radix Angelicae Sinensis, and close tightly. Compress into 1000 tablets, and coat with sugar or film.

Description Sugar or film coated tablets with brown core; odour, fragrant; taste, slightly bitter.

Identification (1) Triturate 5 tablets, removed the coats, to fine powder, add 25 ml of ether, heat under reflux for 1 hour, filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 0.2 g of Radix Polygoni Multiflori reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and ethanol (2 : 1) as the mobile phase, develop about 3.5 cm, and remove the plate, dry in air, develop again with a mixture of benzene and ethanol (4 : 1) as the mobile phase, about 7 cm. Apply separately to the plate 5 μl of the test solution and the reference drug solution. After developing and removal of the plate, dry in air, and spray with phosphomolybdic acid in sulfuric acid (Dissolve 2 g of phosphomolybdic acid in 20 ml of water, add gently 30 ml of sulfuric acid, shake well.) and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(2) Triturate 20 tablets, removed the coats, to fine powder, add 20 ml of ether, macerater over night, filter, evaporate the filtrate to dryness, and dissolve the residue in 0.5 ml of ethanol as the test solution. Prepare a solution of 0.2 g of Rhizoma Chuanxiong reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of cyclohexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately to the plate 10 μl of the test solution and the 2 μl of the reference drug solution. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(3) Triturate 100 tablets, removed the coats, to fine powder, add 20 ml of methanol, ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. To 1 g of Folium Mori reference drug, add 50 ml of water, heat boiling for 30 minutes, filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of toluene, ethyl acetate, and formic acid (5 : 2 : 1) as the mobile phase. Apply separately to the plate 20 μl of the test solution and the 5 μl of the reference drug solution. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Operate protected from light. Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of acetonitrile and water (22 : 78) as the mobile phase. As detector a spectrophotometer set at 320 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of 2,3,5,4'-tetrahedroxystilbene-2-O-β-D-glucoside.

Reference solution Weigh accurately a quantity of 2,3,5,4'-tetrahedroxystilbene-2-O-β-D-glucoside CRS, dissolve in methanol to prepare a solution containing 40 μg per ml.

Test solution To 10 tablets, removed the sugar coats, pulverize to fine powder, and weigh accurately some of the powder (equivalent to about 2 tablets) in a stopper conical flask, add accurately 25 ml of methanol, closely stopper and weigh. Heat under reflux for 30 minutes, cool, weigh again, replenish the lost weight with methanol, mix well, filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 5-10 μl of each of the reference solution and the test solution into the column respectively and calculate.
It contains not less than 0.20 mg of 2,3,5,4'-tetrahedroxystilbene-2-O-β-D-glucoside ($C_{20}H_{22}O_9$) per tablet.

Action To nourish *yin* to reinforce the kidney, and nourish blood to extinguish *wind*.

Indications Dizziness, headache, tinnitus, bitter taste in the mouth, dry throat, aching and weakness of the lower back and knees, trichomadesis and gray hair due to *yin* deficiency in the liver and kidney; cerebral arteriosclerosis, hypertension at the initial stage, hyperemic headache and seborrheic trichomadesis with above symptoms.

Usage and dosage 6 tablets, 3 times a day.

Storage Preserve in well closed containers, and stored in dry place.

Tianma Wan
(天麻丸)

Tianma Pills

Ingredients Rhizoma Gastrodiae 60 g; Rhizoma et Radix Notopterygii 100 g; Radix Angelicae Pubescentis 50 g; Cortex Eucommiae (stir-baked with salt) 70 g; Radix Achyranthis Bidentatae 60 g; Rhizoma Dioscoreae Hypoglaucae 60 g; Radix Aconiti Lateralis (processed) 10 g; Radix Angelicae Sinensis 100 g; Radix Rehmanniae 160 g; Radix Scrophulariae 60 g.

Procedure Pulverize the above ten ingredients to fine powder, sift and mix thoroughly. To each 100 g of the powder add 40-50 g of refined honey and a quantity of water to make water-honeyed pills and dry; or add 90-110 g of refined honey to make big honeyed pills.

Description Blackish-brown water-honeyed pills or black big honeyed pills; odour, slightly aromatic; taste, slightly sweet, slightly bitter and numb.

Identification (1) Microscopical: Needles of calcium oxalate in bundles or scattered, 25-48 μm long. Stone cells yellowish-brown or colourless, subrectangular, subrounded or irregular, up to about 94 μm in diameter, with obvious striations. Rubber threads strip-shaped or twisting into masses, granular on surface. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Vittae about 100 μm in diameter, containing brownish-yellow secretion. Parenchymatous cells containing sand crystals of calcium oxalate. Lignified parenchymatous cells pale yellow or yellow, grouped or singly scattered, long ellipsoidal, spindle-shaped or long fusiform, acute or branched at one side, walls slightly thickened with transversal slit-shaped pits and distinct pit-canals.

(2) Pulverize 5 g of the water-honeyed pills or 8 g of big honeyed pills, add 40 ml of *n*-butanol saturated with water, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 2 ml of water, and apply to an prepared column (1cm in inner diameter and 16 cm length) packed with macroporous absorption resin D101. Elute with 25 ml of 10% ethanol, collect the eluate and evaporate to dryness, and dissolve the residue in 0.5 ml of methanol as the test solution. Dissolve gastrodin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (8 : 1 : 3 : 0.1) as the mobile phase. Apply separately to the plate 1-2 μl of the test solution and 3 μl of the reference solution. After developing and removal of the plate, dry in air. Spray with 10% phosphomolybdic acid in ethanol and heat at 110℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Grind well 5 g of the water-honeyed pills or big honey pills, pulverized or cut into pieces, with 4 g of kieselguhr, heat under reflux with 40 ml of petroleum ether (60-90℃) for 20 minutes, allow to cool, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 0.5 g of Rhizoma et Radix Notopterygii reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and a mixture of *n*-hexane, benzene and ethyl acetate (2 : 2 : 1) as the mobile phase. Apply separately to the plate 10 μl of the test solution and 3-5 μl of the reference drug solution. After developing and removal of the plate, dry in air. Spray with 1% vanillin in sulfuric acid, heat at 105℃ for 5 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Heat under reflux 0.2 g of Radix Angelicae Sinensis reference drug in 10 ml of ether for 20 minutes, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of ethyl acetate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately to the plate 5 μl of the test solution obtained under the test for Identification (3) and 2 μl of the above reference drug solution. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(5) Grind well 10 g of the water-honeyed pills, or 12 g of big honeyed pills, cut into pieces, with 6 g of kieselguhr, heat under reflux in 40 ml of ether for 20 minutes, filter. Add 30 ml of ethanol to the drug residue, expelled the solvent, heat under reflux for 30 minutes, allow to cool and filter. Add 2 ml of hydrochloric acid in the filtrate, heat under reflux for 1 hour, concentrate to about 5 ml, add 10 ml of water, extract with two 20-ml quantities of petroleum ether (60-90℃), combine the extracts, evaporate to dryness and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve oleanolic acid CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and a mixture of chloroform and acetone (9 : 1) as the mobile phase. Apply separately to the plate 10 μl of the test solution and 5 μl of the reference solution. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ for 5 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the generl requirements for pills (Appendix Ⅰ A).

Action To expel *wind* and *dampness*, dredge meridians to kill pain, and reinforce the liver and kidney.

Indications Impediment diseases with pain due to accumulation of *wind-dampness* and deficiency in the liver and kidney with manifestations of muscular contracture and numbness of hands and feet, and aching pain in the lower back and legs.

Usage and dosage 6 g of water-honeyed pills or 1 big honeyed pill, 2-3 times a day.

Precaution Be cautious about pregnant women.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Tianwang Buxin Wan
(天王补心丸)

Tianwang Buxin Pills

Ingredients Radix et Rhizoma Salviae Miltiorrhizae 25 g; Radix Angelicae Sinensis 50 g; Rhizoma Acori Tatarinowii 25 g; Radix Codonopsis 25 g; Poria 25 g; Fructus Schisandrae Chinensis 50 g; Radix Ophiopogonis 50 g; Radix Asparagi 50 g; Radix Rehmanniae 200 g; Radix Scrophulariae 25 g; Radix Polygalae (processed) 25 g; Semen Ziziphi Spinosae (stir-baked) 50 g; Semen platycladi 50 g; Radix Platycodonis 25 g; Radix et Rhizoma Glycyrrhizae 25 g; Cinnabaris 10 g.

Procedure Levigate Cinnabaris to very fine powder and pulverize the other fifteen ingredients to fine powder. Triturate all the powders, sift and mix thoroughly. To each 100 g of the powder add 20-30 g of refined honey and a quantity of water to make pills and dry; or add 50-70 g of refined honey to make small honeyed pills or big honeyed pills.

Description Brownish-black water-honeyed pills, brownish-black small honeyed pills or big honeyed pills; odour, slightly aromatic; taste, sweet and slightly bitter.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate solution; hyphae colourless or pale brown, 4-6 μm in diameter. Stone cells trapezoidal or polygonal, slightly acute at one end, relatively thick walled and sparsely pitted. Stone cells yellowish-brown or colourless, subrectangular, subrounded or irregular, striations distinct up to about 94 μm in diameter. Stone cells rectangular or long-stripped, 50-110 μm in diameter, with very fine pits. Stone cells of testa pale yellowish-brown, subpolygonal in surface view, with relatively thickened walls, fine and dense pit-canals, lumina containing dark-brown contents. Needle crystals of calcium oxalate in bundles or scattered, 24-50 μm long, about 3 μm in diameter. Cork cells reddish-brown, polygonal and thin walled. Anastomosing laticiferous tubes 14-25 μm in diameter, containing yellow granule-like substances. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Cells of endotesta brownish-yellow, rectangular or subsquare in surface view, with beaded anticlinal walls. Irregular minute granules dark brownish-red and lustrous, with dark black edge.

(2) Pulverize 1 g or half a big honeyed pill, spread in a crucible and cover with a long neck funnel. Heat gently until the powder is slightly charred. Cool, remove the funnel, and wash the inner wall with 5 ml of water. Examine the washing under ultraviolet light at 365 nm; a pale bluish-green fluorescence is shown.

(3) Wash 1 g or half a big honeyed pill with water, a small quantity of vermillion precipitate is obtained. Moisten the precipitate with hydrochloric acid and scrape it on the smooth surface of a copper plate, a silver-white lustre is shown which disappears on heating or baking.

(4) Triturate 18 g of water-honeyed pills to powder, or cut 27 g of small honeyed pills or big honeyed pills into pieces, add 100 ml of water, ultrasonicate for 30 minutes, adjust to pH 2 with hydrochloric acid and filter. Extract the filtrate with three 60-ml quantities of ether, combine the extract, expel the solvent and dissolve the residue in 1 ml of methanol as the test solution. Dissolve protocatechualdehyde CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substances and a mixture of chloroform, acetone and formic acid (8 : 1 : 0.8) as the mobile phase. Apply separately to the plate 10 μl of the test solution and 3 μl of the reference solution. After developing and removal of the plate, dry in air, examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To replenish *yin* and nourish blood, and reinforce the heart to anchor the mind.

Indication Insufficient *heart-yin*, palpitation, amnesia, insomnia, dreamfulness and dry stools.

Usage and dosage 6 g of water-honeyed pills, 9 g of small honeyed pills, or 1 big honeyed pill, twice a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Tiaojing Cuyun Wan
(调经促孕丸)

Tiaojing Cuyun Pills

Ingredients Cornu Cervi Pantotrichum (burn away soften hairs) 5 g; Herba Epimedii (processed) 10 g; Rhizoma Curculiginis 10 g; Radix Dipsaci 10 g; Herba Taxilli 10 g; Semen Cuscutae 15 g; Fructus Lycii 10 g; Fructus Rubi 10 g; Rhizoma Dioscoreae 30 g; Semen Nelumbinis (plumule removed) 10 g; Poria 15 g; Radix Astragali 10 g; Radix Paeoniae Alba 15 g; Semen Ziziphi Spinosae (stir-baked) 10 g; Ramulus Uncariae cum Uncis 10 g; Radix et Rhizoma Salviae Miltiorrhizae 15 g; Radix Paeoniae Rubra 15 g; Caulis Spatholobi 30 g.

Procedure Pulverize the above eighteen ingredients to fine powder, sift and mix well. To each 100 g of the powder add 40-50 g of refined honey and a quantity of water to make water-honeyed pills, dry and coat with glue.

Description Brown water-honeyed pills; taste, sweet, slightly bitter.

Identifications (1) Microscopical: Palisade cells of testa in two rows, cells in inner row longer than outer ones with bright strip. Nonglandular hair unicellular, walls thickened, lignified, the remains after falling similar to stone cells in shape. Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Cells of endotesta brownish-yellow, rectangular or subsquare in surface view with beaded anticlinal walls.

(2) Pulverize 5 g of the pills, add 20 ml of chloroform, ultrasonicate for 20 minutes. Filter and concentrate the filtrate to 0.5 ml as the test solution. Prepare a solution of 0.5 g of Radix et Rhizoma Salviae Miltiorrhizae reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and a mixture of benzene and ethyl acetate (9 : 1) as the mobile phase. Apply separately to the plate 6 μl of each of the above two solutions. After developing and

removal of the plate, dry in air. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Pulverize 1 g to fine powder, add 60 ml of methanol, heat under reflux for 1 hour and filter. Evaporate the filtrate to dryness and dissolve the residue in 15 ml of water. Extract with three 20-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol solutions, wash with a 1% solution of sodium hydroxide twice (100 ml and 50 ml), then wash with 50 ml of water saturated with *n*-butanol, separate the *n*-butanol layer and evaporate to dryness. Dissolve the residue in 2 ml of methanol as the test solution. Prepare a solution of 1 g of Radix Astragali reference drug with 30 ml of methanol in the same manner as the reference drug solution. Dissolve astragaloside Ⅳ CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13 : 7 : 2), standing below 10 ℃, as the mobile phase. Apply separately 5 μl of the test solution and 3 μl of each of the reference solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol. and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference solution and the reference drug solution. Examine under ultraviolet at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the fluorescent spots in the chromatograms obtained with the reference solution and the reference drug solution.

(4) Boil 5 g of the pills with 100 ml of water for 30 minutes, cool and filter with absorbent cotton. Extract the filtrate with ethyl acetate twice (40 ml and 20 ml), combine the ethyl acetate extracts evaporate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Decoct 0.5 g of Fructus Lycii reference drug in 40 ml of water for 15 minutes, cool and filter. Extract the filtrate by shaking with 20 ml of ethyl acetate and concentrate the ethyl acetate extract to 1 ml as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate and formic acid (3 : 1 : 0.1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (26 : 74) as the mobile phase. As detector a spectrophotometer set at 230 nm. Maintain the column temperature at 35℃. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, weighed accurately, in methanol to prepare a solution containing 0.1 mg per ml as the reference solution.

Test solution Grind the pills, obtained under the test of weight variation, to fine powder, weigh accurately 1.5 g in a Soxhlet's extractor, add a quantity of ether, heat under reflux for 3 hours, discard the ether extract and expel the solvent remained in the residue. Place the residue along with the filter paper in a stopper conical flask, add accurately 50 ml of methanol, stopper well, and weigh accurately. Ultrasonicate (power, 250 W; frequency, 25 kHz) for 30 minutes, cool, weigh again, replenish the loss of the weight with methanol, shake well and filter. Measure accurately 25 ml of the successive filtrate, and evaporate to dryness. Dissolve the residue in a quantity of water, apply to a D 101 macroporous resin column (1.5 cm in diameter, 12 cm in length), elute with water to the eluates colourless, and then elute with diluted ethanol. Collect 100 ml of the successive eluates, evaporate to dryness, dissolve the residue in a quantity of methanol, transfer to a 25 ml volumetric flask, dilute with methanol to volume, and shake well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 1.0 mg per gram of paeoniflorin ($C_{23}H_{28}O_{11}$), referred to Radix Paeoniae Alba and Radix Paeoniae Rubra.

Action To warm the kidney and invigorate the spleen, and promote blood circulation to regulate menstruation.

Indications Irregular menstruation, amenorrhea, dysmenorrhea, sterility caused by *yang* deficiency in the spleen and kidney and stagnation of blood, with manifestations of delayed menstrual periods, scanty menstrual blood with clots, cold pain in the lower abdomen during menstruation, or amenia for a long time, sterility, cold pain in the lower back and knees.

Usage and dosage 5 g (50 pills), twice a day; taken continuously for 20 days from the fifth day of menstrual cycle; or taken continuously for 20 days to a month for disorder of menstrual cycles, Three successive months make one course of treatment or follow doctor's advice.

Precaution It is forbidden to prescribe to patients with hyperactivity of *fire* caused by *yin* deficiency and menorrhagia.

Strength 10 g per 100 pills

Storage Preserve in tightly closed containers.

Tinctura Belladonnae (颠茄酊, Dianqie Ding)

Belladonna Tincture

Belladonna Tincture is the tincture prepared from Herba Belladonnae.

Procedure Take 1000 g of coarse powder of Herba Belladonnae, carry out the method described under Extractum Belladonnae to prepare a thick extract. Determine the content of alkaloids, then add a quantity of 85% ethanol and dilute with water to comply with the regulation of alkaloids content and ethanol content, allow to stand, clarify, and filter.

Description A brownish-red or brownish-green liquid; odour, slightly stinking.

Identification (1) Comply with the test for Identification described under Extractum Belladonnae, using a quantity of

the resulting solution obtained in Assay.
(2) To 10 ml of the tincture, add 10 ml of water and 10 ml of concentrated ammonia TS, extract with three 10-ml quantities of ether by shaking, combine the ether solution, evaporate to dryness, dissolve the residue in 1 ml of chloroform as the test solution. Dissolve atropine sulfate CRS in methanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, methanol and concentrated ammonia TS (17 : 2 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air, and spray with dilute potassium iodobismuthate TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Ethanol content 60 per cent-70 per cent (Appendix Ⅸ M).

Other requirements Comply with the general requirements for tinctures (Appendix Ⅰ N).

Assay Evaporate 100 ml, accurately measured, in an evaporating dish, to about 10 ml on a water bath. Dissolve the precipitate in a quantity of ethanol if necessary, transfer to a separator, wash the evaporating dish with 10 ml of sulfuric acid solution (0.1 mol/L) in portions, and combine the washings into the separator. Extract the solution with several 10-ml quantities of chloroform by shaking, until the chloroform layer is colourless. Combine the chloroform solutions, wash with 10 ml of sulfuric acid solution (0.1 mol/L), combine the acid washings solution and carry out the Assay described under Herba Belladonnae beginning at the words "make the solution alkaline by adding excess of concentrated ammonia TS...". Each ml of sulfuric acid (0.01 mol/L) VS is equivalent to 5.788 mg of hyoscyamine. It contains not less than 0.28 mg and not more than 0.32 mg of alkaloids per ml, calculated as hyoscyamine ($C_{17}H_{23}NO_3$).

Action Anticholinergic, to relieve spasm of smooth muscles and inhibit secretion of glands.

Indications Gastric and duodenal ulcer, colicky pain in the gastrointestinal tract, kidney, gallbladder and so on.

Usage and dosage Usual dose: 0.3-1 ml; 1-3 ml a day. Maximum dose: 1.5 ml; 4.5 ml a day.

Precaution Contraindicated for glaucoma patients.

Storage Preserve in tightly closed containers, stored in a cool place.

Tinctura Polygalae (远志酊, Yuanzhi Ding)

Thinleaf Milkwort Tincture

Thinleaf Milkwort Tincture is the tincture prepared from Extractum Polygalae Liquidum.

Procedure To 200 ml of Extractum Polygalae Liquidum, add 60% ethanol to make 1000 ml, mix, allow to stand and filter.

Description A brown liquid.

Ethanol content 50 per cent-58 per cent (Appendix Ⅸ M).

Other requirements Comply with the general requirements for tinctures (Appendix Ⅰ N).

Action To expel *phlegm*.

Indications Coughing with difficult expectoration of *phlegm*.

Usage and dosage 2-5 ml; 6-15 ml a day.

Storage Preserve in tightly closed containers.

Tinctura Zingiberis (姜酊, Jiang Ding)

Ginger Tincture

Ginger Tincture is the tincture prepared from Extractum Zingiberis Liquidum.

Procedure To 200 ml of Extractum Zingiberis Liquidum add 90% ethanol to make 1000 ml, mix well, allow to stand and filter.

Description A pale yellow liquid; odour, aromatic, resembling Rhizoma Zingiberis; taste, pungent.

Ethanol content 80 per cent-88 per cent (Appendix Ⅸ M).

Other requirements Comply with the general requirements for tinctures (Appendix Ⅰ N).

Action To invigorate the stomach and expel wind.

Usage and dosage 2-4 ml; 6-12 ml a day.

Storage Preserve in tightly closed containers.

Tongguan San (通关散)

Tongguan Powder

Ingredients Fructus Gleditsiae Abnormalis 500 g; Herba Centipedae 250 g; Radix et Rhizoma Asari 250 g.

Procedure Pulverize the above three ingredients to fine powder, sift, mix thoroughly.

Description A pale yellowish-brown powder; odour, aromatic; taste, pungent and irritant.

Identification Microscopical: Epidermal cells of pericarp reddish-brown, subpolygonal in surface view, walls relatively thickened, with fine granules on the surface; fibre bundles pale yellow, surrounded by cells containing prisms or clusters occasionally of calcium oxalate, forming crystal fibres, frequently accompanied by subsquare sclerenchymatous cells. Stomata anomocytic, occurring in fragments of leaves, about 14 μm in diameter, subsidiary cells 4-6 in number. Hypodermal cells subrectangular, with slightly sinuous walls, carrying subsquare or oblong secretory cells.

Other requirements Comply with the general requirments for powders (Appendix Ⅰ B).

Action To free the orifices to resuscitate.

Indications Syncope, lockjaw and coma due to *phlegm* obstructing the orifices.

Usage and dosage A small quantity is insufflated into the nostrils for sneezing.

Precaution Be cautious about pregnant women.

Strength 1.5 g per bottle

Storage Preserve in tightly closed containers.

Tongjingbao Keli
(痛经宝颗粒)

Tongjingbao Granules

Ingredients Flos Carthami; Radix Angelicae Sinensis; Cortex Cinnamomi; Rhizoma Sparganii; Rhizoma Curcumae; Radix et Rhizoma Salviae Miltiorrhizae; Faeces Trogopterori; Radix Aucklandiae; Rhizoma Corydalis (processed with vinegar).

Procedure Distill volatile oil of Cortex Cinnamomi and Radix Aucklandiae, decoct the drug residue and the other ingredients with water for 3 times, 1 hour for the first time, half an hour for the other two times. Combine the decoction, filter, stand and separate the supernatant, concentrate to a thin extract with a relative density of 1.10 (80℃). Allow to cool to room temperature, add ethanol to a content of 70% ethanol, stir thoroughly and stand. Separate the supernatant, recover ethanol and concentrate to a thin extract with a relative density of 1.24 (80℃). Add a quantity of sucrose and dextrin, make to 1000 g granules and dry; or add a quantity of excipient, make to 400 g granules without sucrose and dry. Spray the above volatile oil in ethanol and mix thoroughly.

Description Yellow to brownish-yellow granules, or yellowish-brown to brown granules without sucrose; odour, aromatic; taste, sweet and slightly bitter, or slightly sweet and slightly bitter (granules without sucrose).

Identification (1) Dissolve 1 pack of the granules with 20 ml of 0.1mol/L solution of hydrochloric acid by stiring thoroughly, centrifuge, separate the supernatant and extract with two 20-ml quantities of ether by shaking. Combine the extracts, expel the solvent and dissolve the residue in 1 ml of ethanol to prepare a solution as the test solution. Dissolve protocatechuic aldehyde CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and a mixture of chloroform, acetone, and formic acid (60 : 5 : 2) as the mobile phase. Apply separately to the plate 2 μl of the test solution and 1 μl of the reference solutions. After developing and removal of the plate, dry in air. Spray with 10% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Dissolve 2 packs of the granules with 40 ml of water or 20 ml for the granules without sucrose, by stiring, and centrifuge. To the supernatant adjust to pH 9 with ammonia TS, extract with two 20-ml quantities of ether by shaking, combine the extracts, expel the solvent and dissolve the residue in 1 ml of ethanol to prepare a solution as the test solution. Dissolve tetrahydropalmatine CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances, mixed with 1% solution of sodium hydroxide, and a mixture of *n*-hexane, chloroform, and methanol (15 : 8 : 2) as the mobile phase. Apply separately to the plate 5 μl of the test solution and 1 μl of the reference solution. After developing and removal of the plate, dry in air. Expose to iodine vapour to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. Examine under ultraviolet light at 365 nm, the fluorescent yellow spots are shown.

(3) Macerate 0.5 g of Radix Aucklandiae reference drug in 1 ml of cyclohexane for 1 hour, use the supernatant as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and a mixture of cyclohexane and acetone (10 : 3) as the mobile phase. Apply separately to the plate 5 μl of the test solution obtained under the test of Identification (2) and 1 μl of the above reference drug solution. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid, heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Action To warm meridians and resolve blood stasis, and regulate *qi* flow to relieve pain.

Indications Dysmenorrhea, cold pain in the lower abdomen, menstruation disorders, dark red menstrual blood due to retention of *cold*, stagnation of *qi* and blood stasis.

Usage and dosage 1 pack, twice a day, taken after dissolved in warm boiled water, one week before menstruation and cessation of it 3 days after menstruation, and continuously prescribed in 3 menstrual cycles.

Strength (1) 10 g per pack
(2) 4 g per pack (granules without sucrose)

Storage Preserve in tightly closed containers.

Tongjing Wan
(痛经丸)

Tongjing Pills

Ingredients Radix Angelicae Sinensis 138 g; Radix Paeoniae Alba 92 g; Rhizoma Chuanxiong 69 g; Radix Rehmanniae Praeparata 184 g; Rhizoma Cyperi (stir-baked with vinegar) 138 g; Radix Aucklandiae 23 g; Pericarpium Citri Reticulatae Viride 23 g; Fructus Crataegi (carbonized) 138 g; Rhizoma Corydalis 92 g; Rhizoma Zingiberis Praeparatum 23 g; Cortex Cinnamomi 23 g; Radix et Rhizoma Salviae Miltiorrhizae 138 g; Fructus Leonuri 46 g; Flos Carthami 46 g; Herba Leonuri 551.7 g; Faeces Trogopterori (stir-baked with vinegar) 92 g.

Procedure Decoct Herba Leonuri, Fructus Leonuri, Radix et Rhizoma Salviae Miltiorrhizae and 46 g of Radix Rehmanniae Praeparata with water twice, combine the decoctions, filter, concentrate the filtrate to a quantity of amount. Pulverize the other twelve ingredients and 138 g of Radix Rehmanniae Praeparata to fine powder, sift and mix thoroughly, make pills with the above concentrated solution (reserve a quantity for coating) and a quantity of water, coat, dry, polish, and make 1000 g pills.

Description Brownish-black concentrated watered pills; taste, bitter.

Identification (1) Microscopical: Pollen grains spheroidal or ellipsoidal, about 60 μm in diameter, extine with spines and 3 germinal apertures. Fragments of sclerenchyma greenish-yellow, cells polygonal or slightly elongated, walls slightly sinuous, some beaded, with fine and dense pits. Septate fibres with slightly thickened and unlignified walls, oblique pits distinct. Stone cells of pericarp pale purplish-red. red or yellowish-brown, subrounded or polygonal, up

to about 125 μm in diameter. Stone cells subsquare or subrounded, 32-88 μm in diameter walls thin at one side. Prisms of calcium oxalate abundant in parenchyma. Clusters of calcium oxalate 18-32 μm in diameter, occurring in parenchymatous cells, often arranged in rows, or several in one cell. Secretory cells subrounded, containing pale brownish-yellow to reddish-brown secretion, surrounded by radially arranged cells. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass.

(2) Pulverize 2 g of the pills to fine powder, macerate in 5 ml of ethanol, shake constantly for 1 hour and filter. Evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of ethanol as the test solution. Dissolve paeoniflorin CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately to the plate 3-4 μl of the test solution and 1 μl of the reference solution. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Pulverize 10 g of the pills, to fine powder, place to a stopper conical flask, add 2 ml of concentrated ammonia TS and 40 ml of chloroform, stopper tightly, ultrasonicate for 45 minutes, and filter, evaporate the filtrate to dryness. Dissolve the residue in a quantity of chloroform, and apply to a prepared neutral aluminium oxide column (100-200 mesh, 2g, 1.0 cm in internal diameter) and elute with 30 ml of chloroform, collect the eluate. Evaporate the eluate on a water bath to dryness, and dissolve the residue in 2 ml of chloroform as the test solution. Dissolve tetrahydropalmatine CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane, chloroform, and methanol (10 : 6 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the test solution and the reference solution. After developing and removal of the plate, dry in air, and spray with dilute potassium Iodobismuthate TS, the spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Pulverize 10 g of the pills, to fine powder, add 50 ml of ether, ultrasonicate for 30 minutes, and filter, evaporate the filtrate to dryness. Dissolve the residue in 2 ml of ethyl acetate as the test solution. To 2 g of Radix Angelicae Sinensis, add 20 ml of ether, prepare a reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of n-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately to the plate 10 μl of the test solution and 5 μl of the reference drug solution. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol and 0.3% solution of acetic acid (25 : 75) as the mobile phase. As detector a spectrophotometer set at 232 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of paeoniflorin.

Reference solution Weigh accurately a quantity of paeoniflorin CRS, dissolve in 50% methanol to prepare a solution containing 60 μg per ml.

Test solution Weigh accurately 2 g of the pills, pulverized to fine powder, in a stopper conical flask, add accurately 50 ml of methanol, closely stopper and weigh. Heat under reflux for 1 hour, cool, weigh again, replenish the lost weight with methanol, mix well and filter. Measure accurately 20 ml of the successive filtrate, evaporate to dryness, dissolve the residue in 50% methanol, and transfer to a 10 ml volumetric flask, add 50% methanol to volume, mix well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column respectively and calculate.

It contains not less than 0.58 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per gram, referred to Radix Paeoniae Alba.

Action To warm meridians and promote blood circulation to regulate menstruation and kill pain.

Indications Dysmenorrhea, irregular menstruation due to retention of *cold* and blood stasis in the *lower-energizer*, with manifestations of delayed menstrual cycles, scanty menstrual blood with clots, cold pain in the lower abdomen during menstruation, alleviated with warmth.

Usage and dosage 6-9 g, 1-2 times a day, to be taken before menstruation.

Precaution Contraindicated for pregnant women.

Strength 60 g per bottle

Storage Preserve in tightly closed containers.

Tongqiao Biyan Pian
(通窍鼻炎片)

Tongqiao Biyan Tablets

Ingredients Fructus Xanthii (stir-baked) 200 g; Radix Saposhnikoviae 150 g; Radix Astragali 250 g; Radix Angelicae Dahuricae 150 g; Flos Magnoliae 150 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 150 g; Herba Menthae 50 g.

Procedure Pulverize Radix Angelicae Dahuricae and 80 g of Rhizoma Atractylodis Macrocephalae to fine powder. Decoct remained Rhizoma Atractylodis Macrocephalae, Fructus Xanthii and other four ingredients with water twice, each for 2 hours, combine the decoctions, filter, concentrate the filtrate in vacuum to a thin extract with a relative density of 1.28-1.32 (80℃), mix thoroughly with the above powder, dry, pulverize, make granules, compress into 1000 tablets and coat with sugar.

Description Sugar coated tablets with yellowish-brown to dark brown core; tase, slightly bitter, pungent, and cool.

Identification (1) Microscopical: Needles of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells.

(2) Pulverize 10 tablets, removed sugar coats, to fine powder, add 10 ml of petroleum ether (60-90℃), ultrasonicate for 20 minutes. Filter, reserve the residue for the later use and evaporate the filtrate to 1 ml as the test solution. To 0.1 g of

Radix Angelicae Dahuricae reference drug, add 1 ml of petroleum ether (60-90℃), ultrasonicate for 20 minutes, allow to stand, and use the supernatant as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃) and ether (3 : 2) as the mobile phase. Apple separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm, the fluroscent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Heat under reflux the residue extracted with petroleum ether and expelled the solvent, obtained under the test for Identification (2), in 15 ml of *n*-butanol for 2 hours, filter and wash the filtrate with three 15-ml quantities of 1% solution of sodium hydroxide. Discard the alkaline solution, and then wash again with water saturated with *n*-butanol until the solution become neutral and discard the washings. Evaporate the *n*-butanol solution to dryness, add 2 ml of methanol to disolve the residue and use as the test solution. Dissolve astragaloside Ⅳ CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of chloroform, methanol and water (63 : 35 : 10), stand bellow 10℃, as the mobile phase. Apply separately 5-10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. Examine in sunlight, the spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution; and then examine under ultraviolet light at 365 nm, the same spot show the same colour of fluorescence.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Action To expel *wind* and strengthen the superficies, and disseminate *lung-qi* to free the orifices.

Indications Severe or mild stuffy nose, running nose or thick nasal discharge, and foreheadache due to accumulation of *wind-heat* in the lung and exterior deficiency; chronic rhinitis, allergic rhinitis and nasosinusitis with above sympotoms.

Usage and dosage 5-7 tablets, 3 times a day.

Storage Preserve in tightly closed containers.

Tongru Keli (通乳颗粒)

Tongru Granules

Ingredients Radix Astragali 44.44g; Radix Rehmanniae Praeparata 33.33g; Medulla Tetrapanacis 44.44g; Herba Dianthi 44.44g; Radix Trichosanthis 33.33g; Fructus Liquidambaris 44.44g; Radix Rhapontici 44.44g; Radix Codonopsis 44.44g; Radix Angelicae Sinensis 44.44g; Rhizoma Chuanxiong 33.33g; Radix Paeoniae Alba (stir-baking with wine) 33.33g; Semen Vaccariae 66.67g; Radix Bupleuri 33.33g; Squama Manis (scalded) 3.17g; Cornu Cervi Degelatinatum 22.22g.

Procedure The above ingredients, except Radix Rhapontici, Radix Angelicae Sinensis, Rhizoma Chuanxiong, Radix Bupleuri, decoct the other eleven ingredients with water for 2 times, 2 hours for the first time, and 1.5 hours for the second time. Combine the decoctions, filter and concentrate the filtrate to a thick extract for the later use. To the Radix Rhapontici, Radix Angelicae Sinensis, Rhizoma Chuanxiong, Radix Bupleuri add 6 times volume of 70% ethanol, heat under reflux again for 2 times, each for 2 hours, filter, combine the filtrate, recover ethanol and concentrate to a thick extract. Combine the above two thick extracts, add a quantity of sucrose, make granules and dry; make to 1000 g granules; or add a quantity of soluble starch, dextrin, stevioside, make granules and dry, make to 333 g granules (without sucrose).

Description Brownish-yellow to brown granules; taste, sweet or slightly bitter (without sucrose).

Identification (1) To 30g or 10g (without sucrose) of the contents, grind to fine powder, add 50 ml of methanol, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 15 ml of water, extract with two 20-ml quantities of *n*-butanol saturated with water by shaking, combine the *n*-butanol extracts, wash separately with 30 and 20 ml of ammonia TS. Separate *n*-butanol extract and evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve astragaloside Ⅳ CRS in methanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and the lower layer of chloroform, methanol and water (13 : 7 : 2, stand below 10℃ for 12 hours) as the mobile phase. Apply separately 5 μl of the reference solution and 10-20 μl of the test solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spot clear. Examine in daylight, the spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. Examine under ultraviolet light at 365 nm, the fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) To 20g or 6.7g (without sucrose) of the contents, grind to fine powder, add 40 ml of methanol, ultrasonicate for 20 minutes, cool and filter, evaporate the filtrate to dryness, dissolve the residue in 15 ml of water, extract with two 20-ml quantities of ethyl acetate by shaking, combine the extracts, evaporate to dryness, dissolve the residue im 1 ml of ethyl acetate as the test solution. Prepare a solution of 1 g of Radix Rhapontici reference drug and 20 ml of methanol in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of cyclohexane and butanone (4 : 1) as the mobile phase. Apply separately 10 μl of the reference drug solution and 10-20 μl of the test solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, the fluorescent main spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, acetonitrile and 0.025mol/L phosphoric acid (1.8 ml of triethylamine per 1000 ml) (1.5 : 13.5 : 85)

as the mobile phase. As detector a spectrophotometer set at 230nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, accurately weighed, in methanol to prepare a solution containing 15μg per ml.

Test solution Weigh accurately 5g or 1.7g (without sucrose) of the content, obtained under the test of weight variation and grind to fine powder, place in a conical flask, add 40 ml of methanol, ultrasonicate (power, 250 W; frequency, 33 kHz) for 40 minutes, cool and filter, place the filtrate in a 50 ml volumetric flask, wash the container and the filter apparatus with methanol, combine the washings to the same volumetric flask, dilute to volume with methanol, shake well and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 1.5 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) for strength (1) and (3) and 3.0 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) for strength (2), referred to Radix Paeoniae Rubra.

Action To replenish *qi* and nourish blood, and dredge meridians to promote lactation.

Indications Hypogalactia, agalorrhea, or galactostasis due to insufficiency of *qi* and blood after childbirth.

Usage and dosage 30 g or 10g (without sucrose), 3 times a day.

Strength (1) 15g per bag (2) 30g per bag
(3) 5g per bag (without sucrose)

Storage Preserve in tightly closed containers.

Tongtian Koufuye (通天口服液)

Tongtian Mixture

Ingredients Rhizoma Chuanxiong; Radix Paeoniae Rubra; Rhizoma Gastrodiae; Rhizoma et Radix Notopterygii; Radix Angelicae Dahuricae; Radix et Rhizoma Asari; Flos Chrysanthemi; Herba Menthae; Radix Saposhnikoviae; Tea; Radix et Rhizoma Glycyrrhizae.

Procedure Distill Rhizoma Chuanxiong, Rhizoma et Radix Notopterygii, Radix et Rhizoma Asari, Flos Chrysanthemi, Radix Saposhnikoviae and Herba Menthae with water, collect 800 ml of the distillation, collect the water solution after distillation in a separate container. Decoct the residue and Radix Paeoniae Rubra, Rhizoma Gastrodiae, Radix Angelicae Dahuricae and Radix et Rhizoma Glycyrrhizae twice, 1 hour for each time, combine the decoctions and filter; macerate tea with boiling water for two times, 20 minutes for each time, combine the liquid and filter, add the above filtrate and the water solution after distillation, concentrate in vacuum to a thin extract with a relative density of 1.14 (70℃), stand, allow to cool to room temperature, add ethanol to a content of 70% ethanol, stir thoroughly. Refrigerate for 24 hours, filter, recover the ethanol from the filtrate in vacuum to a thin extract with a relative density of 1.18 (70℃), add the above distillation (increase dissolving with a quantity of polysorbate 80), add water to the volume of 980ml, add 10% solution of sodium hydroxide to adjust to pH 4.5-6.5, add water to the volume of 1000ml, stir well, stand and filter.

Description A brown liquid; odour, aromatic; taste, pungent, slightly bitter and astringent.

Identification (1) Extract 30 ml of the mixture with two 20-ml quantities of ether by shaking, combine the ether extracts (reserve the aqueous layer for latter use), evaporate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. Macerate 1g of Rhizoma Chuanxiong reference drug in ether for 4 hours while shaking frequently, filter, evaporate the filtrate to dryness, dissolve the residue in 2 ml of ethyl acetate as the reference drug solution. Dissolve menthol CRS in ethanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of each of the reference drug solution and the reference solutions to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm, The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution. Spray with 5% vanillin in sulfuric acid, heat at 105℃ to the spot clear, the spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution and the reference solution.

(2) Extract the aqueous layer obtained under the test of Identification (1), with two 20-ml quantities of *n*-butanol saturated with water by shaking, combine the *n*-butanol extracts, wash with 20 ml of water, separate the *n*-butanol layer, evaporate to dryness, dissolve the residue in 2 ml of methanol as the test solution. Dissolve paeoniflorin CRS in methanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of chloroform, ethyl acetate, methanol and concentrated ammonia TS (8 : 1 : 4 : 1) as the mobile phase. Apply separately 3 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid, heat at 105℃ to the spot clear, the spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution and the reference solution.

(3) Heat under reflux 0.5g of Radix et Rhizoma Glycyrrhizae reference drug with 10 ml of ethanol for 1 hour, cool and filter. Concentrate the filtrate to 1 ml as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of chloroform, methanol and water (40 : 10 : 1) as the mobile phase. Apply separately 5 μl of each of the reference drug solution and the test solution obtained under the test of Identification (2). After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spot clear, the main spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Relative density Not less than 1.01 (Appendix Ⅶ A).

pH value 4.5-6.5 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for mixtures. (Appendix Ⅰ J).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (30 : 70) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, accurately weighed, in dilute ethanol TS to prepare a solution containing 0.1 mg per ml.

Test solution Measure accurately 2 ml of the mixture in a 25 ml volumetric flask, dilute with dilute ethanol TS to the volume and mix well. Centrifuge, use the supernatant as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 0.45 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per ml, referred to Radix Paeoniae Rubra.

Action To promote blood circulation to resolve stagnated blood, and expel *wind* to kill pain.

Indications Migraine due to stagnated blood and upward attack by *wind* with manifestations of fixed distending pain or stabbing pain in the head with repeated attack, dizziness, or nausea, vomiting and aversion to wind.

Usage and dosage On the first day: Take 10 ml first, then another 10 ml 1 hour, 2 hours and 4 hours later respectively. After take 10 ml every 6 hours. On the second and third day: 10 ml, 3 times a day. Three days make a course of treatment, or follow doctor's advice.

Precaution Contraindicated for patients with hemorrhagic cerebrovascular diseases and those with *yin* deficiency and *yang* hyperactivity, and for pregnant women.

Strength 10 ml per phial

Storage Preserve in tightly closed containers.

Tongxinluo Jiaonang (通心络胶囊)

Tongxinluo Capsules

Ingredients Radix et Rhizoma Ginseng; Hirudo; Scorpio; Radix Paeoniae Rubra; Periostracum Cicadae; Eupolyphaga seu Steleophaga; Scolopendra; Lignum Santali Alba; Lignum Dalbergiae Odoriferae; Olibanum (processed); Semen Ziziphi Spinosae (stir-baked); Borneolum Syntheticum.

Proceduce Distill the volatile oil of Lignum Santali Alba and Lignum Dalbergiae Odoriferae and remain the residue and the water solution for later use. Heat Radix et Rhizoma Ginseng with 70% ethanol twice under reflux, 3 hours for the first and 2 hours for the second time, combine the extracts and recover ethanol. Combine the residue of Radix Ginseng and the residues and water solutions of Lignum Santali Alba and Lignum Dalbergiae Odoriferae, add Radix Paeoniae Rubra and Semen Ziziphi Spinosae, decoct 2 times, 3 hours for the first and 2 hours for the second time. Combine the decoctions, filter, concentrate the filtrate to a thin extract with a relative density of 1.20-1.25 (60℃). mix well with the above extract of Radix Ginseng, dry at a lower temperature and pulverize to fine powder. Wash clean Hirudo, Scorpio, Periostracum Cicadae, Eupolyphaga seu Steleophaga and Scolopendra, dry in oven at a lower temperature, and triturate with Olibanum to fine powder. Grind Borneolum Syntheticum to fine powder, triturate with the above two fine powders respectively, mix well, spray the volatile oil, mix thoroughly, pack into 1000 capsules.

Description Hard capsules with brown powdered content; odour, aromatic, slightly stinking; taste, slightly salty and bitter.

Identification (1) Microscopical: Fragments of the body walls pale yellow to yellow, with reticulate striations and rounded seta pits, sometimes brown setae visible. Fragments of trachea walls with brown or yellowish-green helical filaments, 1-5 μm wide, with almost colourless punctiform masses between filaments. Fragments of chitinous shells pale yellowish-brown, translucent, densely covered with papillose or short spine bulge. Fragments of the body wall yellow or brownish-red, with rounded seta pits, 8-24 μm in diameter, seta in varying length often visible. Oblique striated muscle fibres usually colourless, separated or jointed, 10-40 μm in diameter, mostly uneven in margins, sometimes partly inflated.
(2) Ultrasonicate the content of 15 capsules with 30 ml of ethanol for 15 minutes, filter, evaporate the filtrate to dryness, wash the residue with two 5-ml quantities of ether, discard ether washings, and expel ether. Dissolve the residue in a quantity of water, apply to a column packed with D101 macroporous absorption resin (2 cm in inner diameter, 12 cm in length, pre-eluted with ethanol and water stepwisely), elute with 100 ml of water and discard the water eluate. Elute with 80 ml of 70% ethanol, and collect the 70% ethanol eluate and evaporate to dryness. Dissolve the residue in 1 ml of ethanol as the test solution. Dissolve ginsenosides Rb_1 CRS, Re CRS, Rg_1 CRS in ethanol to prepare a mixture containing 1 mg each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, ethyl acetate, methanol and water (15 : 40 : 22 : 10), stand below 10℃ for overnight, as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate, After developing and removal of the plate, dry in air, spray with 2% solution of vanillin of sulfuric acid in ethanol (add slowly 50 ml of sulfuric acid to 25 ml of water, allow to cool, add 25 ml of ethanol and shake well, then mix well with 25 ml of 10% solution of vanillin in dehydrated ethanol. The solution should be freshly prepared), heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.
(3) Dissolve paeoniflorin CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 5 μl of each of the test solution obtained under the test of Identification (2) and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with a 2% solution of vanillin of sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(4) Shake the content of 1 capsule with 3 ml of ethanol for 3 minutes, allow to stand, and use the supernatant as the test solution. Dissolve a mixture of (±) borneol and (±) isoborneol CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene and acetone

(9 : 1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with a 2% solution of vanillin of sulfuric acid in ethanol, heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use the octadecylsilance bonded silica gel as the stationary phase and a mixture of acetonitrile and water (12 : 88) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of paeoniflorin.

Reference solution Weigh accurately 10 mg of paeoniflorin CRS, in a 100 ml volumetric flask, add methanol to dissolve and dilute to volume, and shake well. Measure accurately 5 ml into a 50 ml volumetric flask, dilute with 70% methanol to volume, and mix well (containing 10 μg of paeoniflorin per ml).

Test solution Grind well the content of capsules, obtained under the test of weight variation, weigh accurately 0.25 g in a stopper conical flask, add 25 ml of 70% methanol, stopper tightly, weigh and ultrasonicate (power, 250 W; frequency, 40 kHz) for 50 minutes, allow to cool, weigh again, replenish the loss of the weight with 70% methanol, shake well, and filter. Measure accurately 10 ml of the successive filtrate in a 25 ml volumetric flask, dilute with 70% methanol to volume, shake well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, calculate the content.

It contains not less than 0.77 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per capsule, referred to Radix Paeoniae Rubra.

Action To replenish *qi* and promote blood circulation, and dredge meridians to kill pain.

Indications Angina pectoris in coronary heart disease caused by a deficiency of *heart-qi* and blockage of meridians by stagnated blood with manifestations of constriction, fixed stabbing or colic pain in the chest, palpitation, spontaneous sweating, shortness of breath, lassitude, dark purple tongue or ecchymosis, thready and unsmooth pulse or knotted and intermittent pulse; stroke due to a deficiency of *qi* and stagnated blood blocking meridians with manifestations of hemiplegia or numbness of one side of the body, deviated mouth and tongue and dysphasia.

Usage and dosage 2-4 capsules, 3 times a day.

Precaution Contraindicated for patients with hemorrhage, pregnant women and women during periods, and stroke patients from *yin* deficiency and *fire* hyperactivity.

Strength 0.38 g per capsule

Storage Preserve in tightly closed containers.

Tongxuan Lifei Wan
(通宣理肺丸)

Tongxuan Lifei Pills

Ingredients Folium Perillae 144 g; Radix Peucedani 96 g; Radix Platycodonis 96 g; Semen Armeniacae Amarum 72 g; Herba Ephedrae 96 g; Radix et Rhizoma Glycyrrhizae 72 g; Pericarpium Citri Reticulatae 96 g; Rhizoma Pinelliae (processed) 72 g; Poria 96 g; Fructus Aurantii (stir-baked) 96 g; Radix Scutellariae 96 g.

Procedure Pulverize the above eleven ingredients to fine powder, sift, mix thoroughly. To each 100 g of the powder add 35-45 g of refined honey and a quantity of water to make water-honeyed pills and dry; or add 130-160 g of refined honey to make big honeyed pills.

Description Blackish-brown water-honeyed pills or big honeyed pills; taste, slightly sweet and bitter.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate solution; hyphae colourless or pale brown, 4-6 μm in diameter. Fibres pale yellow, fusiform, walls thickened, pit-canals fine. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Stomata characteristic, guard cells dumbbell-like in lateral view. Prisms of calcium oxalate abundant in parenchyma. Needle crystals of calcium oxalate in bundles, 32-144 μm long, occurring in mucilage cells or scattered. Stone cells orange-yellow, conchoidal, walls relatively thickened, pits distinct on the wider side. Anastomosing laticiferous tubes 14-25 μm in diameter, containing pale yellow granules. Vittae containing golden yellow secretion. Mesophyll containing fine clusters of calcium oxalate, 4-8 μm in diameter.

(2) Grind 4 g of water-honeyed pills, or triturate 6 g of big honeyed pills thoroughly with 5 g of kieselguhr, to fine powder and sift through No. 3 sieve. Transfer the mixture to a 50 ml conical flask, add 20 ml of ether and 1 ml of concentrated ammonia TS, stopper tightly, allow to stand for 2 hours, shake frequently and filter. Wash the residue with three 15-ml quantities of ether, filter. Combine the filtrates, add 1 ml of hydrochloric acid in ethanol (1→20), mix well and evaporate to dryness. Dissolve the residue in 2 ml of methanol, filter, use the filtrate as the test solution. Dissolve ephedrine hydrochloride CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and concentrated ammoina TS (40 : 7 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the two solutions. After developing and removal of the plate, dry in air, and spray with ninhydrine TS and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Grind 6 g of water-honeyed pills, or 12 g of big honeyed pills with 20 ml of water. Transfer to a 500 ml round-bottom flask, add 230 ml of water and several glass beads, shake thoroughly. Connect with the apparatus for the determination of volatile oils, add water from the top of the apparatus to volume until the water overflows into the flask. Add 1.5 ml of petroleum ether (60-90℃), connect with condenser and boil gently for 2 hours, allow to cool, use the petroleum ether layer as the test solution. Place 0.7 g of Folium Perillae reference drug to a 500 ml round-bottom flask, add 250 ml of water and several glass beads to prepare a reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (19 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the two solutions, after developing and removal of the plate, dry in air and spray with 5% solution of vanillin in hydrochloric acid, heat at 105 ℃ for 5 minutes, take it out immediately. The spots in the chromatogram obtained with the test

solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(4) Grind 4 g of water-honeyed pills or 6 g of big honeyed pills to powder, mix thoroughly with 4 g of kieselguhr to fine powder and sift through No. 3 sieve. Transfer to a conical flask, add 15 ml of methanol, shake for 30 minutes, filter, use the supernatant as the test solution. Dissolve baicalin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of ethyl acetate, butanone, acetic acid and water (10 : 7 : 5 : 3) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air, and spray with 1% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of acetonitrile and 0.02 mol/L solution of potassium dihydrogen phosphate (containing 0.2% triethylamine, and adjust to pH 2.7 with phosphoric acid) (3 : 97) as the mobile phase. As detector a spectrophotometer set at 210 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of ephedrin hydrochloride.

Reference solution Weigh accurately a quantity of ephedrin hydrochloride CRS, dissolve in a solution of hydrochloric acid in methanol (1→1000) to prepare a solution containing 60 μg per ml.

Test solution Triturate the water-honeyed pills or big honeyed pills, obtained under the test of weight variation, to fine powder, weigh accurately 2 g, add 2 g of kieselguhr, grind to mix well, and place to a Soxhlet's extractor, and 3 ml of concentrated ammonia TS, 10 ml of ethanol, and a quantity of ether, extract under reflux until the extract is colourless, cool. Filter and transfer the ether extract to an evaporating dish, wash the filter paper and apparatus with ether, combine ether washings to the evaporating dish, expel the ether. Dissolve the residue in a solution of hydrochloric acid in methanol (1→1000), and transfer to a 10 ml of volumetric flask, add a solution of hydrochloric acid in methanol (1→1000) to volume, mix well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column respectively and calculate.
It contains not less than 0.30 mg of ephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) per gram of water-honeyed pills and 1.2 mg per pill of big honeyed pills, referred to Herba Ephedrae.

Action To release the exterior to disperse *cold*, and disseminate *lung-qi* and stop coughing.

Indications Common cold with coughing due to affliction from external *wind-cold* and failure of dissemination of *lung-qi*, with manifestations of fever, aversion to cold, coughing, stuffy nose and running nose, headache, absence of sweating and aching pain of limbs.

Usage and dosage 7 g of water-honeyed pills; 2 big honeyed pills, 2-3 times a day.

Strength 10 g per 100 water-honeyed pills; 6 g per big honeyed pill

Storage Preserve in tightly closed containers.

Unguentum Erodii seu Geranii (老鹳草软膏, Laoguancao Ruangao)

Common Heron's Bill Ointment

Common Heron's Bill ointment is prepared from Herba Erodii seu Geranii.

Procedure Decoct 1000 g of Herba Erodii seu Geranii with water twice, 1 hour for each time. Combine the decoctions, filter, concentrate the filtrate and add equal volume of ethanol to precipitate. Allow to stand for 12-24 hours, filter the supernatant and concentrate to an extract with a relative density of 1.20. Add 0.3 g of ethyl *p*-hydroxybenzoate, 50 g of wool fat and a quantity of vaselin, mix thoroughly and make up to 1000 g.

Description A brownish-purple ointment.

Identification Dissolve with stirring 5 g in 10 ml of ethanol on a water bath, cool and filter to remove the solidified vaselin. To 1 ml of the filtrate, add 1 to 2 drops of ferric chloride TS; an dark blue colour is produced, which turns to bluish-black on standing. To another 2 ml of the filtrate add 0.25% cupric sulfate solution; a white precipitate is produced. To another 2 ml of the filtrate add calcium chloride TS; a white precipitate is produced.

Other requirements Comply with the general requirements for ointments (Appendix Ⅰ R).

Action To remove *dampness* and clear *toxicity*, and promote healing and regeneration of tissues.

Indications Eczema, abscess, furuncle, sore, boil due to retention of *dampness*, or burn and scald of small area.

Usage and dosage For external use, applied topically, once a day.

Storage Preserve in tightly closed containers.

Wanshi Niuhuang Qingxin Wan (万氏牛黄清心丸)

Wanshi Niuhuang Qingxin Pills

Ingredients Calculus Bovis 10 g; Cinnabaris 60 g; Rhizoma Coptidis 200 g; Radix Scutellariae 120 g; Radix Curcumae 80 g; Fructus Gardeniae 120 g.

Procedure Levigate Cinnabaris to very fine powder, and pulverize Rhizoma Coptidis, Radix Scutellariae, Fructus Gardeniae and Radix Curcumae to fine powder. Triturate Calculus Bovis with the other five ingredients, sift and mix well. To each 100 g of the powder add 100-120 g of refined honey to make big honeyed pills.

Description Reddish-brown to brown big honeyed pills; odour, characteristic; taste, sweet, slightly astringent and bitter.

Identification (1) Microscopical: Masses of gelatinized starch granules almost colourless. Stone cells of testa yellow or brownish, mostly broken, when whole, long polygonal, rectangular or irregular, walls thickened, with large rounded pits, the lumina containing brownish-red contents phloem fibres pale yellow, fusiform with thickened walls and fine

pit-canals. Fibre bundles bright yellow, with slighly thickened walls and distinct pits. Irregular minute granules dark brown, lustrous, and with dark black edges.

(2) Grind 3 g with a quantity of water, wash with water in portions, to remove the suspended matter until a small quantity of vermilion precipitate is obtained. To the precipitate add 1 ml of hydrochloric acid and a copper plate, and heat to boil; the colour of copper plate turns from yellow to silver-white.

(3) Mix well 3 g, in pieces, with 0.6 g of kieselguhr. Heat under reflux with 10 ml of chloroform and 0.5 ml of glacial acetic acid for half an hour, cool, filter and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of ethanol, filter and use the filtrate as the test solution. Dissolve cholic acid CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of ethyl acetate, *n*-hexane, acetic acid and methanol (32 : 6 : 1 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with 10% phosphomolybdic acid in ethanol and heat at 110℃ for 10 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Mix well 3 g, in pieces, with 0.5 g of kieselguhr. Heat under reflux with 20 ml of methanol for 1 hour, cool, filter and use the filtrate as the test solution. Dissolve baicalin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose containing 4% solution of sodium acetate as the coating substance, and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately to the plate 5 μl each of the two solutions. After developing and removal of the plate, dry in air and spray with 2% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(5) Grind 3 g with 15 ml of ether, discard the ether solution and expel the ether from drug residue. To the drug residue add 30 ml of ethyl acetate, heat under reflux for 1 hour, cool, filter and evaporate to dryness. Dissolve the residue in 3 ml of methanol, filter and use the filtrate as the test solution. Dissolve geniposide CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, acetone, formic acid and water (10 : 7 : 2 : 0.5) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol and heat at 105 ℃ for 10 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(6) Extract 50 mg of Rhizoma Coptidis reference drug with 10 ml of methanol by heating under reflux on a water bath for 15 minutes, filter and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the reference drug solution. Dissolve berberine hydrochloride CRS in methanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonium TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately to the plate 2 μl of each of the remained extract obtained under the Assay for Rhizoma Coptidis and the above two solutions. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay ***Cinnabaris*** Weigh accurately 5 g, obtained under the test of weight variation and cut into pieces, into a 250 ml Kjeldahl's flask, add 30 ml of sulfuric acid and 8 g of potassium nitrate, heat until the solution becomes nearly colourless and cool. Transfer the solution to a 250 ml conical flask, wash the Kjeldahl's flask with 50 ml of water in protions. Combine the washings with the solution, add a 1% solution of potassium permanganate until a pink colour is produced and not faded within 2 minutes. Add dropwise a 2% solution of ferrous sulfate until the pink colour disappears, add 2 ml of ammonium ferric sulfate IS, titrate with ammonium thiocyanate (0.1 mol/L) VS. Each ml of ammonium thiocyanate (0.1 mol/L) VS is equivalent to 11.63 mg of HgS.

It contains not less than 69 mg and not more than 90 mg of HgS per small pill, or not less than 138 mg and not more than 180 mg of HgS per big pill, referred to Cinnabaris.

Rhizoma Coptidis Cut a quantity of the pills, obtained under the test of weight variation, into pieces, weigh accurately a quantity, add accurately the same amount of kieselguhr and grind well. Weigh accurately 1.6 g in a Soxhlet's extractor, and heat under reflux with a quantity of a mixture of hydrochloric acid and methanol (1 : 100) until the extract colourless. Transfer the extract to a 100 ml volumetric flask, wash the container with the same mixture, combine the washings into the same volumetric flask, dilute with the mixture to volume and shake well. Measure accurately 10 ml to a 50 ml volumetric flask, dilute with methanol to volume, shake well as the test solution. Dissolve a quantiy of berberine hydrochoride CRS, weighed accurately, in methanol to prepare a solution containing 0.02 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B). Using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and water (4 : 2 : 1 : 1 : 0.2) as the mobile phase. Apply separately 4 μl of the test solution, 2 μl and 6 μl of the reference solution to the plate, alternately. Pre-equilibrate with concentrate ammonia TS in another slot, for 15 minutes, After developing and removal of the plate, and dry in air. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan with fluorescence mode at the wavelength of $\lambda = 366$ nm. Measure the integration values of the fluorescent absorbance of the test solution and the reference solution, respectively, and calculate the content.

It contains not less than 7.5 mg per small pill, 15.0 mg per big pill, of berberine hydrochloride ($C_{20}H_{18}ClNO_4$), referred to Rhizoma Coptidis.

Action To clear *heat* and *toxins*, relieve convulsion and anchor the mind.

Indications Invasion of the pericardium by *heat* and stirring of *wind* by intense *heat*, with manifestations of high fever, restlessness, coma, delirium or child convulsion due to high fever.

Usage and dosage 2 small pills or 1 big pills, 2-3 times a day.

Precaution Be cautious about pregnant women.

Strength (1) 1.5 g per small pill (2) 3 g per big pill

Storage Preserve in tightly closed containers.

Wantong Yankang Pian (万通炎康片)

Wantong Yankang Tablets

Ingredients Herba Picriae; Herba Sarcandrae.

Procedure Decoct the above two ingredients with water twice, 2 hours for each. Combine the decoctions, and filter. Concentrate the filtrate to a thin extract with a relative density of 1.10-1.15 (75℃), allow to cool, add three times quantity of ethanol and mix well. Allow to stand for 24 hours, separate the supernatant and recover ethanol, concentrate to a thin extract with a relative density of 1.10-1.20 (70℃), make granules with a quantity of excipients, dry, compress into 1000 tablets (big tablets) or 1500 tablets (small tablets), coat with film; or compress into 3000 tablets, and coat with sugar.

Description Film coated tablets or sugar coated tablets with yellowish-brown to brown core; taste, bitter.

Identification (1) To 10 tablets of sugar coated tablets, or 3 tablets of big film coated tablets, or 5 tablets of small film coated tablets, removed the coats, and pulverize to fine powder. Triturate with 5 ml of 70% ethanol, filter, evaporate the filtrate to dryness, dissolve the residue in 5 ml of water and filter. Extract the filtrate with two 5-ml quantities of petroleum ether (60-90℃) by shaking, discard the petroleum ether extracts, add 1 drop of dilute hydrochloric acid to the water layer and 5 ml of ethyl acetate, extract by shaking. Separate the ethyl acetate layer, concentrate to 1 ml as the test solution. Decoct 5 g of Herba Sarcandrae reference drug with water for 1 hour, filter, concentrate the filtrate to about 5ml, add 15 ml of ethanol, mix well and filter. Evaporate the filtrate to dryness, dissolve the residue in 5 ml of water, carry out the procedure as described under the test solution, beginning at the words "Extract the filtrate with two 5-ml quantities of petroleum ether (60-90℃)" to prepare a solution as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of benzene, chloroform, and methanol (4 : 6 : 1) as the mobile phase. Apply separately 5-10 μl of each of the test solution and the reference drug solution to the plate. After developing and removing the plate, dry in air. Spray with a mixture of 2% potassium ferricyanide and 2% ferric chlorid (1 : 1) (freshly prepared). The spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.

(2) To 5 g of Herba Picriae reference drug, carry out the procedure as described under the reference drug solution of Identification (1) to prepare a solution as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B). using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform and methanol (4 : 1) as the mobile phase. Apply separately 5-10 μl of each of the test solution obtained under the test of Identification (1) and the reference drug solution to the plate. After developing and removing the plate, dry in air. Spray with 1% vanillin in sulfuric acid, and heat at 105℃ to spots clear. The spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.

Other requirements Comply to the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% phosphoric acid (25 : 75) as the mobile phase. As detector a spectrophotometer set at 344 nm. The number of theoretical plates of the column is not less than 3500, calculated with the reference to the peak of isofraxidin.

Reference solution Weigh accurately a quantity of isofraxidin CRS, dissolve in methanol to prepare a reference solution containing 20 μg per ml.

Test solution To 20 tablets removed the coats, weigh accurately, pulverize to fine powder, weigh accurately 2 g (sugar coated tablets) or 1 g (film coated tablets) to a stopper conical flask, add 20 ml of water, ultrasonicate (power, 250 W; frequency, 33 kHz) for 20 minutes. Filter, wash the container and the filter with a small quantity of water, and combine the washings with the filtrate. Extract by shaking with five 10-ml quantities of chloroform, combine the chloroform extracts, and evaporate to dryness. Dissolve the residue in methanol, transfer to a 25 ml volumetric flask, dilute to volume with methanol, mix well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 40 μg of isofraxidin ($C_{11}H_{10}O_5$) for each sugar coated tablets, 120 μg for each big film coated tablets, and 80 μg for each small film coated tablets.

Action To dispel *wind* and clear *heat*, and relieve *toxicity* and reduce swelling.

Indications Red swollen throat or gums, or carbuncles due to affliction from external *wind-heat*; acute and chronic pharyngitis, tonsillitis, gingivitis, sores and boils with above symptoms.

Usage and dosage Film coated tablets: 3 tablets for small tablets, 4 tablets in serious cases, 3 times a day; 2 tablets for big tablets, 3 tablets in serious cases, 3 times a day. Sugar coated tablets : 6 tablets, 9 tablets in serious cases, 3 times a day; appropriate reduction of the dosage for children.

Strength (1) 0.35 g for each big film coated tablets
(2) 0.24 g for each small film coated tablets

Storage Preserve in tightly closed containers.

Wanying Ding (万应锭)

Wanying Troches

Ingredients Rhizoma Picrorhizae 100 g; Rhizoma Coptidis 100 g; Catechu 100 g; Borneolum Syntheticum 6 g; Chinese Ink 200 g; Pulvis Fel Ursi 20 g; Moschus 5 g; Calculus Bovis 5 g; Fel Bovis 160 g.

Procedure Pulverize Rhizoma Picrorhizae, Rhizoma Coptidis, Catechu and Chinese Ink to fine powder. Triturate Calculus Bovis, Boneolum Syntheticum and Moschus to fine powder,

triturate with the above powder, sift and mix well. Dissolve Fel Ursi in a quantity of warm water. Concentrate Pulvis Fel Bovis to a quantity, filter and mix with Fel Ursi solution, then mix with the above powder to make troches and dry at a lower temperature.

Description Black and bright spheroidal troches; odour, aromatic; taste, bitter, with cooling sensation.

Identification (1) Microscopical: Fibre bundles bright yellow, with slightly thickened walls and distinct pits. Irregular masses brownish-black or black. Crystals of sublimate pale yellowish-green, in needles, needle-clusters or long plates.
(2) Sublime 0.15 g, in fine powder, observe the sublimates under microscope: Colourless irregular plate crystals are visible, which turn to purpled colour on adding 1 drop of freshly prepared 1% vanillin in sulfuric acid.
(3) Macerate warmly 6 g, in pieces, in 20 ml of methanol on a water bath for 1 hour and filter. Evaporate 10 ml of the filtrate to dryness, dissolve the residue in 5 ml of 5% sodium hydroxide solution and heat on a water bath for 8 hours. Cool, add hydrochloric acid to adjust to pH 2-3, add 10 ml of water, mix well, and extract with two 30-ml quantities of ether. Combine the ether extracts and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve separately ursodesoxycholic acid CRS, cholic acid CRS, deoxycholic acid CRS in methanol to produce solutions containing 1 mg per ml respectively as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of isooctane, ethyl acetate and glacial acetic acid (15 : 7 : 5) as the mobile phase. Apply separately to the plate 2 μl of each of the four solutions. After developing to a distance of 18 cm at a relative humidity below 40%, and removal of the plate, dry in air, spray with sulfuric acid in ethanol (1→10), and heat at 110℃ for several minutes. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference solutions. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the fluorescent spots in the chromatogram obtained with the reference solutions.
(4) Dilute 5 ml of the remains of methanol filtrate obtained in the test for Identification (3) with methanol to 10 ml as the test solution. Prepare a solution with 50 mg of Rhizoma Coptidis reference drug in 5 ml of methanol as the reference drug solution in the same manner. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately to the plate 2 μl of each of the three solutions and place the plate in a chamber pre-equilibrated with ammonia vapour. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for troches (Appendix Ⅰ E).

Action To clear *heat* and toxic materials, and relieve convulsion.

Indications Sores on the mouth and tongue, or swollen painful gums and throat, or high fever in children, irritability and proneness to convulsion due to abundant toxic materials in the interior.

Usage and dosage 2-4 troches, twice a day; appropriate reduction of the dosage for children under 3 years of age.

Precaution Be cautious about pregnant women.

Strength 1.5 g per 10 troches

Storage Preserve in tightly closed containers.

Wanying Jiaonang
(万应胶囊)

Wanying Capsules

Ingredients Rhizoma Picrorhizae 60 g; Rhizoma Coptidis 60 g; Catechu 60 g; Borneolum Syntheticum 3.6 g; Chinese Ink 120 g; Fel Ursi 12 g; Moschus 5 g; Calculus Bovis Artifactus 3 g; Fel Bovis 96 g.

Procedure Pulverize Rhizoma Picrorhizae, Rhizoma Coptidis, Catechu, and Chinese Ink to fine powder, mix thoroughly with Calculus Bovis Artifactus. Dissolve Fel Ursi in a quantity of warm water, concentrate Fel Bovis to a quantity and filter, mix with Fel Ursi, add to the above powder, mix well, make granules. Pulverize Borneolum Syntheticum and Moschus to fine powder, mix thoroughly with the above granules, make 1000 granules (0.3 g) or 2000 granules (0.15 g).

Description Capsules, containing black or dark green granules and powder; odour, aromatic; taste, bitter, and cool.

Identification (1) Pulverize 1.8 g of the contents to fine powder, add 20 ml of ether, heat under reflux on a water bath for 1 hour. Filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of chloroform as the test solution. Dissolve vanillic acid CRS in methanol to produce a mixture containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of *n*-hexane, ether, and formic acid (12 : 8 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution and 5 μl of the reference solution to the plate. After developing and removing the plate, dry in air, and examine under ultraviolet light at 254 nm. The spot in the chromatography obtained with the test solution corresponds in position and colour to the spot in the chromatography obtained with the reference solution.
(2) Pulverize 1 g of the contents to fine powder, add 20 ml of methanol, ultrasonicate for 20 minutes, filter, and use the filtrate as the test solution. To 50 mg of Rhizoma Coptidis reference drug, add 5 ml of methanol, heat under reflux for 15 minutes, filter, use the filtrate as the reference drug solution. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol, and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately 1 μl of each of the reference solution, the reference drug solution, and the test solution to the plate. After developing in a chamber pre-equilibrated with concentrated ammonia vapour, remove the plate and dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in chromatogram obtained with the reference solution and the reference drug solution.

(3) Pulverize 0.5 g of the contents to fine powder, add 20 ml of ether, well stopper, macerate for 1 hour, and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethanol as the test solution. Dissolve a mixture of (±)-borneol and (±)-isoborneol CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃), benzene, and ethyl acetate (9 : 4 : 2) as the mobile phase. Apply separately to the plate 5 μl of the test solution and 2 μl of the reference solution. After developing and removing the plate, dry in air. Spray with 10% vanillin in sulfuric acid, heat at 105℃ to the spots clear. The spot in the chromatography obtained with the test solution corresponds in position and colour to the spot in the chromatography obtained with the reference solution.

(4) Evaporate the test solution, obtained under the Identification (1), to dryness, dissolve the residue in 5 ml of 10% solution of sodium hydroxide, heat under reflux on a water bath for 5 hours. Allow to cool, adjust to pH 2-3 with hydrochloric acid, and extract by shaking with two 15-ml quantities of ether. Combine the ether extracts and wash with two 15-ml quantities of water, separate the ether layer, and evaporate to dryness. Dissolve the residue in 1 ml of ether acetate as the test solution. Dissolve cholic acid CRS, hyodeoxycholic acid CRS, and ursodeoxycholic acid CRS in ethyl acetate to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of *n*-hexane, ethyl acetate, methanol, and acetic acid (20 : 25 : 3 : 2) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removing the plate, dry in air. Spray with the 10% solution of sulfuric acid in ethanol, heat at 105℃ for several minutes, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference solution.

Other requirements Comply to the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatography system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.033 mol/L solution of potassium dihydrogen phosphate solution (30 : 70) as the mobile phase. As detector a spectrophotometer set at 265 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of berberine hydrochloride.

Reference solution Weigh accurately a quantity of berberine hydrochloride CRS, dissolve in a mixture of hydrochloric acid and 70% ethanol (1 : 100) to produce a reference solution containing 10 μg per ml.

Test solution Pulverize the contents, obtained under the test of packing variation, to fine powder, weigh accurately 0.3 g. Add 30 ml of a mixture of hydrochloric acid and 70% ethanol (1 : 100), heat under reflux for 1 hour, allow to cool, filter, and transfer the filtrate to a 50 ml volumetric flask. Wash the container and the residue with a mixture of hydrochloric acid and 70% ethanol (1 : 100) for several times, combine the washings to the same flask, and dilute to volume with a mixture of hydrochloric acid and 70% ethanol (1 : 100). Mix well, centrifuge, measure accurately 1 ml of the supernatant to a 10 ml volumetric flask, dilute to volume with the mobile phase, and shake well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 3.0 mg of berberine hydrochloride ($C_{20}H_{18}ClNO_4$) per capsule for Strength (1), and 1.5 mg for Strength (2), referred to Rhizoma Coptidis.

Action To clear *heat*, relieve *toxicity* and convulsion.

Indications Ulcers in the mouth or on the tongue, swollen and painful gums and throat, or high fever, restlessness and proneness to fright in children due to accumulation of toxic materials.

Usage and dosage 1-2 capsules for Strength (1), and 2-4 capsules for Strength (2), twice a day, appropriate reduction of the dosage for children under 3 years of age.

Precaution Be cautious about pregnant women.

Strength (1) 0.3 g per capsule (2) 0.15 g per capsule

Storage Preserve in tightly closed containers.

Weichang'an Wan
(胃肠安丸)

Weichang'an Pills

Ingredients Radix Aucklandiae; Lignum Aquilariae Resinatum; Fructus Aurantii (stir-baked with bran); Lignum Santali Albi; Radix et Rhizoma Rhei; Cortex Magnoliae Officinalis (processed with ginger); Cinnabaris; Moschus; Semen Crotonis Pulveratum; Fructus Jujubae (cored); Rhizoma Chuanxiong.

Procedure Levigate Cinnabaris to very fine powder. Pulverize Semen Crotonis Pulveratum and Moschus to fine powder separately. Pulverize the other eight ingredients to fine powder, triturate with the fine powder of Semen Crotonis Pulveratum and Moschus, mix thoroughly and sift. Make pills with water, dry at a lower temperature, coat with Cinnabaris, polish and dry in air.

Description Vermilion watered pills; odour, aromatic; taste, sweet, pungent and bitter.

Identification (1) Macerate 1 g of the pills, pulverized to fine powder, in 20 ml of methanol for 1 hour and filter. Evaporate the filtrate to dryness. Dissolve the residue in 10 ml of water, add 0.5 ml of hydrochloric acid, heat on a water bath for 30 minutes, cool at once and extract with two 20-ml quantities of ether. Combine the ether layers and filter through absorbent cotton. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 0.2 g of Radix et Rhizoma Rhei reference drug as the reference drug solution in the same manner. Dissolve chrysophanol CRS and emodin CRS in methanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (14 : 7 : 1) as the mobile phase. Apply separately 4 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution. The spots turn to red on

exposure to ammonia vapour.
(2) Pulverize 1 g of the pills to fine powder, macerate in 20 ml of methanol for 1 hour and filter. Concentrate the filtrate to about 2 ml as the test solution. Prepare a solution of 0.3 g of Cortex Magnoliae Officinalis reference drug as the reference drug solution in the same manner. Dissolve magnolol and honokiol CRS in methanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and methanol (18 : 1) as the mobile phase. Apply separately 2 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air. Spray with 1% vanillin in sulfuric acid and heat at 100℃ for about 10 minutes. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, methanol, and water (20 : 50 : 40) as the mobile phase. As detector a spectrophofometer set at 294 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of magnolol.

Reference solution Dissolve separately a quantity of magnolol CRS and honokiol CRS, weighed accurately, in methanol to produce two solutions containing 60 μg of magnolol per ml and 10 μg of honokiol per ml as the reference solutions.

Test solution Grind 3 g of the pills to fine powder. Weigh accurately 0.5 g, place in a conical flask with stopper, add accurately 50 ml of chloroform, weigh and stand overnight. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 1.5 hours, allow to cool, weigh again, replenish the lost weight with chloroform and filter. Evaporate 15 ml of the successive filtrate, accurately measured, to dryness, dissolve the residue in methanol in a 5 ml volumetric flask, dilute with methanol to the volume and mix well.

Procedure Inject accurately 20 μl of each of the reference solutions and the test solution into the column and determine.
It contains not less than 1.0 mg of the total amount of magnolol ($C_{18}H_{18}O_2$) and honokiol ($C_{18}H_{18}O_2$) per gramme, referred to Cortex Magnoliae Officinalis.

Action To resolve *dampness* with aromatics, regulate *qi* flow to kill pain, and invigorate the stomach and remove retained food.

Indications Diarrhea, loss of appitite, nausea, vomiting, abdominal distension and pain due to *dampness* retaining in the *middle-energizer* and indigestion; enteritis or dysentery with above symptoms.

Usage and dosage 20 small pills, 3 times a day; 4-6 small pills for children under 1 year of age, 2-3 times a day; 6-12 small pills for children of 1-3 years of age, 3 times a day, appropriate increase of the dosage for children older than 3 years of age.
4 big pills, 3 times a day, appropriate reduction of the dosage for children.

Strength (1) 0.08 g per 20 small pills
(2) 0.08 g per 4 big pills

Storage Preserve in tightly closed containers.

Weikangling Jiaonang (胃康灵胶囊)

Weikangling Capsules

Ingredients Radix Paeoniae Alba 317.5 g; Rhizoma Bletillae 238.1 g; Radix et Rhizoma Notoginseng 9.9 g; Radix et Rhizoma Glycyrrhizae 317.5 g; Poria 238.1 g; Rhizoma Corydalis 158.7 g; Endoconcha Sepiae 31.7 g; Extractum Belladonnae 2.1 g.

Procedure Pulverize Rhizoma Bletillae, Radix et Rhizoma Notoginseng and Endoconcha Sepiae to fine powder. Decoct Radix et Rhizoma Glycyrrhizae with water 4 times, 3 hours for the first and second time respectively, 2 hours for the third and forth time respectively; filter, combine the filtrate, allow to stand for 24 hours, reserve the supernatant. Decoct Radix Paeoniae Alba, Rhizoma Corydalis and Poria with water twice, 3 hours for the first time and 1 hour for the second time, filter, combine the filtrate, allow to stand for 24 hours; combine this supernatant with the above reserved supernatant, concentrate them to a appropriate amount, add the above fine powder and Extractum Belladonnae, mix thoroughly, dry, pulverize to fine powder, add a quantity of excipient, mix thoroughly, make to 1000 capsules.

Description Capsules containing light-yellow to brown powder; taste, sweet.

Identification (1) Heat under reflux 2 g of the contents, with 1 ml of hydrochloric acid and 15 ml of chloroform for 1 hour, cool and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve a quantity of glycyrrhetinic acid CRS in dehydrated ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃), toluene, ethyl acetate and glacial acetic acid (10 : 20 : 7 : 0.5) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% phosphomolybdic acid in ethanol and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) Place 4 g of the contents, add 2 ml of concentrated ammonia TS and 20 ml of chloroform, ultrasonicate for 5 minutes, and filter. Transfer the filtrate to a separating funnel, wash with 15 ml of water and discard the washing, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Macerate 1 g of Rhizoma Corydalis reference drug in 1 ml of concentrated ammonia TS and 15 ml of chloroform for 30 minutes, then ultrasonicate for 20 minutes and filter; evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 1% solution of sodium hydroxide as the coating substance and a mixture of *n*-hexane, chloroform and methanol (15 : 8 : 2), as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Exposure to iodine vapours under daylight to the spots clear, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained

with the test solution correspond in position and colour to the spots obtained with the reference drug solution.
(3) Place 4 g of the contents, add 40 ml *n*-butanol saturated with water, and ultrasonicate for 20 minutes, filter, wash the filtrate with two-20 ml quantities of ammonia TS; evaporate the filtrate to dryness and dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 0.3 g of Radix et Rhizoma Notoginseng reference drug and 10 ml of *n*-butanol saturated with water in the same manner as the reference drug solution. Dissolve separately a quantity of ginsenoside Rg_1 CRS and notoginsenoside R_1 CRS in methanol to prepare two kinds of solutions containing 1 mg per ml respectively as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13 : 7 : 2), standing below 10℃, as the mobile phase. Apply separately 2-4 μl of the test solution, 2 μl of each of the reference solutions and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions and the reference drug solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilance bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% solution of phosphoric acid (15 : 85) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, accurately weighed, in methanol to prepare a solution containing 50 μg per ml.

Test solution Weigh accurately 0.3 g of the contents, obtained under the test of packing variation, place to a stopper conical flask, add accurately 25 ml of dilute ethanol TS, stopper tightly and weigh; ultrasonicate (power, 200 W; frequency, 40 kHz) for 30 minutes, allow to stand to cool, weigh again; replenish the loss of weight with dilute ethanol TS and mix well. Filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 1.0 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per capsule, referred to Radix Paeoniae Alba.

Action To nourish the liver and harmonize the stomach, and dissipate stasis to stop bleeding, relieve spasm and pain, remove necrotic tissues and promote regeneration of tissues.

Indications Pain in the stomach and hypochondria, belching, casting up of gastric acid due to disharmony between the liver and stomach and blockage of; acute and chronic gastritis, gastric and duodenal ulcers and gastrorrhagia with above symptoms.

Usage and dosage 4 capsules, 3 times a day, taken after meals.

Strength 0.4 g per capsule

Storage Preserve in tightly closed containers.

Weishuning Keli
(胃舒宁颗粒)

Weishuning Granules

Ingredients Radix et Rhizoma Glycyrrhizae 595 g; Endoconcha Sepiae 595 g; Radix paeoniae Alba 464 g; Rhizoma Atractylodis Macrocephalae 310 g; Rhizoma Corydalis 310 g; Radix Codonopsis 119 g.

Procedure Decoct the above six ingredients with water twice, 2 hours for each time; filter, combine the filtrate, allow to stand. Concentrate the supernatant to an appropriate amount, add a quantity of dextrin, mix thoroughly, and dry; pulverize to fine powder, make granules, dry and make to 1000 g. Or concentrate the supernatant in vacuum to an appropriate amount, dry in spraying; add a quantity of dextrin and lactose to make granules, dry and make to 600 g.

Description Brownish-yellow granules; odour, aromatic; taste, sweet.

Identification (1) Triturate 2 g of the granules (without lactose) or 1.2 g of the granules (with lactose) to powder, add 40 ml of ethanol, and ultrasonicate for 30 minutes; filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 1 g of Radix et Rhizoma Glycyrrhizae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13 : 6 : 2) as the mobile phase. Apply separately 2 μl of each of the test solution and the reference solution to the plate; pre-equilibrate the plate in the chamber for 20 minutes. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ for about 5 minutes. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(2) Triturate 5 g of the granules (without lactose) or 3 g of the granules (with lactose) to powder, add 30 ml of ethanol, and ultrasonicate for 30 minutes, filter; evaporate the filtrate on a water bath to nearly dryness, add 2 g of neutral aluminium oxide (100-200 mesh), stir well and dry on a water bath. Apply to a small column packed with neutral aluminium oxide (100-200 mesh, 2 g, 1 cm in diameter), and elute with ethanol. Collect 30 ml of the elution and evaporate it to dryness; dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of paeoniflorin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and concentrated a mmonia TS (8 : 1 : 3 : 05) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.
(3) Triturate 5 g of the granules (without lactose) or 3 g of the granules (with lactose) to powder, add 25 ml of water, adjust the pH value to 2 with hydrochloric acid, filter; adjust the pH value of the filtrate to 10-11 with concentrated ammonia TS. Extract the filtrate with two 20-ml quantities

of ether, combine the ether extracts, and evaporate to dryness. Dissolve the residue in 0.5 ml of methanol as the test solution. Decoct 0.2 g of Rhizoma Corydalis reference drug with a quantity of water for 30 minutes, filter; use the filtrate to prepare the reference drug solution in the same manner as described in the test solution preparation, beginning at the words "adjust the pH value to 2 with hydrochloric acid". Dissolve a quantity of tetrahydropalmatine CRS in methanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of *n*-hexane, dichloromethane and methanol (12 : 8 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference drug solution, 2 μl of the reference solution to the plate. Pre-equilibrate the plate in the chamber for 20 minutes. After developing and removal of the plate, dry in air. Exposure to iodine vapours and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution and the reference drug solution.

Other requirements Comply with the general requirements for granules (Appendix I C).

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilance bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.017 mol/L solution of phosphoric acid (35 : 65) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of glycyrrhizic acid.

Reference solution Dissolve a quantity of ammonium glycyrrhizinate CRS, accurately weighed, in 60% methanol to prepare a solution containing 0.1 mg per ml (equal to containing glycyrrhizic acid 97.95 μg).

Test solution Triturate a quantity of granules, obtained under the test of weight variation, to powder, and mix thoroughly, Weigh accurately 0.3 g (without lactose) or 0.18 g (with lactose) of the granules, place to a stopper conical flask, add accurately 25 ml of a mixture of methanol and 0.017 mol/L solution of phosphoric acid, stopper tightly and weigh; macerate for 1 hour, and ultrasonicate (power, 160 W; frequency, 50 kHz) for 30 minutes; allow to stand to cool, weigh again; replenish the loss of the weight with the above mixture and mix well. Filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 20 mg of glycyrrhizic acid ($C_{42}H_{62}O_{16}$) per pack, referred to Radix et Rhizoma Glycyrrhizae.

Action To reinforce *qi* and invigorate the spleen, and relieve hyperacidity and kill pain.

Indications Gastric pain alleviated by warmth and pressure, casting up of gastric acid due to *a deficiency of the qi* of the spleen and stomach and disharmony between the liver and stomach; gastric and duodenal ulcer with above symptoms.

Usage and dosage 1 pack, 3 times a day, taken after dissolved in boiled water.

Strength (1) 5 g per pack
(2) 3 g per pack (with lactose)

Storage Preserve in tightly closed containers.

Wubei San
(乌贝散)

Wubei Powder

Ingredients Endoconcha Sepiae (shelled) 850 g; Bulbus Fritillariae Thunbergii 150 g; Oleum Pericarpii Citri 1.5 g.

Procedure Pulverize Endoconcha Sepiae (shelled) and Bulbus Fritillariae Thunbergii to fine powder, add Oleum Pericarpii Citri, mix thoroughly and sift.

Description A yellowish-white powder; odour, slightly aromatic; taste, salty and slightly bitter.

Identification (1) Microscopical: Irregular transparent thin slices or pieces with fine stripes or reticular striations. Starch granules ovoid, 35-48 μm in diameter; hila pointed, V-shaped or U-shaped at the narrower end, with fine and dense striations.

(2) Stir thoroughly 10 g of the powder and 5 ml of concentrated ammonia TS, stand for 30 minutes, add 50 ml of chloroform, ultrasonicate for 2 hours, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of ethanol as the test solution. Prepare a solution of 2 g of Bulbus Fritillariae Thunbergii reference drug, add 5 ml of concentrated ammonia TS, stand for half an hour, and 30 ml of chloroform as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of *n*-hexane, ethyl acetate and diethylamine (8 : 12 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 6 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with dilute potassium iodobismuthate TS. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for powders (Appendix I B).

Action To arrest gastric acid and relieve pain, and stop bleeding.

Indications Gastralgia, acid regurgitation and gastric upset or gastric discomfort due to disharmony between the liver and stomach; gastroduodenal ulcer with above symptoms.

Usage and dosage 3 g, 3 times a day, taken before meals; double the dosage in duodenal ulcer.

Strength 45 g per bottle

Storage Preserve in well closed containers, protected from moisture.

Wufu Huadu Wan
(五福化毒丸)

Wufu Huadu Pills

Ingredients Pulvis Cornus Bubali Concentratus 20 g; Fructus Forsythiae 60 g; Indigo Naturalis 20 g; Rhizoma Coptidis 5 g; Fructus Arctii (stir-baked) 50 g; Radix Scrophulariae 60 g; Radix Rehmanniae 50 g; Radix Platycodonis 50 g; Natrii Sulfas 5 g; Radix Paeoniae Rubra 50 g; Radix et Rhizoma Glycyrrhizae 60 g.

Procedure Pulverize the above ingredients except Pulvis

Cornus Bubali Concentratus, to fine powder. Triturate Pulvis Cornus Bubali Concentratus with the above powder, sift and mix well. To each 100 g of the powder add 45-55 g of refined honey and a quantity of water to make water-honeyed pills and dry; or add 100-120 g of refined honey to make big honeyed pills.

Description Black water-honeyed pills or big honeyed pills; taste, sweet, slightly bitter and salty.

Identification (1) Microscopical: Irregular pieces or granules blue. Anastomosing laticiferous vessels 14-25 μm in diametor, containing pale yellow granules. Stone cells yellowish-brown or colourless, subrectangular, subrounded or irregular, striation well-marked, about 94 μm in diameter. Stone cells of endocarp sharp fusiform or oblong, parquet orderly in surface view, and subrectangular or long-strip in lateral view, walls thickened, lignified, pits elongated. Fibre bundles bright yellow, walls slightly thickened and with distinct pits. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Fibres of endocarp short fusiform, with the upper and lower layers crisscrossed. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass.
(2) Grind well 9 g of the big honeyed pills, cut into pieces, with 4-5 g of kieselguhr, or pulverize 6 g of the water-honeyed pill, add 30 ml of ether, ultrasonicate for 10 minutes and filter. Evaporate the filtrate to dryness and dissolve the residue in 1 ml of chloroform as the test solution. Dissolve indigotin CRS and indirubin CRS in chloroform to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, chloroform and acetone (5 : 4 : 1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.
(3) Grind well 10 g of water-honeyed pills, or triturate 14 g of big honeyed pills, cut into pieces, with 7 g of kieseguhr. Add 30 ml of chloroform, heat under reflux for 1 hour, cool and filter. Evaporate the filtrate to dryness and dissolve the residue in 1 ml of ethanol as the test resolution. Prepare a solution with 0.5 g of Fructus Arctii reference drug in 30 ml of chloroform in the same manner as the reference drug solution. Dissolve arctiin CRS in ethanol to produce a solution containing 5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (40 : 8 : 1) as the mobile phase. Apply separately 2 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution.
(4) Grind well 1.5 g of water-honeyed pills, or triturate 2 g of big honeyed pills, cut into pieces, with 1 g of kieseguhr. Add 2 ml of hydrochloric acid and 15 ml of chloroform, heat under reflux for 1 hour, cool and filter Evaporate the filtrate to dryness and dissolve the residue in 1 ml of ethanol as the test resolution. Prepare a solution with 0.5 g of Radix et Rhizoma Glycyrrhizae reference drug in the same manner as the reference drug solution. Dissolve glycyrrhetic acid CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃), toluene, ethyl acetate and glacial acetic acid (10 : 20 : 7 : 0.5) as the mobile phase. Apply separately 2 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% phosphomolybdic acid in ethanol, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (41 : 59) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 1500, calculated with the reference to the peak of arctiin.

Reference solution Weigh accurately a quantity of acrctiin CRS in methanol to prepare a solution containing 30 μg per ml as the reference solution.

Test solution Grind well the water-honeyed pills, weigh accurately 0.3 g, or cut the big honeyed pill, obtained under the test of weight variation, into pieces, weigh accurately 0.5 g, in a stopper conical flask, add accurately 50 ml of methanol, stopper well, and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, cool, weigh again, replenish the loss of weight with methanol, shake well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.
It contains not less than 3.0 mg per gram of the water-honeyed pill, 6.4 mg per big honeyed pill, of arctiin ($C_{27}H_{34}O_{11}$), referred to Fructus Arctii.

Action To clear *heat* and toxic materials, and cool blood to reduce swelling.

Indications Sores and furuncles in children, or prickly heat, swollen and painful throat, ulcers in the mouth or on the tongue, gum bleeding or mumps due to abundant *heat* in blood.

Usage and dosage 2 g of water-honeyed pills or 1 big honeyed pill, 2-3 times a day.

Strength 3 g per big honeyed pill

Storage Preserve in tightly closed containers.

Wuhu San
(五虎散)

Wuhu Powder

Ingredients Radix Angelicae Sinensis 350 g; Flos Carthami 350 g; Radix Saposhnikoviae 350 g; Rhizoma Arisaematis (processed) 350 g; Radix Angelicae Dahuricae 240 g.

Procedure Pulverize the above five ingredients to fine powder, sift and mix thoroughly.

Description An orange-yellow to dark yellow powder; odour, slightly aromatic; taste, slightly pungent.

Identification (1) Microscopical: Compound starch granules consisting of 8-12 components. Parenchymatous cells spindle-shaped, with slightly thickened walls, and very fine oblique crisscross striations. The fragments of corolla yellow, with reddish-brown or yellowish-brown secretory cells. Pollen grains spheroidal or ellipsoidal, about 60 μm in diameter, exine with spinules and 3 germinal apertures. Vittae containing golden-yellow secretions, about 30 μm in diameter. Needle crystals of calcium oxalate in bundles or scattered, about 90 μm long.

(2) To 3 g add 10 ml of ethanol, ultrasonicate for 10 minutes, filter, and use the filtrate as the test solution. Prepare two solutions of 1 g of Radix Angelicae Sinensis and 1 g of Radix Angelicae Dahuricae reference drug as the reference drug solutions in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (4 : 1) as the mobile phase. Apply separately 5 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solutions.

(3) To 3 g of the powder, add 10 ml of 80% acetone solution, ultrasonicate for 10 minutes, allow to stand and use the supernatant as the test solution. Prepare a solution of 0.5 g of Flos Carthami reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, methanol, formic acid and water (7 : 0.4 : 2 : 3) as the mobile phase. Apply separately 10 μl of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (32 : 48) as the mobile phase. As detector a spectrophotometer set at 292 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of prim-*O*-glucosylcimcifugin.

Reference solution Disslove separately a quantity of prim-*O*-glucosylcimcifugin CRS and 5-*O*-methylvisammioside CRS, weigh, accurately, in methanol to produce two solutions containing 100 μg of prim-*O*-glucosylcimcifugin per ml and 60 μg of 5-*O*-methylvisammioside as the reference solutions.

Test solution To 3 g of the powder, mix well, weigh accurately to a conical flask with stopper, add accurately 25 ml of methanol, weigh, ultrasonicate (power, 100 W; frequency, 40 kHz) for 45 minutes, allow to stand, weigh again, replenish the lost weight, mix well, filter and use the filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.50 mg of prim-*O*-glucosylcimcifugin ($C_{37}H_{54}O_{11}$) and 5-*O*-methylvisammioside ($C_{22}H_{28}O_{10}$) per gram, referred to Radix Saposhnikoviae.

Action To promote blood circulation to dissipate blood stasis and reduce swelling to kill pain.

Indications Traumatic injuries and bruise.

Usage and dosage 6 g, twice a day, taken with warm yellow rice wine or warm boiled water. For external use, mix it with white spirit and apply it to the lesion.

Precaution Be cautious about pregnant women.

Storage Preserve in tightly closed containers.

Wuji Baifeng Wan
(乌鸡白凤丸)

Wuji Baifeng Pills

Ingredients Pullus cum Osse Nigko (removed from feather, claw and intestine) 640 g; Colla Cornus Cervi 128 g; Carapax Trionycis (processed) 64 g; Concha Ostreae (calcined) 48 g; Oötheca Mantidis 48 g; Radix et Rhizoma Ginseng 128 g; Radix Astragali 32 g; Radix Angelicae Sinensis 144 g; Radix Paeoniae Alba 128 g; Rhizoma Cyperi (processed with vinegar) 128 g; Radix Asparagali 64 g; Radix et Rhizoma Glycyrrhizae 32 g; Radix Rehmanniae 256 g; Radix Rehmanniae Praeparata 256 g; Rhizoma Chuanxiong 64 g; Radix Stellariae 26 g; Radix et Rhizoma Salviae Miltiorrhizae 128 g; Rhizoma Dioscoriae 128 g; Semen Euryales (stir-baked) 64 g; Cornu Cervi Degelatinatum 48 g.

Procedure Pulverize Radix Rehmanniae Praeparata, Radix Rehmanniae, Rhizoma Chuanxiong, Cornu Cervi Degelatinatum, Radix Stellariae, Semen Euryales, Rhizoma Dioscoriae and Radix et Rhizoma Salviae Miltiorrhizae to coarse powder. Crush properly the other twelve ingredients separately, place the powder in a tank, add 1500 g of yellow rice wine, cover and stew the wine till exhausted. Take the drug out and stir well with the above coarse powder, dry at a lower temperature, pulverize to fine powder, sift and mix thoroughly. To each 100 g of the powder add 30-40 g of refined honey and a quantity of water to make water-honeyed pills and dry, or add 90-120 g of refined honey to make small honeyed pills or big honeyed pills.

Description Blackish-brown to black water-honeyed pills, small honeyed pills or big honeyed pills; taste, sweet and slightly bitter.

Identification (1) Microscopical: Clusters of calcium oxalate 20-68 μm in diameter, with acute angles. Clusters of calcium oxalate 18-32 μm in diameter, occurring in parenchymatous cells, often arranged in rows, or several clusters in one cell. Raphides of calcium oxalate occurring in mucilage cells, 80-240 μm long, and the single needle 2-5 μm in diameter. Parenchymatous cells spindle-shaped, with slightly thickened walls, showing minute oblique crisscross striations. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Fibres in bundles or scattered, with thickened walls and longitudinal fissures on surface, both ends broken to broom-like, or somewhat truncate. Fibres in bundles, dark brownish-red or reddish-brown, with thickened walls. Stone cells rectangular or slat-shaped, 50-110 μm in diameter, with very fine and dense pits. Cork cells yellowish-brown, with thin and slightly sinuous walls, overlapped in multiple layers. Irregular pieces pale greyish-yellow, with fissures or fine striations on surface. Irregular pieces translucent and strongly reflective on edge, with delicate short striations, small pores and fine fissures on surface.

Long column muscle fibres in bundles, with fine slightly sinuous and meticalous striations on the surface.
(2) Triturate well 18 g of the small honeyed pills or big honeyed pills, in pieces, with 12 g of kieselguhr; or pulverize 12 g of the water-honeyed pills to fine powder, heat under reflux with 100 ml of chloroform for 1.5 hours, filter, collect the drug residue for the further use. Evaporate the filtrate to dryness, dissolve the residue in 1.5 ml of ethanol, filter and use the filtrate as the test solution. Dissolve tanshinone ⅡA CRS in ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of benzene and ethyl acetate (19 : 1) as the mobile phase. Apply separately to the plate 6 μl of each of the two solutions. After developing and removal of the plate, dry in air. The dark red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) To the drug residue, obtained in the test for Identification (2) and extracted with chloroform, add 40 ml of ethanol, warm macerate for 1 hour with frequently shaking and filter. Evaporate the filtrate to dryness, dissolve the residue in 30 ml of water and extract with three 20-ml quantities of *n*-butanol saturated with water. Combine the extracts, wash with two 20-ml quantities of water and discard the washings. Evaporate the *n*-butanol solution on a water bath to about 1 ml, add a quantity of aluminium oxide, stir well and dry on a water bath. Apply to a small column (10-15 mm in internal diameter) packed with aluminium oxide (1 g, 200 mesh) and elute with 30 ml of a mixture of ethyl acetate and methanol (1 : 1). Collect the eluate, evaporate to dryness and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chlorform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 6 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulfuric acid and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (33 : 67) as the mobile phase. As detector a spectrophotometer set at 230 nm, The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of paeoniflorin.

Reference solution Disslove a quantity of paeoniflorin CRS, weigh accurately, in methanol to produce a solution containing 40 μg per ml.

Test solution Cut the big honeyed pills obtained under the test of weight variation into pieces, or pulverize the water-honeyed pills and small honeyed pills, weigh accurately 5 g, add accurately 25 ml of 30% ethanol, weigh, shake at intervals, allow to stand for 24 hours, ultrasonicate (power, 300 W.; frequency, 50 kHz) for 30 minutes, allow to cool, weigh again, replenish the lost weight with 30% ethanol, mix well and filter. Measure accurately 5 ml of successive filtrate, apply to the column (1.5 cm in internal diameter; 12 cm in height) packed with D-101 macroporous adsorptive resins. Elute with 100 ml of 30% ethanol, collect the eluate, evaporate to dryness, dissolve the residue in 5 ml of water for several times to a 25 ml of volumetric flask, wash the containers with methanol for several times to the same volumetric flask, dilute with methanol to the volume and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains paeoniflorin ($C_{23}H_{28}O_{11}$) not less than 0.35 mg per gram of the water-honeyed pills, not less than 0.22 mg per gram of small honeyed pills, and not less than 2.0 mg per big-honeyed pill, referred to Radix Paeoniae Alba.

Action To reinforce *qi* and nourish blood, regulate menstruation and arrest excessive leukorrhea.

Indications Emaciation, weakness and aching in the lower back and knees, disorders of menstruation, metrorrhagia or metrostaxis, and excessive leukorrhea due to a deficiency of *qi* and blood.

Usage and dosage 6 g of water-honeyed pills, 9 g of small honeyed pills, or 1 big honeyed pill, twice a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Wuji Wan
(戊己丸)

Wuji Pills

Ingredients Rhizoma Coptidis 300 g; Fructus Evodiae (processed) 50 g; Radix Paeoniae Alba (stir-baked) 300 g.

Procedure Pulverize the above three ingredients to fine powder, sift and mix thoroughly. Make pills with water and dry.

Description Brownish-yellow watered pills; taste, bitter, slightly numb and pungent.

Identification (1) Microscopical: Fibre bundles bright yellow, with slightly thickened walls and distinct pits. Clusters of calcium oxalate 18-32 μm in diameter, occurring in parenchymatous cells, often arranged in rows or several clusters in one cell. Non-glandular hairs 2-6 celled, some cells filled with reddish-brown contents. Glandular hairs with multicellular head, elliptical, containing brownish-yellow to brownish-red contents and with a 2-5-celled stalk.
(2) Heat under reflux 0.7 g, triturated to pieces, with 10 ml of ethanol for 1 hour, allow to cool, filter and use the filtrate as the test solution. Prepare a mixture with 0.3 g each of Rhizoma Coptidis reference drug and Radix Paeoniae Alba reference drug, 0.1 g of Fructus Evodiae reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of *n*-butanol, acetic acid and water (2 : 1 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the two solutions. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Spray with sulfuric acid solution (1→10), heat at 105℃ for 5 minutes and examine in daylight. The spots in the chromatogram obtained with the test solution correspond in position and colour to the

spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Place 0.7-0.9 g, in powder (through No. 3 sieve), accurately weighed, in a Soxhlet's extractor and heat under reflux with a quantity of hydrochloric acid and methanol (1 : 100) until the extract becomes colourless. Concentrate the extract, transfer to a 25 ml volumetric flask, dilute with ethanol to volume and mix well. Carry out the method for column chromatography (Appendix Ⅵ C). Apply accurately 5 ml of the solution to a neutral aluminum oxide column (0.9 cm in diameter, 5 g, packed with ethanol, pretreated with 30 ml of ethanol). Elute with 35 ml of ethanol in portions, collect the eluate in a 50 ml volumetric flask, dilute with ethanol to volume and mix well. Transfer accurately 2 ml of the solution to a 50 ml volumetric flask, dilute with 0.05 mol/L sulfuric acid solution to volume and mix well. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 345 nm and calculate the content of berberine hydrochloride ($C_{20}H_{18}ClNO_4$), taking 728 as the value of A (1%, 1 cm).
It contains not less than 30 mg of total alkaloids per gram, calculated as berberine hydrochloride ($C_{20}H_{18}ClNO_4$), with reference to the dried drug.

Action To purge the liver and harmonize the stomach, and check adrerse rise of *qi* to stop vomiting.

Indications Burning pain in the stomach, vomiting, casting up of gastric acid, bitter taste in the mouth, stomach discomfort, abdominal pain and diarrhea due to invasion of the stomach by *liver-fire*, and disharmony between the liver and stomach.

Usage and dosage 3-6 g, twice a day.

Storage Preserve in tightly closed containers, protected from moisture.

Wuling San
(五苓散)

Wuling Powder

Ingredients Poria 180 g; Rhizoma Alismatis 300 g; Polyporus 180 g; Cortex Cinnamomi 120 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 180 g.

Procedure Pulverize the above five ingredients to fine powder, sift and mix well.

Description A pale yellow powder; odour, slightly aromatic; taste, slightly pungent.

Identification Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or brownish, 4-6 μm in diameter. Hyphae sticking into masses, mostly colourless; prisms of calcium oxalate octahedral, 32-60 μm in diameter. Parenchymatous cells subrounded, with elliptical pits gathered into pit groups. Anticlinal walls of endodermis cells sinuous, relatively thickened, lignified, with sparse and fine pit-canals. Needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells. Fibre singly scattered, long fusiform, 24-50 μm in diameter, walls thickened, lignified; stone cells subsquare or subrounded, with thinner walls on one side.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Action To warm *yang* to move *qi*, and drain *dampness* to promote water metabolism.

Indications Edema due to failure of *yang* to move *qi* flow and retention of water and *dampness* with manifestations of dysuria, ascites, vomiting, diarrhea and thirst with no desire for drinks.

Usage and dosage 6-9 g, twice a day.

Storage Preserve in well closed containers, protected from moisture.

Wushicha Keli
(午时茶颗粒)

Wushicha Granules

Ingredients Rhizoma Atractylodis 50 g; Radix Bupleuri 50 g; Rhizoma et Radix Notopterygii 50 g; Radix Saposhnikoviae 50 g; Radix Angelicae Dahuricae 50 g; Rhizoma Chuanxiong 50 g; Herba Pogostemonis 50 g; Radix Peucedani 50 g; Fructus Forsythiae 50 g; Pericarpium Citri Reticulatae 50 g; Fructus Crataegi 50 g; Fructus Aurantii Immaturus 50 g; Fructus Hordei Germinatus (stir-baked) 75 g; Radix et Rhizoma Glycyrrhizae 50 g; Radix Platycodonis 75 g; Massa Medicata Fermentata (stir-baked) 50 g; Folium Perillae 75 g; Cortex Magnoliae Officinalis 75 g; Black Tea 1600 g.

Procedure Distil volatile oil of Rhizoma Atractylodis, Radix Bupleuri, Rhizoma et Radix Notopterygii, Radix Saposhnikoviae, Radix Angelicae Dahuricae, Rhizoma Chuanxiong, Herba pogostemonis, Fructus Forsythiae, Radix Peucedani, Pericarpium Citri Reticulatae, Fructus Aurantii Immaturus, Folium Perillae and Cortex Magnoliae officinalis, collect the aqueous solution in a separate container. Decoct the drug residue and other ingredients with water twice for 2 hours and 1 hour respectively. Combine the decoctions, filter, and allow to stand. Combine the supernatant and the above aqueous solution, concentrate to a quantity, and precipitate with equal quantity of ethanol. Concentrate the supernatant to a thick extract, add a quantity of powdered sucrose, make granules and dry. After cooling, spray the volatile oil, mix thoroughly and make to 1000 g.

Description Brown granules; odour, slightly aromatic; taste, sweet and slightly bitter.

Identification To 12 g add 40 ml of ethanol, heat under reflux on a water bath for 30 minutes and filter. Evaporate the filtrate to dryness. Dissolve the residue in 10 ml of water in a separator, extract with successive quantities of 15 ml and 10 ml of ether, discard the ether solution. Extract with successive quantities of 15, 10, 10 and 10 ml of *n*-butanol saturated with water. Combine the *n*-butanol extracts, evaporate to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Dissolve hesperidin CRS in methanol to produce a solution containing 0.2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using a polyamide film as the absorbant and a mixture of chloroform, acetone and methanol (5 : 1 : 1) as the mobile phase. Apply separately 1 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with aluminium chloride TS, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (33 : 67) as the mobile phase. As detector a spectrophotometer set at 284 nm. The number of theoretical plates of the column is not less than 6000, calculated with the reference to the peak of hesperidin.

Reference solution Weigh accurately 5 mg of hesperidin CRS to a 100 ml volumetric flask, dissolve in methanol, dilute to volume and mix well. Measure accurately 5 ml of the solution to a 10 ml volumetric flask, dilute with the mobile phase to volume and mix well (containing 25 μg per ml).

Test solution Grind 6 g of the granules obtained under the test of packing variation, weigh accurately to a conical flak, add 40 ml of ethanol, heat under reflux for 30 minutes, allow to cool, filter, wash the residue and container with small quantities of ethanol, combine the filtrate, evaporate to dryness, dissolve the residue in 10 ml of water to a separator. Extract with 15 ml and 10 ml of ether separately, discard the ether extracts, extract with 15, 10, 10, and 10 ml of *n*-butanol saturated with water, combine the *n*-butanol extracts, recover the solvents to dryness, dissolve the residue in a quantity of methanol to a 10 ml volumetric flask, dilute with methanol to volume and mix well. Measure accurately 5 ml of the solution to a 10 ml volumetric flask, dilute with water to volume, and mix well.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.50 mg of hesperidin ($C_{28}H_{34}O_{15}$) per pack, referred to pericarpium Citri Reticulatae and Fructus Aurantii Lmmaturus.

Action To expel *wind* to release the exterior, and resolve *dampness* to harmonize the *middle-energizer*.

Indications Affliction from external *wind-cold* and internal impairment from indigestion with manifestations of aversion to cold, fever, headache, general pains, fullness and constriction in the chest and stomach, nausea, vomiting, abdominal pain and diarrhea.

Usage and dosage 6 g, taken after dissolved in boiled water, 1-2 times a day.

Strength 6 g per pack

Storage Preserve in tightly closed containers.

Wuwei Qingzhuo San
(五味清浊散)

Wuwei Qingzhuo Powder

Wuwei Qingzhuo Powder is a prescription used by Mongolian Nationality.

Ingredients Fructus Punicae Granati 400 g; Flos Carthami 200 g; Fructus Amomi Rotundus 50 g; Cortex Cinnamomi 50 g; Fructus Piperis Longi 50 g.

Procedure Pulverize the above five ingredients to fine powder, sift and mix thoroughly.

Description A yellowish-brown powder; odour, aromatic; taste, sour, pungent and slightly astringent.

Identification (1) Microscopical: Stone cells colourless, elliptical or subrounded, walls thickened with fine and dense pit-canals. Stone cells subsquare or subrounded, 32-88 μm in diameter, with thinner walls on one side. Sclerenchymatous cells of endotesta yellowish brown or brownish-red, subpolygonal in surface view, with thickened walls, and lumen containing a silica body. Cells of testa reddish-brown, elongated polygonal, with beaded walls. Pollen grains spheroidal or ellipsoidal, about 60 μm in diameter, extine spinous, and with 3 germinal apertures.

(2) To 10 g add 20 ml of acetone, ultrasonicate for 15 minutes, filter, and use the filtrate as the test solution. Dissolve cinnamaldehyde CRS in ethanol to produce a solution containing 2 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (17 : 3) as the mobile phase. Apply separately 6 μl of the test solution and 3 μl of the reference solution to the plate. After developing and removal of the plate, dry it in air. Spray with alcoholic dinitrophenylhydrazine TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) To 2 g of the powder, add 20 ml of 80% acetone solution, shake for 15 minutes, allow to stand and use the supernatant as the test solution. Prepare a solution of 0.5 g of Flos Carthami reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H as the coating substance and a mixture of ethyl acetate, methanol, formic acid and water (7 : 0.4 : 2 : 3) as the mobile phase. Apply separately in strips 10 μl of the test solution and 5 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. The strips in the chromatogram obtained with the test solution correspond in position and colour to the strips in the chromatogram obtained with the reference drug solution.

(4) To 5 g of the powder, add 25 ml of dehydrated ethanol, ultrasonicate for 30 minutes, filter, collect the filtrate to an amber volumetric flask as the test solution. prepare a solution of 0.5 g of Fructus Piperis Longi reference drug and 5 ml of dehydrated ethanol in the same manner as the reference drug solution. Dissolve piperine CRS in dehydrated ethanol to an amber volumetric flash to produce a solution containing 4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of cyclohexane, ethyl acetate and dehydrated ethanol (8 : 2 : 1) as the mobile phase. Apply separately 6 μl of the test solution and 2 μl of each of the reference drug solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, examine under the ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Action To promote digestion and warm the stomach.

Indications Loss of appitite, indigestion, cold sensation and fullness in the stomach, belching, abdominal distension and diarrhea.

Usage and dosage 2-3 g, 1-2 times a day.

Strength 15 g per pack

Storage Preserve in tightly closed containers, protected

from moisture.

Wuwei Shaji San
(五味沙棘散)

Wuwei Shaji Powder

Wuwei Shaji Powder is a prescription used by Mongolian Nationality.

Ingredients Extractum Fructi Hippophae 180 g; Radix Aucklandiae 150 g; Fructus Vitis Viniferae 120 g; Radix et Rhizoma Glycyrrhizae 90 g; Fructus Gardeniae 60 g.

Procedure Pulverize Radix Aucklandiae, Radix et Rhizoma Glycyrrhizae and Fructus Gardeniae to coarse powder. Pulverize Fructus Vitis Viniferae with the above coarse powder, dry by heating, pulverize to fine powder, mix thoroughly, add Extractum Fructi Hippophae and mix thoroughly, dry by heating, pulverize to fine powder and sift.

Description A dark brown powder; odour, aromatic; taste, sour, sweet, bitter and astringent.

Identification (1) Microscopical: stone cells of pericarp containing crystals, subrounded or polygonal, 17-31 μm in diameter, walls thickened, lumina containing prisms of calcium oxalate. Fibre bundles surrouned by parenchymatous cells containing calcium oxalate prisms, forming crystal fibres. Inulin masses irregular, occasionally showing fine radial striations, dissolved on heating. Scaly hairs chrysanthemum-like, yellowish-brown, consisting of over 100 unicellular non-glandular hairs connected each others, and often broken to fan-shape.
(2) To 3 g, add 15 ml of ether, shake for 10 minutes, discard ether and evaporate the ether remained in the drug residue. To the residue add 15 ml of ethyl acetate, heat under reflux on a water bath for 1 hour, cool, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve geniposide CRS in ethanol to produce a solution containing about 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, acetone, formic acid and water (10 : 7 : 2 : 0.5) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Prepare a solution of 0.5 g of Radix Aucklandiae as the reference drug solution in the same manner as described in the test for Identification (2). Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and acetone (10 : 3) as the mobile phase. Apply separately 5 μl of each of the test solution obtained in the test for Identification (2) and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulphuric acid in ethanol and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Compy with the general requirements for powders (Appendix Ⅰ B).

Action To remove *heat*, resolve phlegm, and relieve cough and asthma.

Indications *Heat* in the lung with chronic cough, dyspnea, profuse sputum, feeling of stuffiness and pain in the chest and costal regions; chronic bronchitis with above symptoms.

Usage and dosage 3 g, 1-2 times a day.

Strength 15 g per pack

Storage Preserve in tightly closed containers, protected from moisture.

Wuwei Shexiang Wan
(五味麝香丸)

Wuwei Shexiang Pills

Wuwei Shexiang Pills are prescription used by Tibetan Nationality.

Ingredients Moschus 10 g; Fructus Chebulae (cored) 300 g; Radix Aconiti Balfourii 300 g; Radix Aucklandiae 100 g; Rhizoma Acori Calami 60 g.

Procedure Pulverize the above ingredients, except Moschus, to fine powder. Triturate Moschus with the above fine powder, sift and mix thoroughly. Make pills with aqueous solution saturated with Benzoinum and dry at a lower temperature.

Description Brown watered pills; odour, aromatic, characteristic of Moschus; taste, slightly bitter, astringent and numb.

Identification (1) Microscopical: Fibre layers of pericarp pale yellow, obliquely crisscrossed, walls thin and pitted. Stone cells rectangular or subsquare, with slightly thickened walls. Oil cells rounded, about 50 μm in diameter, containing yellow or yellowish-brown oily contents.
(2) Pulverize 3 g of the pills, add 10 ml of ethanol, ultrasonicate for 20 minutes, and use the supernatant as the test solution. Dissolve gallic acid CRS in ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G sodium carboxymethyl cellulose as the coating substance and a mixture of chloroform, ethyl acetate and formic acid (6 : 4 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 2% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Pulverize 2 g of the pills, add 10 ml of chloroform, ultrasonicate for 20 minutes, filter, and evaporate the filtrate to 2 ml as the test solution. Prepare a solution of 0.5 g of Radix Aucklandiae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (5 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulfuric acid, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(4) Pulverize 2 g of the pills, add 30 ml of ether, heat under reflux for 30 minutes, filter, evaporate the filtrate to dryness and dissolve the residue in 2 ml of methanol as the

test solution. Prepare a solution of 0.5 g of Rhizoma Acori Calami reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (4 : 1) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Limit test for aconitine Pulverize 5 g of the pills, add concentrated ammonia to moisten, add 20 ml of chloroform, allow to stand for overnight, filter, evaporate the filtrate to dryness, dissolve the residue in 2 ml of dehydrated ethanol as the test solution. Dissolve aconitine CRS in dehydrated ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 1% solution of sodium hydroxide as the coating substance and a mixture of chloroform and methanol (7 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with diluted solution of potassium heptaiodobismuthate TS. The spot in the chromatogram obtained with the test solution is not more intense or no spot appear in position and colour than the spot in chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To counteract inflammation, alleviate pain and relieve rheumatic condition.

Indications Tonsillitis, pharyngitis, influenza, anthrax, rheumatic arthritis, neuralgia, gastralgia and toothache.

Usage and dosage 2-3 pills, once a day before going to bed, or buccal use, maximum dose: 5 pills.

Precaution Be cautious about its toxicity, contraindicated in pregnancy.

Strength 0.3 g per 10 pills

Storage Preserve in tightly closed containers.

Wuzi Yanzong Wan
(五子衍宗丸)

Wuzi Yanzong Pills

Ingredients Fructus Lycii 400 g; Semen Cuscutae (stir-baked) 400 g; Fructus Rubi 200 g; Fructus Schisandrae Chinensis (steamed) 50 g; Semen Plantaginis (stir-baked with salt) 100 g.

Procedure Pulverize the above five ingredients to fine powder, sift and mix thoroughly. To each 100 g of the powder, add 35-50 g of refined honey and a quantity of water, make water-honeyed pills and dry; or add 80-90 g of refined honey to make small honeyed pills or big honeyed pills.

Description Deep brown water-honeyed pills, brownish-black small honeyed pills or big honeyed pills; taste, sweet, sour and slightly bitter.

Identification (1) Microscopical: Stone cells of testa irregular poly gonal in surface view, walls thickened, sinuous, striatfion well-defined. Stone cells of epidermis of testa pale yellowish-brown, subpolygonal in surface view, with relatively thickened walls and fine, dense pite-canals, lumina containing dark brown contents. Palisade cells of testa in 2 rows, the inner row longer than the outer one, with a light line. Endocuticula cells of testa subrectangular in surface view, with slightly sinuous walls, parqueted in groups of several cells. Nonglandular hairs unicellular, with thickened, lignified walls, and the remains after falling off simillar to stone cells in shape.

(2) Pulverize 5 g of the water-honeyed pills to fine powder, or cut 5 g of the small honeyed pills or big-honeyed pills into pieces and mix well with 5 g of kieseghul, add 50 ml of ether, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. To 1 g of Fructus Lycii reference drug, add 2 g of kieseghul, mix well, and add 20 ml of ether in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (20 : 20 : 0.1) as the mobile phase. Apply separately 5 μl of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, examine under the ultraviolet light at 365 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) To the drug residue obtained with the Identificafion (2), add 40 ml of chloroform, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve deoxyschizandrin CRS in ethyl acetate to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and the upper layer of a mixture of petroleum ether, ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 254 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To replenish *kidney-essence*.

Indications Impotence, infertility, seminal emission, premature ejaculation, lower back pain and dribbling of urine after micturition due to a deficiency of *kidney-essence*.

Usage and dosage 6 g of watered-honeyed pills, 9 g of small honeyed pills or 1 big honeyed pill, twice a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Xiangfu Wan
(香附丸)

Xiangfu Pills

Ingredients Rhizoma Cyperi (processed with vinegar) 300 g; Radix Angelicae Sinensis 200 g; Rhizoma Chuanxiong 50 g; Radix Paeoniae Alba (stir-baked) 100 g; Radix Rehmanniae Praeparata 100 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 100 g; Fructus Amomi 25 g; Pericarpium Citri Reticulatae 50 g; Radix Scutellariae 50 g.

Procedure Pulverize the above nine ingredients to fine powder, sift and mix well. To each 100 g of powder add 35-45 g of refined honey and a quantity of water to make water-honeyed pills, dry and coat with corn protein; or to each 100 g of powder add 130-140 g of refined honey to make big honeyed pills.

Description Brown water-honeyed pills or big honeyed pills; odour, aromatic; taste, slightly sweet, slightly bitter and pungent.

Identification (1) Microscopical: Clusters of calcium oxalate 18-32 μm in diameter, occurring in parenchymatous cells, usually in rows, or several clusters in one cell. Prisms of calcium oxalate abundant in parenchyma. Needle crystals of calcium oxalate minute, 10-32 μm long, filling irregularly in parenchymatous cells. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Parenchymatous cells fusiform, walls slightly thickened, with very fine and oblique crisscross striations. Sclerenchymatous cells of endotesta yellowish-brown or brownish-red, subpolygonal in surface view, walls thickened, lumina containing silica bodies. Secretory cells subrounded, containing pale yellowish-brown to reddish-brown secretions with adjacent cells arranged in radiation. phloem fibres pale yellow, fusiform, walls thickened, with fine pit-canals.

(2) Triturate 2 g of the water-honeyed pills, add 10 ml of petroleum ether (30-60℃), or triturate well 4.5 g of the big honeyed pills with 3 g of kieselguhr, add 25 ml of petroleum ether (30-60℃). Macerate for 30 minutes by shaking frequently, filter, remain the drug residue for later use and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve α-cyperone CRS in ethyl acetate to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (17 : 3) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with alcoholic dinitrophenylhydrazine TS and allow to stand for a while. The orange-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) To the remaining residue after petroleum ether extraction, obtained in the test for Identification (2), add 25 ml of methanol, ultrasonicate for 20 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose prepared with a 4% solution of sodium acetate as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply in strips separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 1% ferric chloride in ethanol. The strip in the chromatogram obtained with the test solution corresponds in position and colour to the strip in the chromatogram obtained with the reference solution.

(4) To 0.2 g of Pericarpium Citri Reticulatae reference drug add 1 ml of methanol, ultrasonicate for 15 minutes, allow to stand and use the supernatant as the reference drug solution. Dissolve hesperidin CRS in methanol to produce a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G prepared with a 0.5% solution of sodium hydroxide as the coating substance. Apply separately 5 μl of the test solution obtained in the test of Identification (3) and 2 μl of each of the reference durg solution and the reference solution to the plate, and a mixture of ethyl acetate, methanol and water (100 : 17 : 13) as the mobile phase. After developing about 3 cm, removal of the plate, dry in air. Use the upper layer of a mixture of toluene, ethyl acetate, formic acid and water (20 : 10 : 1 : 1) as the mobile phase, After developing about 8 cm and removal of the plate, dry in air. Spray with 1% aluminium chloride in ethanol and examine under ultraviolet light at 365nm. The yellow to yellowish-green fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. A yellow to yellowish-green fluorescent spot and three brilliant blue fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To soothe the liver and invigorate the spleen, and nourish blood to regulate menstruation.

Indications Menstrual disorders before or after periods due to stagnation of *liver-qi*, a deficiency of blood and failure of the spleen in transport action, with manifestations of irregular menstrual cycles, hypermenorrhea or hypomenorrhea with clots, constriction in the chest before menstruation, restlessness, distending pain in the breasts and loss of appitite.

Usage and dosage 9-13 g of water-honeyed pills, 1 or 2 big honeyed pills, twice a day, taken with yellow rice wine or warm boiled water.

Strength 1 g per 10 water-honeyed pills, 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Xiangfu Wan (Shuiwan)
(香附丸)

Xiangfu Pills

Ingredients Rhizoma Cyperi (processed with vinegar) 300 g; Radix Angelicae Sinensis 200 g; Rhizoma Chuanxiong 50 g; Radix Paeoniae Alba (stir-baked) 100 g; Radix Rehmanniae Preparata 100 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 100 g; Fructus Amomi 25 g; Pericarpium Citri Reticulatae 50 g; Radix Scutellariae 50 g.

Procedure Pulverize the above nine ingredients to fine powder, sift and mix well. Make watered pills with a quantity of yellow rice wine, dry at a lower temperature.

Description Dark yellow to dark brown watered pills; odour, aromatic; taste, bitter and pungent.

Identification (1) Microscopical: Clusters of calcium oxalate 18-32 μm in diameter, occurring in parenchymatous cells, usually in rows, or several clusters in one cell. Prisms of calcium oxalate abundant in parenchyma. Needle crystals of calcium oxalate minute, 10-32 μm long, filling irregularly in parenchymatous cells. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Parenchymatous cells fusiform, walls slightly thickened, with very fine and oblique crisscross striations. Sclerenchymatous cells of endotesta yellowish-brown or brownish-red, subpolygonal in surface view, walls thickened, lumina containing silica bodies. Secretory cells subrounded, containing pale yellowish-brown to reddish-brown secretions, with adjacent cells arranged in radiation. phloem fibers pale yellow, fusiform, walls thickened, with fine pit-canals.
(2) Triturate 2 g of the pills, Macerate in 10 ml of petroleum ether (30-60℃), for 30 minutes by shaking frequently, filter, remain the residue for later use and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve α-cyperone CRS in ethyl acetate to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (17 : 3) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with alcoholic dinitrophenylhydrazine TS and allow it to stand for a while. The orange-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) To the remaining residue after petroleum ether extraction, obtained in the test of Identification (2), add 25 ml of methanol, ultrasonicate for 20 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose prepared with 4% solution of sodium acetate as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply in strips separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 1% ferric chloride in ethanol. The strip in the chromatogram obtained with the test solution corresponds in position and colour to the strip in the chromatogram obtained with the reference solution.
(4) To 0.2 g of Pericarpium Citri Reticulatae reference drug add 1 ml of methanol, ultrasonicate for 15 minutes, allow to stand and use the supernatant as the reference drug solution. Dissolve hesperidin CRS in methanol to produce a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G prepared with a 0.5% solution of sodium hydroxide as the coating substance. Apply separately 5 μl of the test solution obtained in the test of Identification (3) and 2 μl of each of the reference durg solution and the reference solution to the plate, and a mixture of ethyl acetate, methanol and water (100 : 17 : 13) as the mobile phase. After developing about 3 cm, removal of the plate, and dry in air. Use the upper layer of a mixture of toluene, ethyl acetate, formic acid and water (20 : 10 : 1 : 1) as the mobile phase After developing about 8 cm, removal of the plate, and dry in air. Spray with a 1% solution of aluminium chloride in ethanol and examine under ultraviolet light at 365 nm. The brilliant yellow to brilliant yellowish-green fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. The three brilliant blue fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requiremenets for pills (Appendix Ⅰ A).

Action To soothe the liver and invigorate the spleen, and nourish blood to regulate menstruation.

Indications Menstrual disorders before or after periods due to stagnation of *liver-qi*, a deficiency of blood and failure of the spleen in transportaction, with manifestations of irregular menstrual cycles, hypermenorrhea or hypomenorrhea with clots, constriction in the chest before menstruation, restlessness, distending pain in the breasts and anorexia.

Usage and dosage 6-9 g, twice a day, taken with yellow rice wine or warm boiled water.

Storage Preserve in tightly closed containers.

Xianglian Pian
(香连片)

Xianglian Tablets

Ingredients Rhizoma Coptidis (processed with Fructus Evodiae); Radix Aucklandiae

Procedure Distil volatile oil from Radix Aucklandiae, collect the volatile oil, filter the aqueous solution, concentrate the filtrate to a thick extract, dry and pulverize to fine powder. Heat Rhizoma Coptidis with 70% of ethanol at 75-80℃ under a reflux condenser for three times, 2 hours for the first time, each 1 hour for other times respectively. Recover ethanol from the combined extracts, concentrate to a thick extract, dry and pulverize to fine powder. Mix a quantity of excipient with the combined powder, make granules and dry. Mix the volatile oil of Radix Aucklandiae with the granules by spraying, press into tablets and coat with sugar or film.

Description Sugar or film coated tablets with yellowish-brown core; odour, slight; taste, bitter.

Identification (1) Triturate 10 tablets, removed the coats, to powder, heat under reflux with 10 ml of chloroform for 20 minutes, filter and evaporate the filtrate to dryness. Disslove the residue in 2 ml of ethanol to produce a solution as the test solution. Dissolve 0.1 ml of costustroot essential oil reference extractive in 10 ml of ethanol and use the solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and ethyl acetate (10 : 1) as the mobile phase. Apply separately 4 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulfuric acid. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.
(2) Dissolve berberine hydrochloride CRS in a mixture of hydrochloric acid and methanol (1 : 100) to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography

(Appendix Ⅵ B), using silica gel G mixed with sodium carboxy methylcellulose as the coating substance and a mixture of *n*-butanol, glacial acetic acid and water (7 : 1 : 2) as the mobile phase. Apply separately 10 μl of the test solution obtained in the test for Assay and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluroscent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Weigh accurately 20 tablets, removed coats, and triturate. Weigh accurately a quantity of the powder, equivalent to about 60 mg of berberine hydrochloride, transfer to a Soxhet's extractor, heat on a water bath under a reflux condenser with a mixture of hydrochloric acid and methanol (1 : 100) until the extract becomes colourless and concentrate the extract if necessory. Transfer the extract to a 100 ml volumetric flask, rinse the container with a small quantity of the same mixture solution, combine the washing with the extract, dilute to volume with the mixture solution and mix well. Transfer 2 ml of the solution, measured accurately, to a 50 ml volumetric flask, dilute with methanol to volume, mix well and use the solution as the test solution. Dissolve berberine hydrochloride CRS, weighed accurately, in methanol to produce a solution containing 0.02 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and water (4 : 2 : 1 : 1 : 0.2) as the mobile phase. Apply accurately 2 μl of the test solution, 2 μl and 6 μl of the reference solution to the plate, separately. After developing the plate in a chamber pre-equilibrated with the vapour of an equal volumes of the mobile phase and concentrated ammonia TS for 15 minutes and develop to the distance 10 cm, remove the plate and dry in air. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatography scanning method), scan with fluorescence mode at the wavelength of $\lambda_{ex}=366$ nm, measure the integration values of fluorescent absorbance from the test solution and the reference solution and calculate the content.
It contains not less than 20 mg of berberine hydrochloride ($C_{20}H_{18}ClNO_4$) for each big tablet and not less than 7.0 mg for each small tablet, referred to Rhizoma Coptidis.

Action To clear *heat* and resolve *dampness*, and move *qi* to kill pain.

Indications Dysentery due to *damp-heat* in the large intestine with manifestations of stools mixed with purulent blood, tenesmus, fever and abdominal pain; enteritis and bacillary dysentery with above symptoms.

Usage and dosage 5 big tablets, 3 times a day; 2-3 small tablets for children, 3 times a day.

Storage Preserve in tightly closed containers.

Xianglian Wan
(香连丸)

Xianglian Pills

Ingredients Rhizoma Coptidis (processed with Fructus Evodiae) 800 g; Radix Aucklandiae 200 g.

Procedure Pulverize the above two ingredients to fine powder, sift and mix thoroughly. To each 100 g of the powder add 8 g of vinegar and a quantity of water to make pills, and dry.

Description Pale yellow to yellowish-brown watered pills; odour, slight; taste, bitter.

Identification (1) Microscopical: Inulin masses irregular, fine radiate striations sometimes visible, dissolved on heating. Reticulated vessels up to 90 μm in diameter. Fibre bundles bright yellow, walls slightly thickened, and pits distinct.
(2) To about 60 mg of the powdered pills, add 5 ml of methanol, heat under reflux on a water bath for 15 minutes, filter and dilute the filtrate to 5 ml with methanol as the test solution. Prepare a solution of 0.05 g of Rhizoma Coptidis reference drug as the reference drug solution in the same manner. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately 1 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution; a yellow fluorescent spot in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with the reference solution.
(3) To 2 g of the powdered pills add 15 ml of ether, allow to stand for 2 hours, shake frequently, filter and evaporate the filtrate to dryness. Disslove the residue in 0.5 ml of ethyl acetate as the test solution. Prepare a solution of 0.4 g of Radix Aucklandiae reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and acetone (10 : 3) as the mobil phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulfuric acid and heat at 105℃ for 5 minutes. The purplish-red to purplish-blue spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Pulverize a quantity of the pills to the fine powder, weigh accurately 0.2 g of the powder to a Soxhlet's extractor, add a quantity of a mixture of hydrochloric acid and methanol (1 : 100) until the extracts become colourless, transfer the extracts to a 100 ml volumetric flask, wash the containers with small quantities of the above solution and transfer the washings to the same volumetric flask, dilute with the above mixture solution to the volume, mix well. Measure accurately 10 ml of the solution to a 50 ml volumetric flak, dilute with methanol to the volume, mix well as the test solution. Dissolve a quantity of berberine hydrochloride CRS, and weigh accurately, in methanol to prepare a reference solution containing 20 μg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate, isopropanol, methanol and water (4 : 2 : 1 : 1 : 0.2) as the mobile phase. Apply accurately to the plate 4 μl of the test solution, 2 μl and 6 μl of the reference solution alternatively. After developing the plate in a chamber pre-equilibrated with the vapour of an equal volumes of the mobile phase and concentrated ammonia TS

for 15 minutes, develop to the distance 10 cm, and removal of the plate, dry in air. Carry out the method for thin layer chromatography (Appendix Ⅵ B thin layer chromatographic scanning method), scan with the fluorescent mode at the wavelength of $\lambda_{ex}=366$ nm. Measure the integration values of the fluorescent absorbance from the test solution and the reference solution respectively, and calculate the content.
It contains not less than 27 mg of berberine hydrochloride ($C_{20}H_{18}ClNO_4$) per gram, referred to Rhizoma Coptidis.

Action To clear *heat* and resolve *dampness*, and move *qi* to kill pain.

Indications Dysentery due to *damp-heat* in the large intestine with manifestations of stools mixed with purulent blood, tenesmus, fever and abdominal pain; enteritis and bacillary dysentery with above symptoms.

Usage and dosage 3-6 g, 2-3 times a day; appropriate reduction of the dosage for children.

Storage Preserve in tightly closed containers, protected from moisture.

Xiangsha Liujun Wan
(香砂六君丸)

Xiangsha Liujun Pills

Ingredients Radix Aucklandiae 70 g; Fructus Amomi 80 g; Radix Codonopsis 100 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 200 g; Poria 200 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle, 70 g; Pericarpium Citri Reticulatae 80 g; Rhizoma Pinelliae (processed) 100 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix thoroughly. Decoct 10 g of Rhizoma Zingiberis Recens and 20 g of Fructus Jujubae with water for several times, filter, make pills with the decoction and the powder, dry at a lower temperature.

Description Yellowish-brown watered pills; odour, slightly aromatic; taste, slightly sweet and pungent.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Anastomosing laticiferous tubes 12-15 μm in diameter, containing fine granules. Sclerenchymatous cells of endotesta yellowish-brown or brownish-red, subpolygonal in surface view, walls thickened, lumina containing silica body. Needle crystals of calcium oxalate in bundles, 32-144 μm long, occurring in mucilage cells or scattered. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate forming crystal fibres.
(2) Grind 5 g of the pills, add 30 ml of ether, heat under reflux on a water bath for 30 minutes and filter. Evaporate the filtrate to dryness, dissolve the residue in 0.5 ml of ethyl acetate as the test solution. Prepare a solution with 0.5 g of Radix Aucklandiae reference drug and 15 ml of ether as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane-acetone (10 : 3) as the mobile phase. Apply separately to the plate 2 μl of the test solution and 1 μl of the reference drug solution. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulfuric acid, heat to the spots clear. The two purplish-red to purplish-blue spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(3) Grind 12 g of the pills, add 15 ml of ethanol, ultrasonicate for 30 minutes, filter and use the filtrate as the test solution. Dissolve hesperidin CRS in methanol to produce a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide film as the coating substance and a mixture of chloroform, acetone and methanol (5 : 1 : 1) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 1% aluminium chloride in methanol, dry with a current of hot air and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(4) Pulverize 5 g of the pills to fine powder, add 20 ml of ethyl acetate, ultrasonicate for 15 minutes, filter, evaporate the filtrate to dryness and dissolve the residue in 2 ml of chloroform as the test solution. Prepare a solution of 0.5 g of Rhizoma Atractylodis Macrocephalae reference drug and 10 ml of ethyl acetate in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of cyclohexane, toluene and ethyl acetate (14 : 3 : 3) as the mobile phase. Apply separately 10 μl of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, examine under the ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitril and 0.2% solution of phosphoric acid (21 : 79) as the mobile phase. As detector a spectrophotometer set at 284 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of hesperidin.

Reference solution Dissolve a quantity of hesperidin CRS, weigh accurately, in methanol to produce a solution containing 40 μg per ml.

Test solution To 10 g of the pills, weigh accurately, grind to the fine powder, weigh accurately 0.2 g to a conical flask with stopper, add accurately 25 ml of methanol, weigh, allow to stand for 2 hours, ultrasonicate (power, 300 W; frequency, 50 kHz) for 1 hour, allow to cool, weigh again, replenish the lost weight in methanol, mix well, filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 4.0 mg of hesperidin ($C_{28}H_{34}O_{15}$) per gram, referred to Pericarpium Citri Reticulatae.

Action To replenish *qi* and invigorate the spleen, and harmonize the stomach.

Indications Indigestion, belching and poor appetite, fullness in the stomach and abdomen and loose stools due to deficiency in the spleen and stagnation of *qi*.

Usage and dosage 6-9 g, 2-3 times a day.

Storage Preserve in tightly closed containers.

Xiangsha Yangwei Wan
(香砂养胃丸)

Xiangsha Yangwei Pills

Ingredients Radix Aucklandiae 210 g; Fructus Amomi 210 g; Rhizoma Atractylodis Macrocephalae 300 g; Pericarpium Citri Reticulatae 300 g; Poria 300 g; Rhizoma Pinelliae (processed) 300 g; Rhizoma Cyperi (processed with vinegar) 210 g; Fructus Aurantii Immaturus (stir-baked) 210 g; Fructus Amomi Rotundus (peeled) 210 g; Cortex Magnoliae Officinalis (processed with ginger) 210 g; Herba Pogostemonis 210 g; Radix et Rhizoma Glycyrrhizae 90 g.

Procedure Pulverize the above twelve ingredients to fine powder, sift and mix thoroughly. Decoct 90 g of sliced Rhizoma Zingiberis Recens and 150 g of Fructus Jujubae with water for several times, filter and make pills with the filtrate and the powder. Coat with a mixture of talcum powder, equivelent to 5% of total amount of drug, and equal amount of ferroferric oxide, and dry at a lower temperature.

Description Black waterd pills with dark brown core; odour, slight; taste, pungent, slightly bitter.

Identification (1) Microscopical: Irregularly branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Prisms of calcium oxalate abundant in parenchyma. Needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filled in parenchymatous cells. Needle crystals of calcium oxalate in bundles, 32-144 μm long, occurring in mucilage cells, or scattered. Sclerenchymatous cells of endotesta yellowish-brown or brownish-red, subpolygonal in surface view, walls thickened, lumina containing silica bodies. Secretory cells subrounded, containing reddish-brown contents, surrounded by cells radially arranged. Nonglandular hairs 1-6-celled, with warty walls. Fibre bundles surrounded by cells containing prisms of calcium oxalate, forming crystal fibres. (2) Pulverize 8 g of the pills, add 30 ml of petroleum ether (30-60℃), heat under reflux on a water bath for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ethyl acetate as the test solution. To 0.5 g of Fructus Amomi Rotundus reference drug and 0.5 g of Radix Aucklandiae reference drug add 15 ml of petroleum ether (30-60℃) respectively and prepare two solutions as the reference drug solutions in the same manner. Dissolve magnolol CRS and honokiol CRS in ethyl acetate to produce a mixture containing 2 mg and 1 mg respectively per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of cyclohexane and acetone (10 : 3) as the mobile phase. Apply separately 2 μl each of the four solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The blue fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the solution of Fructus Aurantii Immaturus reference drug. Examine under ultraviolet light at 254 nm, the spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution. Spray with 5% vanillin in sulfuric acid, heat to the spots clear and examine in sunlight. The purplish-red to purplish-blue spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the solution of Radix Aucklandiae reference drug.

(3) Dissolve α-cyperone CRS in ethyl acetate to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate and glacial acetic acid (60 : 1 : 1) as the mobile phase. Apply separately 2 μl of the reference solution and 4 μl of the test solution obtained in the test for Identification (2) to the plate. After developing and removal of the plate, dry in air, spray with 5% ferric chloride in ethanol which acidified with hydrochloric acid and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirement Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, water and glacial acetic acid (60 : 38 : 2) as the mobile phase. As detector a spectrophotometer set at 294 nm. The number of theoretical plates of the column is not less than 1500, calculated with the reference to the peak of magnolol.

Reference solution Dissolve a quantity of magnolol CRS and honokiol CRS, weighed accurately, in methanol to produce a mixture containg 0.1 mg and 60 μg respectively per ml.

Test solution Triturate a quantity of the pills to fine powder, sift with No. 3 sifter, place 2.5 g of the powder, weighed accurately, in a Soxhet's extractor, heat under reflux with a quantity of methanol for 3 hours and evaporate the extract to dryness. Dissolve the residue in methanol, transfer to a 25 ml volumetric flask, dilute with methanol to the volume. mix well, filter and use the successive filtrate.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, into the column and calculate the content.

It contains not less than 1.2 mg of the amount of magnolol ($C_{18}H_{18}O_2$) and honokiol ($C_{18}H_{18}O_2$) per gram, referred to Cortex Magnoliae officinalis.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To warm the *middle-energizer* to harmonize the stomach.

Indications Stomachache, fullness in the stomach due to a deficiency of *stomach-yang* and *qi* stagnation from retained *dampness*, with manifestations of dull pain, stuffiness and discomfort in the stomach, casting up of gastric acid, loss of appitite and lassitude.

Usage and dosage 9 g, twice a day.

Storage Preserve in tightly closed containers.

Xiangsha Zhizhu Wan
(香砂枳术丸)

Xiangsha Zhizhu Pills

Ingredients Radix Aucklandiae 150 g, Fructus Aurantii (stir-baked with bran) 150 g; Fructus Amomi 150 g; Rhizoma Atractylodis Macrocephalae (stir-baked with bran) 150 g.

Procedure Pulverize the above four ingredients to fine powder,

sift, mix thoroughly, make pills with water, and dry.

Description Yellowish-brown watered pills; odour, slightly aromatic; taste, bitter, slightly pungent.

Identification (1) Microscopical: Sclerenchymatous cells of endotesta yellowish-brown or brownish-red, subpolygonal in surface view, walls thickened, lumen containing a silica body. Needle crystals of calcium oxalate minute, 10-32 μm long, irregularly aggregated in parechymatous cells.
(2) Grind 3 g of the pills to fine powder, add 8 ml of *n*-hexane, ultrasonicate for 15 minutes, filter and use the filtrate as the test solution. Prepare a solution of 1 g of Rhizoma Atractylodis Macrocephalae reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (50 : 1) as the mobile phase. Apply separately 5-10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulfuric acid and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(3) Pulverize 2 g of the pills to fine powder, add 10 ml of chloroform, ultrasonicate for 15 minutes, filter, and evaporate the filtrate to about 1 ml as the test solution. Prepare a solution of 0.5 g of Radix Aucklandiae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of cyclohexane and acetone (5 : 1) as the mobile phase. Apply separately 5 μl of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulphuric acid, and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitril and 0.3% solution of phosphoric acid (20 : 80) as the mobile phase. As detector a spectrophotometer set at 283 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of hesperidin.

Reference solution Dissolve a quantity of hesperidin CRS, weigh accurately, in methanol to produce a solution containing 40 μg per ml.

Test solution Grind a quantity of the pills to fine powder, weigh accurately 0.3 g, add accurately 50 ml of methanol, heat under reflux on a water bath for 1 hour, allow to cool, weigh again, replenish the lost weight with methanol, mix well, filter. Measure accurately 5 ml of the filtrate to a 25 ml volumetric flask, dilute with methanol to volume, and mix well.

Procedure Inject accurately 10 μl of the reference solution and 5-10 μl the test solution into the column, and calculate the content.
It contains not less than 10.0 mg of hesperidin ($C_{28}H_{34}O_{15}$) per gram, referred to Fructus Aurantii Immaturus.

Action To invigorate the spleen and promote appetite, and move *qi* to disperse masses.

Indications Fullness in the stomach and abdomen, loss of appitite, or loose stools due to a deficiency and stagnation of *spleen-qi*.

Usage and dosage 10 g, twice a day.

Precaution Avoid raw and cold foods.

Strength 10 g per pack

Storage Preserve in tightly closed containers.

Xiangsu Zhengwei Wan (香苏正胃丸)

Xiangsu Zhengwei Pills

Ingredients Herba Pogostemonis 80 g; Folium Perillae 160 g; Herba Elsholtziae 80 g; Pericarpium Citri Reticulatae 40 g; Cortex Magnoliae Officinalis (processed with ginger) 80 g; Fructus Aurantii (stir-baked) 20 g; Fructus Amomi 20 g; Semen Lablab Album (stir-baked) 40 g; Fructus Crataegi (stir-baked) 20 g; Massa Medicata Fermentata (stir-baked) 20 g; Fructus Hordei Germinatus (stir-baked) 20 g; Poria 20 g; Radix et Rhizoma Glycyrrhizae 11 g; Talcum 66 g; Cinnabaris 3.3 g.

Procedure Levigate Cinnabaris to very fine powder and pulverize the other ingredients to fine powder, triturate the above powder, sift and mix well. To each 100 g of powder add 120-150 g of refined honey to make big honeyed pills.

Description Blackish-brown big honeyed pills; taste, slightly sweet, slightly sour and bitter.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Prisms of calcium oxalate abundant in parenchyma. Mesophyll containing fine clusters of calcium oxalate, 4-8 μm in diameter. Mesophyll scattered with fine needle crystals of calcium oxalate. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Stone cells branched, walls thickened, striations distinct. Stone cells of pericarp pale purplish-red or yellowish-brown, subrounded or polygonal, up to about 125 μm in diameter. Sclerenchymatous cells of endotesta yellowish-brown or brownish-red, subpolygonal in surface view, walls thickened, lumina containing silica bodies. Irregular fine granules dark brownish-red, lustrous, with dark black edges.
(2) Triturate well 9 g of the pills, cut into pieces, with 6 g of kieselguhr, heat under reflux on a water bath with 60 ml of chloroform for 1 hour and filter. Extract the filtrate by shaking with three 20-ml quantities of a 2% solution of sodium hydroxide. combine the extracts and adjust to pH 1-2 with dilute hydrochloric acid TS. Extract with three 20-ml quantities of chloroform. Wash the combined chloroform solutions with 120 ml of water in two portions, dehydrate with anhydrous sodium sulfate and evaporate to dryness. Dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Dissolve magnolol CRS and honokiol CRS in dehydrated ethanol to produce a mixture containing 1 mg each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} prepared with 1% sodium hydroxide as the coating substance and a mixture of benzene and ethyl acetate (6 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air and examine under ultraviolet light at

254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution. Spray with 5% vanillin in sulfuric acid and heat at 105℃ for several minutes, the spots turn red.

Other requirments Comply with the general requirements for pills (Appendix Ⅰ A).

Action To release the exterior and resolve *dampness*, and harmonize the *middle-energizer* to promote digestion.

Indications Commom cold in chidren due to summer-heat and *dampness* with manifestations of headache and fever, no desire for food or milk, distending pain in the abdomen, vomiting and diarrhea and difficult urination.

Usage and dosage 1 pill, 1-2 times a day; appropriate reduction of the dosage for children under one year of age.

Strength 3 g per pill

Storage Preserve in tightly closed containers.

Xiaochaihu Keli
(小柴胡颗粒)

Xiaochaihu Granules

Ingredients Radix Bupleuri 240 g; Radix Scutellariae 90 g; Rhizoma Pinelliae (processed with ginger) 90 g; Radix Codonopsis 90 g; Rhizoma Zingiberis Recens 90 g; Radix et Rhizoma Glycyrrhizae 90 g; Fructus Jujubae 90 g.

Procedure Decoct Radix Bupleuri, Radix Scutellariae, Radix Codonopsis, Radix et Rhizoma Glycyrrhizae, and Fructus Jujubae with water twice, each for 1.5 hours. Combine the decoctions, and filter. Concentrate the filtrate to a quantity. To Rhizoma Pinelliae (processed with ginger) and Rhizoma Zingiberis Recens, carry out the method for percolation as described under extracts and liquid extracts (Appendix Ⅰ O), macerate with 70% ethanol for 24 hours, then percolate slowly at a speed of 1-3 ml per minute, collect about 900 ml of percolate. Recover ethanol, combine with the above extract, concentrate to a thin extract with a relative density of 1.32-1.35 (75℃). Add 6 times quantity of sucrose, make granules, and dry. Or combine with the above extract, concentrate to a thin extract with a relative density of 1.08-1.10 (60℃), dry by spraying, make dry extract powder. Add a quantity of lactose, mix well, make 400 g of granules (without sucrose).

Description Yellowish-brown to dark brown granules; taste, sweet; or brownish-yellow granules; taste, weak, slightly pungent (without sucrose).

Identification (1) Pulverize 6 g or 1.5 g (granules without sucrose) to fine powder, add 20 ml of ethanol, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness, and dissolve the residue in 20 ml of water. Adjust to pH 2-3 with hydrochloric acid, extract with two 20-ml quantities of ethyl acetate, combine the ethyl acetate extracts and evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose containing 4 % solution of sodium acetat as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately 10 μl each of the reference solution and the test solution to the plate. After developing and removing the plate, dry in air, and spray with 1% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Decoct 1 g of Radix et Rhizoma Glycyrrhizae reference drug with a quantity of water for 30 minutes, allow to cool and filter, concentrate the filtrate to about 20 ml, extract with two 20-ml quantities of n-butanol saturated with water. Combine the n-butanol extracts, wash with water saturated with n-butanol, evaporate n-butanol to dryness, dissolve the residue in 1 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (40 : 10 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 5-10 μl of the reference drug solution to the plate. After developing and removing the plate, dry in the air, spray with 5% vanillin in sulfuric acid, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatography system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (47 : 53 : 0.2) as the mobile phase. As detector a spectrophotometer set at 315 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately 12 mg of baicalin CRS to a 100 ml volumetric flask, dissolve in 70% ethanol and dilute to volume, and mix well. Measure accurately 5 ml to a 10 ml volumetric flask, dilute to volume with 70% ethanol, mix well, and use as the reference solution (containing 60 μg of baicalin per ml).

Test solution Pulverize granules, obtained under the test of packing variation, to fine powder. Weigh accurately 3 g of the granules or 1.5 g of the granules (without sucrose) to a stopper conical flask, add accurately 50 ml of ethanol, stopper and weigh. Ultrasonicate (power, 250 W; frequency, 50 kHz) for 30 minutes, allow to cool, weigh again, replenish the lost weight with 70% ethanol, mix well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 15.0 mg of baicalin ($C_{21}H_{18}O_{11}$) per pack, referred to Radix Scutellariae.

Action To release the exterior and disperse *heat*, and soothe the liver and harmonize the stomach.

Indications Affliction from external pathogenic factors, invasion of the *Shaoyang* by pathogenic factors with manifestations of alternative chills and fever, fullness and discomfort in the chest and hypochondriua, loss of appitite, restlessness, proneness to vomiting, bitter taste in the mouth and dry throat.

Usage and dosage Taken after dissolved in boiled water. 1-2 pack, 3 times a day.

Strength (1) 10 g per pack (2) 2.5 g per pack (without sucrose)

Storage Preserve in tightly closed containers.

Xiaochaihu Pian
(小柴胡片)

Xiaochaihu Tablets

Ingredients Radix Bupleuri 445 g; Rhizoma Pinelliae (processed with ginger) 222 g; Radix Scutellariae 167 g; Radix Codonopsis 167 g; Radix et Rhizoma Glycyrrhizae 167 g; Rhizoma Zingiberis Recens 167 g; Fructus Jujubae 167 g.

Procedure Pulverize 45 g of Radix Codonopsis and 45 g of Radix et Rhizoma Glycyrrhizae to fine powder. Decoct the remained portion of Radix Codonopsis and Radix et Rhizoma Glycyrrhizae, Radix Bupleuri, Radix Scutellariae, and Fructus Jujubae for two times, 1.5 hours each, combine the decoctions, filter, and concentrate the filtrate to a quantity. Carry out the method of percolation as described under liquid extracts and extracts (Appendix Ⅰ O), macerate Rhizoma Pinelliae and Rhizoma Zingiberis Recens with 70% ethanol for 24 hours and percolate slowly at a speed of 1-3 ml per minute. Collect about 1670 ml of the percolates, recover ethanol, then mix with the above concentrated solution, concentrate to a thick extract. Add the above fine powder and a quantity of excipients, mix well, dry, pulverize to fine powder, make granules, dry and compress into 1000 tablets, or coat with film.

Description Greyish-brown to blackish-brown tablets or film coated tablets with greyish-brown to blackish-brown core; odour, slight; taste, sweet, slightly bitter.

Identification (1) Microscopical: Anastomosing laticiferous tubes 12-15 μm in diameter, containing fine granules. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres.

(2) To 10 tablets, finely powdered, add 20 ml of ethanol, ultrasonicate for 20 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in 20 ml of water and adjust to pH 2-3 with hydrochloric acid. Extract with two 20-ml quantities of ethyl acetate, combine the ethyl acetate extracts, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose containing 4% solution of sodium acetate as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and spray with 1% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) To 10 tablets, finely powdered, add 20 ml of ethanol, ultrasonicate for 20 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in 20 ml of water, extract with two 20-ml quantities of *n*-butanol saturated with water, combine the n-butanol extracts, wash with two 10-ml quantities of water saturated with *n*-butanol. Evaporate the *n*-butanol extracts to dryness and dissolve the residue in 1 ml of methanol as the test solution. To 1 g of Radix et Rhizoma Glycyrrhizae reference drug, add a quantity of water, decoct for 30 minutes, allow to cool. Filter, and concentrate the filtrate to 20 ml. Extract with two 20-ml quantities of n-butanol saturated with water, combine the n-butanol extracts, wash with two 10-ml quantities of water saturated with *n*-butanol. Evaporate the *n*-butanol extracts to dryness and dissolve the residue in 1 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (40 : 10 : 1) as the mobile phase. Apply separately 5-10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and spray with 5% vanillin in sulfuric acid, heat at 105 ℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use the octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and glacial acetic acid (50 : 50 : 1) as the mobile phase. As detector a spectrophotometer set at 315 nm. The number of the theoretical plates of the column is not less than 2000, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin CRS, dissolve in 70% ethanol to produce a solution containing 40 μg per ml as the reference solution.

Test solution Grind the tablets, obtained under the test of weight variation, to fine powder, weigh accurately 0.3 g in a 100 ml volumetric flask, add 70 ml of 70% ethanol and ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, cool, add 70% ethanol to volume, shake well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 2.0 mg of baicalin ($C_{21}H_{18}O_{11}$) per tablet, referred to Radix Scutellariae.

Action To release the exterior and disperse *heat*, and soothe the liver and harmonize the stomach.

Indications Affliction from external pathogenic factors, invasion of the *Shaoyang* by pathogenic factors with manifestations of alternative chills and fever, fullness and discomfort in the chest and hypochondrium, anorexia, restlessness, proneness to vomiting, bitter taste in the mouth and dry throat.

Usage and dosage 4-6 tablets, 3 times a day.

Strength 0.4 g per tablet

Storage Preserve in tightly closed containers.

Xiao'er Baibu Zhike Tangjiang
(小儿百部止咳糖浆)

Xiao'er Baibu Zhike Syrup

Ingredients Radix Stemonae (processed with honey) 100 g; Semen Armeniacae Amarum 50 g; Radix Platycodonis 50 g; Cortex Mori 50 g; Radix Ophiopogonis 25 g; Rhizoma Anemarrhenae 25 g; Radix Scutellariae 100 g; Pericarpium Citri Reticulatae 100 g; Radix et Rhizoma Glycyrrhizae 25 g; Rhizoma Arisaematis (processed) 25 g; Fructus Aurantii (stir-baked) 50 g.

Procedure Decoct the above eleven ingredients with water twice, 3 hours for the first time, 2 hours for the second

time. Combine the decoctions, and filter. Collect the filtrate, allow to stand over 6 hours, concentrate the supernatant to an appropriate amount. Boil 650 g of sucrose with water to make syrup, mix well with the above concentrate, boil, allow to cool, add 2.5 g of sodium benzoate and a quantity of essence, add water to 1000 ml. Mix well, allow to stand and filter.

Description A dark brown thick liquid; taste, sweet.

Identification (1) To 5 ml of the syrup, add 15 ml of 75% ethanol, ultrasonicate for 20 minutes, filter, use the filtrate as the test solution. Dissolve baicalin CRS in 75% ethanol to produce a solution containing 0.2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide as the coating substance and acetic acid as the mobile phase. Apply separately 1-3 μl of each of the test solution and the reference solution to the plate. After developing and removing the plate, dry in air. Examine under the ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Measure 1 ml of the syrup to a stopper centrifugal tube, add 1 ml of methanol, shake and centrifuge, use the supernatant as the test solution. Dissolve hesperidin CRS in methanol to produce a saturation solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 0.5% sodium hydroxide as the coating substance and a mixture of ethyl acetate, methanol and water (100 : 17 : 3) as the mobile phase. Apply separately 2 μl of each of the test solution and the reference solution to the plate. After developing about 3 cm and removing the plate, dry in air. Develop again with the upper layer of a mixture of toluene, ethyl acetate, methanol and water (20 : 10 : 1 : 1) as the mobile phase. After developing about 8 cm and removing the plate, dry in air. Spray with aluminium trichloride TS, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply to the general requirements for syrup (Appendix Ⅰ H).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatography system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (45 : 55 : 0.04) as the mobile phase. As detector a spectrophotometer set at 276 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately a quantity of baicalin CRS, dissolve in 50% methanol to produce a reference solution containing 20 μg per ml.

Test solution Measure accurately 2 ml of the syrup to a 100 ml volumetric flask, dissolve and dilute to volume with water, mix well. Measure accurately 10 ml to a 50 ml volumetric flask, dilute to volume with 65% methanol, and mix well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 3.7 mg of baicalin ($C_{21}H_{18}O_{11}$) per ml, referred to Radix Scutellariae.

Action To clear the lung, relieve coughing and resolve phlegm.

Indications Coughing or whooping cough in children due to *phlegm-heat* retained in the lung, with manifestations of coughing, expectoration of profuse yellow phlegm, or difficult expectoration of thick phlegm, or coughing with phlegm continually; and pertussis with above symptoms.

Usage and dosage 10 ml, for children of 2 years old, 5 ml, for children under 2 years of age, 3 times a day.

Strength (1) 10 ml per phial (2) 100 ml per bottle

Storage Preserve in tightly closed containers.

Xiao'er Baishou Wan
(小儿百寿丸)

Xiao'er Baishou Pills

Ingredients Ramulus Uncariae cum Uncis 45 g; Bombyx Batryticatus (stir-baked with bran) 45 g; Arisaema cum Bile (stir-baked with wine) 75 g; Concretio Silicea Bambusae 75 g; Radix Platycodonis 30 g; Radix Aucklandiae 75 g; Fructus Amomi 45 g; Pericarpium Citri Reticulatae 75 g; Rhizoma Atractylodis (processed) 75 g; Poria 30 g; Fructus Crataegi (stir-baked) 150 g; Massa Medicata Fermentata (stir-baked with bran) 45 g; Fructus Hordei Germinatus (stir-baked) 45 g; Herba Menthae 45 g; Talcum 150 g; Radix et Rhizoma Glycyrrhizae 30 g; Cinnabaris 10 g; Calculus Bovis 10 g.

Procedure Levigate Cinnabaris to very fine powder and pulverize the other sixteen ingredients, except Calculus Bovis, to fine powder. Triturate Calculus Bovis and mix with all the above powders, sift and mix well. To each 100 g of the powder add 100-120 g of refined honey to make big honeyed pills.

Description Brownish-red big honeyed pills; odour, aromatic; taste, sweet.

Identification (1) Microscopical: Irregular pieces colourless, in samdwich. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Anastomosing laticiferous tubes 14-25 μm in diameter, containing pale yellow granular contents. Needle crystals of calcium oxalate in bundles or scattered, 90 μm long. Sand crystals of calcium oxalate occurring in parenchymatous cells, crystal cells sometimes arranged in rows. Fragments of body walls colourless, with very fine hyphae. Irregularly branched masses colourless, dissolved in chloral hydrate TS, hyphae colourless or pale brown, 4-6 μm in diameter. Prisms of calcium oxalate occurring in parenchymatous cells. Epidermal cells longitudinally arranged, with one long cell and two short cells connected alternatively, the long cells with thickened, sinuous and lignified walls. Sclerenchymatous cells of endotesta yellowish-brown or brownish-red, subpolygonal in surface view, with thickened walls, each lumen containing a silica body. Stone cells of pericarp purplish-red, red or yellowish-brown, subrounded or polygonal, up to about 125 μm in diameter. Glandular scales composed of a 8-celled head, oblate spheroidal, 90 μm in diameter, and a short unicellular stalk. Irregular minute granules dark brownish-red, lustrous, with dark black edge.

(2) Triturate well 9 g of the pills, cut into pieces, with 3 g of kieselguhr, add 30 ml of ether, ultrasonicate for 10 minutes and filter. Evaporate the filtrate to about 1 ml as the test solution. Prepare a solution of 0.5 g of the Radix Aucklandiae reference drug and 10 ml of ether as the

reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene and methanol (27 : 1) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 1% vanillin in sulphuric acid and heat at 105℃ to the spots clear. The two purplish-blue to purplish-black spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Dissolve ursolic acid CRS in methanal to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and acetone (12 : 1) as the mobile phase. Apply separately 2 μl of each of the test solution obtained in the test of Identification (2) and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulphuric acid in ethanol, heat at 105℃ for several minutes and examine under ultraviolet light at 365 nm. The orange-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To expel *wind-heat* and promote digestion to remove undigested food.

Indications Common cold in children caused by *wind-heat* and food retention with manifestations of fever, headache, fullness in the chest and epigastrium, no desire for food or milk and acid regurgitation, coughing with expectoration of excessive phlegm, or convulsion.

Usage and dosage 1 pill, twice a day; appropriate reduction of the dosage for children under one year of age.

Strength 3 g per pill

Storage Preserve in tightly closed containers.

Xiao'er Feire Kechuan Koufuye (小儿肺热咳喘口服液)

Xiao'er Feire Kechuan Mixture

Ingredients Herba Ephedrae 50 g; Semen Armeniacae Amarum 100 g; Gypsum Fibrosum 400 g; Radix et Rhizoma Glycyrrhizae 50 g; Flos Lonicerae Japonicae 167 g; Fructus Forsythiae 167 g; Rhizoma Anemarrhenae 167 g; Radix Scutellariae 167 g; Radix Isatidis 167 g; Radix Ophiopogonis 167 g; Herba Houttuyniae 167 g.

Procedure Decoct Gypsum Fibrosum with water for half an hour, add Herba Ephedrae and other ingredients, decoct with water twice, each for 1 hour. Combine the decoctions, filter, concentrate the filtrate to a thin extract with a relative density of 1.10-1.15 (80℃), cool, add ethanol to a content of 75%, mix well, and allow to stand for 24 hours. Filter, recover ethanol and concentrate to a thin extract with a relative density of 1.20-1.25 (80℃), add water to 1000 ml, and mix well, refrigerate for 96 hours under 4-7℃. Filter, add a quantity of antiseptic and flavoring agents, add water to a volume of 1000 ml, mix well, pack and sterilize.

Description A brownish-red liquid, little precipitate may be produced when being stored for a long time; taste, bitter, slightly sweet.

Identification (1) Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethanol and concentrated ammonia TS (10 : 0.5) as the mobile phase. Apply separately 3 μl of each of the test solution and the reference solution obtained under the Assay to the plate. After developing and removing the plate, dry in air. Spray with ninhydrin TS, heat at 105℃ to spots clear. The spots in the chromatography obtained with the test solution corresponds in position and colour to the spot in the chromatography obtained with the reference solution.

(2) To 5 ml of the mixture, add 5 ml of water, adjust to pH 1-2 with dilute hydrochloric acid TS, centrifuge at 3000 round per minute for 10 minutes, separate the supernatant and keep the deposition for later use. Extract the supernatant with 15 ml of ethyl acetate, separate the ethyl acetate extracts and evaporate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution Ⅰ. Dissolve the above deposition in 5 ml of ethanol as the test solution Ⅱ. Dissolve chlorogenic acid CRS and baicalin CRS in ethanol to produce solutions containing 1 mg per ml and 0.3 mg per ml respectively as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide as the coating substance and a mixture of ethyl acetate, methanol and formic acid (8 : 1 : 1) as the mobile phase. Apply separately 1-2 μl of each of the test solutions and the reference solutions to the plate. After developing and removing the plate, dry in air. Examine under the ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solutions correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Relative density 1.07-1.12 (Appendix Ⅶ A).

pH value 5.0-7.0 (Appendix Ⅶ G).

Assay Measure accurately 10 ml of the mixture, add 10 ml of a saturation solution of sodium chloride, adjust to pH 12-13 with 10% solution of sodium hydroxide. Extract with one 20-ml, three 15-ml and one 10-ml quantities of ether, combine the ether extracts and evaporate to almost dryness, dissolve the residue immediately in methanol, transfer to a 5 ml volumetric flask, dilute to volume with methanol, mix well, use as the test solution. Dissolve a quantity of ephedrine hydrochloride CRS, weigh accurately, in methanol to prepare a reference solution containing 0.5 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, methanol and concentrated ammonia TS (4 : 1 : 0.1) as a mobile phase. Apply accurately to the plate 3 μl of the test solution, 1 μl and 4 μl of the reference solution alternatively. After developing and removing the plate, dry in air. Spray with 0.5% ninhydrin solution in ethanol prepared freshly, heat at 105℃ to spots clear, cover the plate with a glass plate of the same size and fix up with adhesive plaster. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan at the wavelength of $\lambda_S = 510$ nm, $\lambda_R = 700$ nm. Measure the integration values of the absorbance from the test solution and the reference solution respectively, and calculate the content.

It contains not less than 0.15 mg of ephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) per ml, referred to Herba Ephedrae.

Action To clear *heat-toxins*, and disseminate the lung and resolve phlegm.

Indications Fever, sweating, mild aversion to *cold-wind*, coughing with expectoration of yellow phlegm, or accompanied with shortness of breath, dry mouth and thirsty due to invasion of the lung by *heat*.

Usage and dosage 10 ml, for children of 1-3 years old, 3 times a day; 10 ml, for children of 4-7 years old, 4 times a day; 20 ml, for children of 8-12 years old, 3 times a day; or follow doctor's advice.

Precaution Mild gastro-intestinal disorder might be seen on large dose.

Strength 10 ml per phial

Storage Preserve in tightly closed containers.

Xiao'er Fuxiening Tangjiang (小儿腹泻宁糖浆)

Xiao'er Fuxiening Syrup

Ingredients Radix Codonopsis 150 g; Rhizoma Atractylodis Macrocephalae 200 g; Poria 200 g; Radix Puerariae Lobatae 250 g; Radix et Rhizoma Glycyrrhizae 50 g; Herba Pogostemonis 50 g; Radix Aucklandiae 50 g.

Procedure Distill Rhizoma Atractylodis Macrocephalae, Herba Pogostemonis, Radix Aucklandiae with water, collect the distillate, decoct the residue with the other four ingredients twice, each for 2 hours. Combine the decoctions, filter, concentrate the filtrate to an appropriate amount, allow to cool, add ethanol to a content of 50% ethanol, allow to stand, filter and recover ethanol, add 610 g of sucrose and 3 g of sorbic acid, boil to dissolve, and filter. Add the above distillate to the filtrate, mix well, make to 1000 ml.

Description A dark brown thick liquid; odour, aromatic; taste, slightly astringent and sweet.

Identification (1) Extract 5 ml of the syrup with two 20-ml quantities of n-butanol saturated with water, combine the n-butanol extracts, evaporate to dryness. Dissolve the residue in 2 ml of methanol, apply to a column (1-1.5 cm in diameter) packed with neutral alumina trichloride (100-120 meshs, 5 g), elute with 50 ml of 40% methanol, collect the eluate, evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Decoct 0.5 g of Radix Codonopsis reference drug with 50 ml of water for 30 minutes, prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel as the coating substance and a mixture of *n*-butanol, ethanol and water (7 : 2 : 1) as the mobile phase. Apply separately 2 μl of each of the test solutions and the reference solutions to the plate. After developing and removing the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) Extract 30 ml of syrup with 10 ml of petroleum ether (30-60℃), discard the petroleum ether extracts, extract the water layer again with two 20-ml quantities of ether. Combine the ether extracts, evaporate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 1.5 g of Rhizoma Atractylodis Macrocephalae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel as the coating substance and a mixture of cyclohexane and ethyl acetate (7 : 3) as the mobile phase. Apply separately 10 μl of each of the test solutions and the reference solutions to the plate. After developing and removing the plate, dry in air. Spray with 5% *p*-dimethylaminobenzaldehyde in 10% solution of sulfuric acid, heat at 105℃ to the spots clear. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solutions correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Relative density 1.24-1.28 (Appendix Ⅶ A).

Other requirements Comply with the general requirements for syrups (Appendix Ⅰ H).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatography system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (25 : 75) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of puerarin.

Reference solution Weigh accurately a quantity of puerarin CRS, dissolve in methanol to produce a reference solution containing 80 μg per ml.

Test solution Weigh accurately 6 g of the syrup to a 50 ml volumetric flask, dilute to volume with methanol, mix well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 5-10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 0.25 mg of puerarin ($C_{21}H_{20}O_9$) per gram, referred to Radix Puerariae Lobatae.

Action To invigorate the spleen and harmonize the stomach, generate production of body fluids and stop diarrhea.

Indications Diarrhea due to a deficiency of *spleen-qi* and *stomach-qi*, with manifestations of diarrhea accompanied with distending pain in the abdomen, poor appetite, vomiting, dry mouth, lassitude and pale tongue with white fur.

Usage and dosage 10 ml, for children of 10 years old, twice a day; appropriate reduction of the dosage for children under 10 years of age.

Precaution Be cautious about patients with red tongue and thirty after vomiting and diarrhea, and concentrated urine.

Strength 10 ml per phial

Storage Preserve in tightly closed containers.

Xiao'er Fuxie Waifu San (小儿腹泻外敷散)

Xiao'er Fuxie Waifu Powder

Ingredients Fructus Evodiae; Flos Caryophylli; Fructus Piperis Albus; Cortex Cinnamomi.

Procedure Pulverize the above four ingredients to fine powder, sift, mix well and pack.

Description A brownish-yellow powder; odour, aromatic; taste, pungent.

Identification (1) Microscopical: Pollen grains triangular, about 16 μm in diameter. Nonglandular hairs 2-6-celled, lumina sometimes containing reddish-brown substances. Glandular hairs with multicellular, elliptical head containing brownish-yellow to brownish-red contents, and with a 2-5-celled stalk. Stone cells in pericarp subrounded or oblong, yellow, 15-40 μm in diameter; walls thickened, lumina containing brown substances.

(2) To 1 g of the powder add 10 ml of ethanol, ultrasonicate for 20 minutes, filter and use the filtrate as the test solution. Prepare a solution of 0.5 g of Fructus Evodiae reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of *n*-butanol, glacial acetic acid and water (5 : 1 : 1) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Macerate 1 g of the powder in 30 ml of ether for 1 hour while shaking frequently, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve cinnamaldehyde CRS in ethanol to produce a solution containing 2 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (17 : 3) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and spray with alcoholic dinitropenylhydrazine TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Complies with the general requirements for powders (Appendix Ⅰ B).

Action To warm the *middle-energizer* to expel cold, kill pain and stop diarrhea.

Indications Diarrhea due to *cold* from deficiency in the spleen and stomach with manifestations of loose stools, pain of the *stomach* and abdomen, alleviated by warmth and pressure.

Usage and dosage For external use. A paste is made with vinegar and applied on the umbilical region; one fourth bottle of the powder for children under 2 years of age and one third bottle of the powder for children over 2 years of age. If bowel movements exceed 20 times a day-one fourth bottle of the powder is *yongquan* (KI1). Change the dressing every 24 hours.

Strength 5 g per bottle

Storage Preserve in tightly closed containers.

Xiao'er Ganmao Cha (小儿感冒茶)

Xiao'er Ganmao Medicinal Teas

Ingredients Herba Pogostemonis 75 g; Flos Chrysanthemi 75 g; Fructus Forsythiae 75 g; Folium Isatidis 125 g; Radix Isatidis 75 g; Radix Rehmanniae 75 g; Cortex Lycii 75 g; Radix et Rhizoma Cynanchi Atrati 75 g; Herba Menthae 50 g; Gypsum Fibrosum 125 g.

Procedure Pulverize 25 g of Gypsum Fibrosum and Radix Isatidis to fine powder. Decoct Radix Rehmanniae, Radix Cynanchi Atrati, Cortex Lycii and 100 g of Gypsum Fibrosum with water twice, 3 hours and 1 hour respectively, combine the decoctions and filter. Macerate Flos Chrysanthemi and Folium Isatidis in warm water twice, 2 hours and 1 hour respectively, combine the liquid and filter. Distill volatile oil from Herba Pogostemonis, Herba Menthae and Fructus Forsythiae, then filter the aqueous liquid. Combine the above all filtrates and concentrate to a thin extract with a relative density of 1.30-1.35 (50℃). Mix thoroughly 1 portion of the thin extract, 2 portions of powdered sucrose and 1 portion of dextrin with the above fine powder, make granules and dry. To the dried granules add the above volatile oil, mix thoroughly and compress into lumps.

Description Pale brownish lumps; taste, sweet and slightly bitter.

Identification Triturate 30 g to fine powder, add 40 ml of chloroform, heat under reflux for 1 hour, cool and filter. Evaporate the filtrate to about 0.5 ml as the test solution. Dissolve indigotin CRS in chloroform to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and a mixture of benzene, chloroform and acetone (5 : 4 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements medicinal for teas (Appendix Ⅰ T).

Action To disperse *wind* to release the exterior, and clear *heat* to relieve *toxicity*.

Indications Common cold in children due to *wind-heat* with manifestations of high fever, distending pain in the head, coughing with expectoration of thick phlegm, swollen painful throat; influenza with above symptoms.

Usage and dosage Taken after dissolved in boiled water; 6 g, for children under 1 year old; 6-12 g, for children of 1-3 years old; 12-18 g, for children of 4-7 years old and 24 g, for children of 8-12 years old; twice a day.

Strength 6 g per lump

Storage Preserve in tightly closed containers, protected from moisture.

Xiao'er Ganmao Keli (小儿感冒颗粒)

Xiao'er Ganmao Granules

Ingredients Herba Pogostemonis 75 g; Flos Chrysanthemi 75 g; Fructus Forsythiae 75 g; Folium Isatidis 125 g; Radix Isatidis 75 g; Radix Rehmanniae 75 g; Cortex Lycii 75 g; Radix et Rhizoma Cynanchi Atrati 75 g; Herba Menthae 50 g; Gypsum Fibrosum 125 g.

Procedure Pulverize 25 g of Gypsum Fibrosum and Radix Isatidis to fine powder. Decoct Radix Rehmanniae, Radix Cynanchi Atrati, Cortex Lycii and 100 g of Gypsum Fibrosum with water twice, 3 hours and 1 hour respectively, combine the decoctions and filter. Macerate Flos Chrysanthemi and Folium Isatidis in warm water twice, 2 hours and 1 hour respectively, combine the macerates and filter. Distil essential oils from Herba Pogostemonis, Herba Menthae and Fructus Forsythiae, then filter the aqueous solution remained. Combine the above all filtrates and concentrate to a thin extract with a relative density of 1.30-1.35 (50℃). Mix thoroughly 1 portion of the thin extract, 2 portions of powdered sucrose and 1 portion of dextrin with

the above fine powder, make granules and dry. To the dried granules add the above essential oil and mix well.

Description Pale brown granules; taste, sweet and slightly bitter.

Identification Triturate 30 g to fine powder, add 40 ml of chloroform, heat and extract under reflux for 1 hour, cool, and filter. Evaporate the filtrate to about 0.5 ml as the test solution. Dissolve indigotin CRS in chloroform to produce a solution containing about 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, chloroform and acetone (5 : 4 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Action To disperse *wind* to release the exterior, and clear *heat* to relieve *toxicity*.

Indications Common cold in children due to *wind-heat* with manifestations of high fever, distending pain in the head, coughing with thick phlegm, swollen painful throat; influenza with above symptoms.

Usage and dosage Taken after dissolved in boiling water; 6 g, for children under 1 year of age, 6-12 g, for children of 1-3 years of age, 12-18 g, for children of 4-7 years of age and 24 g, for children of 8-12 years of age, twice a day.

Strength 12 g per pack

Storage Preserve in tightly closed containers, protected from moisture.

Xiao'er Ganyan Keli
(小儿肝炎颗粒)

Xiao'er Ganyan Granules

Ingredients Herba Artemisiae Scopariae 120 g; Fructus Gardeniae (stir-baked with ginger juice) 30 g; Radix Scutellariae 60 g; Cortex Phellodendri Chinensis 60 g; Fructus Crataegi (charred by stir-baked) 90 g; Semen Sojae Germinatum 90 g; Radix Curcumae 15 g; Medulla Tetrapanacis 30 g.

Procedure Pulverize Fructus Gardeniae, Radix Scutellariae and Cortex Phellodendri Chinensis to fine powder. Decoct the other 5 ingredients with water twice, combine the decoctions, filter and concentrate to a thick extract with a relative density of 1.30-1.35 (50℃). For 1 portion of the thick extract, add 3 portions of sucrose, 1 portion of dextrin and the above fine powder, make granules and dry.

Description Yellowish-green to yellowish-brown granules; taste, sweet, slightly bitter and astrigent.

Identification (1) Microscopical: Bast fibres pale yellow, fusiform, walls thickened, with fine pit-canals. Crystal stone cells of pericarp subrounded or polygonal, 17-31μm in diameter; walls thickened, and lumina containing prisms of calcium oxalate. Fibre bundles bright yellow, surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres; the walls of the crystal cells thickened and lignified.

(2) Grind 1 g of the granules to fine powder, add 5 ml of ethanol, macerate overnight, filter, evaporate the filtrate to 1 ml as the test solution. Dissolve berberine hydrochloride CRS in ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately 1 μl of each of the two solutions to the plate. After developing in the chamber pre-equilibrated with ammonia vapour and removal the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Triturate 15 g to fine powder, heat under reflux with 50 ml of ethyl acetate for 1 hour, filter and evaporate the filtrate to dryness. Dissolve the residue in 30 ml of ethanol, add 0.5g of active charcoal, stir well, filter and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of ethanol as the test solution. Dissolve geniposide CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, chloroform, acetone, methanol and concentrated ammonia TS (4 : 5 : 4 : 3 : 0.8) as the mobile phase. Apply separately 4 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Pulverize 5 g of the granules to fine powder, add 30 ml of water, stir to dissolve, filter, extract the filtrate with three 30-ml quantities of chloroform, combine the chloroform extracts, evaporate to dryness, dissolve the residue in 1 ml of chloroform as the test solution. To 1 g of Herba Artemisiae Scopariae reference drug, add 20 ml of water, decoct for 30 minutes, filter, prepare the filtrate in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃), ethyl acetate and acetone (6 : 3 : 0.5) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, examine under the ultraviolet light at 365 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(5) Grind 2 g of the granules to fine powder, add 20 ml of methanol, ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with 1% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and glacial acetic acid (50 : 50 : 1) as the mobile phase. As detector a spectrophotometer set at 277 nm. The number of theoretical plates of the column is not less than 3500, calculated with the reference to the peak of baicalin.

Reference solution Dissolve a quantity of baicalin CRS, weigh accurately, in methanol to produce a solution containing 60 μg per ml.

Test solution Grind a quantity of the granules obtained under the test of packing variation to fine powder, weigh accurately 0.5 g to a conical flask with stopper, add accurately 100 ml of 70 % solution of ethanol, weigh, ultrasonicate (power, 250 W; frequency, 33 kHz) for 40 minutes, allow to cool, weigh again, replenish the lost weight with 70% ethanol, mix well, filter by 0.45 μm millipore filter and use the successive filtrate.

Procedure Inject accurately 10 μl of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 90.0 mg of baicalin ($C_{21}H_{18}O_{11}$) per pack, referred to Radix Scutellariae.

Action To clear *heat* and drain *dampness*, and relieve stagnation of *qi* and kill pain.

Indications Jaundice due to *damp-heat* in the *liver* and gallbladder with manifestations of pain in the hypochondria, abdominal distension and fever, nausea and vomiting, poor appetite, lassitude and yellowish skin; hepatitis with above symptoms.

Usage and dosage Taken after dissolved in boiling water; 5-10 g, for children of 1-3 years of age, 10-15 g, for 4-7 years of age, 15 g, for 8-10 years of age, reasonably increased for over 11 years of age; 3 times a day.

Strength 10 g per pack

Storage Preserve in tightly closed containers.

Xiao'er Huadu San (小儿化毒散)

Xiao'er Huadu Powder

Ingredients Calculus Bovis Artifactus 8 g; Margarita 16 g; Realgar 40 g; Radix et Rhizoma Rhei 80 g; Rhizoma Coptidis 40 g; Radix et Rhizoma Glycyrrhizae 30 g; Radix Trichosanthis 80 g; Bulbus Fritillariae Cirrhosae 40 g; Radix Paeoniae Rubra 80 g; Olibanum (processed) 40 g; Myrrha (processed) 40 g; Borneolum Syntheticum 10 g.

Procedure Levigate Realgar and levigate or pulverize Margarita to very fine powder. Pulverize the other eight ingredients, except Calculus Bovis Artifactus and Borneolum Syntheticum, to fine powder. Triturate Borneolum Syntheticum and Calculus Bovis Artifactus with the above powders, sift and mix thoroughly.

Description An orange-yellow to brownish-yellow powder; taste, bitter with cooling sensation.

Identification (1) Microscopical: Fibre bundles bright yellow, with slightly thickened walls and distinct pits. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Bordered pitted vessels large, mostly broken, some bordered pits hexagonal or rhombic, closely arranged. Clusters of calcium oxalate large, 60-140 μm in diameter. Irregular fragments golden yellow or orange-yellow, lustrous. Irregular fragments colourless or pale green, translucent, lustrous, sometimes showing minute and dense sinuous striations.

(2) Sublime a small quantity, dried previously over phosphorous pentoxide. The sublimate is observed under a microscope as colourless irregular sliced crystals.

(3) Heat under reflux 0.6 g with 5 ml of methanol on a water bath for 15 minutes and filter. To the filtrate, add methanol to 5 ml as the test solution. Prepare a solution of 50 mg of Rhizoma Coptidis reference drug as the reference drug solution in the same manner. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately 1 μl of each of the three solutions to the plate. After developing in a chamber pre-equilibrated with ammonia vapour and removal of the plate, dry it in air, and examine under ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

(4) Macerate 0.6 g in 20 ml of methanol for 1 hour, filter and evaporate 5 ml of the filtrate to dryness. Dissolve the residue in 5 ml of water, add 0.5 ml of hydrochloric acid, heat on a water bath for 30 minutes and cool immediately. Extract the aqueous solution twice with 20 ml of ether. Combine the extracts and evaporate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 0.1 g of Radix et Rhizoma Rhei reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 4 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The five orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The spots turn red on exposure to ammonia vapour.

(5) Triturate 0.6 g with 5 ml of a 0.1% solution of sodium hydroxide and centrifuge. Decant the supernatant into a separator, add 10 ml of water, shake well and extract with two 15-ml quantities of ethyl acetate. Discard the ethyl acetate extracts, acidify the aqueous solution with dilute hydrochloric acid to pH 1, and extract with two 15-ml quantities of ethyl acetate. Wash the combined extract with a small quantity of water and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve cholic acid CRS in ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of isooctane, ethyl acetate and glacial acetic acid (15 : 7 : 5) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat at 105℃ for several minutes and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained

with the reference solution.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Action To clear *heat* and toxic materials, and to promote blood circulation to reduce swelling.

Indications Swollen painful sores on the mouth, ulcerous pyogenic skin infection, irritability, thirsty and constipation due to interior retention of toxic *heat* and unexhausted pathogenic factors.

Usage and dosage 0.6 g, 1-2 times a day; appropriate reduction of the dosage for children under 3 years of age. For external use, appropriate quantity applied topically.

Storage Preserve in tightly closed containers, protected from moisture.

Xiao'er Huashi Wan (小儿化食丸)

Xiao'er Huashi Pills

Ingredients Massa Medicata Fermentata (charred by stir-baked) 100 g; Fructus Crataegi (charred by stir-baked) 100 g; Fructus Hordei Germinatus (charred by stir-baked) 100 g; Semen Arecae Preparata 100 g; Rhizoma Curcumae (processed with vinegar) 50 g; Rhizoma Sparganii (processed) 50 g; Semen Pharbitidis (charred by stir-baked) 200 g; Radix et Rhizoma Rhei 100 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix thoroughly. To each 100 g of the powder add 90-110 g of refined honey to make big honeyed pills.

Description Dark brown big honeyed pills; taste, slightly bitter.

Identification (1) Microscopical: Pericarp stone cells pale purplish-red, red or yellowish-brown, subrounded or polygonal, about 125 μm in diameter. Endospermic pieces colourless, walls relatively thickened, with numerous large subrounded pits. Epidermis cells longitudinally arranged, usually with one long cell and two short cells connected alternatively, walls of the long cells thickened, curved and lignified. Palisade cells of testa pale brown or brown, 48-80 μm long.

(2) Macerate 1 pill, cut into pieces, in 20 ml of methanol for 1 hour, filter and evaporate the filtrate to dryness. To the residue, add 40 ml of water and 4 ml of hydrochloric acid, shake well, heat on a water bath for 30 minutes, cool immediately, extract with two 20-ml quantities of ether and evaporate the combined extract to dryness. Dissolve the residue in 1ml of ethyl acetate as the test solution. Prepare a solution of 0.1g of Radix et Rhizoma Rhei reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl-cellulose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The colour of the spots turn to red on exposure the plate to ammonia vapour.

(3) Cut 3 g of the big honeyed pills into pieces, add 1 g of kieseghul, mix well, add 20 ml of ether, ultrasonicate for 15 minutes, filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Prepare a solution of 1 g of Fructus Crataegi reference drug and 15 ml of ether in the same manner as the reference drug solution. Dissolve ursolic acid CRS in dehydrated ethanol to produce a solution containing 1 mg per ml as reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform and ethyl acetate (20 : 5 : 8) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of each of the reference drug solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 10% sulphuric acid in ethanol, heat at 110℃ for 10 minutes. The purplish-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution and the reference solution.

(4) Cut 15 g of the big honeyed pills into pieces, add 1 g of kieseghul, mix well, add 50 ml of chloroform and 4 ml of concentrated ammonia TS, hest under reflux for 1 hour, filter. To the filtrate, add 5 ml of dilute hydrochloric acid TS and 20 ml of water, extract by shaking, collect the acid, adjust pH to 8-9 with concentrated ammonia TS, extract with two 10-ml quantities of chloroform, collect the chloroform extracts, recover chloroform, and dissolve the residue in 0.5 ml of methanol as the test solution. Prepare a solution of 1 g of Semen Arecae reference drug, 20 ml of chloroform, and 1 ml of concentrated ammonia TS in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, ethyl acetate and concentrated ammonia TS (7.5 : 7.5 : 0.2) as the mobile phase. Apply separately 20 μl of the test solution and 2 μl of the reference drug solution to the plate. After developing in the chamber pre-equilibrated with ammonia vapour and removal of the plate, dry in air, spray with dilute solution of potassium heptaiodobismuthates TS. The orange spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (85 : 15 : 0.05) as the mobile phase. As detector a spectrophotometer set at 289 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of emodin.

Reference solution Disslove a quantity of emodin CRS, weigh accurately, in methanol to produce a solution containing 3 μg per ml.

Test solution Cut the big honeyed pills obtained under the test of weight variation into pieces, to about 6 g, weigh accurately, mix well with equal quantity of kieseghul, weigh accurately 4 g to a conical flask, add accurately 50 ml of methanol, weigh, heat under reflux for 1 hour, allow to cool, weigh again, replenish the lost weight with methanol, mix well, and filter. Measure accurately 10 ml of the filtrate to a round bottomed flask, recover the methanol on a water bath, add 20 ml of a solution of 2.5 mol/L sulfuric acid, ultrasonicate to dissolve for 10 minutes, heat on a water bath for 1 hour, cool immediately, extract with four 25-ml quantities of ether, combine the ether extracts, wash with

15 ml of water, discard the washings, recover the ether on low temperature to dryness, dissolve the residue in a quantity of methanol to a 25 ml of volumetric flask, dilute with methanol to volume, and mix well.

Procedure Inject accurately 10 μl of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 0. 15 mg of emodin ($C_{15}H_{10}O_5$) per pill, referred to Radix et Rhizoma Rhei.

Action To promote digestion to remove retained food, and purge *fire* and relax bowels.

Indications Production of *heat* in food retention, with manifestations of anorexia, irritability, nausea and vomiting, thirst, fullness in the stomach and abdomen, and constipation.

Usage and dosage 1 pill for children under 1 year of age, 2 pills for children over 1 year of age, twice a day.

Precaution Avoid pungent and greasy foods.

Strength 1. 5 g per pill

Storage Preserve in tightly closed containers.

Xiao'er Jiebiao Keli
(小儿解表颗粒)

Xiao'er Jiebiao Granules

Ingredients Flos Lonicerae Japonicae 300 g; Fructus Forsythiae 250 g; Fructus Arctii (stir-baked) 250 g; Herba Taraxaci 300 g; Radix Scutellariae 300 g; Radix Saposhnikoviae 150 g; Folium Perillae 150 g; Spica Schizonepetae 100 g; Radix Puerariae Lobatae 150 g; Calculus Bovis Artifactus 1 g.

Procedure Distil volatile oil from Fructus Forsythiae, Folium Perillae and Spica Schizonepetae, collect the distilled aqueous solution in a separate container. Decoct Flos Lonicerae Japonicae, Fructus Arctii, Herba Taraxaci, Radix Scutellariae, Radix Saposhnikoviae and Radix Puerariae Lobatae with water twice, 2. 5 hours for the first time and 1. 5 hours for the second, filter. Combine the filtrate with the above aqueous solution and concentrate to a thick extract with a relative density of 1. 32-1. 35 (50℃). Make granules with 1 portion of the thick extract, 4 portions of powdered sucrose, 1 portion of dextrin, Calculus Bovis Artifactus and a quantity of ethanol, and dry. Add the above volatile oil and mix well.

Description Yellowish-brown granules; taste, sweet and slightly bitter.

Identification (1) Triturate 15 g of the granules to fine powder, add 40 ml of methanol, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 40 ml of water, extract with two 20-ml quantities of ether, discard the ether extracts, extract the water solution with two 25-ml quantities of ethyl acetate, combine the ethyl extracts, evaporate to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Dissolve chlorogenic acid CRS in methanol to produce a solution containing 0. 2 mg per ml as reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide film as the coating substance and acetic acid as the mobile phase. Apply separately 5 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) To 0. 5 g of Fructus Arctii reference drug, add 20 ml of ethanol, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness, and dissolve the residue in 2 ml of methanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (40 : 10 : 1) as the mobile phase. Apply separately 5 μl of the test solution obtained under Identification (1) and above the reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with 10% sulphuric acid in ethanol, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(3) Triturate 10 g to fine powder, add 20 ml of methanol, ultrasonicate for 10 minutes, filter and evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of the mixture of ethyl acetate, butanone, formic acid and water (10 : 7 : 5 : 3) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and spray with 1% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(4) Triturate 10 g of the granules to fine powder, add 30 ml of ethyl acetate, ultrasonicate for 20 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve puerarin CRS in methanol to produce a solution containing 0. 5 mg per ml as reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of chloroform, methanol and water (28 : 10 : 1) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and glacial acetic acid (50 : 50 : 1) as the mobile phase. As detector a spectrophotometer set at 277 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of baicalin.

Reference solution Dissolve a quantity of baicalin CRS, weigh accurately, in methanol to produce a solution containing 60 μg per ml.

Test solution Triturate the granules obtained under the test of packing variation to fine powder, weigh accurately 0. 8 g of the powder to a 50 ml of volumetric flask, add 40 ml of 70% ethanol, ultrasonicate (power, 250 W; frequency, 40 kHz) for 20 minutes, allow to cool, add 70% ethanol to volume, mix well, allow to stand, and use the supernatant as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 27 mg of baicalin ($C_{21}H_{18}O_{11}$) per pack, referred to Radix Scutellariae.

Action To disseminate *lung-qi* to release the exterior, and clear *heat* to relieve *toxicity*.

Indications Common cold in children due to affliction from external *wind-heat* with manifestations of fever, aversion to wind, headache, coughing, stuffy and running nose, painful and itching throat.

Usage and dosage Taken after dissolved in boiled water; 4 g, for children of 1-2 years of age, twice a day; 4 g, for 3-5 years of age, 2-3 times a day; 8 g, for 6-14 years of age, 2-3 times a day.

Strength 8 g per pack

Storage Preserve in tightly closed containers.

Xiao'er Jindan Pian (小儿金丹片)

Xiao'er Jindan Tablets

Ingredients Cinnabaris 80 g; Exocarpium Citri Rubrum 40 g; Bulbus Fritillariae Cirrhosae 40 g; Arisaema cum Bile 30 g; Radix Peucedani 30 g; Radix Scrophulariae 30 g; Rhizoma Pinelliae (processed with alum) 30 g; Folium Isatidis 30 g; Caulis Aristolochiae Manshuriensis 30 g; Radix Platycodonis 30 g; Spica Schizonepetae 30 g; Rhizoma et Radix Notopterygii 30 g; Cacumen Tamaricis 30 g; Radix Rehmanniae 30 g; Fructus Aurantii (stir-baked) 30 g; Radix Paeoniae Rubra 30 g; Ramulus Uncariae cum Uncis 30 g; Radix Puerariae Lobatae 20 g; Fructus Arctii 20 g; Rhizoma Gastrodiae 20 g; Radix et Rhizoma Glycirrhizae 20 g; Radix Saposhnikoviae 20 g; Borneolum Syntheticum 10 g; Pulvis Cornus Bubali Concentratus 10 g; Pulvis Cornu Saigae Tataricae 5 g; Mentholum 0.1 g.

Procedure Pulverize Borneolum Syntheticum to fine powder. Levigate Cinnabaris to very fine powder. Pulverize Bulbus Fritillariae Cirrhosae, Rhizoma Gastrodiae and Arisaema cum Bile to fine powder, triturate with Pulvis Cornus Bubali Concentratus, Pulvis Cornu Saigae Tataricae and Cinnabaris powder, sift and mix thoroughly. Distill volatile oil from Exocarpium Citri Rubrum, Spica Schizonepetae, Rhizoma et Radix Notopterygii and Radix Peucedani. Decoct the drug residue and the other fourteen ingredients with water twice, 3 hours for the first time and 2 hours for the second time; combine the decoctions, filter and concentrate to a thick extract. Add the above powder and a quantity of excipient to the extract, mix thoroughly, dry, pulverize to fine powder and sift. Make granules, dry, add Borneolum Syntheticum, Mentholum and the volatile oil, mix well and press into tablets.

Description Dark-red tablets; odour, pungent; taste, bitter.

Identification Pulverize 4 tablets to fine powder, triturate the powder with 10 ml of ether, filter and evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of ethanol as the test solution. Dissolve a mixture of (±)-borneol and (±)-isoborneol CRS in ethanol to produce a mixture containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃), benzene and ethyl acetate (9∶4∶2)as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% phosphomolybdic acid in ethanol, and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Triturate the tablets obtained under the test of weight variation to fine powder, weigh accurately 0.5 g of the fine powder to a conical flask. Heat with 25 ml of sulfuric acid and 2 g of potassium nitrate until become milky-white. Allow to cool, add 50 ml of water, add dropwise a 1% solution of potassium permanganate until a pink colour is produced, and then add dropwise a 2% solution of ferrous sulfate until the pink colour disappears. Add 2 ml of ferric ammonium sulfate IS, titrate with 0.1 mol/L ammonium thiocyanate VS. Each ml of 0.1 mol/L ammonium thiocyanate VS is equivalent to 11.63 mg of HgS.
It contains not less than 32 mg and not more than 39 mg of mercuric sulfide (HgS) for small tablet; not less than 48 mg and not more than 58 mg for big tablet, refered to Cinnabaris.

Action To expel *wind* and resolve phlegm, and clear *heat* to relieve *toxicity*.

Indications Common cold due to affliction from external *wind-heat* and excessive internal *phlegm-fire* with manifestations of fever, headache, coughing, dyspnea, swollen painful throat, vomiting, and convulsion due to high fever.

Usage and dosage 0.6 g, for children of one year of age, 3 times a day; appropriate reduction of the dosage for infants under 1 year of age.

Strength (1) 0.2 g per tablet (2) 0.3 g per tablet

Storage preserve in tightly closed containers.

Xiao'er Jingfeng San (小儿惊风散)

Xiao'er Jingfeng Powder

Ingredients Scorpio 130 g; Bombyx Batryticatus (stir-baked) 224 g; Realgar 40 g; Cinnabaris 60 g; Radix et Rhizoma Glycyrrhizae 60 g.

Procedure Levigate separately Realgar and Cinnabaris to very fine powder. Pulverize the other three ingredients to fine powder. Triturate the above powders. sift and mix well.

Description An orange-yellow or brownish-yellow powder; odour, characteristic; taste, sweet and salty.

Identification (1) Microscopical: Fragments of body walls pale yellow to yellow, with reticulate striations and rounded alveoli, sometimes showing brown setae. Fragments of body walls colourless, with very fine hyphae. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Irregular minute granules dark brownish-red, lustrous, with dark black edge. Irregular fragments golden yellow or orange, lustrous.
(2) Dissolve 1 g in 5 ml of a mixture of hydrochloric acid and nitric acid (3∶1) by heating on a water bath and evaporate to dryness. Dissolve the residue in 10 ml of water and filter.

To 2 ml of the filtrate add several drops of stannous chloride TS, a white precipitate is produced and the precipitate turns rapidly greyish-black. To another 2 ml of the filtrate add several drops of potassium iodide TS; a vermillion precipitate is produced, the precipitate can be dissolved in an excess of potassium iodide TS.

(3) Heat 0.2 g in a crucible until a white fume is produced, and cover with a slide, a white condensate is produced. Place the slide in a beaker and dissolve the condensate in 10 ml of water by heating. To 5 ml of the solution add several drops of hydrogen sulfide TS, a yellow colour is produced, and a yellow flocculent precipitate is produced on adding dilute hydrochloric acid. The precipitate is dissolved on adding ammonium carbonate TS.

(4) Moisten 0.2 g with water and dissolve in 2 ml of nitric acid solution saturated with potassium chlorate, add a 10% solution of barium chloride; a white precipitate is produced, the precipitate is insoluble in water.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Action To relieve convulsion and extinguish *wind*.

Indications Child convulsion and coma.

Usage and dosage 1.5 g, twice a day for children of 1 year of age; appropriate reduction of the dosage for children under 1 year of age.

Strength 1.5 g per pack

Storage Preserve in tightly closed containers.

Xiao'er Kechuan Keli
(小儿咳喘颗粒)

Xiao'er Kechuan Granules

Ingredients Herba Ephedrae 90 g; Bulbus Fritillariae Cirrhosae 90 g; Semen Armeniacae Amarum (stir-baked) 150 g; Radix Scutellariae 150 g; Concretio Silicea Bambusae 150 g; Fructus Perillae (stir-baked) 180 g; Bombyx Batryticatus (stir-baked) 180 g; Fructus Crataegi (stir-baked) 180 g; Semen Raphani (stir-baked) 180 g; Gypsum Fibrosum 300 g; Herba Houttuyniae 360 g; Radix et Rhizoma Asari 15 g; Tea 15 g; Radix et Rhizoma Glycyrrhizae 90 g; Radix Platycodi 150 g.

Procedure Pulverize Bulbus Fritillariae Cirrhosae to fine powder. Extract the volatile oil of Radix et Rhizoma Asari and Herba Houttuyniae and keep the aqueous solution after distillation for later use. Decoct the residue and the other twelve ingredients twice, each for 1.5 hours, combine the decoctions, filter, combine the filtrates and the above remaining aqueous solution, and concentrate to a thick extract with a relative density of 1.38-1.40 (85℃). To the extract add quantities of sucrose and dextrin, as well as the fine powder of Bulbus Fritillariae Cirrhosae, mix well, make into granules and dry. To the granules add by spraying the volatile oils of Radix et Rhizoma Asari and Herba Houttuyniae, mix well, and make to 1000 gram.

Description Yellowish-brown to brown granules; odour, with slightly cool feeling; taste, sweet and slightly bitter.

Identification (1) Microscopical: Starch granules broad ovoid or in shell-like shape, 40-64 μm in diameter, hila in short-cleft, V-shaped or U-shaped, striations visible.

(2) Dissolve 6 g, in fine powder, with 30 ml of hot water, filter, allow to cool, add 3 ml of concentrated ammonia TS, shake well, extract with 60 ml of ether by shaking, separate the ether layer, expel the ether, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve ephedrin hydrochloride CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and concentrated ammonia (5 : 1 : 0.1), by standing under 10℃, as the mobile phase. Apply separately to the plate 10 μl of each of the test solution and the reference solution. After developing and removal of the plate, spray with 0.5% ninhydrin in ethanol, heat at 105℃ to the spot clear. The spot in chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Ultrasonicate 3 g with 30 ml of methanol for 30 minutes, allow to cool, filter, concentrate the filtrate to about 5 ml, and use it as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide membrane as the coating substance and acetic acid as the mobile phase. Apply separately to the plate 1 μl of each of the test solution and the reference solution. After developing and removal of the plate, examine under ultraviolet light at 365 nm. A fluorescent spot in chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatography system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (1 : 1) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of ephedrin hydrochloride.

Reference solution Dissolve 12.5 mg of ephedrin hydrochloride CRS, weighed accurately, in a 100 ml volumetric flask, dilute to volume with water, and shake well. Transfer accurately 5 ml to a 100 ml volumetric flask, dilute to volume with water, and shake well. Transfer accurately 10 ml to a 25 ml volumetric flask, add 1 ml of periodic acid (0.25 g → 10 ml) and 2.5 ml of 0.25 mol/L sodium hydroxide, shake well, allow to stand for 30 minutes, adjust to pH 7 with 0.5 mol/L hydrochloric acid, add methanol to volume, shake well, and use it as the reference solution (containing 2.5 μg of ephedrin hydrochloride per ml).

Test solution Grind the granules, obtained under the test of packing variation, into fine powder, weigh accurately 2 g, add 120 ml of 5 mol/L sodium hydroxide, and shake well. Add 7.5 g of sodium chloride, ultrasonicate (power, 250 W; frequency, 33 kHz) for 10 minutes, distill, collect nearly 95 ml of the distillate with a 100 ml volumetric flask, containing 5 ml of 0.5 mol/L hydrochloric acid, add water to volume, and shake well. Transfer accurately 10 ml to a 25 ml volumetric flask, carry out the Procedure as described under reference solution, beginning at the words "add 1 ml of periodic acid" to "add methanol to volume", shake well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, repectively, and calculate the content.

It contains not less than 1.2 mg of ephedrin hydrochloride ($C_{10}H_{15}NO \cdot HCl$) per pack, referred to Herba Ephedrae.

Action To clear *heat* and disseminate *lung-qi*, resolve phlegm and check coughing, and send *qi* downward to relieve asthma.

Indications Coughing, fever, excessive phlegm and asthma due to *phlegm-heat* accumulation in the *lung*.

Usage and dosage Taken with warm bolied water, 2-3 g under 1 year old, 3-6 g between 1-5 years old, 9-12 g over 6 years old, 3 times a day.

Strength 6 g per pack

Storage Preserve in tightly closed containers.

Xiao'er Qingre Pian (小儿清热片)

Xiao'er Qingre Tablets

Ingredients Cortex Phellodendri Chinensis 117.6 g; Medulla Junci 23.5 g; Fructus Gardeniae 117.6 g; Ramulus Uncariae cum Uncis 47 g; Realgar 47 g; Rhizoma Coptidis 70.6 g; Cinnabaris 23.5 g; Radix et Rhizoma Gentianae 47 g; Radix Scutellariae 117.6 g; Radix et Rhizoma Rhei 47 g; Oleum Menthae Dementholatum 0.47 g.

Procedure Levigate respectively Cinnabaris and Realgar to very fine powder; pulverize Rhizoma Coptidis and Radix et Rhizoma Rhei to fine powder; percolate Cortex Phellodendri Chinensis and Radix Gentianae with 70% ethanol, collect the percolation, recover ethanol and concentrate to a thick extract; decoct the other four ingredients except Oleum Menthae Dementholatum with water twice, 2 hours for each time, combine the decoctions, filter and concentrate the filtrate to a thick extract. Mix the above two thick extracts and the fine powders, dry, pulverize, make granules and dry. Add Oleum Menthae Dementholatum, press into 1000 tablets and coat with sugar.

Description Sugar coated tablets with brownish-yellow core; odour, characteristic; taste, bitter.

Identification (1) Microscopical: Fibre bundles bright yellow, walls slightly thickened, with distinct pits. Irregular pieces golden yellow or orange-yellow, lustrous. Irregular fine granules dark brownish-red, lustrous, with dark black edges. Clusters of calcium oxalate large, 60-140 μm in diameter.

(2) Pulverize 8 tablets with coating removed to fine powder, apply to a column (1.5-2 cm in internal diameter) packed with neutral aluminium oxide (200-300 mesh, 5 g, dry-method packing), elute with 50 ml of dehydrated ethanol and evaporate the eluate to dryness. Dissolve the residue in 2 ml of ethanol to produce a solution as the test solution. To 0.5 g of Rhizoma Coptidis reference drug add 5 ml of methanol, ultrasonicate for 15 minutes, filter and dilute the filtrate with 5 ml of methanol to produce a solution as the reference drug solution. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing about 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately 1 μl of each of the three solutions to the plate. After developing in a chamber pre-equilibrated with ammonia vapour and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and with the reference solution.

(3) Pulverize 8 tablets with coating removed to fine powder, add 30 ml of methanol, heat under reflux for 1 hour, filter, evaporate 10 ml of the filtrate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve geniposide CRS in ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of ethyl acetate, acetone, formic acid and water (5 : 5 : 1 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 10% solution of sulphuric acid in ethanol, and heat at 105℃ for about 10 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Pulverize 5 tablets with coating removed to fine powder, add 10 ml of methanol, ultrasonicate for 15 minutes, allow to cool, filter, evaporate the filtrate to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G mixed with sodium carboxymethylcellulose containing 4% solution of sodium acetate as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately 2 μl of the test solution and 5 μl of the reference solution to the plate. After developing in the chamber pre-equilibrated for 30 minutes and removal of the plate, dry in air, spray with 1% solution of ferric chloride in ethanol. The dark green spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(5) Pulverize 5 tablets with coating removed to fine powder, add 10 ml of methanol, ultrasonicate for 15 minutes, allow to cool, filter evaporate the filtrate to dryness, dissolve the residue in 10 ml of water, add 1 ml of hydrochloric acid, heat under reflux on a water bath for 30 minutes, allow to cool immediately, extract with ether for 2 times, 20 ml for each time, combine the ether extracts, recover the ether, and dissolve the residue in 2 ml of methanol as the test solution. Prepare a solution of 0.1 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 4 μl of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The five orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Examine in daylight, the colour of the spots turn to red on exposure to ammonia vapour.

Other requirements Comply with the general requirements for tablets (Appendix I D).

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (25 : 75) as the mobile

phase. As detector a spectrophotometer set at 238 nm. The number of theoretical plates of the column is not less than 1500, calculated with the reference to the peak of geniposide.

Reference solution Disslove a quantity of geniposide CRS, weigh accurately, in methanol to produce a solution containing 50 μg per ml.

Test solution To 20 tablets with coating removed, weigh accurately, pulverize to fine powder, weigh accurately 0.5 g of the powder, add accurately 50 ml of methanol, ultrasonicate (power, 300 W; frequency, 50 kHz) for 30 minutes, allow to cool, weigh again, replenish the lost weight with methanol, mix well, and filter. Measure accurately 10 ml of the successive filtrate to a 25 ml of volumetric flask, dilute with methanol to the volume, and mix well.

Procedure Inject accurately 10 μl of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 1.5 mg of geniposide ($C_{17}H_{24}O_{10}$) per tablet, referred to Fructus Gardeniae.

Action To clear *heat* and *toxicity*, and expel *wind* and relieve convulsion.

Indications Irritability, convulsion, fever, aphtha with concentrated urine and constipation due to attack by *wind-heat* in children.

Usage and dosage 2-3 tablets, 1-2 times a day; appropriate reduction of the dosage for children under 1 year of age.

Storage Preserve in tightly closed containers.

Xiao'er Qingre Zhike Koufuye (小儿清热止咳口服液)

Xiao'er Qingre Zhike Mixture

Ingredients Herba Ephedrae 90 g; Semen Armeniacae Amarum (stir-baked) 120 g; Gypsum Fibrosum 270 g; Radix et Rhizoma Glycirrhizae 90 g; Radix Scutellariae 180 g; Radix Isatidis 180 g; Rhizoma Menispermi 90 g.

Procedure Decoct previously Herba Ephedrae and Gypsum Fibrosum with water for 30 minutes, then add the other five ingredients, decoct 2 times, 2 hours for the first time and 1 hour for the second. Combine the decoctions, filter, concentrate the filtrate in vacuum to about 600ml, allow to stand for 24 hours and filter. Add 200 g of honey, 100 g of sucrose and 3 g of sodium benzoate to the filtrate, boil to dissolve, add water to a total volume of 1000 ml and stir well. Refrigerate for 24-48 hours, filter, pack, seal and sterilize.

Description A brownish-yellow liquid, taste, sweet and slightly bitter.

Identification (1) To 20 ml add 1 ml of concentrated ammonia TS, extract with two 20-ml quantities of ether. Combine the extracts, add 1 ml of a solution of hydrochloric acid in ethanol (1→20), mix well and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve ephedrine hydrochloride CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and concentrated ammonia TS (20 : 3.5 : 0.5) as the mobile phase. Apply separately each of the two solutions. to the plate 10 μl After developing and removal of the plate, dry in air, spray with ninhydrin TS and heat at 105℃ for about 10 minutes. The red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) To 20 ml add 3 ml of hydrochloric acid and 30 ml of chloroform, heat under reflux for 1 hour, allow to cool, filter, evaporate the chloroform extract to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve glycyrrhetinic acid CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of n-hexane, ethyl acetate, acetone and formic acid (10 : 2 : 4 : 0.1) as the mobile phase. Apply separately 5 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 10% solution of phosphomolybdic acid, and heat at 105℃ to the spot clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) To 2 ml adds 8 ml of ethanol, mix well, allow to stand, and use the supernatant as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately 3 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 1% solution of ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Relative density Not less than 1.04 (Appendix Ⅶ A).

pH value 3.5-5.5 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% solution of phosphoric acid containing 0.1% solution of triethylamine (3 : 97) as the mobile phase. As detector a spectrophotometer set at 205 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of ephedrine hydrochloride.

Reference solution Dissolve a quantity of ephedrine hydrochloride CRS, weigh accurately, in 0.1 mol/L solution of hydrochloric acid to produce a solution containing 45 μg per ml.

Test solution Measure accurately 5 ml, add 10 ml of water and 0.5 ml of concentrated ammonia TS, extract with 30, 30, 20, 20 and 20 ml quantities of ether, combine the ether extracts, add 2 ml of a mixture of hydrochloric acid and ethanol (1 : 20), mix well, recover the solvents to dryness at low temperature, dissolve the residue in 5 ml of ethanol to a 25 ml of volumetric flask, dilute with 0.1 mol/L solution of hydrochloric acid to the volume, and mix well.

Procedure Inject accurately 10 μl of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 0.15 mg of ephedrine hydrochloride

($C_{10}H_{15}NO \cdot HCl$) per ml, referred to Herba Ephedrae.

Action To clear *heat* and disseminate the lung, relieve dyspnea, and ease the throat.

Indications Fever, aversion to cold, coughing with expectoration of yellow phlegm, shortness of breath, dry mouth, hoarseness and swollen painful throat in children due to affliction from external *wind-heat* and abundant internal toxic materials.

Usage and dosage 3-5 ml, for children of 1-2 years of age, 5-10 ml, for 3-5 years of age and 10-15 ml, for 6-14 years of age, 3 times a day, taken after shaked well.

Strength 10 ml per phial

Storage Preserve in tightly closed containers.

Xiao'er Resuqing Koufuye (小儿热速清口服液)

Xiao'er Resuqing Mixture

Ingredients Radix Bupleuri; Radix Scutellariae; Radix Isatidis; Radix Puerariae Lobatae; Flos Lonicerae Japonicae; Cornus Bubali; Fructus Forsythiae; Radix et Rhizoma Rhei.

Procedure Distil volatile oil from Radix Bupleuri, Flos Lonicerae Japonicae and Fructus Forsythiae, collect the volatile oil and keep respectively the aqueous solution and the drug residue. Decoct previously Cornu Bubali with water for 3 hours, then decoct with the above drug residue and other four ingredients twice, 1 hour for each time respectively. Filter the combined decoctions, combine the filtrate with the above aqueous solution, concentrate to a quantity, add ethanol to a content of 65% of ethanol and stir well. Recover ethanol from the supernatant, concentrate to a thick extract with a relative density of 1.10-1.15 (90-95℃), cool, mix with the volatile oil and a quantity of corrective, adjust the pH of the extracte to a regulated value. Add water to a volume of 1000 ml, stir well, allow to stand, filter, pack and sterilize.

Description A reddish-brown clear liquid; odour, aromatic; taste, sweet and slightly bitter.

Identification (1) Evaporate 30 ml to almost dryness, triturate well with 10 g of kieselguhr, ultrasonicate with 50 ml of ethyl acetate for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol to produce a solution as the test solution. Dissolve puerarin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (7 : 2.5 : 0.25) as the mobile phase. Apply separately 3 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) Extract 20 ml of the liquid with two 15-ml quantities of ether, concentrate the combined extract to about 1 ml as the test solution. To 0.2 g of Radix et Rhizoma Rhei reference drug add 10 ml of ether, shake for 20 minutes, filter and concentrate the filtrate to about 1 ml as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate and formic acid (7.5 : 2.4 : 0.1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(3) To a quantity of the liquid, test according to the method of Assay, the retention time of the peaks obtained with the test solution and the reference solution is concordant with each other.

Relative density Not less than 1.08 (Appendix Ⅶ A).

pH value 4.5-7.0 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for mixtures, (Appendix Ⅰ J).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (47 : 53 : 0.2) as the mobile phase. As detector a spectrophotometer set at 276 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of baicalin.

Reference solution Dissolve about 10 mg of baicalin CRS, weighed accurately, in a quantity of 50% methanol in a 200 ml volumetric flask by heating on a warm water bath with shaking, allow to cool, dilute with 50% methanol to volume, and mix well (containing 50 μg of baicalin per ml).

Test solution Carry out the method for column chromatography (Appendix Ⅵ C), apply accurately 0.5 ml to a column (1.5 cm in internal diameter, 10 cm long), packed with macroporous resin D_{101}, wash with 70 ml of water, then elute with 40% ethanol at flow rate of 1.5 ml per minute, discard 7-9 ml of the initial eluate, collect the successive eluate in a 50 ml volumetric flask to volume and mix well.

Procedure Accurately inject 5 μl of the reference solution and 10 μl of the test solution, respectively, into the column and calculate the content.
It contains not less than 2.2 mg of baicalin ($C_{21}H_{18}O_{11}$) per ml, referred to Radix Scutellariae.

Action To clear *heat* to relieve *toxicity*, and purge *fire* to ease the throat.

Indications Common cold in children due to affliction from external *wind-heat* with manifestations of high fever, headache, swollen painful throat, stuffy nose and running nose, coughing and dry stools.

Usage and dosage 2.5-5.0 ml, for children under 1 year of age, 5-10 ml, for 1-3 years of age, 10-15 ml, for 3-7 years of age, 15-20 ml, for 7-12 years of age; 3-4 times a day.

Precaution In serious condition or no effect seen taking it for 24 hours increase the dosage appropriately.

Strength 10 ml per phial

Storage Tightly closed, protected from light.

Xiao'er Zhibao Wan (小儿至宝丸)

Xiao'er Zhibao Pills

Ingredients Folium Perillae 50 g; Herba Pogostemonis 50

g; Herba Menthae 50 g; Rhizoma et Radix Notopterygii 50 g; Pericarpium Citri Reticulatae 50 g; Rhizoma Typhonii (processed) 50 g; Arisaema cum Bile 50 g; Semen Sinapis Albae (stir-baked) 30 g; Bulbus Fritillariae Cirrhosae 50 g; Semen Arecae 50 g; Fructus Crataegi (stir-baked) 50 g; Poria 200 g; Massa Medicata Fermentata (stir-baked) 200 g; Fructus Hordei Germinatus (stir-baked) 50 g; Succinum 30 g; Borneolum Syntheticum 4 g; Rhizoma Gastrodiae 50 g; Ramulus Uncariae cum Uncis 50 g; Bombyx Batryticatus (stir-baked) 50 g; Periostracum Cicadae 50 g; Scorpio 50 g; Calculus Bovis Artifactus 6 g; Realgar 50 g; Talcum 50 g; Cinnabaris 10 g.

Procedure Levigate separately Realgar and Cinnabaris to very fine powder. Pulverize the other twenty one ingredients, except Calculus Bovis Artifactus and Borneolum Syntheticum, to fine powder. Triturate Calculus Bovis Artifactus and Borneolum Syntheticum with all the above powders, sift and mix thoroughly. To each 100 g of the powder add 110-140 g of refined honey to make big honeyed pills.

Description Orange-yellow to brownish-yellow big honeyed pills; odour, slightly aromatic; taste, slightly bitter, pungent and cool.

Identification (1) Microscopical: Starch granules broad ovoid or conchoidal, 40-64 μm in diameter, hila short slit shaped, V-shaped or U-shaped, and striated. Irregular branched masses colourless, dissolved in chloral hydrate solution, hyphae colourless or pale brown, 4-6 μm in diameter. Mesophyll containing minute clusters of calcium oxalate, 4-8 μm in diameter. Fine needle crystals of calcium oxalate scattered in mesophyll. Needle crystals of calcium oxalate in bundles or isolated, about 90 μm in length. Prisms of calcium oxalate abundant in parenchyma. Sand crystals of calcium oxalate occurring in parenchymatous cells, sometimes crystal cells connected in rows. Vittae containing brownish-yellow secretion, about 100 μm in diameter. Fragments of chitin shell yellowish-brown, translucent, densely covered with papillose or short-spiny protrudings. Stone cells of pericarp purplish-red, red or yellowish-brown, subrounded or polygonal, about 125 μm in diameter. Epidermal cells often arranged in a longitudinal row with one long cell and two short cells connected alternatively, the long cells with thickened, sinuous and lignified walls. Fragments of endosperm colourless, with relatively thickened walls and numerous large subrounded pits. Palisade cells of testa small, polygonal, with walls thickened in surface view, and subrectangular with thickened lateral and internal walls in lateral view. Fragments of body walls colourless, with very fine hyphae. Fragments of body walls pale yellow or yellow, with reticulate striations and rounded alveoli, sometimes brown setae visible. Irregular fragments golden yellow or orange, lustrous. Irregular minute granules brownish-red and lustrous, with dark black edge.

(2) Triturate well 4.5 g of the pills, cut into pieces, with 2 g of kieselguhr, macerate in 15 ml of ether for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of chloroform to produce a mixture as the test solution. Dissolve a mixture of (±)-borneol and (±)-isoborneol CRS in petroleum ether (60-90℃) to produce mixture containing 5 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, chloroform and ethyl acetate (9 : 1 : 2) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 1% vanillin in sulfuric acid and heat at 105℃ for 3 minutes. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtaind with the reference solution.

(3) To 0.5 g of Rhizoma et Radix Notopterygii reference drug add 5 ml of ether, macerate for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of chloroform to produce a mixture as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and *n*-hexane and ethyl acetate (4 : 1) as the mobile phase. Apply separately 5 μl of the test solution obtained in the test for Identification (2) and 2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air and spray with sulfuric acid. The black spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To subside *wind* to relieve convulsion, and resolve *phlegm* and remove retained undigested food.

Indications Common cold in children due to *wind-cold* with manifestations of no desire for food or milk, high fever, stuffy nose, coughing with expectoration of profuse phlegm, vomiting and diarrhea.

Usage and dosage 1 pill, 2-3 times a day.

Strength 1.5 g per pill

Storage Preserve in tightly closed containers.

Xiaohuoluo Wan
(小活络丸)

Xiaohuoluo Pills

Ingredients Arisaema cum Bile 180 g; Radix Aconiti Praeparata 180 g; Radix Aconiti Kusnezoffii Praeparata 180 g; Pheretima 180 g; Olibanum (processed) 66 g; Myrrha (processed) 66 g.

Procedure Pulverize the above six ingredients to fine powder, sift and mix thoroughly. To each 100 g of the powder add 120-130 g of refined honey to make big honeyed pills.

Description Blackish-brown to black big honeyed pills; odour, stinking; taste, bitter.

Identification Microscopical: Irregular masses colourless or pale yellow, diffused with plenty of minute granules on the surface and around, dissolved on long standing. Stone cells rectangular or subsquare, with slightly thickened walls. Needle Crystals of calcium oxalate in bundles or scattered, about 90 μm long.

Limit test for aconitine To 14 g of the big honeyed pills, cut into pieces, add 10 g of kieseghul, mix well, macerate with 10 ml of concentrated ammonia TS, allow to stand for 2 hours, add 50 ml of ether, shake frequently, allow to stand for 24 hours, mix well, filter, wash the drug residue with 20 ml of ether for several times, combine the washings and filtrate, extract with three 30-ml quantities of dilute hydrochloric acid, combine the acid solutions, adjust pH to 9 with concentrated ammonia TS, extract with three 30-ml quantities of ether, combine the ether extracts, dehydrate water with dehydrated sodium sulfate, filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Dissolve accurately

aconitine CRS in dehydrated ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxy methylcellulose as the coating substance and a mixture of benzene, ethyl acetate and diethylamine (14 : 4 : 1) as the mobile phase. Apply separately 12 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with diluted solution of potassium heptaiodobismuthate TS. The spots in the chromatogram obtained with the test solution are smaller or no in position and colour than the spots in chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To expel *wind* and *cold*, resolve *phlegm* and eliminate *dampness*, and promote blood circulation to kill pain.

Indications Obstruction of *qi* and blood with pain due to accumulation of *wind*, *cold* and *dampness*, and *phlegm* blocking meridians, with manifestations of pain, or cold pain, or pricking pain of the joints of limbs, or pain aggravated at night, immobilized joints, muscular numbness or contracture.

Usage and dosage 1 pill, twice a day, taken with yellow rice wine or warm boiled water.

Precaution Contraindicated for pregnant women.

Strength 3 g per pill

Storage Preserve in tightly closed containers.

Xiaojianzhong Heji (小建中合剂)

Xiaojianzhong Mixture

Ingredients Ramulus Cinnamomi 111 g; Radix Paeoniae Alba 222 g; Radix Et Rhizoma Glycyrrhizae Praeparata Cum Melle 74 g; Rhizoma Zingiberis Recens 111 g; Fructus Jujubae 111 g.

Procedure Distil volatile oil from Ramulus Cinnamomi and collect the aqueous solution after distillation in another container. Decoct the drug residue, Radix Et Rhizoma Glycyrrhizae Praeparata Cum Melle and Fructus Jujubae with water 2 times, 2 hours for each time, combine the decoctions and filter. Combine the filtrate with the above aqueous solution and concentrate to about 560 ml. Carry out the method for percolation as directed under Liquid Extracts and Extracts (Appendix Ⅰ O), macerate Radix Paeoniae Alba and Rhizoma Zingiberis Recens for 24 hours and percolate, using 50% ethanol as solvent. Collect the percolate, recover ethanol and mix with the above concentrated decoction. Allow it to stand, filter, add 370 g of maltose and concentrate to about 1000 ml. To the solution add 3 g of sodium benzoate, the volatile oil and a quantity of water to a volume of 1000 ml and stir well.

Description A brownish-yellow liquid; odour, slightly aromatic; taste, sweet and slightly pungent.

Identification (1) Extract 20 ml with three 15-ml quantities of ether, keep the aqueous solution for further use, combine the extracts and evaporate to dryness. Dissolve the residue in 0.5 ml of ethyl acetate to produce a solution as the test solution. Dissolve cinnamaldehyde CRS in ethanol to produce a solution containing about 1 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (17 : 3) as the mobile phase. Apply separately 10 μl of the test solution and 1-2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air and spray with alcoholic dinitrophenylhydrazine TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Extract the aqueous solution, obtained under the test for Identification (1), with two 15-ml quantities of *n*-butanol, wash the combined extracts with 10 ml of water, discard the washing and evaporate the *n*-butanol extracts to dryness. Dissolve the residue in 1 ml of methanol to produce a solution as the test solution. Dissolve paeoniflorin CRS in methanol to produce a solution containing about 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, ethyl acetate, methanol and concentrated ammonia TS (8 : 1 : 4 : 1) as the mobile phase. Apply separately 2-3 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with a 5% solution of vanillin in sulfuric acid and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) To 0.5 g of Radix Glycyrrhizae reference drug add 10 ml of water, heat under reflux for 30 minutes and filter. Treat the filtrate in the same manner as for preparation of the test solution in the test for Identification (2) to produce a mixture as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 1% solution of sodium hydroxide as the coating substance and a mixture of ethyl acetate, formic acid, glacial acetic acid and water (15 : 1 : 1 : 2) as the mobile phase. Apply separately 1-2 μl of each of the test solution obtained in the test for Identification (2) and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Relative density Not less than 1.10 (Appendix Ⅶ A).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.3% solution of phosphoric acid (25 : 75) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 1500, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, weigh accurately, in 70% ethanol to produce a solution containing 60 μg per ml.

Test solution Measure accurately 5 ml of the mixture to a 100 ml of volumetric flask, dilute with 70% ethanol to volume, mix well, centrifuge, and use the supernatant as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 5-20 μl of the test solution into the column, and calculate the content.
It contains not less than 0.60 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per ml, referred to Radix Paeoniae Alba.

Action To warm and reinforce the *middle-energizer*, and relieve contracture to kill pain.

Indications Cold in the spleen and stomach in a deficiency syndrome, pain of the stomach and abdomen, alleviated by warmth and pressure, stomach discomfort and casting up of gastric acid, poor appetite; gastroduodenitis with above symptoms.

Usage and dosage 20-30 ml, 3 times a day, shaked before use.

Storage Tightly closed, protected from light.

Xiaojianzhong Keli
(小建中颗粒)

Xiaojianzhong Granules

Ingredients Radix Paeoniae Alba 400 g; Fructus Jujubae 200 g; Ramulus Cinnamomi 200 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 133 g; Rhizoma Zingiberis Recens 200 g.

Procedure Distill volatile oil from Ramulus Cinnamomi and Rhizoma Zingiberis Recens, and keep the aqueous liquid of distillation for later use. Decoct the residue and the other three ingredients with water thrice, each for 1 hour, combine the decoctions and filter. Combine the filtrate with the above distillation, concentrate to a thick extract with a relative density of 1.10-1.12 (65℃), add ethanol to a content of 50%, stir thoroughly, allow to stand for 6-8 hours, filter and recover ethanol, add a quantity of a mixture of sucrose and dextrin (4 : 1), make granules, dry, sift, add the above volatile oil, mix well, and make 1000 g granules.

Description Pale brown to brownish-yellow granules; odour, aromatic; taste, sweet.

Identification (1) Dissolve 30 g of the granules in 40 ml of water, add 45 ml of ether, ultrasonicate for 30 minutes, filter, keep the water layer for latter use. Evaporate the ether layer to dryness, dissolve the residue in 0.5 ml of ethyl acetate as the test solution. Dissolve cinnamaldehyde CRS in ethanol to produce a solution containing 1 μg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (17 : 3) as the mobile phase. Apply separately 15 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removing the plate, dry in air, and spray with dinitrophenylhydrazine in ethanol TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) Triturate well 15 g of the granules with 10 g of kieselguhr, add 60 ml of methanol, heat under reflux for 1 hour. Filter, concentrate the filtrate to about 2 ml, grind well with 2 g of neutral alumina oxide and dry. Apply to a column (1 cm in diameter) packed with neutral alumina oxide (100-200mesh, 1 g). Elute with 100 ml of methanol, collect the eluate and evaporate to dryness, and dissolve the residue in 1 ml of dehydrated ethanol as the test solution. To 0.5 g of Radix Paeoniae Alba reference drug, add 20 ml of methanol, carry out the procedure as described under the test solution, beginning at the words "heat under reflux for 1 hour", to produce a solution as the reference drug solution. Dissolve paeoniflorin CRS in methanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (13 : 6 : 2) as the mobile phase. Apply separately 3 μl of each of the test solution, the reference drug solution, and the reference solution to the plate. After developing and removing the plate, dry in air, spray with 5% solution of vanillin in sulfuric acid, and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution and the reference drug solution.
(3) To the water layer extracted with ether, obtained under the Identification (1), extract with two 20-ml quantities of n-butanol saturated with water. Combine the n-butanol extracts, wash with 10 ml of water saturated with n-butanol, separate the n-butanol layer and evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. To 0.5 g of Radix et Rhizoma Glycyrrhizae reference drug, add 10 ml of water, heat under reflux for 30 minutes, filter, prepare a solution with the filtrate in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, formic acid, glacial acetic acid and water (15 : 1 : 1 : 2) as the mobile phase. Apply separately 1-2 μl of each of the test solution and the reference drug solution to the plate. After developing and removing the plate, dry in air. Spray with 1% solution of sulfuric acid in ethanol, heat at 105℃ to the spots clear, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatography obtained with the test solutions correspond in position and colour to the spots in the chromatography obtained with the reference drug solution.

Other requirements Comply to the general requirements for medicine granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatography system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (17 : 83) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of paeoniflorin.

Reference solution Weigh accurately a quantity of paeoniflorin CRS, dissolve in dilute ethanol to produce a reference solution containing 40 μg per ml.

Test solution Pulverize the granules, obtained under the test of packing variation, to fine powder, weigh accurately about 0.25 g in a stoppered conical flask, add accurately 25 ml of dilute ethanol, stopper and weigh. Ultrasonicate (power, 300 W; frequency, 50 kHz) for 30 minutes, cool, weigh again, and replenish the lost weight with dilute ethanol. Mix well, allow to stand, filter the supernatant, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 15 μl of the test solution into the column, respectively, and calculate the content.
It contains not less than 25.0 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per pack, referred to Radix Paeoniae Alba.

Action To Warm and reinforce the *middle-energizer*, relieve contracture to kill pain.

Indications Cold in the spleen and stomach in a deficiency syndrome, pain of the stomach and abdomen, alleviated by warmth and pressure, stomach discomfort and casting up of gastric acid, poor appetite, palpitation; chronic colitis with alternative diarrhea and constipation, and gastroduodenitis with above symptoms.

Usage and dosage 15 g, 3 times a day.

Precaution Contraindicated for patients who have got an exterior syndrome which has not been cured yet, or patients with *damp-heat* in the spleen or with enteric hemorrhage.

Strength 15 g per pack

Storage Preserve in tightly closed containers.

Xiaojin Wan
(小金丸)

Xiaojin Pills

Ingredients Moschus 30 g; Semen Momordicae (removed from shell and oil) 150 g; Radix Aconiti Kusnezoffii Praeparata 150 g; Resina Liquidambaris 150 g; Olibanum (processed) 75 g; Myrrha (processed) 75 g; Faeces Trogopterori (stir-baked with vinegar) 150 g; Radix Angelicae Sinensis (stir-baked with wine) 75 g; Pheretima 150 g; Chinese Ink Cake 12 g.

Procedure Pulverize the above ingredients, except Moschus, to fine powder. Triturate Moschus with the above powder and sift. To each 100 g of the powder add 25 g of starch, mix well to make pills with the dilute paste prepared from 5 g of starch, and dry at a lower temperature.

Description Blackish-brown pasted pills; odour, aromatic, taste, slightly bitter.

Identification (1) Microscopical: Stone cells rectangular or subsquare, with slightly thickened walls. Cells of cotyledon rectangular or polygonal, containing aleurone grains and pieces of fatty oils. Parenchymatous cells fusiform, walls slightly thickened and with very fine oblique crisscross striations. Muscle fibres layered, colourless, or pale brown, sinuous, sometimes crisscross-arranged vertically.
(2) Triturate 5 g of the pills to fine powder, add 20 ml of ether, ultrasonicate for 20 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ethanol to produce a solution as the test solution. Prepare a solution of 1 g of Radix Angelicae Sinensis reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Limit test for aconitine Pulverize a quantity of the pills to fine powder, weigh 10 g of the powder to a conical flask, add 10 ml of ammonia TS, stir well, allow to stand for 2 hours add 120 ml of dehydrated ether, shake for 1 hour, allow to stand for 24 hour, filter. Extract the filtrate with 20, 15 and 15 ml of quantities of a mixture of hydrochloric acid and water (4 : 100), combine the acid solution, adjust pH 9-10 with concentrated ammonia TS, extract with two 20-ml quantities of dehydrated ether, combine the ether extracts recover the ether, and dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Dissolve aconitine CRS in dehydrated ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of benzene, ethyl acetate and diethylamine (7 : 2 : 0.5) as the mobile phase. Apply separately 15 μl of the test solution and 5 μl of the reference solution to the plate. After developing in the chamber pre-equilibriated for 2 hours and removal of the plate, dry in air, spray with diluted solution of potassium heptaiodobismuthate TS. The spots in the chromatogram obtained with the test solution are smaller or no in position and colour than the spots in chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A), except the disintegration test.

Action To dissipate nodulation to reduce swelling and resolve stagnant blood to kill pain.

Indications Scrofula, goiter, breast carcinoma and mammary nodules due to retention of *phlegm* with manifestations of one or several dermal or subcutaneous movable lumps when touched, or enlarged bones or joints with normal colour of the skin and hard painful swellings.

Usage and dosage 1.2-3 g, twice a day, taken after crushed; appropriate reduction of the dosage for children.

Precaution Contraindicated for pregnant women.

Strength (1) 3 g per 100 pills (2) 6 g per 100 pills (3) 6 g per 10 pills

Storage Tightly closed.

Xiaokeling Pian
(消渴灵片)

Xiaokeling Tablets

Ingredients Radix Rehmanniae 200 g; Fructus Schisandrae Chinensis 15 g; Radix Ophiopogonis 100 g; Cortex Moutan 15 g; Radix Astragali 100 g; Rhizoma Coptidis 10 g; Poria 17 g; Radix et Rhizoma Ginseng Rubra 10 g; Radix Trichosanthis 100 g; Gypsum Fibrosum 50 g; Fructus Lycii 100 g.

Procedure Pulverize Poria, Radix Trichosanthis, Gypsum Fibrosum, Radix and Rhizoma Ginseng Rubra, Rhizoma Coptidis and Cortex Moutan to fine powder. Decoct Radix Rehmanniae and other four ingredients with water twice, 3 hours for the first time, 2 hours for the second time, combine the decoctions, allow to stand for 12 hours, concentrate the supernatant in vacuum to a thin extract with a relative density of 1.36-1.38 (80℃), mix with the above powder, dry, pulverize to fine powder, mix well, make granules, dry and compress into 960 tablets.

Description Brown tablets; taste, bitter and sweet.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Stone cells yellowish-green, rectangular, elliptical, subsquare, polygonal or fusiform, 27-72 μm in diameter, walls relatively thickened, with fine and dense pit-canals. Woody fibre bright yellow, with slightly thickened walls and distinct pits. Irregular plate crystals colourless, with straight striations. Fragments of resin canals often visible, containing yellow

masses of secretion.
(2) Pulverize 5 tablets to the fine powder, add 10 ml of methanol, ultrasonicate for 15 minutes, filter and evaporate the filtrate to dryness, dissolve the residue in 2 ml of methanol to produce a solution as the test solution. Prepare a solution of 50 mg of Rhizoma Coptidis reference drug as the reference drug solution in the same manner. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately 1 μl of each of the three solutions to the plate. After developing in a chamber pre-equilibrated with ammonia vapour for 15 minutes and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluroscent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Action To replenish *qi* and nourish *yin*, clear *heat* and purge *fire*, and encourage production of body fluids to extinguish thirst.

Indications Diabetes due to a deficiency of *qi* and *yin* with manifestations of polydipsia, polyphagia, polyuria, emaciation, shortness of breath and lassitude; diabetes type Ⅱ and diabetes of the moderate type with above symptoms.

Usage and dosage 8 tablets, 3 times a day.

Precaution It is forbidden to prescribe to pregnant women, and avoid pungent and spicy foods.

Strength 0.36 g per tablet

Storage preserve in tightly closed containers.

Xiaomi shuan
消糜栓
Xiaomi Suppositories

Ingredients Ginsenosides 25 g; Radix Arnebiae 500 g; Cortex Phellodendri Chinensis 500 g; Radix Sophorae Flavescentis 500 g; Anhydrous Alumen 400 g. Borneolum Syntheticum 200 g; Catechu 500 g.

Procedure Pulverize Catechu and Anhydrous Alumen to fine powder, and Pulverize Borneolum Syntheticum to fine powder. Decoct Cortex Phellodendri Chinensis, Radix Sophorae Flavescentis and Radix Arnebiae with water for 3 times, 2 hours for the first time and 1 hour for the second and third times respectively. Combine the decoctions, filter, concentrate to form a thin extract with a relative density of 1.10 (80℃), add ethanol to a content of 75% ethanol, stand for 24 hours. Filter, recover the ethanol and concentrate to form a thick, extract with a relative density of 1.36 (80℃). Dry, pulverize to fine powder, mix with above powders and Ginsenosides powder. Heat a quantity of polyoxyethylene stearate and 22 g of glycerin to melt, mix at the temperature of 40℃ ± 2℃ with above power, pour into moulds, allow to cool and make 1000 suppositories.

Description Brown to dark brown suppositories; odour, characteristic.

Identification (1) Place 1 suppository in a stopper conical flask, heat to melt on a water bath at 90℃. Remove the flask, add 50 ml of ethyl acetate while hot, shake well and allow to cool. Stand for 20 minutes below 0℃, filter, Use the first filtrate as the test solution. Dissolve a quantity of a mixture of (±)-borneol and (±)-isoborneol CRS in ethyl acetate to prepare a solution containing 5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexene and ethyl acetate (17 : 3) as the mobile phase. Apply separately 2 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.
(2) Macerate 0.2 g of the catechu reference drug in 10 ml of methanol for 20 minutes, filter, use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and formic acid (20 : 5 : 2) as the mobile phase. Apply separately 2 μl of the test solution of Identification (1) and 2 μl of the above reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Other requirements Complies with the general requirements for suppositories (Appendix Ⅰ W).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use octadecylsilane bonded silica gel G as the stationary phase and a mixture of acetonitrile and 0.05% solution of phosphoric acid (20 : 80) as the mobile phase. As detector a spectrophotometer set at 203 nm, maintain the column temperature at 40℃. The number of the theoretical plates of the column is not less than 2500, calculated with the reference to the peak of ginsenoside Re.

Reference solution Dissolve a quantity of ginsenoside Re CRS, accurately weighed, in methanol to prepare a solution containing 0.25 mg per ml.

Test solution Cut the suppositories, obtained under the test of weight variation, into pieces. Weight accurately 0.6 g of the above pieces, in a stopper conical flask. Add accurately 100 ml of *n*-butanol saturated with water and weigh. Heat under reflux for 1 hour, allow to cool. Weigh again and replenish the lost weight with above solution, mix well and filter. Measure accurately 50 ml of the successive filtrate in a separator funnel, wash with two 50-ml quantities of ammonia TS saturated with *n*-butanol and wash successive with 50 ml of water saturated with *n*-butanol. Evaporate the *n*-butanol extract to dryness, dissolve the residue in an appropriate amount of methanol, and transfer to a 10 ml volumetric flask. Dilute with the methanol to volume, mix well, stand for 15 minutes below 0℃, remove the volumetric flask, filter immediately. Use the successive filtrate, allow to cool, as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains no less than 2.4 mg of ginsenoside Re ($C_{48}H_{82}O_{18}$) per Suppository.

Action To clear *heat* and relieve *toxicity*, remove *dampness* and kill fungi, eliminate necrotic tissues and regenerate

tissues.

Indications Leukorrheal disease due to pouring of *damp-heat* with manifestations of leukorrhagia, yellow in colour and thick in quality with fishy smell, and pruritus valvae; trichomonal vaginitis, colpomycosis, nonspecific vaginitis and erosion of cervix with above symptoms.

Usage and dosage Vaginal use. 1 suppository, once a day.

Precaution Contraindicated for the period of pregnancy.

Strength 3 g per Suppository

Storage Preserve in well closed containers below 30℃.

Xiaoqinglong Heji (小青龙合剂)

Xiaoqinglong Mixture

Ingredients Herba Ephedrae 125 g; Ramulus Cinnamomi 125 g; Radix Paeoniae Alba 125 g; Rhizoma Zingiberis 125 g; Radix et Rhizoma Asari 62 g; Radix Et Rhizoma Glycyrrhizae Praeparata Cum Melle 125 g; Rhizoma Pinelliae Preparatum 188 g; Fructus Schisandrae Chinensis 125 g.

Procedure Distil volatile oil from Radix et Rhizoma Asari and Ramulus Cinnamomi and collect the aqueous solution in another container after distillation. Decoct the residue of the above two drugs, Radix Paeoniae Alba, Herba Ephedrae, Fructus Schisandrae Chinensis and Radix Et Rhizoma Glycyrrhizae Praeparata Cum Melle with water for 2 times, 2 hours for the first time and 1.5 hours for the second time. Combine the decoctions and filter. Combine the filtrate with the above aqueous solution and concentrate to about 1000 ml. Carry out the method for percolation as directed under Liquid Extracts and Extracts (Appendix Ⅰ O), macerate Rhizoma Pinelliae Preparatum and Rhizoma Zingiberis for 24 hours and percolate, using 70% ethanol as solvent. Concentrate the percolate, combine with the above concentrated decoction, allow to stand and filter. Concentrate the filtrate to 1000 ml, add 3 g of sodium benzoate and mix well with the above volatile oil.

Description A brownish-black liquid; odour, slightly aromatic; taste, sweet and slightly pungent.

Identification (1) Alkalify 10 ml by adding several drops of concentrated ammonia TS, extract with two 15-ml quantities of chloroform and evaporate the combined extracts to dryness. Dissolve the residue in 1 ml of methanol to produce a solution as the test solution. Dissolve ephedrine hydrochloride CRS in methanol to produce a solution containing about 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of *n*-butanol, glacial acetic acid and water (8 : 2 : 1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with ninhydrin TS and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Extract 10 ml with two 10-ml quantities of ether. Discard the ether solutions, extract the aqueous solution with two 15-ml quantities of *n*-butanol, wash the combined extracts with 20 ml of water. Discard the washing and evaporate the *n*-butanol extract to dryness. Dissolve the residue in 1 ml of methanol to produce a slution as the test solution. Dissolve paeoniflorin CRS in methanol to produce a solution containing about 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, ethyl acetate, methanol and concentrated ammonia TS (8 : 1 : 4 : 1)as the mobile phase. Apply separately 2-3 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 5% solution of vanillin in sulfuric acid and heat to the spots clear. The spot in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(3) To 0.5 g of Radix Et Rhizoma Glycyrrhizae reference drug add 10 ml of water, heat under reflux for 30 minutes and filter. Treat the filtrate in the same manner as for preparation of test solution in the test for Identification (2) to prepare a solution as the reference drug solution. Dissolve ammonium glycyrrhizate CRS in methanol to produce a solution containing about 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with a 1% solution of sodium hydroxide as the coating substances and a mixture of ethyl acetate, glacial acetic acid, formic acid and water (15 : 1 : 1 : 2) as the mobile phase. Apply separately 1 μl of each of the test solution obtained in the test for Identification (2), the reference drug solution and the reference solution to the plate. After developing and removal of the plate, dry it in air. Spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots clear and examine under the ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of isopropanol, methanol, acetic acid and water (2 : 25 : 2 : 71) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of paeoniflorin.

Reference solution Disslove a quantity of paeoniflorin CRS, weigh accurately, in methanol to produce a solution containing 50 μg per ml.

Test solution Measure accurately 3 ml of the mixture to a 25 ml of volumetric flask, dilute with methanol to volume, mix well, and filter.

Procedure Inject accurately 10 μl of the reference solution and 5-20 μl of the test solution into the column, and calculate the content. It contains not less than 0.30 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per ml, referred to Radix Paeoniae Alba.

Action To release the exterior and resolve retained fluid, and relieve cough and asthma.

Indications Aversion to cold, fever, adiaphoresis, asthma or shortness of breath and coughing with expectoration of thin phlegm due to *wind-cold* and retention of fluid.

Usage and dosage 10-20 ml, 3 times a day, shake before use.

Strength (1) 10 ml per phial (2) 100 ml per bottler (3) 120 ml per bottle

Storage Preserve in tightly closed containers, protected from light.

Xiaoqinglong Keli
(小青龙颗粒)

Xiaoqinglong Granules

Ingredients Herba Ephedrae 154 g; Ramulus Cinnamomi 154 g; Radix Paeoniae Alba 154 g; Rhizoma zingiberis 154 g; Radix et Rhizoma Asari; 77 g; Radix Et Rhizoma Glycyrrhizae Preparata Cum Melle 154 g; Rhizoma Pinelliae Preparatum 231 g; Fructus Schisandrae Chinensis 154 g.

Procedure Distil volatile oil from Radix et Rhizoma Asari and Ramulus Cinnamomi, collect the aqueous solution in another container. Decoct the drug residue and Radix Paeoniae Alba, Herba Ephedrae, Fructus Schisandrae Chinensis and Radix Et Rhizoma Glycyrrhizae Preparata Cum Melle with water for 2 times, 2 hours for the first time and 1.5 hours for the second time. combine the decoctions and filter. Combine the filtrate with the above aqueous solution and concentrate to about 1000 ml. Pulverize Rhizoma Pinelliae Preparatum and Rhizoma zingiberis to course powder, carry out the method for percolation as directed under Liquid Extracts and Extracts (Appendix Ⅰ O), using 70% ethanol as the solvent, macerate for 24 hours and percolate. Recover the ethanol from the percolate, combine with the above decoction, allow to stand and filter. Concentrate the filtrate to produce a thin extract with a relative density of 1.08-1.10 (55-60℃), spray with heating to dry, mix with a quantity of lactose, add the above volatile oil by spraying, mix well and make 461.5 g of granules (without sucrose); or concentrate the filtrate to produce thick extract with a relative density of 1.35-1.38 (80℃), add a quantity of powder of sucrose, mix well, make granules and dry. Spray the above volatile oil, mix well and make 1000 g of granules.

Description Pale brown to brown granules; odour, slightly aromatic; taste, sweet and slightly pungent.

Identification (1) Triturate 13 g of granules or 6 g (without sucrose) to fine powder, add 30 ml of dehydrated ethanol, ultrasonicate for 30 minutes and filter. Concentrate the filtrate to about 1 ml, mix with a quantity of neutral aluminium oxide and dry it on a water bath. Apply the mixture to a column (1.5 cm in internal diameter) packed with neutral aluminium oxide (200-300-mesh, 10 g), elute with 70 ml of ethanol, collect the eluate and evaporate to dryness. Dissolve the residue in 2 ml of ethanol to produce a solution as the test solution. Dissolve ephedrine hydrochloride CRS in ethanol to produce a solution containing about 0.4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with a 2% solution of sodium hydroxide as the coating substance and a mixture of cyclohexane, chloroform and ethanol (1 : 3 : 1) as the mobile phase. Apply separately 5 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with ninhydrin TS and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Dissolve paeoniflorin CRS in ethanol to produce a solution containing about 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 5 μl each of the reference solution and the test solution obtained in the test for Identification (1) to the plate. After developing and removal of the plate, dry in air. Spray with a 5% solution of vanillin in sulfuric acid and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Triturate 10 g of the granules or 5 g (without sucrose) to fine powder, add 30 ml of methanol, ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 20 ml of water. Extract with *n*-butanol saturated with water for 2 times, 20 ml for each time, combine the *n*-butanol extracts, evaporate to dryness, and dissolve the residue in 2 ml of methanol as the test solution. To 0.5 g of Radix et Rhizome Glycyrrhizae reference drug, add 20 ml of water, heat under reflux for 30 minutes, filter, extract with *n*-butanol saturated with water to produce a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 1% solution of sodium of hydroxide as the coating substance and the mixture of ethyl acetate, formic acid, glacial acetic acid and water (15 : 1 : 1 : 2) as the mobile phase. Apply separately 10-20 μl of the test solution and 10 μl the reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with 10% solution of sulphuric acid in ethanol, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spot in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of isopropanol, methanol, acetic acid and water (2 : 25 : 2 : 71) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, weigh accurately, in 70% ethanol to produce a solution containing 50 μg per ml.

Test solution Pulverize the granules obtained under the test of packing variation to fine powder, weigh accurately 1.1 g or 0.5 g (without sucrose) of the powder to a 25 ml of volumetric flask, add a quantity of methanol, ultrasonicate for 30 minutes, allow to cool, dilute with methanol to the volume mix well, and filter.

Procedure Inject accurately 10 μl of the reference solution and 5-20 μl of the test solution into the column, and calculate the content. It contains not less than 9.0 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per pack, referred to Radix Paeoniae Alba.

Action To release the exterior to resolve retained fluid, and relieve coughing, asthma or difficulty in breathing.

Indications Aversion to cold, fever, adiaphoresis, asthma or difficulty in breathing and coughing with expectoration of thin phlegm due to *wind-cold* and retention of fluid.

Usage and dosage 1 pack, 3 times a day, taken after

dissolved in boiling water.

Strength (1) 6 g per pack (without sucrose)
(2) 13 g per pack

Storage preserve in tightly closed containers.

Xiaoshi Tuire Tangjiang (消食退热糖浆)

Xiaoshi Tuire Syrup

Ingredients Radix Bupleuri, Radix Scutellariae, Rhizoma Anemarrhenae, Herba Artemisiae Annuae, Semen Arecae, Cortex Magnoliae Officinalis, Pulvis Cornus Bubali Concentratus, Cortex Moutan, Spica Schizonepetae, Radix et Rhizoma Rhei.

Procedure Heat Cortex Magnoliae Officinalis, Cortex Moutan and Spica Schizonepetae under a reflux condenser with 60% ethanol twice, 1.5 hours for each time. Combine the extracts, filter and keep the filtrate for further use. Decoct Pulvis Cornus Bubali Concentratus sacked in a cloth bag and other six ingredients with water twice, 2 hours for each time. Combine the decoctions, concentrate to a quantity, mix with the above filtrate, allow to stand and filter. Recover ethanol from the filtrate and concentrate to a quantity. Add a quantity of simple syrup and sodium benzoate, add water to make 1000 ml, stir well and pack.

Description A brown clear liquid; taste, sweet, slightly bitter.

Identification Shake 25 ml of the syrup with 15 ml of ether, separate the ether solution and evaporate to 2 ml as the test solution. Prepare separately two solutions of 1.5 g each of Herba Artemisiae Annuae and Radix et Rhizoma Rhei reference drug, add 15 ml of ether, macerate for overnight, filter and evaporate the filtrates to about 2 ml as the reference drug solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium caboxymethylcellulose as the coating substance and a mixture of benzene, ethyl acetate, methanol, formic acid and water (60 : 20 : 4 : 1 : 10) as the mobile phase. Apply separately 10 μl each of the three solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The bright blue and yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solutions. Examine in day light, The yellow spots turn to red on exposure the plate to ammonia vapour.

Relative density 1.10-1.23 (Appendix Ⅶ A).

pH value 4.0-6.0 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for syrups (Appendix Ⅰ H).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and glacial acetic acid (40 : 60 : 1) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 9000, calculated with the reference to the peak of baicalin.

Reference solution Dissolve a quantity of paeoniflorin CRS, weigh accurately, in dilute ethanol to produce a solution containing 25 μg per ml.

Test solution Measure accurately 5 ml of the syrup to a 100 ml of volumetric flask, add a quantity of dilute ethanol, mix well, dilute with dilute to volume, and mix well. Measure 15 ml of the solution to another 100 ml of volumetric flask, dilute with dilute ethanol to volume, mix well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 1.7 mg of baicalin ($C_{21}H_{18}O_{11}$) per ml, referred to Radix Scutellariae.

Action To clear *heat-toxicity*, and promote digestion to relax bowels.

Indications Child common cold due to affliction from exogenous seasonal pathogenic factors accompanied with retained undigested food, with manifestations of persistent high fever, fullness in the stomach and abdomen, and difficult bowel movements; upper repiratory tract infection and acute entergastritis with above symptoms.

Usage and dosage 5 ml for children under 1 year old, 10 ml for 1-3 years old, 15 ml for 4-6 years old, 20 ml for 7-10 years old, 25 ml for over 10 years old; 2-3 times a day.

Precaution Contraindicated for patients with diarrhea due to deficiency in spleen.

Strength (1) 60 ml per bottle (2) 100 ml per bottle
(3) 120 ml per bottle

Storage Preserve in tightly closed containers, stored in a cool place.

Xiaoshuan Tongluo Jiaonang (消栓通络胶囊)

Xiaoshuan Tongluo capsules

Ingredients Rhizoma Chuanxiong 287 g Radix et Rhizoma Salviae Miltiorrhizae 215 g Radix Astragali 431 g Rhizoma Alismatis 144 g Radix et Rhizoma Notoginseng 144 g Flos Sophorae 72 g Ramulus Cinnamomi 144 g Radix Curcumae 144 g Radix Aucklandiae 72 g Borneolum Syntheticum 5.7 g Fructus Crataegi 144 g.

Procedure Pulverize separately Borneolum Syntheticum and Radix et Rhizoma Notoginseng to fine powders. Decoct the other nine ingredients with water for three times, combine the decoctions and filter. Concentrate the filtrate in vacuum to a thick extract with a relative density of 1.17-1.19 (80℃). Add the powder of et Rhizoma, dry, pulverize, make granules, dry, add the powder of Borneolum, Syntheticum, mix well and make to 1000 capsules.

Description Hard capsules containing brownish-yellow to brown granules and powder. Odour, aromatic; taste, slightly bitter.

Identification (1) Heat under reflux 3 g of the content powder in 30 ml of 2% solution of potassium hydroxide in methanol for 1 hour, cool, filter, evaporate the filtrate to dryness, dissolve the residue in 15 ml of water, extract with three 20-ml quantities of n-butanol saturated with water. Combine the n-butanol extracts, wash with 30 ml of 1% sodium hydroxide solution, then wash with two 30-ml of water saturated with n-butanol, evaporate the n-butanol extracts to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve astragaloside Ⅳ CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer

chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of the mixture of chloroform, methanol and water (13 : 7 : 2) as the mobile phase. Apply separately to the plate 2-5 μl of the test solutions and 5 μl of the reference solutions. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(2) To 1.5 g of the content powder, add 40 ml of water, ultrasonicate for 30 minutes, centrifuge, adjust the pH to 2-3 with dilute hydrochloric acid TS, extract with two 20-ml quantities of ethyl acetate, combine the ethyl acetate extracts, evaporate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 1 g of Rhizoma Chuanxiong reference drug add 20 ml of water, in the same manner as the reference drug solution. Dissolve ferulic acid CRS in methanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of toluene, ethyl acetate and formic acid (20 : 10 : 1) as the mobile phase. Apply separately to the plate 2-5 μl of the test solutions and 5 μl of the reference solutions. After developing and removal of the plate, dry in air. Spray with a mixture of 1% solution of potassium ferricyanide and 1% solution of ferric chloride (1 : 1), freshly prepared. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

(3) To 1.5 g of the content powder, add 5 ml of ethyl acetate, macerate for 20 minutes, shake constantly, filter, use the filtrate as the test solution. Dissolve Borneolum Syntheticum CRS in absolute ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of petroleum ether (60-90℃), toluene and ethyl acetate (9 : 1 : 1) as the mobile phase. Apply separately to the plate 2-5 μl of the test solutions and 5 μl of the reference solutions. After developing and removal of the plate, dry in air. Spray with 5% solution of vanillin in sulfuric and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.05% phosphoric acid solution (21 : 79) as the mobile phase. As detector a spectrophotometer set at 203 nm. The number of theoretical plates of the column is not less than 5000, calculated with reference to the peak of ginsenoside Rg_1.

Reference solution Dissolve a quantity of ginsenoside Rg_1 CRS, accurately weighed, in methanol to prepare a solution containing 0.5 mg per ml as the reference solution.

Test solution Weigh accurately 2 g of the the content powder, obtained in test of weight variation, and pulverize to fine powder. To a stopper conical flask, add accurately 50 ml of methanol, weight, heat under reflux for 2 hours, cool and weight again. Compensate the loss of the weight with methanol, mix well, and filter, Measure accurately 25 ml of the successive filtrate, and evaporate to dryness. Dissolve the residue in 30 ml of water, extract with two 20-ml quantities of ether, discard the ether extract, extract with four 20-ml quantities of n-butanol saturated with water, combine the n-butanol extracts, wash with two 30-ml quantities of ammonia TS, and wash with two 20-ml quantities of the water saturated with n-butanol. Recover n-butanol to dryness, dissolve the residue with methanol in a 10 ml volumetric flask, dilute with methanol to volume, mix well, filter, use the filtrate as the test solution.

Procedure Inject accurately 5 μl of the reference solution and 5-10 μl of the test solution into the column and measure. It contains not less than 2.0 mg of ginsenoside Rg_1 ($C_{42}H_{72}O_{14}$) per capsule, referred to Radix et Rhizoma Notoginseng.

Action To promote blood circulation to resolve stagnated blood, and warm meridians to dredge them.

Indications Stroke due to blockage of meridians by blood stasis with manifestations of hyponoia, dysphasia, cold hands and feet, and painful limbs; ischemic stroke and hyperlipemia with above symptoms.

Usage and dosage 6 capsules, 3 times a day; or follow doctor's advice.

Precaution Avoid raw, cold, pungent, spicy and animal fatty foods.

Strength 0.37 g per capsule

Storage Preserved in tightly closed containers.

Xiaoshuan Tongluo Pian (消栓通络片)

Xiaoshuan Tongluo Tablets

Ingredients Rhizoma Chuanxiong 287 g; Radix et Rhizoma Salviae Miltiorrhizae 215 g; Radix Astragali 431 g; Rhizoma Alismatis 144 g; Radix et Rhizoma Notoginseng 144 g; Flos Sophorae 72 g; Ramulus Cinnamomi 144 g; Radix Curcumae 144 g; Radix Aucklandiae 72 g; Borneolum Syntheticum 5.7 g; Fructus Crataegi 144 g.

Procedure Pulverize separately Borneolum Syntheticum and Radix et Rhizoma Notoginseng to fine powders. Decoct the other nine ingredients with water for three times, combine the decoctions and filter. Concentrate the filtrate in vacuum to a thin extract with a relative density of 1.35-1.40 (80℃). Add the powder of Radix et Rhizoma Notoginseng, dry, make granules, dry, add the powder of Borneolum Syntheticum, mix thoroughly, compress into 1000 tablets and coat with sugar or film.

Description Sugar or film coated tablets with brown core. Odour, aromatic; taste, slightly bitter.

Identification (1) Triturate a quantity of the tablets, removed the coats to fine powder and sublimate 2 g of the powder. Add 2-3 drops of a 5% solution of vanillin in sulfuric acid to the sublimate. A purplish-red colour is produced.

(2) Triturate 4 tablets with coating removed to fine powder, shake with 10 ml of ehter and filter. Discard the filtrate, moisten the drug residue with water, shake with 10 ml of *n*-butanol saturated with water for 10 minutes and macerate for 2 hours. Seperate the supernatant, extract the drug residue further with 10 ml of *n*-butanol saturated with water again and separate the supernatant. Combine the supernatants, add three quantities of water saturated with *n*-butanol and

shake well, separate the *n*-butanol layer and evaporate to dryness. Dissolve the residue in 1 ml of methanol to produce a solution as the test solution. Dissolve ginsenoside Rb_1, ginsenoside Rg_1 and notoginsenoside R_1 CRS in methanol to produce a mixture containing 2.5 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of *n*-butanol, ethyl acetate and water (4 : 1 : 5) as the mobile phase. Apply separately 5 μl of the test solution and 10 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 10% solution of sulfuric acid in ethanol and heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

(3) Triturate 8 tablets with coating removed to fine powder, add 30 ml of methanol, ultrasonicate for 30 minutes, allow to cool, filter, evaporate the filtrate to dryness, and dissolve the residue in 20 ml of water. Extract with *n*-butanol saturated with water by shaking for twice, 30 ml for the first time and 20 ml for the second time, combine the *n*-butanol extracts, wash with 20-ml quantities of 1% solution of sodium hydroxide, then wash with 15-ml quantities of water saturated with *n*-butanol, evaporate the *n*-butanol extracts to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Dissolve astragaloside Ⅳ CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, ethyl acetate, methanol and water (15 : 40 : 22 : 10) stored at lower than 10℃ as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 10% solution of sulphuric acid in ethanol, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Triturate 10 tablets with coating removed to fine powder, add 30 ml of methanol, ultrasonicates for 20 minutes, allow to cool, filter, evaporate the filtrate to dryness, and dissolve the residue in 25 ml of water, extract with 30 ml of *n*-butanol saturated with water, evaporate the *n*-butanol extracts to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Dissolve rutin CRS in methanol to produce a solution containing 4 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose containing 4% solution of sodium acetate as the coating substance and the mixture of ethyl acetate, formic acid and water (8 : 1 : 1) as the mobile phase. Apply separately 2 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, spray with aluminium trichloride TS, allow to stand for 20 minutes, and examine in daylight. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.05% solution of phosphoric acid (20 : 80) as the mobile phase. As detector a spectrophotometer set at 203 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of ginsenoside Rg_1.

Reference solution Dissolve a quantity of ginsenoside Rg_1 CRS, weigh accurately, in methanol to prepare a solution containing 0.2 mg per ml.

Test solution To 20 tablets with coating removed, weigh accurately, triturate to fine powder, weigh accurately 0.2 g of the powder to a conical flask with stopper, weigh accurately, add accurately 50 ml of methanol, weigh, heat under reflux for 3 hours, allow to cool, weigh again, replenish the lost weight, mix well, and filter. Measure accurately 25 ml of the successive filtrate, evaporate to dryness, dissolve the residue in 20 ml of water for several times to a separator, extract with 30, 30, 20 and 20 ml quantities of *n*-butanol saturated with water by shaking, combine the *n*-butanol extracts. wash with 1% solution of sodium hydroxide for twice, 25 ml for each time, and then wash with two 25-ml quantities of water saturated with *n*-butanol, evaporate the *n*-butanol extracts to dryness, dissolve the residue in methanol to a 25 ml of volumetric flask, dilute with methanol to volume, mix well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 5-20 μl of the test solution into the column. and calculate the content.

It contains not less than 1.8 mg of ginsenoside Rg_1 ($C_{42}H_{72}O_{14}$) per tablet, referred to Radix et Rhizoma Notoginseng.

Action To promote blood circulation to resolve stagnated blood, and warm meridians to dredge them.

Indications Stroke due to blockage of meridians by blood stasis with manifestations of hyponoia, dysphasia, cold hands and feet, and painful limbs; ischemic stroke and hyperlipemia with above symptoms.

Usage and dosage 6 tablets, 3 times a day.

Precaution Avoid raw, cold, pungent, spicy and animal fatty foods.

Strength 0.38 g per tablet with film

Storage Preserve in tightly closed containers.

Xiaoyao Wan (Damiwan) (逍遥丸，大蜜丸)

Xiaoyao Pills (Big Honeyed Pills)

Ingredients Radix Bupleuri 100 g; Radix Angelicae Sinensis 100 g; Radix Paeoniae Alba 100 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 100 g; Poria 100 g; Radix Et Rhizoma Glycyrrhizae Praeparata Cum Melle 80 g; Herba Menthae 20 g.

Procedure Pulverize the above seven ingredients to fine powder, sift, mix well. To each 100 g of the powder add 135-145 g of refined honey to make big honeyed pills.

Description Dark brown big honeyed pills; taste, sweet.

Identification (1) Microscopical: Irregularly branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Clusters of calcium oxalate occurring in parenchymatous cells, 18-32 μm in diameter, usually in rows, or several clusters in one cells. Needle crystals of calcium oxalate fine, 10-32 μm in length, irregularly filling in parenchymatous cells. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Vittae

containing yellow or brownish-yellow secretion 8-25 μm in diameter.

(2) Cut 2 g of the pills into pieces, add 15 ml of ethanol, allow to stand for 1 hour while shaking frequently, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of acetone to produce a solution as the test solution. Prepare a solution of 0.1 g of Radix Angelicae Sinensis reference drug and 10 ml of ethanol as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 5 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Triturate well 18 g of the pills, cut into pieces, with 10 g of kieselguhr, add 60 ml of ethanol, ultrasonicate for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 30 ml of water, extract with two 10-ml quantities of ether, discard the ether solutions, extract the aqueous solution with three 30-ml quantities of *n*-butanol saturated with water, wash the combined *n*-butanol solutions with three 20-ml quantities of water saturated with *n*-butanol. Discard the washings and evaporate the *n*-butanol solution to dryness. Dissolve the residue in 1 ml of methanol to produce a solution as the test solution. Prepare a solution of 1 g of Radix et Rhizoma Glycyrrhizae reference drug and 20 ml of ethanol in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance mixed with a 1% solution of sodium hydroxide and a mixture of ethyl acetate, formic acid, glacial acetic acid and water (15 : 1 : 1 : 2) as the mobile phase. Apply separately 3 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots clear and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Mix the test solution obtained in the test for Identification (3) with a small quantity of neutral aluminium oxide, dry on a water bath, apply to a column (1 cm in internal diameter) packed with neutral aluminium oxide (200 mesh, 2 g), elute with 40 ml of a mixture of ethyl acetate and methanol (1 : 1), collect the eluate and evaporate to dryness. Dissolve the residue in 1 ml of ethanol to produce a solution as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 15 μl of the test solution and 3 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with a 5% solution of vanillin in sulfuric acid and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 1% solution of phosphoric acid (15 : 85) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, weigh accurately, in dilute ethanol to produce a solution containing 50 μg per ml.

Test solution To the pills obtained under the test of weight variation, cut into pieces, mix well, weigh accurately 1 g of the powder to a stopper conical flask, add accurately 25 ml of dilute ethanol, stopper tightly, weigh, Ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, cool to ambient temperature and weigh again. Replenish the lost weight with dilute ethanol TS, mix well, filter and use the successive filtrate.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 6.3 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per pill, refered to Radix Paeoniae Alba.

Action To soothe the liver and invigorate the spleen, and nourish blood to regulate menstruation.

Indications Depression and discomfort, distending pain in the chest and hypochondria, dizziness, poor appetite and menstrual disorders due to stagnation of *liver-qi* and deficiency in the spleen.

Usage and dosage 1 pill, twice a day.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Xiaoyao Wan (Shuiwan)
(逍遥丸，水丸)

Xiaoyao Pills (watered pills)

Ingredients Radix Bupleuri 100 g; Radix Angelicae Sinensis 100 g; Radix Paeoniae Alba 100 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 100 g; Poria 100 g; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle 80 g; Herba Menthae 20 g.

Procedure Pulverize the above seven ingredients to fine powder, sift and mix thoroughly. Decoct 100 g of Rhizoma Zingiberis Recens with water for twice, 20 minutes for each time, filter, make pills with the filtrate and dry.

Description Yellowish-brown to brown watered pills; taste, sweet.

Identification (1) Microscopical: Irregularly branched masses colourless, dissolved in chloral hydrate solution; hyphae colourless or pale brown, 4-6 μm in diameter. Clusters of calcium oxalate occurring in parenchymatous cells, usually in rows, or several clusters in one cell. Needle crystals of calcium oxalate fine, irregularly filling in parenchymatous cells. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Vittae containing yellow or brownish-yellow secretion, 8-25 μm in diameter.

(2) Grind 1 g of the pills, add 15 ml of ethanol, ultrasonicate for 15 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ethanol and use the solution as the test solution. Prepare a solution with 0.1

g of Radix Angelicae Sinensis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 5 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Grind 12 g of the pills to fine powder, add 40 ml of ethanol, ultrasonicate for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 20 ml of water and extract with three 20-ml quantities of *n*-butanol saturated with water. Wash the combined *n*-butanol solutions with three 15-ml quantities of water saturated with *n*-butanol. Discard the washings, evaporate the combined *n*-butanol extracts to dryness and dissolve the residue in 0.5 ml of methanol to produce a solution as the test solution. To 1 g of Radix et Rhizoma Glycyrrhizae reference drug add 20 ml of ethanol and prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance prepared with a 10% solution of sodium hydroxide and a mixture of ethyl acetate, formic acid, glacial acetic acid and water (15 : 1 : 1 : 2) as the mobile phase. Apply separately to the plate 3 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots clear and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Mix the test solution remained in the test for Identification (3) with 2 g of neutral aluminium oxide and dry on a water bath. Apply to a column packed with neutral aluminium oxide (200 mesh, 2 g, 8-10 mm in internal diameter), elute with 50 ml of methanol and evaporate the eluate to dryness. Dissolve the residue in 1 ml of ethanol to produce a solution as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately to the plate 15 μl of the test solution and 3 μl of the reference solution. After developing and removal of the plate, dry in air, spray with a 5% solution of vanillin in sulfuric acid and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 1% solution of phosphoric acid (15 : 85) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantities of paeoniflorin CRS, weigh accurately, in dilute ethanol TS to produce a solution containing 50 μg per ml.

Test solution To 0.4 g of the powdered pills, weighed accurately, add accurately 25 ml of dilute ethanol TS in a conical flask with stopper, stopper tightly and weigh. Ultrasonicate for 30 minutes, cool to ambient temperature and weigh again, replenish the lost weight with dilute ethanol TS, mix well, filter and use the successive filtrate.

Procedure Inject Accurately 10 μl of each of the reference solution and the test solution, respectively, into the column and determine.

It contains not less than 2.5 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per gram, refered to Radix Paeoniae Alba.

Action To soothe the liver and invigorate the spleen, and nourish blood to regulate menstruation.

Indications Depression and discomfort, distending pain in the chest and hypochondria, dizziness, poor appetite and menstrual disorders due to stagnation of *liver-qi* and deficiency in the spleen.

Usage and dosage 6-9 g, 1-2 times a day.

Storage Preserve in well closed containers, protected from moisture.

Xiaoying Wan (消癭丸)

Xiaoying Pills

Ingredients Thallus Eckloniae seu Laminariae 300 g; Sargassum 200 g; Concha Meretricis seu Cyclinae 50 g; Bulbus Fritillariae Thunbergii 50 g; Radix Platycodonis 100 g; Spica Prunellae 50 g; Pericarpium Citri Reticulatae 100 g; Semen Arecae 100 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix thoroughly. To each 100 g of the powder add 110-130 g of refined honey to make big honeyed pills.

Description Brown big honeyed pills; taste, salty and astringent.

Identification (1) Triturate well 12 g of the pills, cut into pieces, with 8 g of kieselguhr, add 50 ml of chloroform and 7.5 ml of concentrated ammonia TS, ultrasonicate for 30 minutes and filter. Shake the filtrate with 10 ml of dilute hydrochloric acid TS and 20 ml of water. Separate the acidic layer, adjust pH to 8-9 with ammonia TS, extract with two 10-ml quanties of chloroform and evaporate the combined extracts to dryness. Dissolve the residue in 0.5 ml of methanol to produce a solution as the test solution. To 1 g of Semen Arecae reference drug, add 20 ml of chloroform and 3 ml of concentrated ammonia TS, and prepare the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with a 1% solution of sodium hydroxide as the coating substance and a mixture of benzene, chloroform and methanol (10 : 4 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the two solutions. After developing and removal of the plate, dry in air and spray with potassium indobismuthate TS. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) Triturate 12 g of the pills, cut into pieces, with 8 g of kieselguhr, add 100 ml of methanol, ultrasonicate for 30 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 3 ml of ethanol and use the supernatant as the test solution. Prepare a solution of 1 g of

Pericarpium Citri Reticulatae reference drug and 20 ml of methanol in the same manner as the reference drug solution. Dissolve a quantity of hesperidin CRS in methanol to produce a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with a 0.5% solution of sodium hydroxide as the coating substance. Apply separately to the plate 2-4 μl of the test solution, 2 μl of each of the reference drug solution and reference solution. Develop about 3 cm, using a mixture of ethyl acetate, methanol and water (100 : 17 : 13) as the mobile phase, remove and dry it in air. Develop about 8 cm again, using the upper layer of toluene, ethyl acetate, formic acid and water (20 : 10 : 1 : 1) as the mobile phase, remove and dry in air, spray with a 1% solution of aluminium chloride in ethanol and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To dissipate nodulation and goiter.

Indications Goiter at its initial stage due to accumulation of *phlegm-fire*; simple endemic goiter with above symptoms.

Usage and dosage 1 pill, 3 times a day, taken before meals; appropriate reduction of the dosage for children.

Strength 3 g per pill

Storage Preserve in tightly closed containers.

Xiaoyin Pian
(消银片)

Xiaoyin Tablets

Ingredients Radix Rehmanniae; Cortex Moutan; Radix Paeoniae Rubra; Radix Angelicae Sinensis; Radix Sophorae Flavescentis; Flos Lonicerae Japonica; Radix Scrophulariae; Fructus Arctii; Periostracum Cicadae; Cortex Dictamni; Radix Saposhnikoviae; Folium Isatidis and Flos Carthami.

Procedure Pulverize Flos Lonicerae Japonica and Flos Carthami to fine powder. Macerate the other eleven ingredients, cut into lumps or pieces, with a quantitie of 70% ethanol for 12 hours and filter. Heat under reflux the drug residue with a quantity of 70% ethanol for 12 hours and filter. Combine the filtrate, recover ethanol and concentrate to a thick extract. Stir thoroughly with the fine powder, a quantity of starch and magnesium stearate and dry. Pulverize, make granules, dry, make to 1000 tablets and coat with sugar.

Description Sugar coated tablets with deep brown core; taste, bitter.

Identification (1) Triturate 10 tablets with coating removed to fine powder, heat under reflux for 20 minutes with 20 ml of chloroform, stand to cool, filter and concentrate the filtrate to 1 ml as the test solution. Dissolve separately indirubin CRS and matrine CRS in chloroform to produce two solutions containing 1 mg of each per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and benzene, acetone and methanol (16 : 6 : 1) as the mobile phase, saturated with ammonia vapour. Apply separately to the plate 10-20 μl of the test solution and 5 μl of the reference solutions. After developing and removal of the plate, dry in air. The spot due to indirubin in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with indirubin reference solution. Spray with modified potassium iodobismuthate TS. The spot due to matrine in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with matrine reference solution.

(2) Triturate 10 tablets with coating removed to fine powder, add 20 ml of ethanol, and ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 15 ml of water and filter. Extract the filtrate with two 15-ml quantities of ether, and discard the ether solution. Extract the aqueous layer with three 15-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts and evaporate to dryness. Dissolve the residue in 1 ml of ethanol as the test solution. Dissolve paeoniflorin CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately to the plate 5-10 μl of each of the two solutions. After developing and removal of the plate, dry in air. Spray with a 5% solution of vanillin in sulfuric acid and heat to visualize the spots clearly. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

(3) Triturate 10 tablets with coating removed to fine powder, add 10 ml of ether, stopper, shake thoroughly, and stand overnight. Filter, expel solvent, and dissolve the residue with 1 ml of ethyl acetate as the test solution. Dissolve paeonol CRS in ethyl acetate to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and toluene as the mobile phase. Apply separately in strip 10-20 μl of the test solution and 10 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 5% solution of ferric chloride in ethanol, heat to spots distinct. The strip in the chromatogram obtained with the test solution corresponds in position and colour to the strip in the chromatogram obtained with the reference solution.

(4) Macerate 1 g of Cortex Dictamni reference drug with 10 ml of ether overnight, filter, evaporate the filtrate, and dissolve the residue with 1 ml of ethyl acetate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene and acetone (20 : 1) as the mobile phase. Apply separately in strip 10-20 μl of the test solution obtained under Identification (1) and the above reference drug solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.1% solution of phosphoric acid (adjust pH to 8.0 with triethylamine) (20 : 80) as the

mobile phase. As detector a spectrophotometer set at 220 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of matrine.

Reference solution Dissolve a quantity of matrine CRS, weigh accurately, with the mobile phase to produce a solution containing 0.2 mg of matrine per ml

Test solution Pulverize 30 tablets, removed coats and weigh accurately, to fine powder, weigh accurately 3.5 g in a stoppered conical flask, add 1 ml of concentrated ammonia TS and 30 ml of chloroform, stopper, shake thoroughly and stand overnight. Filter, wash the flask and residue with 15 ml of chloroform separately in 3 times. Combine the filtrate and washing, evaporate to dryness. Dissolve the residue with the mobile phase. transfer to a 25 ml volumetric flask, dilute to volume, and mix well. Filter and use the filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and the test solution into the column, determine and calculate.
It contains not less than 0.30 mg of matrine ($C_{15}H_{24}N_2O$) per tablet, referred to Radix Sophorae Flavescentis.

Action To clear *heat* to cool blood, nourish blood to moisten the skin, and expel *wind* to stop itching.

Indications Psoriasis due to *blood-heat* with *wind-dryness* and deficiency in blood with *wind-dryness* with manifestations of punctate eruptions with bright red fundus covered with silvery scales, or those with light red fundus covered with thicker silver scales, relatively dry in quality with severer itching.

Usage and dosage 5-7 tablets, 3 times a day; one month making a course of treatment.

Strengh Equivalent to 0.6 g of crude drug per tablet

Storage Preserve in tightly closed containers.

Xiatianwu Pian
(夏天无片)

Xiatianwu Tablets

Xiatianwu Tablets are the sugar costed tablets prepared from Rhizoma Corydalis Decumbentis.

Procedure Pulverize 250 g of Rhizome Corydalis Decumbentis to fine powder for latter use. Pulverize 350 g of Rhizome Corydalis Decumbentis to coarse powder, carry out the method for percolation described under Liquid Extract and Extract (Appendix I O), using a 1% solution of hydrochloric acid as solvent, macerate for 48 hours, percolate until the alkaloid reaction for percolated solution becomes negative, adjust pH of the solution to neutral with a 10% solution of sodium hydroxide, concentrate the solution to a thick extract, add the pulverized fine powder of Rhizoma Corydalis Decumbentis and a quantity of excipient, mix well, and compress into 1000 tablets and coat with sugar.

Description Sugar coated tablets with brownish yellow to dark brown core; taste, bitter.

Identification Pulverize 4 tablets with coating removed to fine powder, add 20 ml of a mixture of chloroform, methanol and concentrated ammonia TS (50 : 10 : 1), ultrasonicate for 30 minutes and filter. Evaporate the filtrate to dryness, dissolve the residue in 2 ml of methanol as the test solution. Dissolve protopine CRS in chloroform to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and cyclohexane, ethyl acetate and diethylamine (16 : 3 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions, and pre-saturate the plate for 15 minutes. After developing and removal of the plate, dry it in air. Spray with dilute potassium iodobismuthate TS. The spot in the chromatogram obtained with the test solution in the position and colour corresponds to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with requirements for tablets (Appendix I D).

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and a buffer solution (to 1000 ml of water add 30 ml of glacial acetic acid and 8 ml of triethylamine) (18 : 82) as the mobile phase. As detector a spectrophotometer set at 289 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of protopine.

Reference solution Weigh accurately 10 mg of protopine CRS in a 50 ml volumetric flask, add 5 ml of 1% solution of hydrochloric acid, dilute with 50% methanol to volume, and mix well. Measure accurately 5 ml in a 25 ml volumetric flask, dilute with 50% methanol to volume, and mix well (containing 40 μg of protopine per ml).

Test solution Pulverize 10 tablets, with coating removed and weigh accurately, to fine powder, weigh accurately 0.6 g in a stoppered conical flask, add accurately 50 ml of 50% methanol, and weigh. Heat under reflux for 30 minutes, stand to cool, weigh again, replenish the lost weight with dilute ethanol, and mix well. Filter, and use the filtrate as the test solution.

Procedure Inject accurately 10-20 μl of the reference solution and the test solution into the column, determine and calculate the content.
It contains not less than 0.90 mg of protopine ($C_{20}H_{19}O_5$) per tablet, referred to Rhizoma Corydalis Decumbentis.

Action To promote blood circulation to dredge meridians, and move *qi* to kill pain.

Indications Stroke due to blockage of meridians by stagnated blood and impeded flow of *qi* with manifestations of hemiplegia, hemianesthesia; traumatic injuries, painful or swollen and numb limbs due to stagnation of *qi* and blood; rheumatic arthritis and sciatica with above symptoms.

Usage and dosage 4-6 tablets, 3 times a day.

Precaution Be cautious about pregnant women.

Storage Preserve in tightly closed containers.

Xiguashuang Runhou Pian
(西瓜霜润喉片)

Xiguashuang Runhou Buccal Tablets

Ingredients Mirabilitum Praeparatum; Borneolum syntheticum; Oleum Menthae Dementholatum; Mentholum.

Procedure Pulverize Mirabilitum Praeparatum to fine powder, add a quantity of sucrose powder and dextrin, dissolve a quantity of citric acid and carmine in water, mix

thoroughly with the above powder, make granules, dry, add Oleum Menthae Dementholatum, Mentholum and a quantity of orange essence, mix thoroughly, close tightly, compress into tablets.

Description Pale red tablets; odour, aromatic; taste, sweet, pungent and cool.

Identification Dissolve a mixture of (±)-borneol and (±)-isoborneol CRS and menthol CRS in dehydrated ethanol to produce a mixture solutions containing 0.6 mg of menthol CRS and 0.3 mg of a mixture of (±)-borneol and (±)-isoborneol CRS per ml as the reference solutions. Carry out the method as described under assay, measure 1μl of each of the above reference solutions and the test solution obtained under the assay of Borneolum syntheticum. The retention time of thepeak in the chromatogram obtained with the test solution correspond with that in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D), except disintegration test.

Assay ***Mirabilitum praeparatum*** Triturate 60 tablets, weighed accurately, to fine powder, mix thoroughly, weigh accurately about 18 g, add 150 ml of water, shake for 10 minutes, centrifuge, filter, wash the residue with 50 ml of water in 3 portions, centrifuge, filter, combine the filtrate, add 1 ml of hydrochloric acid, boil, stir constantly and add gently a hot barium chloride TS to precipitate completely, heat on a water bath for 30 minutes, allow to stand for 1 hour, filter with an ashless filter paper or a Gusser crucible, previously weighed, wash the residue with water in several portions until the washings not present any reaction of chloride, dry, ignite to constant weight, weigh accurately, multiply by 0.6086 and calculate.
It contains not less than 11.5 mg and not more than 13.5 mg (0.6 g per tablet.), or not less than 23.0 mg and not more than 27.0 mg (1.2 g per tablet.) of sodium sulfate (Na_2SO_4) per tablet, referred to Pericarpium Citrullus Vulgaris.

Borneolum syntheticum Carry out the method for gas chromatography (Appendix Ⅵ E).

Chromatographic system and systemin suitability Use a capillary column of modified polyethyleneglycol (PEG)-20 M (30 m long, 0.53 mm in internal diameter, 1.2 μm film), maintain the column temperature at 135℃. The number of theoretical plates of the column is not less than 8000, calculated with reference to the peak of (±)-Borneol.

Correction factor Dissolve a quantity of methyl salicylate, accurately weighed, in dehydrated ethanol to produce a solution containing 0.2 mg per ml as internal standard solution. Dissolve 15 mg of (±)-borneol CRS, accurately weighed, in a 100 ml volumetric flask and dilute with the internal standard solution to volume, and mix well. Inject accurately 1 μl of the solution into the column, and calculate the correction factor.

Procedure Pulverize the tablets obtained under the test of weight variation, to fine powder weigh accurately 1.5 g in a stoppered conical flask, add accurately 5 ml of the internal standard solution, mix thoroughly, and weigh. Ultrasonicate (power, not less than 250 W; frequency, not less than 50 kHz) for 20 minutes, stand to cool, weigh again, replenish the lost weight with dehydrated ethanol, mix thoroughly, and centrifuge. Inject 1 μl of the supernatant into the column and determine.
It contains not less than 0.18 mg (0.6 g per tablet), or not less than 0.36 mg (1.2 g per tablet) of (±)-borneol ($C_{10}H_{18}O$) per tablet, referred to Borneolum syntheticum.

Action To restore normal sound and ease the throat, and reduce swelling and pain.

Indications Swollen painful throat, hoarseness, or inflammation of the throat, or retropharyngeal abscess, or tonsillitis, or aphthous stomatitis, sores on the mouth and tongue, or gingival abscess; acute and chronic pharyngolaryngitis, acute tonsillitis, stomatocace, stomatitis and swollen painful gums.

Usage and dosage For buccal use, 2-4 tablets (0.6 g per tablet) or 1-2 tablets (1.2 g per tablet) one hour.

Strength (1) 0.6 g per tablet (2) 1.2 g per tablet

Storage Preserve in tightly closed containers, protected from light.

Xingren Zhike Tangjiang (杏仁止咳糖浆)

Xingren Zhike Syrup

Ingredients Aqua Armeniacae Amara 40 ml; Extractum Stemonae Liquidum 20 ml; Extractum Polygalae Liquidum 22.5 ml; Extractum Citri Reticulatae Liquidum 15 ml; Extractum Platycodi Liquidum 20 ml; Extractum Glycyrrhizae Liquidum 15 ml.

Procedure Dissolve 244 g of sucrose in water by heating, allow to cool, add a quantity of sodium benzoate, and add successively Extractum Polygalae Liquidum, Extractum Platycodi Liquidum, Extractum Glycyrrhizae Liquidum, Extractum Stemonae Liquidum, Extractum Citri Reticulatae Liquidum and Aqua Armeniacae Amara, stir well and add water to make 1000 ml. Add a quantity of talcum powder, stir well and allow to stand to precipitate, filter the supernatant and pack into appropriate bottles.

Description A pale brown-yellowish to red colour liquid; odour, aromatic; taste, sweet and slightly astringent.

Identification (1) Extract 20 ml with two 20 ml quantities of ethyl acetate, Combine the extract and dissolve the residue in 2 ml of ethyl acetate to produce a solution as the test solution. Heat under reflux 0.5 g of Pericarpium Citri Reticulatae reference drug with 20 ml of ethyl acetate for 1 hour, filter, evaporate the filtrate and dissolve the residue in 1 ml of ethyl acetate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and acetone (9 : 4) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air and spray with a 10% solution of sulphuric acid in ethanol. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(2) Extract 50 ml with three 25-ml quantities of of *n*-butanol saturated with water, evaporate the extract to dryness, dissolve the residue with 5 ml of methanol, add 30 ml of ether and stir. Allow to stand to precipitate completely and filter. Dissolve the precipitate with 50 ml of hydrochloric acid solution (1→10), heat under reflux for 2 hours, stand, dissolve the precipitate with 2 ml of methanol as the test solution Ultrasonicate 0.5 g of Radix Polygalae with 20 ml of methanol for 15 minutes, filter and concentrate the filtrate to about 3 ml. Carry out the method as described under the test solution, beginning at "add 30 ml of ether," and prepare the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and formic acid (15 :

5 : 1) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air and spray with a 5% solution of vanillin in sulfuric acid. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Relative density Not less than 1.09 (Appendix Ⅶ A).

pH value 5.0-7.0 (Appendix Ⅶ G).

Other requirements Complies with the general requirements for syrups (Appendix Ⅰ H).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.2 mol/L solution of sodium acetate (adjust pH to 4.2 with glacial acetic acid (54 : 46) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of glycyrrhizinic acid.

Reference solution Dissolve a quantity of ammonium glycyrrhizinate CRS, accurately weighed, in methanol to prepare a solution containing 50 μg per ml. (equivalent to 48.98 μg per ml of glycyrrhizinic acid).

Test solution Measure accurately 5 ml of the syrups in a 25 ml volumetric flask, dilute with the mobile phase to the volume and mix well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, determine and calculate the content.
It contains not less than 0.15 mg of glycyrrhizinic acid ($C_{42}H_{62}O_{16}$) per ml.

Action To resolve phlegm and stop coughing.

Indications Coughing with copious *phlegm* due to block of the lung by phlegm; acute and chronic bronchitis with above symptoms.

Usage and dosage 15 ml, 3-4 times a day.

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Xinning Pian
(心宁片)

Xinning Tablets

Ingredients Radix et Rhizoma Salviae Miltiorrhizae 300 g; Flos Sophorae 150 g; Rhizoma chuanxiong 150 g; Radix et Rhizoma Notoginseng 54 g; Flos Carthami 150 g; Lignum Dalbergiae Odoriferae 150 g; Radix Paeoniae Rubra 150 g.

Procedure Pulverize Radix et Rhizoma Notoginseng, Rhizoma chuanxiong into fine powder, and sift. Decoct the other five ingredients with water three times, 3 hours for the first time, 2 hours for the second time and 1 hour for the third time. Combine the decoctions and filter. Concentrate the filtrate to a thick extract, mix the thick extract with the above fine powder thoroughly. Dry, pulverize, sift, add a quantity of excipient, mix thoroughly, make granules, dry, and make to 500 tablets (big) or 1000 tablets (small), coat with sugar or film.

Description Film-coated or sugar-coated tablets with brown or dark brown core; taste, pungent.

Identification (1) Triturate 10 tablets, removed film-coat or sugar coat, to fine powder, add 50 ml of ether, ultrasonicate for 20 minutes, and filter. Reserve the residue for use in Identification (2) To 1 g of Rhizoma Chuanxiong reference drug, add 20 ml of ether, to prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of hexane, and ethyl acetate (9 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of above solutions. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(2) To the residue obtained in Identification (1), expel the solvent, add 50 ml of methanol, ultrasonicate for 20 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 50 ml of water, and extract with two 30-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, and wash with two 60-ml quantities of ammonia TS. Evaporate the *n*-butanol extracts to dryness, and dissolve the residue in 1 ml of methanol as the reference solution. To 0.5 g of Radix et Rhizoma Notoginseng reference drug, add 20 ml of methanol, to prepare a solution in the same manner as the reference drug solution. Dissolve a quantity of notoginsenoside R_1 CRS in methanol to produce a reference solution containing 1 mg per ml. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol, and water (13 : 7 : 2) as the mobile phase. Apply separately to the plate 2 μl of each of above three solutions. After developing and removal of the plate, dry in air. Spray with a 10 per cent solution of sulfuric acid in ethanol, and heat at 105℃ to spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution and reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol, water, dimethylformamide, and glacial acetic acid (2 : 95 : 2 : 1) as the mobile phase. As detector a spectrophotometer set at 283 nm. The number of theoretical plates of the column is not less than 6000, calculated with the reference to the peak of danshensu.

Reference solution Weigh accurately a quantity of sodium danshensu CRS, dissolve in 50% solution of methanol to produce a solution containing 50 μg per ml (correspond to 45 μg danshensu per ml).

Test solution Triturate 10 tablets, removed film-coat or sugar coat, to fine powder, weigh accurately 1 g of the powder in a stoppered conical flask, add accurately 50 ml of hydrochloric acid solution (1→50), closely stopper and weigh. Ultrasonicate for 30 minutes (power 250 W; 33 kHz), cool, weigh again, replenish the lost weight with hydrochloric acid solution (1→50), add 5 g of sodium chloride, stir well and centrifuge. Transfer accurately 25 ml of the supernatant solution to a separating funnel, extract by shaking with one 50-ml, one 30-ml, and two 20-ml quantities of ethyl acetate. Combine the ethyl acetate, and evaporate on a water bath to dryness, dissolve the residue in

50 per cent solution of methanol, transfer to a 25 ml of volumetric flask and add 50% of methanol to volume, mix well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column respectively and measure.

It contains not less than 0.40 mg of danshensu ($C_9H_{10}O_5$) per small tablet, not less than 0.8 mg of danshensu per big tablet, referred to Radix Salviae Miltiorrhizae.

Action To regulate *qi* flow to kill pain and promote blood circulation to resolve stagnated blood.

Indications Impeded flow of *yang-qi* due to stagnation of *qi* and blood with manifestations of constriction and pain in the chest, palpitation, shortness of breath; angina pectoris in coronary heart disease with above symptoms.

Usage and dosage 2-3 tablets for big tablet, 6-8 tablets for small tablet; 3 times a day.

Precaution Contraindicated for pregnant women.

Storage Preserve in tightly closed containers.

Xinqin Keli
(辛芩颗粒)

Xinqin Granules

Ingredients Radix et Rhizoma Asari 200 g; Radix Scutellariae 200 g; Herba Schizonepetae 200 g; Radix Saposhnikoviae 200 g; Radix Angelicae Dahuricae 200 g; Fructus Xanthii 200 g; Radix Astragali 200 g; Rhizoma Atractylodis Macrocephalae 200 g; Ramulus Cinnamomi 200 g; Rhizoma Acori Tatarinowii 200 g.

Procedure Decoct the ten ingredients with water for two times, 1.5 hours for the first time, and 1 hour for the second. Combine the decoction, filter, and concentrated the filtrate to a quantity. Add a quantities of sucrose and dextrin, make granules, dry at 80℃, and get 4000 g. Or concentrate the filtrate to a thick extract, dry spraying to powder, add a quantities of dextrin and adjuvant, make granules, dry and make to 1000 g.

Description Grayish brown granules; taste, sweet, slightly bitter; or brown-yellow to brown granules; taste, slightly sweet and bitter (without sucrose).

Identification (1) Grind 20 g or 5 g (without sucrose) to fine powder, add 60 ml of methanol, and ultrasonicate for 20 minutes. Filter, evaporate the filtrate, dissolve the residue with 15 ml of water, and extract with three 15-ml quantities of ether. Combine the extract, expel solvent, and dissolve the residue with 0.5 ml of ethyl acetate as the reference solution. Prepare a solution with 1 g of Radix et Rhizoma Asari reference drug and 30 ml of methanol in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane, chloroform and ethyl acetate (16 : 3 : 4) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with 5% solution of vanillin in sulfuric acid, and heat at 105℃ to spot distinct. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) Grind 6 g or 1.5 g (without sucrose) to fine powder, add 20 ml of ethanol, and ultrasonicate for 10 minutes. Filter, evaporate the filtrate, and dissolve the residue with 1 ml of methanol as the reference solution. Dissolve a quantity of baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G prepared with 4% solution of sodium acetate and sodium carboxymethylcellulose as binder, as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately 10 μl of the two solutions to the plate. After developing and removal of the plate, dry in air, and spray with 1% solution of ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Grind 20 g or 5 g (without sucrose) to fine powder, add 60 ml of ethanol, and ultrasonicate for 20 minutes. Filter, recover solvent, and dissolve the residue with 1 ml of chloroform as the test solution. Prepare a solution with 1 g of Radix Angelicae Dahuricae reference drug and 30 ml of methanol in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and ether as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Grind 40 g or 10 g (without sucrose) to fine powder, add 100 ml of ethanol, and ultrasonicate for 30 minutes. Filter, apply the filtrate to a neutral aluminia oxide column (100-200 mesh, 5 g, 1-1.2 cm in diameter), elute with 100 ml of 40% methanol, collect the eluate, and evaporate to dryness. Dissolve the residue with 30 ml of water, and extract with two 20-ml quantities of *n*-butanol saturated with water. Combine the extract, wash with three 20-ml quantities of 1% solution of sodium hydroxide, and wash again with two 15-ml quantities of water. Dehydrate the extract with sodium sulfate anhydrous, filter, evaporate the filtrate, and dissolve the residue with 0.5 ml of methanol as the test solution. Dissolve a quantity of astragaloside Ⅳ CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13 : 7 : 2), keep at below 10℃ overnight as the mobile phase. Apply separately 10 μl of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% solution of sulfuric acid in ethanol, and heat at 105℃ to spot clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Water Not more than 7.0 per cent (Appendix H), use for granules without sucrose.

Other requirement Comply with the general requiments for granules (Appendix Ⅰ C), except, Determination of water for granules without sucrose.

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (47 : 53 : 0.2) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the

column is not less than 1500, calculated with the reference to the peak of baicalin.

Reference solution Dissolve a quantity of baicalin CRS, weigh accurately, in methanol to produce a solution containing 40 μg of baicalin per ml.

Test solution Pulverize the granules, obtained under the test of weight variation, to fine powder, weigh accurately 1.2 g or 0.3 g (without sucrose) in a stoppered conical flask, add accurately 50 ml of 70% ethanol, stopper, weigh, ultrasonicate (power 250 W, frequency 50 kHz) for 30 minutes, allow to cool, weigh again, replenish the lost weight with 70% ethanol, and mix thoroughly. Filter, and use the filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, determine and calculate.

It contains not less than 30.0 mg of baicalin ($C_{21}H_{18}O_{11}$) per bag, referred to Radix Scutellariae.

Action To replenish *qi* to strengthen the superficies, and disperse *wind* and free the orifices.

Indications Itching nose, sneezing, running nose and proneness to common cold due to a deficiency of *lung-qi* and invasion by *wind*; allergic rhinitis with above symptoms.

Usage and dosage 1 pack, 3 times a day, taken with boiled water. 20 days making a course of treatment.

Strength (1) 20 g per pack
(2) 5 g (without sucrose) per pack

Storage Preserve in tightly closed container.

Xintong Koufuye (心通口服液)

Xintong Mixture

Ingredients Radix Astragali; Radix Codonopsis; Radix Ophiopogonis; Radix Polygoni Multiflori; Herba Epimedii; Radix Puerariae Lobarae; Radix Angelicae Sinensis; Radix et Rhizoma Salviae Miltiorrhizae; Spina Gleditsiae; Thallus Laminariae seu Eckloniae; Concha Ostreae; Fructus Aurantii Immaturus.

Procedure Heat under reflux Radix Puerariae Lobarae and Radix Salviae Miltiorrhizae in 70% ethanol twice, 1 hour for each time, combine the extract; decoct the above drug residue and the other ingredients with water twice, 2 hours for the first time and 1.5 hours for the second time, combine the decoctions, filter and concentrate the filtrate to 1500 ml. Combine the ethanol extract and the aqueous extract, adjust with a quantity of ethanol to a content of 65% ethanol, store at a lower temperature for 24-48 hours, filter, recover ethanol from the filtrate and concentrate to 1300 ml, store at a lower temperature for 24-48 hours; filter, add 150 g of simple syrup, adjust to pH 7.0 with a 10% solution of sodium hydroxide, add water to 1500 ml, stir well, filter, pack and sterilize.

Description A clear, brown-red liquid; taste sweet and slightly bitter.

Identification (1) Extract 5 ml with 10 ml of chloroform, discard the chloroform layer, extract the aqueous layer with 10 ml of *n*-butanol, evaporate the *n*-butanol extract to dryness, dissolve the residue in 2 ml of methanol as the test solution. Dissolve puerarin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, methanol and water (7 : 2.5 : 0.25) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air. Spray with a 1% solution of magnesium acetate in ethanol, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Evaporate 10 ml of the mixture to dryness, dissolve by stirring the residue in 20 ml of dehydrated ethanol on a water bath, stand to cool, filter, evaporate the filtrate to dryness, dissolve the residue in 2 ml of methanol as the test solution. Dissolve CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of benzene, ethyl acetate and formic acid (15 : 5 : 2) as the mobile phase. Apply separately 1 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a mixture (freshly prepared) of 1% solution of potassium ferricyanide and equal quantity of 2% solution of ferric chloride. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Extract 20 ml with 20 ml of chloroform, discard the chloroform layer, extract the aqueous layer with two 20-ml quantities of *n*-butanol, combine the extracts, wash with 20 ml of water, discard the aqueous layer, add a quantity of anhydrous sodium sulfate in the *n*-butanol extract, filter, evaporate the filtrate to dryness, dissolve the residue in 2 ml of methanol, apply to a column packed with neutral aluminium oxide (100-200 mesh, 5g, 1-1.5 cm in internal diameter), elute with 100 ml of 40% methanol, collect the eluate, evaporate to dryness on a water bath and dissolve the residue in 0.5 ml of methanol as the test solution. Dissolve astragaloside Ⅳ CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer a mixture of chloroform, methanol and water (13 : 7 : 2) as the mobile phase. Apply separately 3 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a 10% solution of sulfuric acid in ethanol and heat at 105℃ for 5 minutes. The brown spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Relative density Not less than 1.08 (Appendix Ⅶ A).

pH value 5.0-7.0 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadeylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (21 : 79) as the mobile phase. As detector a spectrosphotometer set at 250 nm. The number of the theoretical plates of the column is not less than 3000, calculated with reference to the peak of puerarin.

Reference solution Dissolve 11 mg of puerarin CRS, weigh accurately, with methanol in a 10 ml volumetric flask, dilute with methanol to the volume and mix well. Measure

accurately 1 ml, transfer to a 25 ml volumetric flask, dilute with 30% methanol to the volume (containing 44 μg of puerarin per ml).

Test solution Measure accurately 5 ml of the mixture obtained under the test of content variation, transfer to a 50 ml volumetric flask, dilute with acetone to the volume and mix well. Centrifuge, measure accurately 5 ml of the supernatant liquid, transfer to a 50 ml volumetric flask, dilute with 30% methanol to the volume and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solutions into the column and measure. It contains not less than 2.2 mg of puerarin ($C_{21}H_{20}O_9$) per ml, referred to Radix Puerariae Lobarae.

Action To invigorate *qi* and promote blood circulation, resolve *phlegm* and dredge meridians.

Indications Obstruction of *qi* in the chest due to a deficiency of *qi* and *yin* and retention of *phlegm* and blood stasis, with manifestations of heart pain, constriction in the chest, shortness of breath, or nausea, vomiting and poor appetite; coronary heart disease and angina pectoris with above symptoms.

Usage and dosage 10-20 ml, 2-3 times a day.

Precaution Contraindicated for pregnant women; taken after meals when there is acid regurgitation often.

Strength 10 ml per phial

Storage Preserve in tightly closed containers, store in a cool and dark place.

Xiongju Shangqing Wan (芎菊上清丸)

Xiongju Shangqing Pills

Ingredients Rhizoma Chuanxiong 20 g; Flos Chrysanthemi 240 g; Radix Scutellariae 120 g; Fructus Gardeniae 30 g; Fructus Viticis (stir-baked) 30 g; Rhizoma Coptidis 20 g; Herba Menthae 20 g. Fructus Forsythiae 30 g; Spica Schizonepetae 30 g; Rhizoma et Radix Notopterygii 20 g; Rhizoma Ligustici 20 g; Radix Platycodonis 30 g; Radix Saposhnikoviae 30 g; Radix et Rhizoma Glycirrhizae 20 g; Radix Angelicae Dahuricae 80 g.

Procedure Pulverize the above fifteen ingredients to fine powder, sift and mix thoroughly, make pills with water and dry.

Description Brownish-yellow to brown watered pills; taste, bitter.

Identification (1) Microscopical: Bast fibres pale yellow, fusiform, walls thickened, with fine pit canals. Stone cells of testa yellow or pale brown, mostly broken, long polygonal, rectangular or irregular when intact, walls thickened, with big rounded pits, lumina brownish-red. Epidermal non-glandular hairs of persistent calyx 2-3 cells, the lower part of apical cells relatively wide, warty protrudings on cell walls. Xylem fibre bundles brightly yellow, relatively thin and long, slightly thickened walls, pits distinct. The upper and lower layers of fibres of endocarp crisscrossed, short fusiform. Stone cells of pericarp pale yellowish-brown or pale yellow, mostly form pieces, limits of stone cells indistinct, with slightly thickened and deeply sinuous anticlinal walls, sparse pits. Vittae containing golden-yellow secretion, about 30 μm in diameter. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres.

(2) To 4 g of the powdered pills add 20 ml of methanol, ultrasonicate for 20 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in a small quantity of ethanol, mix with 1 g of neutral aluminium oxide and dry on a water bath. Apply to a column packed with neutral aluminium oxide (100-200 mesh, 2 g, 1 cm in internal diameter), elute with 30 ml of ethanol and evaporate the eluate to dryness. Dissolve the residue in 1 ml of ethanol and use the solution as the test solution. Dissolve geniposide CRS in ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, ethyl acetate, methanol and water (15 : 40 : 22 : 10), stand below 10℃, as the mobile phase. Apply separately to the plate 2 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with a 5% solution of vanillin in sulfuric acid, and heat to the spots clear if necessary. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) To 3 g of the powdered pills add 20 ml of ether, heat under reflux on a water bath for 30 minutes and filter. Remove ether from drug residue in air, add 20 ml of methanol, ultrasonicate for 20 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of methanol and use the supernatant as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance prepared with a solution of sodium carboxymethylcellulose containing 0.4% sodium acetate and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air and spray with a 5% solution of ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Assay Grind 6 g of the pills to fine powder, passed through No. 4 sieve, weigh accurately 1 g of the powder in a stoppered conical flask, add accurately 25 ml of a mixture of methanol and hydrocloric acid (100 : 1), weigh and macerate overnight. Ultrasonicate for 45 minutes, cool to ambient temperature weigh again and replenish the lost weight with the above mixture solution, filter and use the successive filtrate as the test solution. Dissolve a quantity of berberine hydrochloride CRS, weigh accurately, in the same mixture solution to produce a solution containing 0.06 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} containing sodium carboxymethylcellulose as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and water (12 : 6 : 3 : 3 : 0.6) as the mobile phase. Apply accurately 1-2 μl of the test solution, 1 μl and 2 μl of the reference solution to the plate, separately. After developing in a chamber saturated with ammonia vapour and allowing the solvent front to ascend 8 cm above the line of application, remove the plate and dry in air. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scaning method), scan with fluorescence mode at wavelength of $\lambda_{ex}=366$ nm, measure the integration value of fluorescent strength for the two solutions and calculate.

It contains not less than 0.97 mg per tablet of berberine hydrochloride ($C_{20}H_{18}ClNO_4$), referred to Rhizoma Coptidis.

Action To clear *heat* and release the exterior, disperse *wind* to kill pain.

Indications Aversion to wind, fever, migraine and headache, thin nasal discharge, toothache and sore throat due to affliction from external *wind*.

Usage and dosage 6 g, twice a day.

Precaution Be cautious about debilitated patients.

Storage Preserve in well closed containers, protected from moisture.

Xuanmai Ganjie Keli (玄麦甘桔颗粒)

Xuanmai Ganjie Granules

Ingredients Radix Scrophulariae 400 g; Radix Ophiopogonis 400 g; Radix et Rhizoma Glycirrhizae 400 g; Radix Platycodonis 400 g.

Procedure Decoct the above four ingredients with water for 3 times, combine the decoctions and filter. Allow the filtrate to stand for 12 hours, concentrate the supernatant to thick extract with the relative density of 1.32-1.35. To the thick extract add a quantities of sucrose and dextrin, make granules and dry.

Description Pale brown granules; taste, sweet.

Identification (1) Dissolve 10 g in 40 ml of water by heating, cool and filter. Extract the filtrate with two 30-ml quantities of ether. Separate the aqueous layer, extract with 40 ml of *n*-butanol saturated with water. Separate the *n*-butanol layer and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. To 2.5 g of Radix Scrophulariae reference drug add 50 ml of ethanol, heat under reflux for 1 hour and filter. Concentrate the filtrate to dryness, dissolve the residue in 30 ml of water by heating and prepare the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (5 : 1) as the mobile phase. Apply separately to the plate 10 μl of the test solution and 6 μl of the reference drug solution. After developing and removal of the plate, dry it in air, spray with a 1% solution of vanillin in sulfuric acid and heat at 105℃ until the spots appear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) To 10 g add 20 ml of water, 20 ml of chloroform and 3 ml of hydrochloric acid, heat under reflux for 1 hour and cool. Separate the chloroform layer, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of dehydrated ethanol and use the solution as the test solution. Dissolve glycyrrhetinic acid CRS in dehydrated ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃), benzene, ethyl acetate and glacial acetic acid (10 : 20 : 7 : 0.5) as the mobile phase. Apply separately to the plate 8 μl of the test solution and 6 μl of the reference solution. After developing and removal of the plate, dry in air, spray with a 10% solution of phosphomolybdic acid in ethanol and heat at 105℃ until the spots appear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Triturate 10 g of the granules to fine powder, heat under reflux with 40 ml of methanol on a water bath for 1 hour, filter and evaporate the filtrate to dryness. Dissolve the residue in about 10 ml of water, extract with three 15-ml quantities of *n*-butanol saturated with ammonia TS, separate the *n*-butanol layer and evaporate to dryness. Dissolve the residue in 2 ml of methanol and use the solution as the test solution. Prepare a solution with 2 g of Radix Ophiopogonis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and water (15 : 10 : 2) as the mobile phase. Apply separately to the plate 2-5 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with a 10% solution of sulfuric acid in ethanol and heat at 105℃ until the spots appear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Action To clear *heat* and nourish *yin*, and resolve phlegm to relieve sore throat.

Indications Dryness of the nose and mouth, and sore throat due to flaming of fire from *yin* deficiency.

Usage and dosage 10 g, 3-4 times a day, taken after dissolved in boiled water.

Strength 10 g per pack

Storage Preserve in tightly closed containers.

Xuanshi Yaoshui (癣湿药水)

Xuanshi Solution

Ingredients Cortex Pseudolaricis 250 g; Fructus Cnidii 125 g; Semen Hydnocarpi 125 g; Radix Stemonae 125 g; Radix Saposhnikoviae 50 g; Radix Angelicae Sinensis 100 g; Caulis Impatientis Balsaminae 125 g; Cacumen Platycladi 100 g; Fructus Evodiae 50 g; Pericarpium Zanthoxyli 125 g; Periostracum Cicadae 75 g; Mylabris 3 g.

Procedure Pulverize Mylabris to fine powder. and the other eleven ingredients to coarse powder. Combine the above powders and mix well. Carry out the method for percolation as described under Liquid Extracts and Extracts (Appendix Ⅰ O), using a mixture of ethanol and glacial acetic acid (3 : 1) as solvent. Macerate for 48 hours and percolate slowly. Collect 6700 ml of the percolate and allow to stand. To the supernatant liquid add a quantity of essence and stir well.

Description A dark yellowish-green clear liquid; odour, characteristic of acetic acid.

Identification Evaporate 5 ml to dryness, dissolve the residue in 5 ml of water and extract with two 10-ml quantities of ether. Combine the extracts, add 5 ml of saturated solution of sodium bicarbonate, shake, separate the ether solution and remove ether in air. Dissolve the residue in 1 ml of ether as the test solution. Macerate 0.5 g of Fructus Cnidii reference drug in 10 ml of a mixture of glacial acetic acid and ethanol (1 : 3) for 24 hours, filter and evaporate the filtrate to dryness. To prepare a solution in the same manner, begining from "disslove the residue in 5 ml of water", as the reference drug solution. Macerate 0.1 g of Radix Angelicae Sinensis reference drug in 2 ml of ether for several hours, use the supernatant as the reference drug

solution. Dissolve osthole CRS in methanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (17 : 3) as the mobile phase. Apply separately to the plate 4 μl of the test solution, 2 μl of the reference drug solutions and 1 μl of the reference solution. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The principal fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solutions; the fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Relative density 0.86-0.92 (Appendix Ⅶ A).

Total solids Filter a quantity of the solution through a dry filter paper. Transfer accurately 25 ml into a evaporating dish, previously dried to constant weight, evaporate to dryness on a water bath and dry at 105℃ for 3 hours. Allow to cool for 30 minutes in a desiccator, weigh rapidly, the remained solids not less than 0.75 g.

Content of acetic acid Transfer accurately 2 ml to a 100 ml volumetric flask, dilute with freshly boiled and cooled water to volume. Measure accurately 25 ml of the dilute solution, add 10 ml of freshly boiled and cooled water and 2-3 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS, until the colour turns to pink. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 6.005 mg of $C_2H_4O_2$. It contains not less than 10 per cent of acetic acid.

Action To expel *wind* and *dampness*, and kill parasites to stop itching.

Indications Tinea manuum and tinea pedis due to *wind-dampness* and *toxin* of parasites with manifestations of popular eruptions, blisters, desquamation and itching of different degrees.

Usage and dosage Clean the affected area and apply the lotion to the lesion, 3-4 times a day; for onychomycosis, remove the spongy substance of the nails in order to facilitate the permeation of the lotion.

Precaution It is for external application only. It is strictly forbidden to apply it to the eyes, nose and mucosa of the mouth.

Storage Preserve in tightly closed containers.

Xueshuan Xinmaining Jiaonang (血栓心脉宁胶囊)

Xueshuan Xinmaining Capsules

Ingredients Rhizoma Chuanxiong; Flos Sophorae; Radix et Rhizoma Salviae Miltiorrhizae; Hirudo; Radix Ilicis Pubescens; Calculus Bovis; Moschus; Total Saponins of Ginseng Stems and Leaves; Borneolum Syntheticum; Venenum Bufonis.

Procedure Decoct the Radix et Rhizoma Salviae Miltiorrhizae; Hirudo, Radix Ilicis Pubescens and Rhizoma Chuanxiong with 8 times, 5 times and 5 times volume of 60% ethanol three times, 3 hours for the first time, 2 hours for the second time and 1 hour for the third time, filter. Combine the filtrate, recover ethanol and concentrate in a vacuum, dry and pulverize. Pulverize Hirudo to fine powder for the latter use. To Flos Sophorae in 5 times volume of water, adjust pH to 8-9 with the solution saturated with calcium carbonate, heat to boil slightly for 30 minutes, filter, extract the residues in the same manner twice. Combine the filtrate, concentrate in a vacuum, dry under low temperature (60℃), pulverize. Pulverize Moschus, Venenum Bufonis and Calculus Bovis to fine powder, and mix with Borneolum Syntheticum fine powder, total Saponins of Ginseng Stems and Leaves and the above two powders, mix well, make to 1000 capsules.

Description Hard capsules, containing yellowish-brown or blackish-brown powder; taste, pungent and slightly bitter.

Identification (1) Place 2.5 g of the content, add 50 ml of methanol, heat under reflux for 1 hours, filter, evaporate the filtrate to dryness, dissolve the residue in 10 ml of water, extract with two 20-ml quantities of ether. Combine the layer of ether (keep the layer of water for further use), evaporate to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Dissolve cholic acid CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the mixture of chloroform, ether and glacial acetic acid (2 : 2 : 1) as the mobile phase. Apply separately 3 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% solution of phosphomolybdic acid in ethanol and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution correspond in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) To 2 g of Rhizoma Chuanxiong reference drug in 10 ml of chloroform, cool macerate for 1 hour, filter, and evaporate the filtrate to about 0.5 ml as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the mixture of chloroform and petroleum ether (60-90℃) (3 : 1) as the mobile phase. Apply separately 3 μl of the above test solution obtained under the test for Identification (1) and the reference drug solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the fluorescent spots in the chromatogram obtained with the reference drug solution.

(3) To the water layer obtained under the test for Identification (1), extract with two 20-ml quantities of n-butanol by shaking. Combine the *n*-butanol extracts, evaporate 1 ml of the *n*-butanol extract to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve rutin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the mixture of ethyl acetate, formic acid and water (8 : 1 : 1) as the mobile phase. Apply separately 4 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, and fumigate the plate in ammonia vapour for 30 miuntes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) To the remains *n*-butanol extract obtained under the test for Identification (3), add 3 times volume of ammonia TS, wash twice, discard the washing solution, evaporate the *n*-

butanol layer to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve ginsenoside Rb_1, ginsenoside Re and ginsenoside Rg_1 CRS in methanol to produce three solutions containing 1 mg per ml respectively as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of the mixture of chloroform, ethyl acetate, methanol and water (15 : 40 : 22 : 10) stored below 10℃ as the mobile phase. Apply separately 2 μl of the four solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and the mixture of methanol, water and glacial acetic acid (45 : 54 : 1) as the mobile phase. As detector a spectrophotometer set at 257 nm. The number of theoretical plates for the column is not less than 3000, calculated with the reference to the peak of rutin.

Reference solution Dissolve a quantity of rutin CRS dried previously to constant weight at 120℃ under reduced pressure, weigh accurately, in methanol to produce a solution containing 0.2 mg per ml as the reference solution.

Test solution Weigh accurately 0.5 g of the content of the capsules obtained under the test of weight variation, pulverized to fine powder, to 50 ml volumetric flask. Add 45 ml of methanol, stopper tightly, ultrasonicate (power 250 W, frequency 25 kHz) for 30 minutes, allow to cool, add methanol to volume, mix well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and the test solution into the column and calculate the content.

It contains not less than 12 mg of anhydrous rutin ($C_{27}H_{30}O_{16}$), referred to Flos Sophorae.

Action To replenish *qi* and promote blood circulation, and induce resuscitation and kill pain.

Indications Stroke and impeded flow of *yang-qi* in the chest due to a deficiency and stagnation of blood with manifestations of dizziness, hemiplegia, constriction in the chest, heart pain, palpitation and shortness of breath, convalescence of ischemic stroke and angina pectoris in coronary heart disease with above symptoms.

Usage and dosage 4 capsules, 3 times a day.

Precaution Contraindicated for pregnant women.

Strength 0.5 g per capsule

Storage Tightly closed.

Xuezhiling Pian
(血脂灵片)

Xuezhiling Tablets

Ingredients Rhizoma Alismatis; Semen Cassiae; Fructus Crataegi; Radix Polygoni Multiflori Praeparata Cum Succo Glycines Sotae.

Procedure Pulverize 100 g of the Radix Polygoni Multiflori Praeparata Cum Succo Glycines Sotae to fine powder. Decoct the residuary Radix Polygoni Multiflori Praeparata Cum Succo Glycines Sotae and Rhizoma Alismatis with 90% of ethanol twice, 3 hours for each time, combine the decoction; decoct Semen Cassiae and Fructus Crataegi with 70% of ethanol twice, 3 hours for the first time and 2 hours for the second time. Combine the decoction, recover ethanol, and concentrate to a thick extract for latter use. Decoct the residue of the above drugs with water for three times, 2 hours for former two times and 1 hour for the third time, combine the decoction, filter, and allow to stand for 12 hours, concentrate the supernatant liquid to a thick extract, mix with the above thick ethanol extract and fine powder, stir well, make granules, compress to 1000 tablets and coat with film.

Description Film coated tablets with yellowish-brown to blackish-brown core; taste, slightly bitter.

Identification (1) To 5 tablets, pulverized to fine powder, add 30 ml of methanol, ultrasonicate for 30 minutes, and filter, evaporate the filtrate to dryness, dissolve the residue in 10 ml of dilute hydrochloric acid solution, heat on a water bath for 30 minutes, cool, extract with two quantities, each of 15 ml, of ether, combine the ether layer, evaporate to dryness, and dissolve the residue in 1 ml of ether as the test solution. Prepare a solution of 0.5 g of Radix Polygoni Multiflori reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of the mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 1 μl of thetest solution and the reference solution to the plate. After developing and removal of the plate, dry in air, heat at 105℃ for about 5 minutes, and examine under ultraviolet lightat 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the fluorescent spots in the chromatogram obtained with the reference drug solution.

(2) To 5 tablets, pulverized to fine powder, add 30 ml of ether, macerate for 30 minutes, ultrasonicate for 15 minutes, and filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethanol absolute as the test solution. Dissolve ursolic acid CRS in ethanol absolute to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 4% solution of sodium acetate as the coating substance and the mixture of ether and acetone (4 : 1) as the mobile phase. Apply separately 1 μl of the the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% solution of sulfuric acid in ethanol, heat at 105℃ to the spots clear, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the fluorescent spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay ***Radix Polygoni Multiflori Praeparata Cum Succo Glycines Sotae*, *Semen Cassiae*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and the mixture of methanol and 0.1% solution of phosphoric

acid (85 : 15) as the mobile phase. As detector a spectrophotometer set at 254 nm. The number of theoretical plates for the column is not less than 3000, calculated with the reference to the peak of emodin.

Reference solution Dissolve a quantity of emodin CRS, weigh accurately, in methanol to produce a solution containing 10 μg of emodin per ml as the reference solution.

Test solution Weigh about 0.3 g of the content of the capsules obtained under the test of weight variation, pulverized to fine powder, weigh accurately to a conical flask with stopper. Add accurately 25 ml of methanol, stopper tightly, weighed accurately, heat under reflux for 1 hour, cool, weighted accurately again, replenished the lost weight with methanol, mix well and filter. Discard the initial filtrate, measure accurately 5 ml of the successive filtrate to a stopped flask, add 10 ml 2.5 mol/L solution of sulfuric acid and 20 ml of chloroform, heat under reflux for 2 hours. To chloroform layer, extract the water layer with 10 ml of chloroform by shaking, combine the chloroform, wash with 10 ml of water, evaporate the chloroform extracts to dryness on a water bath, dissolve the residue in methanol, transfer to a 10 ml volumetric flask, add methanol to volume, mix well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 0.15 mg of emodin ($C_{15}H_{10}O_5$) per tablet, referred to Radix Polygoni Multiflori Praeparata Cum Succo Glycines Sotae and Semen Cassiae.

Radix Polygoni Multiflori Praeparata Cum Succo Glycines Sotae Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and the mixture of acetonitrile and water (22 : 78) as the mobile phase. As detector a spectrophotometer set at 320 nm. The number of theoretical plates for the column is not less than 3000, calculated with the reference to the peak of 2,3,5,4'-tetrahydroxystilbene-2-O-β-D-glucoside.

Reference solution Dissolve a quantity of 2,3,5,4'-tetrahydroxystilbene-2-O-β-D-glucoside CRS, weigh accurately, in methanol to produce a mixed solution containing each CRS 36 μg per ml as the reference solution.

Test solution Weigh about 0.2 g of the content of the capsules obtained under the test of weight variation, pulverized to fine powder, weigh accurately to a stopper conical flask. Add accurately 25 ml of methanol, stopper tightly, weigh accurately, ultrasonicate (power 350 W, frequency 50 kHz) for 30 minutes, allowed to cool, weight accurately again, replenished the lost weight with methanol, mix well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution separately into the column and calculate the content.

It contains not less than 0.50 mg of 2,3,5,4'-tetrahydroxystilbene-2-O-β-D-glucoside ($C_{20}H_{22}O_9$) per tablet, referred to Radix Polygoni Multiflori Praeparata Cum Succo Glycines Sotae.

Action To resolve turbidity and lower blood lipids, and moisten the intestines to promote bowel movements.

Indications Hyperlipemia due to phlegm accumulation with manifestations of heaviness of the head, lethargy and dry stools.

Usage and dosage 4-5 tablets, 3 times a day.

Strength 0.3 g per tablet

Storage Tightly closed.

Xuezhining Wan
(血脂宁丸)

Xuezhining Pills

Ingredients Semen Cassiae; Fructus Crataegi; Folium Nelumbinis; Radix Polygoni Multiflori Preparata Cum Succo Glycines Sotae.

Procedure Pulverize the above four ingredients to fine powder, sift and mix with a quantity of refined sugar powder thoroughly. To each 100 g of the powder add 70-90 g of refined honey to make big honeyed pills.

Description Deep brown big honeyed pills; taste, sweet and sour.

Identification Triturate well 9 g of the pills, cut into pieces, with 4 g of kieselguhr, add 30 ml of methanol, ultrasonicate for 30 minutes and filter. Evaporate the filtrate to dryness, dissolve the residue in 10 ml of a 0.5% solution of sodium hydroxide and filter. Acidify the filtrate with hydrochloric acid, extract with two 15-ml quantities of ethyl acetate. Combine the extracts and evaporate to dryness. Dissolve the residue in 1 ml of ethyl acetate as the test solution. To 2 g of Radix Polygoni Multiflori reference drug add 30 ml of chloroform, ultrasonicate for 15 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ethyl acetate as the reference drug solution. Dissolve ursolic acid CRS in ethyl acetate to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance prepared with a 0.5% solution of sodium hydroxide and a mixture of toluene, ethyl acetate and formic acid (15 : 2 : 1) as the mobile phase. Apply separately to the plate 4 μl of the test solution and 1 μl of each of the reference drug solution and reference solution. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Then spray with a 10% solution of sulfuric acid in ethanol, heat at 105℃ for several minutes. The purplish-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Weigh accurately 2 g of the pills, obtained in the test of weight variation, cut into pieces and mix well, add 30 ml of methanol in a conical flask, ultrasonicate for 60 minutes, filter, ultrasonicate the drug residue and the filter paper with 30 ml of methanol for 30 minutes, filter and wash the drug residue with 20 ml of methanol. Evaporate the mixture of combined filtrates and washing to dryness on a water bath, dissolve the residue in methanol and transfer to a 10 ml volumetric flask. Dilute with methanol to volume, mix well and use the solution as the test solution. Dissolve a quantity of ursolic acid CRS, weigh accurately, in methanol to produce a solution containing 0.1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (20 : 0.5) as the mobile phase. Apply accurately 2 μl of the test solution, 2

μl and 4 μl of the reference solution to the plate, separately. After developing and removal of the plate, dry in air, spray with a 10% solution of sulfuric acid in ethanol and heat at 105℃ to the spots clear. Cover the plate with a same size glass and fix with a adhesive tape. Carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan at wavelength of λ_S=540 nm and λ_R=420 nm, measure the integration values of absorbance of the test solution and the reference solution, and calculate.

It contains not less than 4.5 mg per pill of ursolic acid ($C_{30}H_{48}O_3$), referred to Fructus Crataegi.

Action To resolve turbidity and lower blood lipids, and moisten the intestines to promote bowels movement.

Indications Hyperlipemia due to blockage of the lung by phlegm with manifestations of dizziness, constriction in the chest and dry stools.

Usage and dosage 2 pills, 2-3 times a day.

Precaution It is forbidden to prescribe to patients with severe gastric ulcer and hyperhydrochloria or cautious about them.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Xuhan Weitong Keli (虚寒胃痛颗粒)

Xuhan Weitong Granules

Ingredients Radix Astragali Praeparata Cum Melle; Radix Et Rhizoma Glycyrrhizae Praeparata Cum Melle; Ramulus Cinnamomi; Radix Codonopsis; Radix Paeoniae Alba; Rhizoma Alpiniae Officinarum; Fructus Jujubae; Rhizoma Zingiberis.

Procedure Isolate the volatile oil form Rhizoma Alpiniae Officinarum and Rhizoma Zingiberis by distillation, and collect the aqueous extract solution in another container. Decoct the other 6 ingredients with water for 2 times, 2 hours for the first time and 1 hour for the second time. Combine the decoctions, filter, combine the filtrate and the above aqueous extract solution, concentrate to a thin extract with a relative density of 1.04-1.08 (50℃), add three quantities of ethanol, stand for 24 hours. Separate the supernatant, recover the ethanol and concentrate to form a thin extract with a relative density of 1.18-1.22 (50℃). To the extract, add a quantity of sucrose and dextrin to make granules, dry, allow to cool, spray with the volatile, mix well, make to 1000 g of granules, or to the extract, add a quantity of dextrin to make granules, dry, allow to cool, spray with the volatile, mix well, make to 600 g of granules (without sucrose).

Description Pale brownish-yellow to brownish-yellow granules; taste, pungent and sweet.

Identification (1) Pulverize 15 g of the granules or 9 g of the granules (without sucrose), dissolve the above power in 40 ml of water. Extract with two 40-ml quantities of ether, discard the ether extract. Extract the water layer with two 40-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extract and wash with two 40-ml of 0.5% solution of sodium hydroxide and wash with water to neutral. Evaporate the n-butanol extract to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of Astragaloside Ⅳ CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, ethyl acetate, methanol and water (15 : 40 : 22 : 10), standing below 10℃, as the mobile phase. Apply separately 10 μl of each of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and heat at 105℃ to the spots clear. Examine in daylight, the spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. Examine under ultraviolet light at 365 nm, the orange fluorescent spot with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Disslove 15 g of the granules or 9 g of the granules (without sucrose) in 40 ml of water, centrifuge, extract the supernatant with two 20-ml quantities of *n*-butanol. Combine the *n*-butanol extract and evaporate to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve a quantity of paeoniflorin CRS in ethanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (4 : 1) as the mobile phase. Apply separately 10 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric, and heat at 105℃ to the spot clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Pulverize 20 g of the granules or 12 g of the granules (without sugar), ultrasonicate for 15 minutes with 50 ml of ether and filter. Dehydrate the filtrate with 1 g of anhydrous sodium sulfate and filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of absolute ethanol as the test solution. Dissolve a quantity of cinnamic acid CRS in absolute ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of n-hexane, ether and glacial acetic acid (5 : 5 : 0.1) as the mobile phase. Apply separately 15 μl of the test solution and 10 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 254 nm. The dark purple spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.02 mol/L solution of potassium dihydrogen phosphate (28 : 72) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of the theoretical plates of the column is not less than 4000, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, weigh accurately, in methanol to prepare a solution containing 50 μg per ml.

Test solution Pulverize granules, obtained under the test of packing variation, to fine powder. Weigh accurately 1 g of

the powder of granules or 0.6 g of the powder of granules (without sugar), place to a 100 ml volumetric flask and add 80 ml of water. Ultrasonicate (power 250 W, frequency 33 kHz) for 30 minutes, allow to cool, dilute with water to volume, and mix well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 8.0 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per pack, referred to Radix Paeoniae Alba.

Action To replenish *qi* to invigorate the spleen, and warm the stomach to kill pain.

Indications Stomachache due to *deficiency* in the spleen and *stomach* with manifestations of dull pain in the stomach, alleviated with warmth and pressure, or getting worse with cold or an empty stomach; duodenal bulbar ulcer, atrophic gastritis with above symptoms.

Usage and dosage 1 pack, 3 times a day. Taken with boiled water.

Strength (1) 5 g per pack (2) 3 g per pack (without sucrose)

Storage Preserve in tightly closed containers.

Yajiao Hadun San (雅叫哈顿散)

Yajiao Hadun Powder

Yajiao Hadun Powder is a prescription used by the Dai Nationality.

Ingredients Radix Asparagi Pseudofilicini 100 g; Radix Streptocauli 100 g; Fructus Benincasae 100 g; Rhizoma Taccae 100 g; Radix Inulae Cappae 100 g; Herba Viticis 100 g.

Procedure Pulverize the above six ingredients to very fine powders, sift and mix well.

Description A dark grey powder; odour, slightly aromatic; taste, slightly bitter.

Identification Microscopical: Needle crystals of calcium oxalate 40-60 μm long. Starch granules subrounded, cuculliform, 5-25 μm in diameter, hilum 1-shaped, V-shaped, or cracked. Compound granules composed of 2-3 components. Fragments of exocarp with cyclocytic stomata, subsidiary cells 4-5. Stone cells colourless or yellow, subrectangular, 20-25 μm in diameter, walls thickened, lignified, and distinctly pitted. Non-glandular hairs 2-5 celled, 45-175 μm long, with warty walls; glandular hairs 27-65 μm long, with a 1-2-celled head, containing yellow secretion, and a 1-2-celled stalk.

Other requirements Comply with the general requirements for powders (Appendix I B).

Action To remove toxic *heat*, alleviate pain, and arrest bleeding.

Indications Common colds with fever, laryngitis; distending pain in the chest and abdomen; palpitation in consumptive diseases; menstrual disorders, postpartum hemorrhage.

Usage and dosage 3-9 g, 3 times a day.

Storage Preserve in tightly closed containers.

Yangdan Wan (羊胆丸)

Yangdan Pills

Ingredients Extractum Fellis Ovisis Siccum 53 g; Radix Stemonae 150 g; Rhizoma Bletillae 200 g; Bulbus Fritillariae Thunbergii 100 g; Radix et Rhizoma Glycyrrhizae 60 g.

Procedure Pulverize Radix et Rhizoma Glycyrrhizae and Rhizoma Bletillae to fine powder respectively. Pulverize the other three ingredients to fine powder, sift, mix thoroughly, reserve a small portion for lubricating in processing and mix thoroughly the other portion with the powder of Rhizoma Bletillae. Make pills with water and coat with the powder of Radix et Rhizoma Glycyrrhizae and dry.

Description Greyish-yellow watered pills; odour, slightly stinking; taste, sweet and bitter.

Identification (1) Microscopical: Starch granules ovoid, 35-48 μm in diameter, hilum pointed, V-shaped or U-shaped, situated at the narrow end, striations minute and dense. Raphides of calcium oxalate 27-88 μm long. Fibre bundles surrounded by parenchymatous cells containing

prisms of calcium oxalate, forming crystal fibres. Wood parenchymatous cells surrounding vessels subrectangular, with slightly thickened and relatively large rounded pitted walls.
(2) To a small quantity, in powder, add 2 drops of sulfuric acid, and 1 drop of water successively, a rose-red colour is produced.

Other requirements Comply with the general requirements for pills except disintegration (Appendix Ⅰ A).

Action To relieve coughing, resolve phlegm, and arrest bleeding.

Indications Coughing with phlegm or bloody sputum due to blockage of the lung by *phlegm-fire*; whooping cough with above symptoms.

Usage and dosage 3 g, 3 times a day.

Storage Preserve in tightly closed containers, protected from moisture.

Yanghe Jiening Gao (阳和解凝膏)

Yanghe Jiening Plaster

Ingredients Herba Arctii Recence 480 g (or Herba Arctii 120 g); Caulis Impatientis Balsaminae Recence 40 g (or Caulis Impatientis 10 g); Radix Aconiti 20 g; Ramulus Cinnamomi 20 g; Radix et Rhizoma Rhei 20 g; Radix Angelicae Sinensis 20 g; Radix Aconiti Kusnezoffii 20 g; Radix Aconiti Lateralis 20 g; Pheretima 20 g; Bombyx Batryticatus 20 g; Radix Paeoniae Rubra 20 g; Radix Angelicae Dahuricae 20 g; Radix Ampelopsis 20 g; Rhizoma Bletillae 20 g; Rhizoma Chuanxiong 10 g; Radix Dipsaci 10 g; Radix Saposhnikoviae 10 g; Herba Schizonepetae 10 g; Faeces Trogopterori 10 g; Radix Aucklandiae 10 g; Fructus Citri 10 g; Pericarpium Citri Reticulatae 10 g; Cortex Cinnamomi 20 g; Olibanum 20 g; Myrrha 20 g; Styrax 40 g; Moschus 10 g.

Procedure Pulverize Cortex Cinnamomi, Olibanum and Myrrha to fine powder, triturate with Moschus, sift and mix thoroughly. Crash properly all the other ingredients except Styrax, place together with 2400 g of edible vegetable oil in a pot and fry to drying up. Discard the residue, filter and refine until the oil becomes pearl form when droping. Add 750-1050 g of minium to the oil, stir thoroughly, collect the plaster and soak into water. Melt the plaster over gentle flame, add Styrax and the above fine powder, stir well and spread on the pieces of paper in suitable size.

Description A black plaster spread on paper.

Other requirements Comply with the general requirements for plasters (Appendix Ⅰ P).

Action To warm *yang* to resolve *dampness*, reduce swelling and disintegrate nodulations.

Indications Abcesses due to *cold* and phlegm retention, scrofula without ulceration or pain caused by obstruction of *qi* and cold-dampness due to a deficiency of *yang* of the spleen and *kidney*, and retention of *phlegm* and stasis stagnation.

Usage and dosage Softened by heating and applied topically.

Strength Net weight per piece: (1) 1.5 g (2) 3 g (3) 6 g (4) 9 g

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Yangshen Baofei Wan (洋参保肺丸)

Yangshen Baofei Pills

Ingredients Pericarpium Papaveris 120 g; Fructus Schisandrae Chinesis (stir-baked with vinegar) 30 g; Bulbus Fritillariae Cirrhosae 60 g; Pericarpium Citri Reticulatae 60 g; Fructus Amomi 30 g; Fructus Aurantii Immaturus 60 g; Herba Ephedrae 30 g; Semen Armeniacae Amarum 60 g; Gypsum Fibrosum 30 g; Radix et Rhizoma Glycyrrhizae 60 g; Radix Scrophulariae 60 g; Pulvis Radix Panacis Quinquefolii 45 g.

Procedure Pulverize the above ingredients except Pulvis Radix Panacis Quinquefolii to fine powder, sift and mix thoroughly, and triturate with Pulvis Radicis Panacis Quinquefolii thoroughly and sift. To each 100 g of the powder add 120-130 g of refined honey to make big honeyed pills.

Description Blackish-brown big honeyed pills; taste, sweet, slightly bitter.

Indentification (1) Microscopical: Stone cells of epidermis of testa pale yellowish-brown, subpolygonal in surface view, walls thickened with very fine and closed pits, lumina containing dark brown substances. Sclerenchy matous cell of endopleura yellowish-brown or brownish-red, subpolygonal in surface view, walls thickened, lumina containing a silica body. Stomata special, guard cells dumbbell-like in lateral view. Irregular plate crystals colourless with straight striations. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Stone cells yellowish-brown or colourless, subrectangular, subrounded or irregular, striation well-defined, up to 94 μm in diameter.
(2) Heat under reflux 2 pills, cut into pieces and ground with 6 g of kieselguhr, with 50 ml of chloroform and 2 ml of concentrated ammonia TS, for 30 minutes. Filter and evaporate the filtrate to dryness, dissolve the residue in 0.5 ml of methanol as the test solution. Prepare a solution of 1 g of Pericarpium Papaveris reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance mixed with 2% solution of sodium hydroxide solution, and a mixture of toluene, acetone, dehydrated ethanol and concentrated ammonia TS (20 : 20 : 3 : 1) as the mobile phase. Apply separately to the plate 10 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with dilute potassium iodobismuthate TS and alcoholic sodium nitrite TS successively. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(3) Pulverize 4 pills, cut into pieces, with 12 g of kieselguhr, add 5 ml of concentrated ammonia TS and 50 ml of chloroform, heat under reflux for 1 hour and stand to cool. Filter and extract the filtrate with two 20-ml quantities of 0.1 mol/L solution of hydrochloric acid. Combine the extract, adjust to pH 10 with concentrated ammonia TS, extract with two 20-ml quantities of chloroform, combine the chloroform extract, and evaporate to dryness. Dissolve the residue in 0.5 ml of ethanol as the test solution. To 2 g of Bulbus Fritillariae Cirrhosae reference drug, add 1 ml of concentrated ammonia TS and 30 ml of chloroform, prepare in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B),

using silica gel G as the coating substance and a mixture of *n*-hexane, ethyl acetate and diethylamine (12 : 10 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air and spray with dilute potassium iodobismuthate TS and alcoholic sodium nitrite TS. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Pulverize 1 pills, cut into pieces, with 3 g of kieselguhr, add 30 ml of methanol, and ultrasonicate for 30 minutes. Filter and evaporate the filtrate to dryness. Dissolve the residue with a quantities of water, apply to a column of polyamide (60-80 mesh, 3 g, 1.0 cm in diameter), wash with 50 ml of water, and elute with 50 ml of methanol. Collect the eluate, and evaporate to dryness. Dissolve the residue in 1 ml of ethanol as the test solution. Dissolve a quantity of hesperidin CRS in methanol to prepare a saturated solution as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, methanol and water (100 : 17 : 13) as the mobile phase. Apply separately 2 μl of the test solution and 10 μl of the reference solution to the plate. After developing for about 3 cm and removal of the plate, dry in air. Use the upper layer of a mixture of toluene, ethyl acetate, formic acid and water (20 : 10 : 1 : 1) as the mobile phase, after developing again for about 8 cm and removal of the plate, dry in air, spray with aluminium chloride TS, and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(5) Dissolve a quantity of ephedrine hydrochloride CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and concentrated ammonia TS (4 : 1 : 0.1) as the mobile phase. Apply separately 2 μl of the reference solution and 10-20 μl of the test solution obtained under Identification (3) to the plate. After developing and removal of the plate, dry in air and spray with ninhydrin TS and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(6) Pulverize one and half pills, cut into pieces, with 4.5 g of kieselguhr, add 50 ml of chloroform, heat under reflux for 1 hour and stand to cool. Discard the chloroform extract and expel solvent of the residue. Heat under reflux the drug residue with 50 ml of methanol for 1 hour, stand to cool, filter and evaporate to dryness. Dissolve the residue with 20 ml of water, extract with three 20-ml quantities of *n*-butanol saturated with water, combine the extract, wash with two 20-ml quantities of 0.1 mol/L solution of sodium hydroxide, and wash again with 20 ml of water saturated with *n*-butanol. Evaporate *n*-butanol extract, dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 0.5 g of Radix Panacis Quinquefolii reference drug and 30 ml of chloroform in the same manner as the reference drug solution. Dissolve a quantity of pseuoginsenoside F_{11} CRS, Ginsenoside R_{b1} CRS, Ginsenoside Re CRS and Ginsenoside Rgl CRS with methanol to prepare a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using high performance silica gel plate and the upper layer of a mixture of chloroform, ethyl acetate, methanol and water (15 : 40 : 22 : 10, standing for 12 hours at 5-10℃) as the mobile phase. Apply separately 2 μl of the above three solutions to the plate. After developing and removal of the plate, dry in air and spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. Examine in daylight, the spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution. Examine under ultraviolet light at 365 nm, the fluorescent spots obtained with test solution correspond to the spots obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To nourish *yin* and reinforce the lung, and relieve coughing panting.

Indications Coughing and panting due to phlegm, constriction in the chest and shortness of breath, dry mouth and throat and insomnia.

Usage and dosage 2 pills, 2-3 times a day.

Precaution Contraindicated for patients with coughin common colds.

Strength 6 g per pill

Storage Preserve in tightly closed containers.

Yangxin Dingji Gao (养心定悸膏)

Yangxin Dingji Concentrated Decoction

Ingredients Radix Rehmanniae 120 g; Radix Ophiopogonis 60 g; Radix et Rhizoma Ginseng Rubra 20 g; Fructus Jujubae 60 g; Colla Corii Asini 20 g; Semen Sesami Nigrum 50 g; Ramulus Cinnamomi 30 g; Rhizoma Zingiberis Recens 30 g; Radix et Rhizoma Glycyrrhizae Praeparata 40 g.

Procedure Cut Radix Ginseng Rubra into slices, macerate in warm water for 1 hour, decoct for 2 times, 2 hours each, combine the decoctions, and filter. Press Rhizoma Zingiberis Recens to obtain the juice. Extract volatile oil from Ramulus Cinnamomi. Decoct the other ingredients, except Colla Corii Asini, and the residues of Radix Ginseng Rubra, Rhizoma Zingiberis Recens and Ramulus Cinnamomi with water for 2 times, 2 hours each, combine the decoctions, filter, add the extract of Radix Ginseng Rubra to the filtrate, concentrate to produce a thick extract, dissolve Colla Corii Asini in 30 g of yellow rice wine. Make 120 g of sucrose into syrup and add the syrup together with the dissolved Colla Corii Asini and 20 g of refined honey to the above thick extract, continue to concentrate to an appropriate thick extract, cool, add juice of Rhizoma Zingiberis Recens and volatile oil of Ramulus Cinnamomi, mix well, and make to about 300 g of concentrated decoction.

Description A brown, viscous and thick liquid; odour, aromatic; taste, sweet.

Identification (1) To 10 ml add 10 ml of water, mix well, saturate with sodium chloride and extract with 15 ml of ether. Transfer the ether layer to a white porcelain dish, evaporate to dryness, add several drops of 0.5% vanillin in sulfuric acid; a purplish-red colour is produced.

(2) To 10 ml add 5 ml of water, mix well, extract with 10 ml of *n*-butanol, evaporate the *n*-butanol extract to dryness on a water bath, and dissolve the residue in 1 ml of chloroform. Transfer the chloroform solution to a test tube,

add 0.5 ml of sulfuric acid along the tube wall; a red ring is produced at the conjunction of the two liquids.

Relative density 1.08-1.10 (Appendix Ⅶ A), using 10 g, dilute with 20 ml of water.

Other requirements Comply with the general requirements for concentrated decoction (Appendix Ⅰ F).

Assay Weigh accurately 3 g, carry out the method for determination of nitrogen (Appendix Ⅸ L, method 1). The total nitrogen content is not less than 1.0 per cent.

Action To nourish blood and *qi*, and restore normal pulse to cure palpitation.

Indications Palpitation and shortness of breath, arrhythmia, night sweating, insomnia, dry throat and tongue and constipation due to a deficiency of *qi* and blood.

Usage and dosage 15-20 g, twice a day.

Precaution Contraindicated for patients with abdominal bloating, loose stools, poor appetite and greasy fur.

Storage Preserve in tightly closed containers, stored in a cool place.

Yangxue Shengfa Jiaonang (养血生发胶囊)

Yangxue Shengfa Capsules

Ingredients Radix Rehmanniae Praeparata; Radix Angelicae Sinensis; Rhizoma et Radix Notopterygii; Fructus Chaenomelis; Rhizoma Chuanxiong; Radix Paeoniae Alba; Semen Cuscutae; Rhizoma Gastrodiae; Radix Polygoni Multiflori Praeparata.

Procedure Pulverize Radix Angelicae Sinensis, Rhizoma et Radix Notopterygii, Rhizoma Chuanxiong, Radix Polygoni Multiflori Praeparata and Rhizoma Gastrodiae to fine powder; decoct the other four ingredients with water for three times, 2 hours each for the first and the second time and 1 hour for the third time, combine the decoctions and filter; concentrate the filtrate to a quantity, mix thoroughly with the above powder and make granules, dry, sift and pack into capsules.

Description Capsules, containing dark brown granule and powder; taste, pungent, slightly bitter.

Identification (1) Macerate 4 g of the contents in 20 ml of methanol overnight, filter, evaporate the filtrate to dryness on a water bath and dissolve the residue in 5 ml of 5% solution of sodium hydroxide. Transfer to a separator, acidify with hydrochloric acid, extract with 10 ml of ethyl acetate, separate the ethyl acetate solution and use it as the test solution. Prepare a solution of 2 g of Radix Polygoni Multiflori reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance mixed with 0.5% sodium hydroxide solution and a mixture of toluene, ethyl acetate and formic acid (15 : 2 : 1) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The spots turn to red on exposure to ammonia vapour.

(2) Ultrasonicate 10 g of the content with 50 ml of ethanol for 30 minutes, filter, evaporate the filtrate to dryness, dissolve the residue with 3 ml of ethanol, apply to a column packed with macroporous absorption resins D101 (1 cm in diameter and 15 cm high), wash with 40 ml of water, and elute with 40 ml of 40% ethanol. Collect the eluate, evaporate to dryness, and dissolve the residue with 1 ml of ethanol as the test solution. Dissolve a quantity of paeoniflorin CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 6 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% vanillin in sulfuric acid, heat at 105℃ to spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Macerate 5 g of the content with 30 ml of ether for 1 hour, filter, evaporate the filtrate to dryness, and dissolve the residue with 1 ml of methanol as the test solution. Prepare a solution of 1 g of Rhizoma Chuanxiong reference drug and 10 ml of ether in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 4 μl of the test solution and 2 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (19 : 81) as the mobile phase. As detector a spectrophotometer set at 320 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of 2, 3, 5, 4′-tetrahedroxystilbene-2-O-β-D-glucoside.

Reference solution Dissolve a quantity of 2, 3, 5, 4′-tetrahedroxystilbene-2-O-β-D-glucoside CRS, in dilute ethanol TS to prepare a solution containing 50 μg per ml.

Test solution Mix thoroughly the contents obtained under the test of weight variation, weigh accurately 1 g in a stopper conical flask, add accurately 50 ml of dilute ethanol, and weigh. Heat under reflux for 30 minutes, stand to cool, replenish the lost weight with dilute ethanol, and mix well. Filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 5-10 μl of the test solution into the column, and calculate the content.

It contains not less than 1.1 mg of 2, 3, 5, 4′-tetrahedroxystilbene-2-O-β-D-glucoside ($C_{20}H_{22}O_9$) per capsule, referred to Radix Polygoni Multiflori Praeparata.

Action To nourish blood and expel *wind*, and reinforce the kidney and replenish essence.

Indications Alopecia areata and alopecia seborrhoeica due to a deficiency of blood and excess of *wind*, as well as a deficiency of *kidney-essence*, with manifestations of loss of hair patch by patch, or baldness, local exposure of scalp, loose hair around the area of baldness or sparse loss of hair,

trichoxerosis or liparotrichia, itching of scalp; Alopecia areata, baldness and alopecia seborrheica with above symptoms.

Usage and dosage 4 capsules, twice a day.

Strength 0.5 g per capsule

Storage Preserve in tightly closed containers.

Yangyin Qingfei Gao (养阴清肺膏)

Yangyin Qingfei Concentrated Decoction

Ingredients Radix Rehmanniae 100 g; Radix Ophiopogonis 60 g; Radix Scrophulariae 80 g; Bulbus Fritillariae Cirrhosae 40 g; Radix Paeoniae Alba 40 g; Cortex Moutan 40 g; Herba Menthae 25 g; Radix et Rhizoma Glycyrrhizae 20 g.

Procedure Carry out the method for percolation described under extracts and liquid extracts (Appendix Ⅰ O), percolate Bulbus Fritillariae Cirrhosae with 70% ethanol, macerate for 18 hours, collect the percolated solution at the speed of 1-3 ml per minute until the soluble matter is percolated completely, then recover the ethanol. Distil Cortex Moutan and Herba Menthae with steam, collect the distillate, separate the volatile oil and preserve in other container. To the drug residue and another five ingredients, add water and decoct twice, each for 2 hours, combine the decoctions, allow to stand and filter. Combine the filtrate with extract of Bulbus Fritillariae Cirrhosae, concentrate to an appropriate quantity, add 500 g of refined honey, mix well and filter. Concentrate the filtrate to a specified relative density, allow to cool, add the solution of volatile oil of Cortex Moutan and Herba Menthae, mix well.

Description A dark brown and thick semi-fluid; odour, aromatic; taste, sweet with a sensation of cool.

Identification (1) Take about 2 g of the decoctions to a 100 ml beaker, add 10 ml of water, stir well, cover a piece of filter paper, previously moistened with water, on the mouth of the beaker and add a small quantity of mixed powder containing 1 portion of 2,6-dichloro-quinone-chlorimide and 32 portions of sodium tetraborate on the filter paper. Cover it with a watch glass and boil gently then stop heating, a blue colour is shown on the filter paper.

(2) Measure 25 ml of the decoctions to a stoppered conical flask, add 4 ml of the mixture of 1 mol/L solution of hydrochloric acid and methanol (3 : 1), mix well and macerate for 1 hour. Transfer to a separator, extract with successive quantities of 30 ml, 15 ml and 15 ml of chloroform, combine the chloroform extracts, recover chloroform to dryness in vacuum. Dissolve the residue in 1 ml of ethanol as the test solution. Dissolve a quantity of paeonol CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of cyclohexane and ethyl acetate (3 : 1) as the mobile phase. Apply separately to the plate 4 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with 5% ferric chloride in ethanol acidified with hydrochloric acid. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Ultrasonicate 10 ml of the decoction with 50 ml of methanol for 30 minutes, filter, evaporate the filtrate to dryness, dissolve the residue with 100 ml of water, apply to a column packed with GDX-201 macroporous absorption resins (60-80 mesh, 1 cm in diameter and 12 cm high), wash with 50 ml of 5% methanol, and elute with 50 ml of 35% methanol. Collect the eluate, evaporate to dryness, and dissolve the residue with 2 ml of methanol as the test solution. Dissolve a quantity of paeoniflorin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 4 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat at 105℃ to spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spots in the chromatogram obtained with the reference solution.

Relative density Not less than 1.37 (Appendix Ⅶ A).

Other requirements Comply with the general requirements for concentrated decoctions (Appendix Ⅰ F).

Action To nourish *yin* to relieve dryness by moistening, and clear *lung-heat* to cure sore throat.

Indications Dry and sore throat, dry cough with expectoration of scanty phlegm or blood-flecked phlegm due to *lung-dryness* from *yin* deficiency.

Usage and dosage 10-20 ml, 2-3 times a day.

Storage Preserve in tightly closed containers, stored in a cool place.

Yangyin Qingfei Wan (养阴清肺丸)

Yangyin Qingfei Pills

Ingredients Rhizoma Rehmanniae 200 g; Radix Ophiopogonis 120 g; Radix Scrophulariae 200 g; Bulbus Fritillariae Cirrhosae 80 g; Radix Paeoniae Alba 80 g; Cortex Moutan 80 g; Herba Menthae 50 g; Radix et Rhizoma Glycyrrhizae 40 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix well. To each 100 g of the powder add 70-90 g of refined honey to make big honeyed pills.

Description Black big honeyed pills; taste, sweet and slightly bitter.

Identification (1) Microscopical: Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Parenchyma grayish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Stone cells yellowish-brown or colourless, subrectangular, subround or irregular, about 94 μm in diameter. Needle crystals of calcium oxalate in bundles or scattered, 24-50 μm long, about 3 μm in diameter. Hesperidin crystals pale yellow, occurring in mesophyll tissues, especially abundant in palisade tissues.

(2) Cut 1 pill into pieces, ultrasonicate with 30 ml of methanol for 30 minutes, filter, and evaporate the filtrate to dryness at a lower temperature. Dissolve the residue in 30 ml of water, extract by shaking with two 20-ml quantities of ether, combine the ether extracts, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of paeonol CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography

(Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (13 : 2) as the mobile phrase. Apply separately to the plate 2 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with a 5% ferric chloride in ethanol acidified with hydrochloric acid and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solutions.
(3) Cut 1 pill into pieces, ultrasonicate with 40 ml of methanol for 40 minutes, and allow to cool. Filter, evaporate the filtrate to dryness, and dissolve the residue in 20 ml of 5% methanol. Apply the solution to a column packed with GDX-201 macroporous absorption resin (60-80 mesh, 1 cm in diameter, 12 cm high), elute with 50 ml of 5% methanol, discard the elute, then elute with 50 ml of 35% methanol, collect the eluate, evaporate to dryness, and dissolve the residue in 2 ml of methanol as the test solution. Dissolve a quantity of paeoniflorin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phrase. Apply separately to the plate 4 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with 5% vanillin solution in sulfuric acid, and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsiane bonded silica gel as the stationary phase and a mixture of acetonitrile, water and glacial acetic acid (33 : 67 : 2) as the mobile phase. As detector a spectrophotometer set at 274 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of paeonol.

Reference solution Dissolve a quantity of paeonol CRS in methanol to prepare a solution containing 20 μg per ml as the reference solution.

Test solution Weigh accurately 1 g, obtained under the test of weight variation, cut into pieces and mixed well, add accurately 50 ml of methanol, stopper tightly, weigh, heat under reflux for 1 hour, allow to cool, weigh again, replenish the loss of weight with methanol, shake well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.
It contains not less than 5.8 mg of paeonol ($C_9H_{10}O_3$) per pill, referred to Cortex Moutan.

Action To replenish *yin* and relieve *dryness* by moistening, and clear *lung-heat* to ease the throat.

Indications Dry and sore throat, dry cough with expectoration of scanty phlegm or blood-flecked phlegm due to *lung-dryness* from *yin* deficiency.

Usage and dosage 1 pill, twice a day.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Yao'aitiao
(药艾条)

Yao'ai Paper Strip-rolls

Ingredients Folium Artemisiae Argyi 20000 g; Ramulus Cinnamomi 1250 g; Rhizoma Alpiniae Officinarum 1250 g; Herba Pogostemonis 500 g; Lignum Dalbergiae Odoriferae 1750 g; Rhizoma Cyperi 500 g; Radix Angelicae Dahuricae 1000 g; Pericarpium Citri Reticulatae 500 g; Radix Salviae Miltiorrhizae 500 g; Radix Aconiti 750 g.

Procedure Triturate Folium Artemisiae Argyi to tiny pieces. Pulverize all the other ingredients to fine powder, sift and mix thoroughly. Spread homogeneously 20 g of the tiny pieces of Folium Artemisiae Argyi on a sheet of white cotton-paper of 28 cm in length and 15 cm in width and sprinkle evenly 8 g of the above powder. Fold the cotton paper from two sides for 6 cm, make paper-rolls, and make 1000 rolls seal dry at a lower temperature.

Description Cylindrical, 20-21 cm long, 1.7-1.8 cm in diameter; odour, aromatic, smoked persistently with characteristic odour after burning.

Identification (1) Microscopical: T-shaped hairs curved, with a 2-4-celled stalk. Nonglandular hairs 1-6-celled, with warty walls. Fibre bundles brown, walls heavily thickened, some surrounded by cells containing prisms of calcium oxalate, forming crystal fibres. Secretory cells subrounded, containing pale yellowish-brown to reddish-brown secretions, surrounded by radially arranged cells. Prisms of calcium oxalate abundant in parenchyma.
(2) Macerate 5 g, removed cotton paper and mixed thoroughly, with 30 ml of ether for 30 minutes, filter, and expel ether to about 1 ml as the test solution. Dissolve a quantity of cineole CRS in ether to prepare a solution containing 1 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of petroleum ether (30-60℃) and ethyl acetate (18 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 3 μl of the reference solution to the plate. After developing and removal of the plate, dry in air and spray with 5% vanillin in sulfuric acid and heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Macerate 5 g, removed cotton paper and mixed thoroughly, with 30 ml of ether for 60 minutes, shake constantly, filter, and expel the solvent. Dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve a quantities of isoimperatorin CRS in ethyl acetate to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (30-60℃) and ether (3 : 2) as the mobile phase. Apply separately 15 μl of the test solution and 4 μl of the reference solution to the plate. After developing at the temperature below 25℃ and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(4) Macerate 5 g, removed cotton paper and mixed thoroughly, with 40 ml of ethanol for 50 minutes, shake

constantly, filter, and use the filtrate as the test solution. Dissolve a quantity of cinnamaldehyde CRS in ethanol to prepare a solution containing 1 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of petroleum ether (30-60℃) and ethyl acetate (17 : 3) as the mobile phase. Apply separately 10 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air and spray with dinitrophenylhydrazine TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Weight variation Take 10 rolls, removed cotton paper, weigh separately, and compare with the labeled weight. Limit of weight variation is not less than 10 per cent and not more than 10 per cent of the labeled weight.

Action To move *qi* and promote blood circulation, and expel *wind-dampness*.

Indications Arthralgia due to *wind*, *cold* and damp, aching and numbness of muscles, painful joints and limbs, and cold pain in the stomach and abdomen.

Usage and dosage Applied for direct moxibustion until the appearance becomes glowing. 1-2 times a day or following doctor's advice.

Strength 28 g per roll

Storage Preserve in tightly closed containers, protected from moisture.

Yatong Yili Wan
(牙痛一粒丸)
Yatong Yili Pills

Ingredients Venenum Bufonis 240 g; Cinnabaris 50 g; Realgar 60 g; Radix et Rhizoma Glycyrrhizae 240 g.

Procedure Levigate separately Cinnabaris and Realgar to very fine powder. Pulverize Venenum Bufonis and Radix et Rhizoma Glycyrrhizae separately to fine powder. Triturate all the powders, sift and mix thoroughly. Make small pills with water and dry.

Description Yellowish-brown watered pills; odour, slight; taste, pungent and numb.

Identification (1) Moisten 0.1 g, in fine powder, with water, add 2 ml of nitric acid solution saturated with potassium chlorate, shake, and allow to cool, centrifuge, add 0.5 ml of barium chloride TS to the supernatant liquid and mix well; a white precipitate is produced. Centrifuge, discard the supernatant, add 2 ml of water to the precipitate and shake, the precipitate is not dissolved.

(2) Grind well 0.2 g, add 10 ml of dilute ethanol, heat under reflux for 1 hour, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of ethanol as the test solution. Prepare a solution of 50 mg of Radix et Rhizoma Glycyrrhizae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of chloroform, methanol and water (13 : 7 : 2) as the mobile phase. Apply separately to the plate 2 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with 10% sulphuric acid in ethanol and heat at 105℃ to the spots distinct. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Transfer 0.5 g, ground well, to a Sohxlet's extractor, add 70 ml of chloroform, heat under reflux for 2 hours, and concentrate the extracts to about 1 ml as the test solution. Dissolve a quantity of resibufogenin CRS in chloroform to prepane a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of cyclohexane, chloroform and acetone (4 : 3 : 3) as the mobile phase. Apply in strip separately 5-10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. The strip in the chromatogram obtained with the test solution corresponds in position and colour to the strip in the chromatogram obtained with the reference solution.

Arsenic trioxide Weigh accurately 1.85 g of the pills, pulverized to fine powder, add 20 ml of dilute hydrochloric acid, stir constantly for 30 minutes, centrifuge, and take the supernatant. Wash the precipitate with two 10-ml quantities of dilute hydrochloric acid TS, stir for 30 minutes, and centrifuge. Combine the supernatant in a 100 ml volumetric flask, dilute with water to volume, and mix well. Measure accurately 10 ml to a 100 ml volumetric flask, dilute with water to volume, and mix well. Measure accurately 2 ml, add 5 ml of hydrochloric acid and 21 ml of water, carry out the limit test for arsenic (Appendix Ⅸ F), any stain produced is not more intense than the standard stain.

Weight variation Take 125 pills as one part, weigh separately 10 parts, and compare with the labeled weight. Limit of weight variation is not less than 10% and not more than 10% of the labeled weight. Not more than 2 parts exceed the limit of weight variation and none double the limit of weight variation.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (50 : 50) as the mobile phase. As detector a spectrophotometer set at 296 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of cinobufagin.

Reference solution Weigh accurately 10 mg each of cinobufagin CRS and bufogenin CRS in a 100 ml volumetric flask, dissolve with methanol and dilute to volume. Measure accurately 5 ml in a 10 ml volumetric flask, dilute with methanol to volume, and mix well (containing 50 μg each of cinobufagin and bufogenin per ml).

Test solution Weigh accurately 75 mg of the pills, pulverized to fine powder, in a stopper conical flask, add accurately 25 ml of methanol, stopper, and weigh. Ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, stand to cool, weigh again, replenish the lost weight with methanol and mix well. Filter and use the successive filtrate as the test solution

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 19.5 mg of the total amount of cinobufagin ($C_{26}H_{34}O_6$) and bufogenin ($C_{24}H_{32}O_4$) per gram,

referred to Venenum Bufonis.

Action To relieve toxicity and swelling, and kill parasites and pain.

Indications Swollen painful gums or dental cavities due to exuberant fire in the interior.

Usage and dosage 1-2 pills, filled in the tooth cavity or the crevice between the affected teeth and pack with a sterilized cotton ball to prevent the pills from falling off.

Precaution Spit out the saliva after it is sucked, and never swallow the saliva.

Strength 0.3 g per 125 pills

Storage Preserve in tightly closed containers, protected from moisture.

Yejuhua Shuan (野菊花栓)

Yejuhua Suppositories

Yejuhua Suppositories are Suppositories prepared from Flos Chrysanthemi Indici.

Procedure Decoct Flos Chrysanthemi Indici with water three times, 1.5 hours for the first time, 1 hour for the second time and 40 minutes for the third time respectively. Combine the decoctions, filter, and concentrate the filtrate to a thin extract with a relative density of 1.10 (50-60℃), add ethanol to a content of 65% ethanol, stand. Separate the supernatant, recover ethanol and concentrate to an extract with a relative density of 1.17 (50℃). Add ethanol to a content of 80% ethanol, stand. Separate the supernatant, recover ethanol and concentrate to a thick extract (about 800 g). Heat 1380 g of semi-synthetic fatty acid ester to melt, keep the temperature (40℃ ± 2℃). Add 60% ethanol 300 g into the thick extract, stir well, add it into the suppository bases, stir constantly, pour into moulds; Or Heat 1600 g of polyethylene glycol to melt, add into the thick extract with stirring, stir well, pour into moulds with lubricant additive, make to 1000 suppositories.

Description Brown or dark brown suppositories like torpedo.

Identification To 0.5 g, cut into pieces, add 5 ml of petroleum ether (60-90℃) and macerate on a water bath at 50℃ for 15 minutes, with constant shaking, discard the petroleum ether, treat the residue with petroleum ether again in the same manner, discard the petroleum ether, Evaporate the residue to dryness and macerate in 20 ml of methanol on a water bath at 60℃ for 15 minutes, shake frequently, cool and filter, use the filtrate as the test solution. Macerate 0.2 g of Flos Chrysanthemi Indici reference drug in 10 ml of petroleum ether (60-90℃) on a water bath at 50℃ for 30 minutes, discard the petroleum ether. Evaporate the residue to dryness, add 10 ml of methanol, heat under reflux for 30 minutes, cool and filter, use the filtrate as the reference drug solution. Dissolve Buddleoside CRS in methanol to prepare a solution containing 0.2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately 3 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air. Spray with aluminum chloride TS, heat to dryness, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for suppositories (Appendix Ⅰ W).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use Octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and acetic acid (54 : 44 : 2) as the mobile phase. As detector a spectrophotometer set at 326 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of Buddleoside.

Reference solution Dissolve a quantity of Buddleoside CRS in methanol to prepare a solution containing 40 μg per ml.

Test solution Heat and melt 5 pills, obtained under the test of weight variation, in a small beaker, on a water bath at 60℃, remove and cool while stirring. Ultrasonicate (power, 250 W; frequency, 33 kHz) 0.8 g, weighed accurately, in a 10 ml centrifugal tube, with 5 ml of petroleum ether (60-90℃), at 50℃ for 15 minutes, centrifuge and discard the supernatant. Treat the residue with petroleum ether again, discard the petroleum ether, and evaporate the residue to dryness. Dissolve the residue with a quantity of methanol to a 100 ml volumetric flask, add a quantity of methanol, ultrasonicate at 60℃ for 30 minutes, cool and dilute with methanol to the volume, shake well and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 5.0 mg of Buddleoside ($C_{28}H_{32}O_{14}$) per pill, referred to Flos Chrysanthemi Indici.

Action To clear *heat* and *toxicity*.

Indications Stranguria due to accumulated *heat* in the *lower-energizer*, with manifestations of frequent urination, burning and painful urethra, straining and distending pain of the lower abdomen, perineum or the lumbosacral portion; chronic prostatitis and chronic pelvic inflammation with above symptoms.

Usage and dosage 1 suppository, 1-2 times a day, administrated through rectal, or follow doctor's advice.

Strength 2.4 g per suppository

Storage Preserve in tightly closed containers below 30℃.

Yening Tangjiang (夜宁糖浆)

Yening Syrup

Ingredients Cortex Albiziae 105 g; Ganoderma 50 g; Caulis Polygoni Multiflori 105 g; Fructus Jujubae 75 g; Fructus Ligustri Lucidi 105 g; Radix et Rhizoma Glycyrrhizae 30 g; Fructus Tritici Aestiri Immaturus 300 g.

Procedure Boil Fructus Tritici Aestiri Immaturus with water, then macerate at 80-90℃ twice, 2 hours for each time, and combine the infusions. Pulverize Ganoderma to coarse powder, macerate with a quantity of ethanol for 7 days, squeeze to filter, recover ethanol of the filtrate. Decoct the residue and the other five ingredients with water twice, each for 3 hours, combine the decoctions, filter,

combine the filtrate and the above two solutions, allow to stand, filter, concentrate the filtrate to a quantity. Add 830 g of sucrose and a quantity of preservative, boil to dissolve, filter, add water to 1000 ml and mix well.

Description A brown thick liquid; odour, slight; taste, sweet, slightly bitter.

Identification Measure 30 ml of the syrup, add 60 ml of water, stir well, extract with 50 ml of ether, shake and separate the ether layer, evaporate the ether extract to dryness, dissolve the residue in 0.5 ml of chloroform as the test solution. Dissolve a quantity of emodin CRS in chloroform to prepare a solution containing 0.1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Relative density Not less than 1.27 (Appendix Ⅶ A).

Other requirements Comply with the general requirements for syrups (Appendix Ⅰ H).

Action To nourish blood to anchor the mind.

Indications Insomnia, dreamfulness, dizziness and lassitude due to insufficient *heart-blood*; neurasthenia with above symptoms.

Usage and dosage 40 ml, twice a day.

Storage Preserve in tightly closed containers.

Yiganning Keli
(乙肝宁颗粒)

Yiganning Granules

Ingredients Radix Astragali 606 g; Herba Hedyotis Diffusae 408 g; Herba Artemisiae Scopariae 606 g; Herba Lysimachiae 408 g; Radix Codonopsis 490 g; Herba Taraxaci 408 g; Radix Polygoni Multiflori Praeparata Cum Succo Glycines Sotae 490 g; Cortex Moutan 408 g; Radix et Rhizoma Salviae Miltiorrhizae 490 g; Poria 408 g; Radix Paeoniae Alba 408 g; Rhizoma Atractylodis Macrocephalae 408 g; Fructus Toosendan 408 g.

Procedure Decoct Radix Astragali with water twice, 2 hours for each, combine the decoctions, filter, and concentrate the filtrate to a thin extract with a relative density of 1.25 (20℃). Distill volatile oil from Herba Artemisiae Scopariae, coat with 290 g of β-cyclodextrin. Decoct the residue with the other eleven ingredients with water twice, 2 hours for each, combine the decoctions, filter, and concentrate the filtrate to a thin extract with a relative density of 1.25 (20℃). Cool and add ethanol to a content of 55% ethanol, allow to stand over 24 hours, recover ethanol in supernatant to no ethanolic smell, add the thin extract of Radix Astragali, and concentrate to a thin extract with a relative density of 1.26 (20℃). Add 145 g of glutin, 1.2 g of stevioside, 162 g of lactose, and the above coated volatile oil, to make granules, dry below the temperature of 60℃, make to 1000 g granules (without sucrose); or add 5270 g of sucrose and the above coated volatile oil, to make granules, dry below the temperature of 60℃, make to 5670 g granules.

Description Yellowish-brown to dark brown granules; taste, sweet, slightly bitter, or slightly sweet, slightly bitter (granules without sucrose).

Identification (1) To 1 pack of the granules, add 50 ml of methanol, heat under reflux for 1 hours, cool and filter. Evaporate the filtrate to dryness, dissolve the residue in 30 ml of water. Extract with two 30-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, wash with two 20-ml quantities of 1% solution of sodium hydroxide, wash the extract of *n*-butanol to neutral with water saturated with *n*-butanol. Separate the *n*-butanol layer and evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of astragaloside Ⅳ CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, ethyl acetate, methanol and water (20 : 40 : 22 : 10, standing below 10℃ over 12 hours) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spot in the chromatography obtained with the test solution corresponds in position and colour to the spot in the chromatography obtained with the reference solution.

(2) Dissolve 1 pack of the granules in 30 ml of water, adjust to pH 2 with hydrochloric acid. Extract with two 20-ml quantities of ether, evaporate the ether extracts to dryness, dissolve the residue in 1 ml of ethanol as the test solution. Dissolve a quantity of protocatechuic aldehyde CRS in ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, acetone and formic acid (12 : 1 : 0.4) as the mobile phase. Apply separately 2 μl of the test solution and 1 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with a mixture of 2% solution of ferric chloride and 1% solution of potassium ferricyanide (1 : 1). The spot in the chromatography obtained with the test solution corresponds in position and colour to the spot in the chromatography obtained with the reference solution.

(3) To 2 packs of the granules, add 50 ml of methanol, heat under reflux for 1 hours, cool and filter. Evaporate the filtrate to dryness, dissolve the residue in 20 ml of water. Extract with three 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, wash with 5 ml of ammonia TS. Separate the *n*-butanol layer, wash again with two 15-ml quantities of water saturated with *n*-butanol. Separate the *n*-butanol layer and evaporate to dryness, dissolve the residue in 1 ml of ethanol as the test solution. Dissolve a quantity of paeoniflorin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 2 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with vanillin TS, heat at 105℃ for several minutes. The spot in the chromatography obtained with the test solution corresponds in position and colour to the spot in the chromatography obtained with the reference solution.

(4) To 3 packs of the granules, add 50 ml of 2 mol/L solution of sulfuric acid, heat under reflux for 1 hour, and allow to cool. Extract with two 30-ml quantities of ether, separate the ether layer, evaporate to dryness, dissolve the

residue in 1 ml of methanol as the test solution. Prepare a solution of 1 g of Radix Polygoni Multiflori reference drug and 20 ml of 2 mol/L solution of sulfuric acid in the same manner as the reference drug solution. Dissolve a quantity of emodin CRS in methanol to prepare a solution containing 1 mg per ml as the reference. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate, and formic acid (15 : 2 : 1) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of each of the reference solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatography obtained with the test solution correspond in position and colour to the spots in the chromatography obtained with the reference solution and the reference drug solution, expose the plate to ammonia vapour, the spots turn to red.

Water Not more than 8.0 per cent for granules without sucrose (Appendix Ⅸ H).

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (75 : 25) as the mobile phase. Examine with the evaporative light scattering detector. Maintain the column temperature at 40℃. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of astragaloside Ⅳ.

Reference solution Weigh accurately a quantity of astragaloside Ⅳ CRS, dissolve in methanol to prepare a reference solution containing 60 μg per ml.

Test solution Pulverize the granules, obtained under the test of weight variation, to fine powder, weigh accurately 5 g or 1 g (granules without sucrose), and dissolve in 20 ml of water. Extract with four 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, wash with two 20-ml quantities of ammonia TS. Separate the *n*-butanol layer, wash again with two 20-ml quantities of water saturated with *n*-butanol. Separate the *n*-butanol layer, evaporate to dryness, dissolve the residue in a quantity of methanol, transfer to a 5 ml volumetric flask, dilute to volume with methanol. Mix well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl, 30 μl of the reference solution and 10 μl of the test solution into the column, respectively, and calculate the content, using a calibration equation of logarithm alteration of two external standards.
It contains not less than 0.50 mg of astragaloside Ⅳ ($C_{41}H_{68}O_{14}$) per pack, referred to Radix Astragali.

Action To reinforce *qi* and spleen, promote blood circulation to resolve stagnant blood, and clear heat and relieve *toxicity*.

Indications Chronic hepatitis due to a *deficiency* of *spleen-qi*, blockage of meridians by stagnant blood and retention of *damp-heat* with manifestations of hypochondriac pain, abdominal bloating, lassitude and dark yellow urine; acute hepatitis with above symptoms.

Usage and dosage 1 pack, 3 times a day; appropriate reduction of the dosage for children. 3 months making a course of treatment for chronic hepatitis.

Precaution Avoid pungent and greasy foods during administration.

Strength (1) 17 g per pack (2) 3 g per pack (granules without sucrose)

Storage Preserve in tightly closed containers.

Yinhuang Koufuye (银黄口服液)

Yinhuang Mixture

Ingredients Extractum Lonicerae Japonicae 2.4 g (calculated as chlorogenic acid); Extractum Scutellariae 24 g (calculated as baicalin).

Procedure Dissolve Extractum scutellariae with water, adjust to pH 8 with 8% solution of sodium hydroxide, filter; combine the filtrate with Extractum Lonicerae Japonicae, adjust to pH 7.2 with 8% solution of sodium hydroxide, decoct for 1 hour and filter, add a quantity of simple syrup to the filtrate and dilute with water to almost the total amount, mix well, adjust to pH 7.2 with 8% sodium hydroxide, dilute with water to 1000 ml, filter, pack, seal and sterilize.

Description A clear, reddish-brown liquid; taste, sweet, slightly bitter.

Identification Mix well 1 ml of the mixture with 9 ml of 75% ethanol as the test solution. Dissolve a quantity of baicalin CRS and chlorogenic acid CRS in methanol to prepare a solutions containing 1 mg and 0.3 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B) using acetic acid as the mobile phase. Apply separately 2 μl of each of the above three solutions to a polyamide membrane. After developing and removal of the membrane, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Relate density Not less than 1.10 (Appendix Ⅶ A).

pH value 5.5-7.0 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay ***Extractum Lonicerae Japonicae*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.4% solution of phosphoric acid (10 : 90) as the mobile phase. As detector a spectrophotometer set at 327 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of chlorogenic acid.

Reference solution Dissolve a quantities of chlorogenic acid CRS, weighed accurately, in an amber volumetric flask, in 50% methanol to prepare a solution containing 40 μg per ml.

Test solution Measure accurately 1 ml of the mixture in a 50 ml amber volumetric flask, dilute with 50% methanol to volume, mix well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 1.7 mg of chlorogenic acid ($C_{16}H_{18}O_9$)

per ml, referred to Extractum Lonicerae Japonicae.

Extractum Scutellariae Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphoric acid (50 : 50 : 0.2) as the mobile phase. As detector a spectrophotometer set at 274 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of baicalin.

Reference solution Weigh accurately 10 mg of baicalin CRS in a 100 ml volumetric flask, dissolve with methanol, dilute with methanol to volume, and mix well. Measure accurately 5 ml in a 10 ml volumetric flask, dilute with water to volume, and mix well (containing 50 μg of baicalin per ml).

Test solution Measure accurately 1 ml of the mixture in a 50 ml volumetric flask, dilute with water to volume, and mix well. Measure accurately 3 ml in a 25 ml volumetric flask, dilute with 50% methanol to volume, mix well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 18.0 mg of baicalin ($C_{21}H_{18}O_{11}$) per ml, referred to Extractum Scutellariae.

Action To clear *heat* and disperse *wind*, and ease the throat and relieve *toxicity*.

Indications Dry and painful throat, swollen tonsil, thirst, fever due to affliction from external *wind-heat* and extremely abundant heat in the lung and stomach; acute or chronic tonsillitis, acute and chronic pharyngitis and upper respiratory tract infection with above symptoms.

Usage and dosage 10-20 ml, 3 times a day; appropriate reduction of the dosage for children.

Strength 10 ml per phial

Storage Preserve in tightly closed containers, stored in a cool place.

Attached:

Extractum Lonicerae Japonicae (金银花提取物)

Honeysuckle Flower Extract

Honeysuckle Flower Extract is a liquid prepared from Flos Lonicerae Japonicae.

Procedure Heat under reflux Flos Lonicerae Japonica with 15% ethanol for two times, one hour for each, combine the extract, concentrate in vacuum to a thin extract of a relative density of 1.15-1.18 (60℃), and add ethanol to the content of 65% ethanol. Allow to stand for 24 hours, concentrate the supernatant in vacuum to a relative density of 1.20-1.24 (60℃), add water to 750 g, preserre in well closed container, refrigerate over 24 hours, and use the supernatant.

Description A reddish-brown, liquid, odour slight; taste, slightly bitter.

Identification Mix well 1 ml of the liquid with 2 ml of 75% ethanol as the test solution. Dissolve a quantity of chlorogenic acid CRS in 75% ethanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using acetic acid as the mobile phase. Apply separately 2 μl of each of the above two solutions to a polyamide film. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Assay Measure accurately 1 ml of the liquid in a 100 ml volumetric flask, carry out the method as described under Assay of Extractum Lonicerae Japonicae in Yinhuang Mixture, and calculate the content. It contains not less than 3.6 mg of chlorogenic acid ($C_{16}H_{18}O_9$) per ml.

Action To clear *toxic-heat*, disperse wind-heat by cooling.

Indication Carbuncle, furunculosis, laryngitis, erysipelas, hematodiarrhoea due to *toxic-heat*, common colds due to *wind-heat*, warm disease with febris.

Usage and dosage Applied to drug products and daily chemical products, dosage is determined according to different usage.

Storage Preserve in tightly closed container, protected from light.

Preparation Yinhuang Mixture

Extractum Scutellariae (黄芩提取物)

Baical Skullcap Extract

Baical Skullcap Extract is a dried powder extracted from Radix Scutellariae.

Procedure Decoct Radix Scutellariae with water for two times, 1.5 hours for each. Filter, combine the filtrate, and concentrate to a quantity (ten to one crude drug in proportion). Adjust to pH 1.8-2.0 with 2 mol/L solution of hydrochloric acid, and keep warm at 60℃ for 30 minutes. Stand to cool to room temperature, and stand for 12 hours. Filter, wash the precipitate with ethanol to pH 4.0, add 10 volumes of water, and stir thoroughly. Adjust to pH 7.0 with 20% solution of sodium hydroxide, add equal volume of ethanol, and stir thoroughly. Allow to stand for 12 hours, filter, adjust the filtrate to pH 1.8-2.0 with 2 mol/L solution of hydrochloric acid, and keep warm at 80℃ for 30 minutes. Allow to cool to room temperature, filter, wash the precipitate with ethanol to pH 4.0, dry in vacuum, and grind to fine powder.

Description Pale yellow powder; odour slight; taste, bitter.

Identification To a small amount of the powder, add 2 ml of water, then add 1 drop of sodium hydroxide TS; a orange colour is produced. Add dilute acetic acid TS, colour of the solution disappear, then add 1 drop of 5% solution of zirconyl dichloride, the solution show yellow colour, which not disappear when adding dilute hydrochloric acid TS.

Water Not more than 5.0 per cent (Appendix Ⅸ H, method Ⅰ).

Assay Carry out the method for higt performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and glacial acetic acid (48 : 52 : 1) as the mobile phase. As detector a spectrophotometer set at 276 nm. The number of theoretical plates of the column is not less than 1000, calculated with the reference to the peak of baicalin.

Reference solution Dissolve a quantity of baicalin CRS in 50% methanol to prepare a solution containing 0.1 mg per ml.

Test solution Weigh accurately 10 mg of the powder in a 100 ml volumetric flask, dilute with 50% methanol to volume, and mix well. Filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 95.0 per cent of baicalin ($C_{21}H_{18}O_{11}$), calculated with reference to the dried drug.

Action To clear *heat* and resolve *damp*, purge fire and release toxicity, and check bleeding and prevent miscarriage.

Indications Constriction in the chest, nausea and vomitting, stuffiness in the chest, dysentery, and jaundice due to *damp-heat* or *summer-heat*; cough due to excessive *lung-heat*, high fever and polydipsia, hematemesis due to *heat* in blood, carbuncles and abscesses, and threatened abortion.

Usage and dosage Applied for making pattern preparations. Dosage determined according to each formula.

Storage Preserve in tightly closed container, proteated from moisture.

Preparation Yinhuang Mixture

Yinianjin
(一捻金)

Yinianjin Powder

Ingredients Radix et Rhizoma Rhei 100 g; Semen Pharbitidis (stir-baked) 200 g; Semen Arecae 100 g; Radix Gingseng 100 g; Cinnabaris 30 g.

Procedure Levigate Cinnabaris to very fine powder and pulverize the other four ingredients to fine powder. Triturate all the powders, sift and mix thoroughly.

Description A yellowish-brown to dark brown powder; odour, slight; taste, slightly bitter and astringent.

Identification (1) Microscopical: Clusters of calcium oxalate large, up to 60-140 μm in diameter. Clusters of calcium oxalate 20-68 μm in diameter, with sharp angle. Palisade cells of testa pale brown or brown, 48-80 μm long. Fragments of endosperm cell colourless, walls relatively thickened, with large subrounded pits. Irregular minute granules dark brownish-red, lustrous, with dark black edge.
(2) Macerate 1. 5 g of the powder in 25 ml of methanol for 1 hour, and filter. Evaporate the filtrate to dryness, dissolve the residue in 20 ml of water, add 2 ml of hydrochloric acid, heat on a water bath for 30 minutes, and cool immediately. Extract with two 20-ml quantities of ether by shaking. Combine the ether liquids, evaporate to dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 0. 1 g Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately to the plate 1-2μl of each of the two solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The five orange-yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Expose to ammonia vapour, examine in daylight, the spots turn to red.
(3) To 3 g add 15 ml of 7% solution of sulfuric acid in 45% ethanol, heat under reflux for 1 hour, cool and filter. Extract the filtrate with 10 ml of chloroform by shaking. Separate the chloroform layer, add a quantity of anhydrous sodium sulfate, shake well and filter. Concentrate the filtrate to about 0. 5 ml as the test solution. Dissolve a quantity of panaxadiol CRS and panaxatriol CRS in dehydrated ethanol to prepare a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and ether (1 : 1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a solution of sulfuric acid in ethanol (1→2), heat at 105℃ for about 10 minutes and examine under ultraviolet light at 365 nm. The fluorecent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and phosphonic acid (85 : 15 : 0. 05) as the mobile phase. As detector a spectrophotometer set at 289 nm. The number of theoretical plates of the column is not less than 2500, calculated with the reference to the peak of emodin.

Reference solution Dissolve a quantities of emodin CRS, weighed accurately, in methanol to prepare a solution containing 4 μg per ml.

Test solution Mix thoroughly the powder obtained under the test of weight variation, weigh accurately 1 g in a stopper conical flask, add accurately 25 ml of methanol, stopper, and weigh. Heat under reflux for 30 minutes, stand to cool, weigh again, and replenish the lost weight with methanol. Mix well, filter, measure accurately 5 ml of the successive filtrate in a 100 ml rounded bottom flask, and recover the solvent. To the residue add 20 ml of 2. 5 mol/L solution of sulfuric acid, ultrasonicate for 10 minutes, heat on a water bath for 1 hour, and cool immediately. Extract with four 25-ml quantities of ether, combine the ether extracts, wash with 15 ml of water, and discard the washing. Recover ether at a lower temperature, dissolve the residue with methanol, transfer to a 25 ml volumetric flask, dilute with methanol to volume and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, separately, into the column, and calculate the content.
It contains not less than 0. 50 mg of emodin ($C_{15}H_{10}O_5$) per pack, referred to Radix et Rhizoma Rhei.

Action To promote digestion to remove stagnancy and obstruction, and expel phlegm and relax bowels.

Indications Indigestion due to disharmony between the spleen and stomach, and retention of *phlegm* and food, with manifestations of loss of appetite for food or milk, abdominal bloating and constipation, or coughing and dyspnea with expectoration of much phlegm.

Usage and dosage 0. 3 g, for children under 1 year old; 0. 6 g 1-3 years old; 1 g, 4-6 years old; 1-2 times a day, or follow doctor's advice.

Strength 1. 2 g per pack

Storage Preserve in tightly closed containers.

Yinqiao Jiedu Jiaonang
(银翘解毒胶囊)

Yinqiao Jiedu Capsules

Ingredients Flos Lonicerae Japonicae 200 g; Fructus Forsythiae 200 g; Herba Menthae 120 g; Herba Schizonepetae 80 g; Semen Sojae Preparatum 100 g; Fructus Arctii (stir-baked) 120 g; Radix Platycodonis 120 g; Herba Lophatheri

80 g; Radix et Rhizoma Glycyrrhizae 100 g.

Procedure Pulverize Flos Lonicerae Japonicae and Radix Platycodonis to fine powder respectively. Distill volatile oil from Herba Menthae and Herba Schizonepetae, and collect the aqueous solution in another container. Decoct the residue after distillation, Fructus Forsythiae, Fructus Arctii, Herba Lophatheri and Radix et Rhizoma Glycyrrhizae twice, 2 hours each, combine the decoctions, filter, and remain filtrate for later use. Boil Semen Sojae Preparatum with water, then macerate at 80℃ twice, 2 hours each, combine the infusions and filter. Combine the above two filtrates and the aqueous solution after distillation, concentrate to a thick extract, add the fine powders of Flos Lonicerae Japonicae, Radix Platycodonis, and a quantity of excipients and mix well. Make granules, dry and allow to cool. Spray the above volatile oils upon the granules, mix well and pack into 1000 capsules.

Description Hard capsules, containing pale brown to dark brown granule and powder; odour, aromatic; taste bitter and pungent.

Identification (1) Microscopical: Pollen grains subspheroidal, about 76 μm in diameter, showing spiny sculptures on the exine, with 3 germinal apertures. Clusters of calcium oxalate abundant, 5-17 μm in diameter, occurring in parenchymatous cells. Anastomosing laticiferous tubes, 14-25 μm in diameter, containing pale yellow granules.

(2) Grind 4 g of the content to fine powder, add 20 ml of petroleum ether (30-60℃), stopper well, shake frequently, macerate overnight, filter and evaporate the filtrate to 1 ml as the test solution. Prepare a solution of 0.8 g of Herba Schizonepetae reference drug and 20 ml of petroleum ether (30-60℃) in the same manner as the reference drug solution. Dissolve a quantity of menthol CRS in ethanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of *n*-hexane and ethyl acetate (17 : 3) as the mobile phase. Apply separately 10 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, spray with anisaldehyde TS, and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

(3) Grind 4 g of the content to fine powder, heat with 20 ml of ethanol under reflux for 1 hour, allow to cool and filter. Evaporate the filtrate to dryness, dissolve the residue in 2 ml of ethanol, filter, and use the filtrate as the test solution. Macerate 2 g of Fructus Forsythiae reference drug in 40 ml of water on a water bath for 1 hour and filter. Evaporate the filtrate to dryness, dissolve the residue in 2 ml of ethanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (20 : 1) as the mobile phrase. Apply separately to the plate 10 μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with a mixture of acetic anhydride and sulfuric acid (20 : 1), heat at 105℃ to the spots clear, allow to cool, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Heat 1.2 g of Fructus Arctii reference drug and 1 g of Radix et Rhizoma Glycyrrhizae reference drug, with 20 ml of ethanol under reflux for 1 hour respectively, allow to cool, filter. Evaporate the filtrate to dryness, dissolve the residue in 2 ml of ethanol respectively, filter, and use the filtrates as the reference drug solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, methanol and water (40 : 10 : 1) as the mobile phrase. Apply separately to the plate 10 μl of each of the two reference drug solutions and the test solution obtained under Identification (3). After developing and removal of the plate, dry in air, spray with a 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solutions.

(5) Grind 4 g of the content to fine powder, add 20 ml of methanol, shake well, stand for 12 hours, filter and use the filtrate as the test solution. Prepare a solution of 0.2 g of Flos Lonicerae Japonicae reference drug and 20 ml of methanol in the same manner as the reference drug solution. Dissolve a quantity of chlorogenic acid CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethyl cellulose as the coating substance and the upper layer of a mixture of ethyl acetate, formic acid and water (10 : 2 : 3) as the mobile phrase. Apply separately 10 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica get as the stationary phase and a mixture of methanol, water, glacial acetic acid and triethylamine (18 : 85 : 1 : 0.3) as mobile phase. As detector a spectrophotometer set at 324 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of chlorogenic acid.

Reference solution Weigh accurately a quantity of chlorogenic acid CRS in an amber volumetric flask, add 50% methanol to prepare a solution containing 35 μg per ml as the reference solution.

Test solution Grind well the content obtained under the test of weight variation, weigh accurately 0.25 g in a 50 ml amber volumetric flask, add accurately 40 ml of 50% methanol, ultrasonicate (power, 260 W; frequency, 40 kHz) for 30 minutes, allow to cool, dilute with 50% methanol to volume, shake well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 2.4 mg of chlorogenic acid ($C_{16}H_{18}O_9$) per capsule, referred to Flos Lonicerae Japonicae.

Action To disperse *wind* to release the exterior, and clear *heat* to relieve *toxicity*.

Indications Common cold due to *wind-heat* with manifestations of fever, headache, coughing, dry mouth and sore throat.

Usage and dosage 4 tablets, 2-3 times a day.

Strength 0.4 g per capsule

Storage Preserve in tightly closed containers.

Yinqiao Jiedu Keli
(银翘解毒颗粒)
Yinqiao Jiedu Granules

Ingredients Flos Lonicerae Japonicae 200 g; Fructus Forsythiae 200 g; Herba Menthae 120 g; Herba Schizonepetae 80 g; Semen Sojae Preparatum 100 g; Fructus Arctii (stir-baked) 120 g; Radix Platycodonis 120 g; Herba Lophatheri 80 g; Radix et Rhizoma Glycyrrhizae 100 g.

Procedure Distill volatile oil from Herba Menthae, Herba Schizonepetae and Fructus Forsythiae, and collect the aqueous solution in another container. Decoct the other six ingredients, pulverized to fine powder, with water twice, 1 hour for each time, filter, combine the filtrate with the above aqueous solution and concentrate to a thin extract with a relative density of 1.33-1.35 (80℃); then add a quantity of sucrose, dextrin and ethanol to make 1120 g of granules after drying, spray the above volatile oil and mix thoroughly. or concentrate to a thin extract with a relative density of 1.08-1.10 (60℃), and dry by spraying to powder. Add a quantities of lactose, mix thoroughly, spray the volatile oil, mix well and make 373.3 g of granules (with lactose).

Description Pale brown granules; taste, sweet, slightly bitter; or taste mild, slightly bitter (with lactose).

Identification (1) To 10g, or 3.3 g (with lactose) of the granules, ground to fine powder, add 20 ml of petroleum ether (60-90℃), stopper well, shake constantly and macerate overnight. Filter and evaporate the filtrate to 1 ml as the test solution. Prepare a solution of 0.8 g of Herba Schizonepetae reference drug in the same manner as the reference drug solution. Dissolve a quantity of menthol CRS in ethanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethyl cellulose as the coating substance and a mixture of *n*-hexane and ethyl acetate (17 : 3) as the mobile phase. Apply separately to the plate 10 μl of each of the three solutions. After developing and removal of the plate, dry in air, spray with anisaldehyde TS, heat at 105℃ to spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution separately. (2) Heat under reflux 5 g, or 1.7 g (with lactose), of the granules, ground to fine powder, in 20 ml of ethanol for 1 hour. Allow to cool and filter, evaporate the filtrate to dryness, add 2 ml of ethanol to dissolve the residue, filter and use the filtrate as the test solution. Macerate 2 g of Fructus Forsythiae reference drug in 40 ml of water on a water bath for 1 hour, filter, evaporate the filtrate to dryness and dissolve the residue in 20 ml of ethanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance and a mixture of chloroform and methanol (20 : 1) as the mobile phase. Apply separately to the plate 10μl of each of the two solutions. After developing and removal of the plate, dry in air, spray with a solution of acetic anhydride and sulfuric acid (20 : 1), heat at 105℃ to the spots clear, cool and examine under ultraviolet light at 365 nm. The fluroscent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. (3) To 1.2 g of Fructus Arctii reference drug and 1 g of Radix et Rhizoma Glycyrrhizae reference drug, add separately 20 ml of ethanol, heat under reflux for 1 hour. Filter and evaporate the filtrates to dryness, dissolve the residue in 2 ml of ethanol respectively, filter and use the filtrate as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, methanol and water (40 : 10 : 1) as the mobile phase. Apply separately to the plate 10μl of each of the above two reference drug solutions and the test solution obtained under Identification test (2). After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solutions.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Action To disperse *wind* to release the exterior, and clear *heat* to relieve *toxicity*.

Indications Common cold due to *wind-heat* with manifestations of fever, headache, coughing, dry mouth and sore throat.

Usage and dosage 15 g or 5 g (with lactose), 3 times a day, 4 times for serious cases; taken after dissolved in boiling water.

Strength (1) 15 g per pack (2) 2.5 g per pack (with lactose)

Storage Preserve in tightly closed containers.

Yinqiao Jiedu Pian
(银翘解毒片)
Yinqiao Jiedu Tablets

Ingredients Flos Lonicerae Japonicae 200 g; Fructus Forsythiae 200 g; Herba Menthae 120 g; Herba Schizonepetae 80 g; Semen Sojae Preparatum 100 g; Fructus Arctii (stir-baked) 120 g; Radix Platycodonis 120 g; Herba Lophatheri 80 g; Radix et Rhizoma Glycyrrhizae 100 g.

Procedure Pulverize Flos Lonicerae Japonicae and Radix Platycodonis to fine powders respectively, and sift. Distill volatile oil from Herba Menthae and Herba Schizonepetae, and collect the aqueous solution in another container. Decoct the residue of distillation, Fructus Forsythiae, Fructus Arctii, Herba Lophatheri and Radix et Rhizoma Glycyrrhizae with water twice, 2 hours each time, combine the decoctions and filter. Boil Semen Sojae Preparatum with water, then macerate at 80℃ twice, 2 hours each time, combine the infusions and filter. Combine the above drug extractives, concentrate to a thick extract, add the fine powders of Flos Lonicerae Japonicae, Radix Platycodonis, and a quantity of excipients and mix thoroughly. Make granules, dry and allow to cool. Spray the above volatile oils upon the granules, mix thoroughly, compress into 1000 tablets or coat with film.

Description Pale brown to brown tablets or film coated tablets with pale brown to brown core; odour, aromatic;

taste, bitter and pungent.

Identification (1) Microscopical: Pollen grains subspheroidal, about 76 μm in diameter, showing sping sculptures on the extexine, with 3 germinal apertures. Clusters of calcium oxalate abundant, 5-17 μm in diameter, containing in parenchymatous cells. Anastomosing laticiferous tubes 14-25 μm in diameter, containing pale yellow granules.
(2) Grind 10 tablets to fine powder, add 20 ml of petroleum ether (60-90℃), stopper well, shake frequently. Macerate overnight, filter and evaporate the filtrate to 1 ml as the test solution. Prepare a solution of 0.8 g of Herba Schizonepetae reference drug and 20 ml of petroleum ether (60-90℃) in the same manner as the reference drug solution. Dissolve a quantity of menthol CRS in ethanol to prepare a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of *n*-hexane and ethyl acetate (17 : 3) as the mobile phase. Apply separately to the plate 10 μl of each of the three solutions. After developing and removal of the plate, dry in air, spray with anisaldehyde TS, and heat at 105 ℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.
(3) Grind 10 tablets to fine powder, add 20 ml of ethanol, heat under reflux for 1 hour, allow to cool and filter. Evaporate the filtrate to dryness, dissolve the residue in 2 ml of ethanol, filter, and use the filtrate as the test solution. To 2 g of Fructus Forsythiae reference drug, add 40 ml of water, macerate on a water bath for 1 hour and filter. Evaporate the filtrate to dryness, add 20 ml of ethanol to the residue, and prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform and methanol (20 : 1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and spray with a mixture of acetic anhydride and sulfuric acid (20 : 1). Heat at 105 ℃ to the spots clear, allow to cool, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(4) To 1.2 g of Fructus Arctii reference drug and 1 g of Radix et Rhizoma Glycyrrhizae reference drug, add 20 ml of ethanol respectively and heat under reflux for 1 hour, then filter. Evaporate the filtrate to dryness, dissolve the residue in 2 ml of ethanol respectively, filter, and use the filtrates as the reference drug solutions. Carry out the method for thin layer chromatograph (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, methanol and water (40 : 10 : 1) as the mobile phase. Apply separately 10 μl of each of the two reference drug solutions and the test solution obtained under Identification (3) to the plate. After developing and removal of the plate, dry in air and spray with 10% sulfuric acid in ethanol. Heat at 105 ℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solutions.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Action To disperse *wind* to release the exterior, and clear *heat* to relieve *toxicity*.

Indications Common cold due to *wind-heat* with manifestations of fever, headache, coughing, dry mouth and sore throat.

Usage and dosage 4 tablets, 2-3 times a day.

Strength 0.52 g per film coated tablet

Storage Preserve in tightly closed containers.

Yinqiao Jiedu Wan
(银翘解毒丸)

Yinqiao Jiedu Pills

Ingredients Flos Lonicerae Japonicae 200 g; Fructus Forsythiae 200 g; Herba Menthae 120 g; Herba Schizonepetae 80 g; Semen Sojae Preparatum 100 g; Fructus Arctii (stir-baked) 120 g; Radix Platycodonis 120 g; Herba Lophatheri 80 g; Radix et Rhizoma Glycyrrhizae 100 g.

Procedure Pulverize Flos Lonicerae Japonicae and Radix Platycodonis to fine powder and sift. Distill volatile oil from Herba Menthae and Herba Schizonepetae, and collect the aqueous solution in another container. decoct the residue of distillation and the other five ingredients with water twice, 2 hours for each time, combine the decoctions and filter. Combine the filtrate and the above aqueous solution, concentrate to a thick extract. Add the fine powders of Flos Lonicerae Japonicae and Radix Platycodonis, mix thoroughly, dry, pulverize to fine powder, and sift. Spray the volatile oil of Herba Menthae and Herba Schizonepetae upon the powder, mix thoroughly. To each 100 g of the powder add 80-90 g of refined honey to make concentrated pills.

Description Brown concentrated pills; odour, aromatic; taste, slightly sweet, bitter and pungent.

Identification (1) Microscopical: Pollen grains subspheroidal, about 76 μm in diameter, spines sculptures on the extine with 3 germinal apertures. Clusters of calcium oxalate abundant, 5-17 μm in diameter, occurring in parenchymatous cells. Anastomosing laticiferous tubes 14-25 μm in diameter, containing pale yellow granules.
(2) Grind well 6 g of the pills with 1.5 g of kieselguhr, Comply with the tests of Identification (2), (3) and (4) described under Yinqiao Jiedu Tablets.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To disperse *wind* to release the exterior, and clear *heat* to relieve *toxicity*.

Indications Common cold due to *wind-heat* with manifestations of fever, headache, coughing, dry mouth and sore throat.

Usage and dosage 1 pill, 2-3 times a day, taken with decoction of reed rhizome (Rhizoma Phragmitis) or warm boiled water.

Strength 3 g per pill

Storage Preserve in tightly closed containers.

Yinqiao Shuangjie Shuan
(银翘双解栓)

Yinqiao Shuangjie suppositories

Ingredients Fructus Forsythiae 1860.46 g; Flos Lonicerae

Japonicae 930.23 g; Radix Scutellariae 1023.26 g; Folium Syringae 465.12 g.

Procedure Decoct Fructus Forsythiae and Flos Lonicerae Japonicae with water twice for 40 minutes each, combine the decoctions, filter and concentrate to a thin extract with a relative density of 1.20-1.25 (60℃), cool, add ethanol to a content of 70% ethanol, allow to stand for 12 hours, filter, and take the filtrate for latter use. Decoct Folium Syringae with water twice for 40 minutes each, combine the decoctions, filter and concentrate to a thin extract with a relative density of 1.20-1.25 (60℃), cool, add ethanol to a content of 70% ethanol, allow to stand for 12 hours, filter. Combine the above filtrates, recove the ethanol to a thick extract with a relative density of 1.32-1.42 (60℃). Pulverize Radix Scutellariae to the coarse powder (pass through No. 2 sieve), decoct with water for three times, 2 hours for the first time, 1 hour for the second and the third time, respectively, combine the decoctions, filter and concentrate to a thin extract with a relative density of 1.0-1.05 (80℃), adjust to pH 1.0-2.0 with 2 mol/L solution of hydrochloric acid at 80℃, keep the temperature for 1 hour, allow to stand for 12 hours, filter. Stir the precipitate in 6-8 times amount of water, adjust to pH 7.0-7.5 with 40% solution of sodium hydroxide and add an equal quantity of ethanol to dissolve by stirring, filter, adjust the filtrate to pH 1.0-2.0 with 2 mol/L solution of hydrochloric acid at 80℃, keep the temperature for 1 hour, allow to stand for 12 hours, filter, wash the precipitate with water to pH 5.0, then wash the precipitate with 50% ethanol to pH 7.0, purify with ethanol to obtain the extract of Radix Scutellariae. Add the extract of Radix Scutellariae to the above thick extract, adjust to pH 7 with 40% solution of sodium hydroxide, heat on a water bath, gently add polysorbate-80 14.54 ml, lanoline 58.15 g, span-40 46.52 g, semi-synthetic fatty acid ester 774.19 g, allow to dissolve, mix well, pour into a suppository mould, cool, make 1000 suppositories (1.5 g per suppository) or 1500 suppositories (1.0 g per suppository).

Description yellowish-brown bullet-shaped suppositories.

Identification (1) To 1 suppository add 20 ml of water, warm to melt, cool and filter, evaporate the filtrate to dryness. Dissolve the residue in 1 ml of 75% ethanol as the test solution. Dissolve separately a quantity of baicalin CRS and chlorogenic acid CRS in 75% ethanol to prepare two solutions containing 0.4 mg each per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide membrane as the absorbant and acetic acid as the mobile phase. Apply separately to the membrane 1 μl of above three solutions. After developing and removal of the film, dry in air. Examine under ultraviolet light at 365 nm, the fluoresent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with reference solutions.

(2) To 1 suppository add 20 ml of water, warm to melt, cool and filter, evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Heat under reflux 0.5 g of Fructus Forsythiae reference drug with 10 ml of methanol for 20 minutes on a water bath, and filter, use the filtrate as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and methanol (5 : 1) as the mobile phase. Apply separately 2 μl of above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for suppositories (Appendix Ⅰ W).

Assay ***Radix Scutellariae*** Carry out the method for high performance liguid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and glacial acetic acid (50 : 50 : 1) as the mobile phase. As detector a spectrophotometer set at 276 nm. The number of theoretical plates of the column is not less than 1600, calculated with reference to the peak of baicalin.

Reference Solution Dissolve a quantity of baicalin CRS, accurately weighed, in 50% methanol to prepare a solution containing 0.1 mg per ml as the reference solution.

Test solution Cut 2 suppositories obtained under the test of weight variation into pieces, weigh accurately 0.1 g, to a 50 ml beaker, dissolve the suppositories in 30 ml of water by heating, cool, filter. Transfer the filtrate to a 50 ml volumetric flask, wash the container and filter with a quantity of water, filter the washings to the same flask, dilute with water to volume, and mix well, filter, use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 45 mg of baicalin ($C_{21}H_{18}O_{11}$) per suppository for strengh (1) or 67.5 mg per suppository for strengh (2), referred to Radix Scutellariae.

Flos Lonicerae Japonicae Carry out the method for high performance liguid chromatography (Apendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and glacial acetic acid (15 : 85 : 1) as the mobile phase. As detector a spectrophotometer set at 324 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of chlorogenic acid.

Reference solution Dissolve a quantity of chlorogenic acid CRS in water, in a amber volumetric flask to prepare a solution containing 10 μg per ml as the reference solution.

Test solution Cut a quantity of the suppositories obtained under the test of weight variation into pieces, weigh accurately 0.5 g, to a conical flask, dissolve the suppositories in 40 ml of water by heating, cool, filter. Transfer the filtrate to a 100 ml volumetric flask, wash the container and filter with successive quantities of 30 ml and 20 ml of hot water, filter the washings to the same flask, dilute with water to volume, mix well, and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 1.7 mg of chlorogenic acid ($C_{16}H_{18}O_9$) per suppository for strength (1) or 2.7 mg per suppository for strength (2), referred to Flos Lonicerae Japonicae.

Action To disperse *wind-heat*, and clear the lung and purge *fire*.

Indications Fever, slight aversion to *wind-cold*, swollen painful throat, coughing with expectoration of white or yellow sputum, dry mouth and slight thirst, reddened tongue with white or yellow fur, floating and rapid pulse, or slippery and rapid pulse due to affliction form external *wind-heat* and excessive *heat* in the lung; upper respiratory tract infection, tonsillitis and acute bronchitis with above

symptoms.

Usage and dosage Administrated through anus. 1 suppository each time, 3 times a day; appropriate reduction of the dosage for children.

Precaution It should be used as an anal suppository to speed up the absorption.

Strength (1) 1 g per suppository (2) 1.5 g per suppository

Storage Preserved in tightly closed containers below 30℃.

Yinxu Weitong Keli
(阴虚胃痛颗粒)

Yinxu Weitong Granules

Ingredients Radix Glehniae; Radix Ophiopogonis; Caulis Dendrobii; Fructus Toosendan; Rhizoma Polygonati Odorati; Radix Paeoniae Alba; Radix et Rhizoma Glycyrrhizae.

Procedure Decoct the above seven ingredients with water twice, 2 hours for the first time and 1 hour for the second time, filter, combine the filtrate, concentrate to a appropriate density, add 3 times quantity of ethanol, allow to stand. Concentrate the supernatant to a thin extract with a relative density of 1.18-1.22 (50℃). Add 2 portions of sucrose and 0.8 portion of dextrin to 1 portion of the thin extract, to make granules.

Description Pale yellowish-brown to yellowish-brown granules; taste, sweet, slightly bitter.

Identification (1) Macerate 25 g of the granules with 30 ml of petroleum ether (30-60℃) for 1 hour, discard the petroleum ether, add 50 ml of ethanol, macerate for 2 hours, concentrate the supernatant to about 1 ml as the test solution. Decoct 1 g of the Radix et Rhizoma Glycyrrhizae reference drug with water twice. Combine the decoctions, evaporate to dryness, add 5 ml of ethanol, stir to dissolved, filter, and concentrate the filtrate to about 0.5 ml as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and glacial acetic acid (2 : 2 : 0.1) as the mobile phase. Apply separately 15 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, Spray with 10% sulfuric acid in ethanol, heat at 110℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) Dissolve 2 g of the granules in 10 ml of water, stir to dissolve, add 2.5 ml of 2 mol/L solution of hydrochloric acid, heat under reflux for 30 minutes, cool and filter, extract by shaking with 5 ml of chloroform. Evaporate the chloroform extract to about 1 ml as the test solution. Decoct 1 g of Radix Ophiopogonis reference drug with 20 ml of water for 10 minutes, filter, add 2.5 ml of 2 mol/L solution of hydrochloric acid in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, ethyl acetate and acetone (8 : 1 : 1) as the mobile phase. Apply separately 2 μl of the test solution and 3 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and the mixture of acetonitrile and water (15 : 85) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates for the column is not less than 4000, calculated with the reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, accurately weighed, in methanol to prepare a solution containing 25 μg per ml as the reference solution.

Test solution Weigh accurately 2 g of the content of the capsules obtained under the test of weight variation, pulverized to fine powder, to a stopper conical flask. Add accurately 100 ml of water, stopper tightly, weigh accurately, ultrasonicate (power 250 W, frequency 40 kHz) for 10 minutes, allow to cool and weigh accurately again, replenish the lost weight with water, mix well and filter. Discard the initial filtrate, and use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of the reference solution and the test solution into the column and calculate the content.

It contains not less than 8.0 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per pack, referred to Radix Paeoniae Alba.

Action To replenish *yin* and invigorate the stomach, and relieve contracture and pain.

Indications Dull burning pain in the epigastrium, dry mouth and tongue, inappetence and retching due to *yin* deficiency of the stomach; chronic gastritis and peptic ulcer with above symptoms.

Usage and dosage 10 g, 3 times a day, taken with boiling water.

Strength 10 g per pack

Storage Preserved in tightly closed containers.

Yiqing Keli
(一清颗粒)

Yiqing Granules

Ingredients Rhizoma Coptidis 165 g; Radix et Rhizoma Rhei 500 g; Radix Scutellariae 250 g.

Procedure Decoct separately the above three ingredients with water for 2 times, 1.5 hours for the first time, and 1 hour for the second time respectively. Combine the decoctions, filter, concentrate in vacuum to a thin extract with a relative densities of 1.25 (70℃) and dry by spraying to powder. To the above three powdered extractives, add a quantity of sucrose and dextrin, mix thoroughly, make granules, dry and pack 125 packs.

Description Yellowish-brown granules; taste, slightly sweet and bitter.

Identification (1) Macerate 4 g of granules in 25 ml of methanol for 2 hours, shake constantly, filter, and evaporate the filtrate to dryness. Dissolve the residue with 10 ml of water, add 1 ml of hydrochloric acid, heat on a water

bath for 30 minutes, and cool immediately. Extract with two 10-ml quantities of chloroform by shaking, combine the chloroform extracts, concentrate to about 1 ml as the test solution. Dissolve a quantity of emodin CRS in chloroform to prepare a solution containing 0.5 mg per ml as the reference solution. Prepare a solution of 0.1 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of petroleum ether (60-90℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 5 μl of each of the test solution, the reference drug solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution. Expose the plate to ammonia vapour, examine in daylight, the spots turn to red.

(2) To 4 g of granules, add 25 ml of methanol and 1-2 drops of hydrochloric acid, ultrasonicate for 20 minutes, filter, concentrate the filtrate on a water bath to about 2 ml as the test solution. Prepare a solution of 0.5 g of Radix Scutellariae in the same manner as the reference drug solution. Dissolve a quantity of baicalin CRS in methanol to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply separately 5 μl of each of the test solution, the reference drug solution and the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 2% ferric chloride in ethanol. The spots in the chromatogram obtained with the test solution corresponds in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

(3) Macerate 4 g of granules in 25 ml of methanol for 2 hours, shake constantly, filter, and concentrate the filtrate on a water bath to about 2 ml as the test solution. Heat under reflux 50 mg of Radix Coptidis reference drug with 5 ml of methanol for 15 minutes, filter and dilute to 5 ml with methanol as the reference drug solution. Dissolve a quantity of berberine hydrochloride CRS in methanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethyl cellulose as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropyl alcohol and water (6 : 3 : 1.5 : 1.5 : 0.3) as the mobile phase, pre-equilibrated with ammonia vapour. Apply separately 1-2 μl of each of the above three solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm, The yellow fluroscent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with reference drug solution and the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 0.2 mol/L sodium dihydrogen phosphate (adjust to pH 2.7 with phosphoric acid) (42 : 58) as the mobile phase. As detector a spectrophotometer set at 275nm. The number of the theoretical plates of the column is not less than 5000, calculated with reference to the peak of baicalin.

Reference solution Dissolve about 12.5 mg of baicalin CRS with 10 ml of methanol in a 250 ml volumetric flask. Dilute with water to volume and mix well (containing 50 μg of baicalin per ml).

Test solution Weigh accurately 0.75 g of the fine powder of granules, obtained under the test of weight variation and mixed thoroughly and triturated, in a 100 ml volumetric flask. Add 10 ml of methanol and ultrasonicate (power, 250 W; frequency, 50 kHz) for 10 minutes, dilute with water to volume, mix well, centrifuge, use the supernatant as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution, respectively, into the column and calculate the content.

It contains not less than 21 mg of baicalin ($C_{21}H_{18}O_{11}$) per pack, referred to Radix Scutellariae.

Action To clear *heat*, purge *fire* to relieve *toxicity*, and resolve stagnant blood, cool blood to arrest bleeding.

Indications Fever, irritability, bloodshot eyes, aphtha, sore throat, swollen and painful gums, constipation, hematemesis, hemoptysis, rhinorrhagia or hemorrhoidal bleeding due to *fire* toxins and *blood-heat*; pharyngitis, gingivitis with above symptoms.

Usage and dosage 7.5 g, 3-4 times a day; taken by mixed with boiled water.

Precaution Appropriate reduction of dosage when diarrhea arises.

Strength 7.5 g per pack

Storage Preserve in tightly closed containers.

Yiqi Yangxue Koufuye (益气养血口服液)

Yiqi Yangxue Mixture

Ingredients Radix et Rhizoma Ginseng 8.3 g; Radix Astragali 83.4 g; Radix Codonopsis 75 g; Radix Ophiopogonis 50 g; Radix Angelicae sinensis 33.3 g; Rhizoma Atractylodis Macrocephalae 33.3 g (stir-baked); Radix Rehmanniae 33.3 g; Radix Polygoni Multiflori Rraeparata Cum Succo Glycines Sotae 30 g; Fructus Schisandrae Chinensis 25 g; Pericarpium Citri Reticulatae 33.3 g; Cortex Lycii 25 g; Cornu Cervi Pantotrichum 1.7 g; Herba Epimedii 50 g.

Procedure Cut Cornu Cervi Pantotrichum into slices, decoct with water for 2 times, 3 hours for each time. Combine the decoctions, filter, concentrate the filtrate to form a thin extract with a relative density of 1.20-1.25 (20℃). Add 3 volumes of ethanol, allow to stand for 24 hours. Filter, recover the ethanol to obtain the reserved extract. Decoct the other 12 ingredients with water for 2 times, 3 hours for the first time and 2 hours for the second time. Combine the decoctions, filter, concentrate the filtrate to form a thin extract with a relative density of 1.19 (20℃). Combine with the above reserved extract, add 133 g of sucrose and 267 g of refined honey, boil for 30 minutes, allow to cool, add 0.5 ml of orange essence, 1 g of ethyl *p*-hydroxybenzoate and a quantity of water to 1000 ml, Stir well and filter.

Description A brownish-yellow to brown liquid; taste, sweet, slightly bitter.

Identification (1) Extract 10 ml of the mixture with three 5-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts and wash with three 5-ml quantities of ammonia TS. Evaporate the *n*-butanol extract to dryness, and dissolve the residue in 1 ml of dilute ethanol TS, and apply to a column (1-1.5 cm in internal diameter) packed with neutral aluminium oxide (100-120 mesh, 2 g). Elute with 50 ml of 40% ethanol, and collect the eluate. Evaporate to dryness and dissolve the residue in 1 ml of water, Apply to a column (1.2-1.5 cm in internal diameter, 12 cm in length) packed with D101 coarse bore resin. Elute successively with 20 ml of water, 30 ml of 40% ethanol, discard the water and 40% ethanol eluates, elute with 50 ml of 70% ethanol, collect the 70% ethanol eluate. Evaporate to dryness and dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of Astragaloside Ⅵ CRS in methanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatograph (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13 : 7 : 2), standing below 10℃, as the mobile phase. Apply separately 4 μl of the above test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and heat at 105℃ to the spots clear. Examine in daylight and under ultraviolet light at 365 nm. The spot or fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) Transfer 10 ml of the mixture into a separator, wash with three 5-ml quantities of cyclohexane. Extract with three 5-ml quantities of ethyl acetate, combine the ethyl acetate extracts, evaporate to dryness. Dissolve the residue in 1 ml of the methanol as the test solution. Decoct 1 g of Pericarpium Citri Reticulatae reference drug with 30 ml of water for 1 hour and filter. Concentrate the filtrate to 10 ml, prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of ethyl acetate, methanol, water and pyridine (100 : 17 : 13 : 5) as the mobile phase. Apply separately 4 μl of each of the above two solutions to the plate. After developing about 3 cm and removal of the plate, dry in air, and then use the upper layer of a mixture of toluene, ethyl acetate, formic acid and water (20 : 10 : 1 : 1) as the mobile phase, after developing 8 cm and removal of the plate, dry in air. Spray with aluminum trichloride TS. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Relative density 1.15-1.19 (Appendix Ⅶ A).

pH value 3.8-5.0 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.05% solution of phosphoric acid (26 : 74) as the mobile phase. As detector a spectrophotometer set at 270 nm. The number of the theoretical plates of the column is not less than 1500, calculated with the reference to the peak of icariine.

Reference solution Dissolve a quantity of icariine CRS, accurately weighed, in methanol to prepare a solution containing 0.1 mg per ml.

Test solution Measure accurately 3 ml of the mixture, place in a 10 ml volumetric flask, add a quantity of methanol, and ultrasonicate (power, 250 W; frequency, 33 kHz) for 30 minutes, allow to cool, and dilute with methanol to volume, mix well, and filter the supernatant, use the successive filtrate as the test solution.

Procedure Inject accurately 10μl of the reference solution and 20 μl of the test solution into the column, and calculate the content.
It contains not less than 0.12 mg of icariine ($C_{33}H_{40}O_{15}$) per ml, referred to Herba Epimedii.

Action To replenish *qi* and nourish blood.

Indications Shortness of breath and palpitation, lusterless complexion, weakness and lassitude due to a *deficiency* of *qi* and blood.

usage and dosage 15-20 ml, 3 times a day.

Strength 10 ml per phvial

Storage Preserve in tightly closed containers.

Yishenling Keli
(益肾灵颗粒)

Yishenling Granules

Ingredients Fructus Lycii 200 g; Fructus Ligustri Lucidi 300 g; Radix Aconiti Lateralis Praeparata 20 g; Semen Euryales (stir-baked) 300 g; Semen Plantaginis (stir-fried) 100 g; Fructus Psoraleae (stir-baked) 200 g; Fructus Rubi 200 g; Fructus Schisandrae Chinensis 50 g; Fructus Mori 200 g; Semen Astragali Complanati 250 g; Semen Allii Tuberosi (stir-baked) 100 g; Herba Epimedii 150 g; Fructus Rosae Laevigatae 200 g.

Procedure Decoct the above thirteen ingredients with water twice, each for 2 hours, combine the decoctions, filter, allow to stand for 12 hours, filter the supernatant, concentrate the filtrate to a thin extract with a relative density of 1.18 (80℃), add a quantity of sucrose powder, mix thoroughly to make granules and dry at a lower temperature, make to 2500 g of granules. Or concentrate the filtrate to a thick extract with a relative density of 1.35 (50℃), add a quantity of dextrin and stevioside, mix thoroughly, dry and make to 1000 g of granules.

Description Yellowish-brown granules; taste, sweet, slightly bitter.

Identification Heat under reflux 10 g or 4 g (without sucrose) of the granules, ground to fine powder, with 25 ml of ethanol for 30 minutes. Filter and evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve a quantity of psoralen CRS and isopsoralen CRS separately in ethyl acetate to produce two solutions each containing 1 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (60-90 ℃) and ethyl acetate (2 : 1) as the mobile phase. Apply separately 5 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sodium hydroxide in ethanol, examine under ultraviolet light at 365 nm. The fluroscent spots

in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Action To warm *kidney-yang* and reinforce the kidney.

Indications Impotence, premature ejaculation, seminal emission or asthenospermia due to a *deficiency* of *kidney-qi* and *yang*.

Usage and dosage 1 pack, 3 times a day, taken after dissolved in boiling water.

Strength (1) 20 g per pack (2) 8 g per pack (without sucrose)

Storage Preserve in tightly closed containers.

Yixian Wan
(医痫丸)

Yixian Pills

Ingredients Rhizoma Typhonii 40 g; Rhizoma Arisaematis (processed) 80 g; Rhizoma Pinelliae (processed) 80 g; Fructus Gleditsiae Abnormalis 400 g; Bombyx Batryticatus (stir-baked) 80 g; Zaocys (processed) 80 g; Scolopendra 2 g; Scorpio 16 g; Alumen 120 g; Realgar 12 g; Cinnabaris 16 g.

Procedure Levigate separately Cinnabaris and Realgar to very fine powder. Pulverize the other nine ingredients to fine powder, and triturate with the above powders, sift and mix thoroughly. Make pills with water and dry.

Description Brown to dark brown watered pills; taste salty, astringent and pungent.

Identification Microscopical: Fibre bundles pale yellow, surrouned by parenchymatous cells containing prisms of calcium oxalate and a few clusters, forming crystal fibres, and often accompanied by subsquare sclerenchymatous cells. Fragments of body walls colourless, covered with minute hyphae. Fragments of body walls pale yellow to yellow, with reticulate striations and rounded alveoli, sometimes showing brown setae. Irregular pieces golden-yellow or orange-yellow, lustrous. Irregular fine granules dark brownish-red, lustrous, with dark black edge.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To expel *wind* and resolve *phlegm*, and relieve epilepsy to stop convulsion.

Indications Epilepsy due to *phlegm* accumulated in the head with manifestations of convulsion, loss of consciousness, upward pulling of eyes and slobbering.

Usage and dosage 3 g, 2-3 times a day; appropriate reduction of the dosage for children.

Precaution Overdosage is forbidden as it contain poisonous ingredients; It is forbidden to prescribe to pregnant women.

Storage Preserve in tightly closed containers.

Yixin Tongmai Keli
(益心通脉颗粒)

Yixin Tongmai Granules

Ingredients Radix Astragali; Radix et Rhizoma Ginseng; Radix Glehniae; Radix Scrophulariae; Radix et Rhizoma Salviae Miltiorrhizae; Rhizoma Chuanxiong; Radix Curcumae; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle.

Procedure Heat under reflux Radix et Rhizoma Salviae Miltiorrhizae and Radix et Rhizoma Ginseng in 75% ethanol 1 hour, filter, recover the ethanol from the filtrate in vacuum, then concentrate to a thin extract with a relative density of 1.20-1.30 (50℃). Decoct the residue and the other 6 ingredients with water 2 times, 1.5 hour for each time, combine the decoctions and filter. Concentrate in vacuum to a thin extract with a relative density of 1.20-1.30 (50℃). Combine the above two thin extract, dry it in vacuum and pulverize to fine powder, mix well. Add a quantity of 75% ethanol, make granules and dry, make to 1000 g.

Description Brown to dark brown granules; taste, sweet and slightly bitter.

Identification (1) To 5 g, triturate to fine powder, add 20 ml of ethanol, ultrasonicate for 5 minutes, and filter. Evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 0.5 g of Rhizoma Chuanxiong reference drug in the same manner as the reference drug solution. Dissolve a quantity of tanshinone ⅡA CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance, and the mixture of toluene and ethyl acetate (9.5 : 0.5) as the mobile phase. Apply separately 10 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air. Examine in daylight, the spots in the chromatogram obtained with the test solution correspond in position and colour to the spot in the chromatogram obtained with the reference solution. Examine under ultraviolet light at 365 nm, the fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(2) Heat under reflux 10 g, ground to fine powder, with 50 ml of methanol for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 30 ml of water. Transfer the solution to a separating funnel, extract with 30 ml of ether by shaking and discard the ether solution. Extract the aqueous solution with two 40-ml quantities of *n*-butanol saturated with water by shaking. Combine the *n*-butanol extracts, wash with 40 ml of 0.1 mol/L solution of sodium hydroxide, wash again with water saturated with *n*-butanol until the solution become neutral. Separate *n*-butanol extract and evaporate to dryness. Dissolved the residue in 5 ml of water, and apply it to a D101 macroporous adsorption resin column (0.9 cm in inner diameter, 12 cm in length). Elute with 50 ml of water, 50 ml of 30% ethanol and 70% ethanol separately, collect the 70% ethanolic eluate and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve separately a quantity of ginsenoside Rg_1 CRS and astragaloside Ⅳ CRS in methanol to produce two solutions each containing 1 mg per ml as the reference solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethyl cellulose as the coating substance, and the lower layer of a mixture of chloroform, methanol and water (13 : 7 : 2, standing below 10℃) as the mobile phase. Apply separately 10 μl of the test solution and 4 μl of the two reference solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponde in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for granules (Appendix Ⅰ C).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use Octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (76 : 24) as the mobile phase. As detector a spectrophotometer set at 268 nm. The number of theoretical plates of the column is not less than 4500, calculated with the reference to the peak of tanshinone ⅡA.

Reference solution Dissolve a quantity of tanshinone ⅡA CRS, accurately weighed and place in a brown volumetric flask, add methanol to produce a solution containing 20 μg per ml.

Test solution Weigh accurately about 5 g of the mixed contents, obtained under the test of weight variation and ground to fine powder, place in a brown conical flask with stopper, add 50 ml of the mixture of dichloromethane and methanol (1 : 1), stopper tightly, and ultrasonicate (power 250 W, frequency 33 kHz) for 30 minutes, filter. Place the filtrate in a 50 ml brown volumetric flask, wash the container and the filter apparatus with the mixture of dichloromethane and methanol (1 : 1), combine the washings to the same volumetric flask, dilute with the same solvent to volume and shake well. Transfer 20 ml, measured exactly, evaporate to dryness. Dissolve the residue with methanol to a 5 ml brown volumetric flask and dilute to the volume, shake well and filter, use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.
It contains not less than 0.4 mg of tanshinone ⅡA ($C_{19}H_{18}O_3$) per pack, referred to Radix et Rhizoma Salviae Miltiorrhizae.

Action To replenish *qi* and nourish *yin*, and promote blood circulation to dredge meridians.

Indications Obstruction of *qi* in the chest due to a deficiency of *qi* and *yin* and blood stasis in meridians, with manifestations of constriction in the chest and heart pain, palpitation and shortness of breath, lassitude and sweating, and dry throat; pectoris angina in coronary heart disease with above symptoms.

Usage and dosage 1 pack, 3 times a day, taken after mixed with boiled water. 4 weeks making a course of treatment, or follow doctor's advice.

Strength 10 g per pack

Storage Preserve in tightly closed containers.

Yiyuan San
(益元散)

Yiyuan Powder

Ingredients Talcum 600 g; Radix et Rhizoma Glycyrrhizae 100 g; Cinnabaris 30 g.

Procedure Levigate Cinnabaris to very fine powder and pulverize the other two ingredients to fine powder, triturate with Cinnabaris powder, sift and mix thoroughly.

Description A pale pink powder, unctuous to the touch; taste, sweet.

Identification (1) Microscopical: Irregular fragments colourless, with scars of stripping in layers. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Irregular fine granules dark brownish-red, lustrous, dark black at the edge.
(2) Comply with the test of Identification (2) described under Liuyi Powder, using 2 g of the powder.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Assay Heat gently about 2.5 g of the powder, accurately weighed, with 10 ml of sulfuric acid and 1.5 g of potassium nitrate in a 250 ml flask to dissolve Cinnabaris and cool. Add 10 ml of 1% nitric acid solution, shake well, cool, filter through a sinter-glass funnel, wash the funnel and flask with 40 ml of 1% nitric acid solution in several portions, combine the washings with the filtrate, add dropwise 1% potassium permanganate solution until the pink colour persists for 2 minutes, add dropwise 2% ferrous sulfate solution until the pink colour disappears. Add 2 ml of ammonium ferric sulfate IS, and titrate with ammonium thiocyanate (0.05 mol/L) VS. Each ml of ammonium thiocyanate (0.05 mol/L) VS is equivalent to 5.815 mg of HgS.
It contains not less than 3.5 per cent and no more than 4.2 per cent of HgS, referred to cinnabaris.

Action To clear *summer-heat* and drain *dampness*.

Indications Feverish sensation of the body, restlessness, thirst with desire for drinks, concentrated urine due to affliction from *summer-heat* and *dampness*.

Usage and dosage 6 g, 1-2 times a day, taken after mixed with water or decocted.

Storage Preserve in well closed containers, protect from moisture.

Yuanhu Zhitong Pian
(元胡止痛片)

Yuanhu Zhitong Tablets

Ingredients Rhizoma Corydalis (processed with vinegar) 445 g; Radix Angelicae Dahuricae 223 g.

Procedure Pulverize 166 g of Radix Angelicae Dahuricae to fine powder. Pulverize the remains of Radix Angelicae Dahuricae and Rhizoma Corydalis to coarse powder. Macerate the coarse powder with 3 times volume of 60% ethanol for 24 hours, heat under reflux for 3 hours and collect the extract. To the residue add two times volume of 60% ethanol, heat under reflux again for 2 hours and collect the extract. Combine the extracts and filter. Concentrate the filtrate to a thick extract, add the above fine powder, make to granules, compress into 1000 tablets and coat with sugar or film.

Description Sugar or film coated tablets, with brown core; odour, aromatic; taste, bitter.

Identification (1) To 10 tablets, removed the coats, add 50 ml of methanol, ultrasonicate for 30 minutes, and filter. To the filtrate add 5 g of aluminium oxide activated, shake for several minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in water, alkalify with concentrated ammonia TS, and then extract with three 10-ml quantities of ether with shaking. Combine the ether extracts and evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. To 1 g of Rhizoma Corydalis reference drug add 50 ml of methanol, ultrasonicate for 30

minutes, filter, and prepare in the same manner, beginning at the words "Evaporate the filtrate to dryness", as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 1% solution of sodium hydroxide as the coating substance and a mixture of *n*-hexane, chloroform and methanol (7.5 : 4 : 1) as the mobile phase. Apply separately 2-3 μl of each of the two solutions to the plate. After developing in a chamber pre-equilibrated with the mobile phase for 1 hour and removal the plate, dry in air. Expose the plate to iodine vapour until the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Expel iodine completely from the plate and examined under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) To 10 tablets, removed the coats and pulverized, add 20 ml of petroleum ether (60-90℃), ultrasonicate for 20 minutes, and filter. Evaporate the filtrate to about 1 ml as the test solution. To 0.1 g of Radix Angelicae Dahuricae reference drug add 1 ml of petroleum ether (60-90℃), macerate for 30 minutes with constantly shaking, allow to stand, and use the supernatant as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of petroleum ether (60-90℃) and ether (3 : 2) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. The fluorescent spots, examined under ultraviolet light at 365 nm, and the spots, examined under ultraviolet light at 254 nm, in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Pulverize 40 tablets, removed coats and weighed accurately, to fine powder, weigh accurately 4 g, add 50 ml of methanol, and ultrasonicate for 30 minutes. Filter, wash the flask and filter with a small quantities of methanol, combine the filtrate and washings, and recover the solvent to dryness. Dissolve the residue with 30 ml of water, adjust to alkalinity with concentrated ammonia TS, extract with five 20-ml quantities of ether, combine the extracts, and wash with two 20-ml quantities of water. To the ether layer, recover the solvent, dissolve the residue with methanol, transfer to a 5 ml volumetric flask, and dilute to the volume with methanol as the test solution. Dissolve a quantity of tetrahydropalmatine CRS, accurately weighed, in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G prepared with 1% solution of sodium hydroxide as the coating substance and a mixture of *n*-hexane, dichloromethane, methanol and concentrated ammonia TS (15 : 8 : 1.7 : 0.05) as the mobile phase. Apply accurately 5-10 μl of the test solution, 1 μl and 6 μl of the reference solution to the plate alternatively. After developing and removal of the plate, dry it in air, expose the plate to iodine vapour for 5-10 minutes until spot distinct, and expel absorbed iodine. Carry out the method for thin layer chromatography (Appendix Ⅵ A, thin layer chromatographic scanning method), scan at the wavelength of $\lambda_S = 346$ nm, $\lambda_R = 200$ nm. Measure the integration values of the absorbance from the test solution and the reference solution respectively, and calculate the content.

It contains not less than 20 μg of tetrahydropalmatine ($C_{21}H_{25}NO_4$) per tablet, referred to Rhizoma Corydalis.

Action To regulate *qi* flow and promote blood circulation to kill pain.

Indications Stomachache, hypochondriac pain, headache and dysmenorrhea due to stagnation of *qi* and blood.

Usage and dosage 4-6 tablets, 3 times a day, or follow doctor's advice.

Storage Preserve in tightly closed containers.

Yueju Wan
(越鞠丸)

Yueju Pills

Ingredients Rhizoma Cyperi (processed with vinegar) 200 g; Rhizoma Chuanxiong 200 g; Fructus Gardeniae (stir-baked) 200 g; Rhizoma Atractylodis (stir-baked) 200 g; Massa Medicata Fermentata (stir-baked) 200 g.

Procedure Pulverize the above five ingredients to fine powder, sift, mix thoroughly, make pills with water and dry.

Description Dark brown to brown watered pills; odour, aromatic; taste, slightly astringent and bitter.

Identification (1) Microscopical: Secretory cells subrounded, containing pale yellowish-brown to reddish-brown secretions, surrounded by radially arranged cells. Needle crystals of calcium oxalate minute, 10-32 μm longer irregularly filling in parenchymatous cells. Stone cells of testa yellow or pale brown, long-polygonal, rectangular or irregular, frequently broken, walls thickened, with large rounded pits, lumina brownish-red.

(2) Heat under reflux 3 g of the pills, ground to powder, with 30 ml of ether for 1 hour. Allow to cool, filter and keep the residue for further use, expel ether of the filtrate and disslove the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 0.5 g of Rhizoma Atractylodis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and petroleum ether (60-90℃) as the mobile phase. Apply separately 5-10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and spray with 5% solution of *p*-dimethylaminobenzaldehyde in 10% sulfuric acid in ethanol, and heat to the spots clear. The dark green colour spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution.

(3) Prepare a solution of 0.5 g of Rhizoma Chuanxiong reference drug in the same manner described under Identification test (2), as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 5 μl of each of the test solution obtained under Identification (2) and the above reference drug solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Heat under reflux drug residue extracted with ether obtained under Identification (2) with 30 ml of ethyl acetate for 1 hour, cool, filter and evaporate the filtrate to dryness.

Dissolve the residue in 3 ml of methanol, filter and use the filtrate as the test solution. Dissolve geniposide CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, acetone, formic acid and water (20 : 14 : 4 : 1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and spray with 10% sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirments for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, water and phosphoric acid (9 : 91 : 0.1) as the mobile phase. As detector a spectrophotometer set at 240 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of geniposide.

Reference solution Dissolve a quantity of geniposide CRS, weighed accurately, in 50% methanol to prepare a solution containing 25 μg per ml.

Test solution Weigh accurately 0.1 g of the pills, pulverized to fine powder, in a stopper conical flask, add accurately 50 ml of 50% methanol, stopper, and weigh. Ultrasonicate (power 150 W, frequency 25 kHz) for 30 minutes, stand to cool, weigh again, and replenish the lost weight with 50% methanol. Mix well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 5.0 mg of geniposide ($C_{17}H_{24}O_{10}$) per gram, referred to Fructus Gardeniae.

Action To regulate *qi* flow to alleviate stagnation, and soothe the *middle-energizer* and relieve epigastric distension.

Indications Fullness and constriction in the chest, abdominal distension, retention of undigested food, belching and casting up of gastric acid.

Usage and dosage 6-9 g, twice a day.

Storage Preserve in well closed containers, protected from moisture.

Yupingfeng Koufuye (玉屏风口服液)

Yupingfeng Mixture

Ingredients Radix Astragali 600 g; Radix Saposhnikoviae 200 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 200 g.

Procedure Break Radix Saposhnikoviae to pieces, and distil volatile oil, collect the aqueous solution in a separate container. Decoct the drug residue of distillation, Radix Astragali and Rhizoma Atractylodis Macrocephalae with water twice, 1.5 hours for the first time and 1 hour for the second. Combine the decoctions, filter, concentrate the filtrate to a appraprate amount and precipitate with a quantity of ethanol. Recover ethanol from the supernatant in vacuum, stir well with water, allow to stand, filter the supernatant and concentrate. Prepare a syrup with 400 g of sucrose, mix with the above solution, and add the volatile oil and the above aqueous solution. Make up to 1000 ml, stir well, filter, pack and sterilize.

Description A brownish-red to brown liquid, taste, sweet, slightly bitter and astringent.

Identification (1) Extract 10 ml by shaking with three 20-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extracts, wash with three 20-ml quantities of ammonia TS. Evaporate the *n*-butanol extract to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of astragaloside Ⅳ CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13 : 7 : 2), stood below 10℃, as the mobile phase. Apply separately 2-4 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sulphuric acid in ethanol and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution. Examine under ultraviolet light at 365 nm, the fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) Extract 20 ml of the mixture with two 25-ml quantities of petroleum ether (30-60℃), combine the extracts, evaporate the extract to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Decoct 2 g of Radix Atractylodis Macrocephalae reference drug with 50 ml of water for 30 minutes, stand to cool, filter, and treat the filtrate to prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (7 : 3) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% solution of *p*-diethylaminobenzaldehyde in 10% sulfuric acid of ethanol, heat at 105℃ to spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Examine under ultraviolet light at 365 nm, the florescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Dilute 1 ml of the mixture with methanol to 10 ml, mix well, centrifuge, and use the supernatant as the test solution. Dissolve a quantity of 5-*O*-methylvisammioside CRS in methanol to produce a solution containing 60 μg per ml as the reference solution. Carry out the method for high performance liquid chromatography (Appendix Ⅵ D), using octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (35 : 65) as the mobile phase. As detector a spectrophotometer set at 254 nm. Inject 10 μl of each of the reference solution and the test solution into the column, the retention time of the peak in the chromatogram obtained with the test solution correspond with that in the chromatogram obtained with the reference solutions.

Relative density Not less than 1.16 (Appendix Ⅶ A).

pH value 4.0-5.5 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (35 : 65) as the mobile phase. Use an evaporative light scattering detector. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of astragaloside Ⅳ.

Reference solution Dissolve a quantities of astragaloside Ⅳ CRS, weighed accurately, in methanol to prepare a solution containing 0.4 mg per ml.

Test solution Extract 20 ml of the mixture, measured accurately, with five 25-ml quantities of *n*-butanol saturated with water, combine the extract, and wash with three 20-ml quantities of ammonia TS. Recover the solvent, dissolve the residue in methanol, transfer to a 10 ml volumetric flask, and dilute with methanol to volume. Mix well, centrifuge, and use the supernatant as the test solution.

Procedure Inject accurately 5 μl, 20 μl of the reference solution and 10 μl of the test solution into the column, determine and calculate the content, using a calibration equation of logarithm alteration of two external standards. It contains not less than 0.12 mg of astragaloside Ⅳ ($C_{41}H_{68}O_{14}$) per ml, referred to Radix Astragali.

Action To replenish *qi* to strengthen the superficies and check sweating.

Indications Spontaneous sweating and aversion to *wind*, and pallar due to exterior deficiency, or weak patients who are susceptible to wind.

Usage and dosage 10 ml, 3 times a day.

Strength 10 ml per phial

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Yuzhen San
(玉真散)

Yuzhen Powder

Ingredients Rhizoma Typhonii 600 g; Radix Saposhnikoviae 50 g; Radix Angelicae Dahuricae 50 g; Rhizoma Arisaematis 50 g; Rhizoma Gastrodiae 50 g; Rhizoma et Radix Notopterygii 50 g.

Procedure Pulverize the above six ingredients to fine powder, sift and mix well.

Description A yellowish-white to pale yellow powder; odour, aromatic; taste, numb and pungent.

Identification Microscopical: Compound starch granules consisting of 8-12 components. Raphides of calcium oxalate up to 136 μm long, mostly occurring in mucilage cells. Stone cells yellowish-green, elongated ovoid, elongated rounded or subrectangular, with relatively thickened walls and distinct pit-canals. Sclerenchymatous cells polygonal or elongated polygonal, 70-180 μm in diameter, with thickened and slightly lignified walls, distinctly pitted. Vittae containing brownish-yellow secretion, about 100 μm in diameter.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Action To expel *wind* to relieve convulsion and relieve *toxicity*.

Indications Tetanus due to incised wound accompanied by *wind* with manifestations of muscular spasms, tic of hands and feet or traumatic injuries.

Usage and dosage 1-1.5 g or follow doctor's advice; appropriate quantity for topical application.

Precaution Contraindicated for pregnant women.

Storage Preserve in well closed containers, protected from moisture.

Zaizao Shengxue Pian
(再造生血片)

Zaizao Shengxue Tablets

Ingredients Semen Cuscutae (processed with wine); Radix et Rhizoma Ginseng Rubra; Caulis Spatholobi; Colla Corii Asini; Radix Angelicae Sinensis; Fructus Ligustri Lucidi; Radix Astragali; Herba Leonuri; Radix Rehmanniae Praeparata; Radix Paeoniae Alba; Radix Polygoni Multiflori Praeparata Cum Succo Glycines Sotae; Herba Epimedii; Rhizoma Polygonati (processed with wine); Cornu Cervi Pantotrichum (burn away the soft hairs); Radix Codonopsis; Radix Ophiopogonis; Herba Agrimoniae; Rhizoma Atractylodis Macrocephalae (stir-baked); Fructus Psoraleae (processed with salt water); Fructus Lycii; Herba Ecliptae.

Procedure Smash Herba Leonuri, Herba Ecliptae, Herba Agrimoniae, Caulis Spatholobi, Semen Cuscutae, Rhizoma Polygonati, Radix Rehmanniae Praeparata, Fructus Ligustri Lucidi, Radix Ophiopogonis, Radix Astragali and Herba Epimedii to small piece. Decoct with water three times, 3 hours for the first time, 2 hours for the second time and 1 hour for the third time. Filter and combine the filtrate, concentrate to a thick extract. Pulverize Radix et Rhizoma Ginseng Rubra, Cornu Cervi Pantotrichum, Radix Angelicae Sinensis, Radix Polygoni Multiflori Praeparata Cum Succo Glycines Sotae, Radix Codonopsis, Fructus Lycii, Fructus Psoraleae, Colla Corii Asini, Radix Paeoniae Alba and Rhizoma Atractylodis Macrocephalae to fine powder, sift. Mix well with the above thick extract, dry and pulverize, sift and make granules, dry. Add a quantity of excipients, compress into 1000 tablets and coat with sugar.

Description Sugar coated tablets with brownish-yellow or blackish-brown core, odour, slight; taste, bitter and astringent slightly.

Identification (1) To 40 tablets, removed the coats, pulverized to powder, add 80 ml of chloroform, ultrasonicate for 30 minutes, and filter, keep the residue for further use, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 1 g of Radix Angelicae Sinensis reference drug and 30 ml of chloroform in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of *n*-hexane and ethyl acetate (4 : 1) as the mobile phase. Apply separately 2 μl of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the fluorescent spots in the chromatogram obtained with the reference drug solution.

(2) To 1 g of Fructus Psoraleae reference drug, add 30 ml of chloroform, ultrasonicate for 30 minutes, cool and filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the reference drug solution. Dissolve psoralen and isopsoralen CRS in methanol to produce a mixture containing 1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of *n*-hexane and ethyl acetate (4 : 1) as the mobile phase. Apply separately 2 μl of each of the test solution obtained under Identification (1) and the reference drug solution, 1 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 10% sodium hydroxide in methanol, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the fluorescent spots in the chromatogram obtained with the reference drug solution and the reference solution.

(3) To 50 tablets, removed the coats, pulverized to powder, add 80 ml of ether, ultrasonicate for 15 minutes, discard the ether extract, expel the ether, add 80 ml of methanol, ultrasonicate for 30 minutes, filter. Evaporate the filtrate to dryness, dissolve the residue in 50 ml of water, filter, and extract the filtrate with two 40-ml quantities of ethyl acetate. Discard the ethyl acetate extracts, and extract the filtrate with two 35-ml quantities of *n*-butanol saturated with water. Combine the *n*-butanol extracts, wash with 50 ml of water saturated with *n*-butanol, evaporate the *n*-butanol extracts to dryness, dissolve the residue in 10 ml of water, apply the water to a column (1.5 cm in internal diameter) packed with D101 macroporous resin (13 cm in length, packed by wet method), elute with 5 ml of ammonia TS, then elute with water (about 200 ml) to the eluate colourless, elute with 100 ml of dilute ethanol TS and collect the ethanol eluate, evaporate the eluate to dryness, and dissolve the residue in 1 ml of methanol as the test drug solution. Dissolve a quantity of paeoniflorin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of chloroform, ethyl acetate, methanol and formic acid (40 : 5 : 10 : 0.2) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanillin in sulfuric acid, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D)

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and the mixture of acetonitrile and 0.125% solution of phosphoric acid (30 : 70) as the mobile phase. As detector a spectrophotometer set at 247 nm. The number of theoretical plates for the column is not less than 3000, calculated with the reference to the peak of psoralen.

Reference solution Dissolve a quantity of psoralen and isopsoralen CRS, accurately weighed, in methanol to produce a mixture containing 16 μg of each per ml as the reference solution.

Test solution To 20 tablets with coating removed, pulverized to powder. Weigh accurately about 1 g of the powder, to a stopper conical flask. Add accurately 25 ml of methanol, stopper tightly, weighed accurately. Ultrasonicate (power, 250 W; frequency, 25 kHz) for 30 minutes, allowed to cool, weighted accurately again, replenish the lost weigh with methanol, mix well and filter. Discard the initial filtrate, measure accurately 1 ml of the successive filtrate in a 10 ml volumetric flask, add methanol to volume, mix well and filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column and calculate the content.

It contains not less than 0.17 mg of the total amount of psoralen ($C_{11}H_6O_3$) and isopsoralen ($C_{11}H_6O_3$) per tablet, referred to Fructus Psoraleae.

Action To reinforce the liver, kidney, *qi* and nourish blood.

Indications Consumption of *qi* due to a *deficiency* of *qi* and blood with manifestations of palpitation, shortness of breath, dizziness and blurred vision, lassitude, weakness and aching in the lower back and knees, pallor, pale lips and nails, accompanied with hemorrhage due to *deficiency* in the liver and kidney and insufficient *qi* and blood; aplastic anemia and iron-deficiency anemia with above symptoms.

Usage and dosage 5 tablets, 3 times a day.

Storage Preserve in tightly closed containers.

Zaizao Wan
(再造丸)

Zaizao Pills

Ingredients Agkistrodon 20 g; Scorpio 15 g; pheretima 5 g; Bombyx Batryticatus (stir-baked) 10 g; Squama Manis (processed) 10 g; Os Pardi (processed) 10 g; Moschus 5 g; Pulvis Cornus Bubali Concentratus 15 g; Calculus Bovis 2.5 g; Carapax et Plastrum Testudinis (processed) 10 g; Cinnabaris 10 g; Rhizoma Gastrodiae 20 g; Radix Saposhnikoviae 20 g; Rhizoma et Radix Notopterygii 20 g; Radix Angelicae Dahuricae 20 g; Rhizoma Chuanxiong 20 g; Radix Puerariae 15 g; Herba Ephedrae 20 g; Cortex Cinnamomi 20 g; Herba Asari 10 g; Radix Aconiti Lateralis Preparata 10 g; Lignum Pini Nodi 10 g; Herba Taxilli 20 g; Rhizoma Drynariae (stir-baked) 10 g; Radix Clematidis (stir-baked with wine) 15 g; Rhizoma Dioscoreae Hypoglaucae 20 g; Radix Angelicae Sinensis 10 g; Radix Paeoniae Rubra 10 g; Rhizoma Wenyujin Concisum 2.5 g; Sanguis Draconis 7.5 g; Radix Notoginseng 5 g; Olibanum (processed) 10 g; Myrrha (processed) 10 g; Radix et Rhizoma Ginseng 20 g; Radix Astragali 20 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 18 g; Poria 10 g; Radix Glycyrrhizae 20 g; Concretio Silicea Bambusae 10 g; Radix Polygoni Multiflori Praeparata 20 g; Radix Rehmanniae Preparata 20 g; Radix Scrophulariae 20 g; Rhizoma Coptidis 20 g; Radix et Rhizoma Rhei 20 g; Exocarpium Citri Grandis 40 g; Pericarpium Citri Reticulatae Viride (stir-baked with vinegar) 10 g; Lignum Aquilariae Resinatum 10 g; Lignum Santali Albi 5 g; Herba Pogostemonis 20 g; Fructus Caryophylli 10 g; Borneolum Syntheticum 2.5 g; Radix Linderae 10 g; Fructus Amomi Rotundus 10 g; Semen Alpiniae Katsumadai 20 g; Rhizoma Cyperi (processed with vinegar) 10 g; Rhizoma Anemones Raddeanae (processed with vinegar) 20 g; Fujian Massa Medicata Fermentata 40 g; Semen Oryzae cum Monasco Fermentatum 5 g.

Procedure Levigate Cinnabaris to very fine powder. Pulverize the other ingredients, except Moschus, Pulvis

Corni Bubali Concentratus, Calculus Bovis and Borneolum Syntheticum, to fine powder. Triturate Moschus, Pulvis Cornus Bubali Concentratus, Calculus Bovis and Borneolum Syntheticum with the above fine powders, sift and mix thoroughly. To each 100 g of the powder add 120-150 g of refined honey to make big honeyed pills.

Description Brown big honeyed pills; odour, aromatic; taste, slightly sweet and bitter.

Identification Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS, hyphae colourless or pale brown, 4-6 μm in diameter. Vittae containing golden yellow secretions. Fibre bundles bright yellow, with slightly thickened and distinctly pitted walls. Fibres in bundles, dark brown or reddish-brown, walls thickened. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres, crystal cells with lignified and thickened walls. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Fibres in bundles or scattered, mostly broken, with thickened walls and longitudinal fissures on the surface, both ends broken to be broom-like, or truncated. Stomata characteristic, guard cells dumb-bell-shaped in lateral view. Stone cells of endotesta yellowish-brown or reddish-brown, subpolygonal in surface view, with thickened walls, lumina containing silica bodies. Stone cells subrounded or subrectangular, with thin walls on one side. Stone cells yellowish-brown or colourless, subrectangular, subrounded or irregular, up to 94 μm in diameter. Prisms of calcium oxalate abundant in parenchyma. Needle crystals of calcium oxalate fine, irregularly filling in parenchymatous cells. Non-glandular hairs 1-6-celled, with warty walls. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Parenchymatous cells filled with brown to reddish-brown contents. Bordered pitted tracheids in bundles, about 25 μm in diameter. Irregular muscle fibre pieces pale brown, with dense and regularly arranged sinuous striations. Fragments of body walls pale-yellow to yellow, with reticulate striations and rounded alveoli, sometimes showing brown setae. Fragments of scales colourless, with numerous rounded pits, varying in size.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To expel *wind* and resolve *phlegm*, and promote blood circulation to dredge meridians.

Indications Stroke due to *wind-phlegm* obstructing meridians with manifestations of hemiplegia, deviation of the mouth and tongue, numbness and pain of hands and feet, muscular contracture and dysphasia.

Usage and dosage 1 pill, twice a day.

Precaution Contraindicated for pregnant women.

Strength 9 g per pill

Storage Preserve in tightly closed containers.

Zanglian Wan
(脏连丸)

Zanglian Pills

Ingredients Rhizoma Coptidis 25 g; Radix Scutellariae 150 g; Radix Rehmanniae 75 g; Radix Paeoniae Rubra 50 g; Radix Angelicae Sinensis 50 g; Fructus Sophorae 100 g; Flos Sophorae 75 g; Spica Schizonepetae 50 g; Radix Sanguisorbae (carbonized) 75 g; Colla Corii Asini 50 g.

Procedure Pulverize the above ten ingredients to coarse powder. Take 350 g of large intestine of pig, wash clean, cut into sections, and mix thoroughly with the coarse powder, steam thoroughly, and dry. Pulverize to fine powder, sift, and mix well. To each 100 g of the powder add 6-10 g of refined honey and a quantity of water to make pills, dry and make water-honeyed pills; or add 80-100 g of refined honey to make small or big honeyed pills.

Description Brown to blackish-brown water-honeyed pills, blackish-brown small honeyed pills or big honeyed pills; taste, bitter.

Identification (1) Microscopical: Fibre bundles bright yellow, walls slightly thickened, pits distinct. Bast fibres pale yellow, fusiform, walls thickened, with fine pit canals. Fibres slender, slightly curved, walls slightly thickened and unlignified. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Palisade cells of testa, 1 row, 100-190 μm long. Lower epidermal cells of corolla polygonal, with anomocytic stomata; parenchymatous cells containing prisms of calcium oxalate.

(2) Pulverize 1 g of water-honeyed pills to powder; or grind 1.8 g of small honeyed pills or big honeyed pills, cut into pieces, with 2 g of kieselguhr; add 10 ml of methanol, and ultrasonicate for 15 minutes. Filter and use the filtrate as the test solution. Prepare a solution of 50 mg of Rhizoma Coptidis reference drug in the same manner as the reference drug solution. Dissolve a quantity of berberine hydrochloride CRS in methanol to produce a solution containing 0.2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isobutanol and concentrated ammomia TS (12 : 6 : 3 : 3 : 1) as the mobile phase, pre-equilibrated with ammonia vapour. Apply separately 3 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The florescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and reference solution.

(3) Pulverize 1.5 g of water-honeyed pills to powder; or grind 2.5 g of small honeyed pills or big honeyed pills, cut into pieces, with 3 g of kieselguhr; macerate with 20 ml of petroleum ether (30-60℃) for 1 hour, shake constantly and filter. Discard petroleum ether layer, and expel solvent of the drug residue. Ultrasonicate the residue with 20 ml of methanol for 30 minutes, filter, evaporate to dryness, and dissolve the residue in 0.5 ml of water. Apply to a polyamide column (100 mesh, 2 g, 1.5-2.0 cm in diameter, packed by dry method), wash with 50 ml of water, discard the washing, elute with 50 ml of ethanol, collect the eluate, evaporate to dryness, dissolve the residue with 2 ml of methanol as the test solution. Dissolve a quantity of rutin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the upper layer of the mixture of ethyl acetate, formic acid and water (10 : 2 : 3) as the mobile phase. Apply separately 1 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 5% aluminium trichloride in ethanol and examine under ultraviolet light at 365 nm. The florescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 2% solution of acetic acid (55 : 45) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of baicalin.

Reference solution Dissolve a quantity of baicalin CRS, weighed accurately, in methanol to produce a solution containing 40 μg per ml as the reference solution.

Test solution Weigh accurately 0.25 g of the water-honeyed pills, pulverized to fine powder, or 0.45 g of small honeyed pills or big honeyed pills, cut into pieces; place to a stopper conical flask, add accurately 50 ml of methanol, weigh, and heat under reflux for 1 hour. Stand to cool, weigh again, replenish the lost weight with methanol and mix thoroughly. Filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 6.0 mg of baicalin ($C_{21}H_{18}O_{11}$) per gram of water-honeyed pills; not less than 3.3 mg per gram of small honeyed pills; and not less than 30 mg per big honeyed pill; referred to Radix Scutellariae.

Action To clear *heat* from intestines and arrest bleeding.

Indications Hematochezia due to *heat* in intestines, burning sensation in the anus, and swollen and painful hemorrhoids.

Usage and dosage 6-9 g of water-honeyed pills; 9 g of small honeyed pills; 1 pill of big honeyed pills; twice a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Zhenggu Shui
(正骨水)
Zhenggu Tincture

Ingredients Caulis et Radix Croton Tiglii; Radix Aucklandiae; Caulis Piperis Kadsurae; Eupolyphaga seu Steleophaga; Radix et Rhizoma Litseae; Fructus Gleditsiae Abnormalis; Cortex Periplocae; Rhizoma Curcumae; Caulis Gneti; Radix et Rhizoma Cinnamomi Camphorae; Radix et Rhizoma Cynanchi Paniculati; Lignum Dalbergiae Odorif-erae; Radix Zanthoxyli; Herba Schoepfiae; Herba Inulae Cappae; Rhizoma Polygoni Cuspidati; Herba Securidaca; Radix Flemingiae; Radix Ardisiae Crenatae; Herba Calophylli; Caulis Piper is wallichii; Radix Araliae Armatae; Radix Aconiti Kusnezoffii; Mentholum; Camphora.

Procedure Heat under reflux the above twenty-six ingredients, except Radix Cynanchi Paniculati, Radix Zanthoxyli, Lignum Dalbergiae Odoriferae, Mentholum, Camphora and 41.7 g of Herba Securidaca, with 1000 ml of ethanol and a quantity of water in a refluxing tanker for 7 hours, then distill, collect about 1200 ml of the distillate. Pulverize separately Radix Cynanchi Paniculati, Radix Zanthoxyli, Lignum Dalbergiae Odoriferae and the left parts of Herba Securidaca to coarse powder, add the powder to the distillate, stir thoroughly, and macerate for 48 hours. Add mentholum and Camphora into the maceration liquid, stir to dissolve, filter, and adjust to 1000 ml of total amount.

Description A clear, brownish-red liquid; odour, aromatic.

Identification (1) Extract 15 ml of the tincture with 25 ml of petroleum ether (30-60℃) in a separator with shaking, separate the lower layer and evaporate to dryness, dissolve the residue in 4 ml of 75% ethanol, filter and use the filtrate as the test solution. Macerate 1 g of Lignum Dalbergiae Odoriferae reference drug in 10 ml of 75% ethanol for 30 minutes, filter, concentrate the filtrate to 2 ml as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of chloroform, methanol and concentrated ammonium TS (90 : 9 : 1) as the mobile phase. Apply separately 3 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) Dissolve paeonol CRS in 60% ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of benzene and ethyl acetate (20 : 1) as the mobile phase. Apply separately 10 μl of the tincture and 5 μl of the above reference solution to the plate. After developing and removal of the plate, dry in air, spray with 5% ferric chloride in ethanol, heat to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in chromatogram obtained with the reference solution.

(3) Evaporate 15 ml of the tincture to dryness on a water bath, dissolve the residue in 1 ml of ethanol as the test solution. To 1 g of Radix Zanthoxyli reference drug add 15 ml of ethanol, ultrasonicate for 30 minutes, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium caboxymethylcellulose as the coating substance and a mixture of toluene, ethyl acetate and methanol (25 : 2 : 0.1) as the mobile phase. Apply separately 4 μl of each of above two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(4) Dilute 1 ml of the tincture with ethanol to 50 ml as the test solution. Dissolve camphor CRS and menthol CRS in ethanol to produce two solutions containing 1 mg per ml as the reference solutions. Carry out the method for gas chromatography (Appendix Ⅵ E), use 10% polyethylene glycol (PEG)-20 M as the stationary phase, and maintain the column temperature at 160℃. Inject separately quantities of the above three solutions into the column, the retention time of the peak in the chromatogram obtained with the test solution correspond with that in the chromatogram obtained with the reference solutions.

Ethanol content 56 per cent-66 per cent (Appendix Ⅸ M).

Other requirements Comply with the general requirements for tinctures (Appendix Ⅰ N).

Assay ***Volatile oil*** Measure accurately 10 ml of the tincture in a separator, add 100 ml of a saturated solution of sodium chloride, shake for 1-2 minutes, allow to stand for 1-2 hours, transfer the supernatant liquid to a round bottom flask, wash the separator with hot water for several times,

transfer the washings to the same flask, carry out the method for determination of volatile oils (Appendix Ⅹ D, method Ⅰ), it contains not less than 9.5 per cent of volatile oil.

Radix et Rhizoma Cynanchi Paniculati Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, water, triethylamine and phosphoric acid (28 : 72 : 0.1 : 0.1) as the mobile phase. As detector a spectrophotometer set at 274 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of paeonol.

Reference solution Dissolve a quantities of paeonol CRS, weighed accurately, with methanol to produce a solution containing 60 μg per ml as the reference solution.

Test solution Measure accurately 10 ml of the tincture in a 25 ml volumetric flask, dilute with ethanol to volume, and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.10 mg of paeonol ($C_9H_{10}O_3$) per ml, referred to Radix et Rhizoma Cynanchi Paniculati.

Action To promote blood circulation to expel stagnated blood, relax muscles and tendons and activate meridians, and reduce swelling to kill pain.

Indications Traumatic injuries, fracture, dislocation and relief of tiredness before or after sports.

Usage and dosage Gently smear the affected part with the absorbent cotton socked with the tincture. For patients of serious injury smear the affected part for 1 hour with the absorbent cotton soaked with tincture, 2-3 times a day.

Precaution Never prescribe for oral administration; never rub it into a wound; cease medication when there occurs itching and rashes.

Strength (1) 12 ml per bottle (2) 30 ml per bottle (3) 45 ml per bottle (4) 88 ml per bottle

Storage Perverse in tightly closed containers, store in a cool and dark place.

Zhenkening Tangjiang (镇咳宁糖浆)

Zhenkening Syrup

Ingredients Extractum Glycyrrhizae Liquidum 40 ml; Radix platycodi 80 g; Ephedrine Hydrochloride 0.8 g; Cortex Mori 20 g.

Procedure Take 80 g of Radix Platycodonis, carry out the percolation as described under liquid extracts and extracts (Appendix Ⅰ O), using 40% ethanol as solvent and collect 240 ml of percolate. Take 20 g of Cortex Mori in the same manner, collect 60 ml of percolate. Prepare a syrup (Syrupus Simplex) with 600 g of sucrose. To the syrup below 60℃, add Extractum Glycyrrhizae Liquidum, percolate of Radix platycodi and Cortex Mori, ephedrine hydrochloride, 0.1 g of antimony potassium tartrate and 0.1 g of ethyl *p*-hydroxybenzoate, and 2 ml of vanillic essence. Stir well, add water to 1000 ml, mix well and filter.

Description A sticky, dark brown liquid; odour, aromatic; taste, sweet.

Identification (1) Extract 10 ml of the syrup with three 20-ml quantities of *n*-butanol saturated with water, combine the extract, and wash with three 20-ml quantities of water. Evaporate the extract to dryness, and dissolve the residue in 5 ml of methanol as the test solution. Heat under reflux 1 g of Radix et Rhizoma Glycyrrhizae reference drug in 20 ml of methanol for 1 hour, filter and evaporate the filtrate to dryness. Dissolve the residue in 10 ml of water, prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), as the coating substance using silica gel G mixed with 1% solution of sodium hydroxide as the coating substance and a mixture of ethyl acetate, formic acid, glacial acetate acid and water (15 : 1 : 1.5 : 2) as the mobile phase. Apply separately 3-5 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol and heat at 105℃ to spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) Heat under reflux 10 ml of the syrup in 20 ml of chloroform and 2 ml of hydrochloric acid for 1 hour, allow to cool, separate the chloroform solution and dehydrous with anhydrous sodium sulfate. Evaporate solvent, dissolve the residue in 2 ml of methanol as the test solution. Prepare a solution of 1 g of Radix Platycodi reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane, ethyl acetate, and glacial acetic acid (3 : 2 : 1) as the mobile phase. Apply separately 2-5 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol and heat at 105℃ to spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Shake 2.5 ml of the syrup with 4 ml of ether and 1 ml of concentrated ammonia TS in a separator, separate the ether layer and extract the aqueous solution further with two 4-ml quantities of ether. Combine the ether extracts, add 2.5 ml of acidic ethanol (mix 20 ml of ethanol and 1 ml of hydrochloric acid), evaporate to dryness, and add 0.5 ml of methanol to dissolve the residue as the test solution. Disslove ephedrine hydrochloride CRS in methanol to produce a solution containing 5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and concentrated ammonia TS (40 : 8 : 1) as the mobile phase. Apply separately 2-3 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with ninhydrin TS, heat at 105℃ to spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Relative density 1.20-1.27 (Appendix Ⅶ A).

Other requirements Comply with the general requirements for syrups (Appendix Ⅰ H).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.02 mol/L solution of sodium dihydrogen phosphate (containing 0.1% triethylamine and adjusted pH to 2.7 with phosphoric acid) (4 : 100) as the

mobile phase. As detector a spectrophotometer set at 210 nm. The number of theoretical plates of the column is not less than 5000, calculated with the reference to the peak of ephedrin.

Reference solution Dissolve a quantity of ephedrin hydrochloride CRS, accurately weighed, in 0.01 mol/L solution of hydrochloric acid to prepare a solution containing 60 μg per ml.

Test solution weigh accurately 2.5 g of the syrup in a 25 ml volumetric flask, dilute with 0.01 mol/L solution of hydrochloric acid to the volume and mix well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, determine and calculate the content.
It contains not less than 0.58 mg and no more than 0.72 mg of ephedrin hydrochloride ($C_{10}H_{15}NO \cdot HCl$) per gram.

Action To stop coughing, relieve asthma and expel phlegm.

Indications Coughing, asthma with expectoration of phlegm due to attack of the lung by *wind-cold*; bronchitis, bronchial asthma with above symptoms.

Usage and dosage 5-10 ml, 3 times a day.

Precaution Follow the doctor's order; be cautious about patients with coronary heart disease, angina pectoris or hyperthyrea.

Storage Preserve in tightly closed containers.

Zhennaoning Jiaonang
(镇脑宁胶囊)

Zhennaoning Capsules

Ingredients Pulvis Cerebrum Suis; Herba Asari; Radix et Rhizoma Salviae Miltiorrhizae; Pulvis Cornus Bubali Concentratus; Rhizoma Chuanxiong; Rhizoma Gastrodiae; Radix Puerariae; Rhizoma Ligustici; Radix Angelicae Dahuricae.

Procedure Pulverize the above ingredients, except Pulvis Cerebrum Suis and Pulvis Cornus Bubali Concentratus, to fine powder, sift. Add Pulvis Cerebrum Suis and Pulvis Cornus Bubali Concentratus, mix well and make to 1000 capsules.

Description Hard capsules with pale brown content; odour, characteristic and aromatic; taste, slightly bitter.

Identification (1) Microscopical: Fibres in bundles, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres, walls of crystal cells lignified and thickened. Irregular fragments pale grayish-white or grayish-yellow, somewhat lustrous with grayish-brown irregular pigment granules and longitudinal cracks on the surface.
(2) Extract 6 g of content with 50 ml of ether by shaking for 1 hour, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ethyl acetate as the test solution. Dissolve tanshinone ⅡA CRS in ethyl acetate to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene and ethyl acetate (19 : 1) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Macerate 2 g of content in 20 ml of ether for 20 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of ethyl acetate as the reference solution. Prepare two solutions separately with 1 g of each of Rhizoma Chuanxiong reference drug and Radix Angelicae Dahuricae reference drug in the same manner as the reference drug solutions. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apply separately 5 μl each of the three solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L)

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecyasilane bonded silica gel as the stationary phase and a mixture of methanol and water (25 : 75) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 4000, calculated with reference to the peak of puerarin.

Reference solution Dissolve a quantity of puerarin CRS, accurately weighed, in 30% ethanol to produce a solution containing 15 μg per ml as the reference solution.

Test solution Mix well the content, obtained under the test of weight variation, weigh accurately 1.0 g, grind well with 1.0 g of kieslguhr, transfer to a Soxhlet's extractor, add a quantity of petroleum ether (60-90℃), heat under reflux on a water bath for 4 hours. Discard the petroleum ether extract and expel solvent remained in the residue. Transfer the residue along with the filter paper to a stopper conical flask and add accurately 50 ml of 30% ethanol, stopper tightly, and weigh. Ultrasonicate (power 250 W, frequency 50 kHz) for 40 minutes, cool, weigh again, replenish the loss of weight with 30% ethanol, shake well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of the reference solution and 10 μl of the test solution into the column, respectively, and calculate the content.
It contains not less than 0.10 mg of puerarin ($C_{21}H_{20}O_9$) per capsule, referred to Radix Puerariae.

Action To extinguish *wind* and dredge meridians.

Indications Headache, dizziness, nausea, vomiting, blurred vision, numbness of limbs and tinnitus due to upward disturbance of *wind*; angioneurotic headache, hypertension and arteriosclerosis with above symptoms.

Usage and dosage 4-5 capsules, 3 times a day.

Strength 0.3 g per capsule

Storage Preserve in tightly closed containers.

Zhibai Dihuang Wan
(知柏地黄丸)

Zhibai Dihuang Pills

Ingredients Rhizoma Anemarrhenae 40 g; Cortex Phellodendri Chinensis 40 g; Radix Rehmanniae Praeparata 160 g;

Fructus Corni (processed) 80 g; Cortex Moutan 60 g; Rhizoma Dioscoreae 80 g; Poria 60 g; Rhizoma Alismatis 60 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix well. To each 100 g of the powder add 35-50 g of refined honey and a quantity of water, make water-honeyed pills and dry; or add 80-110 g of refined honey to make small honeyed pills or big honeyed pills.

Description Brownish-black water-honeyed pills, blackish-brown small honeyed pills or big honeyed pills; taste, sweet and slightly bitter and sour.

Identification (1) Microscopical: Starch granules triangle-ovoid or oblong, 24-40 μm in diameter, hilum short cleft-like or V-shaped. Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Parenchyma greyish-brown to blackish-brown, cells mostly shrunken, and each containing a brown nucleus-like mass. Needle crystals of calcium oxalate in bundles or scattered, 26-110 μm long. Clusters of calcium oxalate occurring in colourless parenchymatous cells, sometimes several cells arranged in rows. Epidermal cells of pericarp orange-yellow, subpolygonal in surface view, with beaded anticlinal walls. Parenchymatous cells subrounded, with elliptical pits gathered into pit groups. Anticlinal walls of endodermal cells sinuous, relatively thickened, lignified, with sparse and fine pit-canals. Fibre bundles bright yellow, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres, walls of crystal cells lignified and thickened.

(2) Pulverize 6 g of water-honeyed pills, or cut 9 g of small honeyed pills or big honeyed pills into pieces; add 15 ml of ether, shake for 15 minutes, stand for 1 hour, filter, and expel ether. Dissolve the residue in 1 ml of acetone as the test solution. Dissolve paeonol CRS in acetone to prepare a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane and ethyl acetate (3 : 1) as the mobile phase. Apply in strip separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 5% ferric chloride in ethanol acidified with hydrochloric acid, and heat to the spots clear. The bluish-brown strip in the chromatogram obtained with the test solution corresponds in position and colour to the strip in the chromatogram obtained with the reference solution.

(3) Pulverize 2 g, add 5 ml of methanol, heat under reflux for 15 minutes, filter, replenish methanol to 5 ml, and use as the test solution. Prepare a solution with 0.1 g of Cortex Phellodendri Chinensis reference drug in the same manner as the reference drug solution. Dissolve berberine hydrochloride CRS in methanol to prepare a solution containing 0.5 g per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately 1 μl each of the three solutions to the plate. After developing in a chamber pre-equilibrated with ammonia vapour and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay ***Fructus Corni*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecyasilane bonded silica gel as the stationary phase and a mixture of acetonitrile, methanol, tetrahydrofuran and 0.05% solution of phosphoric acid (8 : 4 : 1 : 87) as the mobile phase. As detector a spectrophotometer set at 236 nm. Maintain the column temperature at 40℃. The number of theoretical plates of the column is not less than 4000, calculated with reference to the peak of loganin.

Reference solution Dissolve a quantity of loganin CRS, accurately weighed, in 50% methanol to prepare a solution containing 40 μg per ml.

Test solution Cut water-honeyed pills or small honeyed pills, into pieces, weigh accurately 0.7 g; or chip big honeyed pills, obtained under the test of weight variation, into pieces, weigh accurately 1.0 g. Place the pieces to a stopper conical flask, add accurately 25 ml of 50% methanol, and weigh. Ultrasonicate (power 250 W, frequency 33 kHz) for 15 minutes. Heat under reflux for 1 hour, cool, weigh again, replenish the loss of weight with 50% methanol, shake well and filter. Apply accurately 10 ml of the successive filtrate to a column packed with neutral aluminium oxide (100-200 mesh, 4 g, 1 cm in diameter), elute with 50 ml of 40% methanol, collect the eluates, evaporate to dryness and dissolve the residue in 50% methanol. Transfer to a 5 ml volumetric flask, dilute with 50% methanol to volume, shake well, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 0.53 mg of loganin ($C_{17}H_{26}O_{10}$) per gram of water-honeyed pills, 0.40 mg per gram of small honeyed pills, 3.60 mg per pill of big honeyed pills, referred to Fructus Corni.

Cortex Moutan Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecyasilane bonded silica gel as the stationary phase and a mixture of methanol and water (70 : 30) as the mobile phase. As detector a spectrophotometer set at 274 nm. The number of theoretical plates of the column is not less than 3500, calculated with the reference to the peak of paeonol.

Reference solution Dissolve a quantity of paeonol CRS, accurately weighed, in methanol to prepare a solution containing 15 μg per ml.

Test solution Cut water-honeyed pills or small honeyed pills into pieces, weigh accurately 0.4 g, or chip big honeyed pills, obtained under the test of weight variation, into pieces, weigh accurately 0.5 g. Place the pieces to a stopper conical flask, add accurately 50 ml of 50% methanol, stopper well, and weigh. Ultrasonicate (power 250 W, frequency 33 kHz) for 45 minutes, cool, weigh again, replenish the loss of weight with 50% methanol, shake well, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 20 μl of the test solution into the column, respectively, and calculate the content.

It contains not less than 0.80 mg of paeonol ($C_9H_{10}O_3$) per gram of water-honeyed pills, 0.55 mg per gram of small honeyed pills, 5.0 mg per pill of big honeyed pills, referred to Cortex Moutan

Action To nourish *yin* to reduce *fire*.

Indications Tidal fever and night sweating, dry mouth and

sore throat, tinnitus, seminal emission, and concentrated urine due to *yin deficiency* with blazing of *fire*.

Usage and dosage 6 g of water-honeyed pills, 9 g of small honeyed pills or 1 big honeyed pill, twice a day.

Strength 9 g per big honeyed pill

Storage Preserve in tightly closed containers.

Zhichuanling Zhusheye (止喘灵注射液)

Zhichuanling Injection

Ingredients Herba Ephedrae; Flos Daturae; Semen Armeniacae Amarum; Fructus Forsythiae.

Procedure Decoct the above four ingredients with water twice, 1 hour for the first time and 30 minutes for the second time, combine the decoctions, filter and concentrate the filtrate to about 150 ml, add ethanol under stirring to a content of 70% ethanol, stand at 4℃ for 24 hours, filter and concentrate the filtrate. Add ethanol again to the concentrated extract to content of 85% ethanol, stir well, stand at 4℃ for 24 hours, filter. Concentrate the filtrate to 100 ml, dilute the concentrated solution with water for injection to 800 ml, adjust pH value, filter and add water for injection to 1000 ml, pack and sterilize.

Description A pale yellow clear liquid.

Identification (1) Measure 20 ml of the injection, add ammonia TS to adjust alkaline, extract with two 10-ml quantities of chloroform, combine chloroform extracts. Transfer 4 ml to two test tubes, to one tube add 5 drops of each of ammoniated cupric chloride TS and carbon disulfide. Shake and allow to stand; a yellow to yellowish-brown colour is produced in the chloroform layer. Use the other tube as a blank, add 5 drops of chloroform replacing carbon disulfide after shaking, the chloroform layer shows colourless or a yellowish colour.

(2) Evaporate 2 ml of the chloroform extracts, obtained under Identification (1), to almost dryness on a water bath. Transfer to a slide, add 1 drop of 0.5% solution of trinitrophenol, examine under microscope, many yellowish oily-drops are shown.

(3) Evaporate 10 ml of the chloroform extracts, obtained under Identification (1), to about 1 ml, add 1 ml of methanol and mix well. Filter and use the filtrate as the test solution. Dissolve ephedrine hydrochloride CRS in methanol to produce a solution containing 1mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, methanol and concentrated ammonia TS (20 : 5 : 0.5) as the mobile phase. Apply seperately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spay with ninhydrin TS, heat at 105℃ for about 5 minutes. The red colour spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

pH value 4.5-6.5 (Appendix Ⅶ G).

Relevant matter Comply with the test for "Relevant matter" in injections (Appendix Ⅸ S)

Undue toxicity Prepare a solution containing 0.1 ml of the injection per ml with sterilized normal saline. Complies with the test for Undue toxicity (Appendix Ⅺ C, Volume 2), injected intraperitoneally.

Other requirements Comply with the general requirements for injections (Appendix Ⅰ U).

Assay ***Total alkaloids*** Measure accurately 10 ml of the injection to a separator, add 0.5 ml of 1 mol/L solution of sodium hydroxide, extract with successive quantities of 10 ml, 10 ml, 5 ml and 5 ml of chloroform, combine chloroform extracts to a stopper conical flask. Add accurately 10 ml of 0.01 mol/L sulfuric acid VS and 10 ml of freshly boiled water, mix well, then add 1-2 drops of sodium alizarinsulfonate IS, and titrate with sodium hydroxide (0.02 mol/L) VS until a pale red colour is produced. Perform a blank determination and make necessary correction. Each ml of sulfuric acid (0.01 mol/L) VS is equivalent to 3.305 mg of ephedrine ($C_{10}H_{15}NO$).

It contains not less than 0.50 mg and no more than 0.80 mg of total alkaloids per ml, calculated as ephedrine ($C_{10}H_{15}NO$).

Flos Daturae Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.07 mol/L solution of sodium phosphate (containing 17.5 mmol/L solution of sodium laurylsulfate and adjusted pH to 6.0 with phosphoric acid) (30 : 60) as the mobile phase. As detector a spectrophotometer set at 216 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of scopolamine hydrobromide.

Reference solution Dissolve a quantity of scopolamine hydrobromide CRS, weighed accurately, in 0.07 mol/L solution of sodium phosphate (adjust pH to 6.0 with phosphoric acid) to prepare a solution containing 0.2 mg of scopolamine hydrobromide per ml (weight of scopolamine is equal to weight of scopolamine hydrobromide/1.445)

Test solution Measure accurately 20 ml of the injection in a separator, adjust pH to 2 with 2 mol/L solution of hydrochloric acid, and extract with 20 ml of chloroform. Discard chloroform layer, adjust pH of the water layer to 9 with concentrated ammonia TS, and extract with five 20-ml quantities of chloroform. Recover solvent, dissolve the residue with 0.07 mol/L solution of sodium phosphate (adjust pH to 6.0 with phosphoric acid), transfer to a 5 ml volumetric flask, dilute to the volume and mix well.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 15 μg of scopolamine ($C_{17}H_{21}NO_4$) per ml, referred to Flos Daturae.

Action To disseminate the lung and relieve asthma/dyspnea, and expel phlegm and relieve coughing.

Indications Asthma, coughing with expectoration of profuse phlegm and constriction in the chest due to phlegm retained in the lung and failure of the *lung* in dissemination of *lung-qi*; bronchial asthma and asthmatic bronchitis with above symptoms.

Usage and dosage 2 ml, 2-3 times a day, intramuscularly. Appropriate reduction of the dosage for children under 7 years old. 1-2 weeks waking a course of treatment, or follow a doctor's advice.

Precaution Contraindicated for glaucoma patients; following the doctor's order for patients with severe hypertention, coronary heart disease, prostatic hyperplasia and retention of urine.

Strength 2 ml per vial

Storage Preserve in tightly closed containers, protected

from light.

Zhikang Pian
(痔康片)

Zhikang Tablets

Ingredients Herba Siegesbeckiae; Flos Lonicerae Japonicae; Flos Sophorae; Radix Sanguisorbae (carbonized); Radix Scutellariae; Radix et Rhizoma Rhei.

Procedure Pulverize Radix et Rhizoma Rhei to powder, decoct Radix Sanguisorbae (carbonized) with water 2 times, 2 hours for the first time, and 1 hour for the second time, combine the decoctions, and filter for later use. Decoct Herba Siegesbeckiae; Flos Lonicerae Japonicae; Flos Sophorae and Radix Scutellariae with water 2 times, 2 hours for the first time, and 1 hour for the second time respectively, combine the decoctions, and filter, concentrate the filtrate to a thin extract with relative density of 1.08-1.15 (80℃), add ethanol to a content of 70% ethanol, stand for over night, filter. Recover ethanol from the filtrate. Combine the above filtrate, and concentrate to a thick extract with a relative density of 1.38 (40℃), mix with the powder of Radix et Rhizoma Rhei, mix well, dry at 70℃, pulverize, add a quantity of excipient, make granules, make to 1000 tablets and coated with film.

Description Film coated tablets with brown to dark-brown core; taste, bitter, astringent.

Identification (1) Pulverize 10 tablets with coating removed, to fine powder. Add 50 ml of ether, heat under reflux for 30 minutes, discard the ether extract. Evaporate the residue to dryness, add 40 ml of methanol, heat under reflux for 1 hour, filter. Evaporate the filtrate to dryness, dissolve the residue in 20 ml of water, filter, extract with successive quantities of 40 ml, 30 ml, 30 ml, 20 ml of *n*-butanol saturated with water. Combine the *n*-butanol extracts, wash with three 50-ml quantities of 4% solution of sodium hydroxide, discard the washings and wash with water saturated with *n*-butanol to neutral. Evaporate the *n*-butanol extract to dryness. Dissolve the residue in 2 ml of methanol as the test solution. Prepare a solution with 2 g of Herba Siegesbeckiae reference drug in the same manner as the reference drug solution. Carry out the method for the thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, acetone, methanol, formic acid and water (10 : 10 : 5 : 1 : 5) as the mobile phase. Apply separately 5 μl of each of the test solution and the reference drug solution to the plate. After developing and removal of the plate, dry in air. Spray with 5% vanilin in sulfuric acid and heat at 105℃ to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(2) Pulverize 10 tablets with coating removed, to fine powder. Add 50 ml of ether, heat under reflux for 30 minutes, discard the ether extract. Evaporate the residue to dryness, add 40 ml of methanol, ultrasonicate for 40 minutes, filter. Evaporate the filtrate to dryness, dissolve the residue in 20 ml of water. Apply it to a column packed with D-101 macroporous adsorption resin (1.8 cm in internal diameter, 7 cm in length), elute with 90 ml of water, evaporate the filtrate to dryness. Dissolve the residue in 2.5 ml of methanol, filter and use the filtrate as the test solution. Dissolve chlorogenic acid CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide as the coating substance, and acetic acid as the mobile phase. Apply separately 2 μl of each of the test solution and the reference solution to the membrane. After developing and removal of the membrane, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Pulverize 10 tablets, removed the coats, to fine powder. Add 15 ml of methanol, ultrasonicate for 30 minutes, filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of chloroform as the test solution. Dissolve separately emodin CRS and chrysophanol CRS in chloroform to produce solution containing 0.1 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the mixture of *n*-hexane, ethyl acetate and formic acid (30 : 10 : 0.5) as the mobile phase. Apply separately 10 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, expose the plate to ammonia vapour until the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and glacial acetic acid (30 : 70 : 2) as the mobile phase. As detector a spectrophotometer set at 260 nm. The number of theoretical plates of the column is not less than 1500, calculated with the reference to the peak of rutin.

Reference solution Dissolve a quantity of rutin CRS, dried previously to constant weight at 120℃, accurately weighed, in methanol to prepare a solution containing 20 μg per ml as the reference solution.

Test solution Pulverize 20 tablets with coating removed, to fine powder. To about 0.2 g of the powder, weigh accurately, in a Soxhlet's extractor, add a quantity of methanol, heat under reflux at 80℃ on the water bath for 4 hours until the extracts to colourless. Allow to stand to room temperature, transfer to a 100 ml volumetric flask, wash the container with a small quantity of methanol, combine the washings to the same volumetric flask, add methanol to volume. Mix thoroughly, filter and use the successive filtrate as the test solution.

Procedure Inject accurately 5 μl of each of the reference solution and the test solution into the column, and calculate the content.

It contents not less than 3.8 mg of anhydrous rutin ($C_{27}H_{30}O_{16}$) per tables, referred to Flos Sophorae.

Action To clear *heat* to cool blood, and purge *heat* and make bowels movement.

Indications Hemafecia, swollen and painful anus and tenesmus due to excessive *wind-heat* or pouring of *damp-heat*; internal hemorrhoids at the initial or second stage with above symptoms.

Usage and dosage 3 tablets, 3 times a day. 7 days making a clinical course, or follow doctor's advice.

Precaution (1) Contraindicated for pregnant women.

(2) Mild diarrhea can be seen in some patients and reduce the dosage to relieve the condition.
(3) It is not appropriate to use it to treat internal hemorrhoids due to portal hypertension or habitual constipation. Treatment for primary disease should be combined.

Strength 0.3 g per tablet

Storage Preserve in tightly closed containers.

Zhikebao Pian
(止咳宝片)

Zhikebao Tablets

Ingredients Radix et Rhizoma Asteris; Exocarpium Citri Rubrum; Radix Platycodonis; Fructus Aurantii; Radix Stemonae; Fructus Schisandrae Chinensis; Pericarpium Citri Reticulatae; Rhizoma Zingiberis; Herba Schizonepetae; Extractum Pericarpii Papaveris; Radix et Rhizoma Glycirrhizae; Ammonii Chloridum; Radix Peucedani; Oleum Menthae Dementholatum.

Procedure Decoct Radix et Rhizoma Asteris and Radix et Rhizoma Glycirrhizae with water twice, 2 hours for each time, combine the decoctions and concentrate to a thick extract. Pulverize the other ingredients, except Oleum Menthae Dementholatum, Ammonium Chloridum and Extractum Pericarpi Papaveris, to coarse powder and mix thoroughly, macerate in 60% ethanol twice, 48 hours for each time, recover ethanol, concentrate to a thick extract, combine with the above thick extract of Radix et Rhizoma Asteris and Radix et Rhizoma Glycirrhizae, add a quantity of excipients, dry and smash, mix thoroughly with Extractum Pericarpium Papaveris and Ammonii Chloridum to make granules, dry, spray with Oleum Menthae Dementholatum, compress into 1000 tablets and coat with film.

Description Film coated tablets with brownish-black core; taste, slightly bitter and salty.

Identification (1) Pulverize 1 tablet, grind with 10 ml of water and filter. Add 10 ml of sodium hydroxide TS to the filtrate, heat to decompose; an ammonia vapour is produced, it turns the moistened red litmus TP to blue colour.
(2) Evaporate 20 ml of the test solution obtained under Assay to dryness, dissolve the residue in 1 ml of methanol as the test solution. To 10 mg of morphine CRS add 1 ml of 0.1 mol/L solution of hydrochloric acid in a 10 ml volumetric flask, dilute with methanol to volume and mix well as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, acetone, ethanol and concentrated ammonia TS (20 : 20 : 3 : 1) as the mobile phase. Apply separately 2-4 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Heat under reflux 30 tablets, removed the coats and pulverized, with 50 ml of methanol for 2 hours, filter and concentrate the filtrate to about 10 ml. Add 5 g of silica gel (100-120 mesh), stir well and dry. Apply to a column (1 cm in diameter), elute with 40 ml of chloroform. Collect the eluate and evaporate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 1 g of Fructus Schisandrae Chinensis in the same manner as the reference drug solution. Dissolve Schisandrin CRS in chloroform to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of the mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 4 μl of the above three solutions to the plate. After developing 18 cm and removal of the plate, dry in air, and examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and reference solution.
(4) Ultrasonicate 5 tablets, removed the coats and pulverized, with 25 ml of ethanol for 10 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of ethanol as the test solution. Prepare a solution of 1 g of Radix et Rhizoma Asteris in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of toluene, ethyl acetate, methanol and formic acid (20 : 10 : 1 : 1) as the mobile phase. Apply separately 2 μl of the above two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Assay *Reference solution* Weigh accurately a quantity of morphine CRS, previously dried to constant weight at 105℃, dissolve in 0.1 mol/L solution of hydrochloric acid to produce a solution containing 60 μg per ml.

Test solution Weigh accurately 30 tablets, removed coats, pulverize to fine powder, weigh accurately a quantity of the powder, equivalent to about 6 mg of anhydrous morphine, grind with 1 g of calcium hydroxide and a quantity of water to paste and continue grinding for 15 minutes. Transfer to a 100 ml volumetric flask, dilute with water to volume, shake thoroughly, and allow to stand for 30 minutes. Filter through a dry filter paper, measure accurately 50 ml of the successive filtrate, add 0.5 g of ammonium sulfate and shake to dissolve. Extract with successive quantities of 25 ml and 15 ml of benzene, combine benzene extracts, wash with 10 ml of water, combine the washing to the water layer, extract with 60 ml of a mixture of chloroform and ethanol (1 : 1), and extract with successive quantities of 45 ml , 45 ml and 15 ml of a mixture of chloroform and ethanol (2 : 1). Combine the extracts, wash with a mixture of 10 ml of water and 5 ml of ethanol, evaporate the extract to dryness on a water bath. Disslove the residue in 20 ml of 0.1 mol/L solution of hydrochloric acid, heat if necessary, and filter to a 50 ml volumetric flask, wash the container with hydrochloric acid solution, combine to the flask, dilute with 0.1 mol/L solution of hydrochloric acid to volume and mix well.

Procedure Measure accurately two quantities of 5 ml of the test solution to stopper tube A and B, and two quantities of 5 ml of the reference solution to tube C and D separately. Add accurately and separately 3 ml of ammonia TS in tube A and C, mix well, and add accurately and separately 2ml of freshly prepared ethanolic sodium nitrite TS. Add accurately and separately 2 ml of freshly prepared ethanolic sodium nitrite TS firstly in tube B and D, shake gently, and after 15 minutes, add accurately and separately 3 ml of ammonia TS. Allow to stand for 10 minutes. Carry out the method for

ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), taking tube A and C solution as the blank and measure the absorbance of the tube B and D at 420 nm, and calculate the content of anhydrous morphine, multiply by 0.92.

It contains not less than 0.54 mg and no more than 0.66 mg of morphine per tablet, calculated as anhydrous morphine ($C_{17}H_{19}NO_3$).

Action To disseminate the lung and expel phlegm, and relieve coughing and dyspnea.

Indications Coughing with expectoration of profuse thin phlegm, shortness of breath from severe coughing due to affliction from external *wind-cold*; chronic bronchitis and upper respiratory tract infection with above symptoms.

Usage and dosage 2 tablets, 3 times a day, or follow doctor's advice. 7 days in succession making a course of treatment. Patients may take 3-5 courses continuously.

Precaution It is forbidden to prescribe to pregnant or breast-feeding women and babies. Be cautious about patients who bring up bloody sputum or with dry cough caused by *lung-heat* or *lung-dryness*. Avoid catching cold again and cold food, hot pepper and wine.

Strength 0.35 g per tablet

Storage Preserve in tightly closed containers, protected from light.

Zhike Juhong Koufuye (止咳橘红口服液)

Zhike Juhong Mixture

Ingredients Exocarpium Citri Grandis 66 g; Pericarpium Citri Reticulatae 44 g; Rhizoma Pinelliae Praeparatum 33 g; Poria 44 g; Flos Farfarae 22 g; Radix et Rhizoma Glycirrhizae 22 g; Pericarpium Trichosanthis 44 g; Radix et Rhizoma Asteris 33 g; Radix Ophiopogonis 44 g; Rhizoma Anemarrhenae 22 g; Radix Platycodonis 33 g; Radix Rehmanniae 44 g; Gypsum Fibrosum 44g; Semen Armeniacae Amarum (peeled and stir-baked) 44 g; Fructus Perillae (stir-baked) 33 g.

Procedure Decoct Gypsum Fibrosum, in coarse powder, with water 2 times, 1 hour for each time, and filter. Distill Exocarpium Citri Grandis, Pericarpium Citri Reticulatae, Flos Farfarae and Semen Armeniacae Amarum, collect 250 ml of the distillate, filter the aqueous solution, add ethanol to a content of 60% ethanol, stir well, stand for 24 hours, and filter. Combine the other 10 ingredients, in coarse powder, with the above residue, and mix thoroughly, carry out the method for percolation described under liquid extracts and extracts (Appendix Ⅰ O), macerate for 24 hours, using 60% ethanol as the solvent, collect 2700 ml of the percolate and combine with the above filtrates, recover ethanol to no ethanolic smell in vacuum, combine with the above decoction of Gypsum Fibrosum and concentrate to a thin extract with a relative density of 1.06 (50℃). Add 80 g of sucrose, boil, stand for 24 hours and filter. To the filtrate add 0.3 g of ethyl *p*-hydroxybenzoate and 0.5 g of benzoic acid, both previously dissolved in an appropriate quantity of hot water in advance, and the above distillate, adjust the total volume to 950 ml with water, stir well, refrigerate for 48 hours, separate the supernatant, filter, pack, seal and sterilize.

Description A brownish-black liquid; odour, aromatic; taste, sweet and slightly bitter.

Identification (1) To 2 ml add 1 ml of ammonium oxalate TS; a white precipitate is produced. Separate the precipitate, which is soluble in hydrochloric acid, but insoluble in acetic acid.

(2) To 40 ml add 3 ml of hydrochloric acid, heat on a water bath for 1 hour, and cool. Extract under shaking with 30 ml of ether, separate the ether extract, evaporate to dryness, dissolve the residue in 1 ml of chloroform as the test solution. Decoct 2 g of Radix Ophiopogonis reference drug with water for 30 minutes, and filter. Concentrate the filtrate to 40 ml, and prepare a solution in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform and acetone (4∶1) as the mobile phase. Apply separately 5-10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sulphuric acid in ethanol, and heat at 105℃ for about 5 minutes. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) To 20 ml add 3 ml of hydrochloric acid, heat on a water bath for 1 hour, and cool. Extract with two 15-ml quantities of chloroform, combine the chloroform extracts, evaporate to dryness, and dissolve the residue in 1 ml of chloroform as the test solution. Dissolve glycyrrhetinic acid CRS in dehydrated ethanol to produce a solution containing 1mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60℃), benzene, ethyl acetate and glacial acetic acid (10∶20∶7∶0.5) as the mobile phase. Apply separately 15 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% phosphomolybdic acid in ethanol and heat at 105℃ for about 5 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Relative density 1.05-1.15 (Appendix Ⅶ A).

pH value 4.5-6.0 (Appendix Ⅷ G).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol, water and acetic acid (38∶62∶0.5) as the mobile phase. As detector a spectrophotometer set at 283 nm. Maintain the column temperature at 40℃. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of naringin.

Reference solution Weigh accurately 15 mg of naringin CRS, dried previously to constant weight at 110℃, in a 100 ml volumetric flask, dissolve in a quantity of methanol, dilute with methanol to volume, and mix well. Accurately measure 3 ml in a 10 ml volumetric flask, dilute with methanol to volume, and mix well (containing 45 μg of naringin per ml).

Test solution Measure accurately 1 ml of the mixture, in a 25 ml volumetric flask, dilute with methanol to volume, and mix well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and the test solution into the column, and calculate the content.

It contains not less than 0.80 mg of naringin ($C_{27}H_{22}O_{14}$) per ml, referred to Exocarpium Citri Grandis.

Action To clear the lung, relieve coughing and resolve phlegm.

Indications Coughing with expectoration of profuse phlegm, fullness in the chest and shortness of breath, dry and itching throat due to *phlegm-heat* retained in the lung.

Usage and dosage 10 ml, 2-3 times a day. Follow doctor's advice on the dosage for children.

Precaution Avoid pungent and greasy food.

Strength 10 ml per phial

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Zhimaikang Jiaonang
(脂脉康胶囊)

Zhimaikang Capsules

Ingredients Camellia Pu'er 100 g; Radix et Rhizoma Seu Caulis Acanthopanacis Senticosi 100 g; Fructus Crataegi 100 g; Semen Raphani 50 g; Folium Nelumbinis 50 g; Radix Puerariae Lobatae 50 g; Flos Chrysanthemi 50 g; Radix Astragali 50 g; Rhizoma Polygonati 50 g; Radix Polygoni Multiflori 100 g; Fructus Leonuri 50 g; Cortex Eucommiae 50 g; Radix et Rhizoma Rhei (processed with wine) 30 g; Radix et Rhizoma Notoginseng 50 g; Flos Sophorae 100 g; Herba Taxilli 50 g.

Procedure The above sixteen ingredients, pulverize Radix Astragali, Radix Puerariae Lobatae to fine powder, sift, decoct the other fourteen ingredients with water for three times, 3 hours for the first time, 2 hours for the second time and 1 hours for the third time, Combine the decoctions, filter, concentrate the filtrate to a thick extract, dry, pulverize to fine powder, Add Radix Astragali, Radix Puerariae Lobatae fine powder, mix well, make to 1000 capsules.

Description Capsules containing Brown to brownish-brown powder; taste, slightly bitter and astringent.

Identification (1) To 4 g of the contents, add 30 ml of methanol, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 20 ml of water, extract with two 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, wash by shaking, with two 20-ml quantities of ammonia TS. Separate the *n*-butanol solution, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution of 1 g of Radix Astragali reference drug in the same manner as the reference drug solution. Dissolve astragaloside Ⅳ CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of chloroform, methanol and water (13 : 7 : 2) as the mobile phase. Apply separately 5 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution and the reference solution.

(2) To 4 g of the contents, add 50 ml of methanol, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 50 ml of water, wash with two 20-ml quantities of ether by shaking, discard the ether extract, wash with two 20-ml quantities of ethyl acetate, discard the ethyl acetate extract. Extract the water solution with two 20-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, evaporate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. To 2 g of Flos Sophorae reference drug, add 50 ml of water, decoct for 1 hour, filter while hot, evaporate the filtrate to dryness, and dissolve the residue in 2 ml of methanol as the reference drug solution. Dissolve rutin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance, and a mixture of ethyl acetate, methanol and water (8 : 1 : 1) as the mobile phase. Apply separately 4 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air. Spray with aluminum trichloride TS and heat at 105℃ for 10 minutes. Examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D)

Chromatographic system and system suitability Use Octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and water (25 : 75) as the mobile phase. As detector a spectrophotometer set at 250 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of puerarin.

Reference solution Dissolve a quantity of puerarin CRS, accurately weighed, in 30% ethanol to produce a solution containing 20 μg per ml.

Test solution Weigh accurately about 0.2 g of the mixed contents, obtained under the test of weight variation, place in a stopper conical flask, add accurately 50 ml of 30% ethanol, weigh and ultrasonicate (power 250 W, frequency 20 kHz) for 30 minutes, allow to cool, weigh again, replenish the lost weight with 30% ethanol, mix well and filter, using the filtrate as the test solution.

Procedure Inject accurately 5μl of the reference solution and 10-15 μl of the test solution into the column, and calculate the content.

It contains not less than 0.5 mg of puerarin ($C_{21}H_{20}O_9$) per capsule, referred to Radix Puerariae.

Action To promote digestion, lower lipids, activate blood circulation, and replenish *qi* and nourish blood.

Indications Arteriosclerosis and hyperlipemia due to internal block age by stasis and a *deficiency* of *qi* and blood.

Usage and dosage 5 capsules, 3 times a day.

Strength 0.3 g per capsule

Storage Preserve in tightly closed containers.

Zhishi Daozhi Wan
(枳实导滞丸)

Zhishi Daozhi Pills

Ingredients Fructus Aurantii Immaturus (stir-baked) 100 g; Radix et Rhizoma Rhei 200 g; Rhizoma Coptidis

(stir-baked with ginger juice) 60 g; Radix Scutellariae 60 g; Massa Medicata Fermentata (stir-baked) 100 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 100 g; Poria 60 g; Rhizoma Alismatis 40 g.

Procedure Pulverize the above eight ingredients to fine powder, sift, mix well, make pills with water and dry.

Description Pale brown to dark brown watered pills; odour, slightly aromatic; taste, bitter.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS; hyphae colourless or pale brown, 4-6 μm in diameter. Prisms of calcium oxalate abundant in parenchyma. Clusters of calcium oxalate large, 60-140 μm in diameter. Needle crystals fine, 10-32 μm long, irregularly filling in parenchymatous cells. Fibres bundles bright yellow, walls slightly thickened with distinct pits. Bast fibres pale yellow, fusiform, walls thickened with fine pit-canals. Parenchymatous cells subrounded, with elliptic pits gathered into pit groups. Anticlinal walls of endodermis cells sinuous, relatively thickened, lignified, with sparse and fine pit-canals.

(2) Grind well 0.5 g of the pills, macerate in 20 ml of methanol for 10 minutes, and filter. Evaporate 10 ml of the filtrate to dryness, keep the other filtrate for later use. Dissolve the residue in 10 ml of water, add 1 ml of hydrochloric acid, and heat under reflux on a water bath for 30 minutes. Cool immediately, extract by shaking with 20 ml of ether in 2 portions, combine the extracts and evaporate to dryness. Dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 0.1 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxylmethylcellulose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 4 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The five orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Expose the plate to ammonia vapour and examine in daylight, the spots turn to red.

(3) Use the deserved filtrate obtained under Identification (2) as the test solution. Heat under reflux 10 mg of Rhizoma Coptidis reference drug with 10 ml of methanol on a water bath for 15 minutes, filter, and evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the reference drug solution. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxylmethylcellulose as the coating substance and a mixture of *n*-butanol, water and glacial acetic acid (7 : 2 : 1) as the mobile phase. Apply separately 5 μl of the test solution, 2 μl of each of the reference drug solution and the reference solution to the plate. After developing and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution.

(4) Grind well 2 g of the pills, add 20 ml of methanol and ultrasonicate for 30 minutes. Filter, evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide as the coating substance and acetic acid as the mobile phase. Apply separately 1 μl of each of the two solutions to the membrane. After developing and removal of the membrane, dry in air, spray with 1% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Grind the pills to fine pondes, weigh accurately 0.5 g into a Soxhlet' s extractor, heat under reflux with 90 ml of methanol on a water bath for 4 hours, filter immediately to a 100 ml volumetric flask; wash the container with a small amount of methanol, combine the washing with the filtrate, cool, dilute with methanol to the volume and mix well. Measure accurately 5 ml to a 25 ml volumetric flask, dilute with methanol to the volume, and shake well, use as the test solution. Dissolve hesperidin CRS, weighed accurately, in methanol to produce a solution containing 50 μg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using polyamide as the coating substance and methanol as the mobile phase. Apply accurately 5 μl of the test solution and 2 μl, 5 μl of the reference solution to the membrane. After developing about 3 cm and removal of the membrane, dry in air, Spray with 1% of aluminum trichloride in menthanol, allow to stand for 3 hours, locate the position under ultraviolet light at 365 nm, carry out the method for thin layer chromatography (Appendix Ⅵ B, thin layer chromatographic scanning method), scan at wavelength of $\lambda = 300$ nm, with fluorescence mode, measure the integration value of the fluorescent intensity of the test solution and the reference solution and calculate.

It contains not less than 20.0 mg of hesperidin ($C_{28}H_{34}O_{15}$) per gram, referred to Fructus Aurantii Immaturus.

Action To promote digestion to remove retained food, and eliminate *damp-heat*.

Indications Distending pain in the stomach and abdomen, poor appetite, constipation, or dysentery with tenesmus due to retained food, and interior retention of *damp-heat*.

Usage and dosage 6-9 g, twice a day.

Storage Preserve in tightly closed containers, protected from moisture.

Zhisou Dingchuan Koufuye (止嗽定喘口服液)

Zhisou Dingchuan mixture

Ingredients Herba Ephedrae 1000 g; Semen Armeniacae Amarum 1000 g; Radix et Rhizoma Glycirrhizae 1000 g; Gypsum Fibrosum 1000 g.

Procedure Decoct the above ingredients, except Semen Armeniacae Amarum, with water twice, 1.5 hours for each time, combine the decoctions, filter and concentrate to a thin extract with a relative density of 1.05-1.10 (50℃). Allow to cool, add a quantity of ethanol, and stand. Seperate the supernatant, filter the remain portion, combine the filtrate and the supernatant, add 40% solution of sodium hydroxide to adjust to pH 8-8.5, stand and filter. Concentrate the filtrate to 1000 ml. Prepare Aqua Armeniacae with Semen Armeniacae Amarum. Dilute the concentrated decotion with a quantity of distilled water, stir well, add the Aqua Armeniacae, a quantity of honey, polysorbate 80 and sodium

benzoate, then add water to total volume. Adjust to pH 4.5-5.5 with citric acid, stir well, filter, stand, pack and sterilize.

Description A brownish-yellow liquid; odour, slightly aromatic; taste, sweet, slightly sour and astringent.

Identification (1) Alkalify 20 ml by adding several drops of concentrated ammonia TS, extract with 10 ml of chloroform with shaking, allow to stand, and separate the chloroform solution as the test solution. Dissolve ephedrine hydrochloride CRS in methanol to produce a solution containing 5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-butanol, glacial acetic acid and water (8 : 2 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, spray with 0.5% solution of ninhydrin and heat at 105℃ for about 10 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(2) To 20 ml add 1 ml of hydrochloric acid and 20 ml of chloroform, heat under reflux for 1 hour, and cool. Separate the chloroform layer, filter through a dry filter paper, evaporate the filtrate to dryness and dissolve the residue in 2 ml of ethanol as the test solution. Dissolve glycyrrhetinic acid CRS in dehydrated ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and a mixture of petroleum ether (30-60℃), benzene, ethyl acetate and glacial acetic acid (10 : 15 : 7 : 0.5) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 25% phosphomolybdic acid in ethanol and heat at 110℃ for about 10 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Relative density Not less than 1.04 (Appendix Ⅶ A).

PH value 4.5-5.5 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Action To expel *heat* with herbs pungent in flavor and cold in property, and clear the lung and relieve asthma/dyspnea.

Indications Feverish sensation of the body, thirst, coughing with expectoration of profuse phlegm, dyspnea, fullness and constriction in the chest, and acute bronchitis due to exterior cold and interior heat.

Usage and dosage 10 ml, 2-3 times a day. Appropriate reduction of the dosage for children.

Strength 10 ml per phial

Storage Preserve in tightly closed containers.

Zhisou Huatan Wan
(止嗽化痰丸)
Zhisou Huatan Pills

Ingredients Pericarpium Papaveris 625 g; Radix Platycodonis 250 g; Rhizoma Anemarrhenae 125 g; Radix Peucedani 125 g; Pericarpium Citri Reticulatae 125 g; Radix et Rhizoma Rhei (processed) 125 g; Radix et Rhizoma Glycirrhizae praeparata cum Melle 125 g; Bulbus Fritillariae Cirrhosae 125 g; Gypsum Fibrosum 250 g; Semen Armeniacae Amarum 187.5 g; Folium Perillae 125 g; Semen Lepidii seu Descurainiae 125g; Flos Farfarae (processed) 125 g; Radix Stemonae (processed) 125 g; Radix Scrophulariae 125 g; Radix Ophiopogonis 125 g; Flos Buddlejae 75 g; Radix Asparagi 125 g; Fructus Schisandrae Chinensis (processed) 75 g; Fructus Aurantii (stir-baked) 125 g; Semen Trichosanthis 125 g; Rhizoma Pinelliae (processed with ginger juice) 250 g; Radix Aucklandiae 75 g; Fructus Aristolochiae (processed) 125 g; Folium Mori 125 g.

Procedure Pulverize the above 25 ingredients to fine powder, sift and mix well. Make pills with water, dry and polish.

Description Yellowish-brown or brown watered pills; odour, slight; taste, bitter and slightly sour.

Identification (1) Microscopical: Clusters of calcium oxalate large, 60-140 μm in diameter. Fibre bundles surrounded by parechymatous cells, containing calcium oxalate prisms, forming crystal fibres. Epidermal stone cells of testa plae yellowish-brown, subpolygonal in surface view; walls relatively thickened, with fine pit-canals; lumina containing dark brown substances.
(2) Heat under reflux 20 g of the pills, pulverized to fine powder, in 40 ml of methanol for 1 hour, and filter immediately. Evaporate 30 ml of the filtrate to dryness, dissolve the residue with 30 ml of 1% solution of hydrochloric acid, allow to stand, and filter. To the filtrate add concentrated ammonia TS, adjust to pH 10, extract with two 20-ml quantities of chloroform, combine the extracts and evaporate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Prepare a solution with 1 g of Pericarpium Papaveris reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance mixed with 2% solution of sodium hydroxide and a mixture of toluene, acetone, ethanol and concentrated ammonia TS (20 : 20 : 3 : 1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. Spray with potassium iodobismuthate TS and sodium nitrite TS successively, the spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(3) Evaporate the remained filtrate obtained under Identification test (2) to dryness, dissolve the residue in 10 ml of water, and add 1 ml of hydrochloric acid. Heat under reflux for 30 minutes, allow to cool, and extract with two 20-ml quantities of ether. Combine the extracts, evaporate to dryness, dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution with 0.1 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, and expose to ammonia vapour. The five red spots in the chromatogram obtained with the test solution correspond in position to the five red

spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To remove *heat* and phlegm from the lung, and relieve coughing and asthma.

Indications Retention of *phlegm-heat* in the lung, chronic coughing, hemoptysis, asthma with adverse flow of *qi* and insomnia caused by asthma.

Usage and dosage 15 pills, once a day, taken before going to bed.

Precaution Contraindicated for patients with cough caused by *wind-cold*.

Strength 1 g per 6-7 pills

Storage preserve in tightly closed containers, protected from moisture.

Zhitong Huazheng Jiaonang (止痛化癥胶囊)

Zhitong Huazheng Capsules

Ingredients Radix Codonopsis 75 g; Radix Astragali praeparata Cum Melle 150 g; Rhizoma Atractylodis Macrocephalae (parching) 45 g; Radix et Rhizoma Salviae Miltiorrhizae 150 g; Radix Angelicae Sinensis 75 g; Caulis Spatholobi 150 g; Rhizoma Sparganii 45 g; Rhizoma Curcumae 45 g; Semen Euryales 75 g; Rhizoma Dioscoreae 75 g; Rhizoma Corydalis 75 g; Fructus Toosendan 45 g; Herba Houttuyniae 150 g; Herba Patriniae 150 g; Scolopendra 1.8 g; Scorpio 75 g; Eupolyphaga seu Steleophaga 75 g; Rhizoma Zingiberis Praeparatum 22.5 g; Cortex Cinnamomi 15 g.

Procedure pulverize Scolopendra, Scorpio, Eupolyphaga seu Steleophaga to fine powder, decoct the other 16 ingredients with water for three times, 3 hours for the first time, 2 hours for the second time and 1 hour for the third time. Combine the decoctions and filter, concentrate the decoction to a thick extract, and add above fine power. Mix thoroughly, make granules, and make to 1000 capsules.

Description Capsules containing dark brown or blackish-brown powder; odour, slightly aromatic; taste, bitter, slightly salty.

Identification (1) To 9 g of the content, pulverized to powder, add 50 ml of methanol, ultrasonicate for 30 minutes, and filter. Dissolve the residue in 30 ml of water, extract with two 30-ml quantities of n-butanol saturated with water, combine *n*-butanol extracts and wash with 3 times volume ammonia TS, shake well, allow to stand. Transfer the *n*-butanol layer, and evaporate to dryness, dissolve the residue in 1 ml of methanol as the test solution. Dissolve astragaloside Ⅳ CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol, and water (13 : 7 : 2) as the mobile phase. Apply separately 5 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with a 10% sulfuric acid in ethanol, and heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(2) To 6 g of the content, pulverized to powder, add 3 ml of concentrated ammonia TS and 40 ml of chloroform, stir well, allow to stand for 1 hour, then ultrasonicate for 30 min, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Dissolve tetrahydropalmatine CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with 1% solution of sodium hydroxide as the coating substance and a mixture of n-hexane, chloroform, and methanol (7.5 : 4 : 1) as the mobile phase. Apply separately 2-3 μl of each of the test solution and the reference solution to the plate. After developing and removal of the plate, dry in air, expose to iodine vapour to the spots clear and examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and a mixture of methanol, water, dimethylformamide, and glacial acetic acid (2 : 95 : 2 : 1) as the mobile phase. As detector a spectrophotometer set at 283 nm. The number of theoretical plates of the column is not less than 6000, calculated with the reference to the peak of danshensu.

Reference solution Weigh accurately a quantity of sodium danshensu CRS, dissolve in 50% methanol to produce a solution containing 50 μg per ml (correspond to 45 μg danshensu per ml).

Test solution Weigh accurately 1 g of the content obtained under the test of weight variation, pulverized to fine powder, in a stopper conical flask, add accurately 50 ml of a solution of hydrochloric acid (1→50), closely stopper and weigh. Ultrasonicate for 30 minutes (power 250 W, frequency 50 kHz), cool, weigh again, replenish the lost weight with a solution of hydrochloric acid (1→50), add 5 g of sodium chloride, stir well and centrifuge. Transfer accurately 25 ml of the supernatant to a separating funnel, extract by shaking with one 50-ml, one 30-ml, and two 20-ml quantities of ethyl acetate. Combine the ethyl acetate, and evaporate on a water bath to dryness, dissolve the residue in 50% methanol, transfer to a 10 ml volumetric flask and dilute to volume, mix well and filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column respectively and measure.

It contains not less than 0.20 mg of danshensu ($C_9H_{10}O_5$) per capsule, referred to Radix et Rhizoma Salviae Miltiorrhizae.

Action To replenish *qi* to promote blood circulation, and dissipate nodules and kill pain.

Indications Irregular menstruation, dysmenorrhea and abdominal masses due to a *deficiency* of *qi* and stagnation of blood with manifestations of delayed menstrual cycles with scanty menstrual blood and clots, dysmenorrhea and abdominal masses; chronic pelvic inflammatory diseases with above symptoms.

Usage and dosage 4-6 capsules, 2 or 3 times a day.

Precaution Contraindicated for pregnant women.

Strength 0.3 g per capsule

Storage Preserve in tightly closed containers.

Zhitong Zijin Wan
(止痛紫金丸)

Zhitong Zijin Pills

Ingredients Flos Caryophylli 50 g; Sanguis Draconis 50 g; Radix Angelicae Sinensis 50 g; Radix et Rhizoma Rhei (prepared) 50 g; Radix Aucklandiae 50 g; Catechu 50 g; Flos Carthami 50 g; Rhizoma Drynariae (scalded) 50 g; Eupolyphaga seu Steleophaga 25 g; Olibanum (processed) 25 g; Myrrha (processed) 25 g; Radix Paeoniae Rubra 25 g; Pyritum (calcined) 25 g; Radix et Rhizoma Glycyrrhizae 25g.

Procedure Pulverize the above fourteen ingredients to fine powder, sift and mix thoroughly. To each 100 g of powder add 80-90 g of refined honey to make big honeyed pills.

Description Blackish-brown big honeyed pills; odour, slightly fishy; taste, bitter and astringent.

Identification (1) Place 3 g, in pieces, in a test tube, add 10 ml of dilute hydrochloric acid TS, cover the tube with a piece of lead acetate TP, heat on a water bath for 5 minutes, a stinking smell is produced and the lead acetate TP turns gradually to brown colour. Filter the solution, to the filtrate add potassium ferrocyanide TS; a blue precipitate is produced, which turns to brown precipitate on adding sodium hydroxide TS.

(2) Heat 2 g, in pieces, with 10 ml of 25% solution of sulfuric acid for 1 hour in a water bath, cool, add 15 ml of chloroform and heat under reflux on a water bath for 30 minutes. Separate the chloroform layer and evaporate to dryness. Dissolve the residue in 2 ml of methanol, filter and use the filtrate as the test solution. Prepare a solution of 0.6 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of benzene, ethyl acetate, formic acid, methanol and water (30∶10∶0.5∶2∶5) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The orange fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The colour of the spots turns to red on exposure to ammonia vapour.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To relax muscles and tendons and promote blood circulation, and eliminate blood stasis to kill pain.

Indications Traumatic injuries, lumbar sprain, bruise and painful tendons and bones.

Usage and dosage 1 pill, twice a day.

Precaution Contraindicated for pregnant women.

Strength 6 g per pill

Storage Preserve in tightly closed containers.

Zhizhu Wan
(枳术丸)

Zhizhu Pills

Ingredients Fructus Aurantii Immaturus (stir-baked) 250 g; Rhizoma Atractylodis Macrocephalae (stir-baked) 500 g.

Procedure Pulverize the above two ingredients to fine powder, sift and mix thoroughly. Decoct 75 g of Folium Nelumbinis with water, filter. Make pills with the decoction and the above powder, and dry.

Description Brown watered pills; odour, slightly aromatic; taste, slightly bitter.

Identification (1) Microscopical: Prisms of calcium oxalate abundant in parenchyma. Needle crystals of calcium oxalate fine, 10-32 μm long, irregularly filling in parenchymatous cells.

(2) Pulverize 3 g of the pills, add 30 ml of ether, heat under reflux on a water bath for 1 hour, filter, evaporate the filtrate to dryness, dissolve the residue in 1 ml of ethyl acetate as the test solution. Prepare a solution of 1 g of Rhizoma Atractylodis Macrocephalae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (50∶1) as the mobile phase. Apply separately 1 μl of each of the two solutions to the plate. After developing and removal of the plate, spray with 10% vanillin in sulfuric acid, heat to the spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Pulverize 3 g of the pills, add 20 ml of methanol, heat under reflux on a water bath for 1 hour, filter, evaporate the filtrate to dryness, dissolve the residue in 5 ml of methanol, filter and use the filtrate as the test solution. Prepare a solution of 1 g of Fructus Aurantii Immaturus reference drug in the same manner as the reference drug solution. Dissolve synephrine CRS in ethanol to produce a solution containing 2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of chloroform, acetone, methanol and concentrated ammonia TS (13∶4∶3∶0.5) as the mobile phase. Apply separately 2 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, spray with 0.5% ninhydrin in ethanol, heat at 105℃ for about 10 minutes. The pink spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To invigorate the spleen to promote digestion, and promote *qi* flow to resolve *dampness*.

Indications Less intake of food and indigestion, fullness in the abdomen due to hypofunctioning of the spleen and stomach.

Usage and dosage 6 g, twice a day.

Storage Preserve in tightly closed containers.

Zhizi Jinhua Wan
(栀子金花丸)
Zhizi Jinhua Pills

Ingredients Fructus Gardeniae 116 g; Rhizoma Coptidis 4.8 g; Radix Scutellariae 192 g; Cortex Phellodendri Chinensis 60 g; Radix et Rhizoma Rhei 116 g; Flos Lonicerae Japonicae 40 g; Rhizoma Anemarrhenae 40 g; Radix Trichosanthis 60 g.

Procedure Pulverize the above eight ingredients to fine powder, sift and mix well. Make pills with water and dry.

Description Yellow to yellowish-brown watered pills; taste, bitter.

Identification (1) Microscopical: Phloem fibres pale yellow, fusiform, walls thickened, with fine pit-canals. Fibre bundles bright yellow, with slightly thickened walls and distinct pits. Fibre bundles bright yellow, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres, walls of crystal cells lignified and thickened. Needles crystal of calcium oxalate in bundles or scattered, 26-110 μm long, Clusters of calcium oxalate large, 60-140 μm in diameter. Stone cells of testa yellow or pale brown, mostly broken, when whole, long polygonal, rectangular or irregular in shape, walls thickened, with large rounded pits, lumina brownish-red. Pollen grains subspherical, up to 76 μm in diameter, with spinous sculptures and 3 germinal pores Bordered pitted vessels large, mostly broken, some bordered pits hexagonal or rhombic, closely arranged.

(2) To 2 g, in powder, add 10 ml of ether, shake for 10 minutes, discard ether, and evaporate to dryness. Heat the residue under reflux in 20 ml of ethyl acetate for 1 hour, cool, filter, and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of methanol, filter, and use the filtrate as the test solution. Dissolve geniposide CRS in methanol to produce a solution containing 1 mg per ml as the refernce solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, acetone, formic acid and water (10 : 6 : 2 : 0.5) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat at 105℃ for about 10 minutes. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Wash the residue obtained under Identification (2) with two 5-ml quantities of ethyl acetate, discard the washings and expel ethyl acetate remained in the residue. Macerate the residue in 15 ml of methanol for 30 minutes with constant shaking, filter, and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of methanol, filter, and use the filtrate as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the refernce solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase, Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air and spray with 1% ferric chloride in ethanol. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(4) Heat 3 g of the pills, pulverized to fine powder, in 10 ml of 25% solution of sulfuric acid, on a water bath for 1 hour, cool, then add 15 ml of chloroform, and heat under reflux for 30 minutes. Separate the chloroform layer and evaporate to dryness, dissolve the residue in 2 ml of methanol, filter, and use the filtrate as the test solution. Prepare 0.6 g of Radix et Rhizoma Rhei reference drug as the reference drug solution in the same manner. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel H mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of a mixture of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 5 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. The five yellow spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The spots turn to red on exposure to ammonia vapour.

(5) Pulverize 20 g of the pills to fine powder and apply to a column (1.5-2 cm in diameter) packed with 5 g of neutral aluminium oxide (200-300 mesh), elute with 50 ml of dehydrated ethanol, collect the eluate. Evaporate the eluate to dryness, dissolve the residue in 2 ml of ethanol as the test solution. To 0.05 g of Rhizoma Coptidis reference drug, add 5 ml of methanol, ultrasonicate for 15 minutes, filter, dilute the filtrate with methanol to 5 ml as the reference drug solution. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, isopropanol, methanol and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately to the plate 4 μl of the test solution and 1 μl of each of the reference drug solution and the reference solution. After developing in a chamber pre-equilibrated by ammonia vapour and removal of the plate, dry in air and examine under ultraviolet light at 365 nm. The yellow fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution. The yellow fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecyasilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (11 : 89) as the mobile phase. As detector a spectrophotometer set at 238 nm. The number of theoretical plates of the column is not less than 2000, calculated with the reference to the peak of geniposide.

Reference solution Dissolve a quantity of geniposide CRS, accurately weighed, in 50% methanol to prepare a solution containing 30 μg per ml as the reference solution.

Test solution Grind well the watered pills, weigh accurately 1 g in a stopper conical flask, add accurately 50 ml of 50% methanol, stopper well, and weigh. Ultrasonicate (power 300 W, frequency 50 kHz) for 20 minutes, cool, weigh again; replenish the loss of weight with 50% methanol, shake well and filter. Measure accurately 10 ml of the successive filtrate to a 25 ml volumetric flask, dilute with 50% methanol to volume, shake well, filter, and use the successive filtrate as the test

solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.
It contains not less than 2.8 mg of geniposide ($C_{17}H_{24}O_{10}$) per gram, referred to Fructus Gardeniae.

Action To clear *heat* and purge *fire*, and cool blood and relieve *toxicity*.

Indications Sores on the mouth and tongue, or swollen painful gums, or bloodshot eyes, dizziness, or swollen painful throat, or hematemesis, epistaxis and constipation due to extremely abundant *heat* in the lung and stomach.

Usage and dosage 9 g, once a day.

Precaution Used with caution in pregnancy.

Storage Preserve in tightly closed containers, protected from moisture.

Zhongfeng Huichun Pian (中风回春片)

Zhongfeng Huichun Tablets

Ingredients Radix Angelicae Sinensis (processed with wine) 30 g; Rhizoma Chuanxiong (processed with wine) 30 g; Flos Carthami 10 g; Semen Persicae 30 g; Radix et Rhizoma Salviae Miltiorrhizae 100 g; Caulis Spatholobi 100 g; Caulis Lonicerae Japonicae 100 g; Caulis Trachelospermi 60 g; Pheretima (stir-baked) 90 g; Eupolyphaga seu Steleophaga (stir-fried) 30 g; Herba Lycopodii 60 g; Radix Cyathulae 100 g; Scolopendra 5 g; Fructus Leonuri (stir-baked) 30 g; Scorpio 10 g; Radix et Rhizoma Clematidis (processed with wine) 30 g; Bombyx Batryticatus (stir-baked with bran) 30 g; Fructus Chaenomelis 50 g; Bungarus Parvus 6 g.

Procedure Pulverize a half quantity of Radix Angelicae Sinensis, Rhizoma Chuanxiong, Pheretima, Eupolyphaga seu Steleophaga, Scolopendra, Bungarus Parvus, Scorpio, Bombyx Batryticatus and Radix et Rhizoma Salviae Miltiorrhizae to fine powder and sift. Decoct the remained quantity and the other 10 ingredients with water for 2 times, 2 hours for the first time and 1.5 hours for the second. Combine the decoctions, filter and allow the filtrate to stand for 24 hours. Seperate the supernatant, then concentrate to a thick extract with a relative density of 1.20-1.30. Add the fine powder, mix thoroughly, make granules, dry, compress into 1000 tablets and coat with sugar.

Description Sugar coated tablets with brown core; taste, bitter.

Identification (1) Microscopical: crystals subrounded or round clusters of calcium oxalate filling in parenchymatous cells. Muscular fibres, colourless to pale brown, slightly wavy, sometimes vertically crisscrossed. Body pieces colourless, with very fine hyphae on the surface. Body pieces pale yellow or yellow with reticulate striations and rounded alveo, somtimes showing dark brown setae.
(2) To 10 tablets, removed sugar coats and finely powdered, add 20 ml of methanol, heat under reflux for 1 hour, and filter. Evaporate the filtrate to almost dryness, and dissolve the residue in 1 ml of ethyl acetate as the test solution. To 0.5 g of Radix Angelicae Sinensis reference drug add 20 ml of methanol, heat under reflux for 30 minutes, and filter. Evaporate the fitrate to dryness, and dissolve the residue in 1 ml of ethanol as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of toluene, ethyl acetate and formic acid (2 : 1 : 0.1) as the mobile phase. Apply separately to the plate 5 μl of each of the two solutions. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for tablets (Appendix Ⅰ D).

Action To promote blood circulation, to resolve stagnant blood, and relax muscles and tendons and dredge meridians.

Indications Stroke due to blockage of meridians by accumulated *phlegm* with manifestations of hemiplegia, numbness of limbs, dysphasia and deviated mouth and eye.

Usage and dosage 4-6 tablets, 3 times a day, or follow doctor's advice.

Precaution Contraindicated for patients with acute cerebral hemorrhage.

Storage Preserve in tightly closed containers.

Zhongfeng Huichu Wan (中风回春丸)

Zhongfeng Huichu Pills

Ingredients Radix Angelicae Sinensis (processed with wine) 30 g; Rhizoma Chuanxiong (processed with wine) 30 g; Flos Carthami 10 g; Semen Persicae 30 g; Radix et Rhizoma Salviae Miltiorrhizae 100 g; Caulis Spatholobi 100 g; Caulis Lonicerae Japonicae 100 g; Caulis Crachelospermi 60 g; Pheretima (stir-baked) 90 g; Eupolyphaga seu Steleophaga (stir-baked) 30 g; Herba Lycopodii 60 g; Radix Cyathulae 100 g; Scolopendra 5 g; Fructus Leonuri (stir-baked) 30 g; Scorpio 10 g; Radix et Rhizoma Clematidis (processed with wine) 30 g; Bombyx Batryticatus (stir-baked with bran) 30 g; Fructus Chaenomelis 50 g; Bungarus Parvus 6 g.

Procedure Pulverize Radix Angelicae Sinensis, Rhizoma Chuanxiong, Pheretima, Eupolyphaga seu Steleophaga, Scolopendra, Bungarus Parvus, Scorpio, Bombyx Batryticatus and half quantities of Radix et Rhizoma Salviae Miltiorrhizae to fine powder. Decoct the other ten ingredients and the remained quantities of Radix et Rhizoma Salviae Miltiorrhizae 2 times, 2 hours for the first and 1.5 hours for the second time. Combine the decoctions, filter and allow to stand for 24 hours. Separate the supernatant, concentrate to an appropriate amount, add the above fine powder, mix well, dry, triturate to fine powder, make pills, coat and dry.

Prescription Brown to reddish-brown coated concentrated watered pills with blackish-brown core; taste, bitter.

Identification (1) Microscopical: Muscle fibers colourless to pale brown, sinuous, or crisscross arranged. Fragments of body walls colourless, with very fine hyphae on the surface. Fragments of body walls yellow or brownish-red with rounded setae pits, 8-24 μm in diameter, setae in varying length often visible. Fragments of traches walls with brown or yellowish-green helical filaments, 1-5 μm wide, with almost colourless punctiform masses between filaments. Fragments of body walls pale yellow to yellow, with reticular striations and rounded setae pits, sometimes brown setae visible.

(2) Grind 5 g of the pills, extract with 50 ml of ethyl acetate under reflux for 30 minutes, filter, and concentrate the filtrate to about 2 ml as the test solution. Prepare a solution of 2 g of Caulis Japonicae Lonicerae reference drug in 20 ml of ethyl acetate in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate and formic acid (8 : 2 : 1) as the mobile phase. Apply separately 2-4 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(3) Grind 20 g of the pills, extract with 50 ml of 70% ethanol under reflux for 2 hours, filter, evaporate the filtrate to dryness, and dissolve the residue in 10 ml of hot water. Adjust to pH 2 with dilute hydrochloric acid TS, and extract with three 15-ml quantities of ether by shaking. Combine the ether extracts, evaporate to dryness, and dissolve the residue in 5 ml of ethyl acetate as the test solution. Prepare a solution of 6 g of Radix et Rhizoma Salviae Miltiorrhizae reference drug in 30 ml of 70% ethanol in the same manner as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate and formic acid (10 : 8 : 1.5) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate. dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.
(4) Grind 10 g of the pills, extract with 50 ml of chloroform under reflux for 1.5 hours, filter and concentrate the filtrate to about 5 ml as the test solution. Prepare a solution of 2 g of Rhizoma Chuanxiong reference drug in the same manner as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel GF_{254} as the coating substance and a mixture of benzene and ethyl acetate (10 : 1) as the mobile phase. Apply separately 2 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 254 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A)

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of methanol and 1% solution of acetic acid (5 : 95) as the mobile phase. As detector a spectrophotometer set at 280 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of danshensu.

Reference solution Weigh accurately a quantity of sodium danshensu CRS, in 50% methanol to produce a solution containing 40 μg per ml as the reference solution (equivalent to 36 μg of danshensu).

Test solution Grind well a quantity of pills, weigh accurately 0.4 g in a stopper conical flask, add accurately 25 ml of 50% methanol, stopper tightly, weigh and ultrasonicate (power, not less than 300 W, frequency, not less than 50 kHz) for 30 minutes, cool, and replenish the loss of weight with 50% methanol, shake well, centrifuge, filter the supernatant, and use the successive filtrate as the test solution.

Procedure Inject accurately 20 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.
It contains not less than 0.9 mg of danshensu ($C_9H_{10}O_5$) per gram, referred to Radix et Rhizoma salviae Miltiorrhizae.

Action To promote blood circulation to resolve stagnant blood, and relax muscles and tendons and dredge meridians.

Indications Stroke due to blockage of meridians by accumulated phlegm with manifestations of hemiplegia, numbness of limbs, dysphasia and deviated mouth and eye.

Usage and dosage 1.2-1.8 g, 3 times a day, taken with warm water, or follow doctor's advice.

Precaution Contraindicated for patients with acute cerebral hemorrhage.

Strength (1) 16 g per bottle (2) 1.8 g per pack

Storage Preserve in tightly closed containers.

Zhonghua Dieda Wan
(中华跌打丸)

Zhonghua Dieda Pills

Ingredients Herba Hedyotidis 76.8 g; Herba Piperis Sarmentosi 76.8 g; Herba Hyperici Japonici 76.8 g; Herba Smilacis Ripariae 76.8 g; Herba Centipedae 76.8 g; Radix Achyranthis Bidentatae 76.8 g; Radix Linderae 76.8 g; Cortex Parabarii seu Ecdysantherae 76.8 g; Herba Breyniae 76.8 g; Folium Glycosmis Parviflorae 76.8 g; Herba Inulae 76.8 g; Herba Artemisiae anomalae 76.8 g; Caulis Entadae 76.8 g; Herba Hyptis Suaveolentis 76.8 g; Radix Cudraniae 76.8 g; Radix Zanthoxyli 76.8 g; Caulis Spatholobi 76.8 g; Cacumen Claoxyli 76.8 g; Radix Ilicis Asprellae 76.8 g; Semen Momordicae 76.8 g; Radix et Caulis Solani 76.8 g; Rhizoma Begoniae 76.8 g; Radix Angelicae Pubescentis 76.8 g; Rhizoma Atractylodis 76.8 g; Semen Impatientis 76.8 g; Fructus Gardeniae Grandiflorae 76.8 g; Radix Aconiti Praeparata 38.4 g; Flos Caryophylli 38.4 g; Rhizoma Cyperi 153.6 g; Radix Kadsurae Coccineae 153.6 g, Ramulus Cinnamomi 15.36 g; Camphor 3.84 g.

Procedure Pulverize Camphor into fine powder, grind the other 31 ingredients into fine powder, sift, mix well with the above powder of Camphor. To each 100 g of powder add 25-45 g of refined honey and a quantity of water to make pills, macerate with 10% solution of glutin, coat with a quantity of ferriferous oxide and dry to make water honeyed pills; or add 140-170 g of refined honey, make big honeyed pills.

Description Dark brown to blackish-brow water-honeyed pills or big honeyed pills; taste, sweet, slightly pungent.

Identification (1) Grind 7 g of the water-honeyed pills into powder; or cut 7 g of the big honeyed pills into pieces, carry out the method for determination of volatile oil (Appendix Ⅹ D), add 2 ml of ethyl acetate through the top of the apparatus, heat slightly to boil for 1 hours. Allow to cool, use the ethyl acetate layer as the test solution. Macerate 0.2 g of Radix Angelicae Pubescentis reference drug with 2 ml of acetone over night, use the supernatant as the reference drug solution. Dissolve eugenol CRS in ether to produce a solution, containing 16 μg per ml as the reference

solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of cyclohexane and ethyl acetate (8.5 : 1.5) as the mobile phase. Apply separately 1 μl of each of the test solution, the reference solution, and the reference drug solution to the plate. After developing and removing the plate, dry in air, spray with 20% perchloric acid in ethanol, heat at 105℃ to the spots clear, and examine under ultraviolet light at 365 nm. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solution and the reference drug solution.

(2) To 0.2 g of Rhizoma Atractylodis reference drug, add 2 ml of acetone, macerate over night, use the supernatant as the test solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymehylcellulose as the coating substance and a mixture of cyclohexane and ethyl acetate (4 : 0.1) as the mobile phase. Apply separately 3 μl of each of the test solution, obtained under the Identification (1), and the above reference drug solution to the plate. After developing and removing the plate, dry in air, spray with 5% *p*-dimethylaminobenzaldehyde in a solution of 10% sulfuric acid in ethanol, heat at 105℃ to spots clear. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Dissolve α-cyperone CRS in ethyl acetate to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (60-90℃), benzene and ethyl acetate (10 : 1 : 1) as the mobile phase. Apply separately 6 μl of each of the test solution, obtained under the Identification (1), and the above reference solution to the plate. After developing and removing the plate, dry in air, spray with dinitrophenylhydrazine TS, and allow to stand for a few minutes. The orange-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply to the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile and water (13 : 87) as the mobile phase. As detector a spectrophotometer set at 238 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of geniposide.

Reference solution Weigh accurately a quantity of geniposide CRS, dissolve in methanol to produce reference solution containing 80 μg per ml.

Test solution Grind the water honeyed pills into powder, weigh accurately 2 g; or cut the big honeyed pills, obtained under the test of weight variation, into pieces, weigh accurately 3 g. Add accurately 25 ml of methanol, weigh accurately, heat under reflux on a water bath for 30 minutes, allow to cool, weigh again, and replenish the lost weight with methanol. Shaking thoroughly, filter, and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 0.60 mg of geniposide ($C_{17}H_{24}O_{10}$) per gram for the water-honeyed pill, and 3.0 mg per big honeyed pill, referred to Fructus Gardeniae.

Action To reduce swelling to kill pain, relax muscles and tendons and dredge meridians, arrest bleeding to generate new tissues, and promote blood circulation to remove blood stasis.

Indications Injury of tendons and bones, recent or old congestion with pain, traumatic hemorrhage and painful congestion due to *wind-dampness*.

Usage and dosage 3 g for water honeyed pills, and 1 pill for big honeyed pill, twice a day. Reduce to half of the dosage for children and weak patients.

Precaution Contraindicated for pregnant women; not applied to an opening wound with bleeding.

Strength (1) 3 g per 66 water honeyed pills
(2) 6 g per big honeyed pill

Storage Preserve in tightly closed containers.

Zhongjing Weiling Wan
(仲景胃灵丸)

Zhongjing Weiling Pills

Ingredients Cortex Cinnamomi; Rhizoma Corydalis; Concha Ostreae; Fructus Foeniculi; Fructus Amomi; Rhizoma Alpiniae Officinarum; Radix Paeoniae Alba; Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle.

Procedure Decoct Radix Paeoniae Alba and Radix et Rhizoma Glycyrrhizae Praeparata Cum Melle with water for twice, 2 hours for each time. Combine the decoction, filter and concentrate to a thick extract. Pulverize the other six ingredients to fine powder, add the above thick extract, mix thoroughly, dry and pulverize to fine powder. Sift and mix thoroughly. Make pills with water, coat with Pulvis Fumi Carbonisatus, polish, and dry.

Description Blackish-brown concentrated watered pills; odour, aromatic; taste, acrid and sweet.

Identification (1) Microscopical: Stone cells subsquare or subrounded, 32-88 μm in diameter, walls humble in one side. Fragment of thick-walled tissue greenish-yellow, cells polygonal or elongated, walls slightly sinuous, some beaded, fitted pitted. Minute cluster of calcium oxalate, about 5 μm in diameter, containing several cluster in one cell. Thick-walled cells of endotesta reddish-brown or yellow-brown, polygonal in surface view, thick-walled, lumen containing a silica body. Starch granules wooden stick-like, 24-44 μm long or longer, hilum spotted.

(2) Macerate 5 g of the pills, triturated to powder, in 2 ml of concentrated ammonia TS and 20 ml of chloroform for 1 hour, shake constantly, and filter. Evaporate the filtrate to dryness and dissolve the residue in 1 ml of ethanol as the test solution. Dissolve tetrahydropalmatine CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and a mixture of *n*-hexane, chloroform, methanol and diethylamine (10 : 6 : 1 : 0.1) as the mobile phase. Apply separately 20 μl of the test solution and 2 μl of the reference solution to the plate. After developing in the chamber pre-equilibrated for 20 minutes with the mobile phase, and removal of the plate, dry in air. Spray with

dilute potassium iodobismuthate TS. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

(3) Triturate 5 g of the pills to fine powder, macerate in 30 ml of ether for 1 hour, shake constantly, filter, and concentrate the filtrate to about 1 ml as the test solution. Dissolve cinnamaldehyde CRS in ethanol to produce a solution containing 1 μl per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and a mixture of petroleum ether (60-90℃) and ethyl acetate (17 : 3) as the mobile phase. Apply separately 20 μl of the test solution and 2 μl of the reference solution to the plate. After developing and removal of the plate, dry in air. Spray with alcoholic dinitrophenylhydrazine TS. The red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of 0.05 mol/L potassium dihydrogen phosphate solution and acetonitrile (85 : 15) as the mobile phase. As detector a spectrophotometer set at 230 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of paeoniflorin.

Reference solution Dissolve 10 mg of paeoniflorin CRS, accurately weighed, in 50% methanol in a 25 ml volumetric flask, dilute to volume and mix well. Mesure accurately 1 ml in a 10 ml volumetric flask, dilute with 50% methanol to volume, and mix well (containing 40 μg of paeoniflorin per ml).

Test solution Weigh accurately 1.5 g of the pills, triturated to fine powder, in a conical flask with stopper, add accurately 20 ml of 50% methanol, stopper, weigh, and ultrasonicate for 1 hour. Allow to cool, weigh again and replenish the lost weight with 50% methanol. Mix thoroughly, centrifuge, measure accurately 5 ml of the supernatant and evaporate to dryness. Dissolve the residue in water and transfer to a column (1.5 cm in diameter, 10 cm long) packed with macroporous absorbency resins D101, wash with 100 ml of water, and elute with 80 ml of 50% methanol. Collect the eluate and evaporate to dryness. Dissolve the residue with 50% methanol to a 10 ml volumetric flask and dilute to volume. Filter with microporous film (0.45 μm), use the filtrate as the test solution.

Precedure Inject accurately 10 μl of each of the reference solution and the test solution into the column and determine. It contains not less than 0.70 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per gram, referred to Radix Paeoniae Alba.

Action To warm the *middle-energizer* to expel cold, and strengthen the stomach and kill pain.

Indications Cold in the spleen and stomach in the *deficiency* syndrome with manifestations of cold pain in the stomach, poor appetite, fullness in the abdomen, casting up of gastric acid or vomiting of watery fluid.

Usage and dosage 1.2 g, 3 times a day. Appropriate reduction of dosage for children.

Strength 1.2 g per pack

Storage Perverse in well closed containers.

Zhuanggu Guanjie Wan
(壮骨关节丸)

Zhuanggu Guanjie Pills

Ingredients Rhizoma Cibotii; Herba Epimedii; Radix Angelicae Pubescentis; Rhizoma Drynariae; Radix Dipsaci; Herba Taxilli; Caulis Spatholobi; Radix Rehmanniae Praeparata; Radix Aucklandiae; Olibanum; Myrrha.

Procedure Pulverize a half quantity of Olibanum, Myrrha, Radix Aucklandiae, Radix Angelicae Pubescentis and a quarter quantity of Rhizoma Drynariae, Radix Dipsaci, Radix Rehmanniae Praeparata and Caulis Spatholobi to fine powder and sift; decoct the remains of the above ingredients and the other four ingredients with water, filter, and concentrate the filtrate in vacuum to a thick extract with a relative density of 1.25-1.28 (60℃), mix thoroughly with the above powder, dry, pulverize to fine powder to make concentrated watered pills with water, and polish; or pulverize all the twelve ingredients to fine powder, sift, mix thoroughly and make pills with water, dry at a lower temperature, coat with carbonized Radix et Rhizoma Glycyrrhizae (or carbonized Radix Rehmanniae).

Description Black concentrated watered pills or watered pills; odour, aromatic; taste, slightly bitter.

Identification (1) Microscopical: Testa palisade cells pale brown or redish-brown, subpolygonal in surface view; walls slightly thickened; lumina containing redish-brown substances. Parenchyma greyish-brown to blackish-brown, cells usually shrunken, each containing a brown nucleus-like substances. Irregularly masses colourless or pale yellow, surfaces and edges diffusing with numerous tinny granules, dissolved on long standing. Irregular broken pieces pale yellow, translucent, with oil drops secreted. Fibre bundles brownish-yellow, surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres. Clusters of calcium oxalate about 45 μm in diameter, occurring in pale brownish-yellow shrunken parenchymatous cells, often several arranged in a row.

(2) Heat under reflux 5 g of pills, finely powdered, in 30 ml of petroleum ether (60-90℃) for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Prepare a solution with 1 g of Radix Angelicae Pubescentis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of petroleum ether (60-90℃) and ethyl acetate (1 : 1) as the mobile phase. Apply separately 10 μl of the test solution and 5 μl of the reference drug solution to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The purple fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

(3) Expel solvent remained in the drug residue obtained under Identification test (2), add 30 ml of ethyl acetate, heat under reflux for 30 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Dissolve psoralen CRS in dehydrated ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and a mixture of *n*-hexane and ethyl acetate

(4 : 1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To reinforce the liver and kidney, nourish blood and promote blood circulation, relax tendons and muscles and remove obstruction of meridians, and regulate flow of *qi* to kill pain.

Indications Osteo-arthritis and strain of lumbar muscles due to *deficiency* in the liver and kidney, stagnation of *qi* and blood and blockage of meridians with manifestations of swollen painful joints, numbness and immobilization.

Usage and dosage 10 g for concentrated watered pills, or 6 g for watered pills, twice a day. Taken after meals.

Storage Preserve in tightly closed containers.

Zhuanggu Shenjin Jiaonang (壮骨伸筋胶囊)

Zhuanggu Shenjin Capsules

Ingredients Herba Epimedii; Radix Rehmanniae Praeparata; Herba Pyrolae; Rhizoma Drynariae (stir-baked); Herba Cistanches; Caulis Spatholobi; Radix et Rhizoma Ginseng Rubra; Os Canidis; Poria; Radix et Rhizoma Clematidis; Herba Siegesbeckiae; Radix Puerariae Lobatae; Rhizoma Corydalis (processed with vinegar); Fructus Crataegi; Flos Daturae.

Procedure Pulverize Radix et Rhizoma Ginseng Rubra, Os Canidis, Poria, Rhizoma Corydalis to fine powder and pulverize Flos Daturae to fine powder. Decoct other ten ingredients 3 times, respectively 3 hours; 2 hours and 1 hour. Filter, combine the filtrates and concentrate to a thin extract with a relative density of 1.28-1.32 (60℃). Add fine powder of Radix et Rhizoma Ginseng Rubra, Os Canidis, Poria, and Rhizoma Corydalis, mix well, dry (60-80℃), and pulverize to fine powder. Add the fine powder of Flos Daturae, triturate with the above powder, sift, mix well, make granules, and pack into 1000 capsules.

Description Hard capsules with brown granular content; odour, slight, taste, slightly bitter.

Identification (1) Microscopical: Irregular branched masses colourless, dissolved in chloral hydrate TS, hyphae colourless or pale brown, 4-6 μm in diameter. Irregular massive sclerotin fragments colourless or pale yellow, with fine slit on surface, bone lacuna relatively abundant, subrounded or long fusiform, almost syntropically arranged. Pollen grains subrounded or oblong, 42-65 μm in diameter, with striated sculptures on surface. Gelatinized starch masses almost colourless or pale yellow. Clusters of calcium oxalate 20-68 μm in diameter, with acute angles.

(2) Extract 5 g of content with 30 ml of methanol under reflux for 1 hour, allow to cool, filer, and evaporate to dryness. Dissolve the residue in 15 ml of water, extract with two 15-ml quantities of *n*-butanol saturated with water, combine the *n*-butanol extracts, wash with 3 volumes of ammonia TS. Evaporate the n-butanol layer to dryness, and dissolve the residue in 1 ml of methanol as the test solution. Extract 1 g of Radix et Rhizoma Ginseng Rubra reference drug with 20 ml of methanol under reflux for 1 hour, filter, evaporate the filtrate to dryness, dissolve the residue in 10 ml of water, and prepare the reference drug solution in the same manner. Dissolve ginsenoside Rb_1 CRS, ginsenoside R_e CRS and ginsenoside Rg_1 CRS in methanol to produce a mixture containing 2 mg of each per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform, methanol and water (13 : 7 : 2), standing below 10℃, as the mobile phase. Apply 4 μl of the test solution, 3 μl of the reference drug solution and 2 μl of the reference solution separately to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol and heat at 105℃ to the spots clear. The purplish-red spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and reference solution.

(3) Extract 10 g of content with 70 ml of 80% ethanol under reflux for 1 hour, cool, filter, and evaporate the filtrate to dryness. Dissolve the residue in 30 ml of water, adjust to pH 9-10 with ammonia TS, extract with two 20-ml quantities of ether by shaking, combine the ether extracts, evaporate to dryness, dissolve the residue in 3 ml of dehydrated ethanol, and use it as the test solution. Dissolve tetrahydropalmatine CRS in dehydrated ethanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane, chloroform, methanol and diethylamine (10 : 6 : 1 : 0.1) as the mobile phase. Apply separately 4 μl of the test solution and 3 μl of the reference solution to the plate. After developing and removal of the plate, dry in air, exposure to ammonia vapor to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, a mixture of methanol and water (54 : 46) as the mobile phase. As detector a spectrophotometer set at 270 nm. The number of theoretical plates of the column is not less than 6000, calculated with the reference to the peak of icariine.

Reference solution Dissolve a quantity of icariine CRS, accurately weighed, in methanol to prepare a solution containing 80 μg per ml as the reference solution.

Test solution Weigh accurately 0.5 g of the content of the capsules, obtained in the test of weight variation, mix well, in a Soxhlet's extractor, heat under reflux with a quantity of 40 ml of chloroform for 2 hours, discard the chloroform solution. Evaporate the residue to dryness, add 40 ml of methanol, heat under reflux for 4 hours. Evaporate the extractor, moisten the residue with a quantity of methanol, dissolve in 2 ml of water, apply with a column of macroporous absorbency resins D101 (1.5 cm in diameter, 10 cm long), elute with 100 ml of water, 100 ml of 30% ethanol and 50 ml of 70% ethanol at the speed of 3 ml per minute. Collect the elute of 70% ethanol and evaporate to dryness. Dissolve the residue in methanol to a 5 ml of volumetric flask and dilute to the volume. Mix well and filter. Use the filtrate as the test solution.

Procedure Inject accurately 10 μl of the reference solution and 10-20 μl the test solution in to the column, and calculate the content.
It contents not less than 0.13 mg of icariine ($C_{33}H_{40}O_{15}$) per capsule, referred to Herba Epimedii.

Action To reinforce the liver and kidney, tone up muscles and bones, and activate meridians to kill pain.

Indications Nerve root-type cervical spondylosis due to *deficiency* in the liver and kidney and accumulation of *wind-dampness* with manifestations of pain and numbness of the arms and shoulders, and impeded movement of them.

Usage and dosage Oral application, 6 capsules, 3 times a day. 4 weeks making a course of treatment, or under supervision of a physician.

Precaution Overdosage is forbidden as it contains Flos Daturae; Be cautious about patients with hypertension or heart diseases; it is forbidden to prescribe to glaucoma patients and pregnant women.

Strength 0.3 g per capsule

Storage Preserve in tightly closed container.

Zhuche Wan
(驻车丸)

Zhuche Pills

Ingredients Rhizoma Coptidis 360 g; Rhizoma Zingiberis Praeparatum 120 g; Radix Angelicae Sinensis 180 g; Colla Corii Asini 180 g.

Procedure Pulverize the above four ingredients to fine powder, sift, mix thoroughly, make pills with 60 ml of vinegar and a quantity of water, and dry.

Description Yellowish-brown watered pills. Odour, slightly aromatic; taste, bitter, slightly pungent.

Identification (1) Microscopical: Fibre bundles bright yellow, walls relatively thick, pits distinct. Parenchymatous cells fusiform, walls slightly thickened, with very fine oblique crisscross striations. Starch granules elongated-ovoid, broadly ovate or irregular, 25-32 μm in diameter, hilum pointed, at the thinner end, striation well-marked.
(2) To 0.2 g of the powder, add 5 ml of methanol, ultrasonicate for 15 minutes, filter, and dilute the filtrate with methanol to 5 ml as the test solution. Dissolve berberine hydrochloride CRS in methanol to prepare a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately to the plate 1 μl of each of the two solutions. After developing in a chamber pre-equilibrated with concentrated ammonia vapour and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spot in the chromatogram obtained with test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) To 1 g of the powder, add 10 ml of petroleum ether (30-60℃), ultrasonicate for 15 minutes, filter and evaporate the filtrate to dryness, and dissolve the residue in 1 ml of dehydrated ethanol as the test solution. Prepare a solution with 0.2 g of Radix Angelicae Sinensis reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of *n*-hexane and ethyl acetate (9 : 1) as the mobile phase. Apple separately to the plate 4 μl of each of the two solutions. After developing and removal of the plate, dry in air, examine under ultraviolet light at 365 nm. The fluroscent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Assay Weight accurately 2 g of the powder, to a Soxhet's extrator, add a quantity of a mixture of hydrochloricacid and methanol (1 : 100) solution, heat under reflux until the extract colourless. Transfer the extract, concentrated if necessary, to a 50 ml volumetric flask, dilute with a mixture of hydrochloric acid and methanol (1 : 100) to volume and mix well. Carry out the method for column chromatography (Appendix Ⅵ C), apply accurately 5 ml of the solution to a column of aluminium oxide (0.9 cm in internal diameter, packed with 5 g of neutral aluminium oxide with ethanol, previously washed with 30 ml of ethanol), elute with 25 ml of ethanol in portions. Collect the eluate to a 50 ml volumetric flask, dilute with ethanol to volume and mix well. Transfer 2 ml, accurately measured, to a 50 ml volumetric flask, dilute with sulfuric acid (0.05 mol/L) to volume and shake well. Carry out the method for ultraviolet spectrophotometry and colourimetry (Appendix Ⅴ A), measure the absorbance at 345 nm, calculate the content, taking 728 as the value of A (1%, 1 cm).
It contains not less than 30.0 mg of total alkaloids per gram, calculated as berberine hydrochloride ($C_{20}H_{18}ClNO_4$), on the dried basis.

Action To nourish *yin* and relieve dysentery.

Indications Chronic dysentery characterized by *yin* impairment, bloody dysentery, abdominal pain and tenesmus, or recurrent dysentery.

Usage and dosage 6-9 g, 3 times a day.

Precaution Contraindicated for patients with accumulated *heat-dampness* and dysentery at the initial stage.

Strength 3 g per 50 pills

Storage Preserve in tightly closed containers.

Zhuhuang Chuihou Şan
(珠黄吹喉散)

Zhuhuang Chuihou Powder

Ingredients Margarita 50 g; Calculus Bovis Artifactus 30 g; Borax (calcined) 250 g; Mirabilitum Praeparatum 80 g; Realgar 40 g; Catechu 100 g; Rhizoma Coptidis 100 g; Cortex Phellodendri Chinensis 150 g; Borneolum Syntheticum 50 g.

Procedure Levigate or pulverize Margarita to very fine powder, and levigate Realgar to very fine powder, pulverize Borax, Catechu, Rhizoma Coptidis and Cortex Phellodendri Chinensis to fine powder, grind Calculus Bovis Artifactus and Borneolum Syntheticum to fine powder, triturate Mirabilitum Praeparatum with all the above powders, sift, and mix thoroughly.

Description A pale yellow powder; odour, aromatic; taste, bitter with cool sensation.

Identification (1) Microscopical: Fibre bundles bright yellow, surrounded by cells containing prisms of calcium oxalate, forming crystal fibres, walls of crystal cells

lignified and thickened. Fibres bundles bright yellow, walls slightly thickened, pits distinct. Irregular fragments colourless or pale green, translucent, lustrous, fine and sinuous striations visible occasionally. Irregular fragments golden yellow or orange-yellow, lustrous.
(2) Stir 0.3 g of the powder with 10 ml of chloroform and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of 60% acetic acid, add 1 ml of a freshly prepared 1% furfural solution and 5 ml of sulfuric acid (1→2) solution, heat at 70℃ for 10 minutes; a bluish-violet colour is produced gradually.
(3) Sublimate 0.2 g of the powder and dissolve the sublimate in 1-2 drops of ethanol. Add 1-2 drops of a freshly prepared 1% solution of vanillin in sulfuric acid; a purple colour is produced gradually.
(4) To 1 g of the powder add 5 ml of water, shake and filter. Acidify the filtrate with hydrochloric acid, apply a drop to a moistened curcuma TP, and dry; an orange-red colour is produced, which turns dark-green on exposure to ammonia vapour.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Action To relieve *toxicity* and remove slough to promote regeneration of tissues.

Indications Painful, swollen or ulcerative throat, mouth and tongue due to retained *heat*.

Usage and dosage For external use, appropriate quantity to be insufflated to the lesion, 3-5 times a day.

Storage Preserve in tightly closed containers.

Zhuli Datan Wan
(竹沥达痰丸)

Zhuli Datan Pills

Ingredients Radix Scutellariae 200 g; Rhizoma Pinelliae (processed) 150 g; Radix et Rhizoma Rhei (processed with wine) 200 g; Exocarpium Citri Rubrum 200 g; Radix et Rhizoma Glycyrrhizae 100 g; Lignum Aquilariae Resinatum 50 g.

Procedure Pulverize the above 6 ingredients to fine powder, sift and mix thoroughly. Additionally take 200 g of Rhizoma Zingiberis Recens, smashed and squeeze to obtain juice, add 800 ml of Succus Bambusae, mix well and make pills with the above powder. Coat with very fine powder of 100 g of Lapis Chloriti and 30 g of Saltpetre, calcined and levigated, and dry.

Description Greenish-brown watered pills; odour, slightly aromatic; taste, bitter.

Identification (1) Microscopical: Bast fibres pale yellow, fusiform, walls thickened, with fine pit-canals. Needle crystals calcium oxalate in bundles, 32-144 μm long, filling in mucilage cells or singly scattered. Clusters of calcium oxalate large, 60-140 μm in diameter. Prisms of calcium oxalate abundant in parenchymatous cells. Fibre bundles surrounded by parenchymatous cells containing prisms of calcium oxalate, forming crystal fibres.
(2) Grind 2 g of the pills, add 10 ml of methanol, ultrasonicate for 30 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 1 ml of chloroform as the test solution. Prepare a solution of 0.1 g of Radix et Rhizoma Rhei reference drug in the same manner as the reference drug solution. Dissolve emodin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose as the coating substance and the upper layer of petroleum ether (30-60℃), ethyl formate and formic acid (15 : 5 : 1) as the mobile phase. Apply separately 2 μl of each of the three solutions to the plate. After developing and removal of the plate, dry in air, exposure to ammonia vapour. The five orange-red spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution, and the orange-red spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.
(3) Grind 5 g of the pills with 5 g of kieselguhr, add 20 ml of ethyl acetate, heat under reflux for 1 hour, cool, and filter. To the drug residue add 20 ml of methanol, ultrasonicate for 20 minutes, and filter. Evaporate the filtrate to dryness, dissolve the residue in 2 ml of methanol as the test solution. Dissolve baicalin CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G mixed with sodium carboxymethylcellulose containing 4% solution of sodium acetate and as the coating substance and a mixture of ethyl acetate, butanone, formic acid and water (5 : 3 : 1 : 1) as the mobile phase. Apply in strip separately 6 μl each of the two solutions to the plate. After developing and removal of the plate, dry in air, spray with 1% ferric chloride in ethanol. The strip in the chromatogram obtained with the test solution corresponds in position and colour to the strip in the chromatogram obtained with the reference solution.

Other requirements Comply with the general requirements for pills (Appendix Ⅰ A).

Action To eliminate obstinate phlegm and excessive heat, and regulate qi flow.

Indications Retention of obstinate phlegm in the lung, coughing and asthma with copious phlegm, constipation, or irritability and mania due to upward going of *heat* and *phlegm*.

Usage and dosage 6-9 g.

Precaution Be cautious about pregnant women.

Strength 3 g per 50 pills

Storage Preserve in well closed containers, protected from moisture.

Zhusheyong shuanghuanglian
[注射用双黄连(冻干)]

Shuanghuanglian for Injection

Ingredients Fructus Forsythiae; Flos Lonicerae Japonicae; Radix Scutellariae.

Procedure Decoct Radix Scutellariae with water for two times, one hour for each, filter, combine the filtrate, and adjust to pH 1.0-2.0 with 2 mol/L solution of hydrochloric acid. Allow to keep warm at 80℃ for 30 minutes, and stand for 12 hours. Filter, stir the precipitate with 8 volume of water, adjust to pH 6.0-7.0 with 40% solution of sodium hydroxide, add equal quantities of ethanol, stir to dissolve, and filter. To the filtrate adjust to pH 2.0, keep warm at 80℃ for 30 minutes, and stand for 12 hours, and filter. Wash the precipitate with ethanol to pH 4.0, add a quantity of water, stir, and adjust to pH 6.0-7.0. Add a quantity of activated charcoal, stir thoroughly, keep warm at 50℃ for

30 minutes, add 1 to 2 volume of ethanol and stir well. Filter, adjust the filtrate to pH 2.0 with 2 mol/L solution of hydrochloric acid, keep warm at 80℃ for 30 minutes, and stand for 12 hours. Filter, wash the precipitate with small quantities of ethanol, dry below 60℃ for further use. Macerate Flos Lonicerae Japonicae and Fructus Forsythiae with water for 30 minutes, decoct for two times, one hour for each, and filter. Combine the filtrates, concentrate to a thick extract of relative density of 1.20-1.25 (70-80℃), allow to stand to 40℃, and add slowly ethanol to make the content to 75% ethanol, and stir thoroughly. Stand for 12 hours, filter and recover solvent to ethanol odorless. Add 3 to 4 volumes of water, stand for 12 hours, concentrate the supernatant to a thin extract of relative density of 1.10-1.15 (70-80℃). Stand to 40℃, add ethanol to make the content of 85% ethanol, stand over 12 hours, filter, and recover solvent of the supernatant to ethanol odorless. To extract of Radix Scutellariae add a quantity of water, heat and dissolve by adjusting to pH 7.0 with 40% solution of sodium hydroxide. Mix with the above extract of Flos Lonicerae Japonicae and Fructus Forsythiae, add water to 1000 ml. add a quantity of activated charcoal, adjust to pH 7.0, heat to boil and keep boiling for 15 minutes. Stand to cool, filter, add water for injection to total volume, sterile, refrigerate, filter, concentrate, freeze to powder and pack.

Description Yellowish-brown irregular powder or loose mass; taste, bitter and astringent ; hygroscopic.

Identification (1) To 60 mg, add 5 ml of 75% methanol, ultrasonicate to dissolve as the test solution. Dissolve baicalin CRS, chlorogenic acid CRS in 75% methanol separately to produce two solutions each containing 0.1 mg per ml as the reference solutions. Carry out the method for thin layer chromatograply (Appendix Ⅵ B), using acetic acid as the mobile phase. Apply separately to a polyamide film 1 μl of each of the three solutions. After developing and removal of the film, dry in air, examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference solutions.

(2) To 0.1 g, add 10 ml of methanol, ultrasonicate for 20 minutes, and allow to stand, and use the supernatant as the test solution. Prepare a solution of 0.5 g Fructus Forsythiae reference drug in the same manner as the reference drug solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G containing sodium carboxymethylcellulose as the coating substance and a mixture of chloroform and methanol (5 : 1) as the mobile phase. Apply separately 10 μl of each of the two solutions to the plate. After developing and removal of the plate, dry in air. Spray with a solution of 10% sulfuric acid in ethanol, heat at 100℃ until spots distinct. The spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution.

pH value 5.7-6.7 (Appendix Ⅶ G), 2.5 mg per ml in water.

Water Not more than 5.0 per cent (Appendix Ⅸ H, method 3).

Protein Dissolve 0.6g in 10 ml of water, transfer 2 ml to a test tube, add 1-3 drops of tannic acid TS; no opalescence is produced.

Tannin Dissolve 0.6 g in 10 ml of water, comply with the test for tannin (Appendix Ⅸ S), using 1 ml.

Resin Dissolve 0.6 g in 10 ml of water, transfer 5 ml into a separator, and extract with 10 ml of chloroform, comply with the test for Resin (Appendix Ⅸ S).

Oxalate Dissolve 0.6 g in 10 ml of water, adjust to pH 1-2 with dilute hydrochloric acid, filter warmly, adjust the filtrate to pH 5-6. To 2 ml of the solution, add 2-3 drops of 3% solution of calcium chloride, allow to stand for 10 minutes; no opalescence or precipitate is produced.

Potassium Comply with the test for potassium (Appendix Ⅸ S), using 0.12g.

Heavy metals Not more than 10 ppm (Appendix Ⅸ E, method 2), using 1.0 g.

Arsenic To 1.0 g, add 3 ml of 2% solution of magnesium nitrate in ethanol, fire to burn, after burning out heat gently until charred, ignite at 500-600℃ until incineration completed. Allow to cool, dissolve in 5 ml of hydrochloric acid and 21 ml of water. Comply with the limit test for arsenic (Appendix Ⅸ F, method I); not more than 2 ppm.

Pyrogens Dissolve 0.6 g in 10 ml of water for injection, comply with the test for pyrogens (Appendix Ⅺ A), using 3 ml per kg of the rabbit's weight.

Sterility Dissolve 0.6 g in water for injections to produce a solution of 60 mg per ml, comply with the test for sterility (Appendix Ⅷ B, membrane filtration method).

Haemolysis and agglutination *2% red blood cell, RBC, suspension* Measure a quantity of blood of rabbit or sheep, transfer it into a conical flask with glass beads, shake for 10 minutes, discard the fibrinogen, and collect the defibrin blood. To the defibrin blood, add 10 times volume of saline, shake well and centrifuge to remove supernatant. Wash the pellet with saline for 2 or 3 times until the supernatant becomes transparent, and then prepare the 2% RBC suspension with saline.

Test solution To 600 mg, add saline to dissolve and dilute to 20 ml with saline as the test solution.

No. of tubes	1	2	3	4	5	6
2% RBC suspension/ml	2.5	2.5	2.5	2.5	2.5	2.5
saline/ml	2	2.1	2.2	2.3	2.4	2.5
test solution/ml	0.5	0.4	0.3	0.2	0.1	0

Procedure Add the 2% RBC suspension and saline into 6 tubes according to the above proportions. Shake well, and keep it in 37℃ for 30 minutes. Then add 0.5 ml, 0.4 ml, 0.3 ml, 0.2 ml, 0.1 ml of the test solution into No. 1, No. 2, No. 3, No. 4, No. 5. of tubes respectively, No. 6 tube as the blank, and keep them in 37℃ for 2 hours. Examine the result every 15 minutes during the first hour and once for the second hour. Haemolysis and agglutination must not appear in the No. 3 tube within 2 hours.

Other requirements Comply with the general requirements for injections (Appendix Ⅰ U).

Assay ***Flos Lonicerae Japonicae*** Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecyl silane bonded silica gel as the stationary phase and amixture of methanol, water, glacial acetic acid and triethylamine (15 : 85 : 1 : 0.3) as the mobile phase. As detector a spectrophotometer set at 324 nm. The number of theoretical plates of the column is not less than 6000, calculated with reference to the peak of chlorogenic acid.

Reference solution Dissolve a quantity of chlorogenic acid CRS in an umber volumetric flask, weighed accurately, in water to produce a solution containing 20 μg per ml.

Test solution Mix the contents obtained in the test of weight variation, weigh accurately 60 mg in a 50 ml

volumetric flask, dissolve and dilute to volume with water, and mix well.

Procedure Accurately inject 20 μl of each of the reference solution and the test solution, respectively, into the column, and determine the content.
It contains not less than 8.5 mg and not more than 11.5 mg chlorogenic acid ($C_{16}H_{18}O_9$) per vial, referred to Flos lonicerae Japonicae.

Radix Scutellariae Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane boned silica gel as the stationary phase and a mixture of methanol, water and glacial acid (40 : 60 : 1) as the mobile phase. As detector a spectrophotometer set at 274 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of baicalin.

Reference solution Dissolve a quantity of baicalin CRS, weighed accurately, in 50% methanol to produce a solution containing 50 μg per ml as the reference solution.

Test solution Mix the contents obtained in the test of weight variation, weigh accurately 10 mg, add a quantity of 50% methanol, ultrasonicate for 20 minutes to dissolve, to produce a solution containing about 0.2 mg per ml as the test solution.

Procedure Accurately inject 20 μl of each of the reference solution and the test solution, respectively, into the column, determine and calculate the content.
It contains not less than 128 mg and not more than 173 mg of baicalin ($C_{21}H_{18}O_{11}$) per vial, referred to Radix Scutellariae.

Fructus Forsythiae Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase and a mixture of acetonitrile, water and glacial acetic acid (25 : 75 : 0.1) as the mobile phase. As detector a spectrophotometer set at 278 nm. The number of theoretical plates of the column is not less than 4000, calculated with the reference to the peak of forsythin.

Reference solution Dissolve a quantities of forsythin CRS, weighed accurately, in methanol to prepare a solution containing 20 μg per ml.

Test solution Mix well the contents obtained in the test of weight variation, weigh accurately 0.1 g, dissolve with 5 ml of 65% solution of ethanol in several times, apply to a column 1 cm in diameter, packed with neutral aluminium oxide (100-120 mesh, 5 g), elute with 65% ethanol, collect the eluate in a 25 ml volumetric flask, dilute with 65% ethanol to volume and mix well.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, determine and calculate the content.
It contains not less than 1.4 mg and not more than 2.1 mg of forsythin ($C_{29}H_{36}O_{15}$) per vial, referred to Fructus Forsythiae.

Action To clear *heat* to relieve *toxicity*, and disperse *wind* to release the exterior.

Indications Fever, coughing and sore throat due to affliction from external *wind-heat*; upper respiratory tract infection, mild pneumonia or tonsillitis with above symptoms.

Usage and Dosage Intervenous drop infusion. 60 mg per kg body weight each time, once a day; or under supervision of a physician. Dissolved by quantum sufficit of sterile water for injection, then diluted by 500 ml sodium chloride injection or glucose injection before use.

Precaution Cloudiness or sedimentation occurs when it is combined with aminoglycosides (gentamycin, kanamycin and streptomycin), and macrolides (erythromycin and albomycin). Do not use them together

Strength 600 mg per vial

Storage Preserve in tightly closed containers, protected from light, and stored in a cool place.

Zicao Gao (紫草膏)

Zicao Ointment

Ingredients Radix Arnebiae seu Lithospermi 500 g; Radix Angelicae Sinensis 150 g; Radix Saposhnikoviae 150 g; Radix Rehmanniae 150 g; Radix Angelicae Dahuricae 150 g; Olibanum 150 g; Myrrha 150 g.

Procedure Pulverize Olibanum and Myrrha to fine powders, and sift. Cut properly Radix Angelicae Sinensis, Radix Saposhnikoviae, Radix Rehmanniae, Radix Angelicae Dahuricae, then deep-fry with 6000 g of edible vegetable oil, and discard the residue. Soften Radix Arnebiae or Radix Lithospermi with water, deep-fry until the oil becomes purplish-red in colour, discard the residue, filter. Add a quantity of beeswax, to each 10 g of oil add 2-4 g of beeswax, melt, and stir well with the above powders while warm.

Description A purplish-red ointment, with a characteristic oily odour.

Other requirements Complies with the general requirements for ointments (Appendix Ⅰ R).

Action To remove slough to promote regeneration of tissues, and relieve *toxicity* to kill pain.

Indications Ulcer due to retained *heat* with manifestations of painful bright red wound in which pus and slough are almost exhausted.

Usage and dosage Spread on a piece of gauze for topical application. Change the dressing every 1-2 days.

Storage Preserve in tightly closed containers.

Zijin Ding (紫金锭)

Zijin Troches

Ingredients Pseudobulbus Cremastrae seu Pleiones 200 g; Radix Knoxiae 150 g; Semen Euphorbiae Pulveratum 100 g; Galla Chinensis 100 g; Moschus 30 g; Cinnabaris 40 g; Realgar 20 g.

Procedure Levigate Cinnabaris and Realgar to very fine powder, respectively. Pulverize Pseudobulbus Cremastrae seu Pleiones, Galla Chinensis and Radix Knoxiae to fine powders, grind Moschus to fine powder. Triturate the above powders with Semen Euphorbiae Pulveratum, sift, and mix thoroughly. Add water to 320 g of glutinous rice powder to prepare a mass, steam and mix thoroughly with the above powders. Compress to lozenges and dry at a lower temperature.

Description Dark brown to brown, rectangular or rod-

shaped masses; odour, characteristic; taste, pungent and bitter.

Identification (1) Microscopical: Needle crystals of calcium oxalate in bundles or scattered, up to about 128 μm long, about 2 μm in diameter. Pigment cells reddish-brown or yellowish-brown, elliptical, or elongated to tubular. Non-glandular hairs 1 to several celled, some with slightly twisted apex. Irregular masses pale yellowish-brown, with embeded small prisms. Irregular fine granules reddish-brown, lustrous, with dark black edge. Irregular fragments golden yellow or orange-yellow, lustrous.
(2) Place 0.5 g, in powder, in a test tube, add 1-2 ml of sodium hydroxide TS and a small quantity of zinc powder, cover the test tube with a piece of filter paper moistened with silver nitrate TS, heat the test tube on a water bath, the silver nitrate test paper changes from yellow to brown and finally to black.

Other requirements Comply with the general requirements for troches (Appendix Ⅰ E).

Action To remove pestilence and relieve *toxicity*, and reduce swelling and kill pain.

Indications Sunstroke, distending pain in the stomach and abdomen, nausea, vomiting, diarrhea or dysentery, child syncope due to *phlegm*; furuncles, mumps, erysipelas and throat illness.

Usage and dosage 0.6-1.5 g, twice a day. For external use, appropriate quantity to be mixed with vinegar and applied topically.

Precaution Contraindicated for pregnant women.

Strength (1) 0.3 g per troche (2) 3 g per troche

Storage Preserve in well closed containers.

Zixinyin Koufuye
(滋心阴口服液)

Zixinyin Mixture

Ingredients Radix Ophiopogonis; Radix paeoniae Rubra; Radix Glehniae; Radix et Rhizoma Notoginseng.

Procedure Decoct Radix Ophiopogonis and Radix Glehniae with water for 3 times, 2 hours for the first and second time and 1 hour for the third one, combine the decoction, filter, concentrate the filtrate to an appropriate quantity and adjust with ethanol to a content of 65% ethanol, stand and filter. Heat under reflux Radix et Rhizoma Notoginseng, pulverized to coarse powder, with 75% ethanol for 3 times, 2 hours for each, combine the extract, filter and recover ethanol; decoct the drug residue with water for 3 times, 2 hours for the first and second time and 1 hour for the third one, combine the decoction, concentrate to an appropriate quantity, adjust with ethanol to a content of 65% ethanol, stand and filter. Combine the filtrate and the filtrate of Radix Ophiopogonis and Radix Glehniae, recover ethanol. Decoct Radix Paeoniae Rubra with water for 3 times, 2 hours for the first and second time, 1 hour for the third one. Combine the decoction, filter, concentrate the filtrate to a quantity of amount, adjust to pH 8 with 1% solution of sodium hydroxide, add a quantity of 2% solution of gelatin and precipitate completely, and filter. Concentrate the filtrate to a quantity of amount, adjust with ethanol to a content of 65% ethanol, stand, filter and adjust the filtrate to a content of 85% ethanol, stand, filter, recover ethanol and concentrate to a quantity of amount. Combine the above extracts, stand at a lower temperature for 24 hours, filter, add a quantity of excipient and pack.

Description A clear, reddish-brown liquid; odour, slightly aromatic; taste, sweet, and slightly bitter.

Identification Extract 5 ml of the mixture with three quantities, 20 ml, 10 ml and 10 ml, of *n*-butanol saturated with water. Combine the extracts, and wash with two 10-ml quantities of water saturated with *n*-butanol, discard the washings, recover *n*-butanol to dryness, dissolve the residue in 10 ml of ethanol as the test solution. Dissolve notoginsenoside R_1 CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substances and the lower layer of a mixture of chloroform, methanol and water (13 : 7 : 2) allow to stand at 5-10℃ for 12 hours as the mobile phase. Apply separately 5 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air. Spray with 10% solution of sulfuric acid in ethanol, heat at 105℃ to the spots clear. The spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot in the chromatogram obtained with the reference solution.

Relative density Not less than 1.06 (Appendix Ⅶ A).

pH value 5.0-7.0 (Appendix Ⅶ G).

Other requirements Comply with the general requirements for mixtures (Appendix Ⅰ J).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bounded silica gel as the stationary phase and a mixture of methanol, water and glacial acetic acid (25 : 75 : 0.2) as the mobile phase. As detector a spectrophotometer set at 235 nm. The number of theoretical plates of the column is not less than 3600, calculated with reference to the peak of paeoniflorin.

Reference solution Dissolve a quantity of paeoniflorin CRS, accurately weighed, with 50% methanol to prepare a solution containing 20 μg per ml.

Test solution Measure accurately 10 ml of the mixture, in a 25 ml volumetric flask, dilute with methanol to volume and mix well. Stand over 1 hour, and filter the supernatant. Measure accurately 2 ml of the successive filtrate, apply to a column of neutral aluminum oxide (100-200 mesh, 2 g, pre-washed with 10 ml of water), elute with 25 ml of water. Collect the eluate in a 25 ml volumetric flask, dilute with water to volume and mix well.

Procedure Inject accurately 20 μl of the test solution and 10 μl of the reference solution into the column and determine. It contains not less than 0.4 mg of paeoniflorin ($C_{23}H_{28}O_{11}$) per ml, referred to Radix Paeoniae Rubra.

Action To nourish *heart-yin* and promote blood circulation to kill pain.

Indications Obstruction of *lung-qi* in the chest due to a *deficiency* of *yin* and blood stagnation, with manifestations of constriction and pain in the chest, palpitation or severe palpitation, a hot sensation in the palms, soles and chest, disturbed sleeping at night and reddened tongue with scanty coating; angina pectoris in coronary heart disease with above symptoms.

Usage and dosage 10 ml, 3 times a day.

Strength 10 ml per phial

Storage Preserve in tightly closed containers.

Zixue
(紫雪)

Zixue Powder

Ingredients Gypsum Fibrosum 144 g; Gypsum Rubrum seu Calcitum 144 g; Talcum 144 g; Magnetitum 144 g; Radix Scrophulariae 48 g; Radix Aucklandiae 15 g; Lignum Aquilariae Resinatum 15 g; Rhizoma Cimicifugae 48 g; Radix et Rhizoma Glycyrrhizae 24 g; Flos Caryophylli 3 g; Natrii Sulfas (processed) 480 g; Saltpetre (refined) 96 g; Pulvis Cornus Bubali Concentratus 9 g; Cornu Saigae Tataricae 4.5 g; Moschus 3.6 g; Cinnabaris 9 g.

Procedure Break Gypsum Fibrosum, Gypsum Rubrum seu Calcitum, Talcum, and Magnetitum to small pieces and decoct with water for 3 times. Decoct Radix Scrophulariae, Radix Aucklandiae, Lignum Aquilariae Resinatum, Rhizoma Cimicifugae, Radix et Rhizoma Glycyrrhizae, and Flos Caryophylli with the above decoction for 3 times. Combine the decoctions, filter, concentrate the filtrate to a thick extract. Pulverize Natrii Sulfas and Saltpetre and add to the thick extract, stir well. Dry and pulverize the mixture to fine powder. File Cornu Saigae Tataricae to fine powder. Levigate Cinnabaris to very fine powder. Grind Pulvis Cornus Bubali Concentratus and Moschus to fine powders, triturate with the above powders, sift and mix thoroughly.

Description A brownish-red to greyish-brown powder; odour, aromatic; taste, salty and slightly bitter.

Identification (1) To a small quantity of the powder add a quantity of water, shake, and filter. Mix 2 ml of the filtrate with an equal volume of sulfuric acid, cool, add a freshly prepared ferrous sulphate TS to form two liquid layers; a brown colour is produced at the conjunction of the two liquids. To another 2 ml of the filtrate, add several drops of barium chloride TS; a white precipitate is produced, which is not dissolved in hydrochloric acid and nitric acid. Moisten a platinum wire with hydrochloric acid, dip it into the filtrate, then burn in a colourless flame; a bright yellow colour is produced.

(2) Extract 5 g of the powder in a Sohxlet's extractor with 40 ml of ether, heat under reflux for about 1 hour. Expel the ether, dissolve the residue in 2 ml of cyclohexane as the test solution. Dissolve muscone CRS in cyclohexane to produce a solution containing 0.02 mg per ml as the reference solution. Carry out the method for gas chromatography (Appendix Ⅵ E), using a 2 m long column packed with 1% polyethylene glycol glutarate as the stationary phase; maintain the column temperature at 140℃. Inject 2-5 μl of each of the test solution and the reference solution, respectively, into the column. The retention time of the peak obtained with the test solution and the reference solution corresponds with each other.

Other requirements Comply with the general requirements for powders (Appendix Ⅰ B).

Action To clear *heat* to resuscitate, and relieve convulsion and anchor the mind.

Indications Invasion of the pericardium by *heat* and stirring of *liver-wind* by intense *heat* with manifestations of high fever, restlessness, coma, delirium, convulsive seizures, skin eruptions, hematemesis, deep-coloured urine and constipation.

Usage and dosage 1.5-3 g, twice a day; 0.3 g for children of 1 year old, and add 0.3 g for each year up to 5 years of age, once a day; taken according to doctor's order for children over 5 years old.

Precaution Contraindicated for pregnant women.

Strength 1.5 g per bottle

Storage Preserve in tightly closed containers.

Zuojin Jiaonang
(左金胶囊)

Zuojin Capsules

Ingredients Rhizoma Coptidis 1284 g; Fructus Evodiae 214 g.

Procedure pulverize 71 g of Fructus Evodiae into fine powder, heat under reflux three times, the other Fructus Evodiae and Rhizoma Coptidis with 60% ethanol for three times, 3 hours for the first time, 2 hours for the second time and 1.5 hours for the third time, combine the extracts and filter, recover ethanol and concentrate to a thick extract. Add the fine powder of Fructus Evodiae. Mix thoroughly, dry, and pulverize. Add a quantity of starch, mix thoroughly, make granules, and make to 1000 capsules.

Description Capsules containing redish-brown to brown powder and granules; odour, characteristic; taste, slightly bitter.

Identification (1) To 1 g of capsule content, add 20 ml of ethanol, ultrasonicate for 20 minutes, filter, and use the filtrate as the test solution. Prepare a solution of 0.2 g of Fructus Evodiae reference drug in the same manner as the reference drug solution. Dissolve rutaecarpine CRS in ethanol to produce a solution containing 0.2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of cyclohexane, ethyl acetate, and methanol (19 : 5 : 1) as the mobile phase. Apply separately 1 μl of each of the above three solutions to the plate to the plate. After developing and removal of the plate, dry in air. Spray with 10% sulfuric acid in ethanol, and heat at 105℃ for 5 minutes. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

(2) Dilute the test solution obtained under Identification (1) 10 times as the test solution. To 0.1 g of Rhizoma Coptidis reference drug, add 20 ml of ethanol, ultrasonicate for 20 minutes, filter, and use the filtrate as the reference drug solution. Dissolve berberine hydrochloride CRS in methanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix Ⅵ B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol, and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately to the plate 1 μl of each of the above three solutions. After developing in a chamber pre-equilibrated with ammonia vapour and removal of the plate, dry in air. Examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for capsules (Appendix Ⅰ L).

Assay Carry out the method for high performance liquid chromatography (Appendix Ⅵ D).

Chromatographic system and system suitability Use octadecylsilane bonded silica gel as the stationary phase, and

a mixture of acetonitrile and 0.05 mol/L solution of potassium dihydrogen phosphate pH3.0, adjusted by phosphoric acid (25 : 75) as the mobile phase. As detector a spectrophotometer set at 350 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of berberine hydrochloride.

Reference solution Weigh accurately a quantity of berberine hydrochloride CRS, dissolve with a mixture solution of hydrochloric acid and methanol (1 : 100), and mix well, to produce a solution containing 30 μg per ml.

Test solution Weigh accurately 0.1 g of capsule content, obtained under the test of weight variation and pulverized to fine powder, in a 100 ml volumetric flask, add a quantity of a mixture solution of hydrochloric acid and methanol (1 : 100), ultrasonicate (power 300 W, frequency 50 kHz) for 20 minutes, cool, dilute with the mixture solution of hydrochloric acid and methanol (1 : 100) to volume, mix well, and filter. Discard the initial filtrate and measure accurately 2 ml of the successive filtrate, in a 10 ml volumetric flask, and dilute with the mixture solution of hydrochloric acid and methanol (1 : 100) to volume, stir well, and centrifuge (12000 rpm) for 10 min. Use the supernatant of the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column respectively and measure.

It contains not less than 40 mg of berberine hydrochloride ($C_{20}H_{18}ClNO_4$) per capsule, referred to Rhizoma Coptidis.

Action To purge *fire*, soothe the liver, and harmonize the stomach to kill pain.

Indications Gastric and hypochondriac pain, bitter taste in the mouth, gastric discomfort with acid regurgitation and dislike of hot drinks due to invasion of the stomach by *liver-fire*.

Usage and dosage 2-4 capsules, twice a day; taken after meals. 15 days making a course of treatment.

Strength 0.35 g per capsule

Storage Preserve in tightly closed containers.

Zuojin Wan
(左金丸)

Zuojin Pills

Ingredients Rhizoma Coptidis 600 g; Fructus Evodiae 100 g.

Procedure Pulverize the above two ingredients to fine powder, sift and mix well. Make pills with water and dry.

Description Yellowish-brown watered pills; odour, characteristic; taste, bitter and pungent.

Identification (1) Microscopical: Fibre bundles bright yellow, with slightly thickened walls and distinct pits. Nonglandular hairs 2-6 celled, some lumina filled with reddish-brown contents; glandular hairs with a multicellular, elliptical head, containing brownish-yellow to brownish-red contents, and with a 2-5-celled stalk.

(2) Grind 1 g to fine powder, ultrasonicate with 10 ml of ethanol for 20 minutes, cool, filter and use the filtrate as the test solution. Prepare a solutions with 0.6 g of Rhizoma Coptidis reference drug as the reference drug solution in the same manner. Dissolve berberine hydrochloride CRS in ethanol to produce a solution containing 0.5 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of benzene, ethyl acetate, methanol, isopropanol and concentrated ammonia TS (12 : 6 : 3 : 3 : 1) as the mobile phase. Apply separately to the plate 2 μl of each of the three solutions. After developing in a chamber pre-saturated with ammonia vapour and removal of the plate, dry in air, and examine under ultraviolet light at 365 nm. The fluorescent spots in the chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatogram obtained with the reference drug solution and the reference solution.

(3) To 0.2 g of Fructus Evodiae reference drug, add 10 ml of ethanol, ultrasonicate for 20 minutes, filter, and use the filtrate as the reference drug solution. Dissolve rutaecarpine CRS in ethanol to produce a solution containing 0.2 mg per ml as the reference solution. Carry out the method for thin layer chromatography (Appendix VI B), using silica gel G as the coating substance and a mixture of cyclohexane, ethyl acetate and methanol (19 : 5 : 1) as the mobile phase. Apply separately 5 μl of the test solution obtained under Identification test (2) and 1 μl of each of the above two solutions to the plate. After developing and removal of the plate, dry in air, spray with 10% sulfuric acid in ethanol, heat at 105℃ for 5 minutes, and examine under ultraviolet light at 365 nm. The fluorescent spots in chromatogram obtained with the test solution correspond in position and colour to the spots in the chromatograms obtained with the reference drug solution and the reference solution.

Other requirements Comply with the general requirements for pills (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix VI D).

Chromatographic system and system suitability Use octadecyasilane bonded silica gel as the stationary phase and a mixture of acetonitrile and 0.05 mol/L potassium dihydrogen phosphate (pH3.0, adjusted by phosphoric acid) (25 : 75) as the mobile phase. As detector a spectrophotometer set at 350 nm. The number of theoretical plates of the column is not less than 3000, calculated with the reference to the peak of berberine hydrochloride.

Reference solution Dissolve a quantity of berberine hydrochloride CRS, accurately weighed, in a mixture of hydrochloric acid and methanol (1 : 100) to prepare a solution containing 50 μg per ml as the reference solution.

Test solution Weigh accurately 1.0 g, in fine powder, in a stopper conical flask, add accurately 100 ml of a mixture of hydrochloric acid and methanol (1 : 100), and weigh. Macerate for 1 hour and then heat under reflux for 1 hour, cool, weigh again, replenish the loss of weight with the mixture of hydrochloric acid and methanol (1 : 100), and shake well. Filter and use the successive filtrate as the test solution.

Procedure Inject accurately 10 μl of each of the reference solution and the test solution into the column, respectively, and calculate the content.

It contains not less than 31 mg of berberine hydrochloride ($C_{20}H_{18}ClNO_4$) per gram, referred to Rhizoma Coptidis.

Action To purge *fire*, soothe the liver, and harmonize the stomach to kill pain.

Indications Gastric and hypochondriac pain, bitter taste in the mouth, gastric discomfort with acid regurgitation and dislike of hot drinks due to invasion of the stomach by *liver-fire*.

Usage and dosage 3-6 g, twice a day.

Storage Preserve in tightly closed containers, protected from moisture.

Appendix Ⅰ General Requirements for Preparations

Ⅰ A Pills

Pills are spherical or spherical-like solid dosage forms made of finely powdered crude drugs or crude drug extracts, proper binders or other excipients. They are classified into honeyed pills, water-honeyed pills, watered pills, pasted pills, concentrated pills waxed pills and concentrated pills etc.

Honeyed pills are made of fine powder of crude drugs, using honey as binder. Among them, pills weighing more than 0.5 g (including 0.5 g) per pill are big honeyed pills, pills weighing less than 0.5 g per pill are small honeyed pills.

Water-honeyed pills are made of fine powder of crude drugs, using honey and water as binders.

Watered pills are made of fine powder of crude drugs, using water (or yellow rice wine, vinegar, dilute medicinal juice, dilute syrup) as binder.

Pasted pills are made of fine powder of crude drugs, using rice powder rice-paste or flour-paste as binder.

Waxed pills are made of fine powder of crude drugs, using beeswax as binder.

Concentrated pills are made of condensed extract of crude drugs or partial crude drugs, mixing with appropriate excipient or fine powder of other crude drugs, using water, honey or honey and water as binders. They may be classified into concentrated watered pills, concentrated honeyed pills and concentrated water-honeyed pills based upon the different binders used in the production.

The production and storage of pills should comply with the following requirements.

1. The powdered drugs for preparing pills are fine or very fine powders, unless specified otherwise.

2. The honey used for honeyed pills production should be processed before using. According to the degree of processing, it can be divided into primary processed honey, secondary processed and tertiary processed honey, which may be selected and used to prepare honeyed pills, depending on the climate and the varieties of honeyed pills. In preparing big and small honeyed pills by rubbing method, the processed honey should be added to the drug powder while hot and mixed well, unless specified otherwise. If resin, gum and volatile drugs are contained in the formulation, the processed honey should be added at about 60℃; in preparing water-honeyed pills by water spray rotating method, the processed honey should be diluted with boiling water before using.

3. The extract for preparing concentrated pills should be made by extracting and concentrating according to the certain methods specified under the monograph.

4. Unless specified otherwise, water-honeyed pills, watered pills or concentrated water-honeyed pills, concentrated watered pills should be dried at a temperature below 80℃; pills containing large amount of volatile constituents or starch (including pasted pills) should be dried at a temperature below 60℃. Thermolabile pills should be dried with other proper methods.

5. Beewax used for producing waxed pills complies with the requirements specified under individual monograph in this pharmacopoeia. In preparing melt beewax by heating, then allow to cool to 60℃ and add drug powders proportionally, mix thoroughly and prepare the waxed pills using the kneading method while the temperature is maintained.

6. For pills need to be coated and polished, coat with the coating materials and polish as specified under individual monograph.

7. Pills should be round, integrate and uniform in appearance and colour. Big and small honeyed pills should appear fine, smooth and oily-moistened, with proper hardness. Waxed pills should be smooth in apperance without crack, and no drops or granules found inside the pills the pills.

8. Unless specified otherwise, Pills should be preserved in tightly closed containers and waxed pills, in tightly closed containers and stored in a dry place.

Following relevant tests should be carried out for pills.

Determination of water Carry out the method for the determination of water in general (Appendix Ⅸ H). Unless specified otherwise, big honeyed pills, small honeyed pills and concentrated honeyed pills contain not more than 15.0% of water, water-honeyed pills, concentrated water-honeyed pills not more than 12.0 per cent, watered pills, pasted pills and concentrated watered pills not more than 9.0 per cent. No determination of water is required for waxed pills.

Weight variation Unless specified otherwise Pills to be taken in pill are examined by Method 1 and pills to be taken by weight examined by Method 2.

Method 1 Take the largest number of pills in single dosage as one part (1 pill as one part for pills weighing 1.5 g or more than 1.5 g per pill; 10 pills as one part for pills weighing more than 0.015 g per pill and with the largest number of pills in single dosage is above 10, or pills weighing 0.015 g or less than 0.015 g per pill and with the largest number of pills in single dosage is not up to 10). Weigh separately 10 parts and compare with the labelled total weight (labelled weight of each pill × the number of pills weighed) or labelled single weight (if no labelled weight is stated, compare the weight of each pill with the average weight calculated) According to the requirements stated in Table 1. Not more than 2 parts exceed the limit of weight variation and none doubles the limit of weight variation.

Table 1

Labelled total or single weight (average weight)	Weight variation limit
0.05 g or less	±12%
more than 0.05 g to 0.1 g	±11%
more than 0.1 g to 0.3 g	±10%

continue

Labelled total or single weight (average weight)	Weight variation limit
more than 0. 3 g to 1. 5 g	± 9%
more than 1. 5 g to 3 g	± 8%
more than 3 g to 6 g	± 7%
more than 6 g to 9 g	± 6%
more than 9 g	± 5%

Method 2 Take 10 pills as one part, weigh separately 10 parts, compare with the labelled weight of each part (if no labelled weight is stated, compart the weight of each pill with the average weight calculated). According to the requirements stated in Table 2. Not more than 2 parts exceed the weight variation limit and none doubles the limit.

Table 2

Labelled or Average weight of each part	Weight variation limit
0. 05 g or less	±12%
more than 0. 05 g to 0. 1 g	±11%
more than 0. 1 g to 0. 3 g	±10%
more than 0. 3 g to 1 g	± 8%
more than 1 g to 2 g	± 7%
more than 2 g	± 6%

Weight variation of sugar-coated pills should be examined before coating, pills are not to be coated until the weight variation of the pill cores complies with the requirements. The weight variation of pills is no longer examined after sugar-coating, other coated pills should be examined the weight variation after coating and comply with the requirements; The weight variation is no longer examined for the single dose packed pills, which have been examined according to the filling variation standards.

Filling variation The Filling variation of pills presented in single dose pack should comply with the following requirements.

Table 3

Labelled weight of each pack	Weight variation limit
0. 5 g or less	±12%
more than 0. 5 g to 1 g	±11%
more than 1 g to 2 g	±10%
more than 2 g to 3 g	± 8%
more than 3 g to 6 g	± 6%
more than 6 g to 9 g	± 5%
more than 9 g	± 4%

Procedure Take ten packs (or vials) of pills and weigh separately the content of each pack (or vial), compare with the labelled weight. According to the requirement stated in Table 3. Not more than 2 packs exceed the weight variation limit and none doubles the limit.

Filling The Filling variation of multiple doses packed pills of which filling is labelled in weight should comply with the test for Minimum Fill (Appendix XII C).

Disintegration test Unless specified other wise, Take 6 pills, select a basket with proper porosity of sieve (for pills with the diameter of less than 2. 5 mm, 2. 5-3. 5 mm or more than 3. 5 mm, using sieves with pores of 0. 42 mm, 1. 0 mm or 2. 0 mm in diameter respectively). Carry out the test as described under the disintegration test (Appendix XII A) for tablets, using disk. Unless specified otherwise, Small honeyed pills, water-honeyed pills and watered pills should be completely disintegrated within 1 hour, concentrated pills and pasted pills within 2 hours. During procedure, If pills adhere to the disk, thus hindering the determination, take another 6 pills and carry out the determination as described under the disintegration of tablets without disk, pills should be completely disintegrated within the specified time.
In the determination mentioned above, all the pills should pass through the sieve within the specified time. If there are minute granulated masses which cannot pass the sieve but soften without hard core, should be considered to comply with the requirements.
Waxed pills should comply with the requirements stated in monograph for Determination of Disintegration (Appendix XII A) for enteric-coated tablets.
No disintegration test is required for big honeyed pills.

Microbial limit test Comply with the requirements stated under Microbial Limit Test (Appendix XIII C).

I B Powders

Powders may be defined as mixtures of pulverized crude drugs or extract of crude drugs which are used for oral administration or external application.
The production and storage of powders should comply with the following requirements.

1. The crude drugs or extract of crude drugs for powders production should be comminuted. Unless specified otherwise, Powders of fine grade are employed for oral administration, and powders of very fine grade, for paediatrics and external application.

2. Powders should be dry, loose, well mixed and uniform in appearance and colour. When preparing powders containing poisonous, or precious drugs, they should be prepared by a compounding and grinding method of isochoric increase by degrees, mixed well and sieved.

3. Tools for separating dosage should be enclosed in powders presented in multiple doses pack; Powders for oral administration containing poisonous drugs should be packed in single dose.

4. Unless specified otherwise, Powders should be stored in well closed containers. Powders containing volatile or moisture-absorbing drugs should be stored in tightly closed containers.
Follwing relevant tests should be carried out for powders.

Particle size Powders used for burn or severe trauma should comply with the following test.

Procedure Carry out the method for the determination of particle size in general (Appendix XI B, method 2, single particle size-sieve method), unless specified otherwise, the weight of the powders passing through a sieve No. 6 should not be less than that of 95 per cent of the powders examined.

Uniformity in appearance Spread evenly a sufficient quantity of powders in an area of about 5 cm^2 on a piece of smooth paper, press the surface to be even, observe the powder under a bright light. It should be uniform in colouration without discolourations and stains.

Determination of water Carry out the method for the determination of water in general (Appendix IX H). The powders contain not more than 9. 0 per cent of water, unless specified otherwise.

Filling variation Filling variation limit for powders presented in single dose should comply with the requirements stated in the table below.

Labelled weight per pack (or vial)	Weight variation limit
0.1 g to 0.1 g or less	±15%
more than 0.1 g to 0.5 g	±10%
more than 0.5 g to 1.5 g	± 8%
more than 1.5 g to 6 g	± 7%
more than 6 g	± 5%

Procedure Weigh accurately each of ten packs (or vials) of powders and compare the weight of the content of each with the labelled weight. According to the requirements stated in the table, not more than 2 packs should exceed the packing variation limit and none should double the packing variation limit.

Filling Filling variation for powders presented in multiple doses should comply with the test for Minimum Fill (Appendix XII C).

Sterility Powders used for burn or severe trauma should comply with the Test for Sterility (Appendix XIII B).

Microbial limit test Unless otherwise specified, Comply with the requirements stated under Microbial Limit Test (Appendix XIII C).

I C Granules

Granules are soluble, suspensible or effervescent preparations in granular form with certain particle size made from drug extracts or finely powdered drug and suitable excipients.
The production and storage of medicinal granules should comply with the following requirements.

1. Unless specified otherwise, the crude drugs should be processed by extraction, purification and concentration to form a thin extract with a required relative density as described under individual monograph, dried by the appropriate methods, and pulverized to fine powder particles, added with a quantity of excipients or finely powdered crude drugs, well mixed and granulate. Also, a quantity of excipients or finely powdered crude drugs may be added into the thin extracts, well mixed and granulated. The amount of excipients added should be controlled, which is not more than 2 times of that of the dried extracts, or not more than 5 times of that of the thin extracts in general.

2. The volatile oil should be sprayed evenly upon dried granules, stored in well closed containers for the required time, or be added after being wrapped in β-cyclodextrin, unless specified otherwise.

3. Correctives and flavoring agents may be added in preparation of granules; Granules may also be film-coated to prevent moisture absorption, or cover up unpleasant odour. If necessary, solvent residues should be examined for film-coated granules.

4. Medicinal granules should be dry, uniform in appearance and colour, without moisture absorption, agglomeration, deliquescence and so on.

5. Medicinal granules should be stored in tightly closed containers, and in a dry place to prevent moisture absorption, unless specified otherwise.
Following relevant tests should be carried out for granules.

Particle size Unless specified otherwise. Carry out the method for the Determination of Particle Size (Appendix XI B method 2, double particle size-sieve method), The total which cannot pass through sieve No. 1 and pass through sieve No. 5 are not more than 15 per cent of granules examined.

Determination of water Carry out the method for the determination of water (Appendix IX H). The medicinal granules contain not more than 6.0 per cent of water, unless specified otherwise.

Determination of dispersibility To 1 pack (10 g for granules in multiple doses pack) of medicinal granules, add 200 ml of hot water, stir for 5 minutes, observe immediately, granules should be completely dissolved or in suspension. Solube granules should be dissolved completely and slight turbidity is allowed; suspensible granules should be suspended uniformly.

effervescent granules To 1 pack of effervescent granules, put in the beaker filled with 200 ml of water at the temperature between 15℃ and 25℃. Granules should produce bubbles and be in effervescent state immediately, and be dispersed or dissolved in water completely in 5 minutes.
Examined by the methods above, granules should show no burned charrings etc.

Filling variation The Filling variation limit of single dose package of medicinal granules should comply with the following requirements.

Labelled weight per pack	Filling variation limit
1.0 g or less	±10%
more than 1 g to 1.5 g	± 8%
more than 1.5 g to 6 g	± 7%
more than 6 g	± 5%

Procedure Take 10 packs of medicinal granules, and weigh individual content of each pack. Compare the calculated weight of each pack with the labelled amount, according to the requirements stated in the table. Not more than 2 packs in filling variation exceed the filling variation limit and none doubles the limit.

Filling Granules presented in multiple doses should comply with the test for Minimum Fill (Appendix XII C).

Microbial limit test Comply with the requirements stated under Microbial Limit Tests (Appendix XIII C).

I D Tablets

Tablets are solid preparations of laminal or various shapes compressed to extracts of crude drugs, extracts of crude drugs with finely powdered crude drugs, or finely powdered crude drugs with suitable excipients, including extract tablets, semi-extract tablets and powdered crude drug tablets.
The production and storage of tablets should comply with the following requirements.
Tablets are mainly ordinary tablets for oral administration, there are other tablets such as buccal tablets, chewable tablets, effervescent tablets vaginal tablets, vaginal effervescent tablets, enteric coated-tablets and so on.
Buccal tablets are tablets staying in oral cavity, of which medicaments dissolve slowly and take effects.

Chewable tablets are tablets swallowing down after being chewed or sucked to dissolve in oral cavity.
Effervescent tablets are tablets containing sodium bicarbonate and organic acid, which can produce bubbles and be in effervescent state once meet with water.
Vaginal tablets and vaginal effervescent tablets are tablets for vaginal cavity use.
Enteric-coated tablets are tablets coated with enteric coating materials.

1. The medicinal powders (extracts) for tableting should be mixed with the excipients thoroughly. Tablets containing medicaments toxic in nature or those administered in small dosage should be dispersed uniformly in a way appropriate for the substance concerned.

2. Tablets containing volatile or thermolabile substances are processed in a way to avoid loss on heating.

3. The moisture content of the granules should be controlled under the processing requirement before tableting, thus to prevent mould contamination, deterioration during storage.

4. If necessary, additives such as correctauts, flavoring agents, colouring agents etc. May be added in the preparation of tablets.

5. In order to increase the stability, cover up the unpleasant odour and taste or improve the appearance etc., tablets may be coated with sugar or film. Tablets for oral administration are enteric coated so as to avoid the gastric fluid's destroy, the irritation to the gastric mucosa, thus to obtain a late release in the intestine. If necessary, solvent residues should be examined for film-coated tablets.

6. Tablets should have a clean, smooth and uniformly coloured surface; they are sufficiently hard to withstand handling without abrasion or cracking.

7. Unless otherwise specified, tablets should be preserved in tightly closed containers.
Following relevant tests should be carried out for tablets.

Weight variation Tablets should comply with the following requirements.

labelled or Average weight	Weight variation limit
Less than 0.3 g	± 7.5%
0.3 g or more	± 5%

Procedure Weigh accurately 20 tablets and calculate the average weight, then weigh individually each of the 20 tablets. Compare the weight of each tablet with the labelled tablet weight (if no labelled weight is stated, compare the weight of each tablet with the average weight calculated). According to the requirements stated in the table, not more than 2 of the individual weights exceed the weight variation limit and none doubles the limit.
Sugar coated tablets should be tested before sugar coating to show that the tablet cores comply with the requirements. Tablets need not be tested again after sugar coating, unless specified otherwise, other coated tablets should be tested after coating and comply with the requirements.

Disintegration Unless specified otherwise, Carry out the test as described under the disintegration test (Appendix XII A). All the tablets should comply with the specified requirements.
Vaginal tablets should comply with the requiremeats under Disintegration Test for Suppositories and Vaginal Tablets (Appendix XII B).
No disintegration test is required for buccal tablets and chewable tablets.

Foaming capacity Vaginal effervescent tablets should comply with the following test.

Assay Unless specified otherwise, take 10 25 ml-graduated test tubes with piston, add accurately 2 ml of water individually, put in the water bath with the temperature of 37℃±1℃ for 5 minutes. Put a piece of tablet in each tube, seal up with the piston. Observe the volume of the largest amount of foam. Average volume should not be less than 6 ml, the tablets less than 4 should not be more than 2.

Microbial limit test Comply with the requirements under Microbial Limit Tests (Appendix XIII C).

I E Troches

Troches are solid preparations of various shapes made from fine powders of crude drugs and suitable binders (or using the binding property of crude drugs themselves).
The production and storage of troches should comply with the following requirements.

1. The honey, powder of glutinous rice etc. used for troches should be treated by the specified methods.

2. Troches should be prepared with binders or the binding property of crude drugs themselves as described under individual monograph and formed by a moulding or a kneading method, then renovated and dried in the shade. Torches may also be prepared by water spray rotating method.

3. Troches may be coated or polished, if necessary, using the coating materials stated under the individual monograph of the preparation.

4. Troches should be neat, smooth, uniform in colour with no wrinkle, breach, gap, cavity and change in form.

5. Troches should be preserved in well closed containers and stored in a cool and dry place unless specified otherwise.
Following relevant tests should be carried out for troches.

Weight variation Unless specified otherwise, weight variation for troches complies with the test for Weight variation stated under Pills.

Microbial limit test Comply with the requirements stated under Microbial Limit Tests (Appendix XIII C).

I F Concentrated Decoctions

Concentrated decoctions are semifluid preparations prepared by decocting the crude drugs in water, concentrating the decoction and adding honey or sugar. (or invertsugar)
The production and storage of concentrated decoctions should comply with the following requirements.

1. The crude drugs should be decocted according to the appropriate methods for individual species and filtered. The thin extract is obtained by concentrating the filtrate to a specified relative density.

2. Unless specified otherwise, the fine powder of crude drugs should be added when the powder is needed as required.

3. The thin extract is concentrated by adding specified quantity of processed honey or sugar (or invert sugar). The fine powder of crude drugs should be added into a cold concentrated decoction, stirred and mixed well. The

quantity of honey or sugar (or invert sugar) added is generally not more than 3 times of that of the thin extract, unless specified otherwise.

4. Concentrated decoctions should have no burnt or other abnormal odour, and produce no sugar crystal out.

5. Concentrated decoctions should be preserved in tightly closed containers, stored in a cool place, unless specified otherwise.

Following relevent tests should be carried out for concentrated decoctions.

Relative density Unless specified otherwise, Weigh accurately a sufficient quantity of concentrated decoction being examined, dilute with double quantities of water, weigh accurately and mix well. Carry out the determination of relative density (Appendix Ⅶ A), calculate by the following formula. Should comply with the requirements under individual monograph.

$$\text{Relative density of concentrated decoction} = \frac{W_1 - W_1 \times f}{W_2 - W_2 \times f}$$

Where W_1 is the weight (g) of concentrated decoction in pycnometer;

W_2 is the weight (g) of water in pycnometer.

$$f = \frac{\text{weight of water added in concentrated decoction}}{\text{weight of concentrated decoction} + \text{weight of water added in concentrated decoction}}$$

It is not necessary to examine the relative density when the concentrated decoctions contain fine powder of crude drugs.

Insoluble materials To 5 g of the concentrated decoction add 200 ml of hot water, stir to dissolve, allow to stand for 3 minutes, and observe. No foreign matters such as scorched masses, etc. should be observed (a small amount of fine fibres and particles are not defined in this limit).

The concentrated decoction containing fine powder of crude drugs should be examined before the powder is added. The powder is added if it complies with the requirements. It is not necessary to examine the insoluble materials after the powder is added.

Filling Carry out the test for Minimum Fill (Appendix Ⅻ C), it should comply with the specified requirement.

Microbial limit test Comply with the requirements stated under Microbial Limit Tests (Appendix Ⅻ C).

Ⅰ G Glues

Glues are solid lump preparations intended for internal administration, prepared by decocting animal skin, bone, shell or born with water, concentrating into thick gelatinous mass and then drying.

The production and storage of glues should comply with the following requirements.

1. Soak and rinse the raw materials for the preparation of glues in water, remove foreign matters or non medicinal parts, cut into small lumps or saw into small pieces, then wash clean.

2. Decoct with water for several times until the decoction becomes light, combine the decoctions, allow to stand, filter and concentrate the filtrate. The concentrated gelatinous liquid should be able to coagulate under normal temperature.

3. Before the glues begin to coagulate, add a suitable amount of excipients (yellow rice wine, crystal sugar, edible vegetable oil, etc.), according to the requirements for processing specified in individual monograph.

4. After the glues coagulate, cut into lumps by weight as required and dry in the shade.

5. Glues should be translucent, uniform in appearance and colour, without abnormal odour.

6. In general, total ash, heavy metals, arsenic salts etc. should be determined.

7. Glues should be preserved in well closed containers and protected from moisture.

Following relevant tests should be carried out for glues.

Determination of water Put 1 g of gules into the flat weighing bottle, weigh accurately, add 2 ml of water, then heat it in the water bath to dissolve it, and then dry it. Make sure the thickness is not more than 2 mm. Carry out the method for the determination of water (Appendix Ⅸ H, method 1), the glues contain not more than 15.0 per cent of water.

Microbial limit test Comply with the requirements stated under Microbial Limit Test (Appendix Ⅻ C).

Ⅰ H Syrups

Syrups are concentrated aqueous solutions of sucrose containing extracts of crude drugs.

The production and storage of syrups should comply with the following requirements.

1. Syrups should contain not less than 45 per cent (g/ml) of sucrose.

2. The crude drugs should be extracted, purified and concentrated to a certain volume using the appropriate methods specified under the individual monograph, or drugs are dissolved with freshly boiled water, and then added with simple syrup.

If syrups are prepared with solid sucrose, water is added and boiled and filtered, a suitable amount of freshly boiled water may be added to the filtrate to comply with the labelled amount of drugs described in individual monograph, then mixed well.

3. Suitable additives may be added to syrups. If preservatives are needed, the amount of sorbic acid and benzoic acid should not be more than 0.3% (its potassium or sodium salt should be taken by the acid amount), or the amount of *p*-hydroxybenzoic acid esters, not more than 0.05%.

If other additives are added, the varieties and amount used should comply with the requirements involved in national standards and do not interfere with stability and testing of the preparation concerned. Suitable amount of ethanol, glycerin or other poly-alcohols may be added if necessary.

4. Syrups should be clean, unless specified otherwise. No mold contamination, rancid, gas or other deteriorations are allowed during storage. A small amount of dispersible precipitates are allowed.

5. In general, relative density, pH value etc. should be determined.

6. Syrups should be preserved in tightly closed containers. Stored in a cool place, unless specified otherwise.

Following relevant tests should be carried out for syrups.

Filling Syrups packed in a single dose should comply with the following test.

Procedure Take 5 bottles of syrup, pour the content separately to the calibrated dry graduated cylinders, remove as completely as possible examine at room temperature. Compare the filling volume of each pack with the labelled amount. Not more than 1 bottle in volume is less than the labelled amount, none is less than 95 per cent of the labelled amount.

Syrups packed in multiple doses comply with the requirements stated in Minimum Fill (Appendix XII C).

Microbial limit test Comply with the requirements stated under Microbial Limit Tests (Appendix XIII C).

I I Cataplasms

Cataplasms are sheet preparations made of extract of crude drugs, crude drugs or (and) chemical medicaments and appropriate bases, intended for application to skin, may produce local or general effects, including adhesive plasters, babu plasters and sticking plasters etc..

Adhesive plasters are cataplasms prepared by mixing the extract of crude drugs or (and) chemical medicaments with bases to the backing materials. The preparation methods of this agent consist of solvents method and hot-pressing method. The commonly used solvents consist of gasoline, *n*-hexane, and commonly used bases consist of rubber, hot-plastic rubber, rosin, rosin derivatives, vaselin, lanoline and zine oxide etc.. Other appropriate solvents and bases are applicable. Consist of ethylene/vinyl acetate copolymer, silicone rubber and polyethylene glycol etc.

Babu plasters are cataplasms prepared by well mixing the extract of crude drugs, crude drugs or (and) chemical medicaments with appropriate hydrophilic bases, then spreading to the backing materials. The commonly used bases consist of sodium carboxymethylcellcdose, gelatin, glyce-rine, microniting silica gel and so on.

Sticking plasters are lamelliform cataplasms made of extract of crude drags or (and) chemical medicaments, and appropriate macromolecular materials mainly composed of backing liner, drug-veserving liner, sticking liner and anti-sticking liner. The commonly used bases consist of ethylene/vinyl acetate copolymer, silicone rubber, and polyethylene glycol etc..

The commonly used backing materials for cataplasms consist of calico, non-weaving cloth, paper and so on; commonly used covering materials consist of anti-sticking paper, plastic film, aluminum foil, polyethylene compound film, hard gauze and so on.

Production and storage of cataplasms should comply with the following requirements.

1. The extracts of crude drugs are produced using the methods stated under individual monographs. Unless specified otherwise, solid medicament should be finely powdered previously or dissolved in a suitable solvent.

2. Transderme promoting agents, surfactants, stabiliyers, hygroscopic agents, preservatives, antioxidants may be added in cataplasms, if necessary.

3. The plasters of cataplasms should be spreaded uniformly, the surface should be smooth and clean, uniform in colour, not unglued and unviscous; Backing liner should be smooth and clean, no plaster leaked. When organic solvents are used in spreading, solvent residues should be examined if necessary.

4. The length and width of each piece of a cataplasm, measured by the mid-line, are not less than those labelled.

5. Unless specified otherwise, Cataplasms should be preserved in tightly closed containers.

Following relevant tests should be carried out for cataplasms.

Extractives in plaster mass Adhesive plasters are tested by method 1, babu plasters by method 2.

Method 1 Take 2 pieces of cataplasm (take 35 cm^2 for the cataplasms larger than 35 cm^2 in area), remove the covering liner, weigh accurately and put into a terrarium with cover, macerate in suitable quantity of organic solvent (chloroform, aether etc.) and shake over and again until cataplasm separates from the cloth. Take out the cloth and wash with above solvents until no cataplasm remains on it. Remove the solvent and dry the cloth at the temperature of 105℃ for 30 minutes, transfer the cloth to the desiccator. After cooling for 30 minutes, weigh accurately, the cloth. The difference between the weighings is the weight of cataplasm. Calculate the weight per 100 cm^2 of the cataplasm by the labelled area. The result should comply with the requirement specified in individual monograph.

Method 2 Take one piece of cataplasm, remove the covering liner, weigh accurately and put into a beaker, add suitable quantity of water and heat to boil until cataplasm separates from the liner cloth. Take out the cloth, Wash the cloth with water until no cataplasm remains on cloth. Allow to stand to dry, then put the cloth into an oven with a temperature of 105℃ for 30 minutes, transfer the cloth to a desiccator. After cooling for 30 minutes, weigh accurately the cloth. The difference between the weighings is the weight of cataplasm. Calculate the weight per 100 cm^2 of the cataplasm by the labelled area. The result should comply with the requirement specified in individual monograph.

Heat-resistance Adhesive plasters should be tested for heat-resistance.

Procedure Unless specified otherwise, take 2 pieces of cataplasm, remove the covering liner, heat at the temperature of 60℃ for 2 hours, after cooling, the back of cataplasm should be. no oily; the surface of the cataplasm should have patina and still be viscous when touch it with finger.

Excipient property Excipient property should be tested for babu plasters.

Assay Place one piece of cataplasm into the constant T & H chamber with a temperature of 37℃ and a relative humidity of 64% for 30 minutes, then take out the piece and fix it to a smooth steel plane using a clip, the steel plane is placed at an angle of 60° with the horizontal plane, allow to stand for 24 hours. No moving of the adhesive side occurs.

Adhesive property Unless specified otherwise, babu plasters should comply with the requirements stated under Determination of Cataplasms Adhesion (Appendix XII E, method 1), adhesive plasters should comply with the requirements stated under Determination of Cataplasms Adhesion (Appendix XII E, method 2), sticking plasters should comply with the requirements stated under Determination of Cataplasms Adhesion (Appendix XII E, method 2, 3).

Weight variation Cataplasms should be examined the weight variation and comply with the requirements.

Assay Unless specified otherwise, weigh accurately 20 pieces of cataplasm, and calculate the average weight, then weigh separately each piece of the cataplasm, compare with the average weight. Not more than 2 of the individual weights exceed ±5% of the average weight and none doubles

the limit.

Microbial limit test Unless specified otherwise, comply with the requirements stated under Microbial Limit Test (Appendix Ⅷ C).

Ⅰ J Mixtures

Mixtures are liquid preparations intended for oral administration, prepared by extracting the crude drugs with water or other solvents in suitable ways (package of a single dose is also known as "oral liquids").
The production and storage of mixtures should comply with the following requirements.

1. The drugs should be extracted, purified and concentrated to a certain volume by the methods as described under individual monograph. Unless specified otherwise The volatile ingredients in crude drugs should be extracted at first, then the remaining crude drugs decocted with the other drugs together.

2. Suitable additives may be added to mixtures. If preservatives are needed, the amount of sorbic acid and benzoic acid should not be more than 0.3% (its potassium or sodium salt should be taken by the acid amount), or the amount of p-hydroxybenzoic acid esters, not more than 0.05 per cent. If another additives are added, The variety and quantity to be used should comply with the requirements of the national standard, and not affect the stability and interfere with the tests for mixtures. If necessary, mixtures could also contain a proper quantity of alcohol.

3. If sucrose is used as an additive in mixtures, unless specified otherwise the content of it is not more than 20 per cent (g/g).

4. Unless specified otherwise, mixtures should be clear, show no evidence of mold contamination, rancidity, foreign matters, colour changing, gas or other deterioration during storage, but a small amount of dispelsible precipitates are allowed.

5. In general, relative density and pH value etc. should be determined.

6. Mixtures should be preserved in tightly closed containers and stored in a cool place, unless specified otherwise.
Following relevant test should be carried out for mixtures.

Filling variation For mixtures packed in a single dose should comply with the following test.

Assay Take 5 bottles of a mixture, pour the content separately to the calibrated dry graduated cylinders, examine at room temperature. Compare the filling volume of each pack with the labelled amount, not more than 1 bottle is less than the labelled amount, none is less than 95 per cent of the labelled amount.
Mixtures filled in multiple dose should comply with the requirements stated in Minimum Fill (Appendix Ⅻ C).

Microbial limit test Comply with the requirements stated under Microbial Limit Tests (Appendix Ⅷ C).

Ⅰ K Dripping Pills

Dripping pills are the preparations made by dripping a uniform, melted mixture of medicaments prepared by purify and concentrating extract of crude drugs and appropriate bases into an immiscible cooling liquid and congealing to a spherical or sphare-like.
The manufacture and storage of dripping pills should comply with the following requirements.

1. Water soluble or water-insoluble bases can be used to suit for different varieties of dripping pills. Commonly used bases consist of polyethylene glycols poloxamer, polyoxy [40] stearate, gelatin and stearic acid, glycerin monosterate, hydrogenated vegetable oils and so on.

2. The cooling liquid must be innocuous and should not interact with medicaments; liquid paraffin. vegetable oil, methylsilicone oil and water are commonly used for this purpose.

3. Dripping pills should be round, integrate, uniform in colour and also well shaped without adhesion. No cooling liquid remains on the surface of dripping pills.

4. Dripping pills may be coated as required to suit for the properties of the medicaments and for the clinical usage and storage.

5. Unless specified otherwise, dripping pills should be kept in tightly closed containers.
Following relevant test should be carried out for dripping pills.

Weight variation Unless specified otherwise, the limit of weight variation for dripping pills complies with the following requirements.

Average weight	Limit of weight variation	
0.03 g or less	±11%	±15%
more than 0.03 g to 0.1 g	±10%	±12%
more than 0.1 g to 0.3 g	±8%	±10%
more than 0.3 g	±7%	±7.5%

Procedure Weigh accurately the total weight of 20 dripping pills, calculate the average weight of each dripping pill. Then weigh accurately each of the 20 dripping pills. Compare the weight of each pill with the average weight. According to the requirements stated in the table, not more than 2 pills deviate outside the limit of weight variation, none deviates outside 1 fold of the limit.
The weight variation of sugar-coated dripping pills should be examined before coating. Dripping pills are not to be coated until the weight variation of their cores complies with the requirements. The test of weight variation is not required for dripping pills after sugar-coating, but it is needed for dripping pills after film-coating and should comply with the specified requirements.

Disintegration test Carry out the test as described under disintegration test (Appendix Ⅺ A), it should comply with the specified requirements, unless otherwise specified.

Microbial limit test Comply with the requirements stated under Microbial Limit Tests (Appendix Ⅷ C).

Ⅰ L Capsules

Capsules are preparations made by mixing crude drugs processed by suitable methods and appropriate excipients, enclosing in capsule shell or sealing in soft capsule. Capsules are classified into hard, soft or enteric shells, mainly for oral administration.

Hard capsules Consist of crude drug extracts, crude drug extracts with fine powders of crude drugs, fine powders of crude drugs or any of the above with appropriate excipients, usually in uniform powder, mini granules, mini pills, semisdids or liquids, enclosed in a capsule shell.

Soft capsules Prepared by drip-feed or compression method. The extracts of crude drugs, liquid medicaments or any of above well mixed with appropriate excipients are sealed in soft capsules.

Enteric capsules Enteric capsules are capsules that are insoluble in gastric fluid, but can disintegrate or release the active substance in intestinal fluid.
The production and storage of capsules should comply with the following requirements.

1. Crude drugs should be made into the contents of capsules as specified in the individual monograph and may not result in neither deformation of shells nor in deterioration.

2. Potent medicaments given in small doses are usually mixed thoroughly with suitable diluents before filling.

3. Capsules should have a clean, smooth surface and well shaped without adhesion, deformation leakage, breakage or foreign odour.

4. Capsules should be preserved in tightly closed container, unless specified otherwise.
Following relevant tests should be carried out for capsules.

Water determination Water determination for hard capsules is required the water content in the contents of hard capsule, is determined by the methods described in Determination of Water (Appendix Ⅸ H). Unless otherwise specified, the water content is not more than 9.0 per cent. Water determination is not required while the contents of hard capsule are liquids or semisolids.

Filling variation Unless specified otherwise, weigh accurately 10 capsules respectively, remove the content as completely as possible (no loss of capsule shell). For hard capsule. clean the shell with a small brush or other appropriate tools; for soft capsule or hard capsule containing liquids or semisolids, wash the shell with ether or other easily volatile solvents and allow to ventilate until the odour of the solvents is no longer perceptible. Weigh accurately the shell of each capsule. The difference between the weights represents the filling of each capsule. Compare the filling of each capsule with the labelled filling (if no labelled filling is stated, compare the filling of each capsule with the average filling calculated). The filling variation limit should be within ±10%. No more than two of the individual filling deviate outside the limit and none deviates outside 1 fold of the limit.

Disintegration test Carry out the test as described under Determination of Disintegration (Appendix Ⅻ A), it should comply with the specified requirements, unless otherwise specified.

Microbial limit test Comply with the requirements stated under Microbial Limit Tests (Appendix ⅩⅢ C).

I M Medicinal Wines

Medicinal wines are clear liquid preparations prepared by maceration and extraction of crude drugs with distilled wine.
The production and storage of medicinal wines should comply with the following requirements.

1. Generally, the crude drugs for producing medicinal wines should be properly processed into slices, sections, pieces, slivers or coarse powders.

2. Medicinal wines used for oral administration should be prepared with wines made from grains.

3. Medicinal wines may be prepared by maceration, percolation or other suitable methods. The concentration and quantity of distilled wine, temperature and duration for maceration, speed of percolation, should comply with the requirements for preparation described under individual monograph.

4. Medicinal wines may be flavoured by adding a sufficient quantity of sugar or honey as required.

5. Medicinal wines being prepared should be allowed to stand for clarifying then filtered and packed in clean containers. A small amount of dispersibe precipitates during storage are allowed.

6. Ethanol content should be generally determined for medicinal wines.

7. Unless specified otherwise, medicinal wines should be preserved in tightly closed containers and stored in a cool place.
Following relevant tests should be carried out for medicinal wines.

Total solids Determination of total solids in medicinal wines is generally required. Medicinal wines containing sugar or honey should be examined by method 1, sugar or honey free medicinal wines should be examined by method 2.

Method 1 Transfer accurately 50 ml of the clear medicinal wine to an evaporable dish and evaporate to a thick extract on a water bath. Unless specified otherwise, extract the residue with 4 quantities, each of 10 ml, of dehydrated ethanol with stirring, and filter. Combine the filtrates to another evaporating dish which have been dried to a constant weight and evaporate nearly to dryness on a water bath, add accurately 1 g of diatomite (dry at 105℃ for 3 hours and cooled in a desiccator for 30 min), stir thoroughly, dry at 105℃ for 3 hours, cool the dish in a desiccator for 30 min, and weigh immediately. Deduct the weight of diatomite added, the weight of residue should comply with the requirements stated under the individual monograph.

Method 2 Transfer accurately 50 ml of the clear medicinal wine to an evaporable dish which have been dried to a constant weight and evaporate to dryness on a water bath, then dry at 105℃ for 3 hours. After cooling the dish containing the residue in a desiccator for 30 min, weigh it immediately. The weight of residue should comply with the requirements stated under the individual monograph.

Determination of methanol Comply with the Determination of Methanol (Appendix Ⅸ T).

Filling Comply with the test for Minimum Fill (Appendix Ⅻ C).

Microbial limit test Carried out the Microbial Limit Tests (Appendix ⅩⅢ C), the number of bacteria should not exceed 500 per ml, the number of mildew and microzyme should not exceed 100 per ml, no Escherichia coli should befound.

I N Tinctures

Tinctures are clear liquid preparations of medicinal substances macerated or dissolved in ethanol of specified

concentration or made by diluting the liquid extracts, extended for oral administration or external application.
The production and storage of tinctures should comply with the following requirements.

1. Unless specified otherwise, tinctures containing poisonous drugs are generally equivalent to 10 g of the drug in 100 ml of the tincture; the active ingredients of a tincture containing poisonous drugs may be determined by an assay of its intermediate product and then the potency adjusted to produce a finished product that complies with the requirements stated in the individual monograph; most of other tinctures represent 20 g of the drug in 100 ml of the tincture.

2. Tinctures may be prepared by dissolution, dilution, maceration or percolation.

(1) *Dissolution or dilution* Dissolve a quantity of drug powder or liquid extracts with a quantity of ethanol with specified concentration, allow to stand, filter if necessary.

(2) *Maceration* Macerate the properly powdered crude drugs with a quantity of solvent in a stoppered container for 3-5 days or a specified time, stirring or shaking occasionally. Separate out the supernatant liquid, and add a quantity of the solvent to the residue, and continue the maceration in the same way until the active ingredients are completely extracted. Combine the extracts and add solvent to volume as required, allow to stand for 24 hours and filter.

(3) *Percolation* Percolate with a quantity of solvent as described under Liquid Extracts and Extracts (Appendix Ⅰ O) until required quantity of the percolate is obtained, allow to stand and filter.

3. Ethanol content should be generally determined for tinctures.

4. Precipitates produced on prolonged standing of the tincture may be removed by filtration provided that the content of active ingredients and ethanol still comply with the requirements stated in the monograph.

5. Tinctures should be preserved in light-resistant, tightly closed containers and store in a cool place, unless specified otherwise.
Following relevant tests should be carried out for tinetures.

Filling Comply with the test for Minimum Fill (Appendix Ⅻ C).

Microbial limit test Comply with the requirements stated under Microbial Limit Tests (Appendix ⅩⅢ C).

Ⅰ O Liquid Extracts and Extracts

Liquid extracts or extracts are preparations made by soaking crude drugs in suitable solvents to extract the active ingredients and evaporating the solvents partially or completely to a specified concentration.
The production and storage of liquid extracts or extracts should comply with the following requirements.

1. Unless specified otherwise, 1 ml of a liquid extract is equivalent to 1 g of the crude drug concerned; 1 g of an extract is equivalent to 2-5 g of the crude drug concerned.

2. Unless specified otherwise, liquid extracts are prepared by percolation method or by the dilution of an extract with a specified solvent. Extracts are prepared by decoction or percolation method, all the extractike should be concentrated to a thick extract at a low temperature and then added with diluenting agents or further concentrated to the specified ammont. The following requirements should be observed in a percolating process.
(1) Either a cylindrical or a conical percolator may be used, depending on the nature of the crude drug.
(2) Before it is packed into the percolator, the crude drug should be pulverized properly, moistened uniformly with the specified solvent and allowed to stand in a well closed vessel for a required time.
(3) The crude drug should be packed with uniform compactness and the solvent is added to the percolator to expel most of the air in the gap of crude drug. The top of the column of crude drug should be well covered by the solvent, allow to stand for some time before the percolation takes place.
(4) The rate of percolation should comply with that specified in the individual monograph.
(5) When an amount of the initial percolate equivalent to 85% of the crude drug in the percolator has been collected, it is set aside. The rest of the percolate should be concentrated at a low temperature and the mixed products of percolation and concentration are made up to the required volume with the solvent. Allow to stand, and use the supernatant liquid as the final product for packing.

3. Ethanol content should be generally determined for liquid extracts. Precipitates produced on prolonged standing of the liquid extracts may be removed by filtration, but the content of ethanol and active ingredients comply with that specified in the monograph.

4. Unless specified otherwise, liquid extracts should be preserved in tightly closed containers, protected from light, extracts should be stored in a cool place.
Following relevant tests should be carried out for Liquid Extracts & Extracts.

Filling Comply with the test for Minimum Fill (Appendix Ⅻ C).

Microbial limit test Comply with the requirements stated under Microbial Limit Tests (Appendix ⅩⅢ C).

Ⅰ P Plasters

Plasters are preparations intended for external application to the skin, prepared by refining crude drugs, edible vegetable oil and red lead oxide or ceruse as plaster and spreading on the backing material. The former is called black plasters, the latter white plasters.
The production and storage of plasters should comply with the following requirements.

1. The drugs should be broken or cut appropriately, and fried to char as described under the individual monograph; the crude drugs which are light in texture and unbearable to frying, should be added after the other crude drugs are fried to charred yellow.
Crude drugs containing volatile substances, mineral drugs and precious drugs should be grind into fine powders and added just before spreading at a temperature not higher than 70℃.

2. Red lead oxide or ceruse used should be dry, without agglomeration because of moisture absorption.

3. The oil after frying the crude drugs should be refined to "pearl form on dropping". Add red lead oxide or ceruse and stir to mix well and spray with clean water. The plaster lumps are formed and soaked in clean water.

4. Plasters should be, greasy, delicate and bright. They should be done appropriately and spread evenly, with no, breach or gap, and they should be able to stick on the skin without moving after heated. Black plasters should be black, with no red spots; white plasters should be, with no white spots.

5. Plasters should be preserved in tightly closed containers and stored in a cool place, unless specified other wise.
Following relevant tests should be carried out for plasters.

Softening point Carry out the test for Determination of Plaster Softening Point (Appendix XII D) and should comply with the requirements stated under the individual monograph.

Weight variation Weigh separately 5 pieces of plasters, clip a unit area (cm^2) of backing material and weigh. Calculate the weight of backing material of each piece of the plaster. The weight of drugs on the plaster is calculated by subtracting the weight of backing material from the total weight of the plaster. It should comply with the limit given in the table according to the specified labelled weight.

Labelled weight	Weight variation limit
3 g or less	±10%
more than 3 g to 12 g	± 7%
more than 12 g to 30 g	± 6%
more than 30 g	± 5%

I Q Gels

Gels are semisolid or thick liquid preparations with gel-natures which are made by mixing extracts of crude drugs and suitable bases. Gels are divisible into water-soluble gels and greasing gels according to the characters of the bases used.
The production and storage of gels should comply with the following requirements.

1. Crude drugs are extracted, purified using methods directed in individual monographs to produce the intermediate products for late gels manufacture.

2. The choices for appropriate bases depend mainly on the nature of the chief crude drug. Water-soluble bases consist of water, glycerin or propylene glycol and derivatives of cellulose, carbopol, alginate, tragacanth, gelatin or starch ect; greasing bases consist of liquid paraffin and polyoxyethelene or fatty oil and silicon colloid, aluminum soaps or zinc soaps. Additives such as hygroscopic agents, preservatives, antioxidants or skin penetrants may be added if necessary.

3. Gels should be uniform, thin and smooth, stay gelations, without dryness or liquescence at normal temperature.

4. Determination of pH value is generally required.

5. No physicochemical reaction should occur between the bases and the medicaments.

6. Unless specified otherwise, gels should be preserved in well closed containers, protected from light and prevented frostbite.
Following relevant tests should be carried out for gels.

Filling Comply with the test for Minimum Fill (Appendix XII C).

Microbial limit test Comply with the requirements stated under Microbial Limit Tests (Appendix XIII C).

I R Ointments

Ointments are semi-solid preparations with a suitable consistency, usually containing extracts or fine powders of crude drugs incorporated in a suitable base, and intended for external application to the skin. The bases mainly used in preparation of ointments may be classified into greasing bases, water-soluable bases and emulsifying bases. Ointments with emulsifying bases are usually known as creams, which are classified into oil-in water creams and water-in-oil creams according to the bases used.
The production and storage of ointments should comply with the following requirements.

1. In the preparation of ointments, solid medicaments should be powdered finely before use in addition to their dissolution in or formation of an eutectic mixture with one of the ingredients.

2. Ointments should be able to apply uniformly and emolliently to the skin with no irritant action and with proper consistency.

3. Commonly used greasing bases consist of vaselin, paraffin, liquid paraffin, siloxane fluid, beeswax, stearic acid etc; water-soluble bases mainly consist of polyethylene glycols; emulsifying bases consist of sodium soaps, soaps of triethanolamine, sodium fatty alcohol sulphate (sodium dodecyl sulphate), polysorbate, lanolin, monoglycerides, fatty alcohol and so on. Hygroscopic agents, preservatives, antioxidants or skin, penetrants may be added if necessary.

4. Ointments should show no evidence of deterioration such as rancidity, discolouration, hardening melting or separation of oil and water.

5. Unless specified otherwise, ointments should be preserved in well closed containers, protected from light.
Following relevant tests should be carried out for ointments.

Particle size Unless specified otherwise, spread a proper quantity of ointments containing fine powders of crude drugs on the slide to form a thin layer, cover with coverslip. Prepare 3 pieces in all. Carry out the Determination of Particle Size (Appendix XI B, method 1), no particles larger than 180 μm in diameter should be found.

Filling Comply with the test for Minimum Fill (Appendix XII C).

Sterility Ointments used for burn or severe damage should comply with the Test for Sterility (Appendix XIII B).

Microbial limit test Comply with the requirements stated under Microbial Limit Tests (Appendix XIII C).

I S Medicinal Distillates

Medicinal distillates are the aromatic waters prepared by steam distillation of the crude drugs containing volatile constituents.
The production and storage of medicinal distillates should comply with the following requirements.

1. Crude drugs should be macerated in water for a certain time before steam distillation, distillates collected should be stored in sterilized, clean and dry containers in time.

2. Collection of distillates and procedures of filling should be carried out under circumstances with required cleanliness. Steam sterilization may also be applied after filling.

3. Suitable preservatives and correctives may be added to the medicinal distillates if necessary, the variety and quantity used should comply with the requirements stated in notional standards.

4. Medicinal distillates should be clear, and show no evidence of deterioration such as foreign matter, rancidity ect.

5. Determination of pH value is required.

6. Medicinal distillates should be preserved in tightly closed containers, stored in a cool place, unless specified otherwise.

Following relevant tests should be carried out for medicinal destillates.

Filling Comply with the test for Minimum Fill (Appendix Ⅻ C).

Microbial limit test Comply with the requirements stated under Microbial Limit Tests (Appendix Ⅻ C).

Ⅰ T Medicinal Teas

Medicinal teas are preparations intended for oral administration, which are made by mixing crude drugs or extracts (liquid extractives) of crude drugs with tea or other excipients. They consist of medicinal bea lumps, medicinal bag-packed teas and medicinal teas for decoction.

Medicinal tea lumps are classified into sugar free tea lumps and sugar containing tea lumps. Sugar free tea lumps are those prepared by compacting the coarse powder, broken pieces of crude drugs, and tea or suitable adhesive. Sugar containing tea lumps, by compacting extracts or fine powders of crude drugs and suitable excipients such as sugar and so on.

Medicinal bag-packed teas are those prepared by packing bags with tea, coarse powder of crude drugs or partial crude drugs absorbing liquid extractives and then dried. The medicinal bag-packed teas packed into drinking bags are called tea bags.

Medicinal teas for decoction are those prepared by packing bags with slices, pieces, sections, slivers or coarse powder of the crude drugs, and decocted for drinking.

The production and storage of medicinal teas should comply with the following requirements.

1. The crude drugs to be used should be processed into slices, pieces, sections, slivers or coarse powders according to the requirements, and mixed well. The liquid extractives should be sprayed evenly. Where crude drugs and extracts of crude drugs are added with suitable adhesive or excipients such as sugar etc., a uniform mixture is required.

2. Drying should be carried out at a temperature below 80℃ generally; medicinal teas containing large amount of volatile constituents should be dried at a temperature below 60℃ and the thermolabile drugs should be dried with proper methods.

3. Tea and drinking tea bags should comply with the specified requirements of drinking tea.

4. Medicinal teas should be preserved in well closed containers, medicinal teas containing volatile and moisture absorbing drugs should be preserved in tightly closed containers.

Following relevant tests should be carried out for medicinal teas.

Determination of Water *Sugar-free tea lumps* Carry out the method for determination of water (Appendix Ⅸ H). Unless specified otherwise, they contain not more than 12.0 per cent of water.

Sugar containing tea lumps Grind the tea lump into particles with about 3 mm in diameter. Carry out the method for determination of water (Appendix Ⅸ H). Unless specified otherwise, they contain not more than 3.0 per cent of water.

Bag-packed teas and teas for decoction Carry out the method for determination of water (Appendix Ⅸ H). Unless specified otherwise, they contain not more than 12.0 per cent of water.

Determination of dispersibility Sugar containing tea lumps should comply with the following test.

Procedure Take one lump of sugar containing tea lumps, add twenty twice of hot water, stir for 5 minutes. The tea lump should be completely dissolved (allowed to have slight turbidity); showing no burned charings, etc.

Weight variation Medicinal tea lumps should comply with the following test.

Procedure Weigh 10 lumps of medicinal tea respectively, each compares with the labelled weight. Sugar-free tea lumps and sugar. Containing tea lumps should comply with the requirements stated in table 1 and table 2 below respectively. not more than 2 lumps exceed the limit, and none doubles the limit.

Filling variation Unless specified otherwise, medicinal bag-packed teas and medicinal teas for decoction should comply with the following test.

Procedure Weigh the contents of 10 packs respectively, each compares with the labelled filling, not more than 2 packs exceed the limit given in Table 1 and none doubles the limit.

Table 1

Labelled weight or filling	Weight or Filling variation limit
2 g or less	±15%
more than 2 g to 5 g	±12%
more than 5 g to 10 g	±10%
more than 10 g to 20 g	± 6%
more than 20 g to 40 g	± 5%
more than 40 g	± 4%

Table 2

Labelled weight	Weight variation limit
more than 1.5 g to 6 g	±7%
more than 6 g	±5%

Microbial limit test Comply with the requirements stated under Microbial Limit Tests (Appendix Ⅻ C), except teas for decoction.

I U Injections

Injections are sterile products prepared by purifying the extracts of crude drugs, intended for parenteral adiministration into body, including solutions or emulsions, as well as powders or concentrated liquids, which are prepared or diluted to solutions before use.

Injections are classified into liquids for injection, sterilized powders for injection and concentrated liquids for injection.

Liquids for injection Liquids for injection are sterile solutions or emulsions, intended for parenteral administration into body, which can be applied to intramuscular injection, intravenous injection or intravenous drip. Thereinto, liquids for injection with large volume (unless specified otherwise, the volume is not less than 100 ml) for intravenous drip are also called intravenous transfusions.

Sterilized powders for injection Sterilized powders or lumps, which on the addition of suitable sterile solvent, yield solution before use. They may be confected with appropriate solvents for injection, also with intravenous infusion solutions for intravenous drip. Sterile powders are prepared by freeze-drying or spray-drying, sterile lumps are prepared by freeze-drying.

Concentrated solutions for injection Concentrated solutions for injection are the thick sterile solutions prepared for a late intravenous drip.

The production and storage of injections should comply with the following requirements.

1. Unless specified otherwise, crude drugs are extracted, purified using methods directed in individual monographs to produce the intermediate products which are put into manufacture of injections.

2. Solutions for injection should be clear; emulsions for injection should be stable without phase separation and should not be applied to intraspinal route. The size of 90% particles in dispersed phase in emulsions for intravenous injection should be less than 1 μm, there should be no particle larger than 5 μm. Intravenous Infusion solutions should be isoosmotic with blood as far as possible.

3. Solvents employed for injections should be safe and harmless, have no effect on therapeutic efficiency and quality of the drug. They are classified into aqueous and nonaqueous solvents. Besides the most commonly used water, solution of 0.9% of sodium chloride or other appropriate substances may also be employed as aqueous solvents. The commonly employed nonaqueous solutions are vegetable oils mainly containing bean oil which should meet the standards of bean oil (for injection.) In addition, the other solutions such as alcohol, propylene glycol, polyethylene glycol etc. may be applied.

4. While preparing injections, suitable adding may be added, depending upon the characteristics of the medicaments. Such as osmotic adjustors, adjustors for pH values, solubilizing agents, antioxidants, bacteriostatic agents, emulsifiers, suspending agents and so on. Addition agent used should have no effect on therapeutic effect and have no interference with proof-test. The concentration should not be so high as to bring toxicity or excess stimulation. The commonly used antioxidants consist of sodium sulphite, bisulphite and metabisulphite, the concentrations generally used are 0.1%-0.2%. Bacteriostatic agents commonly used consist of phenol 0.5%, cresol 0.3%, tert-trichlorobutanol 0.5% and so on. Switable bacterio-static agents may be added in injections in multidose. The amount of bacteriostatic agents should be sufficient for prohibiting the growth of microorganisms in the injections. Steruization processess are required even though bacteriostatic agents applled. Intravenous infusion solutions and injections for intracistern injection, epidural injection, intraspinal injection should not be added with bacteriostatic agents, Unless specified otherwise, no bacteriostatic should be added while the volume of sigle injection exceeds 15 ml.

5. Containers filled with injections commonly consist of glass or plastic ampoules and vials. (bags). The airtight nature of containers should be testified by suitable methods. Unless specified otherwise, containers should comply with the requirements about medicinal glass containers and plastic containers stated in national standards. Rubber closures used in containers, especially in containers for multi-dose injections should be elastic enough the quality of which should comply with the related requirements stated in National Standards.

6. During the manufacturing of injections, effective measures should be adopted to short the time of preparation as far as possible to avoid the microbes and pyrogen contamination and to prevent deterioration. The preparation procedure for intrevenous infusion solutions should be controlled more strictly. Necessary measures should be taken to ensure the size of particles comply with the requirements stated in the quality standards during the manufactaring of emulsions for injection. Sterile powder for injection should be prepared aseptically.

7. The container can be fuled with the excess quantity appropriately according to the following table. If the labelled quantity is no more than 50 ml. Unless specified otherwise, a container may contain medicaments of multiple doses, but not more than 10 doses, and the excessive quantity in such containers is sufficient to permit withdraw and administration of the labelled quantity of each dose.

Labelled quantity (ml)	Excess quantity (ml)	
	Mobile liquid	Viscous liquid
0.5	0.10	0.12
1	0.10	0.15
2	0.15	0.25
5	0.30	0.50
10	0.50	0.70
20	0.60	0.90
50	1.0	1.5

For solutions containing medicaments liable to deterioration on exposure to air, the air in the containers should be excluded or displaced by inert gases such as carbon dioxide or nitrogen in the process of filling right before the containers are sealed by fusion.

8. After being closed hermetically, injections are sterilized using the appropriate methods according to the characteristics of the medicaments to ensure the sterility of the finished products. After being sealed by fusion, containers of injections should undergo leak-proof test under reduced pressure or by other suitable methods during or after the sterilizing process.

9. Unless specified otherwise. The storage of injections should be protected from light.

10. For the injections have been added with bacterilostatic agents, the concentration and the name of the agents should be indicated on the label. White for sterne powders for injection, the solvent used should be marked.

11. For the intermediate of injections, tests for heavy

metals, arsenic salts should be conducted. Unless specified otherwise, limit of heavy metals is not more than 10 per million (Appendix Ⅸ E, Method 2); limit of arsenic salts not more than 2 per million (Appendix Ⅸ F, Method 1). Organic destraction is needed during the test.
Following relevant tests should be carried out for injections.

Filling The filling of liquids for injection and the concentrated liquids for injections should comply with the following resource examination.

Procedure Select 5 containers if the labelled quantity is not more than 2 ml; 3 containers if the labelled quantity is more than 2 ml to 50 ml. Open the containers with caution to avoid any loss of the contents. Remove individual content of each container by suitable dry syringes with corresponding volure and pinhead to individual calibrated graduated apparatus (the cubage measured is at least 40% of the rated volume of the apparatus), and measure the volume at room temperature. For injections of oily liquids, warm containers and shake thoroughly before removing the contents by suitable dry stringes and pinhead do as above. Cool to room temperature before measuring the volume. The content in each container is not less than the labelled quantity of the injection.
Liquids and concentrated liquids for injection with labelled quantity more than 50 ml to 500 ml should comply with the test for Minimum Fill (Appendix Ⅻ C).

Filling variation Unless specified otherwise, the filling variation of stericized. powders for injection should comply with following requirements.

Average filling	filling variation limit
0.05 g or less	±15%
more than 0.05 g to 0.15 g	±10%
more than 0.15 g to 0.5 g	± 7%
more than 0.5 g	± 5%

Procedure Remove any adherent label and the aluminium cover from the sealed container, and wash the outside with ethanol and dry thoroughly. Open the container with caution to avoid foreign matters such as scraps of glass dropping into the containers, and weigh all part of the container and its contents without delay. Remove the contents, wash the container with water or ethanol, dry under suitable conditions and weigh. The difference between the weights represents the weight of the contents. Repeat the operation with a further four containers and determine the average weight. The weight variation of each container does not deviate from the average weight by a percentage greater than that shown in the table. If the weight variation of one container does not comply with the requirements, repeat the operation with another 10 containers. All of them should comply with the test.
No test for filling variation is required for the sterile powders for injection that require the test for content uniformity.

Visible particles Unless specified otherwise, comply with the Test for Visible Particles (Appendix Ⅺ C).

Particulate matter Unless especially otherwise, solutions for intravenous and infusing use, sterile powder for injection concentrated liquids for injection should be prepared according to the concentrations for clinical use, comply with the Test for Particulate Matter in Injections (Appendix Ⅸ R).

Related substance Carry out the test stated in the individual monograph, comply with the Determination of Materials in Injection (Appendix Ⅸ S).

Sterility Comply with the requirements stated in the Test for Sterility (Appendix Ⅻ B).

Pyrogen or bacterial Endotoxins Injections for intravenous use comply with the requirements of the Test for Pyrogen (Appendix Ⅻ A) or Test for Bacterial Endotoxin (Appendix Ⅻ D) as specified in the individual monograph.

Ⅰ Ⅴ Liniments, Lotions, Smeared films

Liniments, lotions and smeared films are liquid preparations intended for external application.
Liniments are liquid preparations intended for external application by rubbing on unbroken affected part, made of extract of crude drugs in alcohol, oils or other suitable solvents. And liniments with oils solvents are called oily liniments.
Lotions are liquid preparations made of extract of crude drugs by appropriate methods, which are intended for washing or smearing on skin or cavity.
Smeared films are liquid preparations for external smearing to form a film, containing film-forming materials and crude drugs extracted and dissolved by suitable solvents and methods.
Production and storage of Liniments, Lotions, Smeared films should comply with the following requirements.

1. Unless specified otherwise, crude drugs are extracted, purified using the method stated in individual monographs, or pulverized to fine powder.

2. Solvents commonly used for liniments consist of water, ethanol, glycerin, vegetable oils, liquid paraffin; lotions use mainly aqueous solutions; Ethanol is commonly used as solvent for smeared films, film-forming materials commonly used consist of polyvinyl alcohol, polyvinylpy rrolidone, acrylie acid resins and so on. Plasticizers commonly used consist of glycerin, propylene glycol, dibutyl phalate and so on; If necessary, appropriate additives may be added and the excipients added should show no evidence of irritation to skin or mucosa.

3. Unless specified otherwise, test for relative density, pH value should be generally specified for those with water or diluted alcohol as solvents; Test for the amount of alcohol should be specified for those with alcohol as solvents. For those in which oils are used as solvents, there should be no deteriorations such as rancidity etc., and test for refractive index is required.

4. Preserved in well closed containers, unless specified otherwise.
Following relevant tests should be carried out for liniments, lotions. smeared films.

Filling Comply with the test for Minimum Fill (Appendix Ⅻ C).

Microbial limit test Comply with the requirements stated under Microbial Limit Tests (Appendix Ⅻ C).

Ⅰ Ⅵ Suppositories

Suppositories are solid preparations made by incorporating extracts of crude drugs or finely powdered crude drugs in suitable bases, intended for administration to the cavities of the human body.
The production and storage of suppositories should comply

with the following requirements.

1. Semi-synthetic fatty glycerides, cocoa butter, polyoxyethylene stearate, hydrogenated vegetable oil, glycerinated gelatin, mixtures of polyethylene glycols of various molecular size and other suitable materials may be used as suppository bases. If necessary, surfactants may be added to improve the release and absorption of medicaments in the body.

2. Solid drug substances, unless otherwise specified, should be pulverized to fine or very fine powders before use. Suppositories may be made in different shapes according to the cavities conditions and the application.

3. The drug substances and bases in suppositories should be thoroughly mixed. Suppositories are smooth in appearance, uniform in texture and non-irritating. Suppositories are molten, soften or dissolved when inserted in the cavities and are miscible with body fluid to release the medicaments gradually and exert local or systemic effects. Suppositories are sufficiently hard to withstand handling or packaging without deformation.

4. Unless specified otherwise, suppositories should be preserved in well closed containers and stored at a temperature below 30℃ to protect from deformation mould contamination or deterioration due to excessive heat and moisture.
Following relevant tests should be carried out for suppositories.

Weight variation Suppositories should comply with the weight variation limit stated in the table below.

labelled or Average weight	Weight variation limit
1 g or less	±10%
more than 1 g to 3 g	±7.5%
more than 3 g	±5.0%

Procedure Weigh accurately together 10 suppositories and determine average weight, then weigh individually each of the 10 suppositories. Compare the weight of each suppository with the labelled weight (if no labelled weight is stated, compare the weight of each suppository with the average weight calculated). According to the requirements stated in the table, not more than one of the individual weight deviates from the weight variation limit shown in the table, and none deviates by more than twice of that percentage.

Disintegration test Unless specified otherwise, suppositories should comply with the requirements stated under Disintegration test (Appendix Ⅻ B).

Microbial limit test Comply with the requirements stated under Microbial Limit Tests (Appendix ⅩⅢ C).

Ⅸ X Nasal Preparations (including nasal drops)

Nasal preparations are preparations intended for nasal cavity use to exert local or systemic effect, which are made of extract of crude drugs, crude drugs or chemical medicaments.
Nasal preparations are classified into liquid preparations for nasal use (nasal drops, nasal sprays, nasal washes), semi-solid preparations for nasal use (nasal pastes, nasal creams) and solid preparations for nasal use (nasal powders).
The production and storage of nasal preparations should comply with the following requirements.

1. Crude drugs should be extracted and purified using the method stated in individual monograph, or pulverized to specified particle site by suitable methods.

2. Excipients for nasal preparations may be added according to the characteristics of chief drugs and demands of dosage forms. solvents such as water, propylene glycol, liquid paraffin, vegetable oils etc. are commonly applied to liquid preparations for nasal use. Greasy base such as vaselin, lanolin; emulsive bases such as soap, polysorbate, etc, and aqueous bases such as polyethylene, poloxamer etc. are commonly applied to semi-solid preparations for nasal use. If necessary, solubilizing agents, suspending agents, emulsifiers, preservatives etc. may be added.

3. Nasal preparations should show no evidence of irritation and side effect to the mucosa and cilia of nasal cavity. The aqueous nasal drops may require the use of excipients to adjust the pH values, and to make it isoosmotic with the mucus of nasal cavities.

4. Solutions for nasal use should be clear without precipitation and foreign matter. Particles in suspensions for nasal use should be fine and smooth, dispersed evenly. The sediment may not agglomerate on standing, and may generally show no evidence of phase seperation in several minutes after shaking. Particles in emulsions should disperse evenly. The phase separation may occur on standing, but the seperation should be readily redispersed by shaking to give a emulsion. Semi-solid preparations for nasal use should be soft and smeared easily.

5. Nasal preparations should comply with the requirements stated under the individual monographs about related dosage forms.

6. The filling amount of each container of nasal preparations should not exceed 10 ml or 5 g, unless specified otherwise.

7. Unless specified otherwise, nasal preparations may be preserved in tightly closed containers.
Following relevant tests should be carried out for nasal preparations.

Filling Unless specified otherwise, Comply with the test for Minimum Fill (Appendix Ⅻ C).

Sterilily Nasal preparations for severe trauma should comply with the requirements stated under the Test for Sterilily (Appendix ⅩⅢ B).

Microbial limit test Comply with the requirements stated under Microbial Limit Tests (Appendix ⅩⅢ C).

Ⅰ Y Ophthalmic Preparations (including Ophthalmic drops)

Ophthalmic preparations are preparations made of extract of crude drugs, or crude drugs intended for direct eye use to obtain the therapeutic effect. Ophthalmic preparations are classified into liquid preparations for eye use (ophthalmic drops), semi-solid preparations for eye use (ophthalmic ointment) etc, Some are packed in the form of solids along with solvents in the package, to prepare solutions or suspensions before use.
The production and storage of ophthalmic preparations should comply with the following requirements.

1. Crude drugs should be extracted and purified using the method stated in individual monographs, or pulverized to

powder with specified particle size using suitable method.

2. Excipients may be added in ophthalmic drops to adjust osmotic pressure, pH value, viscosity and improve the solubility of medicaments and the stability of preparations, Excipients used should show no evidence of decreasing the efficacy or causing local irritation. Ophthalmic drops with determined pH value should be isoosmotic with tear, unless specified otherwise, the filling amount of each container should not exceed 10 ml of the preparation. The transparency of the container should guarantee the visible foreign matters check.

3. Bases for ophthalmic ointment should be uniform, fine, irritation, and spreaded easily to improve the dispersion and absorption of medicaments. Insoluble crude drugs should be pulverized to ultra fine powders by appropriate methods. The based added should be filtrated and sterilized before preparation. Unless specified otherwise, the filling amount of each container should not exceed 5 g of the preparation.

4. Ophthalmic preparations should comply with the requirements stated under individual monographs about related dosage form.

5. Unless specified otherwise, ophthalmic preparations should be preserved in tightly closed containers, protected from light, and stored in cool place.
Following relevant tests should be carried out for ophthalmic preparations.

Visible particles Unless specified otherwise, ophthal-mic drops should comply with the Test for Visible Particles (Appendix Ⅺ C).

Particle size Unless specified otherwise, ophthalmic preparations containing powders of crude drugs should comply with the following test.
Ophthalmic drops in suspension Shake vigorously and take suitable quantity of the suspension immediately, then drop on the microscope slide. Carry out the Determination of Particle Size (Appendix Ⅺ B, method 1), no particle larger than 90 μm in diameter should be found.
Semi-solid preparations for ophthalmic use in suspension select 10 in random, squeeze all the contents thoroughly in an appropriate container and mix well. Take suitable quantity and put on the microscope slide, spread to form a film, cover with cover slide. Prepare 3 slides. Carry out the Determination of Particle size (Appendix Ⅺ B, method 1), no particle larger than 90 μm in diameter should be found.

Foreign Metals Unless specified otherwise, semi-solid preparations for eye use should comply with the following test.
Select 10 in random, squeeze all the contents thoroughly in a petri dish of 6 cm in diameter with smooth bottom, no visiable foreign matters and bubbles. Cover the dish, and keep it at the temperature of 85℃ for 2 hours to make the preparation melt and spread equably, keep the preparation at the room temperature till its concreting, then put the dish upside down on an appropriate microscope desk. Cast the light of focus lamp at the angle of 45° from upside onto the bottom of the dish (magnifying power, 30 folds). Detect the shining foreign metals with the particle size not less than 50 μm in diameter. The number of the preparation which contains foreign metals exceeding 8 grains should be no more than 1 in every ten samples examined and the total grains should not exceed 50. If not, take another 20 containers for retest, calculate the results of the two tests, the number of the preparation which contains foreign metals exceeding 8 grains should be no more than 3 in 30 samples examined and the total grains should not exceed 150.

Filling Comply with the test for Minimum Fill (Appendix Ⅻ C).

Sterilily Ophthalmic preparations for wound should comply with the Test for Sterilily (Appendix ⅩⅢ B).

Microbial limit test *Liquid preparations for ophthalmic use* Unless specified otherwise, carry out the test by membrane filtration method or direct inoculation method (Appendix ⅩⅢ B Test for Sterility), take specified quantity from at least 2 preparations (inoculate two into each kind of medium, 1 ml per container), inoculate into Thiogly collate medium or modified Martin Broth medium directly or after processing. There should be no bacteria growing after 7 days' culturing. If not, take twice amount of samples and retest by the method above, there should be no bacteria growth in each tube.

Other ophthalmic preparations Unless specified otherwise, comply with the requirements stated under Microbial Limit Tests (Appendix ⅩⅢ C).

Ⅰ Z Aerosols and Sprays

Aerosols are preparations containing extract of crude drugs, finely powdered crude drugs and appropriate propellant in pressurized containers fitted with specified valve equipment. Once the valve is turned on to release the substances, the contents are ejected from the containers by the pressure, in a fine mist, foam or other form. The Preparations of with contents are ejected in foam are defined as bubble bath, ejected in a mist or other form by the pressure supplied by hand-driven pump or other ways, instead of propellant, are defined as sprays. Aerosols and sprays consist of solutions, emulsions and suspensions according to the composition of the contents. They are administered for respiratory tract inhalation, and for topical use on skin, mucous membranes or cavities and so on.
The production and storage of aerosols and sprays should comply with the following requirements.

1. Crude drugs should be extracted, purified and concentrated using the methods stated in individual monographs.

2. Aerosols and sprays should be prepared under the clean circumstance with specified clean lines and filled promptly in the sterilized, clean and dried containers.

3. Appropriate additives such as solvents, solubilizing agents, antioxidants, surfactants, preservatives, etc... may be added, depending upon the characteristics of the medicaments. Various additives should show no evidence of irritation to respiratory tract, skin or mucous membranes.

4. Proper liquid gases with lower boiling points are commonly used as propellants for aerosols. According to the pressure required for an aerosol, a mixture of two or more propellants is applicable in a proper proportion.

5. Solutions for aerosolization and spray should be clear, droplets in emulsions and sprays should disperse evenly in liquid medium, and the fine powder of medicaments and additives should be mixed thoroughly and triturated to a fine state to produce a stable suspension. In the manufacturing process, water content, if necessary, should be controlled strictly to prevent from effect on the stability of the product. The particle and droplet size for inhalation aerosols and sprays should be less than 10 μm, most of them should be less than 5 μm. Finely powdered crude drugs are not applicable in general.

6. The containers for aerosols should be able to withstand the pressure supplied by the propellant. For the components of valve system, the precision of size and the solubilizing and swelling properties should comply with the relevant requirements, and show no evidence of reactions with the medicaments or additives used.

7. Unless specified otherwise, aerosols and sprays eject fine and uniform mist droplets or particles. A metered-dose valve releases a definite volume of the product in one operation of the valve button, and non-metered-dose valve is able to spray a uniform dose continuously. Sprays are capable of delivering a certain dose in one depression of the acutuator button.

8. Aerolsols and sprays should be labelled with the quantity of contents, quantity of active ingredient or extract of crude drugs. Aerosols equipped with metered-dose valve should state where applicable, total number of discharges per container, emitted quantity or content of active ingredient in each delivery.

9. Appropriate method should be adopted to monitor any leakage or explosion for safety measure.

10. Unless specified otherwise aerosols and sprays should be stored in a cool, dark place, with no exposure to heat or sunlight, and away from strike.

For aerosols with non-metered-dose valve system, tests for delivery rate and total amount of spray are required.

Delivery rate Select 4 aerosol containers in random, remove the caps and covers, actuate each valve for a few seconds, and blot to clean the outside of the containers from residual contents. Weigh individual containers accurately, immerse in a constant-temperature water bath (25 ± 1)℃ for 30 minutes. After removal and blotting of water, unless specified otherwise, actuate each valve continually for 5.0 seconds accurately timed, blot to clean and weigh individual containers accurately after blotting to remove the residual contents. Return the containers to the constant-temperature water bath, repeat the foregoing procedure three times. Calculate the average delivery rate (g/s) for each container, it complies with the requirement stated in individual monographs.

Total amount of spray Select 4 aerosol containers in random, remove the caps and covers. Weigh individual containers accurately, actuate each valve continually in a 1000 ml or 2000 ml conical flask in the ventilator until the container is empty, blot to clean and weigh individual containers accurately again. The total amount of spray per container is not less than 85% of the labelled amount.

For aerosols with metered-dose valve, tests for total number of discharges per container, emitted quantity or content of active ingredient in each delivery are required.

Total number of deliveries per container Select 4 aerosol containers in random, remove the caps and covers. Actuate individual valves continually in a 1000 ml or 2000 ml conical flask in the ventilator until the container is empty. Count the number of deliveries, the total number of deliveries per container is not less than the labelled number of deliveries.

Emitted quantity in each delivery Select 4 aerosol containers in random, remove the caps and covers, discharge several times and blot to clean. Weigh individual containers accurately, then actuate individual valves once more, blot to clean and weigh accurately each container again. The difference between weighings is one emitted quantity in each delivery. Three successive quantities emitted are determined by foregoing procedure; After ten successive deliveries without weighing, another three successive quantities emitted are determined by foregoing procedure; After another ten successive deliveries without weighing, the final four successive quantities emitted are determined. Calculate the average quantity emitted from the data of total ten emitted quantities that have been totally determined. The result is, unless specified otherwise, not less than 80 per cent and not more than 120 per cent of the labelled quantity in each delivery.

No test for emitted quantity in each delivery is needed for the preparations that require the test for content of active ingredient in each delivery.

Content of active ingredient in each delivery Select one aerosol container in random, shake thoroughly, remove the caps and covers, discharge 5 deliveries, wash the mouthpiece with a suitable solvent, dry thoroughly, stand the container inverted in a beaker with a certain quantity of absorptive solvent. Discharge 10 or 20 deliveries below (at least 25 mm) the surface of the solvent (actuating the valve at intervals of 5 seconds by shaking the container slowly), remove the container, wash the exterior and interior of the mouthpiece with the solvent, combine the washings. Determine the content of active ingredient by the Assay stated in the monograph, calculate the average content of active ingredient in each delivery. The result should comply with the requirement specified in the monograph, unless specified otherwise.

No test for emitted quantity in each delivery is needed for the preparations that require the test for content of active ingredient in each delivery.

For suspensions for aerosolization and spray intended for inhalation, test for particle size are required.

Particle size Select one aerosol container in random, shake thoroughly, remove the caps and covers, discharge several times to waste, blot the valve, actuate one measured spray onto a clean and dry microscope glass slide which is 5 cm from the mouth of aerosol upright in direction, wash the spray on the slide with about 2 ml of carbon tetrachloride, allow it to dry and place the covered slide on the micrometer stage of the microscope. Examine it under 400 × magnification at a suitable angle and adjust the microscope to see the grid clearly. Count the number of particles within 25 fields of view: most of them are less than 5 μm in effective diameter, not more than 10 particles which are more than 10 μm in effective diameter.

For sprays, spray test and filling are required.

Spray test Select 4 spray containers in random, remove the caps and covers, discharge several times and blot to clean. Weigh individual containers accurately, unless specified otherwise, actuate individual valves five times, blot to clean and weigh accurately each container again. Repeat the foregoing procedures three times. Calculate the average quantity emitted in each delivery, it complies with the requirement stated in individual monographs.

Filling Comply with the test for Minimum Fill (Appendix Ⅻ C).

Sterility Aerosols and sprays used for burn or severe trauma should comply with the requirement stated in the Test for Sterility (Appendix Ⅻ B).

Microbial limit test Unless specified otherwise, comply with the requirements stated under Microbial Limit Tests (Appendix Ⅻ C).

Appendix Ⅱ

Ⅱ A Sampling of Crude Drugs

Sampling of Crude Drugs refers to the method used to sample the crude drugs for examination. The procedure for sampling should be followed in details.

1. Examine the confirmation of the name, source of material, specification and package form of the cargo before sampling. Examine the intactness cleanliness of package and contamination of moulds and foreign matter, make notes in detail. The abnormal packages should be examined separately.

2. The general requirements for sampling of crude drugs in a same consignment are as follows:
when the total number of package is less than 5, the packages are sampled one by one.
5-99 packages, 5 packages are sampled at random; 100-1000 packages, 5% are sampled;
more than 1000 packages, 1% of the part in excess of 1000 packages are sampled;
Precious crude drugs are sampled one by one, regardless of the number of packages.

3. If the material is in crushed or powdered form or in pieces of less than 1 cm in size, at least 2-3 portions of sample are taken by suitable means from different parts in each package. If the volume of package is large, samples taken should be 10 cm in depth below the surface from different parts.
The quantity of samples taken is defined as follows:

Common drugs	100-500 g;
Powdered drugs	25-50 g;
Precious drugs	5-10 g;

As for the drugs of large size or large number, representative samples can be taken on the basis of real situation.

4. Mix the samples thoroughly, i. e. the total quantity of samples taken. If the total quantity of samples taken is several times that required for the testing, take an average sample by quartering, until sufficient quantity of sample is obtained for testing and retention.

5. The quantity or average sample taken should be not less than 3 times of that required for the testing, using one third for analysis, another one third for verification and the remaining as retention which should be kept.

Ⅱ B General Quality Control Method for Crude Drugs

General quality control method for crude drugs includes the "Description", "Identification", "Tests", "Determination of Extractives" and "Assay" of crude drugs. A scheme for the examination of crude drugs is outlined below.

1. Carry out the method for sampling of crude drugs (Appendix Ⅱ A) to take the drugs being examined.

2. Use a reference drug concerned which complies with the requirements specified under individual monograph to verify the result of tests or assays of a crude drug.

3. If the crude drugs being examined are broken, they should comply with the general requirement, except that described under "Description" in the monograph concerned.

4. "Description" consists of the form, size, colour, surface characters, texture (including cut surface or fracture characters) odour and taste.
(1) "Form" refers to the shape of dried crude drugs. In general it is observed without preliminary treatment.
The wrinkled herbs, leaves or flowers can be moistened or softened and spread. As for some fruits and seeds, soften, if necessary, and remove the pericarp or seed coat to examine the inner characters.
(2) "Size" indicates the length, diameter and thickness. In general a number of samples should be measured and a few variations, higher or lower than the defined values, are permitted, using a millimeter ruler. As for the fine seeds, arrange closely 10 seeds in a row, measure with a millimeter ruler and calculate the average value.
(3) The colour and glossiness of crude drugs should be observed under daylight. If the colour is described in a combination of two colours, the main colour is the later one. For example, the main colour is brown in yellowish-brown.
(4) In general, the surface characters, texture and cut surface of the crude drug being examined is observed without preliminary treatment. If the striations of fracture surface is difficult to be observed, it can be cut evenly.
(5) The odour can be examined by smelling directly or after fracturing and rubbing. Sometimes it can be smelled after moistened with hot water.
(6) The flavour can be tasted directly or by tasting the water extract. Precaution should be taken in tasting poisonous drugs.

5. "Identification" indicates the methods for the examination of the identify of crude drugs, consisting of the traditional experiential, microscopic, physical and chemical, spectrographic and chromatographic method.
(1) Experiential identification refers to observe certain characteristics such as the variation of colour, sinking or floating in water, bursting voice and the colour of flame on burning of crude drugs by simple and traditional methods.
(2) Microscopical identification refers to observe the characters of tissues, cells or cell contents in sections or powders or the surfaces of drugs under the microscope. Carry out the method for microscopical identification (Appendix Ⅱ C) by making slide appropriately
(3) Physical and chemical identification refers to test for some constituents in crude drugs by chemical and physical methods.
①Fluorescent identification refers to examine the fluorescenece of fracture or extractive of crude drugs or

examine after the treatment with acid or alkali, at a distance of about 10 cm under ultraviolet light unless specified otherwise, having a maximum output at about 365 nm.
②Microsublimate identification is usually carried out as follows: Place a metallic slide or a glass slide on an asbestos plate with a hole of about 2 cm in diameter and a metallic ring, about 8 mm high, on the slide, just above the hole. Put a thin layer of powdered drugs to be examined in the ring, covered with a glass slide, heat gently under the hole until the powder is charred, then remove the glass slide and allow to cool. Examine the crystal form and colour of sublimate condensed on the slide under a microscope or carry out the appropriate chemical tests on the sublimate.
③spectrographic and chromatographic identification in common use: UV-Vis, IR, TLC, HPLC, GC and so on.

6. Tests refers to limit test for the purity, deleterious or poisonous substance of crude drugs, such as the content of water, ash, foreign matter, poison, heavy metal, deleterious element, the remains of pesticide and so on.

7. Determination of extractive refers to determine the content of soluble substances in crude drugs extracted with water, ethanol or other solvents.

8. Assay refers to examine the efficient, index or sort component of the crude drugs quantatively with chemical, physical or biological methods, including the determination of volatile oils, the content of active principles and potency by biological assay. The common methods are spectrographic, chromatographic identification and so on.

Note (1) If the crude drugs is required to be powdered in assay, pulverize, sift and mix well the crude drug being examined as described under the individual monograph.
(2) Carry out the determination and assay as described in individual monograph or in relevant appendix.

Ⅱ C Microscopical Identification

Microscopical identification is a method with the application of the microscope to identify the characters of tissues, cells or cell contents in sections, powders, disintegrated tissues or surface slides of crude drugs and dosage forms including powders of crude drugs. Representative samples are chosen to be identified and slides are prepared to meet the requirements of identification for each drugs. The slides of patent medicines are made after appropriate treatment with reference to their different dosage forms.

1. Microscopical slides of crude drugs

(1) *Transverse or Longitudinal Sections* Select the observed part of the drug, cut into sections of 10-20 μm in thickness with a razor blade or using sliding microtome after softened. Material may be embedded in hard paraffin before cutting if necessary. Select a flat section on the glass slide, according to different phenomena, treat with glycerol-acetic acid TS, chloral hydrate TS or other test solutions 1-2 drops, and cover the cover glass. If necessary, after treat with chloral hydrate TS, heat until it is transparent, and then treat with glycerol-ethanol TS or diluent glycerol, cover the cover glass.

(2) *Slides of Powder* Spread a small quantity of the powder, through a sieve No. 4, on a slide, and examine after treated with glycerol-acetic acid TS, chloral hydrate TS, or other suitable test solutions, cover the cover glass. Heat until it is transparent as the method above if necessary.

(3) *Slide of Surface* After moistening and softening the materials, cut two parts of about 4 mm^2 of the observed part, place on the glass slide (one for the obverse, the other for the opposite) or tear its epidermis, add suitable test solutions or heat until it is transparent, cover the cover glass.

(4) *Slide of Disintegrated Tissue* The material should be cut into small strips of about 5 mm in length, 2 mm in diameter or pieces of about 1 mm thick before being disintegrated. Potassium hydroxide method can be used if parenchyma makes most part of the material and with a few or scattered woody tissues; chromic-nitric acids method or potassium chlorate method can be used if the material is hard, with the presence of more woody tissues or the woody tissues grouped into larger bundles.

①*Potassium Hydroxide Method* Place the material in a test tube, add an adequate quantity of 5% potassium hydroxide solution, heat until the material can be disintegrated by pressing with a glass rod. Decant the alkali solution and wash the material with water, transfer a little to a slide, tear with dissecting needle, observe using dilute glycerine as mountant and cover the cover glass.

②*Chromic-Nitric Acids Method* Place the material in a test tube, add an adequate quantity of chromic-nitric acid TS, allow to stand until the sample can be disintegrated by pressing with a glass rod. Decant the acid solution, wash with water, prepare a mount as method 1.

③*Potassium Chlorate Method* Place the material in a test tube, add nitric acid solution (1→2) and a little potassium chlorate, heat gently until effervescence relaxes. Add a small quantity of potassium chlorate in time to maintain a light effervescence until the sample can be disintegrated by pressing with a glass rod. Decant the acid solution, wash with water and prepare a mount as method 1.

(5) *Slides of Pollen and Spore* Grind pollens, anthers (or small flowers) or sori (soften the dry material in glacial acetic acid) with a glass rod and filter by carbasus into a centrifugal tube, centrifuge. To the precipitate add 1-3 ml of a freshly prepared mixture of acetic anhydride-sulfuric acid (9∶1), heat on a water bath for 2-3 minutes, centrifuge. Wash the precipitate with water twice, place a little on the glass slide, treat with chloral hydrate TS, cover the cover glass, or add 1-2 drops of 50% glycerin and 1% phenol, mount in fuchsin-glycerin gelatin [gel 1 g, water 6 ml, soak till it is colliquative. Add glycerine 7 ml, heat by gently agitating, until it is mixed well. Add appropriate basic fuchsin solution (basic fuchsin 0.1 g, add absolute alcohol 600 ml and camphor wood oil 80 ml, get it dissolved) after being filtrated onto the culture dish, mix well, and get it after the solidification].

(6) *Slides of ground sections* The method is proper for hard drugs of animals or minerals. Place the tested material of about 1-2 mm in thickness on the coarse grinding stone (or mat-surface glass), add an adequate quantity of water, hold or press the material with the index, middle finger, and abrade it out and home on the grinding stone until either surface is smooth with about several micrometers in thickness. Move the material onto the fine grinding stone, add water, press it with cork before abrading out and home until it is transparent. Rinse with water, treat with ethanol and then prepare a mount with glycerol-ethanol TS.

2. Microscopical slides of preparations including drugs powder

With reference to different dosage form of tested item, take suitable powder directly for powder and capsule (comminute if the content is granular); take the tablet of 2-3 pills, water-paste pill, paste pill, water honeyed pill, pastille (remove

the coating) of several pills or 1-2 troches, pulverize in the mortar and get suitable powder; for honeyed pill, split it and select suitable sample, or get a little precipitate afer removing the honey with water. Prepare a mount as methods for slides of powder (1-5 pills).

3. Identification of Cell Wall

(1) *Lignified Cell Wall* Add 1-2 drops of phloroglucinol TS to the specimen on the slide, allow to stand for a moment, add 1 drop of hydrochloric acid, a red colour or purplish-red colour is produced depending on the extent of lignification.

(2) *Suberized or Cuticutarized Cell Wall* Add Sudan Ⅲ TS as above, allow to stand for a moment or warm gently, an orange-red or red colour is produced.

(3) *Cellulose Cell Wall* Add zinc chloride-iodine TS, or at first add iodine TS to moisten it, allow to stand for a moment, then add sulfuric acid solution (33→50), a blue or purple is produced.

(4) *Siliceous Cell Wall* No change takes place on adding sulfuric acid.

4. Identification of Cell Contents

(1) *starch*
①Add iodine TS, a blue or purple colour is produced.
②Mount in glycerol-acetic acid TS, examine under a polarizing microscope, starch granules show crossed polarized light which disappears in gelatinized granules.

(2) *Aleurone*
① Add iodine TS, a brown or yellowish-brown colour is produced.
②Add mercuric nitrate TS, a brick red colour is produced.
If the material is oily, it should be de-fatted with ether or petroleum ether before being tested.

(3) *Fatty Oil, Volatile Oil or Resin*
①Add Sudan TS, an orange-red, red or purplish-red colour is produced.
②In 90% ethanol, fatty and resin oil is insoluble, except castor oil and croton oil, while volatile oil is soluble.

(4) *Inulin* Add a 10% solution of a-naphthol in ethanol and then add sulfuric acid, the crystals of inulin turn purplish-red and dissolve rapidly.

(5) *Mucilage* Add ruthenium red TS, a red colour is produced.

(6) *Calcium Oxalate Crystals*
① Insoluble in dilute acetic acid, soluble in dilute hydrochloric acid without effervescenece.
②Dissolve gradually in sulfuric acid solution (1→2), but needle crystals of calcium sulfate appear on standing for a moment.

(7) *Calcium Carbonate crystals* (*stalactile*) Soluble in dilute hydrochloric acid with effervescence.

(8) *Silicum* Insoluble in sulfuric acid.

5. Microscopical measure

It refers to measure the size of cells and cell contents in the microscope with ocular micrometer.

(1) *Ocular micrometer* A scaleplate in the eyepiece sleeve of a round glass of 18-20 mm in diameter. In the centre, there is precise parallel-line scale of equal appearing interval, and 50 or 100 panels as usual. (as Fig. 1)

(2) *Stage micrometer* A round glass with fine scale pasted in the centre of specially made glass slide. As usual, divide 1 mm (or 2 mm) precisely into 100 (or 200) panels, and each panel is 10 μm in length to mark the ocular micrometer.

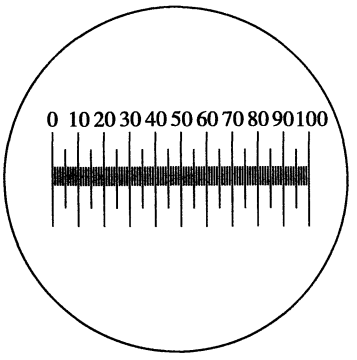

Fig. 1 Ocular micrometer

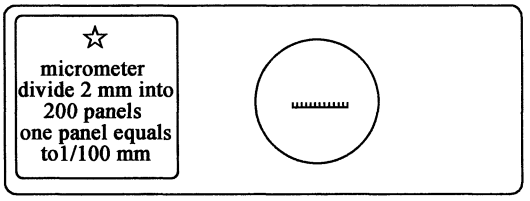

Fig. 2 Stage micrometer

(as Fig. 2)

(3) *Mark of ocular micrometer* Determine the length represented by each panel of ocular micrometer when applying the identical microscope, object glass, ocular glass of definite multiple and body tube of definite length.
Place stage micrometer onto the microscope carrier, and move the scale of it to the centre of visual field in the high-power objective (or low-power objective). Lay up ocular micrometer (the obverse upward) into eyepiece sleeve, turn the ocular micrometer and move the stage micrometer to ensure that the graduation line "0" of ocular micrometer is in coincidence with the certain graduation line of stage micrometer. Find the second coincident graduation line to calculate the corresponding length (μm) represented by each panel of ocular micrometer in the object glass on the basis of the number of the panels of the two micrometers between the two line in coincidence. As shown in Fig. 3, 77 panels (0-77) of ocular micrometer equal to 30 panels (0.7-1.0) of stage micrometer, and the length of each panel of stage micrometer is 10 μm. The length of each panel of ocular micrometer: 10 μm×30÷77=3.8 μm.
Mark respectively during the application of microscopes of different multiples.

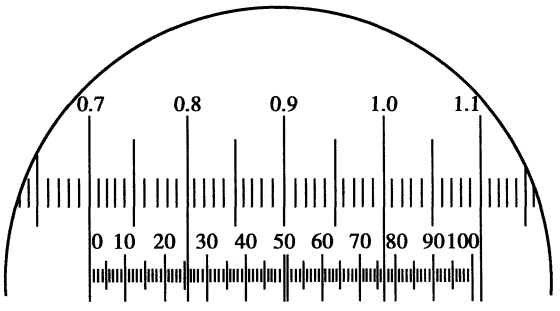

Fig. 3

(4) *Measurements* Lay up the microscopic slide of measured object on the microscope carrier, measure the panel number of the object with ocular micrometer, and multiply the number of μm of each panel as above. Measure by the high power lens as usual except for the measure of longer objects

such as fibre, tube, nonglandular hair by the low power lens. Note the maximum and minimum (μm), and a few values higher or lower than the defined values, are permitted

Ⅱ D The Processing of Crude Drugs

Processing of crude drugs is to make the crude drugs into small processed pieces through processing procedures such as cleaning, cutting and stir-baking, so as to obtain the processed drugs fulfilling the requirements of therapy, dispensing and making preparations thus assuring the safety and efficacy of the drugs.
The water used for processing should be unpolluted drinking water. Unless specified otherwise, the processing should meet the following requirements.

1. Cleaning The crude drugs after cleaning are called "clean crude drugs". Clean crude drugs should be used in cutting, processing, dispensing or compounding.
The crude drugs can be cleansed with the method of sorting, winnowing, washing, sifting, cutting, scraping, paring, rejecting, brushing, rubbing and grinding, cauterizing, soaking, rinsing etc. to reach the quality standard on the basis of specific conditions.

2. Cutting Unless cutted in fresh or dry form, the crude drugs should be moistened to soft for cutting, it is better to keep moisten than to soak in water to prevent the elimination of active principles. The methods for softening: consperging, showering, washing quickly, soaking, moistening, rinsing, parboiling. The crude drugs should be treated separately and appropriately according to their size, diameter and hardness, noting the temperature, quantity of water and duration of treatment. The drugs should be dried in time after cutting.
The crude drugs may be cut into slices, sections, pieces and slivers, etc. Their size, extent and thickness are generally as follows:

Slices: Less than 0.5 mm in thickness for very thin slices, 1-2 mm in thickness for thin slices; more than 2-4 mm in thickness for thick slices.

Sections or segments: 5-10 mm in length for short sections, 10-15 mm in length for long sections.

Pieces: Cubes of 8-12 mm.

Slivers: 2-3 mm in width for microslivers, 5-10 mm in width for thick slivers.
The crude drugs other than those treated by cutting are usually treated by pounding.

3. Roasting and Broiling Unless specified otherwise, the general methods and requirements are as follows.

(1) *Stir-baking* It may be subdivided into simple stir-baking and stir-baking with excipients.
When baking, stir constantly on a homogeneous fire and control the baking temperature, duration and extent of individual drugs.

Simple stir-baking Place clean crude drugs in a pot, stir-bake with gentle heat to the required condition, take them out and cool. For the crude drugs which should be baked to charring, bake at a relatively high temperature until the surfaces of the crude drugs turn brown and the fractures become darkened, then take them out and cool. For the crude drugs inflammable on baking to char, a small amount of water may be sprayed on the crude drugs, then the crude drugs are baked to dryness or dried in the sun.

Stir-baking with bran Put the bran in a hot pot and heat until it smokes, add clean crude drugs to it, stir quickly until the surface of crude drugs turns yellow or dark, then take them out, sift out the bran and cool.
Unless specified otherwise, use 10 kg of bran for each 100 kg of clean crude drugs.

(2) *Scalding* Usually use the clean sand, powdered clam-shell or talc as the excipient for scalding. Put the sand (powdered clam-shell or talc) in a pot, usually heat at a high temperature, add the clean crude drugs, constantly stir until the crude drugs expanded crisply or to a specified extent. Take them out, sift out the sand (powdered clamshell or talc) and cool.
If required to be tempered with vinegar, sift out the excipient, dip the crude drugs into vinegar while hot until they become crisp.

(3) *Calcining* The crude drugs should be calcined until they become crisp and easily crushed.

Calcining openly Crack the clean crude drugs to small pieces, place on smokeless flame or in a suitable container, calcined until the drugs become crisp, brittle or red hot. Take them out, cool and crush to powders.
Drugs of inorganic salts containing water of crystallization need not to be calcined to red hot, but evaporate the water of crystallization completely or calcinate the drugs to honeycomb-like solid masses.

Calcining and quenching Calcine the clean crude drugs to red hot and dip them quickly to a specified liquid to be tempered until they become crisp (repeat the operation, if necessary). Take them out, dry, crushed or powdered.

(4) *Carbonizing* When the crude drugs are carbonized, the nature of the crude drugs should be preserved and prevented from ashing.

Carbonizing by stir-baking Place the clean crude drugs in a hot pot and stir-bake at a high temperature until the surfaces of the drugs darkened and the inner parts turning dark yellow or to a specified condition, spray a small quantity of water, take them out and cool in the air.

Carbonizing by calcining Place the clean crude drugs in a calcining pot, close tightly, braise the crude drugs thoroughly, cool and take them out.

(5) *Steaming* Add the liquid excipient to the clean crude drugs according to the stipulation as described under the individual monograph, mix thoroughly (except simple steaming). Place the mixture into a suitable container, steam thoroughly or appropriately, take out and dry.

(6) *Boiling* Boil the clean crude drugs with water or specified amount of liquid excipient as described under the individual monograph. Take them out when the liquid is absorbed entirely by the drugs or no white spot or core is observed in the centre of the drug on cutting, them dry.
Unless specified otherwise, the remained liquid after boiled with poisonous crude drugs is discarded.

(7) *Stewing* Add the liquid excipient to the clean crude drugs according to the stipulation as described under the individual monograph. Place them into a suitable container, then close tightly, stew them thoroughly on a water bath or by steaming until the liquid is absorbed entirely, cool, take them out and dry.

(8) *Blanching in boiling water* Put the clean crude drugs in boiling water, stir for a short time and take them out. For some seeds, blanch until the wrinkled testa become extended and smooth and can be removed easily. Take them out and soak in cold water to remove the testa and then dry in the sun.

(9) *Processing with wine* It includes stir-baking, stewing and steaming with wine, unless specified otherwise, yellow rice wine is used.

Stir-baking with wine Mix clean crude drugs with wine thoroughly in a closed vessel until it is infused completely. Place the drugs in a pot and roast with gentle neat to a specified condition, take out and cool.
Unless specified otherwise, use 10 kg of yellow rice wine for each 100 kg of clean crude drugs.

Stewing with wine Stew clean crude drugs with wine as described under the method for stewing.

Steaming with wine Steam clean crude drugs with wine as described under the method for steaming.
When stewed or steamed with wine, unless specified otherwise, use 20 kg of yellow rice wine for seeds and 30 kg of yellow rice wine for roots and rhizomes to each 100 kg of clean crude drugs.

(10) *Processing with vinegar* It includes stir-baking, boiling and steaming with vinegar. Rice vinegar or other fermented vinegar should be used in the process.

Stir-baking with vinegar Add vinegar to clean crude drugs and mix thoroughly in a closed vessel until they are infused completely. Place them in a pot and roast to a specified condition, take out and cool.

Boiling with vinegar Boil clean crude drugs with vinegar as described under the method for boiling.

Steaming with vinegar Steam clean crude drugs with vinegar as describe under the method for steaming.
Unless specified otherwise, use 20 kg of vinegar for each 100 kg of clean crude drugs, and, if necessary, dilute with an appropriate quantity of water.

(11) *Processing with salt-water* It includes stir-baking and steaming with salt-water. The salt should be dissolved with an appropriate quantity of water, and filter.

Stir-baking with salt-water Add salt-water to clean crude drugs, mix well in a closed vessel until they are infused thoroughly. Place them in a pot, with gentle heat stir-bake to a specified condition, take out and cool. (for some drugs, add salt-water when stir-baking)

Steaming with salt-water Add salt-water to clean crude drugs and mix well, steam them with salt water as described under the method for steaming.
Unless specified otherwise, use 2 kg of salt for each 100 kg of clean crude drugs.

(12) *Stir-baking with ginger juice* Crush the fresh clean ginger to pasty before processing, then add a quantity of water, press to get juice. Add some more water to the residue and press once more, mix the juices. If dried ginger is used, crush and boil twice with water to get the juice, filtrate, and get the filter liquor.
Add ginger-juice to clean crude drugs and mix well. Stir-bake in a pot with gentle heat until the ginger-juice is absorbed completely or appropriately. Take out and dry in the air.
Unless specified otherwise, use 10 kg of fresh ginger or 3 kg of dry ginger for each 100 kg of clean crude drugs.
Unless specified otherwise, use 10 kg of fresh ginger or 3 kg of dry ginger for each 100 kg of clean crude drugs.

(13) *Stir-baking with honey* The refined honey should be diluted at first with a quantity of boiling water, then add it to clean crude drugs and mix well in a closed vessel until they are infused thoroughly.
Roast them in a pot with gentle heat to a specified condition, take out and cool.
Unless specified otherwise, use 25 kg of refined honey for each 100 kg of clean crude drugs.

(14) *Stir-baking with oil* Heat the sebum oil at first in the vessel to be colliquative, remove the precipitate, add the clean crude drugs and mix well. Roast them with gentle heat until the oil is absorbed completely and the surface of the crude drugs show the oil light. Spread out and cool.

(15) *Frost-like powder* Processed by removal of oil from the crude drugs.
Unless specified otherwise, crush the clean crude drugs to a paste, heat gently, and press out a majority of oil in the crude drugs to make a fairly dispersible powder as required in individual monograph.

(16) *Levigating* Place clean crude drugs in a container. Add a quantity of water to the crude drugs treated according to the stipulation, pulverize to fine powders, then add more water, stir, decant the supernatant suspension. Repeat the operation on the precipitate for several times, remove foreign matter and combine the suspensions. Allow to stand, separate the precipitate, dry and pulverize to fine powder.

(17) *Roast* Wrap up the clean crude drugs with wet flour or wet paper, or place them in uniformity and compartment on the paper of suctioning oil before the process of heating. Or bury the crud drugs in the wheat bran, roast them with gentle heat until the extent required, take out and cool.
Unless specified otherwise, use 50 kg of wheat bran for each 100 kg of clean crude drugs.

Appendix Ⅲ Ingredients of Patent Medicines not Included in the Pharmacopoeia

Some crude drugs and processed drugs used as ingredients in patent medicines are not included in this Pharmacopoeia. Requirements for some crude drugs were promulgated by the health authority of provinces, municipalities or autonomous regions according to the local tradition. The others must comply with the following requirements.

Armadillidium Dried body of *Armadillidium vulgare* (Latreille) (Fam. Armadillididae).

Borax Crystal refined from natural borax.

Bulbus Allii Dried bulb of *Allium sativum* L. (Fam. Liliaceae).

Cacumen Claoxyli Dried young branch of *Claoxylon polot* (*Burm.*) Merr. (Fam. Euphorbiaceae).

Calx Pulveratum A powder mainly containing calcium carbonate.

Camphora Crystal prepared from dried branch, leaf and root of *Cinnamomum camphora* (L.) Sieb. (Fam. Lauraceae).

Carapax Eretmochelydis Shell of *Eretmochelys imbricata* (Linnaeus) (Fam. Cheloniidae).

Caro, Fel et Hepar Caprae seu Ovis Meat, gallbladder and fresh liver of *Capra hircus* Linnaeus or *Ovis aries* Linnaeus (Fam. Bovidae).

Catharsius Dried insect of *Catharsius molossus* Linnaeus (Fam. Scarabaeidae).

Caulis Entadae Dried rattan of *Entada phaseoloides* (L.) Merr. (Fam. Leguminosae).

Caulis et Radix Croton Tiglii Dried root and dried stem of *Croton tiglium* L. (Fam. Euphorbiacceae).

Caulis Gneti Dried rattan of *Gnetum montanum* Markgr. or *Gnetum parvifolium* (Warb.) C. Y. Cheng ex Chun (Fam. Genetaceae).

Caulis Impateintis Balsaminae Dried stem of *Impateins balsamina* L. (Fam. Balsaminaceae).

Caulis Piperis Wallichii Dried stem with leaves of *Piper wallichii* (Miq.) Hand. -Mazz or *Piper puberulum* (Benth.) Maxim. (Fam. Piperaceae).

Caulis Polygoni Aubertii Dried stem of *Polygonum aubertii* Henry (Fam. Polygonaceae).

Caulis Rubi Idaei Dried stem of *Rubus idaeus* L. (Fam. Rosaceae).

Chalcanthitum Minerals mainly containing hydrated copper sulphate.

Compositus Medicatus Fermentatus A processed product fermented by Galla Chinensis and Folium Camelliae Sinensis.

Concentrated Decoction of Fructus Hippophae Wash mature Fructus Hippophae and eliminate foreign matter. Place the fruit in a copper or aluminum pot, add a quantity of water, about 6-10 cm over the drug, heat with vapour or fire to boil for 1-2 hours, decant the decoction. Decoct the residue with water again, combine the decoctions, allow to stand for 12 hours to precipitate, decant the supernatant and filter the solution at the bottom, then concentrate the solution at a high temperature at the beginning, decrease the temperature with the solution concentrated gradually, keep it boil slightly and stir constantly to prevent charring until the concentrated decoction can be raised like sliver or can not seep through paper.

Concentrated Decoction of Dianjixueteng Remove the cork of fresh Dianjixueteng and cut into large pieces. Place them in a pot and add water to over the drug about 6 cm, boil for 5-6 hours by strong heat, filter. Boil the residue with water again for 8-9 hours and filter, combine the filtrates, evaporate in a clean pot by gentle heat until the decoction can be raised like sliver, then cool. The relative density of the concentrated decoction is 1.06-1.08.

Cortex Berberidis Dried root bark of *Berberis soulieana* Schneid. and other species of the same genus (Fam. Berberidaceae).

Cortex Parabarii seu Ecdysantherae Dried stem bark of *Parabarium chunianum* Tsiang, *Parabarium huaitingii* Chun et Tsiang, *Parabarium micranthun* (A. DC.) Pierre or *Ecdysanthera utilis* Hay. et Kaw. (Fam. Apocynaceae).

Cortex Syringae Mandshuricae Dried stem bark or branch bark of *Syringa reticulata* (Bl.) Hara var. *mandshurica* (Maxim.) Hara (Fam. Oleaceae).

Cor Bovis Heart of *Bos taurus domesticus* Gmelin or *Bubalus bubalis* Linnaeus (Fam. Bovidae).

Cupri Carbonas Green rust on the surface of copper, produced by the effect of carbon dioxide or acetic acid, mainly containing basic copper carbonate.

Eriocheir seu Potamon Dried body of *Eriocheir sinensis* H. Miline-Edwards, *Potamon* (*potamon*) *denticulata* or *Potamon* (*Potamon*) *yunanensis* (Fam. Catametopa).

Faeces Bombycis Dried excrements of *Bombyx mori* Linnaeus (Fam. Bombycidae).

Faeces Trogopterori Dried faeces of *Trogopterus xanthipes* Miline-Edwards (Fam. Sciuridae).

Faeces Vespertilionis Dried excrements of *Vespertilio superans* Thomas. (Fam. Vespertilionidae).

Fel Bovis Bile liquid of *Bos taurus domesticus* Gmelin (Fam. Bovidae).

Fel Serpentis Liquidum Bile of many kinds of snake (Fam. Elapidae, Crotalidae, Colubridae). Kill the snake, take out the gallbladder and preserve it in wine containing more than 50% of alcohol, the ratio of the gallbladder and the wine is 1 : 1 (g/g). Remove the membrane of gallbladder before use, take the bile with an equal volume of wine.

Fel Ursi Dried gallbladder of *Selenarctos thibetanus* Cuvier or *Ursus arctos* Linnaeus (Fam. Ursidae).

Flos Gentianae Straminiae Dried flower of *Gentiana straminia*

Maxim. (Fam. Gentianaceae).

Flos Gossampini Dried flower of *Gossampinus malabarica* (DC.) Merr. (Fam. Bombacaceae).

Folium Aconiti Szechenyiani Dried leaf of *Aconitum szechenyianum* Gay. (Fam. Ranunculaceae).

Folium Camelliae Assamicae Leaf of *Camellia sinensis* O. Ktze. var. *assamica* Kitamura (Fam. Theaceae).

Folium Camelliae Sinensis A dried processed product of young leaf of young sprout of *Camellia sinensis* (L.) O. Ktze (Fam. Theaceae).

Folium Glycosmis Dried leaf of *Glycosmis parviflora* (Sims) Kurz (Fam. Rutaceae).

Folium Ilicis Chinensis Dried leaf of *Ilex chinensis* Sims (Fam. Aquifoliaceae).

Folium Pini Massonianae Recens Fresh leaf of *Pinus massoniana* Lamb. (Fam. Pinaceae).

Folium Syringae Dried leaf of *Syringa vulgaris* L., *Syringa dilatata* Nakai or *Syringa oblate* Lindl. (Fam. Oleaceae).

Fossilia Spiriferis Fossil of *Cyrtiospirifer sinensis* (Graban) or *Cyrtiospirifer sp.* (Fam. Spiriferidae).

Fructus Benincasae Dried fruit of *Benincasa hispida* (Thunb.) Cogn. (Fam. Cucurbitaceae).

Fructus Capsici Dried mature fruit of *Capsicum annuum* L. (Fam. Solanaceae).

Fructus Eugeniae Caryophyllatae Dried fruit of *Eugenia caryophyllata* Thunb. (Fam. Myrtaceae).

Fructus Gleditsia sinensis Dried mature fruit of *Gleditsia sinensis* Lam. (Fam. Leguminosae).

Fructus Hordei Dried fruit of *Hordeum vulgare* L. (Fam. Gramineae).

Fructus Punicae Granati Dried fruit of *Punica granatum* L. (Fam. Punicaceae).

Fructus Sapindus Dried mature fruit of *Sapindus mukorossi* Gaertn. (Fam. Sapindaceae).

Fructus Terminaliae Immaturus Dried young fruit of *Terminalia chebula* Retz. or *Terminalia chebula* Retz. var. *tomentella* Kurt. (Fam. Combretaceae).

Fructus Trapae Dried fruit of *Trapa bispinosa* Roxb. or *Trapa maximowiczii* Korsch. (Fam. Claricepitaceae).

Fructus Tritici Dried mature fruit of *Triticum aestivum* L. (Fam. Gramineae).

Fructus Vitis Viniferae Dried fruit of *Vitis vinifera* L. (Fam. Vitaceae).

Gypsum Rubrum seu Calcitum (calcined) Calcine the drug to be white in colour by carrying out the method for calcining and quenching (Appendix Ⅱ D), put into "lada" (defatted milk) until it crisp, take out and pulverize.

Gypsum Rubrum seu Calcitum (processed with milk) Break 1000 g of drug to pieces, add 10 g of potassium nitrate and a quantity of water, boil for 3 hours, decant the liquid, wash with water for 10-15 times until the washing clear, dry in air, pulverize to fine powder, add a quantity of milk, stir to dough shaped, make into round cakes of about 10 cm in diameter and less than 3 cm thick, dry in the shade.

Halitum Crystal of lake salt, mainly containing sodium chloride.

Herba Aconiti Dried herb of *Aconitum naviculare* Stapf or *Aconitum tanguticum* (Maxim.) Stapf (Fam. Ranunculaceae).

Herba Aconiti Kusnezoffii Dried seedling of *Aconitum kusnezoffii* Reichb. (Fam. Ranunculaceae).

Herba Arctii Herb of *Arctium lappa* L. (Fam. Compositae).

Herba Artemisiae Anomalae Dried part of overground of *Artemisia anomala* S. Moore or *Artemisia actiflora* Wall. ex DC. (Fam. Compositae).

Herba Breyniae Dried herb of *Breynia fruticosa* (L.) Hook. f. (Fam. Euphorbiaceae).

Herba Calophylli Dried herb of *Calophyllum membranaceum* Gardn. et Champ. (Fam. Hypercaceae).

Herba Corydalis Bungeanae Dried herb of *Corydalis bungeana* Turcz. (Fam. Papaveraceae).

Herba Corydalis Strictae Dried herb of *Corydalis stricata* Steph. (Fam. Papaveraceae).

Herba Dracocephali Tangutici Dried aerial part of *Dracocephalum tanguticum* Maxim. (Fam. Labiatae).

Herba Ecliptae Liquidum Fresh stem of *Eclipta prostrata* L (Fam. Compositae), add small quantity of water, squeeze and filter.

Herba Euonymusis Dried part overground of *Euonymus fortunei* (Turcz.) Hand. -Mazz., *Euonymus japonicus* L. or *Euonymus subsessilis* Sprague (Fam. Celastraceae).

Herba Gueldenstaedtiae Dried herb of *Gueldenstaedtia verna* (Georgi) A. Bor (Fam. Leguminosae).

Herba Hedyotidis Dried herb of *Hedyotis hedyotidea* DC. (Fam. Rubiaceae).

Herba Hypecoi Dried herb of *Hypecoum leptocarpum* Hook. f. et Thoms (Fam. Papaveraceae).

Herba Hyperici Japonici Dried herb of *Hypericum japonicum* Thunb. (Fam. Guttiferae).

Herba Hyptidis Dried herb of *Hyptis suaveolens* (L.) Poit. (Fam. Labiatae).

Herba Inulae Cappae Dried herb of *Inula cappa* (Buch. Ham.) DC. (Fam. Compositae).

Herba Ixeritis Chinensis Dried herb of *Ixeris chinensis* (Thunb.) Nakai. (Fam. Compositae).

Herba Lagotidis Dried herb of *Lagotis glauca* Gaertn. or *Lagotis brevituba* Maxim. (Fam. Scrophulariaceae).

Herba Lysimachiae Foenum-graeci Dried herb of *Lysimachia foenum graecum* Hance. (Fam. Primulaceae).

Herba Monochasmae Dried herb of *Monochasma savatieri* Franch. ex Maxim. (Fam. Scrophulariaceae).

Herba Oldenlandiae Diffusae Dried herb of *Oldenlandia diffusa* (Willd.) Roxb. (Fam. Rubiaceae).

Herba Oxytropis Dried herb of *Oxytropis chiliophylla* Royle or *Oxytropis falcata* Bge. (Fam. Leguminosae).

Herba Oxytropis Myriophyllae Dried herb of *Oxytropis myriophylla* (Pall.) DC. (Fam. Leguminosae).

Herba Pegaeophyti Dried herb of *Pegaeophyton scapiflora* (Hook. f. et Thoms.) Marq. et Airy-Shaw. (Fam. Cruciferae).

Herba Picriae Dried herb of *Picria felterrae* Lour. (Fam. Scrophulariaceae).

Herba Piperis Sarmentosi Dried part of over ground of *Piper sarmentosum* Roxb. (Fam. Piperaceae).

Herba Pterocephali Dried herb of *Pterocephalus hookeri* (C. B Clarke) Höeck. (Fam. Dipsacaceae).

Herba Saxifragae Tanguticae Dried herb of *Saxifraga tangutica* Engl. (Fam. Saxifragaceae).

Herba Schoepfiae Dried herb of *Schoepfia chinensis* Gardn. et Champ. or *Schoepfia jasminodora* Sieb. et Zucc. (Fam. Olacaceae).

Herba Securidacae Dried herb of *Securidaca inappendiculata* Hassk. (Fam. Polygalaceae).

Herba Senecionis Scandentis Dried part of overground of *Senecio scandens* Buch. -Ham. (Fam. Compositae).

Herba Siphonostegiae Dried herb of *Siphonostegia chinensis* Benth. (Fam. Scrophulariaceae).

Herba Smilacis Ripariae Herb of *Smilax riparia* A. DC. (Fam. Liliaceae).

Holotrichia Diomphalia Dried larva of *Holotrichia diomphalia* Bates or other species of the same genus (Fam. Scarabacidae).

Lac Bovis Milk of *Bos taurus domesticus* Gmelin or *Bubalus bubalis* Linnaeus (Fam. Bovidae).

Lignum Pini Nodi Dried warty node or ramose node of *Pinus tabulaeformis* Carr. or *Pinus massoniana* Lamb. (Fam. Pinaceae).

Lignum Pterocarpi Santalini Wood of *Pterocarpus santalinus* L (Fam. Leguminosae).

Lignum Rubi Wood of *Rubus sp.* (Fam. Rosaceae).

Massa Medicata Fermentata (stir-baked) Cut Massa Medicata Fermentata to small pieces, stir-bake as described under the method for simple stir-baking (Appendix Ⅱ D) until a dark yellow colour develops on the surface.

Massa Pinelliae Fermentata A cake prepared from pinellia tuber, ginger juice, alum, Massa Medicata Fermentata and wheat powder.

Melanteritum Copperas Mineral or chemical products of ferric sulfate, ferrisulfas is main component.

Mirabilitum Preparatum A white crystalline powder prepared from the ripe pericarp of *Citrullus vulgaris* Schrad. (Fam. Cucurbitaceae) and natural sodium sulfate.

Musculus Bungari Dried body of *Bungarus multicinctus* Blyth (Fam. Elapidae), *Agkistrodon strauchii* Bedriaga (Fam. Crotalidae) or *Opheodrys major* (Guenther) (Fam. Colubridae), removed from the head, tail and skin.

Myelencephalon Passeris Montani Brains of *Passer montanus saturatus* Stejneger (Fam. Ploceidae).

Myrrha (processed) (1) Stir the clean Myrrha as described under the method for stir-baking with vinegar (Appendix Ⅱ D) until the surface lustrous. To each 100 kg of Myrrha add 5 kg of vinegar.
(2) Stir-bake the clean Myrrha as described under the method for simple stir-baking (Appendix Ⅱ D) until the surface becomes lustrous.

Olibanum (processed) (1) Stir-bake the clean Olibanum as described under the method for stir-baking with vinegar (Appendix Ⅱ D) until the surface becomes lustrous. To each 100 kg of Olibanum add 5 kg of vinegar.
(2) Stir-bake the clean Olibanum as described under the method for simple stir-baking (Appendix Ⅱ D) until the surface becomes lustrous.

Os Canidis Skeleton of *Canis familiaris* L. (Fam. Canidea).

Os Draconis A skeleton fossils of ancient mammals, such as *Hipparion*, *Rhinoceros*, *Cervus*, *Bos*, *Elephas*, etc, or incisor fossils of *Elephas*.

Os Pardi Dried skeleton of *Panthera pardus* Linnaeus (Fam. Felidae).

Pulvis Cerebri Susis Dried powder of brains of *Sus scrofa domestica* Brisson (Fam. Suidae).

Pulvis Ferri (processed with Fructus Chebulae) Boil 130 g of Cacumen Tamaricis in 100 ml of water for 3 hours, filter, add 500 g of fine iron powder to the filtrate and a quantity of water to macerate it, boil for 3 hours, discard the liquid, wash the residue with water for 3 times, add 50 g of salt and 1000 ml of water, boil for 2 hours, discard the liquid, wash the residue again with water for 4 times, add 2500 g of fine powder of Fructus Chebulae, mix well, add 1800 ml of hot water, stir, stand for 3 days, stir for 3 times a day, take out on the fourth day, spread and dry in the shade, draw out the unreacted iron powder with magnet, pulverize to fine powder, and sift. The drug can not be prepared in summer.

Radix Aconiti Balfourii Dried root of *Aconitum balfourii* Stapf or *Aconitum szechenyianum* Gay (Fam. Ranunculaceae).

Radix Araliae Armatae Dried root of *Aralia armata* (Wall.) Seem. or *Aralia decaisneana* Hance (Fam. Araliaceae).

Radix Ardisiae Crenatae Dried root of *Ardisia crenata* Smis (Fam. Myrsinaceae).

Radix Asparagi Pseudofilicini Dried root of *Asparagus pseudofilicinus* Wang et Tang (Fam. Liliaceae).

Radix Bupleuri Marginati Dried root of *Bupleurum marginatum* Wall. ex DC. (Fam. Umbelliferae).

Radix, Caulis et Folium Crotonis Caudati Dried root, stem and leaf of *Croton caudatus* Geisel. var. *tomentosa* Hook. (Fam. Euphorbiaceae).

Radix Cudraniae Dried root of *Cudrania cochinchensis* (Lour.) Kudo. et Masam. or *Cudrania tricuspidata* (Carr.) Bur. (Fam. Moraceae).

Radix et Caulis Solani Dried root and old stem of *Solanum indicum* L., *Solanum surattense* Burm. f., *Solanum torvum* Swartz. or *Solanum xanthocarpum* Schrad. et Wendl. (Fam. Solanaceae).

Radix et Caulis Solani Melongenae Dried root and stem of *Solanum melongena* L. (Fam. Solanaceae).

Radix et Rhizoma Cinnamomi Camphorae Dried root and rhizome of *Cinnamomum camphora* (L.) Presl or *Cinnamomum porrectum* (Roxb.) Kostern. (Fam. Lauraceae).

Radix et Rhizoma Litseae Dried root or rhizome of *Litsea cubeba* (Lour.) Pers. (Fam. Lauraceae).

Radix et Rhizoma Rhodiolae Dried root and rhizome of *Rhodiola kirilowii* (Regel) Regel (Fam. Crassulaceae).

Radix et Rhizoma Zanthoxyli Dissiti Dried root and stem of *Zanthoxylum dissitum* Hemsl. (Fam. Rutaceae).

Radix Flemingiae Dried radix of *Flemingia philippinensis* Merr. et Rolfe or *Flemingia macrophylla* (Willd.) Merr. (Fam. Leguminosae).

Radix Ilicis Asprellae Dried root of *Ilex asprella* (Hook. et Arn.) Champ. ex Benth. (Fam. Aquifoliaceae).

Radix Ilicis Pubescens Dried root of *Ilex pubescens* Hook. et Arn. (Fam. Aquifoliaceae).

Radix Inulae Cappae Dried root of *Inula cappa* DC. (Fam. Compositae).

Radix Kadsurae Coccineae Dried root of *Kadsura coccinea* (Lem.) A. C. Smith or dried rattan of *Kadsura heteroclite* (Roxb.) Craib. (Fam. Magnoliaceae).

Radix Phlomis Kawaguchii Dried root of *Phlomis kawa-*

guchii Murata (Fam. Labiatae).

Radix Rosae Dried root of *Rosa laevigata* Michx, *Rosa Cymosa* Tratt. or *Rosa multiflora* var. *cathayensis* Rehd. et Wils. (Fam. Rosaceae).

Radix Streptocauli Died root of *Streptocaulon griffithii* Hook. f. (Fam. Asclepiadaceae).

Radix Syringae Pinnatifoliae Dried root of *Syringa pinnatifolia* Hemsl. (Fam. Oleaceae).

Radix Viticis Trifoliae Dried root of *Vitex trifolia* L. var. *simplicifolia* Cham. or *Vitex trifolia* L. (Fam. Verbenaceae).

Ramulus Polygoni Aubertii Dried stem of *Polygonum aubertii* Henry (Fam. Polygonaceae).

Ramulus Pruni Dried young stem of *Prunus persica* (L). Batsch or *Prunus davidiana* (Carr.) Franch. (Fam. Rosaceae).

Ramulus Sambuci Dried stem of *Sambucus racemosa* L. (Fam. Caprifoliaceae).

Ramulus Sophorae Dried young stem of *Sophora japonica* L. (Fam. Leguminosae).

Resina Draconis Dried resin obtained from the fruit and stem of *Daemonorops draco* Bl. (Fam. Palmae).

Rhizoma Acori Calami Dried rhizome of *Acorus calamus* L. (Fam. Araceae).

Rhizoma Begoniae Dried rhizoma of *Begonia crassirostris* Irmsch., *Begonia palmata* D. Don or *Begonia pedatifida* Lévl. (Fam. Begoniaceae).

Rhizoma Dioscoreae Nipponicae Dried rhizome of *Dioscorea nipponica* Makino (Fam. Dioscoreaceae).

Rhizoma Dioscoreae Panthaicae Dried rhizome of *Dioscorea panthaica* Prain et Burkill (Fam. Diosoreaceae).

Rhizoma et Radix Anisochili Dried rhizome with old stem and root of *Anisochilus carnosus* (L.) Wall. (Fam. Labiatae).

Rhizoma Hedychii Rhizome of *Hedychium venustum* Wight (Fam. Zingiberaceae).

Rhizoma Taccae Dried rhizome of *Tacca esquirolii* (Levl.) Rehd. (Fam. Taccaceae).

Sal Ammoniaci Mineral of *Halitum violaceum* mainly containing ammonium chloride.

Saltpetre Crystal refined from natural potassium nitrate.

Semen Cucumis Dried seed of *Cucumis melo* L. (Fam. Cucurbitaceae).

Semen Cynanchi Dried seed of *Cynachum thesioides* (Freyn) K. Schum (Fam. Asclepiadaceae).

Semen Entadae Dried seed of *Entada phaseoloides* (L.) Merr. (Fam. Leguminosae).

Semen Glycinis Germinatus Dried Germinated seed of *Glycine max* (L.) Merr. (Fam. Leguminosae).

Semen Glycinis Dried seed of *Glycine max* (L.) Merr. (Fam. Leguminosae).

Semen Herpetospermi Caudigeri Dried seed of *Herpetospermum caudigerum* Wall. (Fam. Cucurbitaceae).

Semen Hydnocarpi Dried seed of *Hydnocarpus anthelmintica* Pierre (Fam. Flacourtiaceae).

Semen Nigellae Sativae Dried seed of *Nigella sativa* L. (Fam. Ranunculaceae).

Semen Oryzae cum Monasci Fermentatum Hyphae and spores of *Monascus purpureus* Went (Fam. Eurotiaceae) cultivated artificially to make the hyphae grow in the grains of rice and the grains turn red.

Semen Phaseoli Radiati Dried seed of *Phaseolus radiatus* L. (Fam. Leguminosae).

Succinum Obtained by transformation of resin from ancient *Pinus* plants, embeded underground for very long time.

Sumi Sinensis Chinese ink prepared from pine soot, Borneolum Syntheticum, mucilage and perfame.

Tabanus Female insect of *Tabanus bivittatus* Matsumura (Fam. Tabanidae).

Trona A ramified crystal occurring around the salt lake, mainly containing sodium carbonate.

Appendix Ⅳ General Identification Tests

Acetates
(1) Heat a quantity of the substance being examined with sulfuric acid and ethanol; the characteristic odour of ethyl acetate is liberated.
(2) To a neutral solution of the substance being examined add 1 drop of ferric chloride TS; a deep red colour is produced which disappears on addition of dilute mineral acid.

Aluminium Salts
(1) Add sodium hydroxide TS to a solution of the substance being examined; a gelatinous white precipitate appears which is soluble in an excess of sodium hydroxide TS.
(2) Add ammonia TS to a solution of the substance being examined until a gelatinous white precipitate is formed, add a few drops of sodium alizarinsulfonate IS; the precipitate becomes cherry red in colour.

Ammonium Salts
(1) Heat a quantity of the substance being examined with an excess of sodium hydroxide TS; the characteristic odour of ammonia is perceived, the vapour turns moistened red litmus paper to blue and blackens a strip of filter paper moistened with mercurous nitrate TS.
(2) To a solution of the substance being examined add 1 drop of alkaline mercuric potassium iodide TS; a reddish brown precipitate is produced.

Antimony Salts
(1) Acidify a solution of the substance being examined with acetic acid, heat on a water bath and to the hot solution add a few drops of sodium thiosulfate TS; an orange red precipitate is produced gradually.
(2) Acidify a solution of the substance being examined with hydrochloric acid, pass hydrogen sulfide gas into the solution; an orange precipitate, soluble in ammonium sulfide TS or sodium sulfide TS, is produced.

Barium Salts
(1) Moisten the substance being examined with hydrochloric acid on a platinum wire, it imparts a yellowish green colour to a nonluminous flame, or a blue colour when viewed through a green glass plate.
(2) Add dilute sulfuric acid to a solution of the substance being examined; a white precipitate is produced which is insoluble in hydrochloric acid or nitric acid.

Benzoates
(1) Add ferric chloride TS to a neutral solution of the substance being examined; a dull yellow precipitate is formed which turns to white on addition of dilute hydrochloric acid.
(2) Introduce a quantity of the substance being examined into a dry test tube, add sulfuric acid and heat gently; no charring occurs, a white sublimate of benzoic acid is deposited on the inner wall of the test tube.

Bismuth Salts
(1) Add potassium iodide TS to a solution of the substance being examined; a reddish brown colour or dark brown precipitate is produced, the precipitate is soluble in an excess of the reagent, forming a yellowish brown solution. Dilute the solution with water; an orange precipitate is produced.
(2) Acidify a solution of the substance being examined with dilute sulfuric acid, add a quantity of 10% thiourea solution, an intense yellow colour is produced.

Borates
(1) A solution of the substance being examined, acidified with hydrochloric acid, turns turmeric paper to brownish red, the colour deepens on drying and becomes greenish black when moistened with ammonia TS.
(2) Mix a quantity of the substance being examined with sulfuric acid and add methanol, when the mixture is ignited, it burns with a green-bordered flame.

Bromides
(1) Add silver nitrate TS to a solution of the substance being examined; a curdy, pale yellow precipitate is formed which is slightly soluble in ammonia TS and practically insoluble in nitric acid.
(2) Add chlorine TS dropwise to a solution of the substance being examined; bromine is liberated, add chloroform and shake, a yellow to reddish brown colour is developed in the chloroform layer.

Calcium Salts
(1) Moisten the substance being examined with hydrochloric acid on a platinum wire, it imparts a yellowish red colour to a nonluminous flame.
(2) Add 2 drops of methyl red IS to a solution of the substance being examined (1 → 20), neutralize with ammonia TS and then acidify with hydrochloric acid. Add ammonium oxalate TS; a white precipitate is produced which is soluble in hydrochloric acid but insoluble in acetic acid.

Carbonates and Bicarbonates
(1) Add dilute acid to a solution of the substance being examined, it effervesces with the evolution of carbon dioxide, producing a white precipitate when passed into calcium hydroxide TS.
(2) Add magnesium sulfate TS to a solution of the substance being examined; a white precipitate is produced immediately (carbonates) or on boiling (bicarbonates).
(3) A solution of the substance being examined is colourless or only slightly coloured on the addition of phenolphthalein IS (bicarbonates); or an intense red colour is produced (carbonates).

Chlorides
(1) Acidify a solution of the substance being examined with nitric acid and add silver nitrate TS; a curdy, white precipitate is formed which is soluble in ammonia TS and reprecipitated on addition of nitric acid. Organic bases should be removed by the addition of ammonia TS and filtration prior to the test.
(2) Mix a small quantity of the substance being examined with an equal part of manganese dioxide, moisten with sulfuric acid and heat gently; chlorine is evolved which turns a strip of moistened starch-iodide paper to blue.

Citrates
(1) To 2 ml of a solution of the substance being examined equivalent to about 10 mg of citric acid, add a few drops of dilute sulfuric acid and heat to boiling, then add a few drops

of potassium permanganate TS and shake; the violet colour is discharged. Divide the solution into two portions, to one portion add a drop of mercuric sulfate TS, to the other portion add a few drops of bromine TS; a white precipitate is produced in both solutions.
(2) To about 5 mg of the substance being examined add about 5 ml of pyridine-acetic anhydride (3 : 1), shake, a yellow to red or violet-red colour is produced.

Copper Salts
(1) Add a few drops of ammonia TS to a solution of the substance being examined; a light blue precipitate is produced which is soluble in an excess of the reagent, forming a dark blue solution.
(2) Add potassium ferrocyanide TS to a solution of the substance being examined; a reddish brown colour or precipitate is produced.

Ferric Salts
(1) Add potassium ferrocyanide TS to a solution of the substance being examined; a dark blue precipitate is formed which is insoluble in dilute hydrochloric acid, it decomposes to form a brown precipitate on addition of sodium hydroxide TS.
(2) Add ammonium thiocyanate TS to a solution of the substance being examined; a red colour is produced.

Ferrous Salts
(1) Add potassium ferricyanide TS to a solution of the substance being examined; a dark blue precipitate is formed which is insoluble in dilute hydrochloric acid, it decomposes to form a brown precipitate on addition of sodium hydroxide TS.
(2) To a solution of the substance being examined add a few drops of a 1% solution of o-phenanthroline in ethanol; a deep red colour is produced.

Iodides
(1) Add silver nitrate TS to a solution of the substance being examined; a curdy, yellow precipitate is produced which is insoluble in nitric acid or ammonia TS.
(2) Add chlorine TS dropwise to a solution of the substance being examined; iodine is liberated, add chloroform and shake, a violet colour is produced in the chloroform layer; if starch IS is added instead of chloroform, a blue colour is produced.

Lactates
To 5 ml of a solution of the substance being examined equivalent to about 5 mg of lactic acid in a test tube, add 1 ml of bromine TS and 0.5 ml of dilute sulfuric acid. Heat on a water bath with stirring until the colour is discharged, add 4 g of ammonium sulfate and mix well, add dropwise along the inner wall of the tube 0.2 ml of a 10% solution of sodium nitroprusside in dilute sulfuric acid and 1 ml of concentrated ammonia TS, allow to stand for 30 minutes without mixing; a dark green ring is developed at the interface of the two layers.

Lithium salts
(1) Alkalize the solution of the substance being examined with sodium hydroxide TS, add sodium carbonate TS, a white precipitate is produced on boiling which is soluble in ammonium chloride TS.
(2) Moisten the substance being examined with hydrochloric acid on a platinum wire, it imparts a crimson colour to a nonluminous flame.
(3) To a quantity of the substance being examined add dilute sulfuric acid or soluble sulfates solution, no precipitate is produced (distinction from strontium).

Magnesium Salts
(1) Add ammonia TS to a solution of the substance being examined; a white precipitate is produced which redissolves on addition of ammonium chloride TS. Add 1 drop of disodium hydrogen phosphate TS and shake; a white precipitate insoluble in ammonia TS is produced.
(2) Add sodium hydroxide TS to a solution of the substance being examined; a white precipitate is produced which is insoluble in an excess of the reagent, filter, the precipitate is coloured reddish brown on addition of iodine TS.

Malonylureas
(1) Dissolve about 0.1 g of the substance being examined in 1 ml of sodium carbonate TS and 10 ml of water, shake for 2 minutes and filter. To the filtrate add a few drops of silver nitrate TS; a white precipitate is produced which redissolves on shaking, but it is insoluble in an excess of the reagent.
(2) Dissolve about 50 mg of the substance being examined in 5 ml of pyridine solution (1→10), add 1 ml of copper pyridine TS; a violet colour or precipitate is produced.

Mercuric Salts
(1) Add sodium hydroxide TS to a solution of the substance being examined; a yellow precipitate is produced.
(2) Add potassium iodide TS to a neutral solution of the substance being examined; a scarlet precipitate is produced which is soluble in an excess of the reagent. To the solution add sodium hydroxide TS and an ammonium salt; a reddish brown precipitate is produced.

Mercurous Salts
(1) To a quantity of the substance being examined add ammonia TS or sodium hydroxide TS; a black colour is developed.
(2) To a quantity of the substance being examined add potassium iodide TS and shake; a yellowish green precipitate is produced, changing to greyish green rapidly and then to greyish black gradually.

Nitrates
(1) Mix cautiously a solution of the substance being examined with an equal volume of sulfuric acid and allow to cool, add ferrous sulfate TS along the inner wall of the test tube; a brown ring is developed at the interface of the two layers.
(2) To a solution of the substance being examined add cautiously sulfuric acid and metallic copper; a reddish brown fume is evolved on heating.
(3) Add dropwise potassium permanganate TS to a solution of the substance being examined; the violet colour does not disappear (distinction from nitrites).

Organic Fluorinated Compounds
Weigh about 7 mg of the substance being examined, carry out the method for oxygen flask combustion (Appendix Ⅶ C), using 20 ml of water and 6.5 ml of sodium hydroxide solution (0.01 mol/L) as the absorbing liquid. To 2 ml of the resulting solution add 0.5 ml of alizarin fluorine blue TS and 0.2 ml of a solution containing 12% of sodium acetate in dilute acetic acid, dilute with water to 4 ml and add 0.5 ml of cerous nitrate TS; a bluish violet colour is produced. Perform a blank determination in the same manner.

Phosphates
(1) Add silver nitrate TS to a neutral solution of the substance being examined; a light yellow precipitate is formed which is soluble in ammonia TS or dilute nitric acid.
(2) Add magnesium ammonium chloride TS to a solution of the substance being examined; a white crystalline precipitate is produced.
(3) To a solution of the substance being examined add ammonium molybdate TS and nitric acid; a yellow precipitate soluble in ammonia TS is produced on heating.

Potassium Salts
(1) Moisten the substance being examined with hydrochloric acid on a platinum wire, it imparts a violet colour to a

nonluminous flame. If sodium is also present, the yellow colour can be screened out by viewing through a cobalt glass plate.
(2) Ignite the substance being examined to remove any ammonium salt contaminated, cool, dissolve it in water, add acetic acid and a 0.1% solution of sodium tetraphenylborate; a white precipitate is produced.

Primary Aromatic Amines
To about 50 mg of the substance being examined add 1 ml of dilute hydrochloric acid and boil gently to effect dissolution if necessary, cool, add a few drops of sodium nitrite solution (0.1 mol/L) and alkaline 2-naphthol TS; a precipitate coloured from orange yellow to scarlet is formed depending on the identity of the substance being examined.

Salicylates
(1) To a dilute solution of the substance being examined add 1 drop of ferric chloride TS; a violet colour is produced.
(2) Add dilute hydrochloric acid to a solution of the substance being examined; a white precipitate of salicylic acid is produced which is soluble in ammonium acetate TS.

Silver Salts
(1) Add dilute hydrochloric acid to a solution of the substance being examined; a curdy, white precipitate is produced which is soluble in ammonia TS and reprecipitated on addition of nitric acid.
(2) Add potassium chromate TS to a solution of the substance being examined; a brick red precipitate is produced which is soluble in nitric acid.

Sodium Salts
(1) Moisten the substance being examined with hydrochloric acid on a platinum wire; it imparts an intense yellow colour to a nonluminous flame.
(2) Add zinc uranyl acetate TS to a neutral solution of the substance being examined; a yellow precipitate is produced.

Stannous salts
One drop of an aqueous solution of the substance being examined turns ammonium molybdophosphate test paper to blue.

Sulfates
(1) Add barium chloride TS to a solution of the substance being examined; a white precipitate is formed which is insoluble in hydrochloric acid or nitric acid.
(2) Add lead acetate TS to a solution of the substance being examined; a white precipitate is formed which is soluble in ammonium acetate TS or sodium hydroxide TS.
(3) Add hydrochloric acid to a solution of the substance being examined; no white precipitate is produced (distinction from thiosulphates).

Sulfites and Bisulfites
(1) Add hydrochloric acid to the substance being examined; the pungent odour of sulfur dioxide is perceived, the vapour blackens a strip of filter paper moistened with mercurous nitrate TS.
(2) Add iodine TS dropwise to a solution of the substance being examined; the colour of iodine is discharged.

Tartrates
(1) To a neutral solution of the substance being examined in a clean test tube, add a few drops of ammoniacal silver nitrate TS and heat in a water bath; silver is deposited on the inner wall of the test tube as a mirror.
(2) Acidify a solution of the substance being examined with acetic acid, add 1 drop of ferrous sulfate TS and 1 drop of hydrogen peroxide TS, make the solution alkaline with sodium hydroxide TS when the colour is discharged; a violet colour is produced.

Tropane Alkaloids
To about 10 mg of the substance being examined add 5 drops of fuming nitric acid, evaporate to dryness on a water bath, a yellow residue is obtained. Cool, moisten the residue with 2-3 drops of ethanol, add a small pellet of potassium hydroxide; an intense violet colour is produced.

Zinc Salts
(1) Add potassium ferrocyanide TS to a solution of the substance being examined; a white precipitate is formed which is insoluble in dilute hydrochloric acid.
(2) Acidify a solution of the substance being examined with dilute sulfuric acid, add 1 drop of 0.1% copper sulfate solution and a few drops of mercuric ammonium thiocyanate TS; a violet precipitate is produced.

Appendix Ⅴ Spectrophotometry

Spectrophotometry is a method used in qualitative and quantitative analysis in which the light absorption of the substance being examined is measured at a definite wavelength or within a definite range of wavelength.

The spectral ranges involved in pharmaceutical analysis mainly consist of 3 regions: (1) the ultraviolet region 200-400 nm, (2) the visible region 400-760 nm and (3) the infrared region 2.5-25 μm (or 4000-400 cm^{-1}). The instrument should be regularly calibrated to keep the precision and accuraly of determination.

When monochromatic radiation passes through an absorbing medium, the absorbance of the radiation is proportional to the concentration of the absorbing substance and the thickness of the absorbing medium, this relation is expressed by the following equation:

$$A=\lg 1/T=ECL$$

Where A is the absorbance, T is the transmittance, E is the absorption coefficient, denoted by $E^{1\%}_{1\,cm}$, it is the absorbance of 1% solution in a 1 cm cell. C is the concentration of the substance expressed in g per 100 ml, calculated on the dried or dehydrated basis and L is the absorption path length expressed in cm. The term A (1%, 1 cm) is used in this pharmacopoeia to denote the absorbance of a 1% solution in a 1 cm cell.

The wavelength of the selective absorption and the corresponding absorption coefficient are physical constants of the substance being examined. When the absorption coefficient of a pure substance is known, the content of the substance can be calculated by determining the absorbance of the solutions made in the same conditions and using the formula above. In the visible region, the content of a colourless substance can be determined colourimetrically after the addition of a colour developing agent or any other treatment, so it is also called colourimetric analysis.

Ⅴ A Ultraviolet Spectrophotometry and Colourimetry

Calibration and performance test of the instrument

1. *Wavelength* The change of envionment factors may affect the mechanical parts of the spectrophotometer and cause a drift of the wavelength scale, therefore it must be calibrated regularly and immediately before the measurement. Mercury lamp is the best choice of light source for this purpose, the following spectral lines of the mercury lamp can be used: 237.83 nm, 253.65 nm, 275.28 nm, 296.73 nm, 313.16 nm, 334.15 nm, 365.02 nm, 404.66 nm, 435.83 nm, 546.07 nm and 576.96 nm. The wavelength scale may also be calibrated by means of the 486.02 nm and 656.10 nm lines of deuterium discharge lamp. Holmium glass filter exhibits sharp absorption peaks at 279.4 nm, 287.5 nm, 333.7 nm, 360.9 nm, 418.5 nm, 460.0 nm, 484.5 nm, 536.2 nm and 637.5 nm therefore can be used for calibration of wavelength. However, the exact values for the position of these peaks may differ slightly depending on the commercial source of the filter or time.

2. *Accuracy of absorbance* The absorbance scale may be checked with a solution of potassium dichromate in sulfuric acid. Dissolve about 60 mg of potassium dichromate primary standard, previously dried to constant weight at 120℃ and accurately weighed, in 0.005 mol/L sulfuric acid solution to make 1000 ml, Measure and calculate the absorbance coefficient at the specific wavelength, then compare with the specific absorption coefficient. The absorption coefficient should accord with the table below.

Wavelength/nm	235(min)	257	313	350(max)
Absorbance $E^{1\%}_{1\,cm}$	124.5	144.0	48.6	106.6
Normalized absorbance and maximum tolerance $E^{1\%}_{1\,cm}$	123.0-126.0	142.8-146.2	47.0-50.3	105.5-108.5

3. *Check of stray light* The solutions are made according to the reagents and concentrations listed below. The transmittance of these solutions measured in a 1 cm quartz cell against water at the specific wavelength should follow the table below.

Reagent	Concentration/% (g/ml)	Wavelength/nm	Transmittance/%
Sodium Iodide	1.00	220	<0.8
Sodium Nitrite	5.00	340	<0.8

Requirements for the solvents

The organic solvents containing heteroatoms, usually have very strong end absorption. Therefore, when used as solvents, their serviceable range can not be smaller than the cut-off wavelength. For instance, the cut-off wavelength of methanol and ethanol are 205 nm. Also, if the solvent is impure, it may increase the interfere absorption. Therefore, the solvent used in spectrophotometric determinations should be checked for any interfering absorption peak around the selected wavelength for the measurement of the absorbance being examined, namely the absorbance of solvent in a 1 cm quartz cell with air as blank (namely nothing in the light way) is determined. The absorbance of a solvent should not exceed 0.40 in the range of 220 nm to 240 nm, 0.20 in the range of 241 nm to 250 nm, 0.10 in the range of 251 nm to 300 nm and 0.05 at wavelengths above 300 nm, when measured in a 1 cm quartz cell against air.

Procedure

Unless specified otherwise, the same batch of solvent used to prepare the solution of the substance being examined should be employed as the blank in matched 1 cm quartz cells. The wavelength of maximum absorption should be checked by measuring the absorbance of the substance being examined in the vicinity of the specified wavelength, within a range of ±2 nm, to check the wavelength of the absorption

maximum is correct or not. Unless specified otherwise, the absorption maximum must be within ±2 nm as specified in the monograph. When the absorbance reading of the solutions being examined is 0.3 to 0.7, the experimental error is the smallest. The width of the spectral slit must be smaller than one tenth of the half-width of the absorption band, otherwise low absorbance will be resulted. The slit width is appropriate if further reduction does not result in an increase of the absorbance reading. The absorbance of an unmatched cell with the solvent concerned as a blank must be subtracted from the absorbance of the substance being examined or automatically substracted by the instrument.
When the pH of the solution has effect on the determined results, the pH of the solution of the substance being examined should accord with that of CRS.

1. *Identification and quality tests* Ultraviolet spectrophotometry used for identification and quality tests is proceeded according to the method described in the items specified under the corresponding monograph.

2. *Determination of the content* Ultraviolet spectrophotometry is used for assay usually as the following methods.

(1) *Reference substance comparison method* Prepare separately solutions of the substance being examined and CRS according to the method described under items of the individual monograph. The content of the CRS in the solution should be within 100%±10% of the labelled amount of the solution prepared with substance being examined and with solvent of the same batch. Determine the absorbances of solutions of test preparation and of reference preparation at specified wavelength, calculate the concentration of the test preparation in the solution according to the following equation:

$$C_x=(A_x/A_R)C_R$$

Where C_x is the concentration of the test preparation; A_x is the absorbance of the test preparation; C_R is the concentration of the reference preparation and A_R is the absorbance of the reference preparation.

(2) *Absorption coefficient method* Prepare the solutions of the substance being examined according to the method described under the individual monograph, determine the absorbance at specified wavelength. The concentration of the test preparation is determined by calculate with the absorption coefficient specified in the monograph concerned. When using this method, the absorption coefficient should usually be larger than 100 and the instrument should regularly be calibrated and checked.

(3) *Colourimetry* Determine the absorption after revealing by adding suitable colour-developing agent in the solution of the substance being examined and determine its content. This method is called colourimetry.
Colourimetry determination should be carried out with a reference substance concomitantly. An equal volume of solvent, added with the same reagent and treated in the same way is used as blank. Examine the absorption of the solutions at different specific wavelength. A curve should be produced by plotting the absorbance against concentration. The concentration of the test preparation can be determined by interpolating its absorbance on the curve.
The reference solution and the solution being examined can be operated simultaneously. After colour-developing, examine both of their absorptions at the specific wavelength, using suitable reagent as blank. Calculate the concentration of the solution being examined as method (1) described above.
Unless specified otherwise, the blank used in this colourimetry method is the substrate using an equal volume of solvent for the reference of the solution being examined, then in turn relative magents with equal quantity are added, then treated with the same method.

Ⅴ C Infrared Spectrophotometry

Calibration and performance test of the instrument
Fourier-transform infrared spectrophotometers or dispersive infrared spectrophotometers are often used for pharmaceutical analysis. The wave-number scale of an infrared spectrophotometer may be calibrated by using a polystyrene film of 0.04 mm thickness. The absorption peaks at 3027 cm^{-1}, 2851 cm^{-1}, 1601 cm^{-1}, 1028 cm^{-1} and 907 cm^{-1} are used for the calibration of the wave-number.
The error of the wave-number of the Fourier transform infrared spectrophotometers at about 3000 cm^{-1} should be not more than ±5 cm^{-1}, at about 1000 cm^{-1} should be not more than ±1 cm^{-1}.
The resolution of the instrument between 3110-2850 cm^{-1} requires that seven peaks should be clearly isolated, the depth of the trough from the maximum absorption at about 1583 cm^{-1} to the minimum at about 1589 cm^{-1} should be not less than 12% transmittance and that from the maximum at about 2851 cm^{-1} to the minimum at about 2924 cm^{-1} should be not less than 18% transmittance. Unless specified otherwise, the labelled resolution of the instrument should not be less than 2 cm^{-1}.

Preparation and test of the substance being examined

1. *Identification of the raw drugs* Unless specified otherwise, for the identification test the substance being examined must be prepared according to the method described in "Atlas of Infrared spectra of Drugs" (in each volume), edited by Chinese Pharmacopoeia Commission.

2. *Identification of the preparations* When the method is used for identification, the treatment should be clearly specified in the text of the monograph.
If auxiliary materials do not have interfere, after treatment, contrast directly with the standard spectrum of the raw drugs. If auxiliary materials still have different degrees of interfere, referring to the standard spectrum of the raw drugs, select 3 to 5 characteristic absorption peaks of the component being examined in the fingerprint region where the auxiliary materials do not have interfere. List the locations of wave-number as the references of identification, the error of wave-number of the measured spectral band should be less than 0.5% of that of the specified wave-number.

3. *Limit or content examination of the crystals and isomers* The method of sample preparation and determination is performed according to the procedure in the individual monograph.

Notices:

1. In the monograph where infrared absorption spectrum is concordant with the reference spectrum refers to the spectrum specified in the above "Atlas of Infrared Spectra of Drugs". (Vol. Ⅰ. 1995 Ed, Vol. Ⅱ. 2000 Ed, Vol. Ⅲ 2005 Ed) If the spectrum of one compound is referred in different editions, refer to that of the latest.

2. The spectrum of a solid substance may be different from the reference spectrum due to polymorphism. In this case, the substance being examined should be pre-treated according to the method described under individual spectrum of the Atlas. or the method described in the specified monograph.

If the crystal form of the drug and the suitable pre-treatment method are not specified, reference substances can be used. In the same conditions, recrystallize the substance being examined and reference substance using suitable solvents. Then examine as the specified method. If the crystal form of the drug is specified, examine the reference substance which has the corresponding crystal form of the drug.

3. Several factors such as difference in instrument performance of various models, inadequate or successive grinding in preparation of the disc, moisture in the sample or halide carrier, may give rise to unsatisfactory spectrum in shape. It should be kept in mind during the comparison with the reference spectrum.

Ⅴ D Atomic Absorption Spectrophotometry

The object being examined of the atomic absorption spectrophotometry is the metallic atoms and some of the nonmetallic atoms which are in the state of atom.

The light of characteristic wavelength emitted from a lamp with the element to be examined is absorbed when it passes through the sample vapor of the atom generated from the nebulizer-burning containing the element being examined atomized to the ground state. Atomic absorption obeys the general rule for absorption spectrophotometry. The assay is carried out by comparing the absorbance of the test preparation with that of the reference preparation.

General demand for the instrument

The instrument is an atomic absorption spectrophotometer, which consists of a light source, a nebulizer-burner or furnace system, a monochromator and detector system. There are also background correction system, automatic sampling system, etc.

1. *Light source* Commonly use the hollow cathode lamp of which the target element is cathode.

2. *Atomizer* Mainly four styles: flame atomizer, graphite furnace atomizer, hydride producing atomizer and cold steam producing atomizer.

1) *Flame atomizer* Mainly contains nebulizer and combustion lamp. It makes the analyte into aerosol, then mixes it with combustion gas, puts the mixture into the flame of combustion lamp to dry, evaporate and dissociate the analyte, so that the target element will appear as ground state atoms. The flame could be made up with several kinds of mixed gas. Ethyne-air flame is commonly used. By changing the proportion of combustion gas and combustion-supporting gas, the temperature of the flame can be controlled and a better stability of the flame and a better sensitivity can be attained.

2) *Graphite furnace atomizer* Mainly contains galvanothermy graphite furnace and power supply. It can dry and incinerate the analyte and then let the target element be ground state atoms. Commonly the graphite is used as heating unit. Shielding gas usually be used to be resistant to oxidation and transport the analyte.

3) *Hydride generating atomizer* Mainly contains a hydride generator and an atomic absorption cell. It can be used to measure the elements, such as arsenic, selenium, stannum and stibium, etc. It deoxidizes the target element in acid medium to hydride which has low boiling point and is easy to decompose when heating. Then with the help of carrier gas, the hydride will be put into the atomic absorption cell which is made up with silica tube and heater. The hydride will be heated to decompose and appear as ground state atoms.

4) *Cold steam generating atomizer* Mainly contains mercurial vapor producer and atomic absorption cell and only used to measure mercurial. It deoxidizes the mercury ion in the analyte to mercurial vapor, then puts the vapor into the silica atomic absorption cell and measures.

3. *Monochromator* It separates a specified wavelength light from the light emitted from the light source. The instrument should provide a good spectral resolution and the ability to work well in quite narrow spectral bandwidth (0.2 nm). The commonly used wavelength region is 190-900 nm.

4. *Detection system* Mainly contains detector, signal treater and indicating recorder. It should provide a fine sensitivity, good stability and a short response time.

5. *Background correction system* It can correct the disturbance of relative adsorption in the atomize of the analyte. Four styles are commonly used: continuum source (deuterium lamp is commonly used for ultraviolet region), raman effect, spontaneous imbibition and non-adsorption effects.

In the analysis of atomic absorption, the disturbance of the background and other matters should be paid attention to. Changes of some of the working conditions (such as wavelength, split width, atomize conditions) may attect the sensitivity, stability and disturbance. We can select an appropriate spectral line and split width to measure. We can also change the flame temperature, add complexing agent or releasing agent and use the standard addition method to reduce the disturbance. In the graphite furnace method can use feasible background correction system or add matrix modifier to reduce the disturbance. The particular method should be selected by the prescription in the specified monograph.

Determination method

Method 1 (*Standard curve method*) Prepare not less than 3 reference solutions of the element being examined of different concentrations, covering the range recommended by the manufacturer of the instrument and add seperately the corresponding reagents as that for the test preparation. Examine the blank reference solution and the reference solutions of different concentrations in turn, note the absorption value. Prepare a calibration curve by plotting the mean value of each group of 3 readings against the concentration.

Prepare a test solution of the substance being examined as specified in the monograph, adjust the concentration to fall within the concentration range of the reference solution. Examine the absorption 3 times, record the readings and calculate the average value, wash the apparatus with deionized water after each spraying. Interpolate the mean

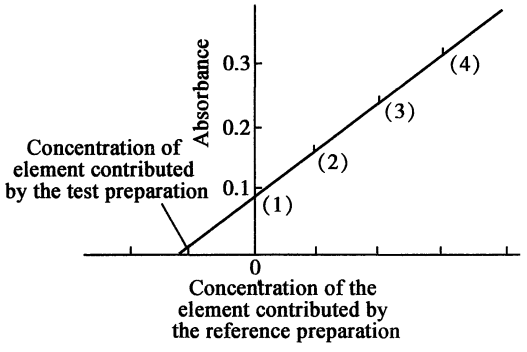

Fig. 4 Concentration of the element contributed by the reference preparation

value of the readings on the calibration curve to determine the concentration of the element.

Method 2 (*Internal standard method*) Place equal volumes of the test preparation in each of 4 volumetric flasks of the same size, to each of the flasks, except the first one, add an accurately measured amount of the reference preparation containing different concentrations of the element being determined. Dilute with de-ionized water to the volume and proceed as directed in the direct calibration method examine, determine and note the absorption value. Plot the mean values of each group of 3 readings against the corresponding concentration of the element contributed by the reference preparation, extrapolate the straight line to intersect with the axis of zero absorbance. The interception represents the concentration of calculate the content of the element in the test preparation. This method is only suitable for the circs, when the standard curve is linear and passes the originpoint the element contributed by the test preparation. (as Fig. 4)

Appendix Ⅵ Chromatography

Depending on the mechanism of the separation process, chromatographic methods can be classified into adsorption chromatography method, partition chromatography method, ion-exchange chromatography method, size-exclusion chromatography method etc.

Adsorption chromatography is based on the different affinity of individual components to the adsorbent (stationary phase), so that they can be eluted successively with a solvent or gas (mobile phase). The adsorbents commonly used are aluminum oxide, silica gel, polyamide powder etc.

Partition chromatography is based on the distribution of individual components between two phases. The stationary phase is coated on or chemically bonded to a solid support of large surface area. The mobile phase is a liquid or a gas. The supports commonly used are silica gel, kieselguhr, diatomaceous earth, cellulose powder, polymers with suitable functional grounds etc.

In ion-exchange chromatography, the stationary phase is either a cation exchange resin or an anion exchange resin. The mobile phase is usually an aqueous buffer solution, sometimes a definite quantity of organic solvent is added to modify the exchange property.

Size exclusion chromatography is also known as gel permeation chromatography or gel filtration chromatography. It is based on the different permeability of components of different molecular size into a support of definite pore size. Molecular sieves, cross-linked polystyrene gels, glucosan gels, silica gel and porous glass beads are commonly used as the stationary phase. Water or organic solvent is used as the mobile phase, depending on the chemical characteristics of the support and the substance being examined.

Chromatography may be classified into paper chromatography, thin layer chromatography, column chromatography, gas chromatography, high performance liquid chromatography and so on based on the method of separation.

Solvents used in chromatography must be of high purity and must not react with the substance being examined. Except gas chromatography, the operation is carried out at room temperature, unless otherwise specified. In column chromatography, paper chromatography and thin layer chromatography, the coloured zones can be detected visually, colourless substances can be detected under ultraviolet radiation of 254 nm or 365 nm. In paper chromatography or thin layer chromatography, colourless substances can also be detected by spraying with a colour-developing agent. Silica gel plates containing a fluorescent substance are sometimes used in thin-layer chromatography, so that colourless substance can be detected by the fluorescence quenching method. In column chromatography, gas chromatography and high performance liquid chromatography, the components can be detected by a suitable detector connected to the outlet of the column. In column chromatography, the components sometimes can be determined quantitatively by a suitable method after fractionation.

Ⅵ A Paper Chromatography

Paper chromatography is a partition chromatographic technique, in which paper in used as a support and the water or other substance contained in the paper is used as a stationary phase.

The substance being examined is developed by the mobile phase, after which the shift ratio value (R_f) could be used to denote the location of each component (R_f is the ratio of the distance between the center of the origin and that of the spots to the distance botween the center of the origin and the frontal of the mobile phase). In practice, R_f values may vary considerably due to experimental conditions. Therefore, the identification of a compound is usually carried out by comparing the behaviour of the compound to be identified with that of a reference substance under the same conditions. For drug identification, the position and colour (or fluorescence) of the main spots of the substance being examinod on the chromatogram should be identical with those of the reference substances. For purity inspection, the number or colour intensity (or fluorescence intensity) of the impurities contained should be examined according to the reguirements specified under each monograph, after a certain amount of substance being examined has been developed. For assay, the main chromatographic spot could be cut out from the paper, eluted with a solvent and subjected to a suitable measurement.

1. Apparatus and Materials

(1) *Developing chamber* It is usually a glass chamber, cylindrical or rectangular, which could be tightly closed with a glass lid. When it is used for descending method, a separator could be inserted through the lid with a hole on it for the addition of the mobile phase. A solvent trough supported by a rack is placed inside near the top of the chamber, a glass rod is used for holding the chromatographic paper, on both sides of the trough, there are two glass rods used to guide the paper so that no part of it is in contact with the wall of the trough. When it is used for ascending method, the hole on the lid is blocked by a stopper with a glass hook where the paper is suspended. The hook is capable of being lowered without opening the chamber. Remove the trough and rack.

(2) *Sample applicator* Microsyringe or capillary tubes with a rack are often used, which could ensure a correct and compact position of the applicated spot.

(3) *Chromatographic filter paper* Filter paper should be clean and uniform in texture and thickness and has a tensile strength. It should contain no impurities which may affect developing process or react with visualizing reagent employed, and affect the separation or identification. It may be pretreated before use if necessary. For descending method, cut a piece of filter paper along the grain direction

into strips of sufficient length and a convenient width, and draw a fine pencil line horizontally across the paper at such a distance from one end to make the line a few centimeters below the guide rod. When this end is secured in the solvent trough and the remainder of the paper is hanging freely outside the trough. The lower end of the paper may be cut into saw-toothed form to facilitate the mobile phase to drop down homogeneously, if necessary. For ascending method, the length of the paper is about 25 cm, the width of the paper is varied as required. Sometimes the paper can be rolled into cylindrical form to save space, the spotting line is about 2.5 cm from the lower edge of the paper.

2. Procedure

(1) *Descending method* Dissolve the substance being examined in a suitable solvent or solvent mixture to prepare a solution of specified concentration. Apply the solution in portions to the pencil line, allow it to dry in air or in a stream of warm air before the next application. The spots are commonly 2-4 mm in diameter, and spaced about 1.5-2.0 cm apart from each other in circular shape. Place the spotted end of paper in the solvent trough and hang the paper freely over the guide rod. Put a Petri dish containing the specified solvent or a strip of chromatographic filter paper moistened with the specified solvent into the chromatographic chamber to pre-equilibrate the chamber with the vapour of the specified solvent. Introduce a sufficient quantity of the mobile phase into the solvent trough and allow it to move along the chromatographic paper for the prescribed distance. Remove the chromatographic paper from the chromatographic chamber, mark the position of the solvent frontal and visualize the chromatogram prescribed in the monograph when the solvent is volatilized.

(2) *Ascending method* The solution of substance being examined is applied on the pencil line as directed in the descending method. The chamber is saturated with the vapour of a specified solvent or the developer placed in it. Lower the hook so that the paper is immersed in the developer to a depth of 0.5 cm, allow the mobile phase to ascend for about 15 cm, unless specified otherwise. Remove the paper from the chamber, mark the position of the solvent frontal and visualize the chromatogram as prescribed in the monograph when the solvent is volatilized.

One dimensional chromatography is that the development proceeds along one direction. Sometimes two-dimensional chromatography may be performed by turning the filter paper at right angle and then continue the development with the original developer or a different solvent system. Other chromatographic techniques, such as multiple development, continuous development and wedge shaped strip development etc., may also be used.

Ⅵ B Thin-Layer Chromatography

The thin-layer chromatography (TLC) is a separation technique in which test solutions are deposited in a uniform thin layer on a support (plate) and developed by the mobile phase in a chromatographic chamber to separate the components of the substance being examined. The chromatogram thus obtained is then compared with that obtained in the same way of the suitable reference solutions. The Thin-layer Scanning instrument can be further used for identification, inspection and assay.

1. Apparatus and Materials

(1) *Plates*

Pre-coated plates The pre-coated plates fall into two kinds: TLC plates and high performance thin-layer chromatography (HPTLC) plates, such as silica gel plates, silica gel GF_{254} plates, polyamide membrane.

Home-made plates The home-made plates could be used if the plates need special treatment and chemical modification in order to meet the separation requirements given that the quality of the chromatogram is ensured. The most widely used stationary phases are silica gel G, silica gel GF_{254}, silica gel H, silica gel HF_{254}, microcrystallite cellulose, etc, the particle size of which is generally 10-40 μm in diameter. Water or solution of carboxymethylcellulose with the concentration of 0.2%-0.5% is then added appropriately to form a pasty which is then spread on the glass plates evenly. The spreader can be used to spread the stationary phase on the glass plates to form a uniform layer of definite thickness. The surface of the glass plate should be smooth and with no globule after cleaning.

(2) *Sample applicator* Micro-liter capillary or other hand-operated, semi-automatic and full automatic sample applicators are used generally.

(3) *Chromatographic chamber* For vertical development, a chamber of a size suitable for the plates, and with a flat bottom or twin trough, and provided with a tightly fitting lid should be used generally, while for horizontal development, a chamber specially designed for horizontal development should be used.

(4) *Visualization device* Glass mister sprayer or special mister sprayer should be used during spray visualization. Compressed gas should be used to eject the visualization reagent in the form of homogeneous mist. Special glass apparatus or appropriate glass chamber can be used instead during the immersion visualization. Twin trough glass chamber or desiccator with appropriately size could be used during the fumigation visualization.

(5) *Detection device* It is a camera obscura equipped with visible light and ultraviolet light of wavelength 254 nm and 365 nm, and corresponding filter. Additional camera equipment could be used to take picture. The light resource should have enough intensity of illumination.

(6) *TLC scanning instrument* It is used to scan the spot(s), which can absorb ultraviolet, visible light or emit fluorescence after being excited. Thus obtained scanning profiles of the chromatogram and the intergration data can be used for qualitative and quantitative analysis.

2. Procedure

(1) *Preparation of TLC plates*

Pre-coated plates Prior to the time of use, the plates should be activated at 110℃ for 30 min. The polyamide membrane need not be activated while the aluminium substrate plate could be clipped if necessary. Pay attention to the silica gel layer at the lower edge of TLC plate, which should not be broken. It may be necessary to pre-wash the plates in the way of vertical development by trichloromethane, methanol or the mixed solution of the above two reagents in the chromatographic chamber if the plates have been polluted by the impurity in the air during the storage. The plates are then activated at 110℃ and put away in the desiccator for later use.

Home-made TLC plates Unless specified otherwise, triturate the mixture of one part of stationary phase and three parts of water (or water solution with binder) in one direction, remove gas bubbles on the surface, and put the paste in the spreader, move the spreader smoothly and steadily over the glass plates (the thickness of the layer is

generally 0.2-0.3 mm). Allow the plate to be dried on a horizontal plane at the room temperature. Heat it at 110℃ for 30 minutes and then put it away in the desiccator for later use. Inspect the degree of the homogeneity under both the reflected light and the transmitted light, the surface of the plates should show uniformity, smooth without rough portion, gas bubble, breakage or impurity.

(2) *Sample application* Unless specified otherwise, the samples are applied on the TLC plates, usually in the form of circular spots or narrow bands, with special capillary or semi-automatic and automatic sample applicators under a clean and dry environment. The distance of the sample zone from the lower edge of TLC plate, is 10-15 mm, while that of HPTLC plates is 8-10 mm. The diameter of the circular spots is generally less than 3 mm for TLC, while less than 2 mm for HPTLC. It is essential that the thin layer where the sample applied should not be damaged. The width of the bands is generally less than 5-10 mm for TLC, while 4-8 mm for HPTLC. Sample could also be applied by spraying method with special semi-automatic or automatic sample applicators. Spots intervals should be adjusted according to the diffusion of the spots and with no interference between neighboring spots. Usually, the interval is not less than 8 mm for TLC, not less than 5 mm for HPTLC.

(3) *Development* Place the above plate loaded with sample into the chromatographic chamber, keeping a distance of about 5 mm from the line of applying sample to the edge of solvent in the chamber. Close the chamber tightly. Unless specified otherwise, the solvent ascends a definite distance, usually 8-15 cm for TLC, while 5-8 cm for HPTLC. When the mobile phase has moved over the prescribed distance, remove the plate and dry it for later visualization.

Add appropriate amount of solvent in the chromatographic chamber if the chamber should be preequilibrated before development. Close the chamber tightly for 15-30 minutes. After the vapor of solvent has reach equilibrium, place the plate loaded with samples quickly into the chamber and close it immediately tightly for development. If the vapor of the solvent should be saturated in the chromatographic chamber, filter paper of the same dimension with the inner diameter of the chamber should be laid on the inner wall of the chamber. Keep the chamber tightly for a while and allow it to be fully saturated before developing. If necessary, secondary development and two-direction development could be applied.

(4) *Visualization and detection* The coloured components of the sample could be detected directly under visible light. Appropriate visualization reagent could also be used for colouration in the way of spraying or immersion. They could also be visualized by being heated and detected directly under the visible light. Fluorescent chromatogram could be detected at 365 nm if the components can emit fluorescence itself or when meeting with some reagents. The silica gel plates with fluorescer (eg. silica gel GF_{254} plate) could be used if the components have no colour but have ultraviolet absorption. The chromatogram formed by fluorescence inhibitor can be observed on the plate at 254 nm.

(5) *Documentation* The image of the TLC could be taken by camera and saved in the form of optical picture or electronic image. The TLC scanning imstrument could also record the corresponding chromatogram.

3. System suitability test The experiment condition should be tested according to the respective requirements of each monograph for its suitability. The test solution and the reference solution are used to test and adjust the experiment condition in order to reach the required sensitivity, resolution and repeatability.

(1) *Sensitivity* During the limit test, the test solution, reference solution and reference solutions diluted for several times are applied, developed and visualized on the same TLC plate according to the prescribed chromatographic conditions. The latter should form distinct spots.

(2) *Resolution* During identification, the main spot(s) in the reference solution and in the test solution should be clearly separated. During limit test or assay, the peak used for quantification should be well separated with the neighboring peak. The formula for calculating the resolution (R) is:

$$R=2(d_2-d_1)/(W_1+W_2)$$

Where d_2 is the distance between the latter of the two neighboring peaks and the original point; d_1 is the distance between the former of the two neighboring peaks and the original point;

W_1 and W_2 is the peak width of the two neighboring peaks respectively.

Unless specified otherwise, the resolution should be more than 1.0.

(3) *Repeatability* The test solution should be applied on the same TLC plate parallelly. The relative standard deviation of the measured value of the peak area for the test components should be not more than 3.0%, for the one, which needs visualizing before measure, the relative standard deviation should be not more than 5.0%.

4. Measurement

(1) *Identification* The reference solution and the test solution of appropriate concentration are applied, developed and visualized on the same TLC plate. The colour (or fluorescence) and the position of the main spot(s) of the test solution should be identical with those of the spot(s) of the reference solution.

(2) *Limit test* Compare the test solution with the quantitatively prepared reference solution or its dilutions. Spot(s) in the chromatogram obtained with the test solution is (are) compared visually either to the corresponding spot(s) in the chromatogram obtained with the reference solution or spot(s) obtained with a series of reference solutions. The colour (or florescence) intensity of the spot(s) of the test solution should be lighter than that of the reference solution. While using the method of TLC scanning, the peak area should be less than that of the reference solution. If necessary, the number of the spots and limitation value should be prescribed.

(3) *Assay* The content of the corresponding component in the test solution could be determined according to the TLC scanning method.

5. TLC scanning method It is to scan the spots, which have ultraviolet light or visiblc light absorption or which can emit fluorescence after being excited, exposing the TLC plate to light of a certain wavelength. Thus obtained chromatograms and integral data are used to identification, limit test and assay. According to the physical structure of different scanning instrument, reflective scanning method in absorbance mode or fluorescence mode is generally used. Unless specified otherwise, the pre-coated TLC plates should be used in the assay.

Single-or dual-wavelength scanning method could be used. During dual-wavelength scanning, the wavelength at which the test spots have no or the least absorption should be used as a reference wavelength. The spots in the chromatogram of the test solution should have the identical shift ratio value (Rf), same absorption spectrum obtained by spectrum scanning or same maximum and minimum absorption wavelength with that of the reference solution in order to make sure the accuracy of the results. During the

quantitative analysis by using the TLC scanning method, it should be ensured that the amount of the sample spot being examined be within the linear range. If necessary, the amount of the test solution being applied on the plate could be adjusted appropriately. The test solution should be applied, developed, scanned, measured and calculated on the same plate with the reference solution.

Generally, two point calibration could be used for calculation when the TLC scanning method is used for assay. If the linear range is very narrow, multinomial regression of multiple level of standard calibration could be used. The test solution and the reference solution should be applied alternatively on the same TLC plate. The number of the spots of the test solution should not be less than 2 and that of the reference solution should not be less than 2 for each concentration. Scan the plate along the direction of development, but not horizontally.

Ⅵ C Column Chromatography

1. Adsorption column chromatography

The chromatographic tube is made of borosilicate glass with uniform internal diameter. A sintered glass disk or a wad of glass wool is placed at the contracted lower end of the tube to keep the adsorbent in the column. Adsorbents of uniform size are required in order to get good seperation. Unless otherwise specified, adsorbents of a uniform size 0.07-0.15 mm in diameter are commonly used. The size of the tube, the type and quantity of the adsorbent to be used, and the composition and flow rate of the eluent are specified under individual monograph.

(1) ***Packing the Adsorbent into the Column*** The column can be packed either by the dry method or the wet method.

①*Dry method* Fill the chromatographic tube with the dry adsorbent, tap the tube gently to form a compact column, then add the mobile phase along the inner wall of the tube. Alternatively, the chromatographic tube can be filled with the mobile phase first, and then the adsorbent added in small portions until a homogeneous bed of the adsorbent is formed. During the whole process the upper surface of the adsorbent must be covered by a layer of the mobile phase.

②*Wet method* Mix the adsorbent with the mobile phase, agitate to expel air bubbles and slowly add the mixture as a slurry into the chromatographic tube. Wash down the adsorbent adhering to the inner wall of the tube with the mobile phase, open the outlet of the tube and allow the mobile phase to flow slowly until the surface of the liquid is almost on the same level as the top of the column. The column is now ready for loading of the substance being examined.

(2) ***Loading the Substance Being Examined*** Unless otherwise specified, the substance being examined is dissolved in the mobile phase and added slowly along the inner wall of the tube, care should be taken that the adsorbent is not disturbed. The substance being examined can also be dissolved in a suitable solvent, mixed thoroughly with a small quantity of the adsorbent and added on top of the column when the solvent is volatilized. If the substance being examined is insoluble in the common solvents, mix it with the adsorbent in a mortar and add the mixture on top of the column.

(3) ***Elution*** It is usually done by changing the type or the composition of the mobile phase in the sequence of increasing order of eluting power, unless otherwise specified. Collect the eluate fractionally until the component disappears from the eluate or the amount eluted decreases markedly, then change the mobile phase and continue the elution as described above. It is important to keep sufficient mobile phase on top of the adsorbent during the whole process.

2. Partition column chromatography

The procedure is similar to that of adsorption column chromatography. The support, mixed with the liquid stationary phase, is added into the chromatographic tube in small portions, pressed with the flat end of a glass rod after each addition. The substance being examined may be dissolved in the liquid stationary phase, mixed with a small quantity of the support, and then loaded on top of the column, The mobile phase is saturated with the liquid stationary phase previously so as to prevent the change of distribution coefficient or degree of partition between two phases in the course of elution.

Ⅵ D High Performance Liquid Chromatography

High performance liquid chromatography (HPLC) is a method of chromatographic separation in which the mobile phase is pumped into a column containing stationary phase by a high-pressure pump system. The test solution injected is carried into the column by the mobile phase. All the components are separated in the column and pass through the detector sequentially. The recorder, integrator or data acquisition system thus records the chromatographic signals.

1. General requirement for the instrument

The HPLC in strument is used here, which should be checked periodically and meets the requirement of relative specification.

(1) *Chromatographic column* The most widely used packing material is the chemically bonded silica gel. Reverse-phase chromatographic system uses nonpolar packing materials, in which the most frequently used is octadecyl-silane bonded silica gel. Octylsilane and other type of chemically bonded silica gel (such as cyano and amino group bonded silica gel) are also used. Positive-phase chromatographic system uses polar packing material, the most widely used of which is silica gel. The ion-exchange resin is used in ion-exchange chromatography. The gel and macromolecular porous microsphere are used in size exclusion chromatography. Chiral bonded packing materials are used in separation of enantiomers (chiral chromatography).

The characteristics of the packing materials (the shape of the support, the particle size, the pore diameter, the surface area, the surface coverage of the bonded functional group, the carbon content and the bonding mode, etc.) and the pack of the chromatographic column effect directly the retention behavior and separation performance. The packing material with pore diameter less than 15 nm (1 nm=10 Å) is suitable for analysis of the compound whose molecular weight is less than 2000, pore diameter more than 30 nm is suitable for analysis of compound whose molecular weight is more than 2000.

The mobile phase in which the pH value is 2-8 is suitable for the stationary phase with silica gel as the support. If the pH value is more than 8, the silica gel may be dissolved and if the pH value is less than 2, the phase chemically bonded with the silica gel may be broken off. In the case when the

mobile phase in which the pH value is more than 8 should be used, the packing material, which is alkali-proof, should be chosen., such as bonded silica gel with high purity silicon as support and a high surface coverage, polymer coated packing material, the organic and inorganic hybridized packing materials and the non-silica gel packing materials. In the case when the mobile phase in which the pH value is less than 2 should be used, the packing material, which is acid-proof, may be chosen. Such as the octadecylsilane modified silica gel with diisopropyl or diisobutyl substitution, which has a bulk mass and thus results in a protection through a steric hindrance, or organic and inorganic hybridized packing material, etc.

(2) *Detectors* The most commonly used detector is the ultraviolet (UV) spectrophotometers. Besides, diode array detectors (DAD), fluorescence spectrophotometers, differential refractometers, evaporative light scattering detectors, electrochemical detectors and mass spectrometers may also be used.

The UV spectrophotometers, diode array detectors, fluorescence spectrophotometers and electrochemical detectors are all selective detectors. The response value is related not only to the concentration of the test solution, but also to the structure of the compound. On the contrary, the differential refractometers and evaporative light scattering detectors are general-purpose detectors; they will respond to all compounds. The response value of the evaporative light scattering detectors for compounds with similar structure is almost related to the mass of the test compound. Diode array detector may record the absorption spectrum within the prescribed wavelength range simultaneously, thus could be used to measure the spectrum and inspect the purity of the chromatographic peaks.

The response values of the UV spectrophotometers, fluorescence spectrophotometers, electrochemical detectors and differential refractometers are linear with the concentration of the test solution within a certain range, while the response value of the evaporative light scattering detectors is not always linear with the concentration of the test solution, if necessary, it should be transferred mathematically before calculation.

Different detectors have different requirements for the mobile phase. For example, if the UV spectrophotometer is used in the experiment, the mobile phase should at least meet the requirement for the solvent described in the UV spectrophotometry (Appendix Ⅴ A). When the light of lower wavelength is applied for detection, the cut-off wavelength of the organic solvent should be considered and it is better to use chromatographic grade organic solvent. The evaporative light scattering detectors and the mass spectrometers generally do not allow using the mobile phase that contains non-volatile salts.

(3) *Mobile phase* As the C_{18} chain is not able to keep an spread state in the water solution, the ratio of the organic solvent of the mobile phase should not less than 5%, in the reverse phase chromatographic system of which the stationary phase is octadecylsilane bonded silica gel. Otherwise the random curl of the C_{18} chain will lead to the change of the retention value of the component, which may result in the instability of the chromatographic system.

The type of the stationary phase, the composition of the mobile phase and the mode of the detectors specified under the monograph should not be changed. Others, such as the inner diameter, the length, the brand of the stationary phase and the particle size of the support, the flow rate of the mobile phase and the ratio of each component in the mixed mobile phase, the time span in the gradient elution program, the temperature of the column, the injection volumn and the sensitivity of the detectors could be changed appropriately to meet the requirement of the system suitability test. But for some certain monographs, in which only the specific brand of packing material is able to satisfy the requirement of the separation, clear indications should be given under them.

2. The system suitability test

The suitability test of the chromatographic system generally includes four indexes, number of theoretical plates, resolution, repeatability and tailing factors, in which the resolution and the repeatability are more practical indexes.

To carry out the suitability test of the chromatographic system according to the requirement under the individual monograph is to test the chromatographic system by using specific reference substance. The separation conditions of the chromatography should be adjusted in case if the requirement cannot be met.

(1) *Theoretical plates of the column* (n) Inject the test solution or the internal standard specified under the monograph into the system according to the prescribed chromatographic conditions. Record the chromatogram and measure the retention time t_R (in minutes or length units, the same as below, which should be in the same unit) and the peak width at half peak height ($W_{h/2}$) of the principle component peak of the test solution or that of the internal standard. Calculate the theoretical plates of the chromatographic column by the equation: $n=5.54(t_R/W_{h/2})^2$.

(2) *Resolution* (R) No matter in qualitative analysis or quantitative analysis, the peak(s) of substance being examined and other peaks, such as internal standard peak(s) or specific impurity peak(s) must have good resolution. The equation for calculating the resolution is:

$$R=\frac{2(t_{R2}-t_{R1})}{W_1+W_2}$$

Where t_{R2} is the retention time of the latter of the two adjacent peaks, t_{R1} is the retention time of the former of the two adjacent peaks.

W_1 and W_2 are the peak width of the two adjacent peaks (as Fig. 5).

Unless specified otherwise, the resolution value should not be less than 1.5 in quantitative analysis.

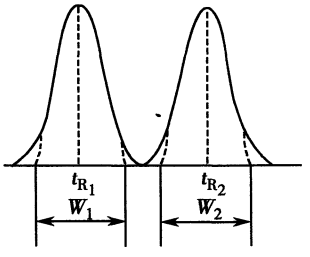

Fig. 5

(3) *Repeatability* Inject the reference solution described under the monograph for 5 times successively. Unless specified otherwise, the relative standard deviation of the measured value of the peak areas should be no more than 2.0%.

According to the measurement of the correction factor specified under each monograph, prepare a series of reference solutions equivalent to 80%, 100% and 120% of the content of the substance being examined, each containing a definite amount of internal standard substance, inject each solution at least 2 times, calculate the average correction factors, the relative standard deviation of which should be no more than 2.0%.

(4) *Tailing factor* (T) In order to guarantee the perfor-

mance of the separation and the precision of the measurement, the tailing factor should be inspected to see whether it meets the prescription under each monograph. The equation for calculating the tailing factor is as follows:

$$T=\frac{W_{0.05h}}{2d_1}$$

Where $W_{0.05h}$ is the peak width at 5% of the peak height, d_1 is the distance between the perpendicular line passing through the peak maximum and that of the leading edge of the peak. (as Fig. 6).

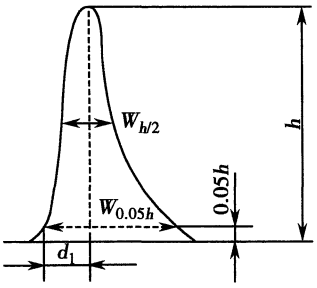

Fig. 6

Unless specified otherwise, the T value should be within 0.95-1.05 in the quantitative analysis by using peak height. In the quantitative analysis by using peak area, the over deviation of the T value will also effect the detection and the quantification precision of the small peak (s).

3. Procedure

(1) *Corrected internal standard method for the determination of individual impurities or the main components*

Prepare solutions containing an accurately weighed quantity of the reference substance and the internal standard respectively as specified in the monograph. Accurately measure each solution and prepare the reference solution for determining the correction factors. Inject a certain amount of solution into the equipment and record the chromatogram. Measure the peak area or height of the reference substance and the internal standard and calculate the correction factor according to the following equation:

$$\text{Correction factor}(f)=\frac{A_S/C_S}{A_R/C_R}$$

Where A_S is the peak area or the peak height of the internal standard
A_R is the peak area or the peak height of the reference substance
C_S is the concentration of the internal standard
C_R is the concentration of the reference solution

Prepare solutions containing the substance being examined and the internal standard as described in the monograph. Inject the solution into the equipment and record the chromatogram. Measure the peak area or the peak height of the substance being examined and that of the internal standard. Calculate the content as follows:

$$Content(C_x)=f\times\frac{A_x}{A'_S/C'_S}$$

Where A_x is the peak area or peak height of the substance being examined (or its impurity);
C_x is the concentration of the solution of the substance being examined (or its impurity);
A'_S is the peak area or the peak height of the internal standard;
C'_S is the concentration of the internal standard solution;
f is the correction factor.

If an equal amount of the internal standard of the same concentration is used both in preparing the reference solution for measuring the correction factor and in preparing the test solution, that is $C_S=C'_S$.

In this case accurate weighing is not necessary for preparing the internal standard solution.

(2) *External standard method for the determination of the individual impurity or the main component*

Prepare solutions containing an accurately weighed quantity of the reference substance and the substance being examined respectively and inject a certain amount of each solution into the equipment. Record the chromatogram and measure the peak area (or peak height). Calculate the content as follows:

$$Content(Cx)=C_R\frac{A_x}{A_R}$$

Where each symbol has the same meaning as that mentioned above.

As the micro syringe is not able to control the amount of solution being injected precisely, the sampling loop or automatic sampler may be used in measuring the content of the impurity and main components in the substance being examined.

(3) *Corrected peak areas of impurities compared with that produced by the main peak of a diluted solution of substance being examined*

This method could be used to measure the content of the impurity. Prepare solutions containing an accurately weighed quantity of the reference substances of impurities and the main component as specified in the monograph. Inject a volume and record the chromatogram. Calculate the correction factor of the impurity according to the method described in the (1). The correction factor could be directly recorded in the individual monograph and used for correction of the measured peak areas of impurities. These impurities, which need correction computation, are generally located by the relative retention time to the main component as the reference and all these data are recorded in the individual monograph.

When measuring the content of the impurities, dilute the solution of the substance being examined to a concentration as specified in the individual monograph so that its peak area is around that produced by the impurities in the original concentration. Inject and adjust the attenuation of the detector (limited by the noise level that can be accepted) or vary the injection volume (limited by the load ability of the column) until the peak height of the main component is about 10%-25% of the full scale or the peak area which could be accurately measured (generally, for the impurity, the content of which is lower than 0.5%, the RSD of the peak area should be less than 10%; while for the impurity, the content of which is between 0.5%-2%, the RSD of peak area should be less than 5%; for the impurity whose content is higher than 2%, the RSD of the peak area should be less than 2%). Inject separately an appropriately amount of test solution and reference solution. The recorded time span of the test solution, unless specified otherwise, should be 2 times that of the main component. Measure the peak areas of each impurity on the chromatogram of the test solution. Multiply them by the respective correction factors and then compare them with the peak area of the main component of the reference solution and calculate the content of the impurities accordingly.

(4) *Peak areas of impurities compared with that produced by the main peak of a diluted solution of substance being examined*

This method could be used when the impurity reference substance is not available. Prepare the reference solution

according to method (3) and adjust the attenuation of the detector. Inject separetely an appropriate volume of the test solution and reference solution. The record time span of the former should be 2 times that of the main component, unless specified otherwise. Measure the peak areas of the impurities on the chromatogram of the test solution and compare them with those of the main component of the reference solution and calculate the content of the impurities.

If there are some impurities in the substance being examined which are not completely separated from the solvent peak, record the chromatogram Ⅰ of the substance being examined according to the specification and then record the chromatogram Ⅱ of the pure solvent of equil volume. The peak area of the solvent solution on the chromatogram Ⅱ is subtracted from the total peak area of the impurities in the chromatogram Ⅰ (including the solvent peak). The result is equal to the correction peak area of the total impurities. Calculate the content of the impurities accordingly.

(5) *Peak area normalization method*

As the deviation of this method is so large that it can be only used to roughly inspect the contents of impurities in the substance being examined. It is not suitable for the determination of minute impurities, unless specified otherwise. In this method, the peak area of the impurities and the total peak area on the chromatogram except the solvent peak are measured. Calculate the peak area of each impurity and the percentage of their sum in the total peak area.

Ⅵ E Gas Chromatography

Gas chromatography (GC) is a separation technique in which the mobile phase, an inert gas known as carrier gas, is passing through the chromatographic column packed with packing materials for separation and determination. The substance or its derivatives are injected into the vaporizer with a micro-syringe and vaporized, separated on the stationary phase, each component passes through the detector in succession and a chromatogram is thus recorded by integrator, recorder or data acquisition system.

1. General requirements for the instrument

The apparatus consists of a carrier gas source, an injector port, a chromatographic column contained in an oven, a detector and a data acquisition system. The injection port, column, and detector are temperature-controlled.

(1) *Carrier gas source* The mobile phase of gas chromatography is gas, known as carrier gas. Carrier gases used are usually nitrogen, helium and hydrogen. The gas is supplied by a high-pressure steel cylinder or high-purity gas generator and passes through suitable pressure-reducing valves and a flow meter to the injector port and column. The gas selection depends on the properties of the substances being examined and the species of the detector. The commonly used carrier gas is nitrogen, unless specified otherwise.

(2) *Injection port* Direct injections of solutions and headspace injection are the usual modes of injection.

Direct injection may be carried out by using a syringe or an injection valve, or into a vaporization chamber which may be equipped with a stream splitter. The temperature of the vaporizer is usually 30-50℃ higher than that of the column when using direct injection. The volume of solution injected is not more than several μl. The smaller the column diameter the less volume of injected solution is. Capillary column is used with injectors which is able to split samples into two fractions to avoid overloading.

Headspace injectors are suitable for separation and determination of volatile component in solid or liquid substance being examined. The test solutions produced with solid or liquid substance being examined and stored in tightly closed containers are heated in the chamber for a period of time, allowing the volatile components in the test solution to reach a equilibrium between the nongaseous phase and the gaseous phase. A predetermined amount of the head-space of the vial is flushed into the column by automatic syringe.

(3) *The chromatographic column* The chromatographic columns are classified into the packed columns and capillary columns. The packed columns, which are made of stainless steel or glass, are 2-4 mm in internal diameter and 2-4 m in length. The columns are packed with the sorbent, porous polymer bead or the supports coated with liquid phase, particle size of which is 0.25-0.18 mm, 0.18-0.15 mm or 0.15-0.125 mm. The support usually used is acid washed and silanized diatomaceous earth or porous polymer beads; the liquid phase commonly used is methylpolysiloxane, polysilphenylene of different consist, polyethyleneglycol etc. The capillary columns are made of glass or quartz. The inner wall of the column is coated or cross-linked with stationary liquid, the internal diameter is usually 0.25 mm, 0.32 mm or 0.53 mm, the length is 5-60 m, and the film thickness of the stationary liquid is 0.1-5.0 μm. The stationary liquid commonly used are methyl poly siloxane, phenylmethylpolysiloxane with different ratio of composition and carbowax, etc. New packed and capillary column must be conditioned before use to remove oxygen and residual solvents. The chromatographic column must be conditioned before use until the baseline is stable if the column is not in use long time.

(4) *The column oven* The temperature-controlled precision of the oven should be ±1℃ and fluctuation of temperature should be less than 0.1℃ per hour, as the temperature fluctuation of oven will influence the reproducibility of chromatographic analysis result. Temperature-controlled system may be classified into constant temperature and temperature programming.

(5) *Detector* The detectors suitable for the gas chromatography include flame-ionization detector (FID), thermal conductivity detector (TCD), nitrogen-phosphorus detector (NPD), flame-photometer detector (FPD), electron-capture detector (ECD), mass spectrometric detector (MSD) etc.. FID responses well to hydrocarbon and is suitable for the determination of most drug compounds; NPD is sensitive to organic nitrogen and phosphorus compounds; FPD is sensitive to organic sulfur and phosphorus compounds; ECD is suitable for determination of halogen compounds; MSD can offer chemical construction information of the compounds which is useful for structure verification. Unless specified otherwise, the detector should be FID which employs hydrogen as combustion gas and air as combustion-supporting gas. When FID is used, its temperature is higher than that of the column and not less than 150℃ to prevent condensation of the vapour, which usually is 250-350℃.

(6) *Data process system* It is classified into recorder, integrator and computer station etc.

If necessary, parameters which specified under the individual monograph, except the kind of the detector, the type of the stationary phase and the material of the column, other parameters such as the intenal diameter and length of the column, brand and size of the support, concentration of the stationary phase, the flow rate of carrier gas, the temperature of the column, the injection volume, the sensitivity of the detector etc, may be varied to meet the requirment of the system suitability test. Usually the

chromatogram is completed within 30 minutes.

2. System suitability test

The requirements are the same as described under High Performance Liquid Chromatography, unless specified otherwise.

3. Procedure

(1) Corrected internal standard method for the determination of individual impurities or the main component.

(2) External standard method for the determination of individual impurities or the main component.

(3) Peak area normalized method.

The specific content of (1)-(3) is the same as described under High Performance Liquid Chromatography.

(4) Standard addition method for the determination of individual impurities or the main component. Dissolved an accurately weighed quantity of impurities or reference substance of the substance to be examined to produce reference solution with a suitable concentration. Measure accurately the solution and add to the test solution, then calculate the content of individual impurities or the main component by internal standard method or external standard method. Deduct the content of added standard solution and gain the content of individual impurities or the main component in the test solution.

The content may also be calculated by the following equation. The correction factor is the same as that of adding the reference solution.

$$\frac{A_{is}}{A_x}=\frac{C_x+\triangle C_x}{C_x}$$

The concentration C_x of component being examined may be calculated by the following equation.

$$C_x=\frac{\triangle C_x}{(A_{is}/A_x)-1}$$

Where C_x is the concentration of component X being examined;

A_x is the peak area of component X being examined;

$\triangle C_x$ is the concentration of added reference substance of component being examined.

A_{is} is the peak area of component X after adding reference substance of component being examined.

In quantitative assay of gas chromatography, a major source of error is the irreproducibility in the amount of sample injected, which is affected by retaining time of syringe and room temperature, notably when manual injections are made with a syringe. The effects of variability can be minimized by an internal standard. Automatic injectors greatly improve the reproducibility of sample injections and reduce the need for internal standards. When headspace injectors are equipped, the effect of matrix may be eliminated by standard addition method because the test solution and the reference solution are in different matrix. When the quantitative result of standard addition method is different from others, the result of standard addition method should be adopted.

Ⅵ F Capillary Electrophoresis

Capillary electrophoresis is a separation technique using elastic quartz capillary as the separation channel and high voltage direct current electric field as the driving force. The components in the sample are separated according to the difference of their migration velocity under the unit electric field strength and (or) phase partition. When a fused-quartz capillary is filled with an operating buffer, silanol groups on the inner wall of the capillary release hydrogen ions to the buffer, which cause the wall's surface to carry the negative charges, and then form an electrical double layer with the solution, even when the buffer is in a fairly low pH value. The solution with positive charges will move to the cathode by applying direct current voltage on the capillary. This movement of the solution under the force of the electrical field is called the electroosmotic flow (EOF). The ionization degree of silanol groups of the capillary innerwall mainly depends on the pH value of the operating buffer and the additive modifiers. When the pH value becomes lower, the silanol groups generally will have a low ionization degree, meanwhile the EOF becomes lower. When the pH value becomes higher, the silanol groups will generally have a high ionization degree and the EOF becomes higher. The addition of organic modifiers sometimes could affect the ionization degree of the internal surface, then it will result in the decreasing of the EOF. In the buffer, the charged particles migrate towards the opposite direction to their respective charge with different velocity under the action of electric field, resulting in electrophoresis. The migration velocity of the charged particles in the buffer is equal to the vector sum of its electrophoretic mobility and eletroosmotic mobility. The EOF is usually greater than the electrophoretic mobility; thus, even anions are swept to the cathode and the detector. Beside lower pH, coated capillaries can also cause a decrease in the EOF and reduce the substances adsorbing on silica surfaces.

1. Separation mode

The current separation modes of capillary electrophoresis are as follows:

(1) *Capillary zone electrophoresis* (CZE) In CZE, after the sample being introduced into the capillary, apply direct current voltage on the capillary. Every fractions will be separated depending on the differences in the rector sum of its electrophoretic and eletroosmotic mobility. The mobility differences are functions of their charge and size under specific method conditions. Neutro-moleculars can't be isolated from each other. The elution time of certain component in the electrophoretogram is called migration time (t_m), equivalent to the retention time in HPLC and GC.

(2) *Capillary gel electrophoresis* (CGC) For analysis of protein, DNA and other large molecules. One kind of operation, called capillary chemical gel electrophoresis, is carried out by loading monomers into the capillary and initiating monomers to form the gel for analysis. The other kind of operation, called capillary physical gel electrophoresis, is carried out by loading the solution of polymer with sieving action, such as dextran and polyethylene oxide, into the capillary for analysis.

(3) *Capillary isotachophoresis* (CITP) It employs two buffers, which enclose the analyte zones between them. Either anions or cations can be analyzed in sharply separated zones and pass through the detector one by one.

(4) *Capillary isoelectric focusing electrophoresis* (CIEF) Electroosmotic flow is minimized by coating the capillary internal wall and the mixture of sample and amphoteric electrolyte is injected into the capillary. Acid and alkali solutions are separately kept in two electrode reservoirs. The pH gradient is formed in the capillary after high voltage is applied. The solutes migrate to their isoelectric point respectively in the capillary, forming discrete zones. After focusing, the solutes pass through the detector by applying pressure or changing the pH value of the solutions in the electrode reservoirs at the end of the detector.

(5) *Micell electrokinetic capillary electrophoresis* (MEKC or MECC) Ionic surfactants are added to the operating buffer at a concentration above their critical micelle concentration. The micelles provide a pseudostationary phase. The substances are distributed between the aqueous phase and the micelle phase, travel along with the electroosmotic flow in the capillary, and are separated. With common anionic surfactant, sodium lauryl sulfate, strong hydrophilic component can not enter the micelle after injection. It flows towards the detector along the buffer solution (capacity factor $k' = 0$). But strong hydrophobic components enter the micelle core and reach the detector lastly ($k' = \infty$). Commonly used micelle reagents still include cationic surfactant, such as cetrimide and cholic acid.

(6) *Capillary electrochromatography* (CEC) It is carried out by loading the micro grain size stationary phase in the capillary and using electroosmotic flow as the driving force for the mobile phase.

Among the above modes, (1) and (5) are used more widely. Mode (5) and (6) are mainly chromatographic mechanism combined with electrophoresis. For the separation of optical isomers, a chiral selector, such as cyclodextrins, modified cyclodextrins, crown ethers, polysaccharides, proteins, chleolates or some kinds of antibiotics, is added into the operating buffer. Organic solvent is added to improve separation.

2. General requirement for the instrument

The main assembly unit of capillary electrophoresis apparatus and their function are described as follows:

(1) *Capillary* Using an elastic quartz capillary with internal diameter of 50 μm and 75 μm (capillary with larger internal diameter is sometime used in CEC). Smaller capillary diameter will usually cause lower heat, which will increase resolution and permit a higher voltage. However, larger capillary diameters have advantages of better mass loading and improved signal-to-noise ratio. Length of the capillary is called total length. Capillaries of 20-100 cm can be chosen according to the separating requirement; length between injector and detector is called effective length. Capillary is usually housed in a cartridge to control the Joule heat, viscosity of the operating buffer and electrical conductivity. This is very important to the repeatability of the measurments.

(2) *High-voltage direct-current power supply* A power supplying controllable direct-current of 0-30 kV, which can supply direct-current of about 300 μA and provide constant voltage and constant currency.

(3) *Electrode and electrode reservoirs* Add operating buffer into two electrode reservoirs, insert two ends of the capillary and platinum electrodes into the operating buffer; connect platinum electrodes with high-voltage direct-current power supply, the polarity of electrodes can change with each other. In many type of instruments, sample bottles are also serve as electrode reservoirs.

(4) *Auto-flush and injection system* Capillary should be flushed with different solutions each time before injection. It is convenient to flush the capillary by auto-flush and inject system. Modes of sample introduction into the capillary include electromigration (electrokinetic mode) and negative- and positive-pressure injection (hydrostatic mode). The sample volume injected depends on the time of the voltage or pressure applied.

(5) *Detection system* CE system can use UV-visible absorbance detectors, laser-induced fluorescence (LIF) detectors, electrochemical detector and mass spectrometric detector. UV-visible absorbance detectors, including single wavelength, programming wavelength and photodiode array detector, are most widely applied. Strip polymer from the outer layer of the capillary about 2 mm in length and make the quartz tubal wall to be exposed. Put a quartz ball on both side of the capillary so that the light can be focused on and pass through the capillary and reach the photovoltaic cell. Indirect test method may be adopted to detect non-absorption (or fluorescent) solute. Additives which can absorb light (or fluorescence) may be added to the operating buffer so that reversal peak will appear as solute reach detection windows.

(6) *Data processing system* It is generally the same as common chromatographic data processing system.

3. System suitability test

System suitability test, such as repeatability (relative standard deviation, RSD), capacity factor (k'), theoretical plate number of capillary, resolution (R), tailing factor (T), linearity range, limit of detection (LOD) and limit of quantitation (LOQ), together with calculating equation and requirements are the same as those described under HPLC or GC in order to investigate the configuration of the capillary electrophoresis system and the setting of parameters. The concrete index should meet the requirements specified under each monograph, especially the effect on the precision of the analysis produced by the precision of the sample introdution and the difference in the migration rate of different charged analytes.

4. Procedure

(1) Switch on the instrument, pre-heat, input parameters, such as capillary temperature, operating voltage, detection wavelength and flush procedure, etc. Filtrate and degas the operating buffer. Fill the flush solution and buffer in the sample bottles, put onto the injector in order.

(2) The treatment of the capillary has large effect on the detection result. Using of a new uncoated fused-silica capillary usually requires a regeneration procedure to activate the surface silanol groups. This procedure may include an extended rinse with 1 mol/L sodium hydroxide solution at 60℃ and then with 0.1 mol/L sodium hydroxide solution, water and operating buffer, each for a few minutes. In the intermission of runs, the capillary may be rinsed with the operating buffer. But if the efficiency of separation changed, the capillary should be rinsed with 0.1 mol/L sodium hydroxide solution, even with concentrated hydroxide solution at high temperature. Gel capillary, coated capillary and packed capillary may be rinsed following their guidelines. Put the rinsing solution onto the injector in order, set the order and time program.

(3) Type of operating buffer, pH value, concentration and additive (used for increasing solubility and (or) controlling the degree of dissociation and separating the chiral components, etc.) have large effect on the detection result. They may be prepared according to the procedure specified in the monograph and adjusted and optimized according to the result.

(4) Put the bottles filled with samples onto the injector, set operating parameters, such as pressure (voltage in electrokinetic mode), injecting time, injecting terminal (positive electrode or negative electrode), operating voltage or current and detection parameter, etc, begin testing. Adjust the operating parameters and operating buffer according to the electrophoretogram.

(5) After analysis, the capillary is rinsed with water and the ends of the capillary are preserved in water. For long time preservation, it should be flushed with nitrogen gas to dry before shutting the instrument.

(6) Injection precision is not as good as HPLC because of the limitation of injection methods. The required injection precision for a specific method may need the use of an internal standard. Viscosity of test solution will affect

injection volume with negative-and positive-pressure injection. It is necessary to keep uniform viscosity of the test solution and the reference solution. When the electrokinetic mode is used, electric discrimination phenomenon and ionic strength of solution will affect the migration amount of component in the solution.

Appendix Ⅶ

Ⅶ A Determination of Relative Density

Relative density is defined as the ratio of the mass density of a substance to that of water under the same conditions of temperature and pressure. Unless otherwise specified, the measuring temperature is 20℃.

Relative density of the pure substance is a constant under particular condition. But, when the substance is not purified the determined value of relative density changes with the purity. So relative density is indicative of the identity and purity of the substance being examined.

The relative density of a liquid can be determined with a pycnometer (as Fig. 7 or as Fig. 8). In some cases, the Westphal balance (as Fig. 9) is used, for example, in the determination of the relative density of a volatile liquid.

The temperature of the determination environment of the pycnometer and balance should be a little bit below 20℃ or that specified under individual monograph.

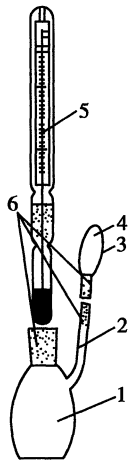

Fig. 7

1 main body of pydometer
2 side tube 3 side pore 4 mask
5 thermometer 6 glass joints

Fig. 8

1. Pycnometric method

(1) Fill a clean, dry and accurately weighed pycnometer (as Fig. 7) with the substance being examined (keep the temperature below 20℃ or that specified under individual monograph), fix the thermometer (no air bubble is left in the pycnometer). Place the pycnometer in a water bath maintained at 20℃ or the specified temperature, allow to stand in the water bath for several minutes, so as to raise the temperature of the content to 20℃ or to the temperature specified in the monograph. Wipe away the liquid overflown from the side tube with a piece of filter paper and put the cap immediately. Remove the pycnometer from the water bath and clean off any material on the outside with a piece of filter paper, weigh the pycnometer accurately and calculate the weight of its content.

Discard the content of the pycnometer and wash the pycnometer with water, fill it with freshly boiled and cooled water. Determine the weight of the water in the pycnometer in a similar manner. The relative density of the substance being examined can be calculated from the following formula:

$$\text{Relative density}=\frac{\text{weight of the substance being examined}}{\text{weight of water}}$$

(2) Fill a clean, dry and accurately weighed pycnometer (as Fig. 8) with the substance being examined (keep the temperature below 20℃ or that specified under individual monograph). Insert the capillary stopper and wipe away the overflown liquid with a piece of filter paper. Place the pycnometer in a water bath maintained at 20℃ or the specified temperature, allow to stand in the water bath for several minutes.

Some of the liquid spills out through the capillary constantly with the rise of the temperature of the content. Wipe away the overflown liquid with a piece of filter paper at any time until the fluid does not overflow anymore. Remove the pycnometer from the water bath rapidly. Proceed as described under method (1), starting from the words "clean off any material on the outside with a piece of filter paper..."

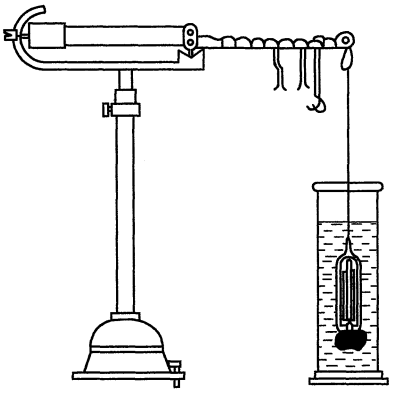

Fig. 9

2. Hydrostatic method

Fill the glass cylinder of the Westphal balance (as Fig. 9) with freshly boiled and cooled water to about 80% of the volume. Place the cylinder and stir the content of it in a water bath maintained at 20℃ or the specified temperature. Dip the plunger hung on the end of the beam into the water in the cylinder, place a rider at the notch marked 1.0000 and adjust the equilibrating screw until the beam is horizontal. Discard the water and wipe away any water left in the cylinder, fill the cylinder with the substance being examined to about 80% of the volume and adjust the temperature as mentioned above. Dip the plunger into the substance being examined and equilibrate again by placing suitable riders at

appropriate notches along the beam. The reading gives directly the relative density of the substance being examined. If the Westphal balance is standardized to give a relative density of 1.0000 at 4℃, the riders should be placed at appropriate notches to give a reading of 0.9982 when calibrating with water at 20℃, and the relative density of the substance being examined, measured at 20℃, should be divided by 0.9982.

Ⅶ B Determination of Distilling Range

The distilling range of a liquid is the temperature range, corrected for a pressure of 101.3 kPa (760 mmHg), within which the liquid distils under the following conditions. The lower limit of the range is the temperature at which the fifth drop of condensate leaves the tip of the condenser and the upper limit is the temperature at which all the liquid except 3-4 ml has been distilled, or when a specified amount of distillate has been collected.
Distilling range is indecative of the identity and purity of the substance being examined.

Apparatus Use a set of distillation apparatus No. 19, with standard ground joint made in China (as Fig. 10), A, a distillation flask; B, a condenser, for liquids distilling below 130℃, the condenser is cooled by water, for liquids distilling above 130℃, it is cooled by air; C, a 25 ml glass cylinder, graduated in 0.5 ml increments; D, a partial-immersion thermometer, graduated in 0.5℃ subdivisions and calibrated. The upper end of the mercury bulb is level with the lower wall of the side-tube of distillation flask. According to different distilling range of the substance being examined, select different heater. For liquids of distilling range below 80℃, a water bath is used as the heater; for liquids of distilling range above 80℃, use an open flame or an electric heater.

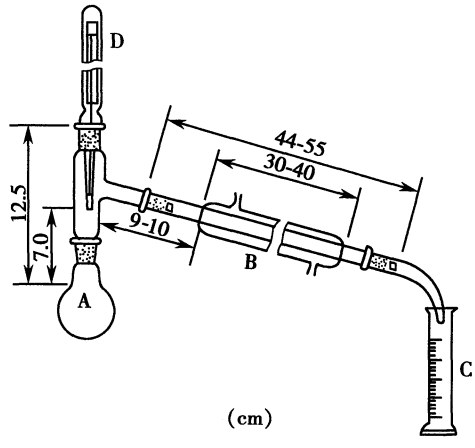

Fig. 10

Procedure Pour 25 ml of the substance being examined into the dried distillation flask through a dry funnel with a long stem. Add a few enamel-free porcelain fragments and insert the thermometer with ground joint. Attach an adapter to the lower end of the condenser and put the cylinder under the adapter. If heat with an open flame, place the distillation flask on the hole in the center of an asbestos plate (in the form of a square with sides of 12-15 cm and with a perforation of 2.5-3.0 cm in diameter in the center, 0.3-0.5 cm thick), the bottom of the flask should be fitted tightly into the perforation to avoid the excessive heating of the vapour of the liquid. Heat with an open flame so that the liquid distils at a rate of 2-3 ml per minute. Record the temperature at which the fifth drop of condensate leaves the tip of the condenser and the temperature at which all the liquid except 3-4 ml has been distilled, or when a specified volume of distillate has been collected. The temperature range exhibited on the thermometer, is the distilling range of the substance being examined. When not less than 90% of the liquid is to be distilled within the distilling range, use a 100 ml distillation flask with 50 ml of the substance being examined, and a 50 ml galss cylinder as the receiver.
Correct the observed temperature readings for any variation in the barometric pressure from the normal (101.3 kPa or 760 mmHg) by subtracting or adding 0.1℃ for every 0.36 kPa (2.7 mmHg) increase or decrease of the pressure.

Ⅶ C Determination of Melting Point

Three methods for the determination of melting point are given herein, varying in accordance with the nature of the substance being examined. When no specified method is designated in the monograph, use method 1.

Method 1 For pulverizable solid substances
Pulverize the substance being examined to a fine powder, dry at a temperature as specified in the monograph under the test for loss on drying. If no drying temperature is specified in the monograph, dry the substance at 105℃ if it melts above 135℃ without decomposition; if the substance melts below 135℃ or decomposes on heating, dry it overnight over phosphorus pentoxide or with and suitable method, e. g. in vacuum at a constant temperature.
Transfer a quantity of the dried powder to a capillary tube (made of neutral hard glass with one end sealed, 0.9-1.1 mm in internal diameter with a wall thickness of 0.10-0.15 mm and at least 9 cm in length. When a capillary tube is immersed in the liquid as heat source, not less than 3 cm of it is above the surface of the liquid) and pack the powder by tapping on a hard surface or dropping from the top of a clear vertical glass tube so as to form a tightly packed column of 3 mm in height. Put the thermometer (a partial-immersion thermometer graduated in divisions of 0.5℃ and calibrated with a reference substance for melting point determination) into the glass vessel with heating liquid (the heating liquid is water for melting points below 80℃; liquid paraffin, silicone oil for above 80℃), the bottom of its bulb is at least 2.5 cm away from the bottom of the vessel (when the vessel equipped with internal heating is used, the bulb of the thermometer is at least 2.5 cm away from the surface of the heating source). Add the appropriate liquid to the vessel until the surface of the liquid reaches the immersion line of the thermometer when it is heated. Heat the bath with stirring, when the temperature is about 10℃ below the lower limit of the expected milting range, insert the capillary tube into the bath, the content of the tube being kept close to the middle of the bulb of the thermometer. Regulate the rate of temperature rise to 1.0-1.5℃ per minute, and keep the temperature uniform in the bath with constant stirring. Record the temperature of the beginning of melting to the end of melting. Repeat for 3 times and take the mean value.
"Beginning of melting" is the temperature at which partial liquefaction of the substance in the capillary tube occurs and definite ilquid drop just appears.

"End of melting" is the temperature at which liquefaction of the substance takes place just completely.

For a substance which melts with decomposition, the melting point is determined in the same way as described above except that the rate of temperature rise is regulated to 2.5-3.0℃ per minute. The temperature at which liquefaction occurs (or frothing begins) is taken as the beginning of melting, and the temperature at which solid phase disappears is regarded as the end of melting. If the solid phase disappears not distinctly, the temperature at which expanding and rising of decomposition product occurs is taken as "end of melting". If there is no distinction between the beginning and the ending of melting, the temperature at which a sudden change of the substance occurs should be recorded. This temperature, as well as the beginning and the ending of melting point must fall within the melting range as specified in the monograph.

Mehod 2 For substances not pulverizable (such as fat and fatty acids, hard paraffin, lanolin etc.)

Melt the substance at a temperature as low as possible, and then suck the liquid up to a height of about 10 mm in a capillary tube which is left open at both ends. Cool the tube at 10℃ or lower for 24 hours or cool it on ice for not less than 2 hours. Attach the tube to the thermometer by means of a rubber band so that the column of substance in the tube is kept colse to the middle of the bulb of the thermometer (as method 1). Place the thermometer and capillary tube into the heating bath, the distance between the upper end of the column of substance and the level of heating liquid is about 10 mm. Heat the bath with constant stirring until the temperature is about 5℃ below the lower limit of the expected melting range, regulate the rate of temperature rise to not more than 0.5℃ per minute. Record the temperature at which the substance in the capillary tube begins to move upwards.

Method 3 For vaseline or other similar substances

Place a quantity of the substance being examined in a heat-resisting vessel with flat bottom, stir slowly and heat until it reaches a temperature of 90-92℃, allow the thickness of the substance being examined reaches 12 mm±1 mm, then cool to a temperature of 8-10℃ above the specified melting point. Dip vertically a thermometer graduated in divisions of 0.2℃ with mercury bulb 18-28 mm long and 5-6 mm in diameter (previously put a cork at the upper end and with a groove cut in the side, chilled to 5℃, wipe to dry) into the above molten substance to the bottom of the vessel (immerse 12 mm). Withdraw it immediately, and hold it vertically until the surface of the substance adhesived at the bulb of thermometer becomes turbid, then dip it for 5 minutes into a water bath at a temperature below 16℃, then place the thermometer in a test tube with external diameter about 25 mm and 150 mm long, stopped tightly. Fix the thermometer securely in the test tube so that the bulb of thermometer is about 15 mm above the bottom of the test tube. Suspend the test tube in a water bath of about 16℃, adjust the height of the test tube to make the partial-immersion line of the thermometer at the surface of water; raise the temperature of the bath at the rate of 2℃ per minutes to 38℃, then change to a rate of 1℃ per minute and record the temperature at which the first drop of melted substance leaves the thermometer: This is the approximate melting point of the substances being examined. Repeat the determination twice. If the variation of three determinations is less than 1℃, take the average of the three as the melting point. If the variation of three determination is greater than 1℃, make two additional determinations and take the average of the five.

Ⅶ D Determination of Congealing Point

The congealing piont of a substance, determined as described below, is the highest temperature, which remains constant for a short time, occuring during the solidification of the liquid. Congealing point is indicative of the identity and purity of the substance being examined.

Apparatus As Fig. 11, a dry test tube (A) about 25 mm in internal diameter and 170 mm long is suspended by means of a bored cork inside a larger tube (B) about 40 mm in internal diameter and 160 mm long. The distance between the bottoms of the two tubes is about 10 mm. The inner tube is stoppered by a bored cork which carries a thermometer (C) graduated in 0.1℃ and stirrer (D). The thermometer is so fixed that the bottom of its bulb is about 10 mm from the bottom of the inner tube. Stirrer (D) is a glass rod slightly bent at the upper end, the other end is in the form of a loop which is about 18 mm in diameter at right angle to the rod. The whole assembly is placed in a 1000 ml beaker containing water or a suitable cooling liquid and the surface of the cooling liquid is about 20 mm from the mouth of the beaker.

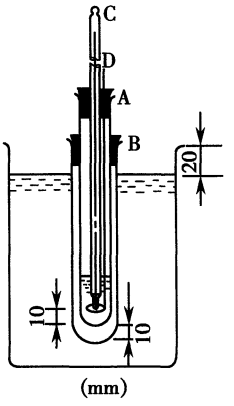

Fig. 11

Procedure Place in the inner tube 15 ml of the liquid or 15-20 g of the melted solid substance being examined and determine the approximate congealing point by cooling rapidly. Place the inner tube in a water bath about 5-10℃ above the approximate congealing point until all the solidified substance but the last trace is melted. Fill the beaker with water or other suitable cooling ilquid at a temperature about 5℃ below the approximate congealing point and fix the apparatus as described above. Stir the liquefied substance gently and read the temperature every 30 seconds until it begins to solidify. Stop stirring and read the temperature every 5-10 seconds until the temperature remains constant or becomes constant after a slight eleration for about 1 minute. The highest temperature observed is regarded as the congealing point of the substance being examined.

Annotations If the substance being examined does not start to solidify under normal condition, congealation may be induced by adding a small amount of the substance crystallized by cooling to a lower temperature.

Ⅶ E Determination of Optical Rotation

The plane of polarized light can be rotated clockwise or counterclockwise when plane polarized light passes through some liquids or solutions of compounds which are optically active. Optical rotation is expressed in degrees by which the plane of polarization is rotated under specified condition. Specific optical rotation is defined as the optical rotation measured under given wavelength and temperature, when polarized light passes through a layer of a solution 1 dm thick containing 1 g of optically active substance per ml. The measurement of specific optical rotation (or optical rotation) may be used as an identification test, a purity test or a method of assay.

Unless otherwise specified, the values of optical rotation cited in this method are measured at 20℃ with sodium D line (589.3 nm), in a tube of 1 dm. Conversion factor should be applied if the tube used is not of the appropriate length. Optical rotation is measured with a calibrated polarimeter accurately read to 0.01°. Rinse the polarimeter tube several times with the liquid or solution prepared as described in the individual monograph. Fill the polarimeter tube slowly with the liquid or solution, taking care to avoid creating or leaving air bubbles. Put the tube into the polarimeter and read the degrees of optical rotation. Substances are described as dextrorotatory or levorotatory according to whether the plane of polarization is rotated clockwise or counterclockwise, respectively, as viewed toward the light source. Dextrorotation is designated (+) and levorotation is designated (−). Carry out 3 measurements, take the average and calculate the specific optical rotation from one of the following equations:

For liquids $$[\alpha]_D^t=\frac{\alpha}{ld}$$

For solid substances $$[\alpha]_D^t=\frac{100\alpha}{lc}$$

Where $[\alpha]$ is specific optical rotation;
D is sodium D line;
t is measuring temperature;
l is the length of the polarimeter tube, dm;
α is the observed rotation in angular degrees;
d is the relative density of the liquid;
c is the weight of solute (g) in 100 ml of the solution, calculated on the dried basis or anhydrous basis.

Standard quartz polarimetric tube may be used to calibrate the polarimeter, the deviation of reading should comply with the requirements.

Announcements (1) Blank tests should be performed to check the zero point before and after each measurement. If the deviation of reading does not comply with the requirements after measurement, repeat the measurement.

(2) The temperature of the solution being tested should be kept constant at 20℃ ± 0.5℃ (or at the temperature specified in the individual monograph).

(3) Liquids or solutions of solid substance should be completely dissolved, and the test solution should be clear.

(4) The specific rotation of a liquid or a substance in solution is affected by several factors including light source, wavelength, solvent, concentration and temperature. When describing the specific optical rotation, the measuring condition should be provided.

Ⅶ F Determination of Refractive Index

Refraction takes place when a beam of light is transmitted from a transparent medium into another transparent medium, since the velocity of light changes in a medium of different density. The refractive index of a substance is the ratio of the velocity of light in air to its velocity in the substance. The refractive index may also be defined as the ratio of the sine of the angle of incidence to the sine of the angle of refraction:

$$n=\frac{\sin i}{\sin r}$$

Where n is the refractive index;
i is the angle of incidence;
r is the angle of refraction.

The refractive index varies with the temperature of the substance being examined and the wavelength of incident light. It decreases with the increase of temperature. The shorter the wavelength of incident light, the larger the refractive index. Refractive indices are usually stated in terms of sodium line D at a temperature of t and symbolized by n_D^t. The measurement of refractive index is employed to establish the identity of oils and test for purity of the substance being examined.

Unless otherwise specified, the values of refractive index cited in this method are measured at 20℃ with sodium line D (589.3 nm) against air (White light may be used if an Abble refractometer is available).

The refractometer should be able to give readings accurate to 0.0001 in the range of 1.3-1.7. If an Abble refractometer or other equivalent instrument is used, the measurement should be conducted at 20℃ ± 0.5℃ (or in accordance with the temperature stated under individual monograph). Three readings should be taken and the mean value is used as the refractive inedx of the substance being examined. The readings of the refractometer should be calibrated before use with a prism or against water. The refractive index of water is 1.3330 at 20℃, 1.3325 at 25℃ and 1.3305 at 40℃.

Ⅶ G Determination of pH Value

The pH value of an aqueous solution is determined by a pH meter using a glass electrode as the indicator electrode, and a saturated calomel electrode as the reference electrode. Metrological verification of the pH meter should be carried out at regular intervals to meet the related national requirements. Before each measurement, the pH meter should be calibrated with the standard buffer solutions prepared as follows, or those of a declared pH valve accurate to 0.01 pH unit distributed by national administrative department of certified reference material (CRM).

1. Standard buffer solutions used for the calibration of pH meters are prepared as follows.

(1) *Standard tetraoxalate BS* Dissolve 12.71 g of potassium tetraoxalate, previously dried at 54℃ ± 3℃ for 4-5 hours and accurately weighed, in water to produce 1000 ml.

(2) *Standard biphthalate BS* Dissolve 10.21 g of potassium biphthalate, previously dried at 115℃ ± 5℃ for 2-

3 hours and accurately weighed, in water to produce 1000 ml.

(3) *Standard phosphate BS* Dissolve 3.55 g of anhydrous disodium hydrogen phosphate and 3.40 g of potassium dihydrogen phosphate, previously dried at 115℃±5℃ for 2-3 hours and accurately weighed, in water to produce 1000 ml.

(4) *Standard sodium tetraborate BS* Dissolve 3.81 g of sodium tetraborate, accurately weighed (avoid efflorescence), in water to produce 1000 ml. Preserve the solution in well closed polyethylene containers, protected from carbon dioxide in the air.

(5) *Standard calcium hydroxide BS* Use the supernatant of a saturated solution of calcium hydroxide, saturated with carbon dioxide-free water at 25℃. Store protected from carbon dioxide in the air. Discard and repeat the preparation if the solution becomes turbid.

Standard buffer solutions mentioned above must be prepared from the certified reagents for pH determination. The exact pH values of the standard buffer solutions at different temperatures mentioned above are given in the following table.

Temp. ℃	Standard buffer solutions①				
	1	2	3	4	5
0	1.67	4.01	6.98	9.64	13.43
5	1.67	4.00	6.95	9.40	13.21
10	1.67	4.00	6.92	9.33	13.00
15	1.67	4.00	6.90	9.28	12.81
20	1.68	4.00	6.88	9.23	12.63

① The standard buffer solutions are numbered here in the same sequence as shown in the preceding paragraph.

2. Announcements Operate the pH meter according to the manufacturer's instructions and pay attention to the following precautions when pH value is determined.

(1) Select two standard buffer solutions with difference in pH value of 3 units before determining test solution, and the pH value of the test solution is between that of two standard buffer solutions.

(2) Calibrate the apparatus using the primary standard buffer solution whose pH value is closer to test solution, adjusting the meter (fixed position) to read the appropriate pH value given in table mentioned above.

(3) Then calibrate the apparatus using the second standard buffer solution. The deviation should not be more than ± 0.02 pH units, adjusting the slope carefully to make the observed pH value meet the value in the table mentioned above if it is not. Repeat the adjusting procedure for fixed position and slope until the difference between the observed value on the apparatus and the value of standard buffer solution is not more than 0.02 pH units. Otherwise the apparatus should be examined or the electrode should be exchanged till comply with the requirement.

(4) The electrode should be rinsed with water and dried (or rinsed with the solution being examined) before each measurement.

(5) A highly alkaline glass electrode should be used if the pH value of the solution being examined is high. The error caused by alkalinity should be corrected if the electrode used is apt to produce such an error.

(6) The determination of the pH value of a liquid with weak buffering capacity (e.g. water) should be conducted after the pH meter is calibrated with standard potassium biphthalate BS and repeated after the pH meter is calibrated with standard sodium tetraborate BS. The readings should not be recorded until the shift in 1 minute is within 0.05 unit. The pH value of the liquid being examined is the mean value of the two readings provided that they do not differ by more than 0.1 unit.

(7) Freshly boiled and cooled distilled water with a pH value of 5.5-7.0 should be used for preparing standard buffer solutions and dissolving the substance to be examined in pH determinations.

(8) Usually, the standard buffer solutions can be kept for 2-3 months, but should not be used if any turbidity, mould or precipitate is discovered.

Appendix Ⅷ

Ⅷ A Potentiometric Titration and Dead-stop Titration

The potentiometric method and dead-stop method may be used for the confirmation of end point or the colour change of indicators at the end point. Using a suitable electrode system, these methods can be applied to oxidation-reduction, neutralization aqueous solution or non-aqueous solution, argentometric and nitrite titrations as well as the method 1 of volumetric determination of water. Two different electrodes are used in potentiometric titration, one is an indicator electrode, whose potential is sensitive to the ionic concentration of the substance being examined, the other is a reference electrode, whose potential is constant. At the end point of the titration, the ionic concentration of the substance being examined changes sharply, causing an abrupt increase or decrease of the potential (a potential jump) of the indicator electrode.

In the dead-stop titration, a low voltage of about 50 mV is applied across two same platinum electrodes. Since the electrodes are polarized, there is no current or only a very weak current flows. When the end point is reached, a slight excess of the titrant depolarizes the electrodes and a current flows, causing a permanent deflection of the galvanometer needle. On the other hand, if non-polarized electrodes are polarized, the deflected galvanometer needle turns back to zero permanently.

Apparatus In potentiometric titration, a pH meter or potentiometer, or any model of a potentiometric titration apparatus may be used. In dead-stop titration, any model of a dead-stop titration apparatus or an assembly illustrated in the following figure may be used. (as Fig. 12)

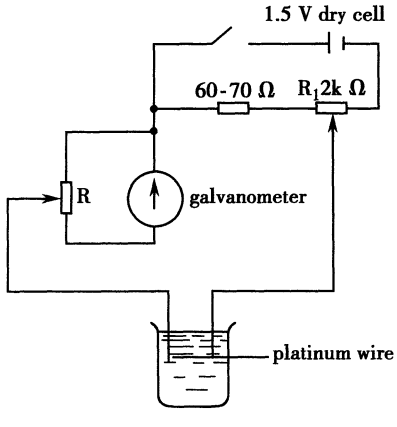

Fig. 12
the value of *R* is approximately equivalent to the critical damping resistance of the galvanometer

Unless otherwise specified, the sensitivity of galvanometer is 10^{-6} A per graduation for the determination of water, and 10^{-9} A per graduation for nitrite titration. The electrode system employed are shown in the following table.

Procedure	Electrode system	Note
Redox titration in aq. solution	Platinum-calomel	Platinum electrode cleaned with nitric acid containing a small quantity of ferric chloride, or with chromic acid cleaning solution
Neutralization titration in aq. solution	Glass-calomel	
Neutralization titration in no-naqueous solution	Glass-calomel	Use a saturated solution of KCl in dehydrated methanol as the salt bridge. Wash the glass electrode after each titration and immerse in water while not in use
Argento-metric titration	Silver-glass Silver-KNO_3 salt bridge-calomel	Silver electrode cleaned with dilute nitric acid
Hydrogen displacement in —C≡CH	Glass-KNO_3 salt bridge-calomel	
Mercury potentio-metric titration	Platinum-mercury-mercurous sulfate	Platinum electrode rinsed with water after being immersed in 10% (w/v) sodium thiosulfate. Platinum-mercury-mercurous sulfate electrode rinsed with water after being immersed in dilute nitric acid
Dead-stop titration	Platinum-platinum	Cleaned with nitric acid containing a small quantity of ferric chloride, or with chromic acid cleaning solution

Titration

(1) *Potentiometric Titration* Place a beaker containing the solution of the substance being examined on a magnetic stirrer, dip the electrodes into the solution and start the stirrer. Add the titrant from a burette in portions, record the potential after each addition. When the end point is nearly reached, add the titrant dropwise and record the potential. Add a few drops more after the potential jump and record the potential reading.

Potentiometric end point detection Plot an E-V curve with the potential (E) as ordinate and the volume of titrant (V) as abscissa, the midpoint of the rapid ascent or descent portion is the end point. Alternatively, plot a $(\Delta E/\Delta V)$-V curve (ΔE is the potential difference between successive measurements and ΔV is the volume of titrant added between successive measurements), the volume corresponding to the maximum of $\Delta E/\Delta V$ is the end point. Also the end point can be determined by second derivative method. Plot a $(\Delta^2 E/\Delta V^2)$-V curve, calculate the difference between successive

$\Delta E/\Delta V$, i. e. $\Delta^2 E/\Delta V^2$, the volume corresponding to $\Delta^2 E/\Delta V^2=0$ is the end point.
If the colour changes of an indicator at the end point is to be checked, add the indicator solution before the titration and observe the colour changes in the vicinity of the end point.

(2) *Dead-stop Titration* For the indication of the end point of diazotization reaction by a nitrite titration, apply a voltage of about 50 mV across the electrodes by adjustion R_1. Place an accurately weighed quantity of the substance being examined in a beaker on a magnetic stirrer, add 40 ml water and 15 ml of hydrochloric acid solution (1→2), unless otherwise specified, stir to effect dissolution. Add 2 g of potassium bromide, dip the electrodes into the solution, plunge the burette into the solution so that about 2/3 of the tip is under the liquid surface, titrate with sodium nitrite (0.1 or 0.05 mol/L) VS quickly with stirring. Withdraw the burette tip when the end point is nearly reached, rinse it with water and add the washings to the solution, continue the titration slowly until the galvanometer needle is permanently deflected.
For the indication of the end point of the method 1 of volumetric determination of water, adjust the resistance R_1 until the galvanometer shows an initial current of 5-10 μA, titrate with Fischer reagent until the current rises to 50-150 μA abruptly and the deflection of galvanometer needle persists for a few minutes.

Ⅷ B Non-aqueous Titration

Non-aqueous titration is carried out in a non-aqueous solvent and used mainly for the determination of organic bases; organic salts of hydrochalic acid, phosphoric acid and sulfuric acid or organic acids and the alkali metal salts of organic acids, as well as some weak organic acids.

Non-aqueous Solvents

(1) *Acidic solvents* The relative alkalinity of weak organic bases can be remarkably enhanced in acidic solvents. The most commonly used acidic solvent is glacial acetic acid.

(2) *Basic solvents* The relative acidity of weak organic acids can be remarkably enhanced in basic solvents. The most commonly used basic solvent is dimethylformamide.

(3) *Amphiprotic solvents* They have the properties of acids and bases. The most commonly used amphiprotic solvent is methanol.

(4) *Aprotic solvents* They are neither acidic nor basic, such as benzene, chloroform etc.

Method 1
Unless otherwise specified, dissolve an accura-tely weighed quantity, equivalent to about 8 ml of perchloric acid (0.1 mol/L) VS, of the substance being examined in 10-30 ml of glacial acetic acid, add 1-2 drops of the indicator solution as specified in the monograph and titrate with perchloric acid (0.1 mol/L) VS. The colour change of the indicator should be checked by potentiometric method and a blank determination performed to make any necessary correction.
If the temperature at which the titration is performed differs by more than 10℃ from the temperature at which the perchloric acid VS was standardized, the titrant must be standardized again. If the difference does not exceed 10℃, the concentration of the titrant can be corrected as follows:

$$N_1=\frac{N_0}{1+0.0011(t_1-t_0)}$$

Where 0.0011 is the volume expansion coefficient of glacial acetic acid;
t_0 is the temperature at which perchloric acid VS was standardized;
t_1 is the temperature at which the titration is performed;
N_0 is the concentration of perchloric acid VS at t_0;
N_1 is the concentration of perchloric acid VS at t_1.

When the substance being examined is a salt of hydrohalic acids, the titration should be carried out after the addition of 3-5 ml of mercuric acetate TS. Phosphates and sulfates can be titrated directly, but in the case of sulfates, the reaction stops when bisulfate is formed. In the titration of nitrates, the end point should be determined by potentiometric method, because the indicator can be discoloured by nitric acid.
In non-aqueous potentiometric titration, the indicator electrode is a glass electrode and the reference electrode is a saturated calomel electrode using a saturated solution of potassium chloride in dehydrated methanol as the salt bridge.

Method 2
Unless otherwise specified, dissolve an accurately weighed quantity, equivalent to 8 ml of the titrant (0.1 mol/L), of the substance being examined in a solvent specified in the monograph, add 1-2 drops of the specified indicator solution and titrate with the specified basic titrant (0.1 mol/L). The colour change of the indicator should be checked by potentiometric method and a blank determination performed to make any necessary correction.
In the course of the titration, protect the solvent and titrant from atmospheric carbon dioxide and moisture, avoid the evaporation of the titrant.
The electrodes used in potentiometric titration is the same as that described in method 1.

Appendix Ⅸ

Ⅸ A Determination of Foreign Matter

Foreign matter consists of any or all of the following:
(1) The biological origin of which is the same as that specified in the monograph concerned but the appearance or botanical part is different.
(2) The biological origin of which differs from that specified in the monograph concerned.
(3) Foreign mineral matters such as stones, sand, lumps of soil.

Method (1) Weigh a quantity of substance being examined and spread out in a thin layer. Detect the foreign matter by inspection with eye or with lens (5-10×), or by the use of a suitable sieve, if necessary, to separate the foreign matter.
(2) Weigh separately each kind of foreign matter and calculate the percentage content.

Note (1) In some crude drugs where the foreign matter may closely resemble to the official drug, it may be necessary to use either microscopical, chemical or physical method to identify the foreign matter.
(2) Cut the big crude drugs and examine for the occurrence of insects, moulds and deterioration.
(3) The quantity of substance being examined for the determination of foreign matter is accordant with the method for the sampling of crude drugs (Appendix Ⅱ A), unless specified otherwise.

Ⅸ B Determination of Lead (Pb), Cadmium (Cd), Arsenic (As), Mercury (Hg) and Copper (Cu)

1. Atomic absorption spectrophotometry
This method is provided to determine the lead, cadmium, arsenic, mercury and copper in Traditional Chinese Medicinal substances using atomic absorption spectrophotometry (Appendix Ⅴ D). The following procedures are given unless specified otherwise.

(1) Determination of lead (graphite oven method)
①***Determination conditions*** Reference condition: dry temperature: 100-120℃, maintain 20 seconds; ash temperature: 400-750℃, maintain 20-25 seconds; atomic temperature: 1700-2100℃, maintain 4-5 seconds; measurement wavelength: 283.3 nm; background calibration: deuterium lamp (D lamp) or Zeeman effect.

②***Preparation of lead standard stock solution*** Measure accurately a quantity of lead single-element standard solution to prepare standard stock solution with 2% nitric acid solution, which containing 1 μg per ml, stored at 0-5℃.

③***Preparation of calibration curve*** Measure accurately a quantity of lead standard stock solutions respectively, diluted with 2% nitric acid solution to the concentration of 0, 5, 20, 40, 60, 80 ng per ml respectively. Measure respectively accurately 1 ml the above solution, add respectively 1 ml of 1% ammonium dihydrogen phosphate (ADP, $NH_4H_2PO_4$) and 0.2% magnesium nitrate [$Mg(NO_3)_2$], mix well, pipette accurately 20 μl to inject into the atomic generator of graphite oven and determine their absorbance, then draw the calibration curve with absorbance as vertical axis and concentration as horizontal ordinate.

④***Preparation of test solution***
Method A Weigh accurately 0.5 g of the coarse powder of the substance being examined, transferred into a Teflon slaking-tank, add 3-5 ml of nitric acid (HNO_3), mix well, soak overnight, cover the inner lid, screw down the outer coating, put into the suitable microwave slaking oven to slake (operate according to the instrumental specific slaking procedure). Then put the slaking tank on the electric hot plate, heat slowly until brown fumes are no longer evolved, and continuously concentrate slowly to 2-3 ml, cool, transferred to a 25 ml flask and diluted to volumn with water, shake well. Prepare synchronously the reagent blank solution according to the above method.

Method B Weigh accurately 1 g of the coarse powder of the substance being examined, transferred into a casparian flask, add 5-10 ml of the mixture of nitric acid (HNO_3) and perchloric acid ($HClO_4$) (4∶1), add a small hopper on the flask-top, macerate overnight, heat to slake on the electric hot plate, keep somewhat-boiling, if brownish-black, add again a quantity of the above mixture, continuously heat till the solution becomes clarifying and transparent, then raise temperature, heat continuously to thick smoke, till white smoke disperse, the slaked solution becomes colourless and transparent or a little yellow, cool, transfer it into a 50 ml volumetric flask, wash the container with 2% nitric acid solution (HNO_3), add the washing solution into the same volumetric flask, and dilute with the same solvent to the volumn, shake well. Prepare synchronously the reagent blank solution according to the above procedure.

Method C Weigh accurately 0.5 g of the coarse powder of the substance being examined, transferred into a porcelain crucible, charred at the low temperature on the electric hot plate to smokeless, transfered into the high temperature oven, ignite for 5-6 hours at 500℃ (if incomplete incineration observed add proper nitric acid (HNO_3), heat at the low temperature on the electric hot plate, repeat till completely ash.), take out and keep cool, dissolved with 5 ml of 10% HNO_3, transferred into a 25 ml volumetric flask, wash the container with water, add the washing solution into the same volumetric flask, and dilute to the volumn, shake well. Prepare synchronously the reagent blank solution according to the above method.

⑤***Determination*** Measure accurately 1 ml of the test solution and its corresponding reagent blank solution respectively, add 1 ml of solution containing 1%

$NH_4H_2PO_4$ and 0.2% $Mg(NO_3)_2$, shake well, pipette accurately 10-20 μl to determine their absorbance according to the above method of "Preparation of calibration curve", calculate the content of lead (Pb) in the test solution from the calibration curve.

(2) Determination of cadmium (Cd) (graphite oven method)

①Determination conditions Reference conditions: dry temperature: 100-120℃, maintain 20 seconds; ash temperature: 300-500℃, maintain 20-25 seconds; atomic temperature: 1500-1900℃, maintain 4-5 seconds; measurement wavelength: 228.8 nm, background calibration: deuterium lamp (D lamp) or Zeeman effect.

② Preparation of Cd standard stock solution Measure accurately a quantity of Cd single-element standard solution to prepare standard stock solution Cd with 2% HNO_3, which containing 0.4 μg per ml, stored at 0-5℃.

③Preparation of calibration curve Measure accurately a quantity of lead standard stock solution, diluted to the concentration of 1.6, 3.2, 4.8, 6.4 and 8.0 ng per ml with 2% HNO_3 respectively. Pipette accurately 10 μl the above solutions respectively, inject them into the graphite oven, determine their absorbance, and then draw the calibration curve with absorbance as vertical axis and concentration as horizontal ordinate.

④Preparation of test solution Reference to "Preparation of test solution" of Pb in the above.

⑤Determination Pipette accurately 10-20 μl of the test solution and its corresponding reagent blank solution respectively, determine their absorbance according to the above method of "Preparation of calibration curve" (if interference occurs, weigh accurately respectively 1 ml of the standard solution, blank solution and test solution, add 1 ml of a solution containing 1% $NH_4H_2PO_4$ and 0.2% $Mg(NO_3)_2$, shake well, determine their absorbance according to the method above, calculate the content of Cd in the test solution from the calibration curve.

(3) Determination of arsenic (As) (hydride method)

①Determination conditions Apparatus: suitable hydride generator device, reducing agent: a solution containing 1% sodium borohydride and 0.3% sodium hydroxide; carrier liquid: 1% hydrochloric acid; carrier gas: nitrogen; measurement wavelength: 193.7 nm, background calibration: deuterium lamp (D lamp) or Zeeman effect.

②Preparation of As standard stock solution Measure accurately a quantity of As single-element standard solution to prepare standard stock solution with 2% nitric acid solution (HNO_3), which containing 1.0 μg per ml As, stored at 0-5℃.

③Preparation of calibration curve Measure accurately proper quantities of arsenic standard stock solution, diluted with 2% HNO_3 to the concentration of 2,4,8,12, and 16 ng per ml respectively. Accurately transfer 10 ml of each into 25 ml volumetric flask respectively, add 1 ml of 25% potassium iodide solution (prepared prior to use), shake well, add 1 ml of ascorbic acid solution (prepared prior to use), shake well, dilute with hydrochloric acid solution (20→100) to the volumn, shake well, close the stopper and immerse the flask in a water bath at 80℃ for 3 minutes. Cool, transfer proper quantities of each solution respectively into the hydride generator device, determine the absorbance, then plot the calibration curve with peak area (absorbance) as vertical axis and concentration as horizontal ordinate.

④Preparation of test solution Reference to A or B method of "Preparation of the test solution" of Pb in the above.

⑤ Determination Pipette accurately 10 ml of the test solution and its corresponding reagent blank solution respectively, proceed as described under "Preparation of calibration curve" beginning at the words "add 1 ml of 25% potassium iodide solution". Calculate the content of As in the test solution from the calibration curve.

(4) Determination of Mercury (Hg) (cold absorption method)

①Determination conditions Apparatus: suitable hydride generator device; reducing agent: a solution containing 0.5% sodium borohydride and 0.1% sodium hydroxide; carrier liquid: 1% hydrochloric acid; carrier gas: nitrogen; measurement wavelength: 253.6 nm; background calibration: deuterium lamp (D lamp) or Zeeman effect.

②Preparation of mercury standard stock solution Measure accurately a proper quantity of mercury single-element standard solution to prepare standard stock solution with 2% nitric acid solution, which containing 1.0 μg per ml Hg, stored at 0-5℃.

③Preparation of calibration curve Measure accurately 0, 0.1, 0.3, 0.5, 0.7 and 0.9 ml of mercury standard stock solution, transferred into a 50 ml volumetric flask respectively, add 40 ml of 4% sulfuric acid solution and 0.5 ml of 5% potassium permanganate solution, shake well, drop 5% hydroxylamine hydrochloride solution until the violet red just disappears, dilute with 4% sulfuric acid solution to the volumn, shake well. A quantity of each solution is injected to the hydride generator device, determine the absorbance, then plot the calibration curve with peak area (or absorbance) as vertical axis and concentration as horizontal ordinate.

④Preparation of test solution

Method A Transfer 0.5 g of the coarse powder of the substance being examined, accurately weighed, into a Teflon slaking-tank, add 3-5 ml of nitric acid (HNO_3), mix well, macerate overnight, cover the inner lid, screw firmly the outer coating, put it into the proper microwave slaking oven to slake (operate according to the instrumental specific slaking procedure). Then put the slaking-tank on the electric hot plate heat slowly until brown fumes are no longer evolved, and continuously concentrate slowly to 2-3 ml, cool, add a quantity of 4% sulfuric acid solution, 0.5 ml of 5% potassium permanganate solution, shake well, drop 5% hydroxylamine hydrochloride solution until the violet red just disappears, dilute with 4% sulfuric acid solution to 10 ml, shake well, centrifugate if necessary, the supernatant is used as the test solution. Prepare synchronally the reagent blank solution following the above procedure.

Method B Transfer 1 g of the coarse powder of the substance being examined, accurately weighed, into a casparian flask, add 5-10 ml of the mixed solution of nitric acid solution (HNO_3) and perchloric acid ($HClO_4$) (4 : 1), mix well, fix a small hopper on the flask-top, immerse overnight, heat to slake on the electric hot plate at 120-140℃ for 4-8 hours until slaking completely, cool, add a quantity of 4% sulfuric acid solution and 0.5 ml of 5% potassium permanganate solution, shake well, drop 5% hydroxylamine hydrochloride solution until the violet red just disappears dilute with 4% H_2SO_4 solution to 25 ml, shake well, centrifugate if necessary, the supernatant is used as the test solution. Prepare synchronally the reagent blank solute based on the same procedure.

⑤Determination Pipette accurately a quantity of the test solution and its corresponding reagent blank solution, respectively, proceed as described under "Preparation of calibration curve". Calculate the content of mercury (Hg) in the test solution from the calibration curve.

(5) Determination of Copper (flame method)

①Determination conditions Measurement wavelength: 324.7 nm; flame: air-acetylene flame; background calibration:

deuterium lamp (D lamp) or Zeeman effect.

②***Preparation of copper standard stock solution*** Measure accurately a proper quantity of copper single-element standard solution, to prepare the standard stock solution with 2% nitric acid solution, which containing 10 μg per ml Hg, stored at 0-5℃.

③ ***Preparation of calibration curve*** Measure accurately a quantity of copper standard stock solution, dilute with 2% HNO_3 solution to the concentrations of 0.05, 0.2, 0.4, 0.6 and 0.8 μg per ml respectively. Inject each standard solution into the flame and determine the absorbance, respective, then plot the calibration curve with absorbance as vertical axis and concentration as horizontal ordinate.

④***Preparation of the test solution*** Reference to "Preparation of the test solution" of Pb in the above.

⑤***Determination*** Pipette accurately quantities of the test solution and its corresponding reagent blank solution respectively, proceed as described under "Preparation of calibration curve". Calculate the content of Cu in the test solution from the calibration curve.

2. Inductively-coupled plasma mass spectrometry

This method is provided to determine arsenic, cadmium, lead, mercury and copper in Traditional Chinese Medicinal substances using inductively-coupled plasma mass spectrometer. The instrument consists of plasma ionization and quadrupole mass spectrometer. The plasma ionization is made up of sampling system, atomization device, atomizer chamber, quartz fire-cannulation, and sampling cone; mass spectrometer is made up of quadrupoles analyzer, detector and other components.

(1) *Preparation of reference stock solution* Measure accurately a quantity of arsenic, cadmium, lead and mercury single-element standard solution, into a volumetric flask respectively, and prepare respective stock solution of 1 μg per ml lead, 0.5 μg per ml arsenic, 1 μg per ml cadmium, 1 μg per ml mercury and 10 μg per ml copper with 10% nitric acid solution (HNO_3).

(2) *Preparation of reference solution* Measure accurately a quantity of reference stock solutions of lead, arsenic, cadmium and copper to prepare the mixture solution containing arsenic and lead with respective concentration of 0,1,5,10 and 20 ng per ml, cadmium with the concentration of 0,0.5,2.5,5 and 10 ng per ml and copper with the concentration of 0,50,100,200, 500 ng per ml with 10% HNO_3 solution. Measure accurately a quantity of mercury reference stock solution, diluted with 10% HNO_3 to the concentrations of 0,0.2,0.5,1,2 and 5 ng per ml. This solution should be prepared prior to use.

(3) *Preparation of internal standard solution* Measure precisely a quantity of single standard solution of germanium (Ge)、indium (In) and bismuth (Bi), prepare the mixture solution with their respective concentration of 1 μg per ml.

(4) *Preparation of test solution* Substances being examined are dried for 2 hours at 60℃, ground to coarse powder, weighed accurately 0.5 g of each, and put into the microwave slaking tank with the ability of pressurization and resistibility to elevated temperature, add 5-10 ml of HNO_3 (given severe reaction, lay aside till the reaction ceases). Close tightly and slake according to the instrumental requirements and relative procedures. After slaking completely, cool to the temperature of slaked solution lower than 60℃, take out the slaking-tank, cool, transfer the slaked solution into 50 ml volumetric flask, wash the slaking-tank with a little water three times and add them into the same flask, add 200 μl of 1 μg/ml aurum single-element standard solution, dilute to the volumn, shake well (If there is some deposit, get the supernatant after centrifugation).

Prepare the reagent blank solution according to the same procedure except not adding aurum single-element standard solution.

(5) *Determination* The chosen isotopes to detect are ^{63}Cu, ^{75}As, ^{114}Cd, ^{202}Hg and ^{208}Pb. Select ^{72}Ge as the internal standard of ^{63}Cu、^{75}As, ^{115}In as the internal standard of ^{114}Cd, ^{209}Bi as the internal standard of ^{202}Hg and ^{208}Pb, and correct the detected elements by choosing the suitable correction equation according to the requirements of different instruments.

Insert the internal standard sampling pipe of instrument in the internal standard solution during the analyzing, while insert the sampling pipe in turn into the different concentrations control solutions and detect. Plot the calibration curve with the detected values (mean value of three readings) as vertical axis and concentrations as horizontal ordinate. Insert the sampling pipe into the test solution, detect and get the average value of three readings. Calculate the corresponding concentrations from the calibration curve, subtract the concentrations of the corresponding blank solutions, and then obtain the content of the above elements respectively.

Ⅸ C Limit Test for Chlorides

Test preparation Unless otherwise specified, weigh a quantity of the substance being examined as prescribed under individual monographs, dissolve it in about 25 ml of water (if the solution is alkaline, neutralize with nitric acid dropwise). Add 10 ml of dilute nitric acid and filter if necessary, transfer the solution to a 50 ml Nessler cylinder, add water to produce 40 ml and mix well.

Reference preparation Transfer a volume of sodium chloride standard solution as prescribed under individual monographs to a 50 ml Nessler cylinder, add 10 ml of dilute nitric acid and sufficient water to produce 40 ml, mix well.

Procedure To each of the Nessler cylinders described above add 1.0 ml of silver nitrate TS, dilute with water to 50 ml and mix well. Allow to stand in the dark for 5 minutes, compare the opalescence produced by viewing down the vertical axis of the cylinders against a black background.

If the test preparation is coloured, unless otherwise specified, place two aliquots of the test preparation in Nessler cylinders separately, to one cylinder add 1.0 ml of silver nitrate TS, mix and allow to stand for 10 minutes, filter the content of the cylinder repeatedly until the filtrate is perfectly clear, then add the prescribed volume of standard sodium chloride solution to the filtrate, use it as the reference preparation. To the other cylinder add 1.0 ml of silver nitrate TS, use it as the test preparation. Dilute the test preparation and the reference preparation with water to 50 ml, mix well and allow to stand in the dark for 5 minutes, compare the opalescence as described above.

Sodium chloride standard solution Dissolve 0.165 g of sodium chloride in water in a 1000 ml volumetric flask, and dilute to the volume, mix well (stock solution). Transfer 10 ml of the stock solution, accurately measured, into a 100 ml volumetric flask immediately before use, dilute with water to the volume and mix well (each ml is equivalent to 10 μg of Cl).

Annotations The filter paper used in this test, if necessary, should be previously washed with water containing nitric acid

until the washing is free from chlorides.

Ⅸ D Limit Test for Iron

Unless specified otherwise, dissolve a quantity of the substance being examined as described under individual monographs in water to 25 ml. Transfer the solution to a 50 ml Nessler cylinder, add 4 ml of dilute hydrochloric acid and 50 mg of ammonium persulfate. Dilute with water to about 35 ml, add 3 ml of 30% ammonium thiocyanate solution and sufficient water to produce 50 ml, mix well. Compare the colour produced with that of a reference preparation containing a volume of standard iron solution as prescribed under individual monographs and subjected to the same treatment.

If the colour of the test preparation is of a different shade as compared with that of the reference preparation, transfer each preparation to a separator and extract with 20 ml of *n*-butanol. Transfer each of the *n*-butanol layers to a 50 ml Nessler cylinder, add *n*-butanol to 25 ml and compare the colour of the two solutions.

Iron standard solution Dissolve 0.863 g of ferric ammonium sulfate $FeNH_4(SO_4)_2 \cdot 12H_2O$, accurately weighed, in water in a 1000 ml volumetric flask, add 2.5 ml of sulfuric acid, dilute with water to volume and mix well. This is the stock solution.

Transfer 10 ml of the stock solution, accurately measured, to a 100 ml volumetric flask immediately before use, add water to volume and mix well (each ml is equivalent to 10 μg of Fe).

Ⅸ E Limit Test for Heavy Metals

The term "heavy metals" refers to those metals that react with thioacetamide or sodium sulfide under the specified conditions to produce a coloured compound.

Lead standard solution Dissolve 0.160 g of lead nitrate in 5 ml of nitric acid and 50 ml of water in a 1000 ml volumetric flask, dilute to volume with water, mix well (stock solution).

Transfer 10 ml of the stock solution, accurately measured, to a 100 ml volumetric flask, dilute with water to volume and mix well (each ml is equivalent to 10 μg of Pb). This solution should be prepared immediately before use.

All glassware used for the preparation and preservation of standard lead solution should be free from lead.

Method 1

Unless otherwise specified, use two 25 ml Nessler cylinders. To cylinder A add the specified volume of lead standard solution and 2 ml of acetate BS (pH 3.5), dilute with water or other solvent as specified under individual monographs to 25 ml. To cylinder B add 25 ml of the test preparation containing a quantity of the substance being examined as specified under individual monographs.

If the original test preparation is coloured, it may be matched by the addition of a few drops of dilute caramel solution or other suitable solution to cylinder A.

To each cylinder add 2 ml of thioacetamide TS and mix well, allow to stand for 2 minutes, compare the colour produced by viewing down the vertical axis of the cylinders against a white background. The colour produced in cylinder B is not more intense than that produced in cylinder A.

If the colour cannot be matched by the addition of caramel solution, dissolve the double amount of the substance being examined and the reagent, in water or other solvent as specified under individual monographs to produce 30 ml of test preparation. Divide the test preparation into two equal portions and transfer to Nessler cylinders A and B. To cylinder B add sufficient water or other solvent as specified under individual monographs to produce 25 ml. To cylinder A add 2 ml of thioacetamide TS, mix well and allow to stand for 2 minutes, filter through filter membrane of 3 μm in porosity. To cylinder A add the prescribed volume of lead standard solution and dilute with water of other solvent as specified under individual monographs to produce 25 ml. Then add 2 ml of thioacetamide TS to cylinder B and 2 ml of water to cylinder A and compare the colour as described above.

If the substance being examined contains a ferric salt which interferes with the test, 0.5-1.0 g of ascorbic acid should be added to each cylinder.

Unless otherwise specified, evaporate the same quantity of the same reagents to dryness in a porcelain dish. Dissolve the residue in 2 ml of acetate buffer (pH 3.5) and 15 ml of water. Transfer the solution to a Nessler cylinder, add the specified quantity of lead standard solution and water to 25 ml. The solution is used as reference solution for the test solution which is prepared by using more than 1.0 ml of hydrochloric acid or equivalent amount of dilute hydrochloric acid, 2 ml of ammonia TS or by treating with other reagents.

Method 2

Unless specified otherwise, use the residue obtained from the Determination of Residue on Ignition, add 0.5 ml of nitric acid, evaporate to dryness, heat until nitrous oxide fumes are no longer evolved (or alternatively, ignite a quantity of the substance being examined in a crucible until thoroughly charred, cool, moisten the residue with 0.5-1.0 ml of sulfuric acid, ignite at a low temperature until sulfurous acid fumes are no longer evolved, add 0.5 ml of nitric acid, evaporate to dryness, heat until nitrous oxide fumes are no longer evolved and ignite at 500-600℃ until the incineration is complete). Cool, add 2 ml of hydrochloric acid, evaporate to dryness on a water bath, add 15 ml of water, followed by ammonia TS dropwise until the solution is neutral to phenolphthalein IS, then add 2 ml of acetate BS (pH 3.5) and warm to effect dissolution. Transfer the resulting solution to Nessler cylinder B, dilute with water to 25 ml and proceed as described under method 1. The reference preparation should be prepared as follows. Place the same quantity of the same reagents used for the preparation of test solution in a porcelain dish and evaporate to dryness, heat gently to dissolve in 2 ml of acetate BS (pH 3.5) and 15 ml of water, transfer to the Nessler cylinder A and add the specified volume of standard lead solution, dilute with water to 25 ml.

Method 3

Unless otherwise specified, dissolve a quantity of the substance being examined in 5 ml of sodium hydroxide TS and 20 ml of water. Transfer the solution to a Nessler cylinder, add 5 drops of sodium sulfide TS and mix well, the colour produced is not more intense than that of a reference preparation containing the specified volume of lead standard solution and treated in the same manner.

Method 4

Apparatus The filter holder is composed of tightly sealed upper and lower parts with screw thread, washer, filter membrane and nylon pad web (as Fig. 13).

Lead standard stain Measure accurately a quantity of lead

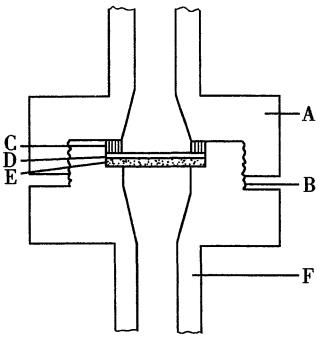

Fig. 13

A is the upper cap part of the filter holder, the entrance may be fitted with a 50 ml syringe; B is joint; C is washer (external diameter is 10 mm, internal diameter is 6 mm); D is filter membrane with 10 mm in diameter and 3.0 μm of porosity, soaked in water for more than 24 hours before use; E is nylon pad web (porosity diameter is not required) with 10 mm in diameter; F is the lower part of the filter holder, the exit is fitted with a suitable rubber tube

standard solution to a small beaker, dilute to 10 ml with water or other solvent as specified under individual monographs, add 2 ml of acetate BS (pH 3.5) and 1.0 ml of thioacetamide TS, mix well, allow to stand for 10 minutes. Transfer to the above filter holder with a 50 ml syringe and filter it on applying an even pressure (filter rate is about 1 ml per minute), then place the filter membrane on a piece of filter paper and dry it.

Procedure Transfer 10 ml of the test preparation prepared as described under individual monographs and proceed as described under Lead standard stain, beginning with the words "add 2 ml of acetate BS (pH 3.5)". Any stain produced is not more intense than the standard stain.

If the test preparation is coloured or turbid, filter it previously with filter membrane. If the filter membrane is contaminated, replace it with another filter membrane and repeat the filtration until the filter membrane remains uncontaminated. Proceed as described under Lead standard stain, beginning at the words "add 2 ml of acetate BS (pH 3.5)", using 10 ml of filtrate, and compare the stain as described above.

IX F Limit Test for Arsenic

Arsenic standard solution Dissolve 0.132 g of arsenic trioxide in 5 ml of 20% sodium hydroxide solution in a 1000 ml volumetric flask, neutralize with dilute sulfuric acid and add 10 ml in excess, dilute with water to volume and mix well, as a stock solution.

Transfer 10 ml of the stock solution, accurately measured, to a 1000 ml volumetric flask immediately before use, add 10 ml of dilute sulfuric acid, dilute with water to volume and mix well (each ml is equivalent to 1 μg of As).

Method 1 (Gutzeit's method)

Apparatus As Fig. 14. A is a 100 ml conical flask with standard ground joint; B is a standard hollow ground glass stopper connected to glass conduit C (external diameter 8.0 mm, internal diameter 6.0 mm), the total length of B and C is about 180 mm, D is a plastic screw, the upper part of which has an aperture 6.0 mm in diameter and the lower part of which has an aperture 8.0 mm in diameter; E is a plastic screw cap which has an aperture 6.0 mm in diameter. A wad of lead acetate cotton wool weighing about 60 mg is packed into tube C to a depth of about 60-80 mm. A disc of mercuric bromide test paper is placed between the contacting surfaces of D and E.

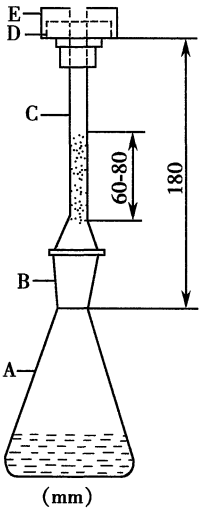

Fig. 14

Arsenic standard stain Place 2 ml of standard arsenic solution, accurately measured, in flask A, add 5 ml of hydrochloric acid and 21 ml of water. Then add 5 ml of potassium iodide TS and 5 drops of acid stannous chloride TS, allow to stand at room temperature for 10 minutes and add 2 g of zinc granules. Insert the stopper B and conduit C into the mouth of flask A and immerse the flask in a water bath at 25-40℃ for 45 minutes. Remove the mercuric bromide test paper.

Use arsenic standard solution instead of the substance being examined and treat it in the same manner described under the individual monographs, prepare arsenic standard stain as described above, if the substance being examined needs to be destroyed organically before carrying out the limit test for arsenic.

Procedure Transfer the test preparation prepared as described under individual monographs to flask A and proceed as described under Arsenic standard stain, beginning with the words "Then add 5 ml of potassium iodide TS". Any stain produced is not more intense than the standard stain.

Method 2 (Silver diethyldithiocarbamate method)

Apparatus As Fig. 15. A is a 100 ml conical flask with standard ground joint; B is a standard hollow ground glass stopper connected to glass conduit C (at one end, the external diameter is 8.0 mm and the internal diameter is 6.0 mm; the other end is in length of 180 mm, in external diameter of 4 mm and in internal diameter of 1.6 mm, the internal diameter of sharp end is 1 mm). D is a glass tube with flat bottom (length 180 mm, internal diameter 10 mm, and with a graduation at 5.0 ml). A wad of cotton wool previously moistened with lead acetate TS and dried weighing about 60 mg is packed into conduit C to a depth of about 80 mm, and measure accurately 5 ml of silver diethyldithiocarbamate TS in tube D.

Standard arsenic reference solution Transfer 5 ml of arsenic standard solution as described under Method 1 to flask A, accurately measured, add 5 ml of hydrochloric acid and 21 ml of water. Then add 5 ml of potassium iodide TS and 5 drops of acid stannous chloride TS, allow to stand at room temperature for 10 minutes and add 2 g of zinc granules. Connect conduit C into flask A immediately, and allow the

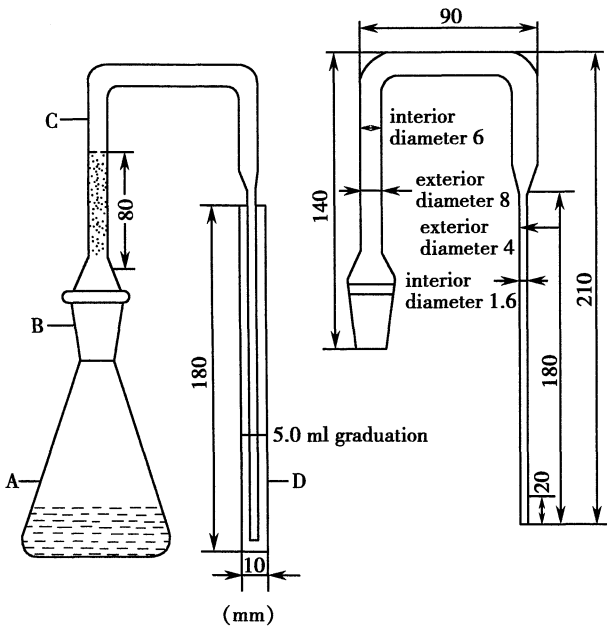

Fig. 15

evolved arsine to enter tube D. Immerse the flask A in a water bath at 25-40℃ for 45 minutes. Remove tube D, add chloroform to the graduation, mix well.

Use arsenic standard solution instead of the substance being examined and treat in the same manner described under the individual monographs, prepare arsenic standard stain as described above, if the substance being examined needs to be destroyed organically before carrying out the limit test for arsenic.

Procedure Transfer the test preparation prepared as described under individual monographs to flask A and proceed as described under standard arsenic reference solution, beginning with the words "Then add 5 ml of potassium iodide TS..." .

Compare the above two solutions against a white background. Any colour produced by the test preparation is not more intense than that produced by the standard arsenic reference solution. If necessary, determine the absorbance at the wavelength of 510 nm, using silver diethyldithiocarbamate TS as the blank (Appendix Ⅴ A).

Annotations (1) Make sure that a blank test produces no arsenic stain or only a barely visible stain.

(2) The preparation of standard stain and test stain must be carried out concommitantly.

(3) The zinc granules should be arsenic free and the size is such that they will pass through a No. 1 sieve. The quantity used should be increased and the reaction time should be extended up to 1 hour, if the granules are of larger size.

(4) Lead acetate cotton wool is prepared by immersing 1.0 g of absorbent cotton in 12 ml of a mixture of equal volumes of lead acetate TS and water. Drain off excess liquid and make the cotton wool fluffy, allow it to dry at a temperature below 100℃ and preserve in a well closed glass container.

Ⅸ G Determination of Loss on Drying

Mix the substance being examined thoroughly, if it is in the form of large crystals, reduce them to a size of about 2 mm by crushing. Place 1 g or the amount specified under individual monographs of the substance being examined in a tared, shallow weighing bottle, previously dried to constant weight under the conditions specified in individual monographs, unless otherwise directed.

The substance being examined should be evenly distributed to form a layer of not more than 5 mm in thickness, or not more than 10 mm in the case of bulky material. When the loaded bottle is placed in the drying chamber of desiccator, remove the stopper and put it beside the bottle, or leave it on the bottle in half open position. Upon the opening of the drying chamber or desiccator, the bottle should be closed promptly. If the substance is dried by heating, allow it to cool to room temperature in a desiccator before weighing.

If the substance melts at a lower temperature than the specified drying temperature, maintain the bottle with its content below the melting temperature until most of the water is removed, then dry it under the specified conditions.

If a vacuum desiccator or constant temperature vacuum desiccator is to be used, a pressure of 2.67 kPa (20 mmHg) or less should be maintained unless otherwise directed. The desiccants used in a desiccator are usually anhydrous calcium chloride, silica gel or phosphorus pentoxide. Phosphorus pentoxide is often used in a constant temperature vacuum desiccator. The desiccants should be kept fully effective.

Ⅸ H Determination of Water

The substance being examined is usually broken into granules or pieces with less than 3 mm in diameter. The substances which have less than 3 mm in length and diameter, can be examined without further breaking. The substance being examined using the drying method under reduced pressure has to pass through a No. 2 sieve.

Method 1 (Drying in oven method)

The method is used for the determination of water in crude drugs containing no or scarcely any volatile constituents.

Measurement Place 2-5 g of substance being examined in a flat weighing bottle which is previously dried to constant weight to form a smooth layer not exceeding 5 mm in thickness, or not exceeding 10 mm in thickness for substance of loose texture and then weigh accurately. Dry in an oven at 100-105℃ for 5 hours with the stopper of the bottle removed. Upon opening the oven, close the bottle promptly and allow it to cool in a desiccator for 30 minutes. Weigh accurately and dry it again under similar condition for 1 hour, cool and weigh. Repeat the operation until the difference between two successive weighings is not more than 5 mg. Calculate the percentage content of water in the substance being examined according to the weight loss on drying.

Method 2 (Toluene distillation method)

The method is used for the determination of water in crude drugs containing volatile constituents.

Apparatus As Fig. 16, the apparatus consists of a 500 ml round bottom flask (A), a graduated receiving tube (B) and a reflux condenser (C) approximately 40 cm in length. All parts of the apparatus should be cleaned and dried in an oven.

Measurement Place a quantity of the substance being examined which is anticipated to yield about 1-4 ml of water and accurately weighed, in the flask A, add about 200 ml of toluene and a few glass beads if necessary. Assemble the apparatus and fill the receiving tube B with toluene through the condenser. Heat the flask gently, when toluene begins

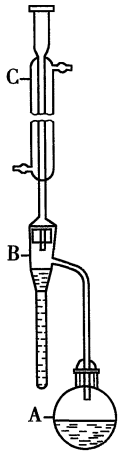

Fig. 16

to boil, adjust the temperature and allow to distill at a rate of 2 drops per second. When the volume of water in the receiving tube does not increase any more, rinse the inside of condenser with toluene and push down the toluene adhering to the wall with a brush or other suitable tools. Continue the distillation for 5 minutes, cool to room temperature and disconnect the apparatus. Push down any droplet of water adhering to the wall of the receiving tube with a copper wire wetted with toluene. Allow to stand until water is completely separated from toluene in the receiving tube (a small amount of methylene blue may be added to facilitate observation). Record the volume of water distilled and calculate the percentage of water in the substance being examined.

Annotations When the chemical pure grade toluene is used for direct determination, if necessary, add a small amount of water into the toluene, fully shake it and stand still, discard the water after separation and use the toluene after distillation.

Method 3 (Drying under reduced pressure method)
The method is used for determination of water in noble crude drugs containing volatile constituents.

Vacuum desiccator Distribute 0.5-1 cm depth of phosphorous pentoxide into a Petri dish of 12 cm in diameter and put the dish in a vacuum desiccator of 30 cm in diameter.

Procedure Mix thoroughly 2-4 g of the substance being examined. Weigh accurately 0.5-1 g in a tared weighing bottle, previously dried to constant weight under the same conditions to be employed in the determination. Place the loaded bottle in the vacuum desiccator, remove the stopper of the bottle and leave it also in the desiccator. Reduce the pressure of the desiccator by suction to 2.67 kPa (20 mmHg) and last for 30 minutes. Allow to stand in room temperature for 24 hours. Open the stopper cork and connect an anhydrous calcium chloride tube at the air inlet. Upon opening the desiccator, close the bottle promptly and weigh accurately. Calculate the percentage content of water in the substance being examined according to the weight loss on drying.

Method 4 (Gas chromatographic method)
Chromatographic system suitability Carry out the method for gas chromatography, using porous polymer beads of ethylvinylbenzene cross-linked with divinylbenzene 0.25-0.18 mm in diameter as the support; maintain the column temperature at a range of 140-150℃, determinate with thermal conductivity detector. The performance of the instrument should comply with following requirements.
(1) The number of theoretical plate of the column calculated with peak of water should be more than 1000, while the number of theoretical plate of the column calculated with peak of ethanol should be more than 150.
(2) The resolution of the peaks of water and ethanol is more than 2.
(3) Carry out 5 replicate injections with absolute ethanol, the RSD of the peak area of water should not be more than 3.0 per cent.

Reference solution preparation Place about 0.2 g of purified water, weigh accurately, add absolute ethanol to make 25 ml, mix well.

Test solution preparation Place sufficient test sample (containing about 0.2 g water), Shear and crush or porphyrize it weigh accurately, place in a conical flask, add absolute ethanol 50 ml accurately and mix well. Ultrasonicate for 20 minutes and allow to stand for 12 hours, then ultrasonicate for another 20 minutes and place airtightly. After the solution becomes clarified. The supernatant liquid is used as test solution.

Procedure Measure accurately 1-5 μl of absolute ethanol, reference solution and test solution respectively, inject it into the column, determine and calculate the content.

Annotations (1) Use the reagent with the same batch number when preparing the reference solution and the test solution. The water contained should be deducted.
(2) The external standard method is used to calculate the water content. Since absolute ethanol is used as solvent, and the method of deducting water content in the reagent performances as follow:
Peak area of water practically added into the reference solution = the total peak area of ethanol in the reference solution − K × peak area of ethanol in the reference solution.
Peak area of water in test solution = the total peak area of water in test solution − K × peak area of ethanol in test solution.

$$K=\frac{\text{Peak area of water in absolute ethanol}}{\text{Peak area of ethanol in absolute ethanol}}$$

Ⅸ J Determination of Residue on Ignition

Place 1.0-2.0 g or the quantity specified under individual monographs of the substance being examined, accurately weighed, in a suitable crucible (If the substance being examined contains alkali metals or fluorine element, the platinum crucible should be used). Previously ignited to constant weight. Heat gently until it is thoroughly charred, cool and moisten the residue with 0.5-1 ml of sulfuric acid, unless otherwise directed. Heat gently until white fumes are no longer evolved and then ignite at 700-800℃ until the incineration is complete. Cool in a desiccator and weigh accurately, ignite again at 700-800℃ to constant weight.
If the residue is to be used in the limit test for heavy metals, the ignition temperature should be controlled at 500-600℃.

Ⅸ K Determination of Ash

1. Total ash Pulverize the material being examined, pass through No. 2 sieve, mix well. Place 2-3 g (3-5 g for the

determination of acid-insoluble ash) of powdered drug in a tared crucible, weigh accurately (to nearest 0.01 g), ignite slowly till the sample is completely carbonized, keep it from burning with care, raise the temperature gradually to 500-600℃, incinerate to constant weight and the ash is carbon-free. Calculate the percentage of ash with reference to the air-dried drug.

If a carbon-free ash cannot be obtained in this way, cool the crucible and moisten the residue with hot water or 2 ml of 10% ammonium nitrae solution. Evaporate to dryness on a water bath, ignite the residue as above until carbon-free ash is obtained.

2. Acid-insoluble ash Place the ash obtained in the determination of total ash in a crucible, add 10 ml of dilute hydrochloric acid with great care, cover with a watch glass, heat on a water bath for 10 minutes. Rinse the watch glass with 5 ml of hot water and add the rinsings to the crucible, filter with an ashless filter paper, transfer the residue to the filter paper with water, wash till the filtrate yields no reactions of chlorides. Transfer the filter paper together with the residue to the original crucible, dry and ignite to constant weight. Calculate the percentage of acid-insoluble ash with reference to the air-dried drug.

Ⅸ L Determination of Nitrogen

Method 1 (Macro Method) Place an accurately weighed quantity of the substance being examined equivalent to about 25-30 mg of nitrogen in a 500 ml Kjeldahl flask. Solid or semi-solid substances may be wrapped in a sheet of nitrogen-free filter paper and then transfered to the Kjeldahl flask. Add successively 10 g of potassium sulfate or anhydrous sodium sulfate, 0.5 g of powdered cupric sulfate and then add slowly 20 ml of sulfuric acid along the inner wall of the Kjeldahl flask inclined at an angle of 45℃. Heat the mixture gently, keep the temperature below boiling point until frothing subsides. Raise the temperature and boil the mixture briskly until a clear, green solution is obtained. Continue the heating for 30 minutes, unless otherwise specified. Cool, add cautiously 250 ml of water along the inner wall of the flask, mix well and allow to cool. Add 75 ml of 40% sodium hydroxide solution along the inner wall of the flask to form a layer beneath the acid solution. Add a few pieces of zinc granules, connect one end of a nitrogen bulb to the flask and the other end to a condenser. To a 500 ml conical flask add 50 ml of 2% boric acid solution and 10 drops of a mixed methyl red-bromocresol green IS. Dip the end of the condenser into the boric acid solution, mix the contents of the Kjeldahl flask by gentle rotation and distil. When 250 ml of distillate is collected, draw the end of the condenser above the surface of the distillate. Continue the distillation for about 1 minute and rinse the tip of the condenser with water. Titrate the distillate with sulfuric acid (0.05 mol/L) VS until the colour changes from bluish green to greyish-violet. Perform a blank determination and make any necessary correction. Each ml of sulfuric acid (0.05 mol/L) VS is equivalent to 1.401 mg of N.

Method 2 (Semi-micro Method) The distillation plant (as Fig. 17). The apparatus consists of a 1000 ml round bottom flask A, a safety tube B, a distillator C with a nitrogen bulb, a funnel D, a condenser E and a 100 ml conical flask F. G and H are two clamps.

Add a few drops of methyl red IS and a quantity of water in flask A and acidify with dilute sulfuric acid, add a few pieces

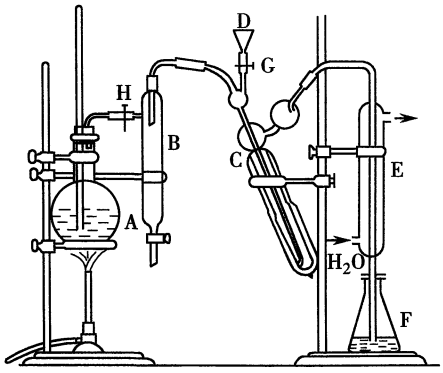

Fig. 17

of glass beads or zeolite and connect flask A to tube B. To distillator C add about 50 ml of water through funnel D, close clamp G, turn on the condensation water and heat the water in flask A to boiling. Stop heating when water vapour condenses and drips out of the condenser. The water in distillator C backflushes to tube B on the closure of clamp H. Open clamp G and drain the water in tube B. Close the stopcock of tube B and clamp G, dip the end of the condenser into about 50 ml of water which backflushes to C and B in turn, again drain the water in tube B. Repeat this process 2-3 times so that the apparatus inside is washed clean.

Place an accurately weighed quantity of the substance being examined equivalent to 1.0-2.0 mg of nitrogen in a 30-50 ml Kjeldahl flask, add 0.3 g of potassium sulfate or anhydrous sodium sulfate and 5 drops of 30% cupric sulfate solution, then add dropwise 2.0 ml of sulfuric acid along the wall of the flask. Place a funnel on top of the Kjeldahl flask inclined at an angle of about 45°, heat the mixture gently, keep the temperature below boiling point until frothing subsides. Raise the temperature and boil the mixture briskly until a clear, green liquid is obtained. Continue the heating for 10 minutes more, unless otherwise specified, allow to cool and add 2 ml of water.

To the conical flask F add 10 ml of 2% boric acid solution and 5 drops of a mixed methyl red-bromocresol green IS. Dip the end of the condenser into the boric acid solution. Transfer the content of the Kjeldahl flask into the distillator C through funnel D, rinse the Kjeldahl flask and funnel several times with small amounts of water. Add 10 ml of 40% sodium hydroxide solution and again wash the funnel several times with small amounts of water. Close clamp G and heat the water in flask A and distil with steam until the colour of the boric acid solution changes from red to bluish green. Continue the distillation for 10 minutes more, lift the end of the condenser above the surface of the distillate, flash the condenser with steam for about 1 minute and stop the distillation and wash the tip of the condenser with water.

Titrate the distillate with sulfuric acid (0.005 mol/L) VS until the colour changes from bluish green to greyish violet. Perform a blank determination and make any necessary correction (the volume of distillate collected in the blank determination should be approximately the same as that collected in the determination made with the substance being examined, i.e. about 70-75 ml). Each ml of sulfuric acid 0.005 mol/L VS is equivalent to 0.1401 mg of N. The amount of sulfuric acid should be increased when the substance being examined is more than 0.1 g so as to make the digestion complete, and the amount of sodium hydroxide solution should also be increased proportionally.

Ⅸ M Determination of Ethanol

The gas chromatographic method (Appendix Ⅵ E) is used for the determination of the content expressed in percentage (ml/ml) of ethanol (C_2H_5OH) in various preparations at 20℃, unless otherwise specified.

Chromatographic system suitability Measure accurately 4 ml, 5 ml, 6 ml of dehydrated ethanol, add separately 5 ml of *n*-propanol (as internal standard) and dilute with water to 100 ml, mix well (diluted further, if necessary). Carry out the method for gas chromatography (Appendix Ⅵ E), using porous polymer beads of ethylvinylbenzene cross-linked with divinylbenzene 0.25-0.18 mm in diameter as the support; maintain the column temperature at a range of 120-150℃.
The performance of the instrument complies with following requirements.
(1) The number of theoretical plates of the column is more than 700 calculated with reference to *n*-propanol.
(2) The resolution of the peaks of ethanol and *n*-propanol is more than 2.
(3) Carry out 5 replicate injections for each of the three solutions mentioned above, the relative standard variation of 15 correction factors is not more than 2.0%.

Procedure Measure accurately a quantity of the solution being examined (equivalent to 5 ml of ethanol) and 5 ml of *n*-propanol, dilute with water to 100 ml and mix well as the test preparation.
Measure accurately 5 ml each of dehydrated ethanol and *n*-propanol, maintained at 20℃ dilute with water to 100 ml and mix well as the standard preparation.
The standard preparation and the test preparation may be further diluted if necessary.
Carry out successively 3 injections of the standard preparation, followed by 3 injections of the test preparation at the above conditions. Calculate the mean value of the correction factor obtained from the 3 injections of the standard preparation, and the mean value of ethanol content obtained from the 3 injections of the test preparation.

Annotations (1) Be sure that no peak due to impurity corresponding to the internal standard appears in the chromatogram obtained from the test preparation in the absence of internal standard.
(2) The relative deviation of individual values of the correction factor and the ethanol content should not be more than 1.5% of their mean value respectively, otherwise the determination must be repeated.
(3) System suitability must comply with the requirements described above, when any supports are used.

Ⅸ N Tests of Fats and Fatty Oils

If a liquid sample being examined shows turbid owing to the separation of stearin, warm the container on a water bath at 50℃ until the sample melts to form a clear liquid. If it does not become clear on warming, centrifuge or filter through a dry filter with hot-water jacket. Mix while hot and not solidified, weigh as many portions as needed for the various determinations, using preferably a weighing bottle having a pipette dropper, or a weighing beaker having a glass spoon. Solid sample is previously melted at a temperature not more than 10℃ above its melting range, centrifuge or filter and then weigh.

Determination of relative density Carry out the method for Determination of Relative Density (Appendix Ⅶ A).

Determination of refractive index Carry out the method for Determination of Refractive Index (Appendix Ⅶ F).

Determination of melting range Carry out the method for Determination of Melting Point (Appendix Ⅶ C, method 2).

Determination of congealing point of fatty acids

(1) *Preparation of the fatty acids* Heat 75 g of 20% (g/g) solution of potassium hydroxide in glycerin and 50 g of the substance being examined, in a 800 ml beaker, at 150℃ with frequent stirring for about 15 minutes until saponification is complete. Cool to about 100℃, add 500 ml of freshly boiled water, stir and mix well, add slowly 50 ml of sulfuric acid solution (1→4), and heat the solution until the fatty acids separate clearly as a transparent layer. Transfer the fatty acids to another beaker while hot, wash the acids with freshly boiled water repeatedly until the washing shows yellow colour to methyl orange IS. Collect the clear fatty acids in a dry small beaker while hot, add 5 ml of dehydrated ethanol, mix well and heat gently until there is no small bubbles evolved.

(2) *Determination of congealing point* Carry out the method for Determination of congealing point (Appendix Ⅶ D), using the dry fatty acid obtained above.

Determination of acid value Acid value is the number of mg of potassium hydroxide required to neutralise the free acid in 1 g of fat, fatty oil or other related substances. In its determination, sodium hydroxide (0.1 mol/L) VS may also be used.

Presumed acid value	Quantity of substance being examined/g
0.5	10
1	5
10	4
50	2
100	1
200	0.5
300	0.4

Unless otherwise specified, weigh accurately a quantity of the substance being examined as indicated in the above table, in a 250 ml conical flask, add 50 ml of a mixture of ethanol-ether (1 : 1) which has been neutralised to 1.0 ml of phenolphthalein IS with sodium hydroxide (0.1 mol/L) VS before use, shake to effect the solution (heat under reflux gently, if necessary, until the substance is completely dissolved). Titrate the resulting solution with sodium hydroxide (0.1 mol/L) VS until a pink colour which persists for 30 seconds is obtained. Take the number of ml of sodium hydroxide (0.1 mol/L) VS required as A and weight of substance being examined (g) as W, calculate the acid value from the expression:

$$\text{Acid value}=\frac{A\times 5.61}{W}$$

Use semi-micro burette of 10 ml in capacity for the titration when the acid value is less than 10.

Determination of saponification value The saponification

value is the number of mg of potassium hydroxide required to neutralise and saponify the free acids and esters contained in 1 g of fat, fatty oil or other related substances. Weigh accurately a quantity of the substance, equivalent to about 250/maximum saponification value of the substance, in a 250 ml conical flask, add 25 ml, accurately measured, of ethanolic potassium hydroxide (0.5 mol/L) VS, heat under reflux for 30 minutes, cool. Rinse the inner wall of condenser and the lower part of stopper with 10 ml of ethanol, add 1 ml of phenolphthalein IS, titrate with hydrochloric acid (0.5 mol/L) VS until the pink colour just disappears. Heat the solution to boiling, continue the titration if pink colour reappears. Note the volume (ml) of hydrochloric acid (0.5 mol/L) VS required in titration for the substance being examined as (*A*). Perform a blank determination and note the volume (ml) of hydrochloric acid (0.5 mol/L) VS required in blank determination as (*B*). Calculate the saponification value from the expression:

$$\text{Saponification value}=\frac{(B-A)\times 28.05}{W}$$

Where W is the weight of the substance being examined, g.

Determination of hydroxyl value The hydroxyl value is the number of mg of potassium hydroxide equivalent to the hydroxyl group contained in 1 g of the substance being examined after acetylation.

Presumed hydroxyl value	Quantity of substance being examined/g
10-100	2.0
100-150	1.5
150-200	1.0
200-250	0.75
250-300	0.60

Unless otherwise specified, weigh accurately a quantity of the substance being examined as indicated in the table, in a 250 ml dry glass stoppered conical flask, add 5 ml, accurately measured, of acetylation agent (prepared by dissolving 14.4 g of *p*-toluene-sulfonic acid in 360 ml of ethyl acetate in a 500 ml conical flask, then add slowly 120 ml of acetic anhydride, mix well and allow to stand for 3 days). Moisten the glass stopper with a small quantity of pyridine, stopper the flask tightly and shake gently to effect the solution. Place the flask in a water bath at 50℃±1℃ for 25 minutes (shake gently at every 10 minutes interval). Cool, add 20 ml of a mixture of pyridine-water (3 : 5). After 5 minutes, add 8-10 drops of cresol red-thymol blue mixed indicator solution, titrate with potassium hydroxide (or sodium hydroxide) (1 mol/L) VS until the colour of solution changes to grey-blue or blue. Note the volume (ml) of potassium hydroxide (or sodium hydroxide) (1 mol/L) VS required as *A*, perform a blank determination and note the volume (ml) of potassium hydroxide (or sodium hydroxide) (1 mol/L) VS required as *B*. Calculate the hydroxyl value from the expression:

$$\text{Hydroxyl value}=\frac{(B-A)\times 56.1}{W}+D$$

Where W is the weight of the substance being examined, g;
D is the acid value of the substance being examined.

Determination of iodine value Iodine value is the weight of iodine in g, required to halogenate 100 g of fat, fatty oil or other related substances. Weigh accurately a quantity of the substance (g), equivalent to 25/maximum iodine value of the substance being examined, in a 250 ml dry iodine flask. Dissolve it in 10 ml of chloroform, add 25 ml of iodine bromide solution, accurately measured, stopper the flask, mix well and allow to stand in a dark place for 30 minutes. Then add 10 ml of freshly prepared potassium iodide TS and 100 ml of water, mix well. Titrate with sodium thiosulfate (0.1 mol/L) VS with constant shaking until the colour changes to pale yellow, add 1 ml of starch IS, continue to titrate until the blue colour just disappears. Note the volume (ml) of sodium thiosulfate (0.1 mol/L) VS as *A*. Perform a blank determination, and note the volume (ml) of sodium thiosulfate (0.1 mol/L) VS as *B*. Calculate the iodine value from the expression:

$$\text{Iodine value}=\frac{(B-A)\times 1.269}{W}$$

Where W is the weight of the substance being examined, g.

Determination of peroxide value The peroxide value is the number that expresses in milliequivalents of active oxygen the quantity of peroxide contained in 1000 g of the substance. Unless otherwise specified, place accurately weighed 5 g of the substance being examined in a 250 ml iodine flask fitted with a ground-glass stopper. Add 30 ml of a mixture of 2 volumes of chloroform and 3 volumes of glacial acetic acid. Shake to dissolve the substance and add 0.5 ml of saturated potassium iodine TS. Shake for exactly 1 min, then add 30 ml of water. Titrate with sodium thiosulfate (0.01 mol/L) VS, adding the titrant slowly with continuous vigorous shaking, until the yellow colour is almost discharged. Add 5 ml of starch IS and continue the titration, shaking vigorously, until the blue colour is discharged. Note the volume (ml) of sodium thiosulfate (0.01 mol/L) VS as *A*. Carry out a blank test under the same conditions, and note the volume (ml) of sodium thiosulfate (0.01 mol /L) VS as *B* and weight of substance being examined (g) as *W*. The volume of sodium thiosulfate (0.01 mol/L) VS used in the blank titration must not exceed 0.1 ml. Calculate the peroxide value from the expression:

$$\text{peroxide value}=\frac{10(A-B)}{W}$$

Heating test Heat about 50 ml of the substance being examined, in a beaker, on a sand bath to about 280℃ at a rate of 10℃ per minute. Note the change in colour or other character of the oil.

Foreign matter Dissolve about 20 g, accurately weighed, in 20 ml of petroleum ether (boiling range 60-90℃), in a conical flask. Filter through a dry and weighed sinter-glass filter (if necessary, add more volume of petroleum ether to facilitate filtration). Wash the residue and filter with petroleum ether, dry to constant weight at 105℃ and weigh accurately. The weight increased represents the content of foreign matter in the substance being examined.

Water and volatile matter Weigh accurately about 5 g of the substance being examined in a bottle dried to constant weight previously, weigh accurately, dry at 105℃ for 40 minutes, allow to cool in desiccator and weigh accurately. Repeat the drying at 105℃ for further 20 minutes, cool and weigh again until the difference of two successive weighings is not greater than 0.001 g. The loss on drying is the content of water and volatile matter in the substance being examined.

Annotations *Preparation of iodine bromide solution*
Dissolve completely 13.0 g of powdered iodine in 1000 ml of glacial acetic acid by warming in a dry glass-stoppered flask. Add promptly 2.5 ml (or 7.8 g) of bromine, stopper the flask and mix well. In order to check the quantity of bromine added, two titrations may be performed.
(1) Before the addition of bromine, pipette 20.0 ml of the solution, titrate with sodium thiosulfate (0.1 mol/L) VS, note the volume (ml) required as *A*.
(2) After the addition of bromine, pipette 20.0 ml of the

solution, add 10 ml of freshly prepared potassium iodide TS, titrate with sodium thiosulfate (0.1 mol/L) VS, note the volume (ml) required as *B*. *B* is slightly less than 2 *A*. Iodine bromide solution should be kept in a well-closed container and protected from light.

Ⅸ O Determination of Swelling Capacity

Swelling capacity is an index to indicate the swelling property of drugs. It is defined as the volume (ml) of 1 g of dried drug swelled in water or in other specified solvent at a definite time and temperature. It is used mainly for the natural drugs containing mucilage, gelatin and semicellulose.

Procedure Weigh accurately (to the nearest 0.01 g) a definite quantity of drug being examined, pulverized if necessary, to a assay tube (160 mm in total length, 16 mm in inner diameter, 125 mm long in the graduated portion, graduated in 0.2 ml), add 25 ml of water or specified solvent at 20-25℃, stopper tightly, shake and allow to stand. Shake once in every ten minutes in the first hour, than allow to stand for 4 hours, read the volume of the sample after swelling, and read again after standing for 1 hour, until the volume difference is not more than 0.1 ml between two successive readings. Determine three samples for each drug, and calculate the average value (to the nearest 0.1 g) using the last reading of each determination from the following equation, in which *S* is the swelling capacity; *V* is the volume (ml) of a drug after swelling and *W* is the weight (g) of the drug calculated on the dried basis.

$$S=\frac{V}{W}$$

Where *S* is swelling capacity;
V is the swelling volume of the test sample (ml);
W is the weight of the test sample calculated.

Ⅸ P Limit Tests of Rancidity

Rancidity means that the complex chemical reaction occur and the decomposed components, for instance, free fatty acids, peroxides, and low molecular aldehydes and ketones are produced during the storage of fatty oils or seeds which contain fatty oils, turning up distinctive smell and influencing the sense properties and interior quality of the crude drugs.

This method check the rancidity of crude drugs through the determination of acid value, carbonyl value and peroxide value.

1. Extraction of fatty oil

Unless specified otherwise, pulverize 30-50 g of the seeds (varying in accordance with the content of fatty oil), then grind them into coarse powder, extract under reflux with 100-150 ml of hexane in a Soxhelt's extractor for 2 hours, stand for cool, filter through a No. 3 sintered funnel, recover the solvent to dryness in vacuum, and use the obtained fatty oil as the substance being examined.

2. Determination of rancidity

Determination of acid value Carry out the method for the tests of fats and fatty oils (Appendix Ⅸ N).

Determination of carbonyl value The carbonyl value is the millimole number of per kilogram carbonyl compounds contained in the test sample.

Unless specified otherwise, weigh accurately 0.02-0.5g of the substance being examined in a 25 ml volumetric flask, dissolve and dilute to volume with benzene and mix well. Measure accurately 5 ml in a 25ml stoppered tube, add 3 ml of a 4.3% solution of trichloroacetic acid in benzene and 5 ml of a 0.05% solution of 2, 4-dinitrophenylhydrazine in benzene, mix well and heat in a 60℃ water bath for 30 minutes. Stand to cool, add slowly 10ml of a 4% solution of potassium hydroxide in ethanol along the tube wall, stopper well, shake thoroughly for 1 minute and stand for 10 minutes. Carry out the method for spectrophotometry (Appendix Ⅴ A), determine the absorbances at 453 nm, and calculate according to the following equation:

$$\text{Carbonyl value}=\frac{A}{854\times G\times\frac{V_2}{V_1}}\times 1000$$

Where *A* is absorbance of the substance being examined;
G is weight of the test sample;
V_1 is total diluted volume of the substance being examined;
V_2 is volume of the solution being determined;
854 is average value of millimole number absorbance index of aldehydes.

Determination of peroxide value The peroxide value is the percentage of free iodine produced by the reaction of peroxide compounds with potassium iodide.

Unless specified otherwise weigh accurately 2-3 g of the substance being examined in 250 ml dried iodine flask, add 30 ml of a mixture of chloroform-glacial acetic acid (1∶1), dissolve the sample completely. Add accurately 1 ml of a freshly saturated solution of potassium iodide, stopper well, shake gently for 30 seconds, stand in a dark place for 3 minutes, and add 100 ml of water. Titrate with sodium thiosulfate VS (0.01 mol/L or 0.005 mol/L) until the colour changes to yellow, add 1ml of starch IS, continually titrate to the blue colour disappear, and perform a blank determination. Calculate the peroxide value according to the following equation:

$$\text{Peroxide value}=\frac{(A-B)\times C\times 0.1269}{G}\times 100$$

Where *A* is the volume of sodium thiosulfate VS (ml);
B is the volume of sodium thiosulfate VS for blank determination (ml);
C is the concentration of sodium thiosulfate VS (mol/L);
G is the weight of the substance being examined (g);
0.1269 is the weight (g) of iodine equivalent to 1 ml of sodium thiosulfate VS (1mol/L).

Ⅸ Q Determination of Pesticides Residue

The gas chromatographic method (GC) (Appendix Ⅵ E) is used for the determination of parts of organochlorine pesticides, organophosphorus pesticides and pyrethrins pesticides residue in medicinal substances and preparations, unless specified otherwise.

1. Determination of organochlorine pesticides residue

Chromatographic system and system suitability Use an elasticity quartz capillary column (0.25 μm in internal diameter, 0.32 mm in external diameter, and 30 meter long) bonded with 5% dipheny 95% dimethylpolysiloxane

(SE-54), or 14% cyanopropylphenyl-86% dimethylpolysiloxane (DB-1701), detect with ^{63}Ni-electron capture detector (ECD), maintain injector temperature at 230℃ and detector temperature at 300℃, inject split keep maintain initial oven temperature at 100℃, then ascend to 220℃ at 10℃ per minute, then ascend to 250℃ at 8℃ per minute. hold for 10 minutes; The number of theoretical plates of the column is not less than 10^6, calculated with the reference to the peak of α-BHC, the resolution between two neighbouring peaks is more than 1.5.

Preparation of reference stock solution Weigh accurately a quantity of reference substance of benzene hexachloride (BHC) (α-BHC, β-BHC, γ-BHC, δ-BHC), dichlorodiphenyl trichloroethane (DDT) (PP'-DDE, PP'-DDD, OP'-DDT, PP'-DDT) and pentachloronitrobenzeen (PCNB) pesticides, dissolve with petroleum ether (60-90℃) respectively to prepare solutions containing 4-5 μg per ml.

Preparation of mixed reference stock solution Measure accurately 0.5 ml of each of the above reference stock solutions to a 10 ml volumetric flask, diluted with petroleum ether (60-90℃) to volume and mixed well.

Preparation of mixed reference solution Measure accurately the above mixed reference stock solution, diluted with petroleum ether (60-90℃) to prepare a series of solutions containing 0 μg, 1 μg, 5 μg, 10 μg, 50 μg, 100 μg and 205 μg per liter.

Preparation of test solution Crude drug Weigh accurately 2 g of the substance being examined, previously dried at 60℃ for 4 hours and pulverized to fine powder, in a 100 ml conical flask with stopper, macerate with 20 ml of water overnight. Add accurately 40 ml of acetone, weigh and ultrasonicate for 30 minutes, allow to cool, weigh, replenish the lost weight with acetone. Add 6 g of sodium chloride approximately and 30 ml of accurately measured methylene chloride, weigh and ultrasonicate for 15 minutes, weigh, replenish the lost weight with methylene chloride and stand for layer separation. Transfer quickly the organic layer to a 100 ml stopper conical flask, containing a quantity of anhydrous sodium sulfate, stand for 4 hours. Measure accurately 35 ml the above solution, concentrate in vacuum to almost dryness at 40℃. Add a small quantity of petroleum ether (60-90℃) to the residue, repeat the above procedures to exhaust the solvent of acetone and methylene chloride. Dissolve the residue with petroleum ether (60-90℃) and transfer to a 10 ml graded centrifugal tube with stopper, dilute with petroleum ether (60-90℃) to 5 ml. Add cautiously 1 ml of sulfuric acid, shake for 1 minute, and centrifuge (3000 rpm) for 10 minutes. Measure accurately 2 ml of the supernatant liquid to a graduated concentration flask (as Fig. 18), link the rotatory evaporator, concentrate in vacuum below 40℃ (or concentrate with nitrogen) to a quantity and dilute accurately to 1 ml.

Preparations Weigh accurately a quantity of substance being examined (equivalent to 2 g of crude drug), triturated to fine power (cut into pieces of pills or measure the liquid preparation directly), carry out the method described as the above preparation of test solution.

Procedure Inject accurately 1 μl of each of the test solution and the mixed reference solution with corresponding concentration, respectively, into the gas chromatograph, calculate the content of organochlorine pesticide residue of 9 kinds by external method.

2. Determination of organophosphorus pesticides residue

Chromatographic system and system suitability Use an elastic quartz capillary column (0.25 μm in internal

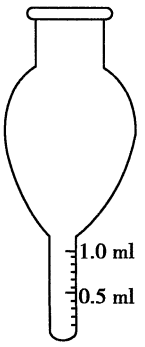

Fig. 18

diameter, 0.25 mm in external diameter, and 30 meters long) bonded with 14% cyanopropylphenyl-86% dimethylpolysiloxane mass spectrometry (DB-17MS) or HP-5, detect with nitrogen phosphorous detector (NPD); maintain injector temperature at 220℃, detector temperature at 300℃, maintain initial oven temperature at 120℃, ascend to 220℃ at 10℃ per minute, then ascend to 240℃ at 5℃ per minute and hold for 2 minutes; then ascend to 270℃ at 20℃ per minute and hold for 0.5 minutes inject split, The number of theoretical plates of the column is not less than 6000, calculated with the reference to the peak of dichlorvos, the resolution between two neighbouring peaks is more than 1.5.

Preparation of reference stock solution Weigh accurately a quantity of reference substance of parathion, methyl parathion, rogor, oxidative rogor, acephatemet, monocrotophos, alfatox, ethion, malathion, methidathion, dichlorvos and acephate pesticides respectively, dissolve with ethyl acetate to prepare solutions containing 100 μg per ml.

Preparation of mixed reference stock solution Measure accurately 1.0 ml of each of the above reference stock solutions to a 20 ml brown volumetric flask, diluted with ethyl acetate to volume and mix well.

Preparation of mixed reference solution Measure accurately the above mixed reference stock solution, dilute with ethyl acetate to produce a series of solutions containing 0.1 μg, 0.5 μg, 1 μg, 2 μg, 5 μg per ml.

Preparation of test solution

Crude drug Get approximately 5.0 g fine powder of the substance being examined (through the sieve of number 2) and weigh it accurately. Add 5 g of anhydrous sodium sulfate and 50-100 ml of ethyl acetate, ultrasonicate for 3 minutes in ice bath. Filter the super-layer solution, add 30-50 ml of ethyl acetate into the dregs, ultrasonicate for 2 minutes in ice bath, and filter. Combine these two filtrates, wash filter paper and residue with a small amount of ethyl acetate, and combine them with the above filtrate. Concentrate the filtrate in vacuum to almost dryness at 40℃, transfer into a 5 ml volumetric flask with ethyl acetate and dilute to a volume. Measure accurately 1 ml of the solution, put on a small column packed with activated charcoal [120-400 mesh, 0.25 g, 0.9 cm in internal diameter, (as Supelclean ENVI-Carb SPE Tubes, 3 ml of the small column of activated charcoal), pre-washed with 5 ml of ethyl acetate], place in the multifunctional vacuum sample processor, elute with 5 ml of the mixture of hexane and ethyl acetate (1 ∶ 1), collect the eluent, concentrate to almost dryness on the N_2-blowing instrument, and add accurately 1 ml of ethyl acetate to dissolve it.

Procedure Inject accurately 1 μl of each of the test solution and the mixed reference solution with corresponding concentration, respectively, into the gas chromatograph, and calculate the content of 12 kinds of organophosphorus

pesticide residue by external method.

3. Determination of pyrethrins pesticides residue

Chromatographic system and system suitability test Use an elastic quartz capillary column (0.25 μm in internal diameter, 0.32 mm in external diameter, and 30 meters long) bonded with 5% dipheny-95% dimethylpolysiloxane (SE-54), detect with ^{63}Ni-electron capture detector. Maintain injector temperature at 270℃ and detector temperature at 330℃, inject split, the split ratio of 20 : 1 or 5 : 1 (or selecting the optimized split value according to the instrument setting. Maintain the initial oven temperature at 160℃, and hold for 1 minute, ascend to 278℃ at 10℃ per minute, and hold for 0.5 minutes; then ascend to 290℃ at 1℃ per minute and hold for 5 minutes. The number of theoretical plates of the column is not less than 10^5, calculated with the reference to the peak of deltamethrin, the resolution between two neighbouring peaks should be more than 1.5.

Preparation of reference stock solution Weigh accurately a quantity of reference substances of cis-cypermethrin, fenvalerate and deltamethrin pesticides respectively, dissolve with petroleum ether (60-90℃) to produce solutions containing 20-25 μg per ml.

Preparation of mixed reference stock solution Measure accurately 0.5 ml of each of the above reference stock solutions to a 10 ml volumetric flask, dilute with petroleum ether (60-90℃) to volume and mix well.

Preparation of mixed reference solution Measure accurately the above mixed reference stock solutions, dilute with petroleum ether (60-90℃) to produce a series of solutions containing 0 μg, 4 μg, 8 μg, 40 μg and 200 μg of reference substance per liter.

Preparation of test solution

Crude drug Get approximately 1-2 g of substance being examined, previously dried at 60℃ for 4 hours and pulverized to fine powder (through the sieve of number 5). Weigh accurately and put in a 100 ml stopper conical flask, add 30 ml of a mixture of petroleum ether (60-90℃) and acetone (4 : 1), ultrasonicate for 15 minutes, and filter. The filtrates are combine after treating the drugs with the above procedure again. Dehydrate the filtrate with proper amounts of anhydrous sodium sulfate, then concentrate the filtrate in vacuum to almost dryness at 40-45℃, operate repeatedly with a small amount of petroleum ether (60-90℃) to exhaust the solvent of acetone, add proper amounts of petroleum ether (60-90℃) to dissolve residue, put into the small column [it is progressive from down to up 2 g of anhydrous sodium sulfate, 4 g of Florisil, 1 g of microcrystalline cellulose, 1 g of aluminium oxide and 2 g of anhydrous sodium sulfate, prewash with 20 ml of a mixture of petroleum ether (60-90℃) and ether (4 : 1)], elute with the mixture of 90 ml of petroleum ether (60-90℃) and ether (4 : 1), and collect the eluent, concentrate the filtrate in vacuum to almost dryness at 40-45℃. Add 3-4 ml of petroleum ether (60-90℃) and concentrate to almost dryness, repeatedly with a small amount of petroleum ether (60-90℃) to exhaust the solvent of the ether, dissolve with petroleum ether (60-90℃) and transfer to a 5 ml volumetric flask, dilute to volume.

Procedure Inject accurately 1 μl of each of the test solution and the mixed reference solution with corresponding concentration, respectively, into the gas chromatograph, calculate the content of three kinds of pyrethrins pesticide residue in test solution by external method.

Ⅸ R Test for Particulate Matter in Injections

The test for Particulate Matter is applied to determine the size and number of particulate matter in injections for intravenous injection that are in solutions. Prior to this test, the injection should comply with the visible particles test.

This test consists of light obscuration and microscopic test. Unless otherwise specified, light obscuration test is preferably used. If the test result using light obscuration test does not comply with the requirements or this test is not applicable for the sample, microscopic test should be followed to reach a conclusion on conformance to requirements.

Light obscuration test is not suitable for the preparations having increased viscosity, or the preparation which is apt to crystallization or the injections which will produce air bubbles when drawn into the sensor. If the viscosity of the preparation to be tested is sufficiently high so as to preclude its examination by either test method, a quantitative dilution with an appropriate diluent may be made to decrease viscosity, as necessary to allow the analysis to be performed.

Test environment Perform the test in an environment that does not contribute any significant amount of particulate matter. Test preparation should be carried in a laminar flow cabinet. The glassware and other required equipment should be clean and particle free. The water or other suitable solvent used in the test should be filtered through a filter with a porosity of not more than 1.0 μm.

Place a 50 ml volume of water or other suitable solvents for the test of particulate matter in a sample container, determined as directed under test procedure. For light obscuration test it should meet the requirements that not more than 10 particles of greater than 10 μm in size and not more than 2 particles of greater than 25 μm in size are observed in the combined 10 ml of solvent. For microscopic test it should meet the requirements that not more than 20 particles of greater than 10 μm in size and not more than 5 particles of greater than 25 μm in size are observed in the combined 50 ml of solvent. Otherwise, the water or other suitable solvents for the test of particulate matter, glassware and test environment are not suitable for particulate analysis. In this case, repeat the preparatory steps until conditions of analysis are suitable for the test.

1. Light obscuration particle count test

When particles in solution pass through a narrow testing area, the incident light at right angle with direction of fluid is weakened by obscuring of insoluble particles, therefore the output signal of sensor reduced. The variations of signal are proportional to the cross-sectional areas of particles. Light obscuration method for insoluble particles in injections are based on the principle mentioned above.

Test apparatus Usually consists of sample-feeding device, sensor and data processor.

The range of particular size determination is from 2 to 50 μm and the concentration of particles for measurement is 0-5000 particulates per ml.

Instrument calibration The instrument should be calibrated every 6 months.

(1) *Sample volume* Transfer a volume of water for the test of particulate matter that is greater than the sample

volume to a container after the instrument equilibrated, and weigh. Withdraw through the sample-feeding device a certain volume of the water, and weigh the container again. Obtain the sample volume by calculating the difference of the two weights. Test for 3 times consecutively. Each volume obtained should be within ±5% of the volume specified, and the mean value should be within ± 3% of the volume specified. The results should comply with the requirements mentioned above if it is calibrated by the other suitable methods.

(2) *Particle counting* Prepare a suspension containing 1000-1500 particles of standard particles having average diameters of 10 μm or 25 μm per ml and the relative standard deviation of the size distribution of the standard particles used is not more than 5%. Degas by ultrasonication (at 80-120 watts) for 30 seconds or by allowing to stand. Turn on the stirrer and agitate the sample gently to homogenize it. Withdraw and obtain the particle counts for three consecutive samples, disregarding the first count. The average of second and third counts should be within ±20% of the limits of number of particles.

(3) *Sensor resolution* Prepare a suspension containing 1000-1500 particles per ml of standard particles having average diameter of 10 μm (standard deviation of mean diameter is not more than 1 μm) and the relative standard deviation of the size distribution of the standard particles used is not more than 5%. Degas by ultrasonication (at 80-120 watts) for 30 seconds or by allowing to stand. Turn on the stirrer and agitate the sample gently to homogenize it (taking care not to introduce air bubbles), determine the particles at 10 μm and 12 μm channel. The ratio of the difference count of two channels and the accumulative count of 10 μm channel is not less than 68%. If the instrument calibration does not comply with the requirements, repeat the calibration steps after adjusting the instrument until it is well done.

Note Self-test can be conducted if the instrument is attached by the self-test software.

Procedure

(1) *Intravenous injection with a labelled volume of* 25 *ml or larger* Unless otherwise specified, wash the outside walls of the container of the injection being examined with water. Mix the contents by inverting the container 20 times and carefully open the container immediately. Pour a potion of specimen to wash the bottleneck and sample container, transfer the specimen in the sample container, degas by ultrasonication (at 80 to 120 watts) for 30 seconds or by allowing to stand, then place it on the sample-feeding device (or directly place the specimen on the sample-feeding device without stirring after degas). Turn on the stirrer or swirl gently by hand to homogenize the sample (avoid introducing air bubbles), withdraw a minimum of three aliquots, each not less than 5 ml in volume, record the data. Determine a minimum of another two specimens as the same way. Discard the data from the first portion of each specimen, calculate the average of consecutive counts.

(2) *Intravenous injection with a labelled volume of less than* 25 *ml* Unless otherwise specified, wash the outside walls of the container of the injection being examined with water. Mix the contents by inverting the container 20 times. Degas by ultrasonication (at 80 to 120 watts) for 30 seconds or by allowing to stand. Carefully open the container then place it on the sample-feeding device without stirring. Withdraw directly a suitable volume without introducing air bubbles, record the data. Determine a minimum of another two specimens as the same way. Discard the data from the first portion of each specimen, calculate the average of consecutive counts.

An appropriate method also can be used to combine the contents of 3 or more units to obtain a volume of not less than 20 ml into the sample container in the laminar flow cabinet. Degas by ultrasonication (at 80 to 120 watts) for 30 seconds or by allowing to stand, then place it on the sample-feeding device. Turn on the stirrer or swirl gently by hand to homogenize the sample (avoid introducing air bubbles), withdraw a minimum of three aliquots, each not less than 5 ml in volume into the light obscuration counter sensor, record the data. Discard the data from the first portion of each specimen, calculate the number of particles in each container by average the consecutive counts.

(3) *Sterile powder for intravenous injection or concentrated solution for injection* Unless otherwise specified, wash the outside walls of the container of the injection being examined with water. Carefully remove the cover, accurately add a quantity of water for particulate matter or appropriate solvent, replace the closure carefully and gently agitate the container to ensure the contents dissolved (for concentrated solution for injection, operate directly). Degas by ultrasonication (at 80 to 120 watts) for 30 seconds or by allowing to stand. Carefully open the container then place it on the sample-feeding device without stirring. Withdraw directly a suitable volume without introducing air bubbles, record the data. Determine a minimum of another two specimens as the same way. Discard the data from the first portion of each specimen, calculate the average of consecutive counts.

An appropriate method also can be used, wash the outside walls of 3 or more containers of the injection being examined with water in the laminar flow cabinet. Carefully remove the cover, accurately add a quantity of water for particulate matter or appropriate solvent respectively, gently agitate the container to ensure The contents dissolved (for concentrated solution for injection, operate directly). Combine the solution of each container to obtain a total volume of not less than 20 ml into the sample container. Degas by ultrasonication (at 80 to 120 watts) for 30 seconds or by allowing to stand, then place it on the sample-feeding device. Turn on the stirrer or swirl gently by hand to homogenize the sample (avoid introducing air bubbles), withdraw a minimum of three aliquots, each not less than 5 ml in volume, record the data. Discard the data from the first portion of each specimen, calculate the number of particles in each container by average the consecutive counts.

Evaluation

(1) *Intravenous injection with a labelled volume of* 100 *ml or larger* Unless otherwise specified, each ml of the injection contains not more than 25 particles that are greater than 10 μm and not more than 3 particles that are greater than 25 μm.

(2) *Intravenous injection with a labelled volume of less than* 100 *ml, steril powder for intravenous injection and concentrated solution for injection* Unless otherwise specified, each container of the specimen contains not more than 6000 particles that are greater than 10 μm and not more than 600 particles that are greater than 25 μm.

2. Microscopic particle count test

Test apparatus Usually consists of laminar flow cabinet, microscope, microporous membrane filter, filtration apparatus and Petri dish.

Laminar flow cabinet HEPA-filter having a pore of 0.45 μm, the direction of airflow is from inside to outside. The wind speed and the particles in the cabinet should be examined periodically.

Microscope Use a suitable binocular microscope with big visual field, equipped with an objective micrometer with a calibrated ocular micrometer (0.05-0.1 mm per grid). The coordinate axis can move up and down, left and right, move scope should larger than 30 mm. The microscope is equipped with an illuminator which the incident angle of light and the strength of light can be adjusted. It can give a magnification of 100× during examination.

Microporous membrane The membrane is 25 mm or 13 mm in diameter with pores of 0.45 μm in effective diameter, it is white in colour and grids with partition of 3 mm has been printed on one side. It should be washed with water for particular matter until free from particular matter of an effective diameter greater than 25 μm, and not more than 5 particles greater than 10 μm are left on the membrane.

Preparation Before Examination When test environment meets the requirements, rinse the filter under the cabinet with water for particulate matter or other suitable solvent. Rinse the membrane with water for particulate matter or other suitable solvent, then place it on the filter holder with a blunt forceps, invert the fixed filter and wash the inner wall of the filter repeatedly with water for particulate matter or other suitable solvent. Allow to drain and place the filter on a suction flask.

Procedure

(1) *Intravenous injection with a labelled volume of 25 ml or larger* Unless otherwise specified, wash the outside walls of the container of the injection being examined with water. Under the cabinet mix the contents by inverting the container 20 times and carefully open the container immediately. Transfer 25 ml of specimen to the pretreated filter (25 mm in diameter of membrane) gentlly along the inner wall of the filter, allow to stand for 1 minute and filter under gentle suction. Release the vacuum and wash the inner walls of the filter with 25 ml of water for particulate matter, remove the washings by suction. Release the vaccum and remove the membrane with the forceps. Place the membrane on a Petri slide, using a very thin layer of glycerin, if necessary, to hold the membrane flat and in its place. Allow the membrane to dry and place the covered slide on the micrometer stage of the microscope. Examine the membrane under 100× magnification with the incident light at a suitable angle and adjust the microscope to see the grid clearly. Count the number of particles that are greater than 10 μm, and those greater than 25 μm in effective diameter.

(2) *Intravenous injection with a labelled volume of less than 25 ml* Unless otherwise specified, wash the outside walls of the container of the injection being examined with water. Mix the contents by inverting the container 20 times carefully under the cabinet. Carefully open the container immediately. Withdraw all solutions in each container directly with an appropriate method, Transfer the specimen to the pretreated filter (13 mm in diameter of membrane) gently along the inner wall of the filter, proceed as directed for procedure (1) above.

(3) *Sterile powder for intravenous injection or concentrated solution for injection* Unless otherwise specified, prepare specimen as directed under procedure (3) in light obscuration particle count test, proceed as directed for procedure (1) above.

Evaluation

(1) *Intravenous injection with a labelled volume of 100 ml or larger* Unless otherwise specified, each ml of the injection contains not more than 12 particles that are greater than 10 μm and not more than 2 particles that are greater than 25 μm.

(2) *Intravenous injection with a labelled volume of less than 100 ml, Sterile powder for intravenous injection and concentrated solution for injection* Unless otherwise specified, each container of the specimen contains not more than 3000 particles that are greater than 10 μm and not more than 300 particles that are greater than 25 μm.

Ⅸ S Determination of Materials in Injection

Materials about injection refers to that material which still remain in the injection and whose content probably need controlling after the Chinese medicinal material having been extracted, purified and made into injection.

Unless the prescription of General Requirement of Injection, the content of protein, tannin and resin should be controlled. The content of oxalate and potassium iron should be controlled in venous injection. The determination proceeds as follow:

Protein Unless specified otherwise, measure the injection 1 ml, add fresh 30% sulfonic salicylic acid TS 1 ml, mix well and allow to stand for 5 minutes. Opalescence should not be observed. If the injection contains the composition produced precipitation when meeting with acid, add tannic acid TS 1-3 drops instead. Opalescence should not be observed.

Tannin Unless specified otherwise, measure the injection 1 ml, add fresh sodium chloride physiological solution containing 1% egg white 5 ml and allow to stand for 10 minutes. Opalescence should not be observed. Or measure the injection 1 ml, add dilute acetic acid 1 drop, then add sodium chloride and gelatin TS 4-5 drops. Opalescence should not be observed.

The injection which contains substance such as macrogol and polysorbate will not precipitate though it contains tannin. To this injection, the semi-finished product should be determined before adding additive.

Resin Unless specified otherwise, measure the injection 5 ml, add hydrochloric acid 1 drop and allow to stand for 30 minutes. No flocculus should appear. If the injection contains those composition that will precipitate when meeting with acid, add chloroform 10 ml instead. Shake well, separate the chloroform solution, evaporate on a water bath to dry, add glacial acetic acid 2 ml in the residue to dissolve it, then pour into a test tube with plug, add water 3 ml and mix well, allow to stand for 30 minutes. No flocculus should appear.

Oxalate For the solution of injection for venous injection, unless specified otherwise, measure the injection 2 ml, adjust the pH 1-2 with dilute hydrochloric acid, then filter, adjust the pH value of the filtrate to 5-6, add 3% calcium chloride solution 2-3 drops and allow to stand for 10 minutes. No opalescence or precipitate should be observed.

Potassium iron Unless specified otherwise, measure the injection for venous injection 2 ml, evaporate to dry. First, ignite till carbonized with weak flame, then incinerate at the temperature of 500-600℃ until carbon-free. Add dilute acetic acid to dissolve, and transfer into 25 ml volumetric flask, dilute with water to the volume and mix well, use as a test solution.

Take two absorptiometer, measure accurately potassium iron standard solution 0.8 ml in tube A, add alkaline formaldehyde (measure formaldehyde solution, adjust the pH value to 8.0-9.0 with sodium hydroxide) 12 drops, 3%

disodium edetate solution 2 drops, 3% sodium tetraphenylborate solution 0.5 ml, dilute with water to 10 ml. Measure accurately the test solution 1 ml in tube B, process as what done on tube A at the same time, shake well. Compare to opalescence produced by viewing down the vertical axis of the cylinders against a black background. Opalescence of tube B should not be heavier than that of tube A.

Note Preparation of potassium iron standard solution.

Place suitable potassium sulfate, grind into fine powder, dry to constant weight at 110℃, weigh 2.330 g accurately, put into 1000 ml volumetric flask, add sufficient water to dissolve and dilute to the volume, shake well, use as store solution. Immediately before using, measure accurately the store solution 10 ml in 100 ml volumetric flask, dilute with water to volume and shake well (per ml equals to 100 μg potassium).

Ⅸ T Determination of Methanol

The gas chromatographic method (Appendix Ⅵ E) is used for the determination of the content expressed in percentage of methanol in tincture of Chinese medicine, unless specified otherwise.

Chromatographic system and system suitability Carry out the method for gas chromatography, using porous polymer beads of ethylvinylbenzene cross-linked with divinylbenzene 0.18-0.25 mm in diameter as the support, maintain the column temperature at 125℃. The number of theoretical plates of the column is not less than 1500, calculated with the peak of methanol; The resolution of the peaks of methanol and internal standard should be more than 2.

Determination of Correction Factor Measure accurately 1 ml *n*-propanol into 100 ml volumetric flask, dilute with water to the volume and mix well. It is used as an internal standard solution. Measure accurately 1 ml methanol in 100 ml volumetric flask, measure precisely, dilute with water to the volume. Measure accurately 10 ml each of the test preparation and the internal standard. Carry out successively 3-5 injection of 1 μl of the standard. Calculate the correction factor by the average area of peaks.

Procedure Measure accurately the internal standard 1 ml in 10 ml volumetric flask, add the solution being examined to the volume and mix well, used as a test solution. Inject accurately 1 μl of the test solution into the column, determine and calculate the content.

Unless specified otherwise, the content of methanol should not be more than 0.4 g each 1 L of the solution being examined.

Annotations (1) Be sure that no peak due to impurity corresponding to the internal standard appears in the chromatogram obtained from the test preparation in the absence of internal standard.

(2) System suitability must comply with the requirements descried above, when any supports are used.

(3) The chromatographic system and system suitability must comply this method, when use other supports.

Appendix X

X A Determination of Extractives

1. Determination of Water-soluble Extractives Pulverize the material being examined, pass through No. 2 sieve, mix well.

Cold maceration method Place 4 g of the powdered material, accurately weighed, in a 250-300 ml stoppered conical flask, add accurately 100 ml of water, and stopper well. Macerate the drug with shaking for 6 hours and allow to stand for 18 hours. Filter rapidly through a dry filter, transfer accurately 20 ml of filtrate to an evaporating dish, previously dried to constant weight, and evaporate to dryness on a water bath. Dry at 105℃ for 3 hours and allow to cool for 30 minutes in a desiccator. Weigh rapidly and accurately, unless specified otherwise in the monograph, calculate the percentage of water-soluble extractives on the dried basis (%).

Hot extraction method Place 2-4 g of the powdered material, accurately weighed in a 100-250 ml stoppered conical flask, add accurately 50-100 ml of water, stopper well and weigh, allow to stand for 1 hour. Boil gently under reflux for 1 hour. Allow to cool, take off the flask, stopper well and weigh, add water to restore its original weight, shake well and filter through a dry filter. Place 25 ml of the filtrate, accurately measured, in an evaporating dish, previously dried to constant weight, and evaporate to dryness on a water bath. Dry at 105℃ for 3 hours and allow to cool for 30 minutes in a desiccator. Weigh rapidly and accurately, unless specified otherwise in the monograph, calculate the percentage of water soluble extractives on the dried basis (%).

2. Determination of Ethanol-soluble Extractives Proceed as directed under determination of water-soluble extractives using ethanol of a concentration specified in individual monograph as the solvent instead of water.

3. Determination of volatile ether extractives Place 2-5 g of the powdered material (through No. 4 sieve), accurately weighed, dry for 12 hours in a desiccator with P_2O_5. Place in a Soxhlet's extractor, add a quantity of ether, boil under reflux for 8 hours, unless specified otherwise in the monograph. Place in a evaporating dish, previously dried to constant weight, and evaporate to dryness. Dry for 18 hours in a desiccator with P_2O_5, weigh accurately, heat to 105℃ slowly, dry at 105℃ to constant weight. The weight loss is the weight of volatile ether extractives.

X B Determination of Tanninoids

This experiment should be processed without illumination.

Preparation of reference solution Place 50 ml reference substance solution of gallic acid, accurately measured, in 100 ml brown measuring flask, dissolve and dilute to volume with water. Place 5 ml, accurately measured, in 50 ml brown measuring flask, dilute to volume with water, shake well (0.05 g gallic acid per ml).

Preparation of standard curve Place 1.0 ml, 2.0 ml, 3.0 ml, 4.0 ml, 5.0 ml reference substance solution, in 25 ml brown measuring flask, add 1 ml phosphotungstomolybdic acid respectively, then add 11 ml, 10 ml, 9 ml, 8 ml, 7 ml water respectively, dilute to volume with 29% sodium carbonate, shake well. With corresponding reagents as blank, measure the absorbance at 760 nm according to the Ultraviolet Spectrophotometry and Colourimetry (appendix V A). Draw the standard curve with the absorbance as ordinate and concentration as abscissa.

Preparation of test solution Place a quantity of the powdered material (according to the prescription under the individual monograph), accurately weighed, in a 250 ml brown measuring flask, add 150 ml water, stand overnight, treat with ultrasound for 10 minutes, allow to cool, dilute to volume with water, shake well, keep standing (for solids depositing), filter and throw away the first 50 ml of filtrate. Place 20 ml of the filtrate, accurately measured, in 100 ml brown measuring flask, dilute to volume with water.

Procedure

Total phenol Place 2 ml solution being examined, accurately measured, into 25 ml brown measuring flask. Follow the steps in preparation of standard curve, from "add 1 ml phosphotungstomolybdic acid", add 10 ml water, measure the absorbance according to the method and calculate the content of gallic acid in the test solution using the standard curve.

Non-adsorbed polyphenol Place 25 ml solution being examined, accurately measured, in 100 ml stoppered conical flask, previously added 0.6 g casein, and stopper well. Stay at 30℃ for 1 hour on a water bath, shake well, then allow to cool, filter and throw away the frontal filtrate. place 2 ml of the filtrate, accurately measured, in 25 ml brown measuring flask. Follow the steps in Preparation of standard curve, from "add 1 ml phosphotungstomolybdic acid", add 10 ml water, measure the absorbance and calculate the content of gallic acid in the solution being examined using the standard curve.

Use this following formula to calculate the content of tannin in the test solution.

Tatol tannin=(Total phenol)−(Non-adsorbed polyphenol)

X C Determination of Cineol

Carry out the method for gas chromatography (Appendix VI E).

Chromatographic system and system suitability Pack a column with 7 : 3 (g/g) of 10.0% polyethylene glycol (PEG)-20M and 2.0% silicon (OV-17), with PEG at the end of injection; maintain the column temperature at 110℃±5℃; the number of theoretical plates of the column is not less than 2500, calculated with reference to cineol; the resolution factor of the peaks of cineol and its neighboring impurities should meet the requirement.

Determination of the correction factor Dissolve a quantity of cyclohexanone, accurately weighed, in *n*-hexane to make a solution containing 50 mg per ml as the internal standard. Weigh accurately about 100 mg of cineol CRS to a 10 ml volumetric flask, add accurately 2 ml of the internal standard solution, dilute with *n*-hexane to volume, shake well, inject 1 μl of the solution to the column for 3-5 times, and calculate the correction factor by the average area of peaks.

Preparation and determination of the test solution Weigh accurately about 100 mg of the sample to a 10 ml volumetric flask, add accurately 2 ml of internal standard solution, dissolve and dilute with *n*-hexane to volume, shake well, use it as the test solution. Inject 1 μl of the solution to the column and calculate the content of cineol.

Ⅹ D Determination of Volatile Oil

The drug being examined should be pulverized to pass through No. 2 or No. 3 sieves and then mixed well, unless specified otherwise.

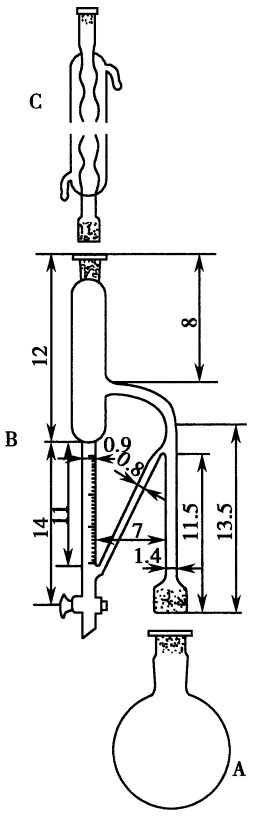

Fig. 19

Apparatus The apparatus consists of three parts as shown in the figure (as Fig. 19).

A is an 1000 ml (or 500 ml, 2000 ml) round-bottom flask made of hard glass, B is a volatile oil determination tube and C is a reflux condenser. All parts are connected via ground glass joints. The measuring tube in B is graduated into divisions of 0.1 ml. The glass apparatus is cleaned thoroughly and the ground glass joints are tightly connected to avoid the escape of volatile oil.

Note The volatile oil determination tube B must be set vertically, while the connecting point between the side tube and the graduated measuring tube is at a horizontal level.

Procedure

***Method* 1** This method is used for determining volatile oils of which the relative density is less than 1.0. Weigh accurately to the nearest 0.01 g, a quantity of the substance being examined equivalent to 0.5-1.0 ml of volatile oil, into flask A. Add 300-500 ml of water and a few glass beads, shake and mix well. Connect flask A to volatile oil determination tube B and then connect B to reflux condenser C. Add water through the top of reflux condenser C until the graduated tube of B is filled and overflows to flask A. Heat the flask gently in an electric heating jacket or by other suitable means until boiling begins and continue heating for about 5 hours, until the volume of oil does not increase. Stop heating, allow to stand for a few minutes, and open the stopcock at the lower part of B, run off the water layer slowly until the oily layer is 5 mm above the zero mark. Allow to stand for at least 1 hour, open the stopcock again, run off the remaining water layer carefully until the oily layer is just on the zero mark. Read the volume of oil in the graduated portion of the tube and calculate the content of volatile oil, expressed as percentage (ml/g).

***Method* 2** This method is used for determining volatile oils of which the relative density is more than 1.0. Transfer 300 ml of water and a few glass beads to flask A. Connect flask A to volatile oil determination assembly B. Add water through the top of B until the graduated tube of B is filled and water overflows to flask A. Add 1 ml of xylene with a pipette and then connect the reflux condenser C to B. Heat the flask until boiling begins and continue the distillation at a rate that will keep the middle part of the condenser cold. Stop heating after 30 minutes, and allow to stand for at least 15 minutes. Read the volume of xylene in the graduated portion of the tube. Carry out the procedure described under Method 1, beginning at the words "Weigh accurately to the nearest 0.01 g". Substract the volume of xylene previously observed from the volume of the oily layer, the remainder is taken to be the content of volatile oil in the drug being examined, expressed as percentage (ml/g).

Appendix XI

XI A Colour of Solution

The colour of solution and its difference from the specified colour can, to some extent, demonstrate the purity of drug. Colour of Solution is a method for testing the colour of a solution, by comparing the colour of solution of drug with that of the reference solutions specified, or, measuring the absorbance at the specified wavelength.

A solution which is termed "colourless" specified in an individual monograph means that the colour of solution of drug is the same as that of the solvent being used for the preparation of the solution, and a solution which is termed "almost colourless" means that the colour of solution of drug is less intense than that of a reference solution, prepared by diluting reference solution No. 1 with same volume of water.

Method 1

Unless otherwise specified, dissolve a quantity of the substance being examined specified in an individual monograph with water in a 25 ml Nessler cylinder, dilute with water to 10 ml. Place in another Nessler cylinder 10 ml of reference solution of specified tint and colour. View down vertically the cylinders against a white background, or view horizontally against a white background in diffused light. The colour in the cylinder containing the test solution is not more intense than that in the cylinder containing the reference solution. If the colour in the cylinder containing the test solution is, or is almost, the same as that in the cylinder containing the reference solution, or the tint between cylinders is not consistent, so that it is unable to estimate the result by naked eye, Method 3 (Colour Difference Meter Method) should be used, and the result should be accorded for justifying.

Potassium dichromate standard solution as reagents Dissolve 0.4000 g of reference potassium dichromate, previously dried to constant weight at 120℃ and accurately weighed, in water in a 500 ml volumetric flask and dilute with water to volume, shake thoroughly. Each ml of the solution contains 0.800 mg of $K_2Cr_2O_7$.

Cupric sulfate standard solution as reagents Dissolve about 32.5 g of cupric sulfate in a quantity of hydrochloric acid solution (1→40) to produce 500 ml. Transfer 10 ml of the solution, accurately measured, to an iodine flask, add 50 ml of water, 4 ml of acetic acid and 2 g of potassium iodide. Titrate with sodium thiosulfate (0.1 mol/L) VS, add 2 ml of starch IS towards the end point of the titration and continue to titrate until the blue colour disappears. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 24.97 mg of $CuSO_4 \cdot 5H_2O$. Dilute the rest of cupric sulfate solution with hydrochloric acid solution (1→40) to contain 62.4 mg of $CuSO_4 \cdot 5H_2O$ per ml, based on the above assay result.

Cobaltous chloride standard solution as reagents Dissolve about 32.5 g of cobaltous chloride in a quantity of hydrochloric acid solution (1→40) to produce 500 ml. Transfer 2 ml of the solution, accurately measured, to a flask, add 200 ml of water, mix well. Add ammonia TS until the solution turns from pink to green colour, add 10 ml of acetic acid-sodium acetate BS (pH 6.0), heat to 60℃ and then add 5 drops of xylenol orange IS. Titrate with disodium edetate (0.05 mol/L) VS until the solution turns to yellow. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 11.90 mg of $CoCl_2 \cdot 6H_2O$. Dilute the rest of cobaltous chloride solution with hydrochloric acid solution (1→40) to contain 59.5 mg of $CoCl_2 \cdot 6H_2O$, based on the above assay result.

Preparation of stock reference solutions Prepare the following stock Reference Solutions, using the 3 Standard Solutions.

Preparation of stock reference solutions (expressed in ml)

Colour	Cobaltous chloride standard solution	Potassium dichromate standard solution	Cupric sulfate standard solution	Water
yellowish green(YG)	1.2	22.8	7.2	68.8
yellow(Y)	4.0	23.3	0	72.7
orange yellow(OY)	10.6	19.0	4.0	66.4
orange red(OR)	12.0	20.0	0	68.0
brownish red(BR)	22.5	12.5	20.0	45.0

Preparation of reference solutions Prepare the following reference solutions, using the Stock Reference Solutions.

Preparation of reference solutions (expressed in ml)

Number of reference solution	1	2	3	4	5	6	7	8	9	10
Stock Reference Solution	0.5	1.0	1.5	2.0	2.5	3.0	4.5	6.0	7.5	10.0
Water	9.5	9.0	8.5	8.0	7.5	7.0	5.5	4.0	2.5	0

Method 2

Unless otherwise specified, dissolve a quantity of the substance being examined specified in an individual monograph with water to produce a solution of 10 ml, filter if necessary. Measure the absorbance at the wavelength specified, it gives not more than the required value.

Method 3 (Colour Difference Meter Method)

This is a method describing and analyzing the colour of a solution quantitatively by direct measurement of its tristimulus values of transmittance using colour difference meter. Using this method for determination recognition when it is difficult to identify the colour difference between a test specimen and a reference solution visually.

Colour difference between a test specimen and a reference solution is achieved by comparing their tristimulus values directly or by comparing them with those of water respectively.

According to the modern colour vision theory, there are three kinds of colour-sensitive pyramidal cells in retina of human eyes, which are sensitive to red, green and blue respectively. The colour vision procedure can be divided into two steps. Firstly, the three kinds of independent colour-sensitive pyramidal substances in retina absorb light radiation of various wavelengths of spectrum selectively and at the same time each by itself produces the reaction of white in the strong light or of black without stimulation outside. Then these three reactions combine again in the course of nerve stimulation transmission from the pyramidal receptors to the vision centre, resulting in three pairs of opposite neural reactions, i. e., red or green, yellow or blue, and white or black reaction. At last various senses of colours are formed in the vision centre of the pallium.

All colours in nature can be composed of a mixture of proper ratio of red, green and blue, the three primary colours, which are suitably chosen to excite the three kinds of receptor cells in human eyes. So a new concept, the tristimulus values, (X, Y, and Z), can be defined as three primary source stimulation values to match the colour being examined in the given three-colour system. Through extensive colour-matching experiments with human subjects having normal colour vision (who are called standard observers or standard eyes), distribution coefficients ($\bar{x}$ (λ), $\bar{y}$ (λ) and $\bar{z}$ (λ)) have been measured for each visible wavelength (380-780 nm) which stimulates each pyramidal receptor to give the relative data. The curve of the combined distribution coefficients is called the spectral tristimulus values curve of the CIE 1931 standard colourimetric observer (as Fig. 20).

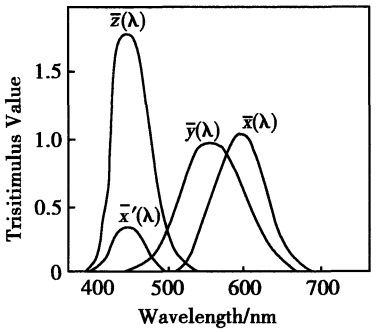

Fig. 20 The spectral tristimulus values curve of CIE 1931 standard colourimetric observer (the visual field being 10°)

The relationships between the distribution coefficient and the tristimulus values are given in following equations

$$X=K\int S\ (\lambda)\ P\ (\lambda)\ \bar{x}\ (\lambda)\ \mathrm{d}\ (\lambda)$$

$$Y=K\int S\ (\lambda)\ P\ (\lambda)\ \bar{y}\ (\lambda)\ \mathrm{d}\ (\lambda)$$

$$Z=K\int S\ (\lambda)\ P\ (\lambda)\ \bar{z}\ (\lambda)\ \mathrm{d}\ (\lambda)$$

Where K is the normalization coefficient;
S (λ) is the relative spectral power distribution of the illuminant;
P (λ) is either the spectral reflectance or spectral transmittance produced by the colour object;
$\bar{x}$ (λ), $\bar{y}$ (λ) and $\bar{z}$ (λ) are the distribution coefficients of standard observers;
d (λ) is the wavelength interval, usually of 10 nm or 5 nm.

Once the tristimulus values of a colour have been determined, they may be used to calculate the coordinates of the colour in an idealized three-dimensional colour space. Many sets of colour equations named as the colour express system have been developed to define the space, such as the CIE 1931-*XYZ* colour express system, the CIE 1964 supplemental standard chroma system, the CIE 1976$L^*a^*b^*$ colour space or the CIE *Lab* uniform colour space, the Hunter colour express system, etc.

In order to understand and compare conveniently, the CIE *Lab* uniform colour space is often used to describe colour and colour difference. It is constructed by a right-angle coordinate labelled by L^* a^* b^* respectively. Every point in the three-dimensional-colour coordinate represents a colour and the geometrical distance between the point and the reference point illustrates the difference between the two colours (as Fig. 21 and Fig. 22). The same distance means the same colour difference. When the instrumental method is applied to compare the colour of a test preparation with that of a standard, the parameter needed to be compared is the difference, in the visually uniform colour space, between the colour of the blank and that of the test specimen or standard.

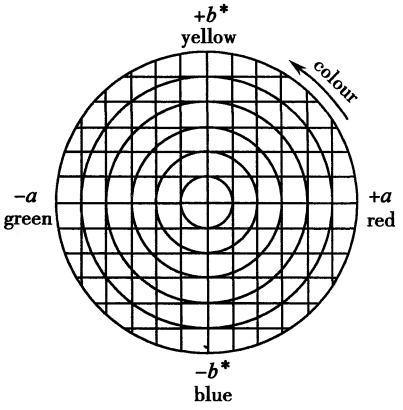

Fig. 21 The L^* a* b* chromaticity diagram

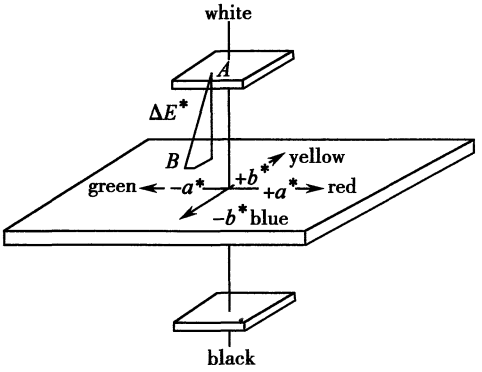

Fig. 22 The L^* a* b* colour space and the colour difference ΔE^*

In the CIE *Lab* uniform colour space, the relationships of among colour coordinates L^*, a^* and b^*, the tristimulus values X, Y and Z and the colour difference ΔE^* are defined by

Luminosity Index $L^* = 116 \times (Y/Y_n)^{1/3} - 16$

Chromaticity Index $a^* = 500 \times [(X/X_n)^{1/3} - (Y/Y_n)^{1/3}]$

Chromaticity Index $b^* = 200 \times [(Y/Y_n)^{1/3} - (Z/Z_n)^{1/3}]$

Colour Difference $\Delta E^* = \sqrt{(\Delta L^*)^2 + (\Delta a^*)^2 + (\Delta b^*)^2}$

Where X, Y and Z are the tristimulus values of the test specimen, X_n, Y_n and Z_n are the tristimulus values of the absolutely diffuse reflection material, and X/X_n, Y/Y_n and Z/Z_n should be more than 0.008856. ΔE^*, ΔL^*, both Δa^* and Δb^* are the colour difference, the luminosity index difference, and the chromaticity index differences of the test specimen and the standard respectively. The colour of the test specimen is brighter than that of the standard when ΔL^* is positive, and deeper or more saturated when Δa^* and Δb^* are both positive.

Briefly, the operating principle of colour difference meter is to simulate the sense of sight system of human eyes and turn the tristimulus values of spectral data into the mathematical expression of the colour through its inner analogy integrating optical system, then calculate L^*, a^*, b^* and ΔE^*. Fig. 23 is the working schematic diagram of a colour difference meter. Instrumental methods can provide accurate and precise measurements of colour and colour differences with the same spectral power distribution of the standard light source as that of the light source used in common colour observation (e.g., in daylight) and with the same photo-electrical response receptor as the colour vision of the observers (e.g., the visual field is 10°.) The provided data are more objective that do not drift with time, place and individuals.

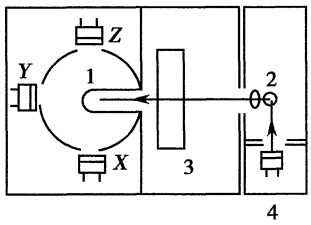

Fig. 23 The photometry system diagram of the colour difference meter

1-integrating sphere; 2-light source; 3-transmissive sample; 4-photo-electric tube for balance

1. General requirements of the instrument The instrument is commonly a photo-electric integrating colour difference meter. The illumination and observation condition is o/d or d/o, the light source is D65, and the visual field is 10°. It can detect the tristimulus values X, Y and Z and calculate L^*, a^*, b^*, ΔE^*, the hue and the hue number of the test solution directly.

For the measurement of the spectral transmittance of clear liquids, the colour of solutions changes with the thickness of the layer measured. Unless otherwise specified, a cell of 1 cm should be used.

To ensure the reliability of the measurement, the instrument should be calibrated at regular intervals. Colourless materials such as water or air should be used as a standard and assigned a transmittance of 1.000 at all wavelengths during the calibration.

The tristimulus values of water or air are $X = 94.81$, $Y = 100.00$, and $Z = 107.32$ under the conditions of the light source being D65 and the visual field being 10° at room temperature.

2. Determination Unless otherwise specified, the colour difference meter should be calibrated with water firstly. Then detect the solutions of the test specimen and the standard which are prepared as directed in the individual monograph. The colour difference ΔE^* between the solutions of the test specimen and water should not be more than that between the solutions of the standard and water.

If there are two tints specified in the individual monograph, and the actual tint of the solution of the test specimen is between the two standard tints specified, and difficult to judge, the colour difference ΔE^* between the solutions of the test specimen and water should not be more than the mean value of the colour differences between the solution of the two standard tints and water $[\Delta E^* \leqslant (\Delta E^*_{s1} + \Delta E^*_{s2})/2]$.

Ⅺ B Determination of Particle Size

The following procedures determine the particle size or size limit of powders in pharmaceutical preparations.

Method 1 (microscopy)

The particle size determined by this method is expressed as the length of particles observed under a microscope.

Standardization of ocular micrometer standardize following the microscopic identification method (appendix Ⅱ C).

Procedure Unless specified otherwise, thoroughly mix the substances being examined [For the substances with high viscosity, a suitable quantity of glycerin solution (1→2) specified in the individual monograph may be added.] Introduce the substances being examined onto a slide as specified in the appendix of the dosage from or in the individual monograph, cover a cover glass (prevent formation of bubbles), and press gently to make the particles spread uniformly. For the substances being examined which is semisolid, it can be spread directly onto a slide. Immediately examine the slide under a microscope, in the whole field of view, using 50-100× magnification. No agglomeration occurs and none of the particles has a dimension of 50 μm or greater than it specified in the individual monograph. Examine the slide again under a microscope, in the field of view specified in the appendix of the dosage form or in the individual monograph, using 200-500× magnification. Record the total number of particles observed and the number of particles having the specified dimension. Calculated the percentage.

Method 2 (sieving)

1. Single sieve Unless specified otherwise, place 10 g of the substances being examined upon the specified No. sieve with a close-fitting receiving pan and cover. Shake the sieve in a rotary horizontal direction for not less than 3 minutes, and gently tap on the sieve frequently in vertical direction. Weight accurately the amount in the receiving pan, and calculate the percentage.

2. Two sieves Unless specified otherwise, place 30 g of the substances being examined upon the specified No. sieve. Shake the sieve in a left-to-right horizontal direction by gently tapping on the sieve for 3 minutes. Weigh accurately the amount remaining on the smaller No. sieve and passing through the larger No. sieve. Calculate the percentage of each fraction.

Ⅺ C Test for Visible Particles

Visible particles are defined as insoluble substance that

present in injections or eye drops and can be observed under the required conditions by visual test. Their size or length are usually more than 50 μm.

Injections or eye drops should be produced according to the Good Manufacture Practice (GMP). All of the products should be detected respectively by suitable methods before released, and the unacceptable products are eliminated synchronously.

There are two methods for the test for visible particles-lamp test and light scattering method. Lamp test is commonly used, but light scattering method also may be used especially some products that unsuitable for lamp test, such as the containers are coloured transparent glass or the colour of the solutions being examined is too dark to observe, should be detected by light scattering method.

During the test is carring out in laboratory, must prevent to introduce foreign visible particles. All procedures must be performed under hygienic class 100, preferably in a laminar-air-flow cabinet, if the containers of samples being examined are unsuitable for detected (opaque or unshaped), and need to transfer the contents into other appropriative glass containers.

1. Lamp test

This test is carried out in a darkroom.

Apparatus See the following figure (as Fig. 24):

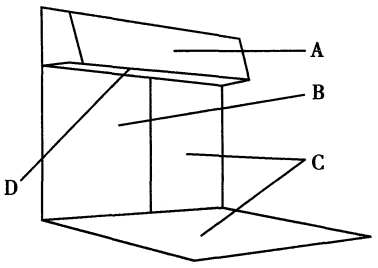

Fig. 24

A-a light source of daylight lamp with panel for obstructing from light; The intensity of illumination is adjustable between 1000-4000 lx;
B-a non-glare black background;
C-a non-glare white background and the bottom (supply with test for coloured particles);
D-a glare white background (inboard of light baffle).

Requests for inspector Inspector's visions of distant and near distance should be 4.9 or more than 4.9 (vision after correcting defects should be 5.0 or more than 5.0); Inspector is also not colour blindness.

Procedure Unless otherwise specified, take 20 containers being examined randomly. First remove any adherent labels from the containers, clean the outer surfaces, then gently swirl and invert each individual container in order to force the visible particles that present in solutions being examined floating (Caution: ensuring that air bubbles are not introduced). If necessary, transfer the solutions being examined into other clean and transparent appropriative glass containers. Hold the bottle-neck of the container at the edge of light baffle and gently invert the container, meanwhile observe the presence of any particles in it, and retain appropriate distance to inspectors' eyes (common distance is 25 cm) with visual method respectively under black background and white background.

The intensity of illumination should be 1000-1500 lx for the colourless injections or eye drops; The intensity of illumination should be 2000-3000 lx for the samples which with coloured glass or transparent plastic containers and coloured solutions being examined; For the suspensions for injections or eye drops only detect coloured mass, cilia etc. the intensity of illumination should be 4000 lx.

Criteria

Solutions for injection i. v., concentrated solutions for injection and eye drops All of the 20 containers should be free from visible particles. If visible particle has been found in not more than 1 container, repeat the procedure for a further 20 containers, and none visible particles could be found.

Suspensions for injection or eye drops All of the 20 containers should be free from coloured mass, cilia etc.

Injections not used for i. v., power for injections and sterile raw material for injection Comply with the related requirements of the drug surveillance administration of State Council.

2. Light scattering method

When a beam of monochromatic colour laser pass through the solution being examined, the insoluble substances in the solution cause the light scattering. The scattering energy is related to the size of insoluble substance. This method is intended to measure the light scattering energies caused by insoluble substance in solutions and then compare the energies with liminal value which preseted to check out the visible particles.

The light scattering energies caused by insoluble substance can be analyzed base on the series of the images collected. Suppose the light scattering energies is E, it is processed opto-electrical signal change over, became a corresponding stereopicture with the height of pyramid is H and the diameter is D and a pick-up camera can catches it. The light scattering energies E is a monotonous function for D and H, i. e. $E=f(D, H)$. Meanwhile, suppose the intensity of the light scattering energies is q, the exposure time of take a photograph is T, there is furthermore $E = g(q,T)$. Reasoning can be obtained from the above that the relationship between D with q and D with T is $D = w(q,T)$, remain the relationship of monotonous function. After D has been determined, the light scattering energies can be calculated according to the curve of the function.

Apparatus and Principle The apparatus consists of the rotator for sample bottle, laser photosource, image collecting equipment, data processing system and terminal monitoring system. It also includes the automatic send and deliver devices for the bottle.

The samples are transferred to the rotator by the send device. The rotator must rotate the bottle rounding the perpendicular line in high speed for a while and then stopped sharply. The homogeneous laser beam from laser photosource should evenly illuminates through the solutions being examined. As soon as the turbulent flow in the solutions disappears, but the solution is still rotating due to inertia, the image collecting equipment takes images continuously at specific angle for light scattering energies that resulting from insoluble substances in the rotating solution. The numbers of image should be not less than 75. Data processing system then processes the series of the images. It will assess automatically the insoluble substance more than given size exists or not according to the predefined criteria, or it will display the images on the monitor in order to making decision manually. The results will be recorded at the same time. Then the deliver device will be instructed to differentiate the qualified and unqualified samples automatically.

Standardization for Instrument The instrument should have the automatic calibrating function. The calibration should be carried out using the reference particles before the test.

Unless otherwise specified, calibrate the instrument using

the reference particles with diameter 40 μm and 60 μm respectively. The curve equation resulting from the calibration then is used to calculate the corresponding pinel parameter of the reference particle with diameter 50 μm for test criterion.

After the pinel parameter is set according to the 50 μm reference particle, detect the solutions containing the 60 μm reference particle three times, each result should be positive.

Procedure Unless otherwise specified, choice the corresponding test parameters from the menu provided in the instrument according to the strength of samples and adjust the parameters in compliance with the size of the containers. The test must carry out three times. If a container fails the test even one time, change the method to the lamp test for further confirmation except the container is coloured transparent vessel or the colour of the solution being examined is too dark to observe by visual test.

In general conditions, the left and right lines of sampling window should overlap with the edges of the container, the upper line should be a secant line with the curve surface of the solution in the container. Rotating time parameter should be setted longer than the time that the whirlpool in the solution reaches to the bottom of the bottle in order to force the solid substances floating and air bubble broken. Holding time parameter should be set as short as possible but not shorter than the time for the whirlpool calming down in order to avoid the interference of air bubbles meanwhile retain the solid substances in moving state when image collecting equipment start to work. The tightness parameter for holding bottle prefer to same with the diameter of the bottom of the bottle (mm), and it is adjustable based on the qualities of the bottle. If the bottle is not smooth and straight enough to avoid the vibration during rotating, air bubbles would be introduced. In this case the tightness parameter should be increased to decrease the vibration, meanwhile, the rotating time parameter should be increased so ensuring that the whirlpool in the solution reach to the bottom of the bottle.

Injections Unless otherwise specified, take 20 containers being examined randomly. First remove any adherent nontransparent labels from the containers, clean the outer surfaces, then put the samples onto the send device, start the instrument and record the results. All of the 20 containers should be free from visible particles. If it is confirmed that visible particle has been found in not more than 1 container, repeat the procedure for a further 20 containers, and none visible particles could be found.

Eye drops Unless otherwise specified, take 20 containers being examined randomly and transfer the solutions into other clean and diaphanous appropriative glass containers. Put the containers onto the send device, start the instrument and record the results. All of the 20 containers should be free from visible particles. If it is confirmed that visible particle has been found in not more than 1 container, repeat the procedure for a further 20 containers, and none visible particles could be found.

XI D Inductively-Coupled Plasma Mass Spectrometry

Inductively-coupled plasma mass spectrometry aims at ionizing test substances using inductively-coupled plasma, separating them according to mass-to-charge ratio of ions, determining the intensitd of all kinds of ion peaks. Plasma composed of free electrons, ions and neutral atoms or molecules, is a gas characterizing electric neutrality in the whole, and its inner temperature is high to several thousand centigrade to million centigrade. The sample is atomized by atomization device, and brought by carrier gas to traverse the center of plasma flame torch, quickly evaporated and ionized and admitted into mass analyzer via sampling cone or ion introduction interface. Samples completely evaporate and dissociate at ultra high temperature, the percentage of ionization is high, so it is very sensitive for nearly all elements; because molecular constitution of compounds have been destructed, it is merely applicable to elemental analysis.

Ⅰ. General requirement for instruments

Inductively-coupled plasma mass spectrometer is generally composed of sampling system, Inductively-coupled plasma (ICP) ion source, mass analyzer and detector, realizes the coupling of ICP and mass spectrometer, mainly used for elemental analysis and valence analysis.

Carrier gas Carrier gas generally used by instruments is argon, whose purity should be better than 99.99%, possibly supplied by high-pressure cylinder and liquid storage tank, and enters ion torch pipe at certain of flow rate through proper decompression device.

Sampling system Sampling mode is direct sampling of solution. Inject solution into instrument through sampling pipe using peristaltic pump. Sampling pipe generally includes sample pipe and internal standard pipe. During the test, the temperature of atomizing chamber should be stable (according to instrument requirement). After using, atomizing chamber should be rinsed, and it is forbidden to touch directly the spout by hand.

Ion source and sampling cone Torch pipe and sampling cone should be rinsed after a period of time in use. During test gas pipe should be kept closed without leaking, and the reflection power of instrument should be monitored. Because of rather high temperature during flare burning of plasma, circulating water system should be utilized to cool, and use air exhaust system of proper power to exhaust the heat inside the instrument. Temperature of circulating water and air exit should be controled under the instrument requirement.

Mass analyzer and detector Mass analyzer is generally quadrupole analyzer with the function of mass inside the scanning. Detector is generally photoelectricity multiplier or electron multiplier. Mass analyzer should be kept in vacuum and vacuum degree should meet the instrument requirement. The instrument may be kept standby in vacuum state, but vacuum degree should be recovered to atmospheric pressure according to requirement before cutting electric source. When the concentration of test element of test substance is rather high, dilution is required so as to prolong detector's useful life. Sensitivity should be tuned before sample analysis till the performance is satisfied.

Ⅱ. Determination

Prepare at lest three duplications of standard solution containing test element in the concentration range recommended by instrument, concentration increasing in turn, adding the corresponding regents as test solutions. Prepare aqueous solution with de-ionized water, unless specified otherwise. Initiate instrument according to the requirement, and analyze samples in turn according to concentration gradient. calibration curve with the average value of three numerical readings per concentration and corresponding concentration.

Prepare test solution according to the requirement of each kind of sample, keeping the estimated concentration of test element in the concentration range of calibration curve. Analyze test solution look up corresponding concentration from the standard curve, and calculate the content of

element.

During quantitative analysis, sample pipe should be inserted in the sample solution when sampling, while internal standard pipe should be kept laying in the corresponding internal standard element solution in the course of analysis. Internal standard element should generally be selected from natural rare elements which have similar mass with the test element.

Appendix XII

XII A Determination of Disintegration

Disintegration is provided to determine whether the solid preparations disintegrate disperse into fragments within a prescribed time and get through the wire gauze (except undissolved tablet coating material or fragments of capsule shell).

This method refers to the examination of disintegration of solid preparations under the prescribed conditions.

Disintegration is not required for the preparations which comply with the requirements for dissolution, drug release or disintegration.

1. Tablets

Apparatus The apparatus mainly consists of a basket-rack assembly with disks and a metallic device for raising and lowering the basket in the liquid medium at a constant rate between 30-32 cycles per minute through a distance of 55 mm±2 mm.

Basket-rack assembly The basket-rack assembly consists of six glass tubes, each 77.5 mm±2.5 mm long, 21.5 mm in internal diameter with a wall of 2 mm in thickness. The tubes are held in a vertical position by two transparent plastic plates, each 90 mm in diameter and 6 mm in thickness, with six holes, each about 26 mm in diameter. On the top of the upper plastic plate is a stainless-steel plate about 90 mm in diameter and 1 mm in thickness, with six holes each about 22 mm in diameter. Attached to the under surface of the lower plate is a disk of stainless-steel wire gauze about 90 mm in diameter, with apertures of 2.0 mm in internal diameter. A stainless-steel central shaft about 80 mm long is fixed with the upper plastic plate and stainless-steel plate. The stainless-steel plate, the two plastic plates and the wire gauze are fixed together by three screws (as Fig. 25).

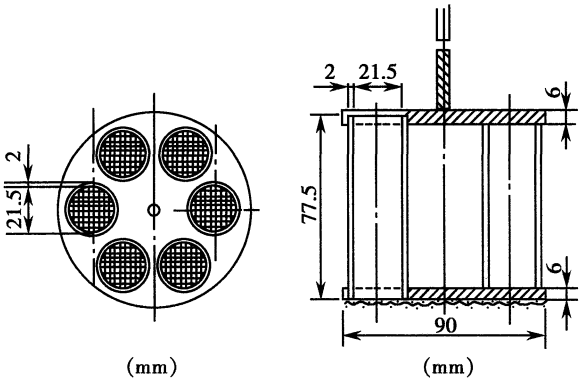

Fig. 25

Disks The disk is made of a smooth transparent plastic material having aspecific gravity of 1.18-1.20, 2.07mm± 0.15 mm in diameter, 9.5 mm±0.15 mm in thickness. It has five holes with 2 mm in diameter, one of the holes is located in the center and the others at an equal distance of 6 mm from the central hole. Equally spaced on the sides of the disk are four V-shaped notches. The dimensions of each notch are such that the upper openings are 9.5 mm wide and 2.55 mm deep and the lower opening are 1.6 mm wide and 1.6 mm deep (as Fig. 26).

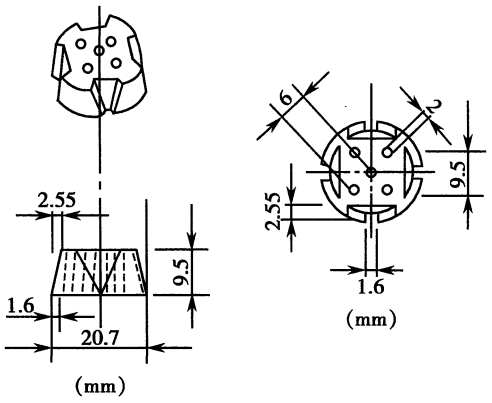

Fig. 26

Procedure The basket is suspended in a water bath preferably using a 1000 ml beaker, maintained at 37℃ ± 1℃, the volume of the fluid in the vessel is adjusted appropriately so that at the highest point of the upward stroke the wire mesh remains 15 mm below the surface of the fluid and descends to a distance not less than 25 mm from the bottom of the vessel on the downward stroke.

Unless specified otherwise, place 1 tablet in each of the six tubes of the basket, add disks and operate the apparatus. All of the powder tablets disintegrate completely within 30 minutes. All of extractum tablets and sugar-coated tablets disintegrate completely within 1 hour. If 1 tablet fails to disintegrate completely, repeat the test on 6 additional tablets. All of the tablets should comply with the requirement. If the test specimen adheres to the disk, repeat the test on further 6 tablets; all the tablets should comply with the test.

Film-coated tablets Comply with the test as described above. Replacing the water in the beaker with hydrochloric acid (9→1000), all of the tablets disintegrate within 1 hour. If any one of the tablets has not disintegrated, repeat the test on further six tablets; all the tablets should comply with the test.

Entric-coated tablets Entric-coated tablets are tested in the same way as described above using hydrochloric acid solution (9→1000) as the immersion fluid and the tablets show no evidence of cracking, disintegrating or softening in 2 hours. Remove the basket, wash the tablets with a small quantity of water, add a disk to each tube. Repeat the operation using phosphate BS (pH 6.8) as the immersion fluid, all tablets should disintegrate completely within 1 hour. If 1 tablet fails to comply with the test, repeat the operation with another 6 tablets. All the tablets should comply with the test.

Effervescent tablets Effervescent tablets are tested in the following way. Place 6 tablets in a 250 ml beaker containing 200 ml of water maintained at 15-25℃, numerous gas bubbles are evolved. When the evolution of gas around the tablet or its fragments has ceased the tablets dissolve or disperse in the water so that no agglomerates of particles remain. Unless specified otherwise, all of the tablets disintegrate within 5 minutes. If 1 tablet fails to disintegrate completely, repeat the test on 6 additional tablets. All of the tablets should comply with the requirement.

The tablets containing extractum, resin, lipid and much gelatinized starch comply with the requirement if a small part of the particles have soften and have no solid core even they haven't got through the wire mesh.

2. Capsules

For hard capsules or soft capsules, unless specified otherwise, repeat the test of tablets described above on 6 capsules The hard capsules should disintegrate within 30 minutes and the soft capsules disintegrate within 1 hour. For soft capsules, replacing the water in the beaker with simulated gastric fluid. If 1 of the capsules fails to disintegrate completely, repeat the operation with another 6 capsules. All the capsules should comply with the test.

For enteric capsules, unless specified otherwise, repeat the test described above on 6 tablets. Using hydrochloric acid solution (9→1000) as the immersion fluid and the capsules shells show no evidence of cracking, disintegrating within 2 hours. Remove the basket, wash the capsules with a small quantity of water, add a disk to each tube. Repeat the operation using simulated intestinal fluid as the immersion fluid, all capsules should disintegrate completely within 1 hour. If 1 capsule fails to comply with the test, repeat the operation with another 6 capsules. All the capsules should comply with the test.

It complies with the requirement if part of the particles have soften and have no solid core even they haven't got through the wire mesh.

3. Dripping pills

Carry out the test with the same apparatus as tablets using the stainless-steel wire gauze with apertures of 0.425 mm in internal diameter. Carry out the test as described above using 6 dripping pills. All the dripping pills disperse completely within 30 minutes, and the coated-dripping pills should disperse completely within 1 hour. If 1 of the dripping pills fails to disperse completely, repeat the operation with another 6 dripping pills. All the dripping pills should comply with the test. Dripping pills made of gelatin base may be tested in simulated gastric fluid.

Annotation *Simulated gastric fluid* Add about 800 ml of water and 10 g of pepsin to 16.4 ml of dilute hydrochloric acid, mix well, dilute with water to produce 1000 ml.

Simulated intestinal fluid Phosphate buffer solution (containing pancreatin) (pH 6.8) (Appendix ⅩⅤ D Buffer Solution).

Ⅺ B Disintegration Test for Suppositories and Vaginal Tablets

The test for disintegration of suppositories and vaginal tablets determines whether a solid dosage form such as suppositories and vaginal tablets can disintegrate, soften, dissolve or disperse under the specified experimental conditions.

1. Suppositories

Apparatus The apparatus is composed of a transparent sleeve and a metal device (as Fig. 27).

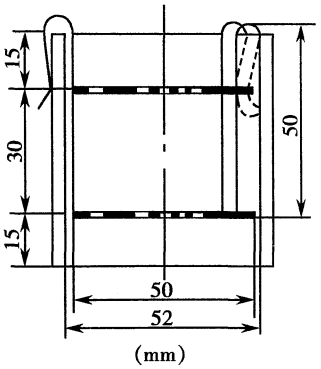

Fig. 27

Transparent sleeve The transparent sleeve is made of glass or suitable plastic, with a height of 60 mm, an internal diameter of 52 mm and an appropriate wall thickness.

Metal device The metal device consists of two stainless metal discs and three metal hooks. Each of the disc has a diameter of 50 mm and contains 39 holes, each 4 mm in diameter (as Fig. 28). The discs are separated by a distance of 30 mm. The metal device is attached to the outer sleeve by means of the three equally-spaced hooks.

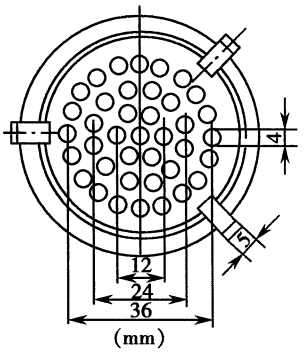

Fig. 28

Procedure Take 3 suppositories being examined and allow to stand at room temperature for 1 hour. Place them on the lower discs of 3 metal devices respectively, then insert the devices into separate sleeves and fix them by means of the hooks. Unless specified otherwise, place each piece of the above apparatus in 3 vessels separately, each containing not less than 4 litres of water at 37.0℃±0.5℃ and fitted with a slow stirrer and a means of holding the apparatus vertically 90 mm below the surface of water, after each 10 minutes invert each apparatus without allowing it to emerge from the liquid.

Interpretation Unless specified otherwise, all of the fat-based suppositories should disintegrate, soften or have no solid core offering resistance to pressure in not more than 30 minutes; all of the water-soluble based suppositories should completely dissolve in not more than 60 minutes. If one of the suppositories fails to comply with the requirements, repeat the test on 3 additional suppositories and all of them should comply with the requirements.

2. Vaginal tablets

Apparatus The apparatus is the same as that used for suppositories except that set the hook-end upside down in the vessel (as Fig. 29).

Procedure Adjust the water surface level until the holes of the upper metal disc are just covered by a uniform layer of

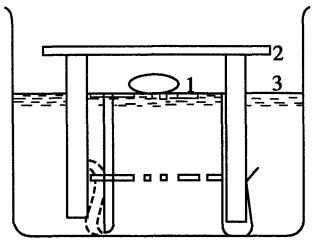

Fig. 29
1-Vaginal tablet; 2-Glass plate; 3-Water surface

water. Put 3 vaginal tablets being examined on separate upper discs and cover the apparatus with a glass plate to maintain appropriate humidity.

Interpretation Unless specified otherwise, all of the vaginal tablets should melt or disintegrate into fragments and pass through the perforated plates or only remain a small amount of soft masses which have no solid core within 30 minutes. If one of the tablets fails to comply with the requirements, repeat the test on 3 additional tablets and all of them should comply with the requirements.

Ⅻ C Minimum Fill

The following tests and specifications apply to solid, semisolid, and liquid dosage forms packed in containers in which the labelled net wight (volume) is not more than 500 g (ml), except those preparations for which the tests for weight variation of contents and volume in container are otherwise specified required or radio active pharmaceuticals.

Procedure ***Gravimetric method for containers labelled by weight*** Unless specified otherwise, select 5 containers (or 3 containers if the labelled quantity is more than 50 g), remove the cover and label. Thoroughly clean and dry the outside of the containers by suitable means, and weigh individually. Quantitatively remove the contents from each container, washing with a suitable solvent. Dry, and again weigh each empty container. Determine the net weight of contents in each container and the average net weight of contents. The results comply with the requirements. If one container fails the requirements a further 5 (or 3 of over 50 g) containers may be tested individually and all must comply.

Volumetric method for containers labelled by volume Unless specified otherwise, select 5 containers (or 3 containers if the labelled quantity is more than 50 ml). Open the containers with caution to avoid any loss of the contents. Take up individually the contents of each container into a dry, previously standardized graduated cylinder, if the labelled quantity is more than 50 ml. For viscous liquids, keep the containers upside down for 15 minutes to pour the contents as completely as possible. Measure the volume of the contents in each container, calculate the average volume of the contents. The results comply with the requirements. If one container fails the requirements, a further 5 (or 3 of over 50 g) containers may be tested and all must comply.

labelled quantity	solids, semisolids, liquids		viscous liquids(volumetric method)	
	average quantity	quantity in each container	average quantity	quantity in each container
less than 20 g(ml)	not less than the labelled quantity	not less than 93% of the labelled quantity	not less than 90% of the labelled quantity	not less than 85% of the labelled quantity
20-50 g(ml)	not less than the labelled quantity	not less than 95% of the labelled quantity	not less than 95% of the labelled quantity	not less than 90% of the labelled quantity
more than 50 g(ml)	not less than the labelled quantity	not less than 97% of the labelled quantity	not less than 95% of the labelled quantity	not less than 93% of the labelled quantity

Ⅻ D Determination of Plaster Softening Point

This is a method to determine the temperature of plaster when softened by heat under the prescribed conditions. By determining the temperature at which the plaster descends by 25 mm using the method below, it examines the degree of the hardness and reflects the viscosity indirectly.

Apparatus Softening point radiomete. The specimen ring(as Fig. 30)is a turbinate brass ring, 6.35 mm high, 17.46 mm in upper pore diameter and 15.88 mm in lower pore diameter. The steel ball localizer(as Fig. 31), 20.60 mm in internal diameter with the steel ball located in the center. The steel ball(as Fig. 32)is 9.53 mm in diameter and 3.50 g±0.05 g in weight. The upper of the bracket(as Fig. 33)is a deplanate brass board with two horizontal toroidal rings. It supports two specimen rings. The lower bracket is a deplanate lubricous brass board. The distance, from the bottom of the turbinate brass ring on the upper bracket to the supine surface of the lower bracket is 25 mm. The superficies inferia of the lower bracket is 16 mm±3 mm over the bottom of the beaker. Fig. 34 is the combined apparatus.

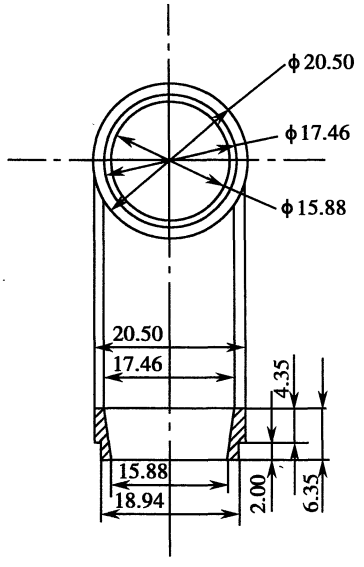

Fig. 30 The turbinate brass ring

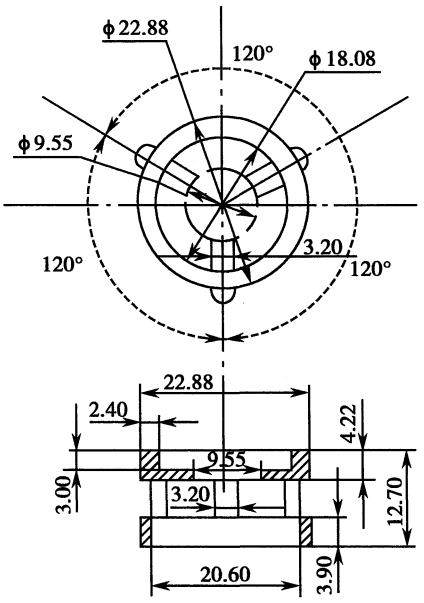

Fig. 31 The steel ball localizer

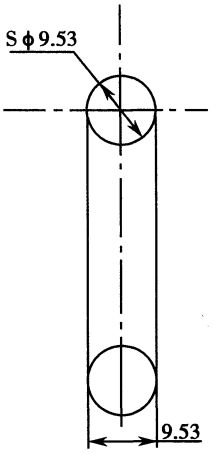

Fig. 32 The steel ball

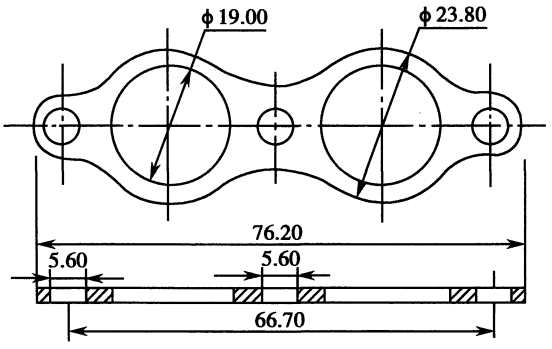

Fig. 33 The bracket

Procedure Place the specimen in baking oven to soft it by heat. Take out and scrape the plaster. Fill each of the two specimen rings with 1.8 g of the plaster. Place the specimen ring inverted on a tin foil which is smeared by some glycerine and tiled on a glass board. Heat it in a calorstat oven at the temperature of 75℃ ± 2℃ until the surface is level. Put the specimen in the toroidal rings of the bracket after 1 hour with the room temperature, fix the steel ball localizer. Place the steel ball localizer and the steel ball in a beaker of water bath at constant temperature of 37℃ ± 1℃. After 20 minutes for

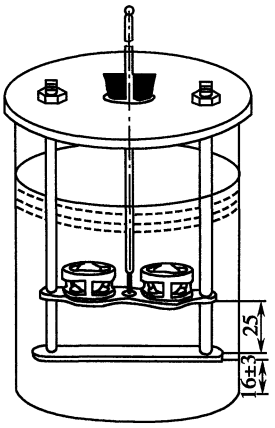

Fig. 34 The combined apparatus

balance, place the steel ball in the localizer and heat the bottom of the beaker with the temperature rising 1.0-1.5℃ per minute. Read the temperature on the thermometer (calibrated) when the steel ball touched the surface of the lower bracket. Take the mean value of the temperature as the softening point.

Ⅻ E Determination of Cataplasms Adhesion

This is a method to measure the adhesion of cataplasms applied to the surface of skin. Specified in an individual monograph, three indexes of measurement are initial adhesive power, maintaining adhesive power and peeling strength.

Method 1 (Determination of initial adhesive power)
Using ramp rolling method. Roll a stainless steel ball over the viscid side of the specimen on the tiltboard. Evaluate the viscosity according to the max number of the ball that the specimen can stick to.

Apparatus Composed by tiltboard, pedestal, stainless steel ball and take-over box. The tiltboard, about 2 mm in thickness, is a stainless steel board with the tilt angle of 15° or 30°. The pedestal can adjust and keep the apparatus horizontal. With soft material in inner wall, the take-over box is used to receive the rolling steel ball, The number and the specification should comply with the regulations below.

The number and the specification of the rolling steel ball

Number	Diameter/mm	Weight of per 1000/kg
1	0.794	0.002
2	1.588	0.016
3	2.381	0.055
4	3.175	0.132
5	3.969	0.257
6	4.763	0.440
7	5.556	0.702
8	5.953	0.86
9	6.350	1.03

32	23.8131	55.5
33	25.400	57.4
34	26.988	80.8
35	28.575	95.5
36	30.163	112.8
37	31.750	131.9
38	33.338	152
39	34.925	175
40	36.513	198.1
41	38.100	227.3
42	41.275	287.57
43	42.863	320.4
44	44.450	361
45	47.625	439.5
46	50.800	538.8

Procedure Remove the packing material of the specimen before test and put avoiding overlap at room temperature for more than 2 hours.

Place 3 tablets of the specimen in the center of the tiltboard (the tilt angle of 15° or 30° as specified in an individual monograph) with the plaster side upward. 10 cm of the upper part of the inclined plane and 15 cm of the lower are covered with terylene film of 0.025 mm in thickness. Plaster can be seen in 5 cm of the middle part (as Fig. 35). Roll the balls specified in an individual monograph from the top of the inclined plane freely.

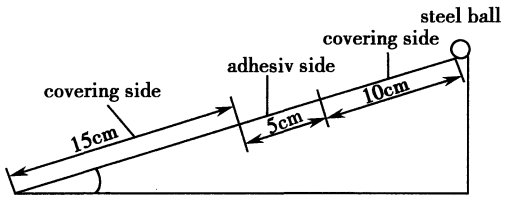

Fig. 35

2 or over 2 tablets of the 3 specimens should stick to the steel ball in the test. If 1 tablet fails, repeat the test with a smaller number or ball. It should succeed. If 1 tablet succeeds and the other 2 tablets only succeed in smaller number balls, repeat the test on 3 further tablets. It comply with the requirement only when all the tablets succeed.

Method 2 Determination of maintaining adhesive power

Paste the viscid side of the specimen to the surface of the test board, vertically standing. Hang a weight of specified mass in the length direction of the specimen. Record the time when the specimen falls off or the distance of displacement in a period of time.

Apparatus

Test shelf Composed of a pedestal adjusting the level and a bracket hanging and fixing the test board. The test shelf should keep the working plane of the test board hanging on the bracket in a vertical direction.

Test board A stainless steel board, 1.5-2.0 mm thick, 125 mm wide and 125 mm long, with the surface rugosity less than 0.4 μm. Replace the test board if there is permanent smut or seam on the surface.

Pressing roller a steel axle with rubber cladding of 2000 g.

Loading board The requirements of material, dimension and surface are the same to that of the test board.

Procedure Remove the packing material of the specimen before test and put avoiding overlap at room temperature for more than 2 hours.

Scrub the test board and loading board with wiping material dipping abluent, use clean gauze to wipe dry. Repeat the operation above over 3 times so that the working plane is clean. The clean working plane should not get in touch with hands or other objects. Paste the specimen onto the middle of the test board and loading board with a pressing roller of 2000 g rolling over 3 times. After 20 minutes, fix the test shelf and record the beginning time of the test.

Remove the weight when the specified time passes. Measure the displacement of the specimen, or record the time when the specimen falls off the test board. Take the arithmetic mean of the displacement or the time of a group of specimen as the results.

Method 3 (Determination of peeling strength)

Determined by 180° peeling strength test.

Apparatus

Tensile force test machine The destroy load should be between 15% and 85% of the full load, and the error of the force should be less than 1%. The test machine peels consecutively at the speed of 300 mm/min ± 10 mm/min. There should be a plotting apparatus that could auto-record the peeling load.

Test board A stainless steel board, 1.5-2.0 mm thick, 50 mm±1 mm wide and 125 mm±1 mm long.

Polyester film Specified in JB 1256-77 (6020 polyester film), 0.025 mm in thickness about 110 mm in length and about 20 mm wider than the specimen.

Procedure Remove the packing material of the specimen before test and put avoiding overlap at room temperature for more than 2 hours.

Fix the specimen to the test board with double-faced rubberized fabric. If necessary, fix the upper and the nether sides of the specimen with adhesive tape to make it level.

Paste the viscid side of the specimen with the clean polyester film, roll a pressing roller of 2000 g over the specimen 3 times to prevent the creation of bubbles in splicing. The specimen can be tested after 20-40 minutes.

Fold the polyester film in half (180°). The free ends of the polyester film and the test board are clapped to the test machine together. The peeling plane and the test machine should be in one level. The test machine peels consecutively at the speed of 300 mm/min ± 10 mm/min. Take the arithmetic mean of the peeling strength as the results. The peeling strength of the specimen σ (kN/m) is calculated by the equation below.

$$\sigma = (S/LB) \cdot C$$

Where S is the area of the curve in the value-selective range, mm^2;

L is the length of the curve in the value-selective range, mm;

B is the actual width of the specimen, mm;

C is the load of unit height of the record paper, kN/m.

Appendix XIII

XIII A Test for Pyrogens

The test for pyrogens is carried out in rabbits by measuring the rise of body temperature following the intravenous injection of a specified dose of the preparation being examined.

Test animal Use healthy, matured rabbits weighing 1.7-3.0 kg, male or non-pregant female. Keep the rabbits under observation for 7 days before the selection test, loss of weight, loss of appetite or other abnormal signs should not appear. Within 3-7 days prior to pyrogen test, rabbits which have not previously been used in a pyrogen test should be subject to a selection test as prescribed under the *procedure* except injection. Record the body temperature of each rabbit 8 times successively at 30 min intervals, if the recorded body temperatures of a rabbit are all in the range of 38.0-39.6℃, and the difference between the highest and lowest temperature is not greater than 0.4℃, it is fit for the pyrogen test. Do not use a rabbit more than 10 times and more frequently than once every 48 hours. The selection test should be repeated if a rabbit is to be used again after a break of 3 weeks, or if it has a maximum temperature rise of 0.6℃ or more in a previous pyrogen test. All rabbits which have been used in a pyrogen test in which the preparation being examined was adjudged to be pyrogenic should not be used again.

Test conditions House the rabbits in a living area of uniform temperature (a temperature which does not differ by more than 5℃ from that of the laboratory where the test is to be conducted) 1-2 days before the test. Conduct the pyrogen test in a laboratory of 17-25℃ and free from disturbances. During the test, the variation of room temperature should not be more than 3℃. Withhold food from the rabbits and place the animals in suibable boxes at least 1 hour before the test, until the test is completed. Measure the body temperature with a suitable temperature-sensing device with a precision of ±0.1℃. Insert the thermometer or temperature sensing probe into the rectum of the rabbit to an uniform depth (about 6 cm) for not less than 1.5 minutes. Record the body temperature of each rabbit once at an interval of 30 minutes, usuall measure twice. The difference between the two readings taken immediately before injection should not be greater than 0.2℃, use the mean value of these two readings as the normal body temperature of each rabbit. In any one test, the normal body temperature of each rabbit must be within 38.0-39.6℃ and must not differ from one another by more than 1℃.

Render the syringes, needles and glassware free from pyrogens by heating at 250℃ for 30 minutes or by any other suitable method.

Procedure Warm the preparation being examined to about 38.0℃. Within 15 minutes after the determination of normal body temperature, inject a dose as specified in the monograph into the ear vein of each of 3 rabbits slowly. Record the temperature of each rabbit once at an interval of 30 minutes, measure 6 times after the injection. The temperature rise of each rabbit is calculated by subtracting its normal temperature from the highest temperature recorded. If one of the 3 rabbits shows a temperature rise of 0.6℃ or more; or none of the 3 rabbits shows a temperature rise of 0.6℃ or more, but the sum of the 3 temperature rises exceeds 1.4℃, repeat the test with 5 other rabbits using the same procedure.

Evaluation of the results If none of the 3 rabbits in the first test shows a temperature rise of 0.6℃ or more, and the sum of the 3 temperature rises does not exceed 1.4℃; or if only one of the 5 rabbits in the second test shows a temperature rise of 0.6℃ or more, and the sum of the 8 temperature rises does not exceed 3.5℃, the preparation being examined passes the test. If more than one rabbits in either test show a temperature rise of 0.6℃ or more; or the sum of the 8 temperature rises exceed 3.5℃, the preparation being examined is considered to be pyrogenic.

When the temperature rise is negative, the result is counted as a zero response.

XIII B Test for Sterility

The test for sterility is a method to detect whether raw materials, preparations or other articles, which are required to be sterile according to the Pharmacopoeia, are aseptic. However, a result conforming with the requirements only indicates that no contaminating micro-organism has been found in the sample examined under the conditions of the test.

Test for sterility should be carried out in a class 100 laminar-air-flow cabinet located within a 10 000-class clean-room, or an isolator. The whole process should be performed under strictly aseptic conditions to avoid any microbial contamination. The cleanliness of working areas including laminar flow cabinet, working bench, background room should be monitored regularly according to the current national standard such as The detecting method for airborne particles, airborne microbe and settling microbe in the clean room (area) of the pharmaceutical industry. The isolator should be validated according to the relevant requirements, the cleanliness of inner isolator space should also comply with aseptic requirements.

Culture media

Media preparation

Media for the test may be prepared as described below, dehydrated media may be used provided that they have same ingredients and comply with the requirements. Media should be sterilized using a validated process. Store at a temperature between 2℃ and 25℃ and protect from light. If the prepared media are stored in unsealed containers, they can be used in 3 weeks. If stored in suitable sealed containers, the media can be used in 1 year.

1. Fluid thioglycollate medium (for culturing aerobic bacteria and anaerobic bacteria)

Pancreatic digest of casein	15.0 g
Glucose	5.0 g
L-Cystine	0.5 g
Sodium thioglycollate or	0.5 g
(or Thioglycollic acid)	(0.3 ml)
Yeast extract	5.0 g
Sodium chloride	2.5 g
0.1% Resazurin solution (freshly prepared)	1.0 ml
Agar	0.75 g
Water	1000 ml

Mix the above ingredients in water except glucose and resazurin solution, heat until dissolved, adjust pH to slightly alkaline, boil and filter, add glucose and resazurin solution, mix, adjust the pH so that after sterilization the solution will have a pH of 7.1 ± 0.2. Dispense the medium in suitable containers which provide a ratio of surface to depth of medium such that no more than the upper half of the medium has undergone a colour change (pink colour) indicative of oxygen uptake at the end of the incubation period. Sterilize using a validated process. When ready for use, not more than the upper one-fifth of the medium has acquired a pink colour, otherwise, the medium can be restored only once by heating the containers in a water-bath until the pink colour disappears (no more than 20 minutes), cooled quickly, taken care to prevent the introduction of non-sterile air into the container.

Fluid Thioglycollate Medium is to be incubated at 30-35℃.

2. Modified Martin medium (for culturing fungi)

Peptone	5.0 g
Yeast extract	2.0 g
Glucose	20.0 g
Dipotassium hydrogen phosphate (K_2HPO_4)	1.0 g
Magnesium sulfate ($MgSO_4$)	0.5 g
Water	1000 ml

Mix the above ingredients in water except glucose, heat until dissolved, adjust pH to about 6.8, boil, add glucose, mix, filter, adjust the pH so that after sterilization the solution will have a pH of 6.4 ± 0.2, dispense the media into containers and sterilize using a validated process.

Improved Martin medium is to be incubated at 23-28℃.

3. Selective medium

Before sterilization or innoculation, add proper quantity of suitable neutralizer or surface-active substance, such as polysorbate 80 (used in test for sterility for water insoluble substances) etc. to each of the media described above. The quantity of neutralizer or surface-active substance should be validated.

4. Nutrient broth medium

Peptone	10.0 g
Beef powder	3.0 g
Sodium chloride	5.0 g
Water	1000 ml

Mix the above ingredients in water, heat until dissolved, adjust pH to slightly alkaline, boil, filter, adjust the pH so that after sterilization the solution will have a pH of 7.2 ± 0.2, dispense the media into containers and sterilize using a validated process.

5. Nutrient broth agar medium

Add 14.0 g agar to nutrient broth medium as described above, adjust the pH so that after sterilization, the solution will have a pH of 7.2 ± 0.2, dispense the media into containers and sterilize using a validated process.

6. Modified Martin agar medium

Add 14.0 g agar to Improved Martin medium as described above, adjust the pH so that after sterilization the solution will have a pH of 6.4 ± 0.2. Dispense the media into containers and sterilize using a validated process.

Suitability Tests of Medium The media used in the test for sterility, as described above, should comply with the following sterility and sensitivity tests, carried out before or in parallel with the test on the product to be examined.

Sterility Incubate no less than 5 vessels of each batch of sterilized medium at the specified incubation temperature for 14 days. Growth of microorganisms should not occur.

Test for sensitivity of medium

Test strains The viable microorganisms used in the test must not be more than five passages removed from the original master seed lot. The suitable seed-stock technique should be used so that the microorganism characters can be maintained.

Staphylococcus aureus	[CMCC (B) 26003]
Pseudomonas aeruginosa	[CMCC (B) 101041]
Bacillus subtilis	[CMCC (B) 63501]
Clostridium sporogenes	[CMCC (B) 64941]
Candida albicans	[CMCC (F) 98001]
Aspergillus niger	[CMCC (F) 98003]

Preparation of inoculum Inoculate freshly cultured *Staphylococcus aureus* or *Pseudomonas aeruginosa* or *Bacillus subtilis* into nutrient agar medium or nutrient broth medium *and freshly cultured Clostridium sporogenes* into fluid thioglycollate medium, incubate at 30°-35° for 18-24 hours. Inoculate freshly cultured *Candida albicans* into Modified Martin medium or Modified Martin agar medium, incubate at 23°-28° for 24-48 hours, prepare suspension, with the above cultures, containing less than 100 cfu microorganisms per ml with sterile 0.9% w/v sodium chloride solution. Inoculate freshly cultured *Aspergillus niger* into Modified Martin agar medium, incubate at 23°-28° for 5-7 days until good sporulation is obtained. Wash the *Aspergillus niger* spore culture and transfer it to sterile tube, prepare spore suspension containing less than 100 cfu per ml with sterile 0.9% w/v sodium chloride solution.

Inoculation of medium Take 9 containers of fluid thioglycollate medium (containing 12 ml medium per container), inoculate 2 containers of the medium with less than 100 cfu test microorganisms of *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Bacillus subtilis* and *Clostridium sporogenes* respectively, and the remaining uninoculated culture medium (one container) is used as blank control, then incubate for not more than 3 days. Take 5 containers of Modified Martin medium (containing 9 ml medium per container), inoculate 2 containers of the medium with less than 100 cfu test microorganisms of *Candida albicans and Aspergillus niger* respectively, and use the remaining uninoculated culture medium (one container) as blank control, incubate for not more than 5 days. Observe the test containers for growth of the microorganisms every day during the incubation.

Evaluation of results The blank control must be no growth of microorganisms. If a clearly visible growth of the microorganisms occurs in an inoculated culture medium, the medium meets the requirement of the test for sensitivity of medium.

Diluents and rinsing fluids

1. 0.1% Peptone solution Dissolve 1.0 g of peptone in 1000 ml of water, heat until dissolved, adjust the pH to 7.1 ± 0.2, filter and dispense into containers. Sterilize using a validated process.

2. pH 7.0 sodium chloride-peptone buffer Mix 3.6 g KH_2PO_4, 7.2 g Na_2HPO_4, 4.3 g sodium chloride and 1.0 g peptone in 1000 ml of water, heat until dissolved, filter and dispense into containers. Sterilize using a validated

process.
If necessary, Add suitable neutralizer or surface-active substance to each of the diluents or rinsing fluids described above before or after sterilization

Validation test

In the course of establishing sterility testing method for product to be examined, the method must be verified to ensure that the adopted method is suitable for sterility test of the product. Whenever there is a change of drug composition or experimental conditions of the test, the testing method must be revalidated. Validation test is to be conducted as described below under Test for sterility of the product being examined using exactly the same methods and the following instructions. The tests should be performed separately for each of the microorganism tested.

Tested strains and preparation of inoculum Same as the test for sensitivity of medium described above.

Membrane filtration Filter the specified quantity of the test specimen with Membrane filtration apparatus, rinse the membrane, add test microorganism with less than 100 cfu to the final portion of rinsing fluids, filter again. Transfer the membrane filter into fluid thioglycollate medium or Modified Martin medium, or add the medium to the filtration apparatus containing the membrane. Use another container containing the same volume of the medium, then add the same amount of test microorganisms as control. Incubate the containers at Specified temperature for 3-5 days. Repeat the procedure for each of the test microorganism tested.

Direct Inoculation Take 8 containers containing certain required volume of fluid thioglycollate medium for direct Inoculation, inoculate into 2 containers of each of medium with less than 100 cfu test microorganisms of *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Bacillus subtilis* and *Clostridium sporogenes* separately. Take 4 containers containing Modified Martin medium complying with the required volume for direct Inoculation, inoculate into 2 containers of each of the medium with less than 100 cfu test microorganisms of *Candida albicans and Aspergillus niger* separately. Add specified quantity of the product being tested to one of the inoculated containers of each test microorganism, the other inoculated container is for control. Incubate the containers at specified temperature for 3-5 days.

Evaluation of results Compare with the control container, if clearly visible growth of each test microorganisms is obtained in the test containers containing the product to be tested, visually either the product possesses no antimicrobial activity under the conditions of the test or such activity has been satisfactorily eliminated. The test for sterility of the product being examined may then be carried out using the same method and conditions of the test. If the growth of test microorganisms is not obtained, or poor, or slow in any tested container, visually comparable to that in the control container without product, then the product with the specified quantity possesses antimicrobial activity under the conditions of the test. In such a case, modify the conditions in order to eliminate the antimicrobial activity by using a large amount of rinsing fluid, or increase the volume of medium, or using suitable neutralizer or inactivator such as β-lactamase or p-aminobenzoic acid, or replacing the type of the membrane filter used etc. and repeat the validation test. The validation may also be performed simultaneously with the Test for sterility of the product being examined.

Test for sterility of the product being examined

Number of products to be tested It is the number of the minimum package of the product to be examined for test for sterility once. Unless otherwise specified, test the number of products is specified in Table 1. The number of the products for positive control test is not included in table 1.

Quantity of product to be tested It is the minimum quantity (g or ml) of the product in test for sterility once. Unless otherwise specified, the minimum quantity of the product for each medium are defined in table 2 and table 3. When using the technique of direct inoculation, if the contents in a single container are sufficient to inoculate two containers of medium, they should be transferred to fluid thioglycollate medium and Modified Martin medium respectively. When using the technique of membrane filtration, the quantity of the products to be tested should not be less than the whole quantity used in direct inoculation, whenever permitted, the whole contents of each container should be filtered for testing.

Positive control The microorganisms for positive control should be selected according to the nature of the product being examined. *Staphylococcus aureus* is used for the product possessing no antimicrobial activity or mainly anti-gram-positive-bacteria activity. Encherichia coli is used for the product mainly possessing anti-gram-negative-bacteria activity. *Clostridium sporogenes* is used for the product possessing anti-anaerobic bacteria activity. *Candida albicans* is used for the product possessing fungistatic activity. Preparation of the inoculums for positive control is the same as described under the Test for sensitivity of medium (E. Coli inoculums preparation is same as *Staphylococcus aureus* inoculums), number of test microorganism added should be less than 100 cfu, the quantity of the product used is the same as described under the Test for sterility of the product being examined for each container of medium. Incubate the positive control container for 48-72 hours, the growth of the test microorganisms should be well.

Negative control In the course of the sterility test for examined product, a negative control should be performed with the same solvent and diluents as the test used. There must be no growth of microorganisms.
If surface-active substances, neutralizers or inactivators etc. are used during the test, their efficacy and their absence of inhibition for growth and survival of microorganisms must be demonstrated.
The test for sterility is carried out by the membrane filtration method or direct Inoculation method. The membrane filtration method is used whenever the nature of the product permits. The same method and experimental conditions should be adopted in sterility test as that used in validation test.
Before opening the product containers to be tested, the exterior surfaces of containers must be thoroughly cleansed with a suitable disinfectant. If the containers are packaged under vacuum, sterile air should be transmitted into the container aseptically with suitable equipments (eg. Needles with sterilizing filter) before the container is opened to release the contents.

Sample preparation and medium inoculation
Unless otherwise specified, Carry out the test as described below.

1. Membrane filtration method
Sealed sterility testing system may be preferred used in the technique of membrane filtration. Other general membrane filter may also be adopted. The membrane used in the test for sterility has a nominal pore size which is not greater than 0.45 μm and a diameter about 50 mm. Selection of filtration membrane type should be performed according to the characters of product to be tested and solvent used. The filtration apparatus and membrane should be sterilized by appropriate means before use. Integrality of the membrane in the apparatus should be kept during the process filtration.

When filtering aqueous solution, the membrane in the filter should be pre-wetted with a small quantity of rinsing fluids. When the samples tested are oily preparations, the filtration apparatus and membrane must be thoroughly dried before use. the sample solution and rinsing fluid should be kept to always cover the whole surface of the membrane throughout the operation for maximal filtration efficiency. If necessary, wash the membrane by filtering through it with 100 ml of rinsing fluid for one single membrane each time, and the total volume used should not be too much to avoid any damage to the microorganisms held by the membrane, after filtering the sample solution

Aqueous solutions Transfer the specified quantity of samples tested directly into the membrane or membranes, or mix the samples into an aseptic vessels containing suitable quantity of the sterile diluent and transfer the mixture to the the membrane or membranes. Filter immediately. If the product being examined contain preservatives or have inherent antimicrobial activity, the membrane should be washed not less than three times by filtering through it with suitable quantity of the rinsing fluid. If sealed sterility testing system is used, transfer 100 ml of fluid thioglycollate medium and Modified Martin medium into the correspondence filter apparatus respectively after washing. If other general membrane filters are used, aseptically remove the membrane from the apparatus and cut it into three equal parts, and transfer each part to each of container containing 50 ml of suitable media, set one of the container as a positive control.

Solid soluble in aqueous vehicle Transfer the specified quantity of specimens tested, dissolve with suitable sterile diluent or as directed in the label. Proceed with the test as directed above for aqueous solutions.

Water insoluble substances Transfer the specified quantity of specimens and filter directly, or mix in a sterile diluent containing polysorbate 80 or other suitable emulsifying agent, and transfer it into the membrane or membranes. Filter immediately. Wash the membrane at least three times with rinsing fluid containing 0.1%-1% polysorbate 80. The membranes are inoculated to medium with or without containing polysorbate 80. Inoculate medium as directed above for Aqueous solutions.

Ointments and Viscous oils soluble in isopropyl myristate Mix specified quantity of specimens tested in suitable quantity of sterile isopropyl myristate, shake vigorously to completely dissolve the sample. If necessary, heat the mixture to not more than 44℃, Filter as rapidly as possible before the mixture cools down. In exceptional case when the mixture is unable to be filtered, more than 100 ml diluents should be added to the above mixture, shake sufficiently and extract the solution, then transfer the aqueous phase in underlayer into the membrane or membranes and filter immediately. Proceed washing membrane and inoculating medium as described above for water insoluble substances.

Sterile aerosol (or nebulization) products Transfer the specified quantity of product containers tested to a refrigeratory, and freeze for about 1 hour. Aseptically drill quickly a hole in the top end of each container and release the propellant, then open the container aseptically. Proceed as directed above for aqueous solutions or water insoluble substances, whichever applicable.

Prefilled syringes with drug Take the specified quantity of specimens tested, fit a sterile needle on the syringe (not included in the product package). If necessary, dissolve with suitable sterile diluent or with solvent specified by product label. Proceed with the test as directed above for Aqueous solutions or water insoluble substances, whichever applies. Needles included in the product package should also be tested for sterility using direct inoculation method.

2. Direct Inoculation method

Direct Inoculation method is to directly transfer the specified quantity of product tested into fluid thioglycollate medium and Modified Martin medium respectively. In each container Incubated, the volume of samples tested is not more than 10% of the volume of the medium, and the volume of fluid thioglycollate medium should not be less than 15 ml, the volume of Modified Martin medium should not be less than 10 ml, unless otherwise specified. Use the same medium volume and height in the container as in Validation test. Inoculate the same number of containers for each medium as the number of products to be tested.

Turbid aqueous solution Transfer the specified quantity of specimens tested into each culture medium.

Solid articles Directly transfer specified quantity of specimens tested into each culture medium, or prepare a suspension of the product with suitable sterile diluent or as directed in the label, then transfer the specified quantity of specimens into each culture medium.

Water insoluble substances Transfer the specified quantity of specimens tested to a sterile container, add the dilution containing suitable quantity of polysorbate 80 or other emulsifying agent to the container and mix to emulsify the specimens. Inoculate the suspension prepared above into each culture medium. Alternatively, Transfer directly the specified quantity of specimens into each culture medium containing polysorbate 80 or other emulsifying agent.

Incubation and observation

Incubate all medium containers above for 14 days at required temperature. Observe and record each medium container for evidence of microbial growth every day during incubation period. If the product being tested renders medium turbid so that the presence or absence of microbial growth can not be readily determined by visual examination, 14 days after the beginning of incubation. transfer suitable portions of the medium to fresh containers with the same kind of medium or slants, and incubate the fresh containers 2 days for bacteria and 3 days for fungi, then examine the fresh containers for evidence of microbial growth; or smear a small amount of the medium on a slide, stain and examine with microscope for the suspected microbial growth.

Evaluation of results

Except the positive control container, if no evidence of microbial growth is found in all of the test containers described above, the product to be examined complies with the test for sterility; if evidence of microbial growth is found in any one of the test containers, the product to be examined does not comply with the test for sterility, unless it can be clearly demonstrated that the test was invalid for causes unrelated to the product to be examined. The test may be considered invalid only when one or more of the following conditions are fulfilled:

(1) The result of the microbiological monitoring of the sterility testing facility shows that it does not meet the requirements of the test for sterility,

(2) A review of the testing procedure used during the test in question reveals a fault.

(3) Microbial growth is found in the negative control container.

(4) After determination of the identification of the microorganisms isolated from the test, the growth of this species (or these species) may be ascribed unequivocally to faults in respect with the material or the technique used in conducting the sterility test procedure.

If the test is validated to be invalid, it should be repeated with the same number of the samples and procedure as in the

original test. If no evidence of microbial growth is found in the test repeated, the product examined complies with the test for sterility; if microbial growth is found, the product examined does not comply with the test for sterility.

Table 1 Minimum number of product to be tested from each batch

Product to be tested	Number of items in the batch	Minimum number of items to be tested for each medium *
Parenteral preparations	Not more than 100	10% or 4 containers, whichever is the greater
	More than 100 but not more than 500	10 containers
For large-volume parenteral preparations (more than 100 ml)	More than 500	2% or 20 containers, whichever is less 2% or 10 containers, whichever is less
Ophthalmic and other noninjectable preparations	Not more than 200 containers	5% or 2 containers, whichever is the greater
	More than 200	10 containers
Bulk solid products	Up to 4	Each container
	More than 4 containers, but not more than 50 containers	20% or 4 containers, whichever is greater
	More than 50 containers	2% or 10 containers, whichever is greater

* If the content of one container are not sufficient to inoculate the two media, this number may be doubled.

Table 2 Minimum quantity of liquid product to be used for each medium

Quantity per container	Minimum quantity per container to be used for each medium
Not more than 1 ml	The whole contents of each container
more than 1 ml, and less than 5 ml	Half the contents of each container
Not less than 5 ml, and less than 20 ml	2 ml
not less than 20 ml, and less than 50 ml	5 ml
not less than 50 ml, and less than 100 ml	10 ml
not less than 50 ml, and less than 100 ml(Intravenous)	Half the contents of each container
not less than 100 ml, and not more than 500 ml	Half the contents of each container
not less than 500 ml	500 ml

Table 3 Minimum Quantity of solid product to be tested for each medium

Quantity per container	Minimum quantity per container to be used for each medium
Less than 50 mg	The whole contents of each container
not less than 50 mg, and less than 300 mg	Half the contents of each container
not less than 300 mg, and less than 5 g	150 mg
Not less than 5 g	500 mg

XIII C Microbial Limit Tests

Microbial limit tests provide tests for the estimation of the number of viable micro-organisms present in non-sterile pharmaceutical products of all kinds, including preparations, raw materials, excipients. The bacteria, fungi or yeasts count, as well as the specified bacteria, are tested.

Microbial limit tests should be carried out in a class 100 laminar-air-flow cabinet located within a 10000-class clean-room. The whole process should be performed under strictly aseptic conditions to avoid any microbial contamination. The cleanliness of working areas including laminar flow cabinet, working bench, background room should be monitored regularly according to the current national standard such as **The detecting method for airborne particles, airborne microbe and settling microbe in the clean room (area) of the pharmaceutical industry.**

Surfactants, neutralizing agents, or inactivators do not affect the growth of micro-organisms if they are used in the products to be examined.

Unless otherwise prescribed, incubate bacteria at 30-35℃, at 23-28℃ for fungi or yeasts, and at 35-37℃ for specified bacteria.

The test result is reported in the unit of 1 g, 1 ml, 10 g, 10 ml, or 10 cm^2.

Quantity of products to be tested

It refers to the quantity of the product to be examined for one single test (in g, ml, or cm^2).

Unless otherwise prescribed, use samples of 10 g or 10 ml of the product to be examined for testing. Use 50 cm^2 for pellicles. The quantity may be appropriately decreased for expensive drugs and small-package drugs. Increase the quantity by 10 g or 10 ml when *Salmonella* is tested.

Select the samples at random from at least 2 minimum containers, and at least 4 pieces for honeyed pills or pellicles.

The quantity of sampling (from at least 2 minimum containers) is 3 times the quantity for testing.

Preparation of the sample

Samples are prepared appropriately depending on their physico-chemical properties and biological characteristics. If necessary, samples are warmed in a water bath not more than 45℃. The samples are inoculated to the culture media within one hour of preparation.

Unless specified otherwise, follow the methods below to prepare the samples.

1. Liquids

Take 10 ml of the product, dilute to 100 ml with sterile sodium chloride-peptone buffer (pH 7.0), mix well. Use this 1 : 10 solution as the test solution. Add an appropriate amount of sterile polysorbate 80 to an oil to make it dispense evenly. For aqueous preparations, the products may be mixed as the test solution.

2. Solids, semi-solids, and viscous products

Take 10 g of the product, dilute to 100 ml with sterile sodium chloride-peptone buffer (pH 7.0), mix well with a homogenizer or other devices. Use this 1 : 10 solution as the test solution. If necessary, add an appropriate amount of polysorbate 80 and warm the sample in a water bath so that it dispense evenly.

3. Sample specified preparation

(1) Non-aqueous products.

Method I Transfer 5 g (or 5 ml) of the product into a sterile beaker containing 5 g melt (not exceeding 45℃) Span 80, 3 g glyceryl monostearate, 10 g polysorbate 80, mix, slowly add sterile sodium chloride-peptone buffer (pH 7.0, 45℃) to 100 ml with agitating to make an emulsion. Use this 1 : 20 emulsion as the test solution.

Method II Transfer 10 g of the product to a suitable container with 20 ml sterile isopropyl myristate (prepared as described under Sterility test, the amount may be increased if necessary) and sterile glass beads, agitate thoroughly to dissolve the product. Then add 100 ml sterile sodium chloride-peptone buffer (pH 7.0, 45℃), agitate for 5-10 min for extraction. Allow it to stand until the two layers separate. Use the 1 : 10 aqueous layer as the test solution.

(2) Pellicles
Take 50 cm^2 of the pellicles, cut into pieces. Immerge into an appropriate amount of sterile sodium chloride-peptone buffer (pH 7.0, usually 1 ml or 2 ml per 1 cm^2), and agitate. Use the 1 : 10 or 1 : 20 diluent as the test solution.

(3) Enteric-coated and colonic-coated products
Transfer 10 g of the product to 100 ml sterile phosphate buffer solution (pH 6.8 for enteric-coated and pH 7.6 for colonic-coated), warm in a 45℃ water bath, and shake so that it dissolves. Use this 1 : 10 solution as the test solution.

(4) Aerosols and sprays
Chill a prescribed amount of the product in a refrigerator for approximately 1 hour. Take it out, dig a small hole rapidly and aseptically. Put it at room temperature and allow the propellant to escape. Transfer all the residue with a sterile syringe, add an appropriate amount of sterile sodium chloride-peptone buffer (pH 7.0, add an appropriate amount of sterile polysorbate 80 for water-insoluble ingredients), and mix well. Take a sample equivalent to 10 g or 10 ml, and dilute by 10 folds. Use this 1 : 10 solution as the test solution.

(5) Products containing antimicrobial agents
When the products to be examined possess antimicrobial activities, eliminate the activity before the test. Follow the methods described below.

①Culture media dilution Transfer the prescribed amount of the product to an adequate volume of culture media. Thus the concentration of the product decreases until it possesses no antimicrobial activity. For the limit test of bacteria, fungi, and yeasts, distribute 2 ml of the diluted solution over Petri dishes. Add agar media, mix well, and allow it to solidify. Incubate the dishes under appropriate conditions. Count the average number of colonies obtained with 1 ml of the solution. Report the counts by the plate-count method. The amount of diluting culture media may increase when specified bacteria are tested.

②Enrichment of microorganisms by centrifugation
Centrifuge a specified quantity of the product at 3000 rpm for 20 minutes. If the product contains precipitates, centrifuge at 500 rpm for 5 minutes at first, and then collect the supernatant and centrifuge again as described above. Discard the supernatant and dilute the residue at the bottom (about 2 ml) to orginal specified quantity with diluting solution.

③Membrane filtration See the membrane filtration method under Bacteria, fungi, and yeasts count.

④Neutralization If the product to be examined contains antimicrobial agents like mercury, arsenic, or antiseptics, use suitable neutralizing agents or inactivators to eliminate its antimicrobial activity. The neutralizing agents or inactivators may be added in the diluting solutions or culture media.

Bacteria, fungi or yeasts count

Method validation
The bacteria, fungi or yeasts count method for microbial limit tests is validated before it is used for drugs. The count method is re-validated if changes in composition of the product or testing conditions may affect the result.
Validation test is to be conducted as described under Bacteria, fungi or yeasts count using exactly the same methods and the following instructions. The tests should be performed separately for each of the microorganism tested.

Test strains
The viable microorganisms used in the test must not be more than five passages removed from the original master seed lot. The suitable seed-stock technique should be used so that the microorganism characters can be maintained.

Escherichia coli	[CMCC (B) 44102]
Staphylococcus aureus	[CMCC (B) 26003]
Bacillus subtilis	[CMCC (B) 63501]
Candida albicans	[CMCC (F) 98001]
Aspergillus niger	[CMCC (F) 98003]

Preparation of Inoculum Inoculate freshly cultured of *Escherichia coli*, *Staphylococcus aureus*, or *Bacillus subtilis* to nutrient broth medium or nutrient agar medium, incubate for 18-24 hours; Inoculate freshly cultured of *Candida albicans* to modified Martin medium or modified Martin agar medium, and incubate for 24-48 hours; The above cultures are diluted to 50-100 colony-forming units (cfu) per ml with sterile solution of 0.9% sodium chloride. Inoculate freshly cultured of *Aspergillus niger* to modified Martin agar medium, and incubate for 5-7 days. Wash out the spores with 3-5 ml sterile solution of 0.9% sodium chloride. Transfer the spore suspension to a sterile test tube. Dilute the suspension to 50-100 cfu per ml with sterile solution of 0.9% sodium chloride.

Validation test Carry out at least 3 parallel tests, and calculate the recovery of micro-organisms for each test.

(1) Testing group When the plate count method is used, transfer 1 ml of the lowest possible serial dilution of the sample and 50-100 cfu testing micro-organisms to a Petri dish, and pour the agar medium immediately. Use 2 Petri dishes for each microbial strain, and record the colony number by the plate count method. When the membrane filtration method is used, transfer specified quantity of the sample solution through a membrane, rinse appropriately, add 50-100 cfu testing micro-organisms in the last portion of rinsing solution. Record the colony number by membrane filtration method.

(2) Microbial group Determine the number of micro-organisms added in the test.

(3) Product control Transfer a prescribed quantity of the product, determine the number of bacteria, fungi or yeasts in sample.

(4) Diluting solution control Diluting solution control should be carry out when the sample of preparation used dispersant, emulsification, neutralization, centrifugation and filtration etc. Use diluting solution instead of sample and add the testing micro-organisms to 50-100 cfu per ml, preparation test solution and determine the number of micro-organisms as described above for testing group.

Evaluation of results
In each of the 3 parallel tests, the microbial recovery is not less than 70% (average colony number of the diluting solution control/average colony number of the testing group× 100%). If the microbial recovery of the testing

group is not less than 70% [(average colony number of the testing group-average colony number of the product control)/average colony number of the microbial group × 100%], proceed the bacteria, fungi or yeasts count of the product to be examined as described above. If the microbial recovery in any of the tests is below 70%, eliminate the antimicrobial activities of the product by appropriate methods like culture media dilution, centrifugation, membrane filtration, or neutralization. The method needs re-validation.
The validation test is carried out in parallel with the bacteria, fungi, or yeasts count of the product to be examined.

Examination method
Examination method include plate count and membrane filtration method. Use validated plate count method or membrane filtration method to carry out the bacteria, fungi, or yeasts count of the product to be examined.
Dilute the homogenized solution to be test with pH 7.0 sterile solution of sodium chloride-peptone buffer solution to make serial dilutions of 1∶10, 1∶100, 1∶1000, etc.

1. Plate count method
Use two to three successive serial dilutions as the testing solution. Transfer 1 ml of the sample to a sterile Petri dish (90 mm in diameter), add 15-20 ml Nutrient agar medium, or Sodium rose bengal agar medium, or Yeast extracts peptone glucose agar medium (melted at not exceeding 45℃), mix well, and allow the contents to solidify at room temperature. Invert the Petri dish and incubate under appropriate conditions. For each dilution, use at least 2 Petri dishes for each culture medium.

Negative control Transfer 1 ml of the dilution to a sterile Petri dish, promptly add the culture medium, and allow the contents to solidify at room temperature. Invert the Petri dish and incubate under appropriate conditions. Use at least 2 Petri dishes for each culture medium. No evident growth of micro-organisms occurs in either of the Petri dish.

Incubation and counting Unless otherwise prescribed, incubate the bacteria for 48 hours, count the number of colonies every day, report the number on the 48 hour; incubate the fungi and yeasts for 72 hours, count the number of colonies every day, report the number on the 72 hour; extend the incubation time to 5-7 days if necessary. Do not count the number if colonies assemble. Following counting, calculate the number of colonies of each dilution of the product , report the result following the Microbial number report rule described below.
For liquid preparations containing honey and royal jelly, use Sodium rose bengal agar medium for fungi count and Yeast extracts peptone glucose agar medium for yeasts count. Sum the counts as the final result.

Microbial number report rule Select the dilution in which the average number of colonies of bacteria and yeasts is 30-300 cfu and of the fungi is 30-100 cfu.
If average microbial number of any dilution is less than 30, select the number of the lowest dilution. Calculate the number of cfu per g or per ml product to be tested.
When no microbial growth occurs in any of the dilutions, or it only occurs for the lowest dilution where the average microbial number of the cfu is less than 1, report the result with 1 multiplying by the lowest dilution folds.

2. Membrane filtration
Use membranes having a nominal pore size not greater than 0.45 μm, and a diameter of appropriately 50 mm. The type of filter material is chosen in such a way that the bacteria retaining efficiency is not affected by the component or solvent of the sample to be investigated. The filter unit and membrane are sterilized prior to use by appropriate means. Maintain the performance characteristic of the filter during the testing process. Moist the membrane with a minimum amount of rinsing solution before the test of aqueous products. Where the product to be examined is an oil, the membrane and filter unit are thoroughly dried before use. Let the product solution and rinsing solution cover the whole membrane to obtain its maximal performance. Rinse the membrane with 100 ml of rinsing solution each time if necessary. Do not use a large amount of rinsing solutions to avoid disturbance of the micro-organisms on the membrane.
Take representively 1 g or 1 ml of the product, or 1 ml suitable dilution solution of the sample, which containing large numbers of micro-organism), and dilute to 100 ml with diluting solution, mix well and filter. Rinse the membrane with pH 7.0 sterile sodium chloride-peptone buffer solution or other suitable rinsing solution, as described above for validation test. Transfer the membrane onto a Nutrient agar medium or Sodium rose bengal agar medium, or Yeast extracts peptone glucose agar medium plate, and incubate. Use at least one membrane for each medium.

Negative control Use 1 ml of the dilution, and carry out the test as described above. No evident growth of micro-organisms occurs in the negative control.

Incubation and counting Carry out the test as described above for plate count method. The number of micro-organisms on each membrane is not more than 100.

Microbial number report rule Multiply the average microbial number by dilution folds as the number of cfu per g or per ml product to be test. If no microbial growth occurs, report the result with less than 1 or 1 multiplying by the lowest dilution folds.

Test for specified micro-organisms

Method validation.
The method for specified micro-organisms test is validated before it is used for microbial limit tests for drugs. The method is re-validated if changes in composition of the product or testing conditions may affect the result.

Validation micro-organisms used should be complied with requirements of the microbial limits of the product. Validation the method of coliform should be used Escherichia coli. Carry out the test as describe under the Test for specified micro-organisms exactly the same methods and the following instructions.

Test strains he strains comply with the requirements as described above for bacteria, fungi, or yeasts count.

Escherichia coli	[CMCC (B) 44102]
Staphylococcus aureus	[CMCC (B) 26003]
Salmonella paratyphi B	[CMCC (B) 50094]
Pseudomonas aeruginosa	[CMCC (B) 10104]
Clostridium sporogenes	[CMCC (B) 64941]

Preparation of Inoculum Inoculate freshly cultured of *Escherichia coli*, *Staphylococcus aureus*, *Salmonella paratyphi B*, or *Pseudomonas aeruginosa* to nutrient broth medium or nutrient agar medium; inoculate freshly cultured of *Clostridium sporogenes* to fluid thioglycollate medium; incubate for 18-24 hours. Dilute the suspension to 10-100 cfu per ml with sterile solution of 0.9% sodium chloride.

Validation test

(1) Testing group Add a specified quantity of the product to be examined and 10-100 cfu testing micro-organisms to the culture medium, carry out the test by prescribed methods described below. When the membrane filtration method is used, filter an appropriate quantity of the product through a membrane, rinse appropriately, add the testing micro-organisms in the last portion of rinsing solution. Transfer the membrane to the culture medium for incubation.

(2) Negative control Negative control is set to verify the specificity of the testing method. The procedure is the same as described above for testing group. Use *Staphylococcus aureus* as the negative control microorganism for the test of *Escherichia coli*, coliform, or *Salmonella* species. Use *Escherichia coli* as the negative control microorganism for the test of *Pseudomonas aeruginosa*, *Staphylococcus aureus*, and *Clostridium* species. No control micro-organism is detected.

Evaluation of results

No control micro-organism is detected in the negative control. If the tested micro-organism is detected in the testing group, proceed the test with the product to be examined. If the tested micro-organism is not detected in the testing group, eliminate the antimicrobial activities of the product by appropriate methods like culture media dilution, centrifugation, membrane filtration, or neutralization. The method needs re-validation.

The validation test is carried out in parallel with the test for specified micro-organisms of the product to be examined.

Examination method

Carry out the test of the product to be examined as described above for validation test.

Positive control Add 10-100 cfu of the tested micro-organism to the positive control, carry out the test as the Test for specified micro-organisms. The tested micro-organism can be detected in the positive control.

Negative control Transfer 10 ml of diluting solution to a prescribed amount of culture media, and incubate as the Test for specified micro-organisms. No micro-organism growth occurs in the negative control.

(1) *Escherichia coli* Inoculate 10 ml of the test solution (equivalent to 1 g, 1 ml or 10 cm^2) to be examined to an appropriate amount of Bile salt lactose culture medium (not less than 100 ml) directly or after appropriate treatment, incubate for 18-24 hours (48 hours if necessary).

Inoculate 0.2 ml of the above culture to a tube containing 5 ml MUG medium, and incubate. Observe under 366 nm UV light at the time of 5 hours and 24 hours, respectively. Use blank MUG medium as the negative control. The result is MUG-positive if the cultures give fluorescent light, or MUG negative if no fluorescent light is observed. Following observation, add several drops of indole test solution. The result is indole-positive if the liquid surface presents a rosy colour, or indole-negative if no colour change takes place. The negative control is MUG-negative and indole-negative.

A MUG-positive and indole-positive result indicates the presence of *E. coli* in the product. A MUG-Negative and indole-Negative result indicates the absence of *E. coli* in the product. If the product is MUG-positive and indole-negative, or MUG-negative and indole-positive, inoculate the cultures on eosin methylene blue agar medium plate or MacConkey agar medium plate, and incubate for 18-24 hours.

If no growth of micro-organism occurs on the plate, or the appearance of the microbial colonies does not match the descriptions in Table 1, the product passes the test. Otherwise, confirm the result by suitable biochemical tests.

Table 1 Morphologic characteristics of Escherichia coli colonies

Culture medium	Characteristic colonial morphology
Eosin methylene blue agar medium	Purple black, light purple, bluish purple or pink, deep purple at the center of colony or no obvious dark center, circular, slight convex, regular margin, smooth surface, moist, metal gloss often appeared.
MacConkey agar medium	Brilliant pink or pale red, deep pink at center of the colony, circular, flat, regular margin, smooth surface, moist.

(2) Coliform Use 3 tubes each containing an appropriate amount of Bile salt lactose fermentation culture medium (not less than 10 ml), respectively add 1 ml of 1∶10 (containing 0.1 g or 0.1 ml of the product), 1∶100 (containing 0.01 g or 0.01 ml of the product), 1∶1000 (containing 0.001 g or 0.001 ml of the product) dilutions. Add 1 ml of diluting solution to another tube as the negative control. Incubate for 18-24 hours.

The product passes the test if no microbial growth occurs, or no gas bubbles or acid forms. If the formation of acid and gas bubbles is observed, inoculate the cultures on Eosin methylene blue agar medium plate or MacConkey agar medium plate, and incubate for 18-24 hours.

If no growth of micro-organisms occurs on the plate, or the appearance of the microbial colonies does not match the descriptions in Table 2, or the colonies are not gram-negative bacilli, the product passes the test. If the morphology of the colonies matches the descriptions in Table 2, and they are gram-negative bacilli without spores, confirm the result by suitable biochemical tests.

Table 2 Morphologic characteristics of coliform colonies.

Culture medium	Characteristic colonial morphology
Eosin methylene blue agar medium	Purple black, or purple red, circular, slight convex, regular margin, smooth surface, moist.
MacConkey agar medium	Brilliant pink or pale red, circular, flat, regular margin, smooth surface, moist.

Validation test Choose 4-5 suspect colonies from the plate, individually inoculate in tubes containing bile salt lactose culture medium, and incubate for 24-48 hours. The formation of acid and gas bubbles indicates the presence of coliform. Otherwise, absence coliform in the product.

According to the number of coliform-positive tubes, and Table 3, record the probable number of coliform 1 g or 1 ml of the product.

Table 3 Probable number of coliform.

Result of each quantity of product			Probable number of coliform N(per g or ml)
0.1 g or 0.1 ml	0.01 g or 0.01 ml	0.001 g or 0.001 ml	
+	+	+	$N>10^3$
+	+	−	$10^2<N<10^3$
+	−	−	$10<N<10^2$
−	−	−	$N<10$

Note: + represents coliform is detected, and-not detected.

(3) *Salmonella species* Inoculate 10 g or 10 ml of the product to be examined to an appropriate amount (not less than 200 ml) of Nutrient broth culture medium directly or after appropriate treatment, mix well with a homogenizer or other devices, and incubate for 18-24 hours.

Inoculate 1 ml of the culture above to 10 ml Sodium tetrathionate brilliant green culture medium, incubate for 18-24 hours. Then streak the cultures on the surface of Bile salt sulfur milk agar culture medium (or Salmonella and Shigella agar medium) and MacConkey agar medium (or Eosin methylene blue agar) plates separately, incubate for 18-24

hours (or 40-48 hours if necessary). If no bacterial growth occurs on the plate, or the morphology of the colonies does not conform to the descriptions in Table 4, *Salmonella* is absence in the product to be tested.
If the morphology of the colonies conforms to or is similar to the description in Table 4, choose 2-3 colonies and transfer to Triple sugar iron agar culture medium slant with a inoculating needle, using surface and deep inoculation. Incubate for 18-24 hours. If red colour on the surface and yellow colour at the bottom, or yellow on the surface and black at the bottom is not observed, *Salmonella* is absence in the product to be tested. Otherwise, confirm the presence of *Salmonella* by carrying out suitable biochemical and Serum agglutination tests with the cultures on triple sugar iron agar culture medium slant.

Table 4 Morphologic characteristics of Salmonella colonies.

Culture medium	Characteristic colonial morphology
Bile salt sulfur lactose agar	Colourless to pale orange, semitransparent, black at the center or whole black or no black
Salmonella and *Shigella* agar medium	Colourless to pale red, semitransparent or opaque, black brown in the center of the colonies occasionally
Eosin methylene blue agar medium	Colourless to pale orange colour, transparent or semitransparent, smooth moist circular colonies
MacConkey agar medium	Colourless to pale orange colour, transparent or semitransparent, dark in the center occasionally

(4) *Pseudomonas aeruginosa* Inoculate 10 ml of the test solution (equivalent to 1 g, 1 ml or 10 cm^2 of the product) to an appropriate amount (not less than 100 ml) of Bile salt lactose culture medium, incubate for 18-24 hours. Then streak the cultures on the surface of Cetyl trimethylammonium bromide agar culture plate, and incubate for 18-24 hours. *Pseudomonas aeruginosa* colonies are typically flat, irregular, diffusing margin, moist surface, greyish white, occasionally surrounded by bluish green zone. If no bacterial growth occurs on the plate, or the morphology of the colonies does not conform to the above descriptions, *Pseudomonas aeruginosa* is absence in the product to be tested. If the growth colonies reveal the above characters, choose 2-3 colonies, inoculate separately on Nutrient agar culture slant, incubate for 18-24 hours. Use the slant cultures for Gram's staining, microscopical examination, and oxidase test.

Oxidase test Place a piece of clean filter paper in a Petri dish, spread the slant cultures on the filter paper with a sterile glass bar, add dropwise freshly prepared 1% *N*, *N*-dimethyl-*p*-phenylenediamine dihydrochloride test solution. The oxidase test is positive if the cultures appear pink and then turn into purplish red within 30 seconds. Otherwise, the test is negative.
If the slant cultures are not Gram-negative bacilli, or the oxidase test is negative, *Pseudomonas aeruginosa* is absence in the product to be tested. Otherwise, carry out the pyocyanin test.

Pyocyanin test Inoculate the slant cultures onto PDP agar culture slant, and incubate for 24 hours. Then add 3-5 ml of chloroform to the test tube, agitate the medium and shake thoroughly. Allow to stand for a while, then transfer the chloroform layer to a new tube, add about 1 ml of 1 mol/L hydrochloric acid solution, allow to stand for a moment following shaking, observe the phenomenon. If the solution appears pink, the pyocyanin test is positive; or otherwise, negative. Use un-inoculated PDP agar culture slant as the negative control. The negative control is pyocyanin-negative.
If the bacteria in question are Gram-negative bacilli, and are oxidase test positive and pyocyanin test positive, *Pseudomonas aeruginosa* is presence in the product to be examined. If the bacteria in question are Gram-negative bacilli, and are oxidase test positive and pyocyanin test negative, proceed the test by carrying out suitable biochemical tests to confirm whether they are *Pseudomonas aeruginosa*.

(5) *Staphylococcus aureus* Inoculate 10 ml of the test solution (equivalent to 1 g, 1 ml or 10 cm^2 of the product) to an appropriate amount (not less than 100 ml) of Sodium tellurite broth culture medium (or Nutrient broth culture medium) directly or after appropriate treatment, incubate for 18-24 hours (48 hours if necessary). Then streak the cultures on the surface of Egg yolk high salt agar culture medium plate or Mannitol high salt agar culture medium plate, incubate for 24-72 hours. If no bacterial growth occurs on the plate, or the morphology of the colonies does not conform to the descriptions in Table 5, *Staphylococcus aureus* is absence in the product in question.

Table 5 Morphologic characteristics of Staphylococcus aureus colonies

Culture medium	Characteristic colonial morphology
Mannitol high salt agar culture medium	Golden yellow, circular convex, regular margin, yellow outer circle, colony diameter 0.7-1 mm.
Egg yolk high salt agar culture medium	Golden yellow, circular convex, regular margin, opaque outer circle due to lecithin degradation, colony diameter 1-2 mm.

If the morphology of the colonies conforms to or is similar to the description in Table 5, choose 2-3 colonies and inoculate onto Nutrient agar culture medium slant, and incubate for 18-24 hours. Take the obtained cultures for Gram's staining. And inoculate the cultures in Nutrient broth culture medium, and incubate for 18-24 hours, then carry out the coagulase test.

Coagulase test Use 3 sterile tubes, add 0.5 ml of (1 : 1) mixture of plasma and sterile water in each tube, then respectively add 0.5 ml of nutrient broth cultures of the suspect bacteria (or concentrated bacterial suspension prepared from the nutrient agar slant cultures), 0.5 ml of nutrient broth cultures of *Staphylococcus aureus* (or concentrated bacterial suspension prepared from the nutrient agar slant cultures), and 0.5 ml of Nutrient broth culture medium or 0.9% sterile sodium chloride solution, which are testing tube, positive tube, and negative tube, respectively. Incubate the 3 tubes together. Examine the tubes at 3 hours and subsequently at suitable intervals up to 24 hours. The plasma in the negative tube maintains fluidity, and the plasma coagulates in the positive tube. If the plasma in the testing tube coagulates, the coagulase test is positive, or otherwise, negative. If the result of positive or negative tube does not conform to the above description, repeat the test.
If the suspect bacteria are not Gram-positive cocci, and the coagulase test is negative, *Staphylococcus aureus* is absence in the product to be tested.

(6) *Clostridium* Take two equal portions (10 ml, equivalent to 1 g or 1 ml of the product) of the sample solution. Heat one portion at 80℃ for 10 minutes and cool rapidly. Do not heat the other portion. Inoculate the test solutions above to 100 ml of Chopped meat culture medium directly or after appropriate treatment separately. Incubate under anaerobic conditions for 72-96 hours. If no turbidity,

gas bubbles, beef digestion, or bad smells form in the testing tube, *Clostridium* is absent in the product being examined. Otherwise, spread 0.2 ml of the cultures onto the surface of columbia agar culture medium plate to which gentamicin has been added, and incubate under anaerobic conditions for 48-72 hours. If no microbial growth occurs on the plate, *Clostridium* is absent in the product to be tested. If colonies are observed on the plate, select 2-3 colonies and carry out Gram's staining test and catalase test.

Catalase test Put the colonies from the plate above onto clean glass slices, add dropwise 3% hydrogen peroxide solution. If gas bubbles appear on the colony surface, the catalase test is positive, or otherwise, negative.

If the suspect colonies are Gram-positive *Clostridium*, with or without oval or round spores, and catalase test is negative, *Clostridium* is presence in the product being examined. Or otherwise, *Clostridium* is absence.

Evaluation of results

If specified micro-organisms or other pathogenic micro-organisms are detected in one single test, the product does not pass the test. The test needs not repetition.

If any count of bacteria, of fungi, or of yeasts does not comply with the requirements, take samples at random from the same batch, and carry out two more independent repetitive tests. Report the average value from three determinations as the final result.

If fungi and yeasts are detected in eye preparations, the product being examined passes the test for fungi and yeasts count only if micro-organisms are not detected in two more repetitive tests.

If results of bacteria, fungi and yeasts count, as well as the test for specified micro-organisms meet the specified requirements for the product being examined, the product passes the test. If the result of bacteria, fungi and yeasts count, or the result for the test for specified micro-organisms does not comply with the specified requirements for the product being examined, the product does not pass the test.

Diluting solutions

The diluting solutions are sterilized by validated sterilization methods after preparation.

1. pH 7.0 sterile sodium chloride-peptone buffer solution

Prepare the solution as described under the Test for Sterility (Append XIII B)

2. pH 6.8 sterile phosphate buffer solution, pH 7.6 sterile phosphate buffer solution

Prepare the solution as described under Appendix XV D, filter, dispense in containers, and sterilize.

If necessary, add surfactants or neutralizing solutions before or after the sterilization.

3. 0.9% sterile sodium chloride solution

Transter 9.0 g sodium chloride, dissolve in 1000 ml water, filter, dispense in containers, and sterilize.

Culture media

The media may be prepared as described below, or their dehydrated formulations may be used. The media should be Sterilized using a validated process.

1. Nutrient agar culture medium, nutrient broth culture medium, fluid thioglycollate medium, modified Martin medium, and modified Martin agar medium

Prepare the media as described under the Test for Sterility (Appendix XIII B).

2. Sodium rose bengal agar medium

Peptone	5.0 g
Glucose	10.0 g
Potassium dihydrogen phosphate (KH_2PO_4)	1.0 g
Magnessium sulfate ($MgSO_4 \cdot 7H_2O$)	0.5 g
Sodium tetrachloro-tetraiodo-fluorescein	0.0133 g
Agar	14.0 g
water	1000 ml

Mix the above ingredients in water except glucose and sodium tetrachloro-tetraiodo-fluorescein, heat until dissoved, filter, and then add glucose and sodium tetrachloro-tetraiodo-fluorescein, Dispense in containers and sterilize.

3. Yeast extracts peptone glucose agar medium (YPD)

peptone	10.0 g
Yeast extracts	5.0 g
Glucose	20.0 g
agar	14.0 g
water	1000 ml

Mix the above ingredients in water except glucose, heat until dissolved, filter, and then add glucose, Dispense in containers and sterilize.

4. Bile salts lactose medium (BL)

peptone	20.0 g
lactose	5.0 g
Sodium chloride	5.0 g
Dipotassium hydrogen phosphate (K_2HPO_4)	4.0 g
Potassium dihydrogen phosphate (KH_2PO_4)	1.3 g
Ox bile salts (or sodium desoxycholate 0.5 g)	2.0 g
water	1000 ml

Mix the above ingredients in water except lactose and ox bile salts (or sodium desoxycholate), heat until dissolved, adjust the pH so that after sterilization it is 7.4 ± 0.2, boiling. Filter, add lactose and ox bile salts (or sodium desoxycholate), dispense in containers and sterilize.

5. Bile salts lactose fermentation medium

Add 0.04% bromocresol purple indicator to the un-sterilized bile salts lactose medium, dispense in suitable tubes containing inverted tubule, and sterilize.

6. Eosin methylene blue agar medium (EMB)

Nutrient agar medium	100 ml
2% eosin solution	2 ml
20% lactose solution	5 ml
0.5% methylene blue solution	1.3-1.6 ml

Melt the nutrient agar medium by heating, cool to 60℃, add aseptically the other three solutions, shake thoroughly, and pour into Petri dishes.

7. MacConkey agar medium (MacC)

Peptone	20.0 g
Sodium chloride	5.0 g
lactose	10.0 g
1% neutral red solution	3.0 ml
Ox bile salts	5.0 g
Agar	14.0 g
water	1000 ml

Mix peptone and sodium chloride in water, heat until dissoved, adjust the pH so that after sterilization it is 7.2 ± 0.2. Add agar, heat to melt, then add the other ingredients. Shake thoroughly, dispense in containers, and sterilize. Cool to 60℃, and pour into the Petri dishes.

8. 4-methylumbelliferyl-β-D-glucuronide (MUG) culture medium

peptone	10.0 g
Manganese sulfate	0.5 mg
Zinc sulfate	0.5 mg
Magnesium sulfate	0.1 g
Sodium chloride	5.0 g
Calcium chloride	50 mg
Potassium dihydrogen phosphate (anhydrous)	0.9 g
Disodium hydrogen phosphate (anhydrous)	6.2 g
Sodium sulfite	40 mg

Sodium desoxycholate	1.0 g
MUG	75 mg
water	1000 ml

Mix the above ingredients in water except MUG, heat until dissolved, adjust the pH so that after sterilization it is 7.3±0.1, add MUG, dissolve, dispense 5 ml of the medium to each tube and sterilize.

9. Triple sugar iron agar medium (TSI)

Peptone	20.0 g
glucose	1.0 g
Beef extract powder	5.0 g
Sodium chloride	5.0 g
lactose	10.0 g
sucrose	10.0 g
Ferrous sulfate	0.2 g
Sodium thiosulfate	0.2 g
0.2% phenosulfonphthalein solution	12.5 ml
agar	12.0 g
water	1000 ml

Mix peptone, beef extracts powder, sodium chloride, ferrous sulfate and sodium thiosulfate, dissolve in water heat until dissolved, adjust the pH so that after sterilization it is 7.3±0.1. Add agar, heat to melt, then add the other ingredients. Shake thoroughly, dispense in containers, and sterilize. Make short slants (2-3 cm) after the media cool.

10. Sodium tetrathionate brilliant green medium (TTB)

Peptone	5.0 g
Calcium carbonate	10.0 g
Ox bile salts	1.0 g
Sodium thiosulfate	30.0 g
water	1000 ml

Dissolve the above ingredients in water heat until dissolved, and sterilize.

Just prior to use, add 0.2 ml iodine test solution and 0.1 ml brilliant green test solution to 10 ml of the medium, and shake thoroughly.

11. Salmonella and Shigella agar culture medium (SS)

peptone	5.0 g
Sodium citrate	8.5 g
0.1% Brilliant green solution	0.33 ml
Beef extract powder	5.0 g
Ammonium ferrous citrate	1.0 g
lactose	10.0 g
Sodium thiosulfate	8.5 g
Ox bile salts	8.5 g
1% neutral red solution	2.5 ml
agar	16.0 g
water	1000 ml

Mix the above ingredients in water except lactose, neutral red solution and agar, heat until dissolved, adjust the pH so that after sterilization it is 7.2±0.1. Filter, add agar and heat to melt. Then add the other ingredients, shake thoroughly, sterilize, cool to 60℃, and pour into Petri dishes.

12. Bile salts sulfur lactose agar culture medium (DHL)

peptone	20.0 g
Beef extracts	3.0 g
lactose	10.0 g
sucrose	10.0 g
Sodium desoxycholate	1.0 g
Sodium thiosulfate	2.3 g
Sodium citrate	1.0 g
Ammonium ferrous citrate	1.0 g
1% neutral red solution	3 ml
agar	16.0 g
water	1000 ml

Mix the above ingredients in water except sugars, indicators and agar, heat until dissolved, adjust the pH so that after sterilization it is 7.2±0.1. Add agar and heat to melt. Then add the other ingredients, shake thoroughly, sterilize, cool to 60℃, and pour into Petri dishes.

13. Cetrimide agar medium

peptone	10.0 g
Beef extracts powder	3.0 g
Sodium chloride	5.0 g
Cetyl trimethyl ammonium bromide	0.3 g
agar	14.0 g
water	1000 ml

Mix the above ingredients in water except agar, heat until dissolved, adjust the pH so that after sterilization it is 7.2±0.1. Add agar and heat it to melt, shake thoroughly. Dispense in containers, sterilize, cool to 60℃, and pour into Petri dishes.

14. Tellurite broth medium

Just prior to use, add 0.2 ml of freshly prepared 1% sodium (or potassium) tellurite solution, mix well.

15. Egg yolk high salts agar medium

peptone	6.0 g
Beef extracts	1.8 g
Sodium chloride	30.0 g
10% sodium chloride egg yolk solution	100 ml
agar	16.0-18.0 g
water	650 ml

Mix the above ingredients in water except 10% sodium chloride egg yolk solution, heat until dissolved, adjust the pH so that after sterilization it is 7.6±0.1. Sterilize and cool to 60℃. Add aseptically 10% sodium chloride egg yolk solution, shake thoroughly, and pour into Petri dishes.

16. Mannitol high salts agar medium

peptone	10.0 g
Beef extracts	1.0 g
mannitol	10.0 g
Sodium chloride	75.0 g
1% phenolsulfonphthalein solution	2.5 ml
agar	14.0 g
water	1000 ml

Mix the above ingredients in water except mannitol, phenolsulfonphthalein solution and agar, heat until dissolved, adjust the pH so that after sterilization it is 7.6±0.1, add agar and heat to melt. Filter and dispense in containers, sterilize and cool to 60℃, then pour into Petri dishes.

17. Lactose fermentation culture medium

peptone	20.0 g
Lactose	10.0 g
0.04% bromocresol purple indicator	25 ml
water	1000 ml

Mix the above ingredients in water except 0.04% bromocresol purple indicator, heat until dissolved, adjust the pH so that after sterilization it is 7.2±0.2, add the indicator, dispense in suitable tubes (3 ml per tube). Sterilize.

18. Pyocyanin culture medium

peptone	20.0 g
Magnesium chloride (anhydrous)	1.4 g
Potassium sulfate (anhydrous)	10.0 g
glycerol	10 ml
agar	14.0 g
water	1000 ml

Mix peptone, magnesium chloride and potassium sulfate, heat until dissolved, adjust the pH so that after sterilization it is 7.3±0.1, add glycerol and agar, heat to melt, shake thoroughly, dispense in suitable tubes and sterilize. Cool at room temperature to make slants.

19. Chopped meat culture medium

Preparation of the Beef bits. Use fresh beef, remove the fats and muscles, and boil for 10 minutes. Cut into pieces of 5 mm^3, add three folds (w/w) of distilled water, immerse in 4-10℃ water for 18-20 hours, then boil for 1 hour, filter through gauze. The residue is washed twice with water. Then put the beef bits into an appropriate amount of sodium hydroxide solution so that the pH is around 8.4, agitate thoroughly. Immerse the beef overnight, and discard the upper water the next day, and wash 2-3 times with water. Spread the beef on a tray, sterilize, and dry at 80-100℃, remove the powders, put into bottles, and keep away from moisture.

Preparation of chopped meat culture medium. Put the beef bits in suitable containers, add an appropriate amount of Nutrient broth medium so that the beef bits constitute 1.5% of the volume, adjust the pH so that after sterilization it is 7.3±0.1, sterilize.

20. Columbia agar culture medium

Pancreatic digest of casein	10.0 g
Pepsin digest of beef	5.0 g
Pancreatic digest of heart	3.0 g
Yeast extracts powder	5.0 g
Corn flour	1.0 g
Sodium chloride	5.0 g
agar	15.0 g
water	1000 ml

Mix the above ingredients in water except agar, heat until dissolved, adjust the pH so that after sterilization it is 7.3±0.2, add agar and heat to melt. Filter, dispense in containers and sterilize. Cool to 45-50℃, add sterile gentamicin sulfate (equivalent to 20 mg gentamicin), mix well, and pour into Petri dishes.

Microbial contamination limits of Pharmaceutical Preparations

The microbial contamination limits of non-sterile preparations is drawn by fully considering the drug administration routes, potential harm to the patients, and the special characteristics of Chinese meteria medica. Unless otherwise prescribed, Microbial limit test follows the criterion below in the manufacturing, storage and distribution of preparations, as well as in the establishment of new preparations standards, evaluation of imported preparations, and the quality control of preparations, extracts, and excipients.

1. Sterile preparations specified in General Notice or monographs, and other preparations labelled sterile

Comply with the test for Sterility.

2. Preparations for oral administration

2.1 Preparations not containing crude drugs

Bacteria count Not more than 1000 cfu per g, or 100 per ml.

Fungi and yeasts count Not more than 100 cfu per g or per ml.

E. coli. Absence in 1 g or 1 ml.

2.2 Preparations containing crude drugs

Bacteria count Not more than 10000 cfu per g (not more than 30000 per g for pills). Not more than 500 cfu per ml.

Fungi and yeasts count Not more than 100 cfu per g or per ml.

E. coli count Absence in 1 g or 1 ml.

Coliform count Less than 100 cfu per g, and less than 10 cfu per ml.

2.3 Preparations containing crude drugs with fermentation ingredients

Bacteria count Less than 100000 cfu per g. and less than 1000 cfu per ml.

Fungi and yeasts count Not more than 500 cfu per g, and not more than 100 cfu per ml.

E. col. Absence in 1 g or 1 ml.

Coliform count Less than 100 cfu per g, and less than 10 cfu per ml.

3. Preparations for local administration

3.1 Local administration preparations for surgery, burn or serious injury

Comply with the test for sterility.

3.2 Local administration preparations containing crude drugs used for incomplete skin or mucosa

Bacteria count Not more than 1000 cfu per g or per 10 cm^2, and not more than 100 cfu per ml.

Fungi and yeasts count Not more than 100 cfu per g, per ml or per 10 cm^2.

Staphylococcus aureus and *Pseudomonas aeruginosa* Absence in 1 g, 1 ml or 10 cm^2.

3.3 Local administration preparations containing crude drugs used for complete skin or mucosa

Bacteria count Not more than 10000 cfu per g or per 10 cm^2.

Fungi and yeasts count Not more than 100 cfu per g, per ml or per 10 cm^2.

Staphylococcus aureus and *Pseudomonas aeruginosa* Absence in 1 g, 1 ml or 10 cm^2.

3.4 Preparations for eye use

Bacteria count Not more than 10 cfu per g or per ml.

Fungi and yeasts count Absence in 1 g or 1 ml.

Staphylococcus aureus, *Pseudomonas aeruginosa* and *Escherichia coli* Absence in 1 g or 1 ml.

3.5 Preparations administered via ear, nose or respiratory tract

Bacteria count Not more than 100 cfu per g, per ml or per 10 cm^2.

Fungi and yeasts count Not more than 10 cfu per g, per ml or per 10 cm^2.

Staphylococcus aureus and *Pseudomonas aeruginosa* Absence in 1 g, 1 ml or 10 cm^2.

Escherichia coli. Absence in 1 g, 1 ml or 10 cm^2 for preparations for nose and respiratory tract administration.

3.6 Preparations for vagina and urethra use

Bacteria count Not more than 100 cfu per g or per ml.

Fungi and yeasts count Less than 10 cfu per g or per ml.

Staphylococcus aureus, *Pseudomonas aeruginosa* and *Clostridium* Absence in 1 g or 1 ml.

3.7 Preparations for rectal administration

Bacteria count Not more than 1000 cfu per g, and not more than 100 cfu per ml.

Fungi and yeasts count Not more than 100 cfu per g or per ml.

Staphylococcus aureus, *Pseudomonas aeruginosa* and *Escherichia coli* Absence in 1 g or 1 ml.

3.8 Other preparations for local administration

Bacteria count Not more than 100 cfu per g, per ml or per 10 cm^2.

Fungi and yeasts count Not more than 100 cfu per g, per ml or per 10 cm^2.

Staphylococcus aureus and *Pseudomonas aeruginosa* Absence in 1 g, 1 ml or 10 cm^2.

4. Oral preparations containing animal tissues (including extracts) and crude drugs of animal origin (except honey, royal jelly, cornu and Colla Corii Asini)

Salmonella species are absence per 10 g or per 10 ml.

5. Preparations for more than one administration routes

Comply with the requirements for each administration route.

6. Extracts and excipients

Refer to the criterion for corresponding preparation.

XIII D Test for Bacterial Endotoxin

The test for bacterial endotoxins is used to detect or quantify endotoxins of gram-negative bacterial origin using TAL regent. It is used to determine the limit concentration of bacterial endotoxin in a preparation being examined.

Two method are used for this test: the gel-clot method and the photometric method. The latter includes a turbidimetric method and a chromogenic method. Proceed by any one of these two methods. In the event of doubt or dispute, the final decision is made based on the gel-clot method, unless otherwise indicated in the monograph.

The quantities of endotoxin are expressed in Endotoxin Units (EU).

The National Standard for Endotoxin (NSE) is prepared and purified from Escherichia coli. It is used only for calibration of the working standard for endotoxin (WSE) and for calibration and verifying the sensitivity of TAL reagents.

The working standard for endotoxin (WSE) of which the potency has been standardized against NSE in collaboration assay, is used for bacterial endotoxin test as positive control, for interference test and for sensitivity test of TAL reagent.

The water used in the gel-clot test for bacterial endotoxins is a sterile water for injection, of which quantities of bacterial endotoxins are less than 0.015 EU per ml. The quantities of bacterial endotoxins of water used in the photometric test are less than 0.005 EU per ml.

Depyrogenate all glassware and other heat-stable apparatus used in the test by heating in a hot-air oven at 250℃ for at least 60 minutes (or by any other validated suitable method) to eliminate extraneous endotoxin that may present. If employing plastic apparatus, such as microtitre plates and pipette tips for automatic pipetters, use apparatus shown to be free of detectable endotoxin and of interfering effects for the test. Avoid microbial contamination during the test.

Preparation of the test solutions Prepare the test solutions by dissolving or diluting active substances or medicinal products using water for bacterial endotoxins test (water for BET). Some substances or preparations may be more appropriately dissolved or diluted in other aqueous solutions. If necessary, adjust the pH of the test solution (or dilution thereof) so that the pH of the mixture of the TAL reagents and test solution falls within the pH range specified by the TAL reagents manufacturer. This usually applies to a product with a pH in the range of 6.0 to 8.0. The pH may be adjusted by the use of acid, base or a suitable buffer, as recommended by the TAL reagents manufacturer. Acids and bases may be prepared from concentrates or solids with water for BET in containers free of detectable endotoxin. Buffers must be validated to be free of detectable endotoxin and interfering factors.

Establishment of endotoxin limits The endotoxin limit (L) for drugs or biological products is usually defined as follows:

$$L=K/M$$

Where L is the endotoxin limit for active substances administered parenterally, which is specified in units such as EU/ml, EU/mg, or EU/Unit of biological activity;

K is the threshold human pyrogenic dose of endotoxin per kg of body weight in a single hour period, which is expressed as EU/(kg • h). For injections, K = 5 EU/(kg • h); for injections of radiopharmaceuticals, K = 2.5EU/(kg • h); and for intrathecal injections, K=0.2 EU/(kg • h);

M is equal to the maximum recommended human dose of product per kg of body weight in a single hour period, which is specified in units such as ml/(kg • h), mg/(kg • h), or U/(kg • h). Here the human average body weight is 60 kg; the injection period is calculated as 1 hour when the injection is completed within 1 hour.

The endotoxin limit calculated by human dose may be adjusted according to the situation of manufacture and clinical use if necessary. In that case, appropriate reasons for adjustment have to be submitted.

Determination of the Maximum Valid Dilution (MVD) The Maximum Valid Dilution (MVD) is the maximum allowable dilution of the substance being examined at which the endotoxin limit can be determined. Determine the MVD using the following formulae:

$$MVD=cL/\lambda$$

Where L is the endotoxin limit of the substance being examined;

c is the concentration of the substance being examined, when L is expressed as EU/ml, c is 1.0ml /ml; when L is expressed as EU/mg or EU/U, the unit of C is mg /ml or U/ml. Minimum valid dilution concentration, $c=\lambda/L$, may be calculated for drug substance or sterilized powders for injection when MVD is 1;

λ is the labelled sensitivity of TAL reagent in the gel-clot method (EU/ml) or the lowest point used in the standard curve of the turbidimetric or chromogenic method.

Gel-clot method (Method 1)

The gel-clot method detects or qualifies endotoxins based on clotting of the TAL reagent in the presence of endotoxins.

Test for confirmation of labelled TAL reagent sensitivity The labelled sensitivity of TAL reagent (EU/ml) is defined as the lowest concentration of endotoxin that is required to cause the TAL reagent to clot under the conditions specified in the following procedure. The test for confirmation of the labelled TAL reagent sensitivity is to be carried out when each new batch of TAL reagent is used or when there is any change in the experimental conditions which may affect the outcome of the test.

Dissolve NSE or CSE in water for BET according to the labelled sensitivity of TAL reagent (λ), mix for 15 minutes using a vortex mixer. Prepare four replicate series of two-fold dilutions of NSE or CSE using water for BET to produce 4 dilutions with concentration of 2.0 λ, 1.0 λ, 0.5 λ, 0.25 λ, mix each dilution for 30 seconds using a mixer. Use 18 tubes of 10 mm× 75 mm in size containing of 0.1 ml of TAL reagent or use 18 original ampoules of 0.1 ml of TAL reagent. Add 0.1 ml of each of 16 endotoxin standard solutions (four standard concentrations in quadruplicate) to each of 16 tubes, and 0.1 ml of water for BET to each of 2 tubes as negative control. Mix gently after each addition, cover the tubes tightly and incubate the tubes vertically at 37±1℃ for 60±2 minutes.

Take each tube in turn directly from the incubator and invert it through about 180° in one smooth motion to test the integrity of the gel. If a firm gel has formed that remains in place upon inversion, record the result as positive. A result is negative if an intact gel is not formed. Handle the tubes with care to avoid vibration, or false negative may result.

The test is not valid unless all the four tubes of highest concentration (2.0 λ) give positive results, all the four tubes of lowest concentration (0.25 λ) give negative results and the two tubes of negative control give negative results.

Calculate the geometric mean endpoint concentration, i. e. the measured sensitivity of the TAL reagent (λ_c), using the following expression:

$$\lambda_c = \lg^{-1} (\sum X/4)$$

Where X is the log endpoint concentration which is the last positive result in a series of decreasing concentrations of endotoxin.

If this λ_c is not less than 0.5 λ and not more than 2 λ, the labelled sensitivity (λ) is confirmed and is used in tests performed with this TAL reagent.

Test for interfering factors Prepare solutions A, B, C and D as shown in Table 1, and use the test solutions at a dilution less than the MVD, not containing any detectable endotoxins, operating as described under the *Test for confirmation of labelled TAL reagent sensitivity*.

The test is not valid unless all replicates of solutions A and D show no reaction and the result of solution C confirms the labelled TAL reagent sensitivity. The geometric mean endopoint concentrations of solutions B (E_t) and C (E_s) are determined using the following formulas.

$$E_s = \lg^{-1} (\sum X_s/4)$$
$$E_t = \lg^{-1} (\sum X_t/4)$$

Where X_s is the log endpoint concentration of the solution C. X_t is log endpoint concentration of the solution B.

If both E_s and E_t are not less than 0.5 λ and not more than 2 λ, the test solution does not contain interfering factors under the experimental conditions used. Otherwise, the solution interferes with the test. If the preparation being examined interferes with the test at a dilution less than the MVD, repeat the test for interfering factors using a greater dilution, not exceeding the MVD. The use of a more sensitive TAL regent permits a greater dilution of the preparation being examined and this may contribute to the elimination of interference.

Table 1 Preparation of solutions in the test for interfering factors by using gel-clot method

Solution	Endotoxin Concentration/Solution to which endotoxin is added	Diluent	Dilution factor	Initial endotoxin concentration	Number of replicates
A	None/Test solution	—	—	—	2
B	2 λ/Test solution	Test	1	2 λ	4
		solution	2	1 λ	4
			4	0.5 λ	4
			8	0.25 λ	4
C	2 λ/Water for BET	Water for	1	2 λ	4
		BET	2	1 λ	4
			4	0.5 λ	4
			8	0.25 λ	4
D	None/Water for BET	—	—	—	2

Solution A: solution of the preparation being examined that is free of detectable endotoxins.
Solution B: test for interference.
Solution C: control of the labelled TAL reagent sensitivity.
Solution D: negative contorl (water for BET).

Interference may be overcome by suitable treatment, such as filtration, neutralization, dialysis or heat treatment. To establish that the treatment chosen effectively eliminates interference without loss of endotoxins, repeat the test for interfering factors using the preparation being examined to which the standard endotoxin has been added and which has then been submitted to the chosen treatment.

When establish a method of bacterial endotoxin test for a new drug, the test for interfering factors should be carried out.

When the souce of the TAL reagent, or the formula or the manufacture process of the substance being examined are changed, or there is any change in the experimental conditions which may affect the outcome of the test, the test for interfering factors should be performed again.

Procedure

(1) Gel-clot limit test

Prepare solutions A, B, C and D as shown in Table 2, and perform the test following the procedure in the *Test for confirmation of labelled TAL reagent sensitivity*.

Table 2 Preparation of solutions in gel-clot limit test

Solution	Endotoxin Concentration/Solution to which endotoxin is added	Number of replicates
A	None/Diluted test solution	2
B	2 λ/Diluted test solution	2
C	2 λ/Water for BET	2
D	None/Water for BET	2

Solution A: solution of the preparation being examined
Solution B: positive product control
Solution C: positive control
Solution D: negative control

Prepare solution A and solution B (positive product control) using a test solution at the dilution of the MVD, with which *the Test for interfering factors* was completed.

Invaluation of results The test is not valid unless both replicates of the two positive control solutions B and C are positive and those of negative control solution D are negative.

The preparation being examined complies with the test when a negative result is found for both replicates of solution A.

The preparation being examined does not comply with the test when a positive result is found for both replicates of solution A. Repeat the test by 4 replicates of solution A when a positive result is found for one replicate of solution A and a negative result is found for the other. The preparation being examined complies with the test if a

negative result is found for all replicates of solution A in the repeat test.

(2) Gel-clot semi-quantitative test

The test quantifies bacterial endotoxins in the test solution by titration to an endpoint. Prepare solutions A, B, C and D as shown in Table 3, and perform the test following the procedure in the *Test for confirmation of labelled TAL reagent sensitivity*.

Table 3 Preparation of solutions in the gel-clot semi-quantitative test

Solution	Endotoxin Concentration/Solution to which endotoxin is added	Diluent	Dilution factor	Initial endotoxin concentration	Number of replicates
A	None/Test solution	Water for	1	—	2
		BET	2	—	2
			4	—	2
			8	—	2
B	2 λ/Test solution		1	2 λ	2
C	2 λ/Water for BET	Water for	1	2 λ	2
		BET	2	1 λ	2
			4	0.5 λ	2
			8	0.25 λ	2
D	None/Water for BET	—	—	—	2

Solution A: test solution at the dilution, not exceeding the MVD, with which the test for interference factors was carried out. Subsequent dilution of the test solution must not exceed the MVD. Use water for BET to make two dilution series of 1, 1/2, 1/4, and 1/8, relative to the dilution with which the test for interfering factors was carried out.
Solution B: solution A containing standard endotoxin at a concentration of 2 λ (positive product control).
Solution C: two series of water for BET containing the standard endotoxin at concentrations of 2 λ, λ, 0.5 λ, and 0.25 λ, repectively.
Solution D: negative control (water for BET).

Invaluation of results The test is not valid unless the following 3 conditions are met: (1) both replicates of solution D (negative control) are negative; (2) both replicates of solution B (positive product control) are positive; and (3) the geometric mean endpoint concentration of solution C is in the range of 0.5 λ to 2 λ.

To determine the endotoxin concentration of solution A, calculate the endpoint concentration for each replicate series of dilutions by multiplying each endpoint dilution factor by λ. The endotoxin concentration in the test solution is the geometric mean endpoint concentration of the replicates ($E=\lg^{-1}(\sum X/2)$). If the test is conducted with a diluted test solution, calculate the concentration of endotoxin in the original solution by multiplying the result by the dilution factor.

If none of the dilutions of the test solution is positive in a valid test, record the endotoxin concentration as less than λ (or, if a diluted sample was tested, as less than λ times the lowest dilution factor of the sample). If all dilutions are positive, the endotoxin concentration is recorded as equal to or greater than the greatest dilution factor multiplied by λ.

The preparation being examined meets the requirements of the test if the concentration of endotoxin is less than that specified in the individual monograph. Otherwise, the preparation being examined does not meet the requirements of the test.

Photometric method (Method 2)

The photometric method includes a turbidimetric method and a chromogenic method.

The turbidimetric method measures the endotoxin concentrations of test solutions based on the measurement of the increase in turbidity during the gel formation of the TAL reagent. Depending on the test principle used, this method is classified as being the endpoint-turbidimetric test or the kinetic-turbidimetric test. The endpoint-turbidimetric test is based on the quantitative relationship between the concentration of endotoxins and the turbidity (absorbance or transmission) of the reaction mixture at the end of an incubation period. The kinetic-turibidimetric test in a method to measure either the onset time needed for the reaction mixture to reach a predetermined absorbance, or the rate of turbidity development.

The chromogenic method measures the chromophore released from a suitable chromogenic peptide by the reaction of endotoxins with the TAL reagent. Depending on the test principle employed, this method is classified as being the endpoint-chromogenic test or the kinetic-chromogenic test. The endpoint-chromogenic test is based on the quantitative relationship between the concentration of endotoxins and the quantity of chromophore released at the end of an incubation period. The kinetic-chromogenic test is a method to measure either the onset time needed for the reaction mixture to reach a predetermined absorbance, or the rate of colour development.

All photometric tests are usually carried out by special instrumentation at the incubation temperature of 37±1℃.

The quantities and volume ratios of the substance being examined and the TAL reagent, incubation time etc. employed in the test are decided according to the related instructions of instruments and the TAL reagents.

To assure the precision or validity of the turbidimetric and chromogenic tests, preparatory tests are conducted to assure that the criteria for the standard curve are satisfied and that the test solution does not interfere with the test.

Assurance of criteria for the standard curve The test for assurance of criteria for the standard curve must be carried out when each new batch of TAL reagent is used or any changes are made to the experimental conditions that are likely to influence the result of the test.

Using the standard endotoxin solution, prepare at least three endotoxin concentrations (the dilution factor of adjacent concentrations is not greater than 10) to generate the standard curve within the range of endotoxin concentrations indicated by the TAL reagent manufacturer. The mixing time for every dilution is the same as that of gel-clot method. Perform the test using at least three replicates of each standard endotoxin solution, and duplicate of negative control solution at the same time. When both reaction times of the duplicate of negative control solution are greater than that of the lowest concentration, perform statistic analysis of linear regression for all the data.

The test is not valid unless the absolute value of the correlation coefficient, $|r|$, is greater than or equal to 0.980, otherwise repeat the test.

Test for interfering factors Select an endotoxin concentration (λ_m) at or near the middle of the endotoxin standard curve. Prepare solutions A, B, C and D as shown in Table 4.

Table 4 Preparation of solutions in the test for interfering factors by using photometric method

Solution	Endotoxin Concentration	Solution to which Endotoxin is Added	Number of Replicates
A	None	Test solution	not less than 2
B	Middle concentration(λ_m)of the standard curve	Test solution	not less than 2
C	At least 3 concentrations (lowest concentration, λ, is designated)	Water for BET	each not less than 2
D	None	Water for BET	not less than 2

Solution A: test solution, that may be diluted not to exceed the MVD.
Solution B: preparation to be examined at the same dilution as Solution A, containing added endotoxin at a concentration equal to or near the middle of the standard curve.
Solution C: standard endotoxin solution at the concentrations used in the validation of the method described in *Assurance of criteria for the standard curve*.
Solution D: water for (negative control) BET.

Calculate the content of endotoxin contained in the solution A (C_t) and solution B (C_s) respectively, and calculate the recovery of the endotoxin added to solution B as followes:

$$R=[(C_s-C_t)/\lambda_m]\times 100\%$$

If under the conditions of the test, the recovery of the endotoxin added to solution B is within 50% to 200%, the test solution is considered to be free of interfering factors.
When the endotoxin recovery is out of the specified ranges, the interfering factors must be removed as described in the *Test for interfering factors* under *Gel-Clot Techniques*. The efficiency of the treatment is verified by repeating the test for interfering factors.
When the souce of the TAL reagent, or the origin, formula and the manufacture process of the substance being examined are changed, or there is any change in the experimental conditions which may affect the outcome of the test, the *Test for interfering factors* should be performed again.

Procedure
Follow the procedure described in the *Test for interfering factors* under *Photometric method*.
Calculate the endotoxin concentration of each replicate of solution A using the standard curve generated by the series of positive controls, solution C.
The test is not valid unless the following 3 requirements are met:
(1) the results obtained with the series of positive controls, solution C, comply with the requirements for validation defined in the *Assurance of criteria for the standard curve* under *Photometric method*;
(2) the endotoxin recovery, calculated from the concentration found in solution B after subtracting the endotoxin concentration found in solution A, is within the range of 50% to 200%;
(3) both reaction times of the solution D (negative control) are greater than that of the lowest concentration of the endotoxin standard curve.

Invaluation of results The preparation being examined complies with the test if the mean endotoxin concentration of the replicates of solution A, after correction for dilution and concentration, is less than the endotoxin limit for the product. Otherwise, the preparation being examined does not meet the requirements of the test.

Note In this chapter, the term "tube" includes all types of receptacles such as micro-titer plate wells.

Appendix XIV Water for Pharmaceutical Purposes

Water for Pharmaceutical Purposes is used as a solvent or a diluent for the cleaning, processing and extraction of Chinese crude drugs or for the formulation and administration of preparations during the manufacture and usage of traditional Chinese Patent Medicines and Simple Preparations; and is used for cleaning pharmaceutical manufacture equipment as well. Water for Pharmaceutical Purposes in this pharmacopoeia includes Drinking Water, Purified Water, Water for Injections and Sterile Water for Injections. Suitable type of Water for Pharmaceutical Purposes should be selected generally according to its procedures of production or the purposes and requirements of usage. Natural water should not be used as Water for Pharmaceutical Purposes.

Drinking Water Drinking Water is obtained by purifying natural water. The quality of Drinking Water complies with the national standard of the People's Republic of China (GB 5749—85 "Hygienic Standard of Living Drinking Water"). Drinking Water is used in the rinsing of the cleaning and processing of Chinese crude drugs and in the primary stages of the cleaning of pharmaceutical manufacture equipment. Unless specified otherwise, it is also used as a solvent for the extraction of Chinese crude drugs in ordinary preparations for oral administration or external application. Drinking Water should not be used for the extraction of Chinese crude drugs in sterile preparations such as injections and eye drops of traditional Chinese medicines.

Purified Water Purified Water is Water for Pharmaceutical Purposes prepared from Drinking Water by distillation, by ion exchange, by reverse osmosis or by other suitable methods. The quality of Purified Water complies with the requirements described under Purified Water in Volume Ⅱ. Purified Water should not contain any additive. It is used as a solvent for the extraction of Chinese crude drugs in sterile preparations such as injections of traditional Chinese medicines and eye drops, a solvent or a diluent for the formulation of preparations for oral administration or external application, and water for the thorough cleaning of apparatus for none-sterile preparations. It can also be used as a solvent for the extraction of Chinese crude drugs in none-sterile preparations, if necessary. Purified Water should not be used for the preparation and dilution of injections.

The procedure of production of purified water should be monitored strictly to avoid the microbial contamination. Purified Water should generally be freshly prepared before use when used as a solvent, a diluent or water for thorough cleaning.

Water for Injections Water for Injections is Water for Pharmaceutical Purposes obtained by distilling Purified Water. The quality of Water for Injections complies with the requirements described under Water for Injection in Volume Ⅱ.

Water for Injections is used as a solvent or a diluent for the preparation of injections, an aqueous phase of fatty emulsions for intravenous administration and water fot the thorough cleaning of containers of injections. To ensure the quality of Water for Injections, the links in the production chain of distillation should be monitored constantly, and the manufacture and transferring device should be cleaned and sterilized regularly. Qualified Water for Injection is collected, generally preserved under sterile conditions and used within 12 hours after preparation.

Sterile Water for Injections Sterile Water for Injections is prepared from water for injection according to the technological conditions under which injections are prepared. The quality of Sterile Water for Injection complies with the requirements described under Sterile Water for Injection in Volume Ⅱ.

Sterile Water for Injection is mainly used as a solvent for sterile powder for injections or a diluent for injections. Sterile Water for Injection should be packaged in suitable amount to meet the requirements of the clinical use and avoid the contamination caused by a large amount and frequent usage.

Appendix XV

XV A Reagents

Reagents are substances used for various assays and tests described in the Pharmacopoeia. However, adsorbents, supports and packing materials used in chromatography are not included. With the exception of biochemical reagents and indicators, chemical reagents are classified into 4 grades: primary standard, guaranteed reagent, analytical pure and chemical pure. The following rules may be followed in choosing the grade of reagent for different purpose.
(1) Primary standard should be used for standardization of volumetric solutions.
(2) Reagents of "analytical pure" or "chemical pure" grade may be used for the preparation of volumetric solutions, but in case of the concentration of the solution is determined according to the weight of the solute without standardization. In such cases, "primary standard" should be used.
(3) "Guaranteed reagents" or "analytical pure" grade should be used for the preparation of standard solutions used for limit tests of impurities.
(4) Reagents of "analytical pure" or "chemical pure" grade may be used for the preparation of test solutions and buffer solutions, etc.

Acacia White or Slightly yellow granules or powder. Freely soluble in water and forms viscous liquid; insoluble in ethanol.

Acetaldehyde [CH_3CHO 44.05]
A clear, colourless; volatile; inflammable; liquid; odour, stiling; easily oxidized into acetic acid; polymerized to form turbidity or sediment after long storage.
Miscible with water, ethanol, chloroform or ether.

Acetic Acid [$C_2H_4O_2$ 60.05]
A clear, colourless liquid; it contains 36%-37% of $C_2H_4O_2$ (g/g).
Miscible with water, ethanol or ether; insoluble in carbon disulfide.

Acetic Acid, Glacial [CH_3COOH 60.05]
A clear, colourless liquid; odour, irritant; corrosive; solidifies to icy crystal below its congealing point (16.7℃).
Miscible with water or ethanol.

Acetic Anhydride [$(CH_3CO)_2O$ 102.09]
A clear, colourless liquid.
Miscible with chloroform, ether or glacial acetic acid; soluble in water to form acetic acid; soluble in ethanol to form ethyl acetate.

Acetone [CH_3COCH_3 58.08]
A clear, colourless liquid; odour, characteristic; highly volatile; inflammable.
Soluble in water or ethanol.

Acetonitrile [CH_3CN 41.05]
A clear, colourless liquid; odour, slightly ether-like, inflammable.
Miscible with water or ethanol.

Acetylacetone [$CH_3COCH_2COCH_3$ 100.12]
A colourless or pale yellow liquid with slightly acetone and acetic acid odour; inflammable.
Miscible with water, ethanol, ether or chloroform.

Acetyl Chloride [CH_3COCl 78.50]
A colourless fumy liquid; odour, pungent; inflammable; highly irritant to skin, mucous membrane; decomposes vigorously in water or ethanol.
Soluble in chloroform, ether, benzene, or petroleum ether glacial acetic acid.

Activated Charcoal (Active Carbon) [C 12.01]
A black fine powder odourless, tasteless; having high adsorptive capacity for organic pigment and nitrogenous base.
Insoluble in any solvents.

Agar Complies with the requirements prescribed in the monograph of the Chinese Pharmacopoeia.

Agarose
White or pale yellow granules or powder; hygroscopic.
Soluble in hot water.

Ethanol, Aldehyde Free
Dissolve 2.5 g of lead acetate in a stoppered conical flask, with 5 ml of water, then add 1000 ml of ethanol, mix well, slowly add 25 ml of alcoholic potassium hydroxide solution (1→5), allow to stand for 1 hour, shake vigorously, allow to stand for 12 hours, decant the supernatant liquid and distil.
Introduce 25 ml of the distillate to a conical flask, add 75 ml of dinitrophenyl hydrazine TS, heat under reflux for 24 hours in a water bath, evaporate to expel ethanol, add 200 ml of 2% (ml/ml) solution of sulfuric acid, allow to stand for 24 hours, no sediment or crystal is produced.

Aluminium Hydroxide [$Al(OH)_3$ 78.00]
A white powder; odourless.
Soluble in hydrochloric acid, sulfuric acid or sodium hydroxide; insoluble in water or ethanol.

Aluminium Nitrate [$Al(NO_3)_3 \cdot 9H_2O$ 375.13]
White crystals; hygroscopic; induces combustion and explosion when heated with organic substances.
Freely soluble in water and ethanol; slightly soluble in acetone; insoluble in ethyl acetate or pyridine.

Aluminium Oxide [Al_2O_3 101.96]
A white powder; tasteless; hygroscopic.
Soluble in sulfuric acid; slowly soluble in aqueous sodium hydroxide solution with the formation of hydroxides; insoluble in water, ethanol or ether.

Aluminium Trichloride [$AlCl_3$ 133.34]
White or pale yellow crystals or a crystalline powder; odour, characteristic of hydrochloric acid; fuming on exposure to air; liberation of much heat or even explosion occurs in contact with water; hygroscopic; corrosive.

Soluble in water or ether.

4-Aminoantipyrine [$C_{11}H_{13}N_3O$ 203.24]
Pale yellow crystals.
Soluble in water, ethanol or benzene; slightly soluble in ether.

***p*-Aminobenzoic Acid** [$C_7H_7NO_2$ 137.14]
White crystals; turns pale yellow on exposure to air or to light.
Freely soluble in boiling water, ethanol, ether or acetic acid; very slightly soluble in water.

Ammonia [NH_3 17.03]
Obtained by heating ammonium salt (ammonium chloride) with strong base (calcium hydroxide), or heating concentrated ammonia solution then the gas is dried with calcium oxide.
Colourless; odour, characteristic of ammonia; liquefying at −33℃, congealing to colourless crystals at −78℃.
Very soluble in water with the liberation of much heat.

Ammonium Acetate [$NH_4C_2H_3O_2$ 77.08]
White granules or crystals; hygroscopic.
Soluble in water or ethanol; slightly soluble in acetone.

Ammonium Carbonate
A mixture of ammonium bicarbonate and ammonium carbonate; white transparent mass or powder; odour, ammonia-like.
Soluble in water, decomposes in hot water; insoluble in ethanol or concentrated ammonia solution.

Ammonium Chloride [NH_4Cl 53.49]
White crystals or a crystalline powder.
Soluble in water or glycerin; slightly soluble in ethanol.

Ammonium Molybdate [$(NH_4)_6Mo_7O_{24}\cdot 4H_2O$ 1235.86]
Colourless or pale yellowish-green crystals.
Soluble in water or ethanol.

Ammonium Nitrate [NH_4NO_3 80.04]
White, transparent crystals or a white powder.
Freely soluble in water; slightly soluble in ethanol.

Ammonium Oxalate [$(NH_4)_2C_2O_4\cdot H_2O$ 142.11]
White crystals; decompose on heating.
Soluble in water; slightly soluble in ethanol.

Ammonium Persulfate [$(NH_4)_2S_2O_8$ 228.20]
White, transparent crystals or powder; odourless; strong oxidizing agent.
Freely soluble in water.

Ammonium Reineckate [$NH_4Cr(NH_3)_2(SCN)_4\cdot H_2O$ 354.45]
Red or deep red crystals; decompose in aqueous solution with formation of a blue colour and liberate hydrogen cyanide.
Soluble in hot water and in alcohol; slightly soluble in water.

Ammonium Sulfate [$(NH_4)_2SO_4$ 132.14]
White crystals or granules.
Soluble in water; insoluble in ethanol or in acetone.

Ammonium Thiocyanate [NH_4SCN 76.12]
White crystals.
Freely soluble in water and ethanol; soluble in methanol and acetone; practically insoluble in chloroform or ethyl acetate.

Ammonium Vanadate [NH_4VO_3 116.98]
A white or slightly yellow crystalline powder.
Freely soluble in hot water or dilute ammonia solution; slightly soluble in cold water; insoluble in ethanol.

Amyl Acetate [$CH_3COOC_5H_{11}$ 130.19]
A clear, colourless liquid; odour, fruit-like; inflammable.
Miscible with ethanol or ether; slightly soluble in water.

Aniline [$C_6H_5NH_2$ 93.13]
A colourless or pale yellow, clear oily liquid; odour, characteristic; it turns brown gradually on exposure to light and air; inflammable.
Miscible with ethanol, ether or benzene; slightly soluble in water.

Anisaldehyde [$C_8H_8O_2$ 136.15]
A colourless or pale yellow oily liquid.
Miscible with ethanol or ether; slightly soluble in water.

Anthrone [$C_{14}H_{10}O$ 194.23]
White crystals.
Soluble in ethanol, benzene or hot sodium hydroxide solution; insoluble in water.

Antimony Trichloride [$SbCl_3$ 228.11]
White crystals; fuming on exposure to air; hygroscopic; corrosive.
Soluble in ethanol, acetone, ether or benzene; soluble in water and produces sediment of antimony hydroxide.

Arnebia
Complies with the requirements prescribed in the monograph of the Chinese Pharmacopoeia.

Arsenic Trioxide [As_2O_3 197.84]
A white crystalline powder; odourless; tasteless; when slowly heated, sublimes but does not decompose.
Soluble in hot water, sodium hydroxide solution or sodium carbonate solution; slightly soluble in cold water; practically insoluble in ethanol, chloroform or ether.

Ascorbic Acid (Vitamin C) [$C_6H_8O_6$ 176.13]
White crystals or a crystalline powder; odourless; taste, sour; darkens gradually on exposure to light. Very soluble in water and the aqueous solution exhibits acid reaction; sparingly soluble in ethanol; insoluble in chloroform or ether.

Auric Chloride [$HAuCl_4\cdot 3H_2O$ 393.83]
Bright yellow or orange crystals.
Soluble in water, ethanol or ether; slightly soluble in chloroform.

Barium Hydroxide [$Ba(OH)_2\cdot 8H_2O$ 315.46]
White crystals; absorbs carbon dioxide easily to form barium carbonate.
Freely soluble in water; slightly soluble in ethanol.

Barium Nitrate [$Ba(NO_3)_2$ 261.34]
White crystals or crystalline powder; burns and detonates when being in contact, rubbing or bumping with organic substances.
Soluble in water; slightly soluble in ethanol.

Benzalkonium Chloride A white or pale yellow powder or gelatinous flakes.
Very soluble in water, ethanol or acetone; slightly soluble in benzene; practically insoluble in ether.

Benzene [C_6H_6 78.11]
A colourless clear liquid; odour, characteristic; inflammable.
Miscible with ethanol, ether, acetone, carbon tetrachloride, carbon disulfide or acetic acid; slightly soluble in water.

Benzidine [$H_2NC_6H_4C_6H_4NH_2$ 184.24]
A white or faintly red crystalline powder; darkens on exposure to air and light.
Freely soluble in boiling ethanol; sparingly soluble in ether; slightly soluble in boiling water; very slightly soluble in cold water.

Benzidine Acetate [$C_{14}H_{16}N_2O_2$ 244.29]
White or pale yellow crystals or powder.
Soluble in water, acetic acid or hydrochloric acid; very

slightly soluble in ethanol.

Benzoic Acid [C_6H_5COOH 122.12]
Complies with the requirements prescribed in monograph of the Chinese Pharmacopoeia.

Benzoquinone [$C_6H_4O_2$ 108.10]
Yellow crystals; odour, characteristic; sublimable.
Soluble in ethanol or ether; slightly soluble in water.

Bismuth Subnitrate [$4BiNO_3(OH)_2 \cdot BiO(OH)$ 1461.99]
A white powder; heavy; odourless; tasteless; slightly hygroscopic.
Soluble in hydrochloric acid, nitric acid, dilute sulfuric acid or acetic acid; practically insoluble in water or ethanol.

Borax [$NaB_4O_7 \cdot 10H_2O$ 381.37]
White crystals or granules; hard.
Soluble in water and glycerin; insoluble in ethanol or acid.

Boric Acid [H_3BO_3 61.83]
White transparent crystals or a crystalline powder; with pear-like luster.
Freely soluble in hot water, hot ethanol or hot glycerin; soluble in water or ethanol; slightly soluble in acetone or ether.

Brilliant Green [$C_{27}H_{33}N_2 \cdot HSO_4$ 482.64]
Lustrous golden crystals.
Soluble in water or ethanol, the colour of solution is green.

Bromine [Br_2 159.81]
A deep red liquid; odour, asphyxiating irritant; fuming; freely volatile.
Miscible with ethanol, chloroform, ether, benzene or carbon disulfide; slightly soluble in water.

Bromocresol Green [$C_{21}H_{14}Br_4O_5S$ 698.02]
A pale yellow or brown powder.
Soluble in ethanol or dilute alkaline solution; insoluble in water.

Bromocresol Purple [$C_{21}H_{16}Br_2O_5S$ 540.23]
A pale yellow or pale red crystalline powder.
Soluble in ethanol or dilute alkaline solution; insoluble in water.

Bromophenol Blue [$C_{19}H_{10}Br_4O_5S$ 669.97]
A yellow powder.
Soluble in ethanol, ether, benzene or dilute alkaline solution; slightly soluble in water.

Bromothymol Blue [$C_{27}H_{28}Br_2O_5S$ 624.39]
A white or pale red crystalline powder.
Freely soluble in ethanol, dilute alkaline solution or ammonia solution; slightly soluble in water.

Butanol (*n*-Butanol) [$CH_3(CH_2)_3OH$ 74.12]
A clear, colourless liquid; odour, characteristic; inflammable; highly refractive.
Miscible with ethanol, ether or benzene; soluble in water.
Boiling point: 117-118℃.

Butanone [$CH_3COC_2H_5$ 72.11]
A colourless liquid; freely volatile; inflammable; azeotropic with water; acutely irritant to mucous membrane of nose and eyes.
Miscible with ethanol or ether.

Butyl Acetate [$CH_3COO(CH_2)_3CH_3$ 116.16]
A clear, colourless liquid.
Miscible with ethanol or ether; insoluble in water.

Caffeine [$C_8H_{10}N_4O_2 \cdot H_2O$ 212.21]
White or yellowish-green needle crystals with silky luster; odourless; taste bitter; efflorescent.
Freely soluble in hot water or chloroform; sparingly soluble in water, ethanol or acetone; slightly soluble in ether.

Calcein [$C_{30}H_{24}N_2Na_2O_{13}$ 666.51]
A bright yellow powder.
Soluble in water; insoluble in dehydrated ethanol or ether.

Calcium Carbonate [$CaCO_3$ 100.09]
A white crystalline powder.
Soluble in acid; insoluble in water and ethanol.

Calcium Chloride [$CaCl_2 \cdot 2H_2O$ 147.01]
White granules or lumps; hygroscopic.
Freely soluble in water or ethanol.

Calcium Chloride Anhydrous [$CaCl_2$ 110.99]
White granules or fused masses; highly hygroscopic.
Freely soluble in water or ethanol; liberates much heat when dissolved in water.

Calcium Fluoride [CaF_2 78.08]
A white powder or cubic crystals; luminous when heated.
Soluble in concentrated mineral acids to liberate hydrogen-fluoride; insoluble in water.

Calcium Hydroxide [$Ca(OH)_2$ 74.09]
A white crystalline powder; absorbs carbon dioxide easily to form calcium carbonate.
Slightly soluble in water.

Calcium Orthophosphate [$Ca_3(PO_4)_2$ 310.20]
A white amphorous powder; odourless, tasteless.
Stable in air, decomposive in hot water. Soluble in dilute hydrochloric acid or nitric acid; practically insoluble in water, ethanol or acetic acid.

Calcium Sulfate [$CaSO_4 \cdot 2H_2O$ 172.17]
A white crystalline powder.
Soluble in solutions of ammonium salts, sodium thiosulfate, sodium chloride or acids; insoluble in water or ethanol.

Calcon [$C_{20}H_{13}N_2NaO_5S$ 416.39]
A brown or brownish-black powder.
Soluble in water or ethanol.

Camphor [$C_{10}H_6O$ 152.24]
A white crystalline powder or colourless translucent hard solid, easily reduced to fine powder after adding a little ethanol, chloroform or ether; odour, pungent; taste, pungent then cool and refreshing; easily volatilizes at normal temperature, burns with black fume and luminous flame.
Very soluble in chloroform; freely soluble in ethanol, ether, fatty oil or volatile oil; very slightly soluble in water.

Camphor oil
Natural oil with strong odour of camphor.
Soluble in ether or chloroform; insoluble in ethanol.

Carbon Disulfide [CS_2 76.14]
A clear, colourless liquid; inflammable; the pure substance has an ether-like odour; the usual commercial grade has a foul smell; decomposes on standing for a long time.
Freely soluble in ethanol or ether; insoluble in water, it can dissolve iodine, bromine, sulphur, fat, rubber etc.
Boiling point: 46.5℃.

Carbon Tetrachloride [CCl_4 153.82]
A clear, colourless liquid; odour, characteristic; heavy.
Miscible with ethanol, chloroform, ether or benzene; very slightly soluble in water.

Casein
A white or pale yellow granular powder; odourless.
Insoluble in water or other neutral solvent; freely soluble in solutions of alkali hydroxide.

Catechol [$C_6H_6O_2$ 110.11]
Colourless or greyish crystals or a crystalline powder; volatilizes with steam.
Freely soluble in water, ethanol or benzene.

Ceric Ammonium Nitrate [$(NH_4)_2Ce(NO_3)_6$ 548.22]
Reddish-orange crystals; strong oxidizing agent.
Soluble in water or ethanol; insoluble in concentrated nitric acid.

Ceric Ammonium Sulfate [$(NH_4)_4Ce(SO_4)_4 \cdot 2H_2O$ 633]
A yellow or orange-yellow crystalline powder.
Soluble in solutions of acid; slightly soluble in water; insoluble in acetic acid.

Ceric Sulfate [$Ce(SO_4)_2$ 332.24]
Deep yellow crystals.
Soluble in hot acid solution; slightly soluble in water, decomposes with the formation of basic salt.

Cetrimonium Bromide [$C_{16}H_{33}N(CH_3)_3Br$ 364.45]
A white crystalline powder.
Soluble in water; slightly soluble in ethanol; insoluble in ether.

Chloral Hydrate [$C_2H_3Cl_3O_2$ 165.40]
White crystals; odour, pungent; irritant to skin; volatilizes on exposure to air; turns to yellow after long time storage.
Soluble in ethanol, chloroform or ether; soluble in water with hydrolysis.

Chloramine T [$C_7H_7ClNNaO_2S \cdot 3H_2O$ 281.69]
A white crystalline powder; odour, faintly chlorine-like.
Soluble in water; insoluble in chloroform or benzene.

Chlorinated Lime (Bleaching powder)
Complies with the requirements prescribed in monograph of the Chinese Pharmacopoeia.

Chlorine [Cl 35.45]
Obtained by the action of hydrochloric acid manganese dioxide.
Yellowish-green gas; odour, strong suffocating.
Freely soluble in carbon disulfide and carbon tetrachloride; soluble in water and alkaline solution.

Chloroform [$CHCl_3$ 119.38]
A colourless, clear liquid; heavy; refractive; volatilizes easily.
Miscible with ethanol, ether, benzene or petroleum benzin; slightly soluble in water.

Chloroplatinic Acid [$PtH_2Cl_6 \cdot 6H_2O$ 517.90]
Orange-red crystal. Soluble in water, ethanol and ether.

Chlorosulfonic Acid [SO_2ClOH 116.52]
A colourless or slightly yellow liquid; corrosive and strongly irritant; fuming in air; explosive when dripped into water; decomposes to sulfuric acid and hydrochloric acid in water.

Cholesterol [$C_{27}H_{46}O$ 386.66]
Monohydrate of cholesterol is white or pale yellow laminar crystals; anhydrous cholesterol is obtained at 70-80℃; it turns to yellow on exposure to air.
Soluble in benzene, petroleum benzin or vegetable oil; slightly soluble in ethanol; practically insoluble in water.

Chromic Acid [H_2CrO_4 118.01]
An aqueous solution of chromium trioxide.

Chromium Trioxide [CrO_3 99.99]
Dark red crystals; powerful oxidizing agent and corrosive; hygroscopic; may cause fire in contact with organic substances.
Freely soluble in water; soluble in sulfuric acid.

Chromotropic Acid [$C_{10}H_8O_8S_2 \cdot 2H_2O$ 356.33]
White crystals.
Soluble in water.

Citric Acid [$C_6H_8O_7 \cdot H_2O$ 210.14]
White crystals or granules; efflorescent; hygroscopic.
Freely soluble in water or ethanol.

Cobaltous Acetate [$CO(C_2H_3O_2)_2 \cdot 4H_2O$ 249.08]
Violet-red crystals.
Soluble in water, ethanol, dilute acid or amyl acetate.

Cobaltous Chloride [$CoCl_2 \cdot 6H_2O$ 237.93]
Red or purplish-red crystals.
Freely soluble in water or ethanol; soluble in acetone; slightly soluble in ether.

Cobaltous Nitrate [$Co(NO_3)_2 \cdot 6H_2O$ 291.03]
White crystals or crystalline granules.
Freely soluble in water or ethanol; slightly soluble in acetone or ammonia solution.

Concentrated Ammonia Solution (Strong ammonia solution) [NH_4OH 35.05]
A colourless, clear liquid; corrosive; contains 25%-28% (g/g) of NH_3.
Miscible with ethanol or ether.

Congo Red [$C_{32}H_{22}N_6Na_2O_6S_2$ 696.68]
A reddish-brown powder.
Soluble in water or ethanol.

Coomassie Brilliant Blue G 250 [$C_{47}H_{48}N_3NaO_7S_2$ 854.04]
A violet crystalline powder.
Soluble in hot water or ethanol; slightly soluble in water.

Coomassie Brilliant Blue R 250 [$C_{45}H_{44}N_3NaO_7S_2$ 825.99]
A violet powder.
Soluble in hot water or ethanol; insoluble in water.

***O*-Cresol** [$CH_3C_6H_4OH$ 108.14]
A colourless liquid or crystal; odour, phenolic; corrosive and poisonous; changes into brown gradually on exposure to air and light.
Soluble in ethanol, ether or chloroform; slightly soluble in water.

Crystal Violet [$C_{25}H_{30}ClN_3$ 407.99]
A dull green powder with metallic luster.
Soluble in water, ethanol or chloroform; insoluble in ether.

Copper [Cu 63.55]
Red brown slices, granules, crumbs or powder; lustrous; stable under dry air and room temperature, produces basic salts on exposure to moist air for a long time.
Freely soluble in hot sulfuric or nitric acid; soluble in ammonia solution and produces complex salt.

Cupric Acetate [$Cu(C_2H_3O_2)_2 \cdot H_2O$ 199.65]
Dark green crystals.
Soluble in water or ethanol; slightly soluble in ether or glycerin.

Cupric Carbonate, Basic [$CuCO_3 \cdot Cu(OH)_2$ 221.12]
A green or blue amorphous powder or greyish-green crystal; poisonous.
Soluble in dilute acid or ammonia solution; insoluble in water or ethanol.

Cupric Chloride [$CuCl_2 \cdot 2H_2O$ 170.48]
Pale Bluish-green crystals.
Soluble in water, ethanol or methanol; slightly soluble in acetone or ethyl acetate.

Cupric Nitrate [$Cu(NO_3)_2 \cdot 3H_2O$ 241.60]
Blue, columnar crystals; burns and detonates when heated, rubbed or bumped with pulverized carbon, sulphur or other combustible substances.
Soluble in water or ethanol.

Cupric Sulfate [$CuSO_4 \cdot 5H_2O$ 249.69]
Blue crystals, granules or crystalline powder.
Soluble in water; slightly soluble in ethanol.

Cupric Sulfate, Anhydrous [$CuSO_4$ 159.61]

Greyish-white or greenish-white crystals or an amorphous powder; hygroscopic.
Soluble in water; practically insoluble in ethanol.

Curcuma Powder (Turmeric Powder)
A powder of the rhizome of *Cureuma longa* L. (Fam. Gingiberaceae), containing 5% volatile oil, yellow curcumin, starch and resin.

Cyclohexane [C_6H_{12} 84.16]
A colourless, clear liquid; inflammable.
Miscible with methanol, ethanol, acetone, ether, benzene or carbon tetrachloride; practically insoluble in water.
Boiling point: 80.7℃.

Cyclohexanone [$C_6H_{10}O$ 98.14]
A colourless oily liquid; odour resembling peppermint or acetone; its vapour mixed with air is explosive.
Miscible with ethanol or ether; slightly soluble in water.

L-Cystine [$C_6H_{12}N_2O_4S_2$ 240.30]
White crystals.
Soluble in acid or alkali solution; practically insoluble in water or ethanol.

Dextrin
Complies with the requirements prescribed in monograph of the Chinese Pharmacopoeia.

Diammonium Hydrogen Citrate [$(NH_4)_2HC_6H_5O$ 226.19]
A colourless tiny crystal or white granule.
Soluble in water; slightly soluble in ethanol.

Diammonium Hydrogen Phosphate [$(NH_4)_2HPO_4$ 132.06]
White crystals or a crystalline powder.
It loses ammonia on exposure to air and turns into ammonium dihydrogen phosphate.
Soluble in water; insoluble in ethanol.

***O*-Dianisidine** [$(CH_3OC_6H_3NH_2)_2$ 244.9]
White crystals.
Soluble in ethanol, ether or benzene; insoluble in water.

Dichloromethane [CH_2Cl_2 84.93]
A colourless liquid; odour, ether-like.
Miscible with ethanol, ether or dimethylformamide; sparingly soluble in water.
Boiling point 40-41℃.

2,6-Dichloroquinone Chlorimide [$C_6H_2Cl_3NO$ 210.45]
A greyish-yellow crystalline powder.
Freely soluble in chloroform or ether; soluble in hot ethanol or dilute sodium hydroxide solution; insoluble in water.

Diethylamine [$(C_2H_5)_2NH$ 73.14]
A colourless liquid; volatile; inflammable; odour, ammonia like; strongly alkaline, corrosive.
Miscible with water or ethanol.

Digitonin [$C_{56}H_{92}O_{29}$ 1229.33]
White crystals.
Sparingly soluble in dehydrated ethanol; slightly soluble in ethanol; practically insoluble in water, chloroform or ether.

***p*-dimethylaminobenzaldehyde** [$C_9H_{11}NO$ 149.19]
White or pale yellow crystals; odour, characteristic; gradually turns to red on exposure to light.
Soluble in ethanol, acetone, chloroform, ether or acetic acid; slightly soluble in water.

Dimethylformamide [$HCON(CH_3)_2$ 73.09]
A colourless liquid with slightly ammonia odour.
Miscible with water, ethanol, chloroform or ether.

Dimethylsulfoxide [$(CH_3)_2SO$ 78.14]
A colourless, viscous liquid; very hygroscopic; taste, slightly bitter; violent reaction occurs in contact with chlorine at room temperature.
Soluble in water, ethanol, acetone, chloroform, ether or Benzene.

***m*-Dinitrobenzene** [$C_6H_4(NO_2)_2$ 168.11]
A pale yellow crystal; inflammable.
Freely soluble in chloroform, ethyl acetate or benzene; soluble in ethanol; slightly soluble in water.

3,5-Dinitrobenzoic Acid [$C_7H_4N_2O_6$ 212.12]
White or pale yellow crystals; volatilizes with steam.
Freely soluble in ethanol or glacial acetic acid; soluble in water, benzene or carbon disulfide.

2,4-Dinitrochlorobenzene [$C_6H_3ClN_2O_4$ 202.55]
Yellow crystals. It may cause explosion when heated to high temperature.
Freely soluble in hot ethanol; soluble in ether, benzene or carbon disulfide; insoluble in water.

2,4-Dinitrophenylhydrazine [$C_6H_6H_4O_4$ 198.14]
A red crystalline powder; stable in acid solution, unstable in alkaline solution.
Soluble in hot ethanol, ethyl acetate, aniline or dilute mineral acids; slightly soluble in water and ethanol.

Dioxane [$C_4H_8O_2$ 88.11]
A colourless liquid; inflammable; odour ether-like; freely absorbs oxygen to form peroxide.
Miscible with water or most of organic solvents.
Boiling range: 100-103℃.

Diphenylamine [$(C_6H_5)_2NH$ 169.23]
White crystals, odour, aromatic; gradually discolours on exposure to light.
Soluble in ether, benzene, glacial acetic acid or carbon disulfide; insoluble in water.

Diphenylcarbazide [$C_6H_5NHNHCONHNHC_6H_5$ 242.28]
A white, crystalline powder; gradually turns to red in air.
Soluble in hot ethanol, acetone or glacial acetic acid; very slightly soluble in water.

Dipotassium Hydrogen Phosphate [K_2HPO_4 174.18]
White granules or a crystalline powder.
Freely soluble in water; slightly soluble in ethanol.

Disodium Edetate [$C_{10}H_{14}N_2Na_2O_8 \cdot 2H_2O$ 372.24]
A white crystalline powder.
Soluble in water; very slightly soluble in ethanol.

Disodium Hydrogen Phosphate [$Na_2HPO_4 \cdot 12H_2O$ 358.14]
White crystals or a granular powder; efflorescent.
Soluble in water; insoluble in ethanol.

Disodium Hydrogen Phosphate, Anhydrous [Na_2HPO_4 141.96]
A white crystalline powder; hygroscopic; it can absorb 2-7 mol of water on exposure to air for a long time.
Freely soluble in water; insoluble in ethanol.

Distilled Water, Ammonia Free
To 1000 ml of distilled water add 1 ml of dilute sulfuric acid and 1 ml of potassium permanganate TS, distil.
To 50 ml of the distillate add 1 ml of alkaline mercuric potassium iodide TS, no colour is produced.

Dithizone [$C_6H_5NHNHCSNNC_6H_5$ 256.33]
A bluish-black crystalline powder.
Soluble in chloroform or carbon tetrachloride; insoluble in water.

Eosin Sodium [$C_{20}H_6Br_4Na_2O_5$ 691.86]
A red powder.
Freely soluble in water; an aqueous solution exhibits a red fluorescence; slightly soluble in ethanol; insoluble in ether.

Eriochrome Black T [$C_{20}H_{12}N_3NaO_7S$ 461.39]
A brownish-black powder.

Soluble in water or ethanol.

Ethanol [C_2H_5OH 46.07]
Complies with the requirements prescribed in monograph of the Chinese Pharmacopoeia.

Ethanol Dehydrated [C_2H_5OH 46.07]
A clear, colourless liquid; odour, alcoholic; it contains not more than 0.3% of water.
Miscible with water, acetone or ether.
Boiling Point: 78.5℃.

Ether [$C_2H_5OC_2H_5$ 74.12]
A clear, colourless liquid; taste, paralysing sweet and astringent; freely volatile; inflammable; anaesthetic; oxidized to peroxide on exposure to light or on long storage.

Ether Dehydrated [$(C_2H_5)_2 \cdot O$ 74.12]
As described under Ether, but its water content is less than that of Ether.

Ethyl Acetate [$CH_3COOC_2H_5$ 88.11]
A clear, colourless liquid.
Miscible with acetone, chloroform or ether; soluble in water.

Ethyl Formate [$HCOOC_2H_5$ 74.08]
A mobile, flammable liquid; irritant to skin and mucous membranes; anaesthetic in high dosage.
Miscible with ethanol or ether; soluble in about 10 parts of water and gradually decomposes into formic acid and ethanol.

Ferric Ammonium Sulfate [$FeNH_4(SO_4)_2 \cdot 12H_2O$ 482.20]
White to pale violet crystals.
Soluble in water; insoluble in ethanol.

Ferric chloride [$FeCl_3 \cdot 6H_2O$ 270.30]
Brownish-yellow or orange-yellow crystals; highly hygroscopic.
Freely soluble in water, ethanol, acetone, ether or glycerin.

Ferrous Sulfate [$FeSO_4 \cdot 7H_2O$ 278.02]
Pale blue crystals or granules.
Soluble in water; insoluble in ethanol.

Fluorescein [$C_{20}H_{12}O_5$ 332.11]
An orange or red powder.
Soluble in hot ethanol, glacial acetic acid; in sodium carbonate solution or sodium hydroxide solution; insoluble in water, chloroform or benzene.

Formaldehyde Solution [HCHO 30.03]
A colourless liquid; odour, pungent; it becomes muddy with polymerization when cooled. Slowly oxidized to formic acid on exposure to air. It contains about 37% of HCHO.
Miscible with water or ethanol.

Formamide [$HCONH_2$ 45.04]
A colourless, slightly viscous liquid with faint odour of ammonia; hygroscopic; irritant.
Miscible with water or ethanol.

Formic Acid [HCOOH 46.03]
A clear, colourless liquid; odour, pungent; corrosive to skin. It contains not less than 85% of HCOOH.
Miscible with water, ethanol, ether or glycerin.

Formic Acid, Anhydrous [HCOOH 46.03]
A clear, colourless liquid; odour, pungent; highly corrosive; strongly acidic; it contains not less than 98% of HCOOH.
Miscible with water, ethanol or ether.

Fuchsin Basic
Dark green crystals with metallic lustre.
Soluble in water or ethanol; insoluble in ether.

Furfural [$C_5H_4O_2$ 96.09]
A colourless or pale yellow oily liquid; easily turns to brown on exposure to air or light.
Miscible with water, ethanol or ether.

Gallic Acid [$C_7H_6O_5 \cdot H_2O$ 188.14]
White or pale brown crystals or a powder.
Soluble in hot water, ethanol or ether; insoluble in chloroform or benzene.

Gelatin
Pale yellow to yellow, translucent and faintly lustrous granules or thin sheets; odourless. Easily decomposed by microorganisms when moistened. Swell and softens when immersed in water for a long duration, its weight increases gradually five to ten times due to the absorption of water.
Soluble in hot water, acetic acid or a hot mixture of glycerol and water; insoluble in ethanol, chloroform or ether.

Glucose [$C_6H_{12}O_6 \cdot H_2O$ 198.17]
Complies with the requirements prescribed in monograph of the Chinese Pharmacopoeia.

Glycerin (Glycerol) [$C_3H_8O_3$ 92.09]
A clear, colourless, viscous liquid; odourless; taste, sweet; hygroscopic.
Miscible with water or ethanol.

Heptane [C_7H_{16} 100.20]
A colourless, clear liquid, inflammable.
Miscible with ethanol, chloroform or ether; insoluble in water. Boiling point: 98.4℃.

***n*-Hexane** [C_8H_{14} 86.18]
A clear, colourless liquid; odour, characteristic; highly volatile; irritant to respiratory tract.
Miscible with ethanol or ether, insoluble in water.
Boiling point: 69℃.

Holmium Oxide [Ho_2O_3 377.86]
Yellow solid; slightly hygroscopic; dissolves in acid with formation of a yellow salt.
Freely soluble in water.

Hydrazine Sulfate [$(NH_2)_2 \cdot H_2SO_4$ 130.12]
White crystals or powder.
Freely soluble in hot water; slightly soluble in water or ethanol.

Hydroiodic Acid [HI 127.91]
Solution of hydrogen iodide, colourless; on exposure to air and light quickly produces iodine and coloured from yellow to brown; corrosive; odour, strongly pungent.
Miscible with water or ethanol.

Hydrochloric Acid [HCl 36.46]
A colourless, clear liquid; odour, pungent and characteristic; corrosive; fuming on exposure to air. It contains 36%-38% (g/g) of HCl.
Miscible with water or ethanol.

Hydrofluoric Acid [HF 20.01]
A colourless, fuming liquid; odour, pungent; highly corrosive to metal or glass.
Miscible with water or ethanol.

Hydrogen Peroxide Solution (30%) [H_2O_2 34.01]
A colourless, clear liquid; strong oxidizing agent and corrosive.
Miscible with water or ethanol.

Hydroquinone [$C_6H_4(OH)_2$ 110.11]
White or almost white crystals; discoloured on exposure to light.
Freely soluble in hot water, soluble in water, ethanol or ether.

Hydroxylamine Hydrochloride [$NH_2OH \cdot HCl$ 69.49]
White crystals; decomposes easily when moistened, corrosive.

Soluble in water, ethanol or glycerin.

5-Hydroxymethyl Furfural [$C_6H_6O_3$ 126.11]
A needle crystal.
Freely soluble in methanol, ethanol, acetone, ethyl acetate and water; soluble in benzene, chloroform and ether; difficult to resolve in petroleum ether.

Iodine [I_2 253.81]
Purplish-black scale crystals or masses with metallic lustre.
Soluble in ethanol, ether or solution of potassium iodide; very slightly soluble in water.

Iodine Monochloride [ICl 162.36]
A brownish-red, oily liquid or dark-red crystals; strongly irritant; with odour of chlorine and iodine; corrosive and oxidative.

Iodine Trichloride [ICl_3 233.26]
Yellow or pale brown crystals; odour strongly pungent; volatile at room temperature; readily decomposes in contact with water; hygroscopic; corrosive.
Soluble in water, ethanol, ether or benzene.

Iron [Fe 55.85]
A silky grey, or greyish black amorphous powder; easily oxidized on exposure to moist air.
Soluble in dilute acid; insoluble in concentrated acid and dilute alkaline solution.

Isatin [$C_8H_5NO_2$ 147.13]
Dark red crystals or a crystalling powder; taste, bitter; sublimable.
Soluble in ether or boiling water; freely soluble in boiling ethanol; practically insoluble in cold water.

Isoamyl Acetate [$CH_3COOCH_2CH_2CH(CH_3)_2$ 130.19]
A clear, colourless liquid; odour, characteristic resembling that of banana.
Miscible with ethyl acetate, ethanol, amyl alcohol, ether, benzene or carbon disulfide; very slightly soluble in water.

Isobutanol [$(CH_3)_2CHCH_2OH$ 74.12]
A colourless, clear liquid; strongly refractive; inflammable.
Missible with water, ethanol or ether.
Boiling range: 107.3-108.3℃.

Isobutyl Acetate [$CH_3COOCH_2CH(CH_3)_2$ 116.16]
A colourless liquid; inflammable.
Miscible with ethanol or ether; insoluble in water.

Isooctane
See Trimethylpentane.

Isopentanol [$(CH_3)_2CHCH_2CH_2OH$ 88.15]
A colourless liquid; odour, characteristic; inflammable.
Miscible with organic solvent; slightly soluble in water.

Isopropanol [$(CH_3)_2CHOH$ 60.10]
A colourless, clear liquid; odour, characteristic; taste, slightly bitter.
Miscible with water, ethanol or ether.
Boiling range: 82.0-83.0℃.

Isopropyl Ether [$C_6H_{14}O$ 102.18]
A colourless, clear liquid; inflammable.
Miscible with ethanol, ether, chloroform or benzene; slightly soluble in water.

Kerosene, Refined
A colourless or pale yellow oily liquid; odour, characteristic.
Miscible with chloroform, benzene or carbon disulfate; insoluble in water or ethanol.
Wash 300 ml of commercial kerosene with 20 ml of crude sulfuric acid in a 500 ml separator for 4-5 times, until the acid layer is pale black, separate the kerosene layer and wash with water. Then wash it with 20 ml of sodium hydroxide solution (1→5), wash it with water and dehydrate with anhydrous, calcium chloride, transfer it into a distilling flask, distil under an air condenser on a sand bath. Collect the distillate in the range of 160-250℃.

Kieselguhr
A white or almost white powder; strongly adsorptive powder and good filter medium.
Insoluble in water, acid or alkali solution.

Lactic acid [$CH_3CH(OH)COOH$ 90.08]
Complies with the requirements prescribed in monograph of the Chinese Pharmacopoeia.

Lactose [$C_{12}H_{22}O_{11} \cdot H_2O$ 360.31]
White crystalline granules or a crystalline powder; odourless; taste, slightly sweet. Freely soluble in water; insoluble in ethanol, chloroform of ether.

Lead Acetate [$Pb(C_2H_3O_2)_2 \cdot 3H_2O$ 379.34]
White crystals or a powder.
Freely soluble in water or glycerin; soluble in ethanol.

Lead Monoxide [PbO 233.20]
A yellow to brownish-yellow powder or crystals.
At 300-500℃, it converts into Pb_3O_4, but at higher temperature reverts to PbO.
Soluble in hot solution of sodium hydroxide, acetic acid or dilute nitric acid.

Lead Nitrate [$Pb(NO_3)_2$ 331.21]
White crystals; burns and detonates when in contact, rubbed or bumped with organic substances.
Soluble in water; slightly soluble in ethanol.

Liquid paraffin
A colourless oily liquid; almost odourless; tasteless.
Soluble in benzene, ether or chloroform; insoluble in water or ethanol.

Litmus
A blue powder or mass.
Partly soluble in water or ethanol.

Lithium Sulfate [$Li_2SO_4 \cdot H_2O$ 127.96]
White crystalline powder. Soluble in water, insoluble in ethanol.

Magnesium [Mg 24.31]
A silky white powder with metallic lustre.
Soluble in acid; insoluble in water.

Magnesium Acetate [$(CH_3COO)_2Mg$ 142.39]
White crystals; Hygroscopic.
Freely soluble in water or ethanol.

Magnesium Chloride [$MgCl_2 \cdot 6H_2O$ 203.30]
White crystals or a powder; hygroscopic.
Soluble in water or ethanol.

Magnesium Oxide [MgO 40.30]
A white very fine powder; odourless; easily absorbs water and carbon dioxide on exposure to air, produces magnesium hydroxide with water.
Soluble in dilute acid; very slightly soluble in pure water; insoluble in ethanol.

Magnesium Sulfate [$MgSO_4 \cdot 7H_2O$ 246.48]
White crystals or a powder; efflorescent.
Freely soluble in water; slowly soluble in glycerin; slightly soluble in ethanol.

Malonic Acid [$C_3H_4O_4$ 104.06]
White transparent crystals; strongly irritant.
Soluble in water, methanol, ethanol, ether or pyridine.

Maltose [$C_{12}H_{22}O_{11}$ 342.30]
White crystals (β-type); odour, sweet.

Freely soluble in water; slightly soluble in ethanol; insoluble in ether.
Specific rotation: $[\alpha]_D^{20}$ +125°-+137°.

Manganese Dioxide [MnO_2 86.94]
Black crystals or a powder. It can cause burning or explosion when heated or rubbed with organic substances or other oxidizable substances.
Insoluble in water, nitric acid or cold sulfuric acid; soluble in nitric acid or dilute sulfuric acid in presence of hydrogen peroxide or oxalic acid.

Manganese Sulfate [$MnSO_4 \cdot H_2O$ 169.02]
Pink crystals.
Soluble in water; insoluble in ethanol.

Mannitol [$C_6H_{14}O_6$ 182.17]
White crystals; odourless; taste, sweet.
Soluble in water; slightly soluble in ethanol.

Mercuric Acetate [$Hg(C_2H_3O_2)_2$ 318.68]
White crystals or a powder; odour, resembling acetic acid.
Soluble in water or ethanol.

Mercuric Bromide [$HgBr_2$ 360.40]
White crystals or a crystalline powder.
Freely soluble in hot ethanol, hydrochloric acid, hydrobromic acid or solution of potassium bromide; slightly soluble in chloroform or ether.

Mercuric Chloride [$HgCl_2$ 271.50]
White crystals or a crystalline powder, slightly volatile at room temperature. It decomposes to mercurous chloride on exposure to light.
Soluble in water, ethanol, acetone or ether.

Mercuric Nitrate [$Hg(NO_3)_2 \cdot H_2O$ 342.62]
A white or slightly yellow crystalline powder, with an odour of nitric acid; hygroscopic.
Freely soluble in water or dilute acid; a precipitate of basic salt is formed in a large amount of water or boiling water.

Mercuric Oxide, Yellow [HgO 216.59]
A yellow or orange powder; heavy; darkens gradually on exposure to light.
Freely soluble in dilute sulfuric acid, dilute hydrochloric acid or dilute nitric acid; insoluble in water, ethanol, acetone or ether.

Mercuric Sulfate [$HgSO_4$ 296.65]
White granules or a crystalline powder.
Soluble in hydrochloric acid, hot dilute sulfuric acid or concentrated sodium chloride solution.

Mercurous Nitrate [$HgNO_3 \cdot H_2O$ 280.61]
White crystals; usually with an odour of nitric acid.
Freely soluble in water or dilute nitric aicd.
A precipitate of basic salt is formed in a large amount of water.

Mercury [Hg 200.59]
A silver-white lustrous, liquid metal; heavy; slightly volatile at room temperature; produces amalgam with metals other than iron.
Soluble in dilute nitric acid; insoluble in water.

Metacresol Purple [$C_{21}H_{18}O_5S$ 382.44]
A reddish-yellow or brownish-green powder.
Freely soluble in methanol, ethanol or sodium hydroxide solution; slightly soluble in water.

Methanol [CH_3OH 32.04]
A clear, colourless liquid; volatile; inflammable. It contains 0.1% of water.
Miscible with water, ethanol or ether.
Boiling point: 64-65℃.

Methanol, Dehydrated [CH_3OH 32.04]
A clear, colourless liquid; volatile; burns with a bluish flame without fume. It contains not more than 0.05% of water.
Miscible with water, ethanol or ether.
Boiling point: 64.7℃.

Methyl Acetate [CH_3COOCH_3 74.08]
A clear, colourless liquid.
Miscible with water, ethanol or ether.

Methylene Blue [$C_{16}H_{18}ClN_3S \cdot 3H_2O$ 373.90]
Deep emerald green crystals or a dark brown powder; with bronze lustre.
Freely soluble in hot water.

Methyl Orange [$C_{14}H_{14}N_3NaO_3S$ 327.34]
Orange crystals or a powder.
Freely soluble in hot water; practically insoluble in ethanol.

Methyl Red [$C_{15}H_{15}N_3O_2$ 269.30]
Purplish-red crystals.
Soluble in ethanol or acetic acid; insoluble in water.

α-Naphthol (1-Naphthol) [$C_{10}H_7OH$ 144.17]
White, pale pink crystals or powder; odour, phenolic; darkens gradually on exposure to light.
Freely soluble in ethanol, chloroform, ether, benzene or alkali solution; slight soluble in water.

β-Naphthol (2-Naphthol) [$C_{10}H_7OH$ 144.17]
White or pale yellow crystals or a powder; odour, characteristic; discoloured easily on exposure to light.
Freely soluble in ethanol, ether, glycerin or sodium hydroxide solution; soluble in hot water; slightly soluble in water.

Neutral Red [$C_{15}H_{17}N_4Cl$ 288.78]
A dark green or brownish-black powder.
Soluble in water or ethanol.

Neutral Ethanol
To ethanol add 2-3 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS to pink colour.

Ninhydrin [$C_9H_6O_4$ 178.14]
A white or pale yellow crystalline powder; hygroscopic; discoloured gradually on exposure to light and air.
Soluble in water or ethanol; slightly soluble in chloroform or ether.

Nitric Acid [HNO_3 63.01]
A colourless, clear liquid; fumes on exposure to air; odour, suffocating irritant; turns to brown with formation of nitrogen tetroxide on exposure to light.
It contains 69%-71% (g/g) of HNO_3.
Miscible with water.

Nitric Acid, Fuming [HNO_3 63.01]
A clear, colourless or slightly yellowish-brown liquid; highly oxidative and corrosive; A reddish-yellow fog of nitrogen dioxide and nitrogen tetroxide is produced on contact with air.
Miscible with water.

***p*-Nitroaniline** [$C_6H_6N_2O_2$ 138.13]
Yellow crystals or powder.
Freely soluble in methanol; soluble in ethanol or ether; insoluble in water.

Nitrobenzene [$C_6H_5NO_2$ 123.11]
A colourless or pale yellow oily liquid; odour, bitter almond-like.
Freely soluble in ethanol, ether, benzene or oil; very slightly soluble in water.

***n*-Octanol** [$CH_3(CH_2)_7OH$ 130.23]
A colourless liquid; odour, characteristically aromatic.
Miscible with ethanol, ether chloroform; insoluble in

water.

Olive Oil
A pale yellow or slightly green liquid.

Oxalic Acid [$H_2C_2O_4 \cdot 2H_2O$ 126.07]
White, transparent crystals or crystalline granules; efflorescent.
Freely soluble in water or ethanol; insoluble in chloroform or benzene.

Palladium Chloride [$PdCl_2$ 177.33]
Red, needle crystals; hygroscopic.
Soluble in water, ethanol, acetone or hydrobromic aicd.

Pancreatic Digest of Casein
Yellow granules. Casein hydrolyzed with pancreatin decolourized and purified with active carbon. It is used as culture medium of bacteria, especially in test for sterility.

Pancreatin
An almost white or slightly yellow powder; odour, slight but not moldy; hydroscopic. The aqueous solution is inactivated by acid or on boiling.

***n*-Pentanol** [$C_5H_{12}O$ 88.15]
A clear, colourless liquid; odour; peculiar and pungent. Its vapour can form explosive mixture with air.
Miscible with ethanol or ether; slightly soluble in water.
Boiling point: 138.1℃.

Pepsin
White to yellowish flakes or granules; taste, slightly sour and salty; hygroscopic.
Freely soluble in water; practically insoluble in ethanol, chloroform or ether.

Peptone
A yellow or pale yellow powder; odourless; taste, slightly bitter.
Soluble in water; insoluble in ethanol or ether.

Perchloric Acid [$HClO_4$ 100.46]
A colourless, clear liquid; strong oxidant; very hygroscopic; volatile and corrosive.
Miscible with water.

Periodic Acid [$HIO_4 \cdot 2H_2O$ 227.94]
Colourless monoclinic crystals; hygroscopic; changes to slightly yellow on exposure to air; oxidative.
Freely soluble in water; soluble in ethanol; slightly soluble in ether.

Petroleum Benzin
A clear colourless liquid; odour, characteristic; low boiling fractions of petroleum benzin is highly volatile.
Miscible with dehydrated ethanol, ether or benzene; insoluble in water.
Boiling range: 30-60℃; 60-90℃; 90-120℃.

Phenol [C_6H_6O 94.11]
Colourless or faintly pink needle crystals or a crystalline mass; odour, characteristic; hygroscopic; gradually darkens on exposure to light and air. Freely soluble in ethanol, chloroform, ether, glycerin and volatile oils; soluble in water; sparingly soluble in liquid paraffin.

Phenol, Liquefied
To 90 g of phenol add a little water, heat slowly on a water bath until liquefied, cool, add sufficient water to produce 100 ml.

Phenylhydrazine Hydrochloride [$C_6H_8N_2 \cdot HCl$ 144.60]
White or white transparent crystals; combustible.
Freely soluble in water; soluble in ethanol, practically insoluble in ether.

Phloroglucinol [$C_6H_3(OH)_3 \cdot 2H_2O$ 162.14]
A white or pale yellow crystalline powder; taste, sweet. It turns to pale red on exposure to light.
Freely soluble in water.

Phenolphthalein [$C_{20}H_{14}O_4$ 318.33]
A white powder.
Soluble in ethanol; insoluble in water.

Phenolsulfonphthalein (Phenol red) [$C_{19}H_{14}O_5S$ 354.38]
A deep red crystalline powder.
Soluble in ethanol, solution of sodium hydroxide or sodium carbonate; insoluble in water, chloroform or ether.

Phosphorus Pentoxide [P_2O_5 141.94]
A white powder, odour alliaceous; corrosive; highly hygroscopic.

Phosphomolybdic Acid [$P_2O_5 \cdot 20MoO_3 \cdot 51H_2O$ 3939.49]
Bright yellow crystals.
Soluble in water, ethanol or ether.

Phosphoric Acid [H_3PO_4 98.00]
A clear, colourless, viscous liquid; corrosive.
Soluble in water.

Phosphotungstic Acid [$P_2O_5 \cdot 20WO_3 \cdot 28H_2O$ 5283.34]
White or pale yellow crystals.
Soluble in water, ethanol or ether.

Polyethylene Glycol 1500
A white or cream waxy solid; odour, characteristic; melts on heating.
Soluble in water or ethanol.

Polyethylene Glycol Glutarate
[$HO(CH_2CH_2OCO(CH_2)_3COO]_nH$ 600-800]
A brownish black viscous liquid.
Soluble in acetone or chloroform.

Polysorbate 80
A pale red, oily liquid; odour, fat-like.
Freely soluble in water, ethanol, methanol or ethyl acetate.
Practical insoluble in mineral oils.

Potassium Acetate [$KC_2H_3O_2$ 98.14]
White crystals or powder; hygroscopic.
Freely soluble in water or ethanol.

Potassium Alum [$AlK(SO_4)_2 \cdot 12H_2O$ 474.39]
White, transparent crystals or powder; odourless; taste, slightly sweet and astringent.
Freely soluble in glycerin or water; insoluble in ethanol or acetone.

Potassium antimonyl tartrate [$C_4H_4KO_7Sb \cdot \frac{1}{2}H_2O$ 333.93]
White transparent crystals or a white powder; odourless; taste, slightly sweet; efflorescent.
Soluble in water; insoluble in ethanol.

Potassium Biphthalate [$KHC_6H_4(COO)_2$ 204.22]
A white crystalline powder.
Soluble in water; slightly soluble in ethanol.

Potassium Bisulfate [$KHSO_4$ 136.17]
White crystals; its aqueous solution is strongly acidic.
Soluble in water.

Potassium Bitartrate [$KHC_4H_4O_6$ 188.18]
A white, crystalline powder; taste, sour.
Freely soluble in hot water; insoluble in water or ethanol.

Potassium Borohydride [KBH_4 53.94]
White crystals; stable in the air.
Freely soluble in water.

Potassium Bromate [$KBrO_3$ 167.00]
White crystals or powder.

Soluble in water; insoluble in ethanol.

Potassium Bromide [KBr 119.00]
A white crystalline powder.
Soluble in water, boiling ethanol or glycerin; slightly soluble in ethanol.

Potassium Carbonate [$K_2CO_3 \cdot 1\frac{1}{2}H_2O$ 165.23]
White crystals or granules.
Soluble in water; insoluble in ethanol.

Potassium Carbonate Anhydrous [K_2CO_3 138.21]
White crystals or powder; hygroscopic.
Soluble in water; insoluble in ethanol.

Potassium Chlorate [$KClO_3$ 122.55]
White, transparent crystals or a powder.
Freely soluble in boiling water; soluble in water or glycer in; practically insoluble in ethanol.

Potassium Chloride [KCl 74.55]
White crystals or a crystalline powder.
Freely soluble in water or glycerin; slightly soluble in ethanol; insoluble in acetone or ether.

Potassium Chromate [K_2CrO_4 194.19]
Pale yellow crystals.
Soluble in water; insoluble in ethanol.

Potassium Cyanide [KCN 65.12]
White granules or clinkers.
Soluble in water; slightly soluble in ethanol.

Potassium Dichromate [K_2Cr_2O 294.18]
Lustrous orange-red crystals; taste, bitter; strongly oxidative.
Soluble in water; insoluble in ethanol.

Potassium dihydrogen Phosphate [KH_2PO_4 136.09]
White crystals or a crystalline powder.
Soluble in water; insoluble in ethanol.

Potassium Ferricyanide [$K_3Fe(CN)_2$ 329.25]
Red crystals; decompose easily on exposure to light, air and acid.
Soluble in water; slightly soluble in ethanol.

Potassium Ferrocyanide [$K_4Fe(CN)_6 \cdot 3H_2O$ 422.39]
Yellow crystals or granules. Its aqueous solution readily deteriorates.
Soluble in water; insoluble in ethanol.

Potassium Fluoride [KF 58.10]
White crystals; hygroscopic.
Freely soluble in water; soluble in hydrofluoric acid or ammonia solution; insoluble in ethanol.

Potassium hydroxide [KOH 56.11]
White granules or sticks; absorbs carbon dioxide easily to form potassium carbonate; hygroscopic.
Soluble in water or ethanol.

Potassium Iodate [KIO_3 214.00]
White crystals or a crystalline powder.
Soluble in water or dilute sulfuric acid; insoluble in ethanol.

Potassium Iodide [KI 166.00]
White crystals or powder.
Soluble in water, ethanol, acetone or glycerin; insoluble in ether.

Potassium Nitrate [KNO_3 101.10]
White crystals or powder; burns and detonates when in contact, rubbed or bumped with organic substances.
Soluble in water; slightly soluble in ethanol.

Potassium Periodate [KIO_4 230.00]
A white, crystalline powder.
Soluble in hot water; slightly soluble in water.

Potassium Permanganate [$KMnO_4$ 158.03]
Dark purple crystals with metallic luster; strong oxidant; decomposes in ethanol, concentrated acids or other organic solvents with liberation of oxygen.
Soluble in water.

Potassium Sodium Tartrate [$KNaC_4H_4O_4 \cdot 4H_2O$ 282.22]
White, transparent crystals or a crystalline powder.
Soluble in water; insoluble in ethanol.

Potassium Sulfate [K_2SO_4 174.26]
White crystals or a crystalline powder.
Soluble in water or glycerin; insoluble in ethanol.

Potassium Tetrahydroborate [KBH_4 53.94]
A white crystal. Stable in air.
Easily soluble in water.

Potassium Tetroxalate (Potassium trihydrogen oxalate) [$KH_3(C_2O_4)_2 \cdot 2H_2O$ 254.19]
White crystals or a crystalline powder.
Soluble in water; slightly soluble in ethanol.

Potassium Thiocyanate [KSCN 97.18]
White crystals.
Soluble in water or ethanol.

Potato Starch [$(C_6H_{10}O_5)_n$]
A white, amorphous powder; odourless; tasteless; highly hygroscopic.
Insoluble in water and ethanol, forms slightly blue collosol in hot water.

Propanol [$CH_3CH_2CH_2OH$ 60.10]
A clear, colourless liquid; inflammable.
Miscible with water, ethanol or ether.
Boiling point: 97.2℃.

Propylene Glycol [$CH_3CH(OH)CH_2OH$ 76.10]
A colourless, viscous liquid; taste, slightly acrid.
Miscible with water, acetone or chloroform.

Protocatechuic Acid [$C_7H_6O_4$ 154.12]
White or faintly brown crystals; discoloured on exposure to air.
Soluble in ethanol or ether, slightly soluble in water.

Pyridine [C_5H_5N 79.10]
A colourless, clear liquid; odour, disagreeable; taste, peppery; hygroscopic; inflammable.
Miscible with water, ethanol, ether or petroleum banzin.

Pyridine Dehydrated [C_5H_5N 79.10]
To 200 ml of pyridine reagent add 40 ml of benzene, mix well and distil on a sand bath. Collect the distillate at 115-116℃.

Pyrogallol [$C_6H_3(OH)_3$ 126.11]
White lustrous crystals.
Soluble in water, ethanol or ether; slightly soluble in chloroform, benzene or carbon disulfide.

Radix Arnebiae
See the monograph.

Radix Lithospermi
See the monograph.

Red Mercuric Iodide [HgI_2 454.40]
A bright red powder; heavy; odourless.
Soluble in ether, sodium thiosulfate solution or potassium iodide solution; Slightly soluble in dehydrated ethanol; insoluble in water.

Resazurin [$C_{12}H_7NO_4$ 229.19]
Deep red crystals with green lustre.

Soluble in dilute sodium hydroxide solution; slightly soluble in ethanol or glacial acetic acid; insoluble in water or ether.

Resorcinol [$C_6H_4(OH)_2$ 110.11]
White transparent crystals; turns to pale red on exposure to light, air or in contact with iron.
Soluble in water, ethanol or ether.

Rhodamine B [$C_{28}H_{31}ClN_2O_3$ 479.02]
Green lustrous crystals or a reddish-violet powder.
Freely soluble in water with a bluish-red colour; its diluted solution is strongly fluorescent; freely soluble in ethanol; slightly soluble in hydrochloric acid or sodium hydroxide solution.

Ruthenium Red [$Ru_2(OH)_2Cl_4 \cdot 7NH_3 \cdot 3H_2O$ 551.23] or [$(NH_3)_5RuO\text{-}Ru(NH_3)_4\text{-}O\text{-}Ru(NH_3)_5Cl_6$ 786.35]
A brownish-red powder.
Soluble in water, insoluble in ethanol and glycein.

Silica Gel [$mSiO_2 \cdot nH_2O$]
A white, translucent, or milky white granules or pellets; hygroscopic; usually contains about 3%-7% of water; moisture absorbing capacity about 40%.

Silica Powder
Colourless, transparent crystals or an amorphous powder.
Soluble in an excess of hydrofluoric acid; insoluble in water or acid.

Silicon Dioxide [SiO_2 60.08]
A colourless transparent crystal or powder.
Soluble in excessive hydrofluoric acid, practically in soluble in water or acids.

Silicotungstic Acid [$SiO_2 \cdot 12WO_3 \cdot 26H_2O$ 3310.66]
White or pale yellow crystals; hygroscopic.
Freely soluble in water or ethanol.

Silver Diethyldithiocarbamate [$(C_2H_5)_2NCS_2Ag$ 256.14]
Pale yellow crystals.
Freely soluble in pyridine; soluble in chloroform; insoluble in water, ethanol, acetone or benzene.

Silver Nitrate [$AgNO_3$ 169.87]
White, transparent, flaky crystals.
Freely soluble in ammonia solution; soluble in water or ethanol; slightly soluble in ether or glycerin.

Silver Oxide [Ag_2O 231.74]
A brownish-black powder; heavy; slowly decomposes on exposure to light; inflammable.
Freely soluble in dilute nitric acid or ammonia solution; practically insoluble in water or ethanol.

Soda Lime
A mixture of sodium hydroxide and calcium oxide, pink small granules with the addition of special indicator; the colour fades gradually on absorption of carbon dioxide.

Sodium Acetate [$NaC_2H_3O_2 \cdot 3H_2O$ 136.08]
White transparent crystals or white granules; efflorescent.
Soluble in water.

Sodium Acetate, Anhydrous [$NaC_2H_3O_2$ 82.03]
A white powder; hygroscopic.
Freely soluble in water; soluble in ethanol.

Sodium Alizarinsulfonate [$C_{14}H_7NaO_7S \cdot H_2O$ 360.28]
An orange or yellowish-brown powder.
Freely soluble in water; slightly soluble in ethanol; insoluble in chloroform or benzene.

Sodium Bicarbonate [$NaHCO_3$ 84.01]
A white crystalline powder.
Soluble in water; insoluble in ethanol.

Sodium Bisulfite [$NaHSO_3$ 104.06]
A white crystalline powder; odour resembling sulfur dioxide; oxidized to form sulfate on exposure to air.
Soluble in water; slightly soluble in ethanol.

Sodium Bitartrate [$NaHC_4H_4O_6 \cdot 2H_2O$ 190.09]
A white, crystalline powder.
Soluble in water; insoluble in ethanol.

Sodium Borohydride [$NaBH_4$ 37.83]
A white crystalline powder; hygroscopic.
Soluble in water, ammonia solution, ethylenediamine or pyridine; insoluble in ether.

Sodium Bromide [NaBr 102.89]
White crystals or a powder.
Soluble in water; slightly soluble in ethanol.

Sodium Carbonate [$Na_2CO_3 \cdot 10H_2O$ 286.14]
White transparent crystals.
Soluble in water or glycerin; insoluble in ethanol.

Sodium Carbonate, Anhydrous [Na_2CO_3 105.99]
White crystals or granules; absorbs one mol of water on exposure to air.
Soluble in water; to produce strongly alkaline solution; insoluble in ethanol.

Sodium Carbonate, Monohydrate [$Na_2CO_3H_2O$ 124.00]
White prismatic crystals; hygroscopic; loses water of crystallization at 100℃.
Freely soluble in water; insolube in ethanol.

Sodium Carboxymethylcellulose
A white powder or small granules; hygroscopic; easily disperses and swells in hot water; the viscosity of a 1% solution is 0.005-2.0 Pa·s.

Sodium Chloride [NaCl 58.44]
White crystals or a crystalline powder; hygroscopic.
Soluble in water and in glycerin; very slightly soluble in ethanol or hydrochloric acid.

Sodium Chromotropate [$C_{10}H_6Na_2O_8S_2 \cdot 2H_2O$ 400.29]
A white or grey powder.
Soluble in water with a pale brown colour.

Sodium Citrate [$C_6H_5Na_3O_7 \cdot 2H_2O$ 294.10]
White crystals or a powder.
Freely soluble in water; insoluble in ethanol.

Sodium Cobaltinitrite [$Na_3Co(NO_2)_6$ 403.94]
A yellow or yellowish-brown crystalline powder; readily decomposes.
Very soluble in water; slightly soluble in ethanol.

Sodium Dihydrogen Phosphate [$NaH_2PO_4 \cdot H_2O$ 137.99]
White crystals or granules.
Freely soluble in water; practically insoluble in ethanol.

Sodium Diphenylamine Sulfonate [$C_6H_5NHC_6H_4SO_3Na$ 271.27]
A colourless or white crystalline powder.
Soluble in water or hot ethanol; insoluble in ether, benzene, toluene or carbon disulfide.

Sodium Fluoride [NaF 41.99]
A white powder or cubic crystals.
Soluble in water; its aqueous solution is corrosive to glass; insoluble in ethanol.

Sodium formate [$HCOONa \cdot 2H_2O$ 104.04]
White crystals; odour, faint formic acid; hygroscopic.
Soluble in water or glycerin; slightly soluble in ethanol.

Sodium Hydrosulfite [$Na_2S_2O_4$ 174.11]
A white or almost white powder; odour, characteristic; hygroscopic; decomposes and burns on exposure to air or heat.
Freely soluble in water; insoluble in ethanol.

Sodium Hydroxide [NaOH 40.00]
White granules or flakes; easily absorbs carbon dioxide and water; hygroscopic.
Freely soluble in water, ethanol or glycerin.

Sodium Hypochlorite Solution [NaOCl 74.44]
A clear, pale yellowish-green liquid; corrosive; strongly oxidative and alkaline.
Miscible with water.

Sodium Iodide [NaI 149.89]
White crystals or a powder.
Soluble in water, ethanol or glycerin.

Sodium Molybdate [$Na_2MoO_4 \cdot 2H_2O$ 241.95]
A white crystalline powder; loses water of crystallization at 100℃.
Soluble in water.

Sodium β-Naphthalenesulfonate [$C_{10}H_7NaO_3S$ 230.22]
White crystals or powder.
Soluble in water; insoluble in ethanol.

Sodium Nitrate [$NaNO_3$ 84.99]
Colourless, transparent crystals or white granules; burns and detonates in contact, rubbed or bumped with organic substances.
Soluble in water; slightly soluble in ethanol.

Sodium Nitrite [$NaNO_2$ 69.00]
White or pale yellow crystals or granules; hygroscopic; burns and detonates in contact with organic matter, evolving noxious and irritant gas of nitrogen oxide and nitrogen peroxide.
Soluble in water; slightly soluble in ethanol or ether.

Sodium Nitroprusside [$Na_2Fe(NO)(CN)_5 \cdot 2H_2O$ 297.95]
Transparent, dark red crystals; its aqueous solution decomposes gradually and turns to green colour.
Soluble in water; slightly soluble in ethanol.

Sodium Oxalate [$Na_2C_2O_4$ 134.00]
A white crystalline powder.
Soluble in water; insoluble in ethanol.

Sodium Periodate [$NaIO_4$ 213.89]
A white, crystalline powder.
Soluble in water, hydrochloric acid, nitric acid, sulfuric acid or acetic acid; insoluble in ethanol.

Sodium Pyrosulfite [$Na_2S_2O_5$ 190.11]
White crystals or a powder with slight odour of sulfur dioxide; hygroscopic.
Soluble in water or glycerin; slightly soluble in ethanol.

Sodium Sulfate Anhydrous [Na_2SO_4 142.04]
A white crystalline powder; hygroscopic.
Soluble in water; insoluble in ethanol.

Sodium Sulfide [$Na_2S \cdot 9H_2O$ 240.18]
White crystals; its aqueous solution is alkaline.
Soluble in water; Slightly soluble in ethanol; insoluble in ether.

Sodium Sulfite [$Na_2SO_3 \cdot 7H_2O$ 252.15]
White, transparent crystals; odour, resembling sulfurous acid; efflorescent; oxidized to form sodium sulfate on exposure to air.
Soluble in water; very slightly soluble in ethanol.

Sodium Sulfite, Anhydrous [Na_2SO_3 126.04]
White small crystals or powder.
Soluble in water and glycerin; very slightly soluble in ethanol.

Sodium Tetraphenylborate [$(C_6H_5)_4BNa$ 342.22]
White crystals; odourless.
Freely soluble in water, methanol, dehydrated ethanol or acetone.

Sodium Thioglycollate [$CH_2(SH)COONa$ 114.10]
White crystals; odour, slight; hygroscopic.
Freely soluble in water; slightly soluble in ethanol.

Sodium Thiosulfate [$Na_2S_2O_3 \cdot 5H_2O$ 248.19]
Colourless, transparent crystals or white granules.
Soluble in water with endothermic reaction; slightly soluble in ethanol.

Sodium Tungstate [$Na_2WO_4 \cdot 2H_2O$ 329.86]
A white crystalline powder; efflorescent.
Soluble in water; insoluble in ethanol.

Soluble Starch
A white powder; odourless; tasteless.
Soluble in boiling water; insoluble in water, ethanol or ether.

Solvent Blue 19
It is a mixture of 1-amino-4-anilinoanthraquinone and 1-methylamino-4-anilinoanthraquinone.

Stannous Chloride [$SnCl_2 \cdot 2H_2O$ 225.65]
White crystals.
Soluble in water, ethanol or sodium hydroxide solution.

Strontium Hydroxide [$Sr(OH)_2 \cdot 8H_2O$ 265.76]
Colourless or white crystals; deliquescent; absorbs carbon dioxide from air to form carbonate. It loses seven molecules of water in dry air.
Soluble in hot water or acid; slightly soluble in water.

Succinic Acid [$H_2C_4H_4O_4$ 118.09]
White crystals.
Soluble in hot water; slightly soluble in ethanol, acetone or ether; insoluble in benzene, carbon disulfide, carbon tetrachloride or petroleum benzin.

Sucrose [$C_{12}H_{22}O_{11}$ 342.30]
Colourless crystals or white crystalline, loose powder; odourless; taste, sweet.
Very soluble in water; slightly soluble in ethanol; insoluble in chloroform or ether.

Sudan Ⅲ [$C_6H_5NNC_6H_4N:NC_{10}H_6OH$ 352.40]
A reddish brown powder.
Soluble in chloroform or glacial acetic acid; slightly soluble in ethanol; insoluble in water.

Sulfanilic Acid [$C_6H_7NO_3S$ 173.19]
A white or almost white powder, discoloured on exposure to light.
Freely soluble in concentrated solution of ammonia, sodium hydroxide or sodium carbonate; soluble in hot water; slightly soluble in water.

Sulfur [S 32.06]
Sorts of allotrope of sulfur, yellow fine powder; combustible.
Soluble in benzene, toluene, carbon tetrachloride or carbon disulfide; slightly soluble in ethanol or ether; insoluble in water.

Sulfuric Acid [H_2SO_4 98.08]
A clear, colourless, viscous liquid; generates much heat when mixed with water or alcohol. it contains 95%-98% (g/g) of H_2SO_4.
Miscible with water or ethanol.
Relative density: about 1.84.

Sulfuric Acid, Nitrogen Free
Introduce sulfuric acid to a porcelain evaporating dish heat on a sand bath until the vapor of sulfur trioxide is evolved (about 2 hours), then allow to cool in an empty desiccator.

Sulfurous Acid [H_2SO_3 82.07]
A colourless transparent liquid; asphyxiating odour of sulfur

dioxide; unstable, easily decomposed.
Miscible with water.

Talcum Powder
Complies with the requirements prescribed in monograph of the Chinese Pharmacopoeia.

Tannic Acid [$C_{76}H_{52}O_{46}$ 1701.22]
A pale yellow or pale brown loose powder; odour, characteristic; gradually darkens on exposure to air or light.
Soluble in water or ethanol.

Tartaric Acid [$H_2C_4H_4O_6$ 150.09]
White, transparent crystals or a white crystalline powder.
Soluble in water, methanol, ethanol, propanol or glycerin; slightly soluble in ether; insoluble in chloroform.

Tertiary Butanol [$(CH_3)_3COH$ 74.12]
White crystals; it is a liquid when containing a little of water; odour, camphor-like; hygroscopic; inflammable.
Miscible with ethanol or ether; soluble in water.
Boiling Point: 82.4℃.

Tetrabutylammonium Iodide [$(C_4H_9)_4NI$ 369.37]
A white or pale yellow powder.
Freely soluble in ethanol; soluble in water; slightly soluble in chloroform.

Tetraethylammonium Hydroxide [$C_8H_{21}NO$ 147.26]
The free base only exists in solution or as a hydrate. Usually it is used as a solution of 10%, 25% or 60%. The aqueous solution is colourless, strongly corrosive; very strongly alkaline; freely absorbs carbon dioxide from air.

Tetrahydrofuran [C_4H_8O 72.11]
A colourless liquid; odour, ether-like; inflammable; easily forms peroxide during storage.
Miscible with water, ethanol, acetone or ether.
Boiling Point: 66℃.

Tetrazolium Blue [$C_{40}H_{32}Cl_2N_8O_2$ 727.65]
Colourless or yellow crystals.
Freely soluble in methanol, ethanol or chloroform; slightly soluble in water.

Thioacetamide [CH_3CSNH_2 75.13]
Colourless or white flaky crystals.
Soluble in water, ethanol or benzene; slightly soluble in ether.

Thiourea [NH_2CSNH_2 76.12]
White rhombic crystals or needle crystals; taste, bitter.
Soluble in water or ethanol; slightly soluble in ether.

Thymol [$C_{10}H_{14}O$ 150.22]
White crystals.
Very slightly soluble in water.

Thymol Blue [$C_{27}H_{30}O_5S$ 466.60]
A brownish-green crystalline powder.
Soluble in ethanol; insoluble in water.

Thymolphthalein [$C_{28}H_{30}O_4$ 430.54]
A white powder.
Soluble in ethanol; insoluble in water.

Toluene [$C_6H_5CH_3$ 92.14]
A clear, colourless liquid; odour, benzene-like; inflammable.
Miscible with ethanol or ether.
Boiling Point: 110.6℃.

***p*-Toluenesulfonic Acid** [$CH_3C_6H_4SO_3H \cdot H_2O$ 190.22]
White crystals.
Freely soluble in water; soluble in ethanol or ether.

Toluidine blue [$C_{15}H_{16}ClN_3S$ 305.83]
A dark green powder, with bronze lustre.
Freely soluble in water; slightly soluble in ethanol; very slightly soluble in chloroform; practically insoluble in ether.

Tragacanth
a white or pale yellow powder; odourless. Soluble in alkaline solution and hydrogen peroxide solution; insoluble in ethanol.

Trichloroacetic Acid [CCl_3COOH 163.39]
Colourless crystals; odour, characteristic; hygroscopic; corrosive; its aqueous solution is strongly acidic.
Freely soluble in ethanol or ether; soluble in water.

Triethanolamine [$N(CH_2CH_2OH)_3$ 149.19]
A colourless or pale yellow, viscous liquid. Turns to brown on standing for a long time; absorbs water and carbon dioxide on exposure to air; it is strongly alkaline.
Miscible with water or ethanol.

Triethylamine [$(C_2H_5)_3N$ 101.19]
A colourless liquid; odour, strongly ammoniacal.
Miscible with ethanol or ether; slightly soluble in water.
Boiling point: 89.05℃.

Trifluoroacetic Acid [CF_3COOH 114.02]
A colourless, fuming liquid; hygroscopic; strongly corrosive.
Freely soluble in water, ethanol, acetone or ether.

Trinitrophenol [$C_6H_3N_3O_7$ 229.11]
Pale yellow crystals; odourless; taste, bitter; violet explosion occurs at high temperature or when bumped or rubbed. Soluble in hot water, ethanol or benzene.

Trypsin
A white, almost white or pale yellow powder.
Soluble in water; insoluble in ethanol.

Tyrosine [$C_9H_{11}NO_3$ 181.19]
White crystals.
Soluble in water; insoluble in ethanol or ether.

Uranyl Acetate [$UO_2(C_2H_3O_2)_2 \cdot 2H_2O$ 424.15]
A yellow crystalline powder.
Soluble in water; slightly soluble in ethanol.

Urea [NH_2CONH_2 60.06]
White crystal or a powder; odour, ammoniacal.
Soluble in water, ethanol or benzene; practically insoluble in chloroform or ether.

Vanillin [$CH_3O \cdot C_6H_3(OH)CHO$ 152.15]
White crystals; odour, fragrant.
Freely soluble in ethanol, chloroform, ether, glacial acetic acid or pyridine soluble in oil or sodium hydroxide solution.

Xylene [$C_6H_4(CH_3)_2$ 106.17]
A clear, colourless liquid; odour, characteristic; inflammable.
It is a mixture of the three isomers *o*-, *m*-and *p*-xylene.
Miscible with ethanol, chloroform or ether; insoluble in water.
Boiling point: 137-140℃.

Xylene Cyanol Blue FF [$C_{25}H_{27}N_2NaO_6S_2$ 528.62]
A brown or bluish-black powder.
Freely soluble in ethanol; soluble in water.

Xylenol Orange [$C_{31}H_{28}N_2Na_4O_{13}S$ 760.59]
A reddish-brown crystalline powder; hygroscopic.
Freely soluble in water; insoluble in ethanol.

Yeast Extract
A reddish-yellow to brown powder; odour, characteristic, but no rancid smell.
Soluble in water to yield a weak acidic reaction.
Choloride Not more than 5%, calculated as NaCl.
Nitrogen 7.2%-9.5%, calculated on the dried basis.
Loss on drying Not more than 5.0%.
Residue on ignition Not more than 15%.
Coagulable Protein No sediment is produced when its

aqueous solution (1→20) is filtered and boiled.

Zinc [Zn 65.39]
Greyish-white granules with metallic lustre.
Soluble in dilute acid with liberation of hydrogen; soluble slowly in ammonia solution or sodium hydroxide solution.

Zinc Acetate [$Zn(C_2H_3O_2)_2 \cdot 2H_2O$ 219.51]
White crystals.
Freely soluble in water or boiling ethanol; slightly soluble in ethanol.

Zinc Chloride [ZnCl 136.30]
A white crystalline powder or clinkers.
Freely soluble in water; soluble in ethanol, acetone or ether.

Zincon [$C_{20}H_{15}N_4NaO_6S$ 462.42]
A brown, crystalline powder.
Soluble in ethanol or sodium hydroxide solution; insoluble in water.

Zinc Oxide [ZnO 81.39]
A white or pale yellow powder.
Soluble in dilute acid, concentrated alkali solution or ammonia solution; insoluble in water or ethanol.

Zinc Sulfate [$ZnSO_4 \cdot 7H_2O$ 287.56]
White crystals, granules or powder.
Freely soluble in water; soluble in glycerin; Slightly soluble in ethanol.

Zirconium Nitrate [$Zr(NO_3)_4 \cdot 5H_2O$ 429.32]
White crystals; hygroscopic; decomposes at 100℃.
Freely soluble in water; soluble in ethanol.

XV B Test Solutions

Acetic Acid, Dilute
Dilute 60 ml of glacial acetic acid with water to 1000 ml.

Acid Stannous Chloride TS
Dissolve 20 g of stannous chloride in hydrochloric acid to make 50 ml and filter.
The solution should be used within three months.

Alcoholic Ammonia TS
Add concentrated ammonia solution to dehydrated ethanol. It contains 9-11 g of NH_3 per 100 ml.
Preserve in rubber stoppered bottle.

Alcoholic Dinitrophenylhydrazine TS
Dissolve 1 g of dintrophenylhydrazine in 1000 ml of ethanol add 10 ml of hydrochloric acid slowly and mix well.

Alcoholic Mercuric Bromide TS
Dissolve 2.5 g of mercuric bromide in 50 ml of ethanol by gentle heat.
Preserve in glass-stoppered bottle, protected from light.

Alcoholic Potassium Hydroxide TS
Use alcoholic potassium hydroxide (0.5 mol/L) VS.

Alcoholic Silver Nitrate TS
Dissolve 4 g of silver nitrate in 10 ml of water, dilute with ethanol to 100 ml.

Alcoholic Sodium Nitrite TS
Dissolve 5 g of sodium nitrite in 60% solution of ethanol to make 1000 ml.

* **Alcoholic sulfuric Acid TS**
Add 57 ml of sulfuric acid in ethanol to make 1000 ml. It contains 9.5%-10.5% (g/ml) of H_2SO_4.

Alkaline Cupric Tartrate TS
(1) Dissolve 6.93 g of crystalline cupric sulfate in water to make 100 ml.
(2) Dissolve 34.6 g of crystalline potassium sodium tartrate and 10 g of sodium hydroxide in water to make 100 ml.
Mix solution (1) with solution (2) before use.

Alkaline Hydroxylamine TS
(1) Dissolve 12.5 g of sodium hydroxide in dehydrated methanol to make 100 ml.
(2) Add 100 ml of dehydrated methanol to 12.5 g of hydroxylamine hydrochloride and heat under reflux to dissolve.
Mix equal parts of the two solutions and filter before use.
This solution should be freshly prepared and use within hours.

Alkaline Mercuric Potassium Iodide TS
Dissove 10 g of potassium iodide in 10 ml of water, add slowly with stirring a saturated solution of mercuric chloride until a red precipitate remains undissolved. Add 30 g of potassium hydroxide and allow to dissolve, then add 1 ml or more of the saturated solution of mercuric chloride. Dilute with water to 200 ml. Allow the precipitate to settle and use the supernatant liquid.
Add 2 ml of this solution to 50 ml of water which contains 0.05 mg of ammonia, a yellowish-brown colour is formed immediately.

Alkaline β-Naphthol TS
Dissolve 0.25 g of β-naphthol in 10 ml of sodium hydroxide solution (1→10). This solution should be freshly prepared.

Alkaline Trinitrophenol TS
To 20 ml of 1% trinitrophenol solution add 10 ml of 5% sodium hydroxide solution, dilute with water to 100 ml.
This solution must be freshly prepared.

Aluminium Chloride TS
Dissolve 1 g of aluminium chloride in ethanol to make 100 ml.

Ammonia TS
Dilute 400 ml of concentrated ammonia solution with water to make 1000 ml.

Ammonia Concentrated TS
Use concentrated ammonia solution directly.

Ammoniated Cupric Chloride TS
Dissolve 22.5 g of cupric chloride in 200 ml of water, add 100 ml of concentrated ammonia TS and mix well.

Ammoniated Silver Nitrate TS
Dissolve 1 g of silver nitrate in 20 ml of water, add ammonia TS dropwise with stirring until the precipitate is almost completely dissolved, filter.
Preserve the solution in amber coloured glass bottle, protected from light.

Ammonium Acetate TS
Dissolve 10 g of ammonium acetate in water to make 100 ml.

Ammonium Carbonate TS
Dissolve 20 g of ammonium carbonate with 20 ml of ammonia TS in water to make 100 ml.

Ammonium Chloride TS
Dissolve 10.5 g of ammonium chloride in water to make 100 ml.

Ammonium Magnesium Chloride TS
Dissolve 5.5 g of magnesium chloride and 7 g of ammonium chloride in 65 ml of water and then add 35 ml of ammonia TS. Allow to stand in glass bottle for several days, filter.
The solution should be filtered, if turbidity occurs.

Ammonium Mercuric Thiocyanate TS

Dissolve 5 g of ammonium thiocyanate and 4.5 g of mercuric chloride in water to make 100 ml.

Ammonium Molybdate TS
Dissolve 10 g of ammonium molybdate in water to make 100 ml.

Ammonium Molybdate in Sulfuric Acid TS
Dissolve 0.1 g of ammonium molybdate in 10 ml of sulfuric acid.

Ammonium Molybdate-Sulfuric Acid TS
Dissolve 2.5 g of ammonium molybdate in a mixture of 15 ml of sulfuric acid and water to make 100 ml.
This solution should be used within two weeks.

Ammonium Oxalate
Dissolve 3.5 g of ammonium oxalate in water to make 100 ml.

Ammonium Sulfide TS
To a solution of 60 ml of ammonia TS saturated with hydrogen sulfide add 40 ml of ammonia TS.
Preserve in amber coloured glass bottle, protected from light.
This solution is unsuitable for use if a copious precipitate of sulfur is present.

Ammonium Thiocyanate TS
Dissolve 8 g of ammonium thiocyanate in water to make 100 ml.

Anisaldehyde TS
Dissolve 0.5 ml of Anisaldehyde in 50 ml of acetic acid, add 1 ml of sulfuric acid and mix well.
This solution should be freshly prepared.

Antimony Trichloride TS
Use the saturated chloroform solution of antimony trichloride.

Arnebia TS
Extract 10 g of coarse powder of arnebia with 100 ml of 90% ethanol for 24 hours and filter. Add equal volume of glycerin to the filtrate, mix, allow to stand for 2 hours and filter.
Preserve in amber-coloured glass bottle. Use within 2 months.

Auric Chloride TS
Dissolve 1 g of auric chloride in 35 ml of water.

Barium Chloride TS
Dissolve 5 g of fine powder of barium chloride in water to make 100 ml.

Barium Hydroxide TS
Dissolve barium hydroxide in freshly boiled and cooled water to make a saturated solution.
This solution should be freshly prepared.

Barium Nitrate TS
Dissolve 6.5 g of barium nitrate in water to make 100 ml.

Boric Acid TS
Use the saturated acetone solution of boric acid.

Bromine TS
To 2-3 ml of bromine in a glass bottle which is stoppered and lubricated with vaseline add 100 ml of water to make a saturated solution by shaking.
This solution should be protected from light.

Bromine-Potassium Bromide TS
Dissolve 30 g of bromine and 30 g of potassium bromide in water to make 100 ml.

Calcium Chloride TS
Dissolve 7.5 g of calcium chloride in water to make 100 ml.

Calcium Hydroxide TS
To 1000 ml of water in a stoppered glass bottle, add 3 g of calcium hydroxide, allow to stand for 1 hour with frequent shaking vigorously, use the supernatant liquid as the test solution.

Calcium Sulfate TS
Use the saturated solution of calcium sulfate directly.

Chloral Hydrate TS
Dissolve 50 g of chloral hydrate in a mixture of 15 ml of water and 10 ml of glycerin.

Chlorine TS
Use the saturated solution of chlorine in water.
This solution should be freshly prepared.

Chromic Nitrate TS
(1) Add 10 ml of nitric acid to 100 ml of water and mix well.
(2) Dissolve 10 g of chromium trioxide in 100 ml of water.
Mix equal volume of the two solutions before use.

Chromotropic Acid TS
Dissolve 50 mg of sodium chromotropate in 100 ml of a cold mixture of sulfuric acid and water (9 : 4).
This solution should be freshly prepared before use.

Cupric Acetate TS
Dissolve 0.1 g of cupric acetate in 5 ml of water which contains a few drops of acetic acid. Dilute with water to 100 ml and filter.

Cupric Acetate Concentrated TS
Dissolve 13.3 g of cupric acetate in a mixture of 195 ml of water and 5 ml of acetic acid.

Cupric Sulfate TS
Dissolve 12.5 g of Cupric sulfate in water to make 100 ml.

Diazotized Sulfanilic Acid TS
Dissolve 0.1 g of sulfanilic acid in 2 ml of 10% sodium hydroxide, add 20 ml of dilute hydrochloric acid and 6 ml of 0.1 mol/L sodium nitrite, stir for 1 minute, add 50 mg of urea, stir for another 5 minutes.
This solution should be freshly prepared.

Diazotized *p*-Nitroaniline TS
Dissolve 0.4 g of *p*-nitroaniline in a mixture of 20 ml of dilute hydrochloric acid and 40 ml of water, cool to 15℃ and add 10% solution of sodium nitrite until 1 drop of the solution imparts a blue colour to starch-iodide TP.
This solution should be freshly prepared.

2,6-Dichloroquinone-Chlorimide TS
Dissolve 1 g of 2,6-dichloroquinone-chlorimide in 200 ml of ethanol.

***p*-Dimethylaminobenzaldehyde TS**
Dissolve 0.125 g of *p*-dimethylaminobenzaldehyde in a cooled mixture of 65 ml of nitrogen-free sulfuric acid and 35 ml of water, add 0.05 ml of ferric chloride TS and mix well.
This solution should be used within 7 days.

Dimethylglyoxime TS
Dissolve 1 g of 2,3-dimethylglyoxime in 100 ml of ethanol.

Dinitrobenzene TS
Dissolve 2 g of *m*-dinitrobenzene in ethanol to make 100 ml.

Dinitrobenzoic Acid TS
Dissolve 1 g of 3,5-dinitrobenzoic acid in ethanol to make 100 ml.

Dinitrophenylhydrazine TS
Dissolve 1.5 g of 2,4-dinitrophenylhydrazine in 20 ml of sulfuric acid solution (1→2), dilute with water to 100 ml and filter.

Disodium Hydrogen Phosphate TS

Dissolve 12 g of crystalline disodium hydrogen phosphate in water to make 100 ml.

Ethanol, Dilute TS
Dilute 529 ml of ethanol with water to 1000 ml.
It contains 49.5%-50.5% (ml/ml) of C_2H_5OH at 20℃.

Ferric Chloride TS
Dissolve 9 g of ferric chloride in water to make 100 ml.

Ferric Perchlorate TS
Heat 0.8 g of iron powder with 10 ml of 70% perchloric acid solution slowly to dissolve. Cool and dilute with dehydrated ethanol to 100 ml.
Add 6 ml of 70% perchloric acid solution to 20 ml of the solution, dilute with dehydrated ethanol to 500 ml before use.

Ferrous sulfate TS
Dissolve 8 g of ferrous sulfate crystals in 100 ml of freshly boiled and cooled water.
This solution should be freshly prepared.

Folin TS
Heat under reflux 10 g of sodium tungstate, 2.5 g of sodium molybdate, 70 ml of water, 5 ml of 85% phosphoric acid solution and 10 ml of hydrochloric acid in a 200 ml flask gently for about 10 hours, cool, add 15 g of lithium sulfate, 5 ml of water and 1 drop of bromine. Boil the mixture for about 15 minutes, or until the excess bromine is expelled. Cool, dilute with water to 100 ml and filter. The filtrate is kept in amber coloured glass bottle in a refrigerator.
Dilute 2.5 ml of the stock solution with water to 10 ml before use, shake thoroughly.

Formaldehyde TS
Use "Formaldehyde Solution" directly.

Fuchsin-Sulfurous Acid TS
Dissolve 0.2 g of fuchsin basic in 100 ml of hot water, add 20 ml of sodium sulfite solution (1 → 10), 2 ml of hydrochloric acid and dilute with water to 200 ml, then add 0.1 g of activated carbon, stir and filter promptly. Allow to stand for at least 1 hour.
This solution should be freshly prepared.

Furfural TS
Dilute 1 ml of furfural with water to 100 ml.
This solution should be freshly prepared.

Glycerin Dilute TS
Dilute 33 ml of glycerin with water to 100 ml. Add a small piece of camphor or a drop of liquefied phenol.

Glycerin-acetic Acid TS
Mix 1 volume of glycerin, 1 volume of 50% acetic acid and 1 volume of water.

Glycerin-ethanol TS
Mix 1 volume of glycerin and 1 volume of dilute ethonal.

Hydrochloric Acid Dilute TS
Dilute 234 ml of hydrochloric acid with water to 1000 ml.
It contains 9.5%-10.5% of HCl.

Hydrogen Peroxide TS
Dilute 30% hydrogen peroxide solution with water to a 3% solution.

Hydrogen Sulfide TS
Use the saturated solution of hydrogen sulfide.
Preserve in amber coloured glass bottle and protected from the light. It is unsuitable to be used if it does not possess an odour of H_2S, or if it does not produce a copious precipitate of sulfur when added to an equal volume of ferric chloride TS.

Hydroxylamine Hydrochloride TS
Dissolve 3.5 g of hydroxylamine hydrochloride in 60% ethanol to make 100 ml.

Iodine Potassium Iodide TS
Dissolve 0.5 g of iodine and 1.5 g of potassium iodide in 2.5 ml of water.

Iodine TS
Use iodine (0.1 mol/L) VS directly.

Isatin TS
Dissolve 0.1 g of isatin in 10 ml of acetone. Add 1 ml of glacial acetic acid and mix well.

*** Lanthanum TS**
Dissolve 5 g of lanthanum oxide in 25 ml of hydrochloric acid, dilute it with water to make 100 ml. Allow the solution to stand for 24 hours.

Lead Acetate TS
Dissolve 10 g of lead acetate in freshly boiled and cooled water, add acetic acid dropwise to make the solution clear, and then dilute with water to 100 ml.

Lead Subacetate TS
Add 10 ml of water to 14 g of lead monoxide, triturate until a paste is formed. Transfer it to a glass bottle with 10 ml of water, add 70 ml of a solution which contains 22 g of lead acetate, shake vigorously for 5 minutes. Allow the mixture to stand for 7 days with frequent shake, filter, add freshly boiled and cooled water to make 100 ml.

Magnesium Sulfate TS
Dissolve 12 g of magnesium sulfate crystals ($MgSO_4 \cdot 7H_2O$) in water to make 100 ml.

Mercuric Acetate TS
Dissolve 5 g of mercuric acetate, finely powdered, in warm glacial acetic acid to make 100 ml.
Preserve this solution in a well-closed amber coloured glass bottle.

Mercuric Chloride TS
Dissolve 6.5 g of mercuric chloride in water to make 100 ml.

Mercuric Nitrate TS
Dissolve 40 g of yellow mercuric oxide in a mixture of 32 ml of nitric acid and 15 ml of water.
Preserve in stoppered glass bottle and protected from light.

Mercuric Potassium Iodide TS
Dissolve 1.36 g of mercuric chloride in 60 ml of water and dissolve 5 g of potassium iodide in 10 ml of water, mix these two solutions and dilute with water to 100 ml.

Mercuric Sulfate TS
Mix 5 g of yellow mercuric oxide with 40 ml of water, add 20 ml of sulfuric acid slowly with stirring, then add another 40 ml of water and stir to dissolve completely.

Mercurous Nitrate TS
Dissolve 15 g of mercurous nitrate in a mixture of 90 ml of water and 10 ml of dilute nitric acid.
This solution should be kept in an amber coloured glass bottle with the addition of one drop of mercury.

α-Naphthol TS
Add 6.5 ml of sulfuric acid slowly to 10.5 ml of 15% alcoholic solution of α-naphthol, mix well and then add 40.5 ml of alcohol and 4 ml of water, mix well.

Ninhydrin TS
Dissolve 2 g of Ninhydrin in ethanol to make 100 ml.

Nitric Acid Dilute TS
Dilute 105 ml of nitric acid with water to 1000 ml.
It contains 9.5%-10.5% of HNO_3.

Oxalic Acid TS

Dissolve 6. 3 g of oxalic acid in water to make 100 ml.

Perchloric Acid TS
Add 500 ml of water to 13 ml of 70% perchloric acid. Adjust pH to 0. 5 with 70% perchloric acid.

Phloroglucinol TS
Dissolve 0. 5 g of phloroglucinol in ethanol to make 25 ml. Preserved in glass-stoppered bottle, protected from light.

Phosphotungstic Acid TS
Dissolve 1 g of phosphotungstic acid in water to make 100 ml.

Phosphomolybdic Acid TS
Dissolve 5 g of phosphomolybdic acid in dehydrated ethanol to make 100 ml.

Potassium Acetate TS
Dissolve 10 g of potassium acetate in water to make 100 ml.

Potassium Carbonate TS
Dissolve 7 g of anhydrous potassium carbonate in water to make 100 ml.

Potassium Chlotate TS
Use the saturated solution of potassium chlorate in nitric acid.

Potassium chromate TS
Dissolve 5 g of potassium chromate in water to make 100 ml.

Potassium Cyanide TS
Dissolve 10 g of potassium cyanide in water to make 100 ml.

Potassium Dichromate TS
Dissolve 7. 5 g of potassium dichromate in water to make 100 ml.

Potassium Ferricyanide TS
Dissolve 1 g of potassium ferricyanide in 10 ml of water. This solution should be freshly prepared.

Potassium Ferrocyanide TS
Dissolve 1 g of potassium ferrocyanide in 10 ml of water. This solution should be freshly prepared.

Potassium Ferricyanide Dilute TS
To 10 ml of 1% potassium ferricyanide solution add 0. 5 ml of 5% ferric chloride solution and 40 ml of water, shake thoroughly.

Potassium Hydroxide TS
Dissolve 6. 5 g of potassium hydroxide in water to make 100 ml.

Potassium Iodide TS
Dissolve 16. 5 g of potassium iodide in water to make 100 ml. This solution should be freshly prepared.

Potassium Iodobismuthate TS
Dissolve 0. 85 g of bismuth subnitrate in a mixture of 10 ml of glacial acetic acid and 40 ml of water, and then add 20 ml of potassium iodide solution (4→10) and mix well.

Potassium Iodoplatinate TS
Dissolve 20 mg chloroplatinic in water, add 25 ml potassium iodide solution. shake to dissolve if a precipitate is produced, then add water to 50 ml and shake thoroughly.

Potassium Iodoplatinate, Concentrated TS
Dissolve 0. 15 g of chloroplatinic acid and 3 g of potassium iodide in water to make 60 ml.

Potassium Iodobismuthate, Dilute TS
Dissolve 0. 85 g of bismuth subnitrate in a mixture of 10 ml of glacial acetic acid and 40 ml of water. Before use, add 5 ml of potassium iodide solution (4→10) and 20 ml of glacial acetic acid to 5 ml of the solution mentioned above, dilute with water to 100 ml.

Potassium Iodobismuthate, modified TS
Add 2 ml of 0. 6 mol/L hydrochloric acid solution to 1 ml of Potassium Iodobismuthate TS, and add water to 10 ml.

Potassium permanganate TS
Use potassium permanganate (0. 02 mol/L) VS directly.

Potassium Sulfate TS
Dissolve 1 g of potassium sulfate in water to make 100 ml.

Resorcinol TS
Dissolve 1 g of resorcinol in hydrochloric acid to make 100 ml.

Ruthenium Red TS
Add ruthenium red to 1-2 ml of 10% sodium acetate solution until a wine-red colour is obtained.
This solution should be freshly prepared.

Silicotungstic Acid TS
Dissolve 10 g of silicotungstic acid in water to make 100 ml.

Silver Diethyldithiocarbamate TS
To 0. 25 g of silver diethyldithiocarbamate add a suitable amount of chloroform and 1. 8 ml of triethylamine, dilute with chloroform to 100 ml and dissolve it by stirring. Allow the solution to stand overnight, and then filter with absorbent cotton wool.
Preserve in amber coloured glass bottle and store in a cool place.

Silver Nitrate TS
Use silver nitrate (0. 1 mol/L) VS directly.

Sodium Acetate TS
Dissolve 13. 6 g of crystalline sodium acetate in water to make 100 ml.

Sodium Bisulfite TS
Dissolve 10 g of sodium bisulfite in water to make 30 ml.
This solution should be freshly prepared.

Sodium Bitartrate TS
Dissolve 1 g of sodium Bitartrate in water to make 10 ml.
This solution should be freshly prepared.

Sodium Carbonate TS
Dissolve 12. 5 g of sodium carbonate monohydrate or 10. 5 g of anhydrous sodium carbonate in water to make 100 ml.

Sodium Chloride-Gelatin TS
Dissolve 1 g of gelatin and 10 g of sodium chloride in 100 ml of water by heat on a water bath at a temperature below 60℃.
This solution should be freshly prepared.

Sodium Cobaltinitrite TS
Dissolve 10 g of sodium cobaltinitrite in water to make 50 ml and filter.

Sodium Hydroxide TS
Dissolve 4. 3 g of sodium hydroxide in water to make 100 ml.

Sodium Hypobromite TS
Add 5 ml of bromine to a solution of 20 g of sodium hydroxide in 75 ml of water. Dilute with water to 100 ml and mix.
This solution should be freshly prepared.

Sodium Hypochlorite TS
Prepare a homogeneous suspension by adding 100 ml of water to 20 g of chlorinated lime and add 100 ml of 14% sodium carbonate solution with stirring. Filter with wet filter paper and add a few drops of sodium carbonate TS to 5 ml of the filtrate. If a turbidity is produced, add sufficient 14% sodium carbonate solution to the bulk filtrate until the lime is completely precipitated, filter again, the final filtrate contains not less than 4% of NaClO.
Preserve in amber coloured glass bottle, protected from

light.

Sodium Nitrite TS
Dissolve 1 g of sodium nitrite in water to make 100 ml.

Sodium Nitroprusside TS
Dissolve 1 g of sodium nitroprusside in water to make 20 ml.
This solution must be freshly prepared.

Sodium Periodate TS
Dissolve 1.2 g of sodium periodate in 100 ml of water.

Sodium Sulfite TS
Dissolve 20 g of anhydrous sodium sulfite in 100 ml of water.
This solution should be freshly prepared.

Sodium Sulfide TS
Dissolve 1 g of sodium sulfide in water to make 10 ml.
This solution should be freshly prepared.

Sodium Tetraphenylborate TS
Dissolve 0.1 g of sodium tetraphenylborate in water to make 100 ml.

Sodium Tungstate TS
Dissolve 25 g of sodium tungstate in 72 ml of water. Add 2 ml of phosphoric acid and mix well.

Stannous Chloride TS
Dissolve 1.5 g of stannous chloride in 10 ml of water and a small amount of hydrochloric acid.
This solution should be freshly prepared.

Sudan Ⅲ TS
Dissolve 0.01 g of sudan Ⅲ in 5 ml of 90% ethanol. Add 5 ml of glycerin and mix well.
Preserve in amber coloured glass bottle, use within 2 months.

Sulfuric Acid, dilute, TS
Dilute 57 ml of sulfuric acid with water to 1000 ml.
It contains 9.5%-10.5% of H_2SO_4.

Tannic Acid TS
Dissolve 1 g of tannic acid in 1 ml of alcohol and dilute with water to 100 ml.
This solution should be freshly prepared.

Trichloroacetic Acid TS
Dissolve 6 g of trichloroacetic acid in 25 ml of chloroform, add 0.5 ml of hydrogen peroxide solution and mix well.

Thioacetamide TS
Dissolve 4 g of thioacetamide in water to make 100 ml. Store in refrigerator. Add 1.0 ml of thioacetamide solution to 5.0 ml of a mixture consisting of 15 ml sodium hydroxide solution (1 mol/L), 5.0 ml of water and 20 ml of glycerin before use, heat for 20 seconds in a water bath, cool and use immediately.

Thiourea TS
Dissolve 10 g of thiourea in water to make 100 ml.

Trinitrophenol TS
A saturated solution of trinitrophenol in water.

Zinc Uranyl Acetate TS
Dissolve 10 g of uranyl acetate in 5 ml of glacial acetic acid and 50 ml of water by heating gently.
Dissolve 30 g of zinc acetate in 3 ml of glacial acetic acid and 30 ml of water with gentle heating. Mix the two solutions, cool and filter.

Vanillin TS
Dissolve 0.1 g of vanillin in 10 ml of hydrochloric acid.

Zinc Chloride-Iodine TS
Dissolve 20 g of zinc chloride and 2 g of potassium iodide in 10 ml of water, then saturated with iodine.
Preserve in amber coloured glass bottle.

XV C Test Papers

Ammoniated-Silver Nitrate TP
Immerse a strip of filter paper in ammoniated-silver nitrate TS until thoroughly wetted.

Benzidine-Cupric Acetate TP
To 9 ml of a saturated solution of benzidine acetate add 7 ml of water and 16 ml of 0.3% cupric acetate solution, immerse a strip of filter paper in the mixture until thoroughly wetted. Remove the paper and allow to dry.

Blue Litmus TP
Immerse a strip of filter paper in litmus IS until thoroughly wetted. Remove the paper and allow to dry.
Sensitivity Introduce 0.5 ml of hydrochloric acid (0.1 mol/L) in a beaker. Add 100 ml of freshly boiled and cooled water and mix. Drop a strip of blue litmus TP 10-12 mm in width in the solution and stir continuously. The colour of the paper changes within 45 seconds.

Cadmium Acetate TP
Dissolve 3 g of cadmium acetate in 100 ml of ethanol, add ammonia TS until the majority of the precipitate is dissolved. Filter and immerse a strip of filter paper in the filtrate. Remove the paper before use and allow to dry.

Congo Red TP
Immerse a strip of filter paper in congo red IS until thoroughly wetted, remove the paper and allow to dry.

Curcuma TP (Turmeric TP)
Immerse a strip of filter paper in curcuma IS until thoroughly wetted. Lay the paper on a glass plate and dry at 100℃.

Lead Acetate TP
Immerse a strip of filter paper in lead acetate TS until thoroughly wetted. Remove the paper and allow to dry at 100℃.

Mercuric Bromide TP
Immerse a strip of filter paper in alcoholic mercuric bromide TS for 1 hour. Remove the paper and allow to dry in a dark place.

Mercuric Chloride TP
Immerse a strip of filter paper in a saturated solution of mercuric chloride for 1 hour, then remove the strip and allow to dry in a dark place.

Mercuric Nitrate TP
To 45 ml of a saturated solution of mercuric nitrate add 1 ml of nitric acid. Immerse a strip of filter paper in the solution until thoroughly wetted. Remove the paper and allow to dry.

Red Litmus TP
Immerse a strip of filter paper in litmus IS, add a small amount of hydrochloric acid until a red colour is obtained. Remove the paper and allow to dry.
Sensitivity Introduce 0.5 ml of sodium hydroxide solution (0.1 mol/L) to a beaker, add 100 ml of freshly boiled and cooled water and mix. Drop a strip of red litmus TP 10-12 mm in width in the solution and stir continously. The colour of the paper changes within 30 seconds.

Starch-Iodide TP
Immerse a strip in 100 ml of freshly prepared starch IS, which contains 0.5 g of potassium iodide, until thoroughly wetted. Remove the paper and allow to dry.

Trinitrophenol TP

Immerse a strip of filter paper in a saturated solution of trinitrophenol until thoroughly wetted. Remove the paper and allow to dry.
Immerse the paper in sodium carbonate solution (1→10) immediately before use until wetted uniformly.

XV D Buffer Solutions

Acetate BS (pH 3.5)
Dissolve 25 g of ammonium acetate in 25 ml of water, add 38 ml of hydrochloric acid solution (7 mol/L). Adopt the potentiometric method to adjust accurately the pH value to 3.5 with hydrochloric acid solution (2 mol/L) or ammonia solution (5 mol/L) and dilute with water to 100 ml.

Ammonium Acetate BS (pH 4.5)
Dissolve 7.7 g of ammonium acetate in 50 ml of water. Add 6 ml of glacial acetic acid and dilute with water to 100 ml.

Ammonium Acetate BS (pH 4.8)
Dissolve 77 g of ammonium acetate in about 200 ml of water, add 57 ml of glacial acetic acid and dilute with water to 1000 ml.

Ammonium Acetate BS (pH 6.0)
Dissolve 100 g of ammonium acetate in 300 ml of water, add 7 ml of glacial acetic acid and mix well.

Ammonia-Ammonium Chloride BS (pH 8.0)
Dissolve 1.07 g of ammonium chloride in water to 100 ml. Add dilute ammonia solution (1→30) and adjust pH value to 8.0.

Ammonia-Ammonium Chloride BS (pH 10.0)
Dissolve 5.4 g of ammonium chloride in 20 ml of water, add 35 ml of concentrated ammonia solution. Dilute with water to 100 ml.

Citrate-Phosphate BS (pH 4.0)
(a) Dissolve 21 g of citric acid or 19.2 g of anhydrous citric acid in water to 1000 ml, preserve in a refrigerator.
(b) Dissolve 71.63 g of disodium hydrogen phosphate in water to 1000 ml.
To 61.45 ml of solution (a) add 38.55 ml of solution (b) and mix well.

Phosphate BS (pH 6.8)
Add 118 ml of sodium hydroxide solution (0.2 mol/L) to 250 ml of potassium dihydrogen phosphate solution (0.2 mol/L), dilute with water to 1000 ml and shake thoroughly.

Phosphate BS (pH 7.6)
Dissolve 27.22 g of potassium dihydrogen phosphate in water to make 1000 ml.
Mix 50 ml of this solution with 42.4 ml of sodium hydroxide solution (0.2 mol/L) dilute with water to 200 ml.

Phosphate-Pancreatin BS (pH 6.8)
(a) Dissolve 6.8 g of potassium dihydrogen phosphate in 500 ml of water and adjust the pH value to 6.8 with sodium hydroxide solution (0.1 mol/L).
(b) Dissolve 10 g of pancreatin in water.
Mix the two solutions and dilute with water to 1000 ml.

Sodium Acetate BS (pH 3.7)
Dissolve 20 g of anhydrous sodium acetate in 300 ml of water, add 1 ml of bromophenol blue IS and 60-80 ml of glacial acetic acid until the colour changes from blue to pure green, and then dilute with water to 1000 ml.

Sodium Acetate BS (pH 4.5)
Dissolve 18 g of sodium acetate in 9.8 ml of glacial acetic acid, and dilute with water to 1000 ml.

Sodium Acetate BS (pH 6.0)
Dissolve 54.6 g of sodium acetate in 20 ml of acetic acid solution (1 mol/L). Dilute with water to 500 ml.

XV E Indicator Solutions

Bromophenol Blue IS
Dissolve 0.1 g of bromophenol blue in 3.0 ml of sodium hydroxide solution (0.05 mol/L), and dilute with water to 200 ml.
Colour changes from yellow to bluish green (pH 2.8-4.6).

Bromothymol Blue IS
Dissolve 0.1 g of bromothymol blue in 3.2 ml of sodium hydroxide solution (0.05 mol/L), and dilute with water to 200 ml.
Colour changes from yellow to blue (pH 6.0-7.6).

Calcein Indicator Mixture
Mix uniformly 0.1 g of calcein with 10 g of potassium chloride by grinding.

Calcon Indicator Mixture
Mix uniformly 0.1 g of calcon with 10 g of anhydrous sodium sulfate by grinding.

Cresol Red IS
Dissolve 0.1 g of cresol red in 5.3 ml of sodium hydroxide solution (0.05 mol/L), and dilute with water to 100 ml.
Colour changes from yellow to red (pH 7.2-8.8).

Cresol Red-Thymol blue IS
Mix 1 volume of cresol red IS with 3 volume of a 0.1% solution of thymol blue.

Crystal Violet IS
Dissolve 0.5 g of crystal violet in 100 ml of glacial acetic acid.

Curcuma IS (Turmeric IS)
Extract 20 g of curcuma powder with 4 quantities of each of 100 ml of cool water to remove water soluble matter and dry the residue at 100℃. Macerate with 100 ml of ethanol for a few days and filter.

Diphenylcarbazide IS
Dissolve 1 g of diphenylcarbazide in 100 ml of ethanol.

Dithizone IS
Dissolve 50 mg of dithizone in 100 ml of ethanol.

Eriochrome Black T Indicator Mixture
Mix uniformly 0.1 g of eriochrome black T with 10 g of sodium chloride by grinding.

Ferric Ammonium Sulfate IS
Dissolve 8 g of ferric ammonium sulfate in 100 ml of water.

Fluorescein IS
Dissolve 0.1 g of fluorescein in 100 ml of ethanol.

Litmus IS
Add 40 ml of ethanol to 10 g of litmus powder, heat under reflux for 1 hour. Allow to settle and decant off the supernatant liquid. Repeat the operation twice using 30 ml of ethanol each time. Wash the residue with 10 ml of water and decant off the washing liquid. Boil the residue with 50 ml of water, allow to cool and filter.
Colour changes from red to blue (pH 4.5-8.0).

Methyl Orange IS
Dissolve 0.1 g of methyl orange in 100 ml of water.

Colour changes from red to yellow (pH 3.2-4.4).

Methyl orange-Xylene Cyanol blue FF IS
Dissolve 0.1 g of methyl orange and 0.1 g of xylene cyanol blue FF in 100 ml of ethanol.

Methyl Red IS
Dissolve 0.1 g of methyl red in 7.4 ml of sodium hydroxide solution (0.05 mol/L) and dilute with water to 200 ml.
Colour changes from red to yellow (pH 4.2-6.3).

Methyl Red-Bromocresol Green IS
To 20 ml of 0.1% alcoholic solution of methyl red add 30 ml of 0.2% alcoholic solution of bromocresol green, and mix well.

Methyl Red-Methylene blue IS
To 20 ml of 0.1% alcoholic solution of methyl red add 8 ml of 0.2% solution of methylene blue, and mix well.

***o*-Phenanthroline IS**
Dissolve 0.5 g of ferrous sulfate in 100 ml of water, add 2 drops of sulfuric acid and 0.5 g of *o*-phenanthroline. Shake thoroughly.
This solution should be freshly prepared.

Phenolphthalein IS
Dissolve 1 g of phenolphthalein in 100 ml of ethanol.
Colour changes from colourless to red (pH 8.3-10.0).

Sodium Alizarinsulfonate IS
Dissolve 0.1 g of sodium alizarinsulfonate in 100 ml of water.
Colour changes from yellow to purple (pH 3.7-5.2).

Starch IS
Add 5 ml of water to 0.5 g of soluble starch and mix well, then pour the suspension slowly into 100 ml of boiling water with stirring. Boil for 2 minutes, cool and decant the supernatant liquid.
This solution should be freshly prepared.

Starch Iodide IS
Dissolve 0.2 g of potassium iodide in 100 ml of freshly prepared starch IS.

Thymol Blue IS
Dissolve 0.1 g of thymol blue in 4.3 ml of sodium hydroxide solution (0.05 mol/L), and dilute with water to 200 ml.
Colour changes from red to yellow (pH 1.2-2.8); from yellow to bluish-violet (pH 8.0-9.6).

Thymolphthalein IS
Dissolve 0.1 g of thymolphthalein in 100 ml of ethanol.
Colour changes from colourless to blue (pH 9.3-10.5).

Xylenol Orange IS
Dissolve 0.2 g of xylenol orange in 100 ml of water.

XV F Volumetric Solutions

Ammonium Thiocyanate (0.1 mol/L) VS
[NH_4SCN 76.12] 7.612 g→1000 ml
Preparation Dissolve 8.0 g of ammonium thiocyanate in water to make 100 ml, and mix well.
Standardization To 25 ml of silver nitrate (0.1 mol/L) VS, accurately measured, add 50 ml of water, 2 ml of nitric acid and 2 ml of ferric ammonium sulfate IS; titrate with ammonium thiccyanate solution to the appearance of pale reddish-brown colour which persists on shake vigorously. Calculate the concentration of the ammonium thiocyanate VS according to the volume consumed. Sodium thiocyanate (0.1 mol/L) VS or potassium thiocyanate (0.1 mol/L) VS can be used in place of the Ammonium Thiocyanate (0.1 mol/L) VS.

Benzalkonium Chloride (0.01 mol/L) VS
Preparation Dissolve 3.8 g of benzalkonium chloride in water, add 10 ml of sodium acetate BS (pH3.7) and dilute with water to 1000 ml. Mix well.
Standardization Dissolve about 0.18 g of analytical pure potassium chloride, accurately weighed, previously dried for 1 hour at 150℃, in sodium acetate BS (pH3.7) to make 250 ml. Mix well.
Transfer accurately 20 ml to a 50 ml volumetric flask, add accurately 25 ml of sodium tetraphenylborate (0.02 mol/L) VS, dilute with water to 50 ml and mix well. Filter with dry filter paper, discard the initial filtrate. Transfer accurately 25 ml of the successive filtrate to a 150 ml conical flask, add 0.5 ml of bromophenol blue IS. Titrate with benzalkonium chloride (0.01 mol/L) VS to a blue colour.
Each ml of benzalkonium chloride (0.01 mol/L) VS is equivalent to 0.7445 mg of potassium chloride.

Bromine (0.01667 mol/L) VS
[Br 79.90] 7.990 g→1000 ml
Preparation Dissolve 3 g of potassium bromate and 15 g of potassium bromide in water to make 1000 ml, and mix well.
Standardization To 25 ml of bromine VS, accurately measured, in an iodine flask add 100 ml of water and 2 g of potassium iodide, shake thoroughly. Add 5 ml of hydrochloric acid, stopper the flask and allow to stand in the dark for 5 minutes. Titrate with sodium thiosulfate (0.1 mol/L) VS, add 2 ml of starch IS towards the end point of titration, continue to titrate until the blue colour disappears.
Calculate the concentration of the bromine VS according to the volume consumed.
When the room temperature is above 25℃, the reacting liquid must be cooled to about 20℃. Bromine VS should be standardized immediately before use.
If bromine (0.001667 mol/L) VS is needed, dilute bromine (0.01667 mol/L) VS with water and standardize accordingly.
Storage Preserve in well-closed amber coloured glass bottle, stored at a cool place.

Ceric Sulfate (0.1 mol/L) VS
[$Ce(SO_4)_2 \cdot 4H_2O$ 404.30] 40.43 g→1000 ml
Preparation Dissolve 42 g of ceric sulfate (or 70 g of ceric ammonium sulfate) in 500 ml of water and 28 ml of sulfuric acid by heat, cool, add water to make 1000 ml.
Standardization Dissolve about 0.15g, accurately weighed, of arsenic trioxide, previously dried to constant weight at 105℃, in 10 ml of sodium hydroxide (1 mol/L) VS, by warm, add 50 ml of water, 25 ml of hydrochloric acid, 5 ml of iodine monochloride TS and 2 drops of *o*-phenanthroline IS, then titrate with ceric sulfate (0.1 mol/L) VS towards the end point of titration, heat it to 50℃ and continue to titrate until the colour turns from pale red to pale green. Each ml of ceric sulfate (0.1 mol/L) VS is equivalent to 4.946 mg of arsenic trioxide.
If ceric sulfate (0.01 mol/L) VS is needed, dilute ceric sulfate (0.1 mol/L) VS with water containing 2.8% (ml/ml) of sulfuric acid.

Disodium Edetate (0.05 mol/L) VS
[$C_{10}H_{14}N_2Na_2O_8 \cdot 2H_2O$ 372.24] 18.61 g→1000 ml
Preparation Dissolve 19 g of disodium edetate in water to make 1000 ml and mix well.
Standardization Dissolve 0.12 g of zinc oxide primary standard, previously ignited to constant weight at about 800℃ and accurately weighed, in 3 ml of dilute hydrochloric acid. Add 25 ml of water and 1 drop of 0.025% ethanolic solution of methyl red, and add ammonia TS until a slight yellow colour is obtained. Add 25 ml of water, 10 ml of

ammonium chloride BS (pH 10.0) and a small amount of eriochrome black T indicator. Titrate with disodium edetate VS until the colour changes from violet to pure blue. Perform a blank determination and make any necessary correction. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 4.069 mg of ZnO.
Storage Preserve in a glass stoppered bottle, avoid to contact with rubber.

Ethanolic Potassium Hydroxide (0.5 mol/L) VS
[KOH 56.11] 28.06 g→1000 ml
Preparation Dissolve 35 g of potassium hydroxide in a conical flask, in aldehyde-free ethanol to make 1000 ml, well close with a rubber stopper and allow to settle for 24 hours. Decant the supernatant liquid immediately and transfer into a rubber stoppered amber coloured glass bottle.
Standardization Dilute 25 ml of hydrochloric acid (0.5 mol/L) VS with 50 ml of water, add a few drops of phenolphthalein IS. Titrate with ethanolic potassium hydroxide (0.5 mol/L) VS. Calculate the concentration of the ethanolic potassium hydroxide VS according to the volume consumed.
This solution should be standardized before use.
Storage Preserve in a rubber stoppered amber coloured glass bottle.

Hydrochloric Acid (1.0, 0.5, 0.2 mol/L or 0.1 mol/L) VS
[HCl 36.46] 36.46 g→1000 ml
18.23 g→1000 ml
7.292 g→1000 ml
3.646 g→1000 ml
Preparation (1) Hydrochloric Acid (1 mol/L) VS Dilute 90 ml of hydrochloric acid with water to 1000 ml and mix well.
(2) Hydrochloric Acid (0.5, 0.2 mol/L or 0.1 mol/L) VS Dilute 45 ml, 18 ml or 9.0 ml of hydrochloric acid respectively with water to 1000 ml and mix well.
Standardization (1) Hydrochloric Acid (1 mol/L) VS Weigh accurately about 1.5 g of anhydrous sodium carbonate primary standard, previously dried to constant weight at 270-300℃, and dissolve it in 50 ml of water. Add 10 drops of methyl red-bromocresol green IS, titrate with hydrochloric acid (1 mol/L) VS until the colour turns from green to purplish-red. Boil for 2 minutes, cool to room temperature and continue the titration until the colour turns from green to dark purple. Each ml of hydrochloric acid (1 mol/L) VS is equivalent to 53.00 mg of anhydrous sodium carbonate.
(2) Hydrochloric Acid (0.5 mol/L) VS Weigh accurately about 0.8 g of anhydrous sodium carbonate primary standard titrate as directed above. Each ml of hydrochloric acid (0.5 mol/L) VS is equivalent to 26.50 mg of anhydrous sodium carbonate.
(3) Hydrochloric Acid (0.2 mol/L) VS Weight accurately about 0.3 g of anhydrous sodium carbonate primary standard titrate as directed above. Each ml of hydrochloric acid (0.2 mol/L) VS is equivalent to 10.60 mg of anhydrous sodium carbonate.
(4) Hydrochloric Acid (0.1 mol/L) VS Weigh accurately about 0.15 g of anhydrous sodium carbonate primary standard titrate as directed above. Each ml of hydrochloric acid (0.1 mol/L) VS is equivalent to 5.30 mg of anhydrous sodium carbonate.
If hydrochloric acid (0.05, 0.02 mol/L or 0.01 mol/L) VS is needed, dilute hydrochloric acid (1.0 or 0.1 mol/L) VS with water and standardize if necessary.

Iodine (0.05 mol/L) VS
[I 126.90] 12.69 g→1000 ml
Preparation Dissolve 13.0 g of iodine and 36 g of potassium iodine in 50 ml of water, add 3 drops of hydrochloric acid and dilute with water to 1000 ml, mix well and filter with a sintered glass filter.
Standardization Weigh accurately about 0.15 g of arsenic trioxide primary standard, previously dried to constant weight at 105℃, and dissolve it in 10 ml of sodium hydroxide (1 mol/L) VS by heating gently. Add 20 ml of water, 1 drop of methyl orange IS, and add sulfuric acid (0.5 mol/L) VS until the colour turns from yellow to pink. Then add 2 g of sodium bicarbonate, 50 ml of water and 2 ml of starch IS, titrate with iodine VS until the solution is bluish-violet in colour. Each ml of iodine (0.05 mol/L) VS is equivalent to 4.946 mg of arsenic trioxide.
If iodine (0.025 mol/L) VS is needed, dilute the iodine (0.05 mol/L) VS with water.
Storage Preserve in well-closed, amber glass bottle, store at a cool place.

Mercuric Nitrate (0.05 mol/L) VS
[$Hg(NO_3)_2 \cdot H_2O$ 342.62] 17.13 g→1000 ml
Preparation Dissolve 17.2 g of mercuric nitrate in 400 ml of water and 5 ml of nitric acid, filter, dilute with water to 1000 ml and mix well.
Standardization Weigh accurately about 0.15 g of potassium chloride primary standard previously dried to constant weight at 110℃, and dissolve it in 100 ml of water, add 1 ml of diphenylcarbazide IS and titrate with mercuric nitrate VS, shaking vigorously until a pale rose violet colour appears. Each ml of mercuric nitrate (0.05 mol/L) VS is equivalent to 5.844 mg of sodium chloride.

Oxalic Acid (0.05 mol/L) VS
[$C_2H_2O_4 \cdot 2H_2O$ 126.07] 6.304 g→1000 ml
Preparation Dissolve 6.4 g of oxalic acid in water to make 1000 ml and shake thoroughly.
Standardization Add 200 ml of water and 10 ml of sulfuric acid to 25 ml of oxalic acid VS, accurately measured. Titrate with potassium permanganate (0.02 mol/L) VS towards the end point of titration, heat the solution to 65℃ and continue the titration until the pale red colour persists for 30 seconds. The temperature of the solution should not be lower than 55℃ at the end of titration. Calculate the concentration of oxalic acid VS according to the volume consumed.
If oxalic acid (0.25 mol/L) VS is needed, weigh about 32 g of oxalic acid, prepare and standardize as directed above but titrate with potassium permanganate (0.1 mol/L) VS.
Storage Preserve in well-closed stoppered amber coloured glass bottle.

Perchloric Acid (0.1 mol/L) VS
[$HClO_4$ 100.46] 10.05 g→1000 ml
Preparation To 750 ml of glacial acetic acid add an amount of acetic anhydride equivalent to 5.22 ml per gram of water present, add 8.5 ml of perchloric acid (70%-72%) and mix well. Add 23 ml of acetic anhydride dropwise with shake, cool and dilute with dehydrated glacial acetic acid to 1000 ml, mix well and allow to stand for 24 hours. If the reactant is susceptible to acetylation, the water content of perchloric acid VS should be determined (Appendix Ⅷ M, method 1), and adjusted to 0.01%-0.02% by the addition of water or acetic anhydride.
Standardization Weigh accurately about 0.16 g of potassium biphthalate primary standard previously dried to constant weight at 105℃, and dissolve in 20 ml of dehydrated glacial acetic acid. Add 1 drop of crystal violet IS and titrate slowly with perchloric acid (0.1 mol/L) VS to a blue end point. Perform a blank determination and make any necessary correction.
Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 20.42 mg of potassium biphthalate.
If perchloric acid (0.05 mol/L or 0.02 mol/L) VS is needed, dilute perchloric acid (0.1 mol/L) VS with dehydrated glacial acetic acid and standardize, if necessary.

Perchloric Acid in dioxane (0.1 mol/L) VS Dissolve 8.5 ml of perchloric acid (70%-72%) in 100 ml of isopropanol and dilute with dioxane to 1000 ml.
Weigh accurately about 0.16 g of potassium biphthalate primary standard, previously dried to constant weight at 105℃, and dissolve it in 25 ml of propylene glycol and 5 ml of isopropanol by warming. Cool, add 30 ml of dioxane and a few drops of methyl orange-xylene cyanol blue IS, titrate with perchloric acid in dioxane VS until the colour turns from green to bluish-grey. Perform a blank determination and make any necessary correction.
Storage Preserve in well-closed amber coloured glass bottle.

Potassium Bromate (0.01667 mol/L) VS
[$KBrO_3$ 167.00] 2.784 g→1000 ml
Preparation Dissolve 2.8 g of potassium bromide in water to make 1000 ml and mix well.
Standardization To 25 ml of potassium bromate VS, accurately measured, in an iodine flask add 2 g of potassium iodide and 5 ml of dilute sulfuric acid, stopper the flask and mix well. Allow to stand in the dark for 5 minutes, dilute with 100 ml of water, titrate with sodium thiosulfate (0.1 mol/L) VS towards the end point of titration, add 2 ml of starch IS, continue to titrate until the blue colour disappears. Calculate the concentration of the potassium bromate VS according to the volume consumed.
If the room temperature is above 25℃, the reacting liquid and the water of dilution must be cooled to about 20℃.

Potassium Dichromate (0.01667 mol/L) VS
[$K_2Cr_2O_7$ 294.18] 4.903 g→1000 ml
Preparation Weigh accurately about 4.903 g of potassium dichromate primary standard, previously dried to constant weight at 120℃, and dissolve if in water to make 1000 ml and mix well.

Potassium Iodate (0.05 mol/L or 0.01667 mol/L) VS
[KIO_3 214.00] 10.700 g→1000 ml
3.5667 g→1000 ml
Preparation Potassium Iodate (0.05 mol/L) VS Weigh accurately 10.700 g of potassium iodate primary standard, previously dried to constant weight at 105℃, and dissolve it in water to make 1000 ml, mix well.
Potassium Iodate (0.01667 mol/L) VS Weigh accurately 3.5667 g of potassium iodate primary standard, previously dried to constant weight at 105℃, and dissolve it in water to make 1000 ml, mix well.

Potassium Permanganate (0.02 mol/L) VS
[$KMnO_4$ 158.03] 3.161 g→1000 ml
Preparation Boil about 3.2 g of potassium permanganate with 1000 ml of water for 15 minutes, allow to stand in a well closed vessel for 2 days, filter with a sintered glass filter and mix well.
Standardization Weigh accurately about 0.2 g of sodium oxalate primary standard, previously dried to constant weight at 105℃, and dissolve it in 250 ml of freshly boiled and cooled water and 10 ml of sulfuric acid with stirring. Add quickly from a burette about 25 ml of potassium permanganate (0.02 mol/L) VS, after the fading of its colour, heat the solution to 65℃ and continue to titrate until the red colour persists for 30 seconds. The temperature of the solution should not be lower than 55℃ at the end of titration. Each ml of potassium permanganate (0.02 mol/L) VS is equivalent to 6.70 mg of sodium oxalate.
If potassium permanganate (0.002 mol/L) VS is needed, dilute potassium permanganate (0.02 mol/L) VS with water, boil and cool. Filter and standardize, if necessary.
Storage Preserve in well-closed amber coloured glass bottle.

Silver Nitrate (0.1 mol/L) VS
[$AgNO_3$ 169.87] 16.99 g→1000 ml
Preparation Dissolve 17.5 g of silver nitrate in water to make 1000 ml and mix well.
Standardization Weigh accurately about 0.2 g of sodium chloride primary standard, previouly dried to constant weight at 110℃, and dissolve it in 50 ml of water. Add 5 ml of dextrin solution (1→50), 0.1 g of calcium carbonate and 8 drops of fluorescein IS, titrate with silver nitrate (0.1 mol/L) VS until the colour of the opalescent liquid turns from yellowish-green to red. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 5.844 mg of sodium chloride.
If silver nitrate (0.01 mol/L) VS is needed, dilute silver nitrate (0.1 mol/L) VS with water immediately before use.
Storage Preserve in a well-closed amber coloured glass bottle.

Sodium Hydroxide (1.0, 0.5 mol/L or 0.1 mol/L) VS
[NaOH 40.00] 40.00 g→1000 ml
20.00 g→1000 ml
4.000 g→1000 ml
Preparation Shake sodium hydroxide with water to make a saturated solution, cool, transfer to a polyvinyl plastic bottle and allow to stand for several days.
Dilute 56, 28 ml or 5.6 ml respectively of the saturated and clarified sodium hydroxide solution with freshly boiled and cooled water to 1000 ml, and mix well.
Standardization (1) Sodium Hydroxide (1 mol/L) VS Weigh accurately about 6 g of potassium biphthalate primary standard, previously dried to constant weight at 105℃, add 50 ml of freshly boiled and cooled water and shake thoroughly. Add 2 drops of phenolphthalein IS and titrate with sodium hydroxide (1 mol/L) VS to a pink end point. Potassium biphthalate should have been completely dissolved towards the end point of titration.
Each ml of sodium hydroxide (1 mol/L) VS is equivalent to 204.2 mg of potassium biphthalate.
(2) Sodium Hydroxide (0.5 mol/L) VS Weigh accurately about 3 g of potassium biphthalate primary standard, previously dried to constant weight at 105℃. Standardize as directed above. Each ml of sodium hydroxide (0.5 mol/L) VS is equivalent to 102.1 mg of potassium biphthalate.
Sodium Hydroxide (0.1 mol/L) VS Weigh accurately about 0.6 g of potassium biphthalate primary standard, previously dried to constant weight at 105℃. Standardize as directed above. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 20.42 mg of potassium biphthalate.
If sodium hydroxide (0.05, 0.02 mol/L or 0.01 mol/L) VS is needed, dilute sodium hydroxide (0.1 mol/L) VS with freshly boiled and cooled water. Standardize against hydrochloric acid (0.05, 0.02 mol/L or 0.01 mol/L) VS, if necessary.
Storage Preserve in a tightly closed polyvinyl plastic bottle, insert 2 glass tubes through the stopper, connect one of the tubes to a soda lime tube, use the other tube for the outlet of the volumetric solution.

Sodium Methoxide (0.1 mol/L) VS
[CH_3ONa 54.02] 5.402 g→1000 ml
Preparation Place 150 ml of dehydrated methanol (it contains water less than 0.2%) in a vessel cooled with ice water, add 2.5 g of freshly cut metallic sodium in portions, add dehydrated benzene (it contains water less than 0.2%) to make 1000 ml and mix well.
Standardization Weigh accurately about 0.4 g of benzoic acid primary standard. Previously dried to constant weight in a vaccum desiccator over phosphorus pentoxide, and dissolve it in 15 ml of dehydrated methanol. Add 5 ml of dehydrated benzene and 1 drop of a 1% solution of thymol blue in dehydrated methanol, titrate with sodium methoxide VS to a blue end point. Perform a blank determination and make any necessary correction.

Each ml of sodium methoxide (0.1 mol/L) VS is equivalent to 12.21 mg of benzoic acid.
Sodium methoxide VS must be standardized immediately before use, protected from carbon dioxide and avoid volatilization of solvent.
Storage Preserve in a well-closed container of a titrating assembly, protected from carbon dioxide and moisture.

Sodium Nitrite (0.1 mol/L) VS
[$NaNO_2$ 69.00] 6.900 g→1000 ml
Preparation Dissolve 7.2 g of sodium nitrite and 0.1 g of anhydrous sodium carbonate in water to make 1000 ml and mix well.
Standardization Weigh accurately about 0.5 g of sulfanilic acid primary standard, previously dried to constant weight at 120℃, and dissolve it in 30 ml of water and 3 ml of concentrated ammonia TS. Add 20 ml of hydrochloric acid solution (1→2) with stirring, plunge the burette into the solution so that about 2/3 of the tip is under the liquid surface, titrate with sodium nitrite VS quickly with stirring at a temperature below 30℃. Withdraw the burette tip towards the end point of titration, rinse it with water and add the washings to the solution, continue the titration slowly, adopt the dead-stop method for end point determination. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 17.32 mg of sulfanilic acid.
When sodium nitrite (0.05 mol/L) VS is needed, dilute sodium nitrite (0.1 mol/L) VS with water and standardize, if necessary.
Storage Preserve in well-closed amber coloured glass bottle.

Sodium Tetraphenylborate (0.02 mol/L) VS
[$(C_6H_5)_4BNa$ 342.22] 6.845 g→1000 ml
Preparation Dissolve 7.0 g of sodium tetraphenylborate in 50 ml of water with shake. Add freshly prepared aluminum hydroxide gel (dissolve 1.0 g of aluminum chloride in 25 ml of water, add sodium hydroxide TS dropwise with stirring until the pH is 8-9), 16.6 g of sodium chloride and stir thoroughly. Add 250 ml of water and shake for 15 minutes, allow to stand for 10 minutes and filter. Add sodium hydroxide TS dropwise to the filtrate until the pH is 8-9, and then dilute with water to 1000 ml, mix well.
Standardization To 10 ml of sodium tetraphenylborate VS add 10 ml of sodium acetate BS (pH3.7) and 0.5 ml of bromophenol blue IS, and then titrate with benzalkonium chloride (0.01 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Calculate the concentration of sodium tetraphenylborate (0.02 mol/L) VS according to the volume consumed.
This solution should be standardized before use.
Dilute this solution with water before use, if sodium tetraphenylborate (0.01 mol/L) VS is needed, and standardize, if necessary.
Storage Preserve in well-closed amber coloured glass bottle.

Sodium Thiosulfate (0.1 mol/L) VS
[$Na_2S_2O_3 \cdot 5H_2O$ 248.19] 24.82 g→1000 ml
Preparation Dissolve 26 g of sodium thiosulfate and 0.2 g of anhydrous sodium carbonate in freshly boiled and cooled water to make 1000 ml, shake thoroughly, allow to stand for 1 month and filter.
Standardization Weigh accurately about 0.15 g of potassium dichromate primary standard, previously dried to constant weight at 120℃, and dissolve it in 50 ml of water in an iodine flask. Add 2.0 g of potassium iodide and dissolve with gentle shake, add 40 ml of dilute sulfuric acid. Stopper the flask and shake thoroughly, allow to stand in the dark for 10 minutes, Dilute with 250 ml of water and titrate with sodium thiosulfate (0.1 mol/L) VS until the end point is nearly reached, add 3 ml of starch IS and continue to titrate until the colour turns from blue to brilliant green. Perform a blank determination and make any necessary correction. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 4.903 mg of potassium dichromate. When the room temperature is above 25℃, the reacting liquid and water of dilution must be cooled to about 20℃.
If sodium thiosulfate (0.01 mol/L or 0.005 mol/L) VS is needed, dilute sodium thiosulfate (0.1 mol/L) VS with freshly boiled and cooled water immediately before use.

Sulfuric Acid (0.5, 0.25, 0.1 mol/L or 0.05 mol/L) VS
[H_2SO_4 98.08] 49.04 g→1000 ml
24.52 g→1000 ml
9.81 g→1000 ml
4.904 g→1000 ml
Preparation Sulfuric acid (0.5 mol/L) VS: Add slowly 30 ml of sulfuric acid to water with stirring, cool to room temperature, dilute with water to 1000 ml, mix well.
Sulfuric acid (0.25, 0.1 mol/L or 0.05 mol/L) VS: Add slowly 15 ml, 6.0 ml or 3.0 ml of sulfuric acid to water with stirring, dilute with water to 1000 ml, mix well.
Standardization Standardize as described under hydrochloric acid (1.0, 0.5, 0.2 mol/L or 0.1 mol/L) VS.
If sulfuric acid (0.01 mol/L) VS is needed, dilute sulfuric acid (0.5, 0.1 mol/L or 0.05 mol/L) VS with water and standardize, if necessary.

Tetrabutylammonium Hydroxide (0.1 mol/L) VS
[$(C_4H_9)_4NOH$ 259.48] 25.95 g→1000 ml
Preparation Dissolve 40 g of tetrabutylammonium iodide in 90 ml of dehydrated methanol in a stoppered glass conical flask. Place in an ice bath, add 20 g of finely powdered silver oxide, stopper the flask and shake vigorously for 60 minutes. Centrifuge a few ml and test the supernatant liquid for iodide. If the test is positive, add an additional 2 g of silver oxide to the above mixture and shake vigorously for 30 minutes. When all of the iodide has reacted, filter through a sintered glass funnel, rinse the flask and the funnel with three portions of 50 ml of dehydrated toluene, add the rinsings to the filtrate. Dilute with a mixture of dehydrated toluene and dehydrated methanol (3 : 1) to 1000 ml and mix well. Flush the solution for 10 minutes with dry nitrogen which is free from carbon dioxide. If the solution is not clear, add a few ml of dehydrated methanol.
Standardization Weigh accurately about 90 mg of benzoic acid primary standard, previously dried to constant weight in a vaccum desiccator over phosphrous pentoxide, and dissolve in 10 ml of dimethylformamide. Add 3 drops of a 0.3% solution of thymol blue in dehydrated methanol, and titrate to a blue end point with tetrabutylammonium hydroxide VS (adopt potentiometric method to indicate the end point). Perform a blank determination and make any necessary correction. Each ml of tetrabutylammonium hydroxide (0.1 mol/L) VS is equivalent to 12.21 mg of benzoic acid.
Storage Preserve in well-closed container, keep away from the carbon dioxide and moisture in air.

Zinc (0.05 mol/L) VS
[Zn 65.39] 3.270 g→1000 ml
Preparation Dissolve 15 g of zinc sulfate (equivalent to 3.3 g of Zn) in 10 ml of dilute hydrochloric acid and sufficient water to make 1000 ml, mix well.
Standardization To 25 ml of zinc (0.05 mol/L) VS, accurately measured, add 1 drop of a 0.025% solution of methyl red in ethanol, add ammonia TS dropwise until a slight yellow colour appears. Add 25 ml of water, 10 ml of ammonium chloride BS (pH10.0) and a small amount of eriochrome black T indicator, titrate with disodium edetate (0.05 mol/L) VS until the colour changes from purple to pure blue. Perform a blank determination and make any necessary correction. Calculate the concentration of zinc VS

according to the volume consumed.

Appendix XVI Sterilisation

Sterilisation is the process to inactivate or remove any viable micro-organisms of a product by physical or chemical means. The methods described in this chapter may be used for the sterilisation of preparations, raw materials, excipients and medical devices.

Sterility is the absence of any viable micro-organisms. Absolute sterility of a product can not be guaranteed nor can it be demonstrated by testing to any batch of sterilized product. In practice, a product is sterilized to decrease the survival probability of micro-organisms to a specified level, and is designated as sterility assurance level (SAL). The survival probability of micro-organisms of a product treated by terminal sterilisation is not more than 10^{-6}. The SAL of a process for a given product is established by appropriate validation studies.

The sterility assurance of a sterile product can not be guaranteed by testing, but depends on the use of the validated sterilisation process, good manufacturing practice (GMP), and good quality assurance system. It is essential that the following factors are fully considered in choosing a suitable sterilisation procedure, including nature of the product to be sterilized, effectiveness and economy of the procedure, and integrity and stability of the product after sterilisation.

It is essential to validate the process before being applied to practice. The validated items include:

(1) Establish the validation protocols and the evaluation standard.

(2) Ensure that the equipments are suitable and running effectively.

(3) Demonstrate that the key equipment and instrumentation are capable of operating within the prescribed parameter criteria.

(4) Perform replicate cycles by employing actual or simulated product and demonstrate the effectiveness of the process.

(5) Summarize the records and complete the documents above, to form a validation report.

In manufacture practice, the process of sterilisation should be monitored, and the key parameters of the procedure (such as temperature, pressure, duration, humidity, concentration of the gas and the dose of radiation etc.) shoule be within the validated limits. The Validation of sterilisation process should be repeated at suitable interval. Revalidation is carried out whenever major changes in the procedure, including changes in the load, take place.

The sterility assurance is related with the degree of microbial contamination of the product before sterilisation and the resistance of the contaminating micro-organisms. Therefore, it is essential to control the level of viable micro-organisms contamination of a product prior to sterilisation and the resistance of the contaminating micro-orgamisms, to choose adequate precautions to minimize the contamination with in the prescribed limits in the manufacturing process.

It is necessary to avoid re-contamination of the product after sterilisation. In all cases, the container and closure are required to maintain the sterility of the product throughout its shelf-life.

Methods of Sterilisation

The frequently-used methods include steam, dry heat, ionization radiation, gas and filtration. One or combinations of the above methods may be used, depending on the nature of the product. Wherever possible, the terminal sterilisation should be chosen. If terminal sterilisation is not possible, filtration or aseptic processing is used. Wherever possible, appropriate additional treatment (for example, steam) of a non-final product is applied.

1. Steam sterilisation

In this method, the products are placed in a chamber, and sterilized by saturated steam under pressure or overheated water flow which leads to denaturation of protein and nucleic acid to achieve the inactivation of micro-organisms. Steam is the most effective and most widely used method, and may be used for pharmaceutical preparations, containers, culture media, sterile coats, plastic plugs, and other materials resistant to high temperature and moisture. Steam sterilisation does not guarantee the complete inactivation of bacterial spores, and is often used as an complementary sterile technique for thermo-labile products.

The process is usually carried out by the following conditions:

121℃	15 min
121℃	30 min
116℃	40 min

Other combinations of time and temperature may be used provided that they could give an SAL of 10^{-6} or less. For thermo-stable product, deep sterilisation is used, the SAL should be less than 10^{-12}. For thermo-labile products, the standard time of sterilisation (F_0) [means the standard duration in the condition of 121.1℃ of sterile temperature, one minute of D-value, and 10.0℃ of Z-value] usually is not less than eight minutes. If F_0 is less than eight, the contamination of micro-organisms should be monitored in the whole manufacturing process, all the measures should be taken to minimize the level of contamination of micro-organisms and to ensure that products being sterilized meet the requirements of sterility assurance.

For steam sterilisation, the products to be sterilized should be loaded in the sterilizing chamber perfectly, no tightness, to ensure that they are all effectively and equally sterilized.

Knowledge of the coolest part of the chamber is obtained before this method is applied. Put the biological indicator at the coolest part to ensure SAL of the products has been achieved. Spores of *Bacillus stearothermophilus* are usually used as the indicator for this method.

2. Dry heat sterilisation

Dry heat sterilisation is carried out in an oven or tunnel equipment for sterilisation with forced air circulation, where micro-organisms and pyrogens are inactivated by high temperature. This method is suitable for products where steam sterilisation is inappropriate, such as glass utensils, metal containers, fibre products, solid drugs, and liquid paraffin wax.

The process is usually carried out by heating the product at 160-170℃ for 120 minutes or longer, 170-180℃ for 60 minutes or longer, or 250℃ for 45 minutes or longer. Other

combinations of time and temperature may be used provided that they could give an SAL of 10^{-6} or less. For thermostable product, sterilize it until the SAL is$\leqslant 10^{-12}$ wherever possible. In the latter case, sterility test for these products prior to sterilisation is not necessary. Dry heat at 250℃ for 45 minutes can also remove the pyrogens of containers and other equipments.

Put the products in suitable containers to ensure that they are all effectively and equally sterilized.

Knowledge of the coolest part of the chamber is obtained before this method is applied. Spores of *Bacillus subtilis* are usually used as the indicator for this method. Put the biological indicator at the coolest part to ensure SAL of the products has been achieved. Endotoxin inactivation test can verify the effectiveness of depyrogenation. Generally not less than 1000 EU of endotoxin which is derived from *Escherichia coli* may be added into the items prior to depyrogenation, in this case the reduction of the endotoxin is at least 3-log.

3. Ionising radiation sterilisation

Sterilisation by this method is achieved by exposure of the product to ionizing radiation in the form of gamma radiation from a suitable radioisotopic source (such as cobalt 60) or of a beam of electrons energized by a suitable electron accelerator. This method may be used for medical devices, containers, manufacturing equipments, and other raw materials and preparations resistant to radiation.

The SAL of the product is not more than 10^{-6} after ionising radiation sterilisation. The key parameter of ionising radiation sterilisation is mainly absorbed radiation dose. The radiation dose absorbed by the material being irradiated should be identified according to the suitability of the products and the maximum amount of the contaminated micro-organisms and the maximum resistance to radiation. It should be validated before the performance that the safety, efficiency and stability of a product should not be changed by the radiation dose. A reference absorbed dose is 25 kGy.

Use the lowest possible radiation dose for the final product, raw materials and medical devices. Before irradiation, test the number of contaminated microorganisms and the resistance to the irradiation of the product to evaluate the SAL of the procedure.

During the procedure, the radiation absorbed by the product should be monitored regularly by means of suitable chemical or physical methods to ensure that the dose is appropriate. If dosimeters radiated along with sterilized products are adopted, place them at specifid positions. Calibrate against a standard source at suitable intervals.

Spores of *Bacillus pumilus* are usually used as the indicator for this method.

4. Gas sterilisation

In this method, micro-organisms are inactivated in a high-pressure chamber filled with gas of disinfectors, for example, ethylene oxide, hydrogen peroxide, formaldehyde and ozone (O_3). This method is suitable for the products which are stable in these gases. Inflammability, teratogenesis and residue toxicity of the gases should be considered in the process of sterilisation.

The most generally used gas in this method which is carried out in a high pressure chamber filled with sterilized gas is ethylene oxide, usually mixed with 80%-90% inert gases. This method is applicable to medical devices and plastic products that are not durable by using high temperature methods. This method is not applicable to products which contain chlorine or can absorb ethylene oxide.

Temperature, humidity and gas concentration in the chamber, as well as the duration could affect the effectiveness of sterilisation by using ethylene oxide. The following conditions are recommended:

Temperature: (54±10)℃.

Pressure: 8×10^5 Pa

Relative humidity: (60±10)%

Duration: 90 minutes

The process of sterilisation is validated before application. During the procedure, the chamber is vacuumized first, then filled with vapor to the specified humidity and temperature. Fill in the filtered and pre-heated ethylene oxide. During the process, seriously monitor the temperature, humidity, pressure, concentration of ethylene oxide and time. Use biological indicators to monitor the effectiveness of sterilisation, if necessary. The process should be supervised by skilled technicians. After the material to be sterilized is exposed either to ethylene oxide or to a mixture of ethylene oxide with a suitable inert gas, adequate time should be left to allow dispersal of residual ethylene oxide and other volatile residues. It should be monitored that the residues are within the prescribed limits. Eliminate the remaining gas in the product to a degree free of toxicity to human.

Leaking test should be carried out to ensure obturation of the chamber. Package materials and alignment of the products can affect the gas penetration and diffusion. Spores of *Bacillus subtilis* are usually used as the indicator for this method.

5. Filtration

In this method, micro-organisms in the gas or liquid products are removed by filtering through a certain type of filter material. It is usually used for thermo-labile solutions of drugs and raw materials. Sterilisation filter units use microporous filter membranes (hydrophilic or lipophilic) as the filter material. The pore size is usually less than 0.22 μm. Avoid loss of solute by absorption on to the filter and to avoid the release of contaminants from the filter. Avoid use of membranes containing asbestos. The filter unit and membranes are sterilized before use. The filter units is cleaned first and then new membranes are used for a new batch of products.

The sterility assurance level in this method is related with bioburden of a product prior to sterilisation and the log reduction value (LRV) of the filter unit. Calculate LRV with the following expression:

$$LRV=\lg N_0-\lg N$$

Where N_0 represents the number of micro-organisms before filtration, and N is the number after filtration.

LRV is used to express the efficiency of filtration. The LRV per cm^2 of active filter surface is not less than 7 for 0.22 μm-pore-size membranes. Two filters may be linked to increase the efficiency.

Key factors, such as pore size, membrane integrity and LRV can not be monitored in the filtration process. Therefore, the integrity and effectiveness of the membranes should be validated before use. Validate the filter unit for at least once in a working day.

The products sterilized by this method should be operated in a cleaned area with rigorous monitoring and a sterile area is recommended. Relative facility, package container, stopper and other materials should be sterilized by appropriate methods, and recontamination should be avoided.

Pseudomonas diminuta are usually used as the indicator for this method.

6. Aseptic preparation

Aseptic preparation denotes the manufacturing of sterile preparations under sterile condition. It may include aseptic filling of products into containers and aseptic lyophilization. Filtration is usually used in the latter process.

It is necessary to monitor the environmental of aseptic preparation, and the filtration should be carried out under sterile conditions. The equipments, containers, plugs and other materials should be used suitable sterilisation methods

and recotamination should be avoided.
Sterility assurance of this process is carried out by simulating test for sterility by aseptic filling culture media. Sterility of the circumstance, personnel and materials should be monitored in the whole process.
The aseptic preparation should be validated at intervals, including periodic environmental filter examination and simulating test for sterility by aseptic filling culture media.

Biological indicators
Biological indicators are preparations of viable micro-organisms used to assess the performance of sterilisation equipments, to validate and monitor the effectiveness of sterilisation process. They usually consist of bacterial spores.

1. The Requirements for micro-organisms used as biological indicators
Different biological indicators are used for different sterilisation methods. The micro-organisms used as biological indicators comply with the following requirements:
(1) The test strain is more resistant than any possible contaminating micro-organisms in the product to be examined.
(2) The test strain is non-pathogenic.
(3) The test strain is resistant to mutation and easy to store.
(4) The test strain is easy to culture. If resting spores are used, they should be more than 90% of the indicator.

2. Preparation of biological indicators
The biological indicators are prepared using a specified procedure. Characteristics of the micro-organisms are determined before use, for example, D-value, which is the duration (expressed in minutes) with which the number of viable organisms are reduce to 10% of the original number at a definite temperature. Use suitable culture media for the incubation. Suspend the cultures, which mainly consist of spores. Store the spores as suspensions in innutrient liquids. Biological indicators consist of a definite number of one or more types of spores. They are usually placed on an inert carrier, for example a strip of filter paper, a glass slide, stainless or plastic materials. Spore suspensions may be presented in sealed ampoules. Biological indicators are packed with suitable materials, and an expiry date is set. The carriers and package materials protect the biological indicators from any deterioration or contamination, while allowing the sterilizing agent to enter into and contact with the micro-organisms. The packages are designed to facilitate storage, transportation, sampling and subculture.
Some biological indicators may be inoculated directly into a liquid product to be sterilized or into a liquid product similar to that to be sterilized. In the latter case, the equivalence of the liquid products are demonstrated.

3. Application of biological indicators
In validation of sterilisation process, though some parameter can be used, the effectiveness of a sterilisation process is most easily assessed by the degree to which biological indicators are inactivated. Commercial biological indicators, or spores prepared from resistant micro-organisms isolated from contaminants are used as biological indicators. The resistance, purity and number of spores are validated for the biological indicators. The quantity and resistance of spore of the biological indicators used should be more or greater than the contamination of the product to ensure the effectiveness of the process. Put the biological indicators at different position of the chamber for the terminal sterilisation. Avoid direct contact of the indicator with the product to be sterilized. Incubate the indicators after specified sterilisation on suitable culture media to guarantee inactivation of all the spores.
Commercial biological indicators may be used for validation test of deep sterilisation. For susceptible products, select suitable strains and spores as the biological indicator and design the process depending on the degree that the products are contaminated. Sterility assurance of these products are assessed by monitoring the number and resistance of contaminating micro-organisms and the validation test.

4. Common biological indicators

(1) Steam sterilisation Spores of *Bacillus stearothermophilus* (for example, NCTC 10007, NCIMB 8157, ATCC 7953) are recommended as the indicator for steam sterilisation. The D-value is 1.5-3.0 minutes, the number of viable spores in each tablet (or ampul) is 5×10^5-5×10^6, and all the micro-organisms are inactivated at 121℃ for 19 minutes. Spores of *Clostridium sporogenes* (for example, NCTC 8594, NCIMB 8053, ATCC 7955) may also be used, with D-value of 0.4-0.8 minutes.

(2) Dry-heat sterilisation Spores of *Bacillus subtilis* (for example, NCIMB 8058, ATCC 9372) are recommended as the indicator for dry-heat sterilisation. The D-value is more than 1.5 minutes, the number of viable spores in each tablet is 5×10^5-5×10^6. Use *Escherichia coli* endotoxin for validation of, depyrogenation the amount added is not less than 1000 EU.

(3) Ionising radiation sterilisation Spores of *Bacillus pumilus* (for example, NCTC 10327, NCIMB 10692, ATCC 27142) are recommended as the indicator for ionising radiation sterilisation. The number of viable spores in each tablet is 10^7-10^8. The D-value is around 3 kGy when a 25 kGy radiation dose is applied. Contaminated micro-organisms in the product may be more resistant to radiation than *B. pumlus*. Therefore, the latter can only be used to monitor the process, and can not be used to establish the radiation dose.

(4) Gas sterilisation Spores of *Bacillus subtilis* (for example, NCTC 10073, ATCC 9372) are recommended as the indicator for gas sterilisation with ethylene oxide. The number of viable spores in each tablet is 1×10^6-5×10^6. The D-value is more than 2.5 minutes, and the concentration of ethylene oxide is 600 mg/L. The relative humidity is 60%. The microorganisms are inactivated at 54℃ for 60 minutes. Spores of *Bacillus stearothermophilus* (for example, NCTC 10007, NCIMB 8157, ATCC 7953) are recommended as the indicator for gas sterilisation with hydrogen peroxide.

(5) Filtration *Pseudomonas diminuta* (for example ATCC 19146) is recommended as the indicator when 0.22 μm-pore-size membranes are used for filtration. *Serratin marcescens* (for example, ATCC 14756) is recommended when 0.45 μm-pore-size membranes are used.

Notes 1. The last digit of an atomic mass is shown in parentheses.
2. The figure in square brackets is the atomic mass of an isotope which exists with the longest half-life.

Appendix XVIII

XVIII A Guidelines for Validation of Analytical Method Adopted in Traditional Chinese Medicine Quality Specification

The purpose of validation of analytical method is to ensure that the adopted method meets requirements for the intended analytical applications. When drafting the traditional chinese medicine quality specification, the analytical methods should be validated. When the prescription, the technics changes, or the original analytical method is revised, the analytical methods of the specification also need to be validated. The process and result of the method validation should be recorded in the description of draft or the revision of pharmaceutical quality specification.

The analytical items to be validated are as follows, identification, limit test, quantification and determination of the other components whose content should be limited (such as residues, additives, etc). In the dissolution and release test of traditional chinese medicine pharmaceuticals, the analytical method of dissolution amount should also be validated.

The parameters to be validated are as follows, accuracy, precision (including repeatability, intermediate-precision and reproducibility), specificity, limit of detection, limit of quantification, linearity, range and ruggedness. The parameters to be validated should accord to the practical method. The analytical items and the corresponding parameters to be validated listed in the attached table can be used for reference.

The parameters of analytical method to be validated are as follows:

Accuracy The accuracy of an analytical method is the degree of closeness between the determined result obtained by this method and the true value or the reference value, commonly denoted by the percent rate of recovery (%). Accuracy should be determined in the specified range. The accuracy of the analytical methods used for the determination of quantification should also be validated.

1. Accuracy of the determination methods Reference substances with known purity can be used for the determination of the recovery of added samples, namely an amount of the reference substance with known purity of analyte is precisely added into the substance being examined with known content of analyte to be examined. The margin of the determined value and the amount of the substance being examined is divided by the amount of the added reference substance to calculate the recovery ratio.

In the test of the recovery of added samples, the sum of the added amount of the reference substance and the amount of the analyte in the substance being examined must be in the linearity range of the standard curve. The amount of the added reference substance should be proper. A very low amount will cause a large error. And a high amount will relatively reduce the amount of the interference substances, so the authenticity is bad.

$$\text{Recovery}\% = \frac{C - A}{B} \times 100\%$$

In the above formula: A is the amount of the analyte in the substance being examined;
B is the amount of the added reference substance;
C is the determined value.

2. Requirement for the Data

In the specified range, the determined results of 6 substances being examined with the same concentration are used for evaluating; or 3 different concentration levels are selected, then 3 testing solutions of each concentration level are prepared and determined, and these 9 determined results are used for evaluating. Commonly, the proportion of the added amount of the mid concentration to the content of the substance being examined should be controlled to be about 1 : 1. The added amount of the substance being examined, the amount of the content of the substance being examined, the added amount of the reference substance, the determined results, the calculated value of recovery (%), and the RSD of recovery (RSD%) or the confidential limit should be reported.

Precision The precision of an analytical method is the agreement among individual test results when the procedure is applied repeatly to multiple samplings of a homogeneous sample in the specified test conditions. The precision is commonly denoted by deviation, standard deviation, or relative standard deviation.

The precision includes repeatability, intermediate-precision and reproducibility.

The precision of the results determined by the same analyst within a very short period of time in the same operation conditions, is repeatability. The precision among the results determined by different analysts in the same laboratory with different instrument at different time is intermediate-precision. The precision among results determined by different analysts in different laboratories using the same analytical procedure is reproducibility.

The precision of the analytical methods used for determination of quantification should be determined.

1. Repeatability

In the specified range, the determined results of 6 substances being examined with the same concentration are used for evaluating; or 3 different concentration levels are selected, then 3 testing solutions of each concentration level are prepared and determined, and these 9 determined results are used for evaluating.

2. Intermediate-precision

To examine the effect of random fluctuation factors on the precision, a scheme of intermediate-precision test should be designed. Fluctuation factors are different dates, different analysts and different instrument, etc.

3. Reproducibility

If an analytical method is adopted as a legal standard, the

reproducibility test should be carried out. For example, the reproducibility result is obtained by checking and examining the method in different laboratories, when the pharmacopoeial analytical method is established. The purpose, process and reproducibility result of checking and examining the method should be recorded in the description of the draft. To avoid affecting reproducibility results, the sample should be uniform, properly stored and transported.

4. Requirement for the Data

Standard deviation, relative standard deviation and confidential limit should all be reported.

Specificity The specificity of an analytical method is its characteristic to measure accurately and specially the analyte in the presence of components that may be expected to be present in the sample. The specificity of identification test, detection of limit and content determination method should all be examined.

1. Identification test

The compounds that may be coexist or have close related structures should be distinguished. Substances being examined free of analyte and compounds with similar structure or concerned compounds in constituents should all offer negative response. Microscope identification, chromatograph and spectrum identification should be attached with the representative images or graphs.

2. Content determination and impurity examination

The substance being examined, which does not contain the analyte (except for the medicinal materials that contain the analyte or the simulated prescription that does not contain the analyte), is examined to illustrate the specificity of the method. The representative graphs should be attached when chromatography, spectrum methods or other separation methods are used. The position of each component should be marked in the graph. The resolution of the chromatography should meet the requirement.

When necessary, diode array detection and mass-spectrum could be used to examine the peak purity.

Limit of Detection The limit of detection is the lowest amount, which can be detected, of the analyte of the substance being examined. Methods often used are as follows:

1. Directly observation method:

A series of substances being examined with known concentrations are used for analysis. The lowest concentration or amount that can be reliably detected will be determined.

This method can be used for both non-instrumental and instrumental methods.

2. Signal-to-noise ratio method

This method is only used in the analytical methods that can show the baseline noise. Namely the lowest concentration or amount that can be reliably detected is calculated by comparing the signals of the sample with a known-low concentration with those of the blank sample. Generally the concentration or amount injected into the instrument at which the SN ratio is 3 : 1 or 2 : 1, is the limit of detection.

3. Requirement for Data

The test graphs should be attached. The test process and the results of limit of detection should be illustrated.

Limit of Quantification Limit of Quantification is the lowest quantity, which can be quantitatively determined with acceptable precision and accuracy, of the substance being examined. The limit of quantification of the analytical method used for quantitative examination should be determined.

The Signal-to-noise ratio is often used to determine the quantification limit. Generally the concentration or the amount injected into the instrument, at which the SN ratio is 10 : 1, is used for determination.

Linearity

The linearity of an analytical method is the degree of the test results, that are directly proportional to the concentrations of the analyte in samples in a designed range.

Linearity relationship should be determined over the claimed range of the method. A series of substances being examined could be prepared by accurately diluting of a stock solution or weighing an amount of analyte seperately. Substances being examined with at least 5 different concentrations should be prepared. The determined response signal is used as a dependent variable of analyte's concentrations to draw a graph. The linearity is examined and the least square method is used for a linear regression. The response signals may be subjected to mathematical transformation prior to the linearity regression analysis when necessary.

Requirement for data: regression equation, correlation coefficient and the linear graph should be given.

Range The range of an analytical method is the concentration or quantity interval between the lower and upper levels of analyte in which the testing method can be used with a certain precision, accuracy and linearity.

The range should be determined according to the practical application of analytical methods, results and requirement of linearity, accuracy and precision. As for the analytes with toxicity, special or pharmacological effectiveness, the range should be larger than the range of the limited content. For the determination of dissolution or release, the range should be ±20% of the limit.

Ruggedness The ruggedness of an analytical method is the degree of tolerance that the determined results are not affected when there are small changes in the testing conditions. The ruggedness should be taken into account when an analytical method begins to be studied. If the requirement for the testing conditions are hard, it should be clearly indicated in the method. The representative variable factors are as follows: the stability of the solution being examined, times and duration of sample extraction, etc. Representative variable factors of liquid chromatography include the composition and pH value of the mobile phase, the same type of the chromatographic columns from different manufacturers or batches, column temperature and flow rate, etc. Representative variable factors of gas chromatography include the chromatographic columns and the stationary phase from different manufacturers or batches, different types of support, column temperature, sample inlet and detector temperature, etc. Representative variable factors of thin layer chromatography are layers from different manufacturers, ways of sample applying, changes of temperature and relative humidity at performance, etc.

It should be illustrated whether the testing conditions with slight changes can meet the requirements for system test, so that the validity of the method could be confirmed.

Tab. List of validation items and parameters

Item / Parameter	Identification	Impurity Test		Determination of content and dissolution
		Quantification	Limit	
Accuracy	−	+	−	+
Repeatability	−	+	−	+
intermediate-precision	−	+①	−	+①

continue

Item / Parameter	Identification	Impurity Test		Determination of content and dissolution
		Quantification	Limit	
Reproducibility②	+	+	+	+
Specificity③	+	+	+	+
Limit of Detection	−	−	+	−
Limit of Quantification	−	+	−	−
Linearity	−	+	−	+
Range	−	+	−	+
Ruggedness	+	+	+	+

①It is no need to validate the intermediate-precision if there is a validation of repeatability.
②The repeatability is determined, only when the analytical method is adopted by the legal standard.
③The lack of the specificity of an analytical method can be compensated by other relevant analytical methods.

The most import items in different types of analytical methods are listed in the table above. "−" represents that the items usually need not to be validated. "+" represents that the items usually need to be validated. If there are some special circumstances, it is determined on the basis of practical analysis object and circumstances.

XVIII B Guidelines for Application of Safety Tests for Injection of Traditional Chinese Medicine

The guidelines for application of safety tests for injections are provided for quality control and safely clinic application of injection of traditional Chinese medicine. The guidelines include test for abnormal toxicity, test for depressor substances, test for allergic responses, test for haemolysis and agglomeration, test for pyrogens and test for bacterial endotoxins. The guidelines are suitable for application and implementation of test method of safety tests for injections of traditional Chinese medicine.

Establishment of Limit

The limit is established according to requirements of various items. Since the limit is established, the validation tests should be carried out for at least 3 batches preparations.

1. Abnormal Toxicity

(1) Before the establishment of the limit, median lethal dose (LD_{50}) and minimum lethal dose (LD_5) of one single injection should be determined, as well as the symptoms of toxicity. The administration is usually to inject into vein, unless specified otherwise. If there are several types of injection routes, such as intravenous injection, intraperitoneal injection, subcutaneous injection, etc., the LD_{50} of the injection tested should be determined by into vein at least. The observation duration is 72 hours or longer.

(2) The limit dose of abnormal toxicity of injection should be less than that of normal toxicity (LD_5), and more than that of clinic administration. Meanwhile, the differences of labs, reactivity of animals and preparations should be considered carefully. The establishment of limit of abnormal toxicity should be complied with the variation range of normal toxicity.

For the injection with large dose, inject 0.8 ml of test solution into tail vein at normal speed (0.05-0.1 ml/s) to each of 20 mice. If neither death nor toxicity reaction is observed, the highest dose of injection should be determined as limit of abnormal toxicity test. The duration of observation is usually 48 hours and during the observation, either death or toxicity reaction should be recorded.

2. Depressor Substances

(1) Determine whether or not the preparation being examined can decrease the blood pressure and the correlation between the dose and the depressor value.

(2) The test for depressor substances should be established for the intravenous injection and subcutaneous injection which are possible to induce acute depressor effect like histamine.

(3) The limit of injection with small dose is usually estimated on the basis of clinic practice or not less than clinic dose.

(4) If no depressor effect was observed by injecting into vein with the dose of 2 ml/kg, so the dose can be determined as the limit of administration.

3. Allergic Responses

(1) Observe the acute toxic reactive symptoms of guinea pig after injected intraperitoneally (or subcutaneously) and intravenously the sample tested.

(2) Determine the doses of sensibilization and challenge on the basis of doses caused toxic reaction and clinic practice. The administration is usually to inject intraperitoneally for sensibilization, meanwhile to inject in vein for challenge, unless specific symptom is observed (i.g, severe stimulus effect). The dose of challenge should be more than that of sensibilization, meanwhile the doses of challenge and sensibilization should be less than that of acute toxic reaction.

(3) In the preliminary test, 9 guinea pigs are divided into 3 groups and sensibilized for 3 times. Challenge test or antibody titer test should be carried out on the 14th, 21st and 28th day after the first sensibilization for the determination of optimal time for challenge.

(4) If necessary, semi-product can be used in the preliminary test for sensibilization and challenge to determine the allergenic possibility of components and manufacture procedure of the injection tested. If no sensibilization of semi-product and manufacture procedure is observed, it should be thought that the allergens test need not to be carried out for this product.

4. Test for Haemolysis and Agglomeration

To observe whether or not haemolysis and agglomeration occurred to the injection and its dilution. In test, injection tested, positive control, negative control and injection negative control should be arranged. If positive reaction is observed, the minimum dilution of no reaction should be tested and the limit of dilution for test can be determined combined with the clinic dose and administration.

5. Pyrogen

(1) In the test for pyrogen by using rabbit, the dose of

injection being examined should be 1-3 times more than that of clinic practice for human being per kg weight every hour.
(2) If the injection being examined is extreme acid/basic or not iso-osmia, it should be adjusted.
(3) The dose of injection for pyrogen test should not decrease the temperature of rabbit or induce toxic reaction. If the above disturbance occurs in the test, some measurements such as injecting slowly should be employed to eliminate it, otherwise, bacteria endotoxin test should be carried out as possible.

6. Test for Bacteria Endotoxins
(1) The determination of limit of endotoxin in injection prepared from traditional Chinese medicine should complied with the requirements of test for bacteria endotoxin (Appendix XIII D). Because of complication of manufacture procedure, components and variable factors, the estimation of limit should be more than that of requirement, in consideration of clinic practice and manufacture procedure.
(2) Because of various disturbance of injection, tachypleus amebocyte lysates from different manufacturers and various batches of injections under examination should be used as more as possible in the methodology research to estimate the disturbance effect. If the results are more different, the test for pyrogen should be used instead.

Test for Abnormal Toxicity

The abnormal toxicity of a substance being examined is determined by observing the death of mice within a specified period after having received by injection or taken orally a dose of substance under examination.
Healthy mice from normal breeding each weighing 17-20 g are used and can only be used once for the test.

Preparation of test solution Unless specified otherwise, dissolve the substance being examined in normal saline solution to produce a solution of the concentration specified in individual monographs.

Procedure Unless specified otherwise administer to each of 5 mice 0.5 ml of the test solution by one of the following routes specified in monographs.

Intravenous injection Inject the test solution into a tail vein of each mouse. The injection should be completed within 4-5 seconds at a uniform rate or 30 seconds specified for slowly injection.

Intraperitoneal injection Inject the test solution from the abdominal surface into the peritoneal cavity.

Subcutaneous injection Inject the test solution subcutaneously at one side of the dorsal surface or under the abdominal surface.

Oral administration Administer the test solution orally by means of a suitable cannula.

Evaluation of the results Unless specified otherwise, none of the mice received the test solution dies within 48 hours. If one or more mice die within 48 hours, repeat the test using another 10 mice each weighing 18-19 g; none of the second group of mice dies within 48 hours.

Test for Depressor Substances

The depressor substance of a preparation being examined (T) is determined by comparing its depressor effect on anesthetized cat (or dog) with that of the histamine reference standard (RS) under the condition of the following method.

Preparation of standard solution Dissolve an accurately weighed quantity of the histamine phosphate RS in water to produce a solution of 1 mg histamine base per ml. It can be stored in suitable container at 4-8℃ for 3 months unless precipitation occurred.

Dilution of standard solution Immediately before the test, dilute the histamine solution with normal saline solution to produce a solution of 0.5 μg of histamine base per ml.

Preparation of test solution Prepare a solution of preparation being tested to produce a solution with suitable concentration specified in the monograph so that the volume of the solution being injected will be equal to that of the standard solution.

Procedure A healthy cat weighing over 2 kg, male or non-pregnant female, is anesthetized with a suitable anesthetic such as one of the barbiturates. Care should be taken to maintain the body temperature of the animal during the test. Fix the cat on an operating table, introduce a short glass cannula into the trachea so as to be ready for artificial respiration when necessary. Insert a cannula filled with suitable anticoagulant solution into one of the carotid artery and connect the cannula to a suitable pressure measuring device for making a continuous record of blood pressure. Cannulate the femoral vein for intravenous injection. Adjust the pressure of the pressure measuring device to a level corresponding to the normal blood pressure of the animal (usually 13.3-16.0 kPa) and remove the artery clamp. The doses can be given only when the blood pressure of the animal is constant. Injections should be made at uniform rate and at regular intervals of 3-5 minutes depending on the speed at which the blood pressure returns to a constant level. Each injection is followed by a fixed volume of normal saline solution.
Sensitivity test Inject intravenously in turn 3 doses of standard solution corresponding to 0.05 μg, 0.1 μg and 0.15 μg of histamine base per kg of the cat's weight. Repeat the injections for 2-3 times, if the depressor responses to the injections of 0.1 μg/kg are approximately the same and correspond to a fall of blood pressure not less than 2.67 kPa and the responses to the graded doses are clearly discriminated, the sensitivity of the animal is suitable for the test.
Test for injection Let d_S response the dose of 0.1 μg of the histamine base per kg of the cat's weight and d_T the dose of test preparation specified in individual monographs, inject a series of doses in the order of d_S, d_T, d_T, d_S, compare the depressor response caused by the third dose with that caused by the first dose, and the response caused by the second dose with that caused by the fourth dose. The preparation complies with the test if none of the depressor responses caused by d_T is greater than 1/2 of that caused by d_S. If one response caused by d_T is greater than 1/2 of that caused by d_S, inject another series of d_S, d_T, d_T, d_S and compare their responses in the same way. The test preparation complies with the test if none of the depressor responses caused by d_T are greater than that caused by d_S. If it is not the case, repeat the test with another cat. The test preparation fails the test, if in the repeated test one depressor response caused by d_T is greater than that caused by d_S. The animal can further be used for test of depressor substances, if the sensitivity of the animal is still suitable for the test.

Test for Allergic Response

The allergic response of injection being examined is determined by observing the allergic response of test animals injected intraperitoneally with injection tested for sensibilization and challenged intravenously administration.
Animals used in the test should be healthy guinea pigs, weighing 250-350 g, male or non-pregnancy famale. Before and during the test, it should be feed in normal condition. The guinea pigs must be used only once for the test.

Preparation of test solution Unless specified otherwise,

prepare a solution of preparation being examined with suitable concentration specified in the monograph.

Procedure Unless specified otherwise, inject intraperitoneally to each of 6 guinea pigs 0.5 ml of test solution every other day for 3 times to make it sensibilization. After the sensibilization, the guinea pigs are divided into 2 equal groups, each group include 3 guinea pigs. Inject intravenously to each guinea pig 1 ml of the test solution on the 14th and 21st day after first injection for challenge. Observe the syndrome and behavior of animals every day and record the body weights of animals before first injection and challenge. Observe whether allergic response such as piloerection, dyspnea and convulsion occurred in the animals in 30 minutes after challenged.

Evaluation of the results None allergic responses occurred in the test animals in 30 minutes after injection intravenous of test solution. If two or more than two responses including piloerection, sneeze, retch, cough continuously, dyspnea and convulsion, or one of convulsion, shock and death occurred, the test solution must be determined not to comply with the requirements.

Test for Haemolysis and Agglomeration

The test is to observe the effect on red cell by mixing and incubating with test solution and red cell suspension for certain time.

Preparation of 2 percent red cell suspension Introduce about 20 ml of freshly sheep (or rabbit) blood into a flask containing glass pearls, shake the flask about 10 minutes, or stir the blood with a glass rod to remove fibrin. Fill the flask about 10 times more than that of the volume of blood with 0.9% NaCl solution, stir and centrifuge at a speed of 1000-1500 rpm for 15 minutes, remove the supernatant and wash the precipitated red cell with 0.9% NaCl solution 2-3 times by above means until the colour of supernatant is not red. Prepare the 2 percent suspension of red cell with 0.9% NaCl solution.

Preparation of test solution Unless specified otherwise, the injection with non-blood vessel administration should be diluted with 0.9% NaCl solution (1 : 3 v/v) as a test solution. The injection with blood vessel administration should be prepared with specified concentration in the monograph for clinic practice.

Procedure Use 5 clean and labelled tubers, No. 1, 2 tubers are used for test solution, No. 3 tuber for negative control, No. 4 tuber for positive control and No. 5 tuber for test solution control. As showed in the below sheet, add in turns to the tubers with 2 percent red cell suspension, 0.9% NaCl solution or sterile water, mix the solutions and immediately incubate at 37℃ ± 0.5℃ incubator for 3 hours. Observe the haemolysis and agglomeration.

Tubers	1, 2	3	4	5
2% red cell suspension /ml	2.5	2.5	2.5	
0.9% NaCl /ml	2.2	2.5		4.7
Sterile water /ml			2.5	
Test solution /ml	0.3			0.3

If the test solution is red and clear and no cell or a little cell stayed in the bottom of the tuber, haemolysis has occurred. If all of the red cell sank and the supernatant is colourless and clear, or the supernatant is colour and clear, meanwhile no obvious difference between the No. 1 and 5 tubers, no haemolysis has occurred.

If red brown or brown red flocculate precipitation has appeared, which can not be dispersed by shaking, agglomeration has occurred. If the above appearance occurred, it should be determined as true or false agglomeration by using below means. If the flocculate can be dispersed after shaking the tuber, or put the flocculate on a glass slide and add 2 drops of 0.9% NaCl solution at the edge of cover glass and observe the slide under microscopy, if the flocculate can be scattered, the agglomeration is false, otherwise, it is true.

Evaluation of the results When no haemolysis and agglomeration occurred in negative tuber meanwhile haemolysis occurred in the positive tuber, if no haemolysis and agglomeration occurred in the test solution in 3 hours, the injection being tested can be determined to comply with the requirements, otherwise, it does not comply with the requirements.

Test for Pyrogen

See "Test for Pyrogen" (Appendix XIII A).

Test for Bacteria Endotoxins
